Transit LSP: 0 sessions

Total 0 displayed, Up 0, Down 0

**Meaning** Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up.

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

## Checklist for Working with the Layered MPLS Troubleshooting Model

**Problem** **Description:** This checklist provides a link to more detailed information about the layered Multiprotocol Label Switching network.

**Solution** [Table 22 on page 948](#) provides commands for working with the layered MPLS troubleshooting model.

**Table 22: Checklist for Working with the Layered MPLS Troubleshooting Model**

Tasks	Command or Action
<a href="#">“Understanding the Layered MPLS Troubleshooting Model” on page 948</a>	<pre>show mpls lsp show mpls lsp extensive show mpls lsp name <i>name</i> show mpls lsp name <i>name</i> extensive</pre>

## Understanding the Layered MPLS Troubleshooting Model

**Problem** **Description:** The layered MPLS troubleshooting model is a disciplined approach to investigating problems with an MPLS network. [Figure 95 on page 949](#) illustrates the layers in the model, and the commands you can use to structure your investigation. Because of the complexity of the MPLS network, you can obtain much better results from your investigations if you progress through the layers and verify the functioning of each layer on the ingress, egress, and transit routers before moving on to the next layer.

**Solution** [Figure 95 on page 949](#) shows the layered MPLS troubleshooting model that you can use to troubleshoot problems with your MPLS network.

Figure 95: Layered MPLS Network Troubleshooting Model

<b>BGP Layer</b>	tracroute <i>host-name</i> show bgp summary show configuration protocols bgp show route <i>destination-prefix</i> detail show route receive protocol bgp <i>neighbor-address</i>
<b>MPLS Layer</b>	show mpls lsp show mpls lsp extensive show route table mpls.0 show route <i>address</i> tracroute <i>address</i> ping mpls rsvp <i>Lsp-name</i> detail
<b>RSVP Layer</b>	show rsvp session show rsvp neighbor show rsvp interface
<div> <b>IGP and IP Layers Functioning</b> </div>	
<b>OSPF Layer</b> show ospf neighbor show configuration protocols ospf show ospf interface	<b>IS-IS Layer</b> show isis adjacency show configuration protocols isis show isis interface
<b>IP Layer</b> show ospf neighbor extensive show interfaces terse	<b>IP Layer</b> show isis adjacency extensive show interfaces terse
<b>Data Link Layer</b>	show interfaces extensive <i>JUNOS Interfaces Network Operations Guide</i>
<b>Physical Layer</b>	show interfaces show interfaces terse ping <i>host</i>

9015528

As you move from one layer of the model to the next, you verify the correct functioning of a different component of the MPLS network and eliminate that layer as the source of the problem.

**Physical Layer** When you investigate the physical layer, you check that the routers are connected, and the interfaces are up and configured correctly. To check the physical layer, enter the **show interfaces**, **show interfaces terse**, and **ping** commands. If there is a problem in the physical layer, take appropriate action to fix it; then check that the LSP is operating as expected using the **show mpls lsp extensive** command. For more information on checking the physical layer, see [“Checklist for Verifying the Physical Layer” on page 955](#).

**Data Link Layer** When you investigate the data link layer, you check the encapsulation mode, for example, Point-to-Point Protocol (PPP) or Cisco High-Level Data Link Control (HDLC); PPP options, for example, header encapsulation; frame check sequence (FCS) size; and whether keepalive frames are enabled or disabled. To check the data link layer, enter the **show interfaces extensive** command. If there is a problem in the data link layer, take appropriate action to fix it; then check that the LSP is operating as expected using the **show mpls lsp extensive** command. For more information on checking the data link layer, see [“Checking the Data Link Layer” on page 968](#) and the *Junos Interfaces Operations Guide*.

**IP Layer** When you investigate the IP layer, you verify that interfaces have correct IP addressing, and that the interior gateway protocol (IGP) neighbor adjacencies are established. To check the IP layer, enter the **show interfaces terse**, **show ospf neighbor extensive**, and **show isis adjacency extensive** commands. If there is a problem in the IP layer, take

appropriate action to fix it; then check that the LSP is operating as expected using the **show mpls lsp extensive** command.

- IGP Layer** When you investigate the IGP layer, you verify that the the Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS) protocols are configured and running correctly.
- If you have the OSPF protocol configured, you must check the IP layer first, and then the OSPF configuration. When you investigate the OSPF layer, you check that the protocol, interfaces, and traffic engineering are configured correctly. To check the OSPF layer, enter the **show configuration protocols ospf** and **show ospf interface** commands. If the problem exists in the OSPF layer, take appropriate action to fix it; then check that the LSP is operating as expected using the **show mpls lsp extensive** command. For more information about checking the OSPF layer, see [“Verifying the OSPF Protocol” on page 1009](#).
  - If you have the IS-IS protocol configured, because IS-IS and IP are independent of each other, it doesn’t matter which one you check first. When you check the IS-IS configuration, you verify that IS-IS adjacencies are up, and the interfaces and IS-IS protocol are configured correctly. To check the IS-IS layer, enter the **show isis adjacency**, **show configuration protocols isis**, and **show isis interfaces** commands. If the problem exists in the IS-IS layer, take appropriate action to fix it; then check that the LSP is operating as expected using the **show mpls lsp extensive** command. For more information about checking the IS-IS layer, see *Verifying the IS-IS Protocol*.

**NOTE:** The IS-IS protocol has traffic engineering enabled by default.

---

- RSVP and MPLS Layers** After you have both the IP and IGP layers functioning and the problem is still not solved, you can begin to check the Resource Reservation Protocol (RSVP) and MPLS layers to determine if the problem is in one of these layers.
- When you investigate the RSVP layer, you are checking that dynamic RSVP signaling is occurring as expected, neighbors are connected, and interfaces are configured correctly for RSVP. To check the RSVP layer, enter the **show rsvp session**, **show rsvp neighbor**, and **show rsvp interface** commands. If there is a problem in the RSVP layer, take appropriate action to fix it; then check that the LSP is operating as expected using the **show mpls lsp extensive** command.
  - When you investigate the MPLS layer, you are checking whether the LSP is up and functioning correctly. To check the MPLS layer, enter the **show mpls lsp**, **show mpls lsp extensive**, **show route table mpls.0**, **show route address**, **traceroute address**, and **ping mpls rsvp lsp-name detail** commands. If there is a problem in the MPLS layer, take appropriate action to fix it; then check that the LSP is operating as expected using the **show mpls lsp extensive** command.

- BGP Layer** If the problem persists after you have checked the RSVP and MPLS layers, you must verify that the Border Gateway Protocol (BGP) is working correctly. There is no point in

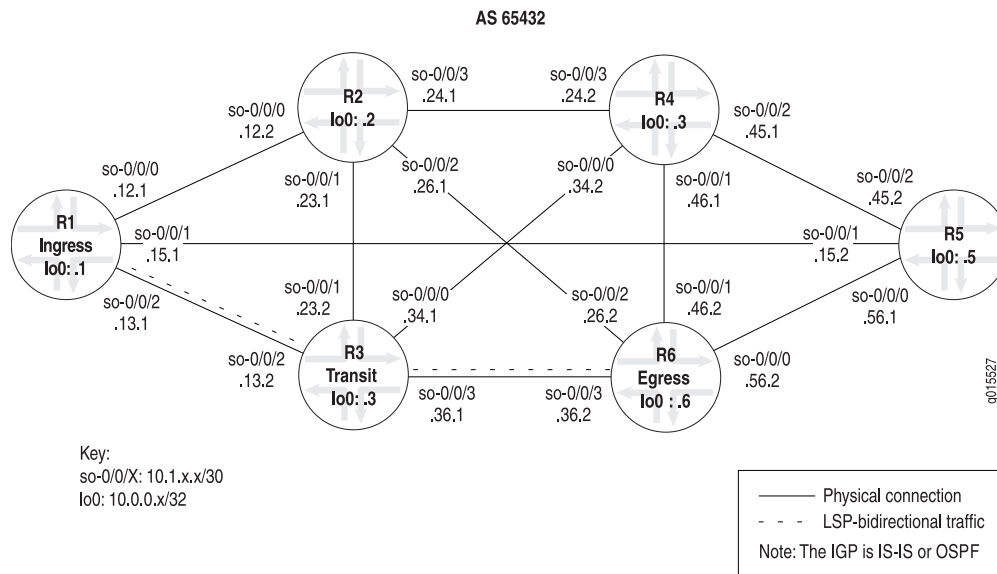

checking the BGP layer unless the LSP is established because BGP uses the MPLS LSP to forward traffic. When you check the BGP layer, you verify that the route is present and active, and more importantly, you ensure that the next hop is the LSP. To check the BGP layer, enter the **traceroute *host-name*, show bgp summary, show configuration protocols bgp, show route destination-prefix detail, and show route receive protocol bgp neighbor-address** commands. For more information on checking the BGP layer, see *Checking the BGP Layer*.

In reality, you could start at any level of the MPLS model to investigate a problem with your MPLS network. However, a disciplined approach, as the one described here, produces more consistent and reliable results.

Figure 96 on page 951 illustrates the basic network topology used in the following topics that demonstrate how to troubleshoot an MPLS network:

- [Checklist for Verifying the Physical Layer on page 955](#)
- [Checklist for Checking the Data Link Layer on page 967](#)
- [Checklist for Verifying the IP and IGP Layers on page 986](#)
- [Checklist for Checking the RSVP Layer on page 1033](#)
- [Checklist for Checking the MPLS Layer on page 921](#)
- [Checklist for Checking the BGP Layer](#)

Figure 96: MPLS Basic Network Topology Example

The MPLS network consists of the following components:

- Router-only network with SONET interfaces
- MPLS protocol enabled on all routers, with interfaces selectively deactivated to illustrate a particular problem scenario

- All interfaces configured with MPLS
- A full-mesh IBGP topology, using AS 65432
- IS-IS or OSPF as the underlying IGP, using one level (IS-IS Level 2) or one area (OSPF area 0.0.0.0)
- A **send-statics** policy on routers R1 and R6, allowing a new route to be advertised into the network
- Two LSPs between routers R1 and R6, allowing for bidirectional traffic.

After you have configured an LSP, it is considered best practice to issue the **show mpls lsp** command to verify that the LSP is up, and to investigate further if you find an error message in the output. The error message can indicate a problem at any layer of the MPLS network.

The LSPs can be ingress, transit, or egress. Use the **show mpls lsp** command for quick verification of the LSP state, with the **extensive** option (**show mpls lsp extensive**) as a follow-up if the LSP is down. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To begin the investigation of an error in your MPLS network, from the ingress router, enter some or all of the following Junos OS command-line interface (CLI) operational mode commands:

```
user@host> show mpls lsp
user@host> show mpls lsp extensive
user@host> show mpls lsp name name
user@host> show mpls lsp name name extensive
```

**Sample Output 1** user@R1> show mpls lsp

**Meaning** The sample output from the ingress router **R1** shows that the label-switched path is traversing the network as intended, from **R1** through **R3** to **R6**, and another LSP in the reverse direction, from **R6** through **R3** to **R1**.

If your network has numerous LSPs, you might consider using the **show mpls lsp** command for quick verification of the LSP state, and the **show mpls lsp name *name* extensive** command to continue your investigation if you find that the LSP is down.

For more information about the status and statistics of the **show mpls lsp** command, see “[Checklist for Determining LSP Status](#)” on page 1056. For more information on the availability and valid use of an LSP, see “[Checklist for Verifying LSP Use](#)” on page 1058.

In all the following topics, the network topology is broken at different layers of the network so that you can investigate various MPLS network problems. The problems presented are not inclusive. Instead, the problems serve to illustrate one possible process of investigation into the different layers of the troubleshooting model.

## Checklist for Verifying the Physical Layer

**Problem Description:** This checklist provides the steps and commands for investigating a problem at the physical layer of a Multiprotocol Label Switching (MPLS) network. The checklist provides links to an overview of verifying the physical layer and more detailed information about the commands used to investigate the problem.

**Solution** [Table 23 on page 955](#) provides commands for verifying the physical layer.

**Table 23: Checklist for Verifying the Physical Layer**

## Verifying the Physical Layer

**Purpose** After you have configured the LSP, issued the **show mpls lsp extensive** command, and determined that there is an error, you can start investigating the problem at the physical layer of the network.

Figure 97 on page 956 illustrates the physical layer of the layered MPLS model.

Figure 97: Verifying the Physical Layer

With this layer, you must ensure that the routers are connected, and that the interfaces are up and configured correctly on the ingress, egress, and transit routers.

If the network is not functioning at this layer, the label-switched path (LSP) does not work as configured.

Figure 98 on page 957 illustrates the MPLS network and the problem described in this topic.

Figure 98: MPLS Network Broken at the Physical Layer

The network shown in Figure 98 on page 957 is a fully meshed configuration where every directly connected interface can receive and send packets to every other similar interface. The LSP in this network is configured to run from ingress router R1, through transit router R3, to egress router R6. In addition, a reverse LSP is configured to run from R6 through R3 to R1, creating bidirectional traffic.

However, in this example, traffic does not use the configured LSP. Instead traffic uses the alternate route from R1 through R2 to R6, and in the reverse direction, from R6 through R5 to R1.

When you become aware of a situation where an alternate route is used rather than the configured LSP, verify that the physical layer is functioning correctly. You might find that routers are not connected, or that interfaces are not up and configured correctly on the ingress, egress, or transit routers.

The cross shown in Figure 98 on page 957 indicates where the LSP is broken because of a configuration error on ingress router R1.

To check the physical layer, follow these steps:

1. [Verify the LSP on page 958](#)
2. [Verify Router Connection on page 959](#)
3. [Verify Interfaces on page 959](#)

4. [Take Appropriate Action on page 960](#)
5. [Verify the LSP Again on page 961](#)

## Verify the LSP

**Purpose** Typically, you use the **show mpls lsp extensive** command to verify the LSP. However, for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down, use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To determine whether the LSP is up, enter the following command from the ingress router:

```
user@ingress-router> show mpls lsp extensive
```

## Sample Output

```

**Meaning** The sample output from ingress router **R1** shows that the LSP is using an alternate path rather than the configured path. The configured path for the LSP is **R1** through **R3** to **R6**, and for the reverse LSP, **R6** through **R3** to **R1**. The alternate path used by the LSP is **R1** through **R2** to **R6**, and for the reverse LSP, **R6** through **R5** to **R1**.

## Verify Router Connection

**Purpose** Confirm that the appropriate ingress, transit, and egress routers are functioning by examining whether the packets have been received and transmitted with 0% packet loss.

**Action** To determine that the routers are connected, enter the following command from the ingress and transit routers:

```
user@host> ping host
```

## Sample Output

```

user@R1> ping 10.0.0.3 count 3
PING 10.0.0.3 (10.0.0.3): 56 data bytes
64 bytes from 10.0.0.3: icmp_seq=0 ttl=254 time=0.859 ms
64 bytes from 10.0.0.3: icmp_seq=1 ttl=254 time=0.746 ms
64 bytes from 10.0.0.3: icmp_seq=2 ttl=254 time=0.776 ms

--- 10.0.0.3 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.746/0.794/0.859/0.048 ms

user@R3> ping 10.0.0.6 count 3
PING 10.0.0.6 (10.0.0.6): 56 data bytes
64 bytes from 10.0.0.6: icmp_seq=0 ttl=255 time=0.968 ms
64 bytes from 10.0.0.6: icmp_seq=1 ttl=255 time=3.221 ms
64 bytes from 10.0.0.6: icmp_seq=2 ttl=255 time=0.749 ms

--- 10.0.0.6 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.749/1.646/3.221/1.117 ms

```

**Meaning** The sample output shows that ingress router **R1** is receiving packets from transit router **R3**, and that the transit router is receiving packets from the egress router. Therefore, the routers in the LSP are connected.

## Verify Interfaces

**Purpose** Confirm that the interfaces are configured correctly with the **family mpls** statement.

**Action** To determine that the relevant interfaces are up and configured correctly, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show interfaces terse
user@host> show configuration interfaces type-fpc/pic/port
```

### Sample Output

```
user@R1> show interfaces so* terse
Interface      Admin Link Proto Local Remote
so-0/0/0       up   up   inet  10.1.12.1/30
so-0/0/0.0     up   up   inet  10.1.12.1/30
               iso
               mpls
so-0/0/1       up   up   inet  10.1.15.1/30
so-0/0/1.0     up   up   inet  10.1.15.1/30
               iso
               mpls
so-0/0/2       up   up   inet  10.1.13.1/30
so-0/0/2.0     up   up   inet  10.1.13.1/30
               iso  <<< family mpls is missing
so-0/0/3       up   down
```

```
user@R1> show configuration interfaces so-0/0/2
unit 0 {
  family inet {
    address 10.1.13.1/30;
  }
  family iso; <<< family mpls is missing
}
```

**Meaning** The sample output shows that interface **so-0/0/2.0** on the ingress router does not have the **family mpls** statement configured at the **[edit interfaces type-fpc/pic/port]** hierarchy level, indicating that the interface is incorrectly configured to support the LSP. The LSP is configured correctly at the **[edit protocols mpls]** hierarchy level.

The output from the transit and egress routers (not shown) shows that the interfaces on those routers are configured correctly.

### Take Appropriate Action

**Problem Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the **family mpls** statement, which was missing, is included in the configuration of ingress router **R1**.

**Solution** To correct the error in this example, enter the following commands:

```
[edit interfaces type-fpc/pic/port]
user@R1# set family mpls
user@R1# show
user@R1# commit
```

**Sample Output** [edit interfaces so-0/0/2 unit 0]  
user@R1# **set family mpls**

```
[edit interfaces so-0/0/2 unit 0]
user@R1# show
family inet {
    address 10.1.13.1/30;
}
family iso;
family mpls;
```

```
[edit interfaces so-0/0/2 unit 0]
user@R1# commit
commit complete
```

**Meaning** The sample output from ingress router **R1** shows that the **family mpls** statement is configured correctly for interface **so-0/0/2.0**, and that the LSP is now functioning as originally configured.

## Verify the LSP Again

**Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the physical layer has been resolved.

**Action** To verify that the LSP is up and traversing the network as expected, enter the following command:

```
user@host> show mpls lsp extensive
```

## Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions
```

```

**Meaning** Sample Output 1 from ingress router **R1** shows that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Sample Output 2 from ingress router **R1** shows that the LSP is forced to take the intended path because MPLS is deactivated on **R1** interfaces **so-0/0/0.0** and **so-0/0/1.0**. If these interfaces were not deactivated, even though the configuration is now correct, the LSP would still traverse the network through the alternate path.

---

## Verify the LSP

**Purpose** Typically, you use the **show mpls lsp extensive** command to verify the LSP. However, for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down, use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To determine whether the LSP is up, enter the following command from the ingress router:

```
user@ingress-router> show mpls lsp extensive
```

## Sample Output

```

user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

so-0/0/2            up    up
so-0/0/2.0          up    up    inet  10.1.13.1/30
                    up    up    iso   <<< family mpls is missing
so-0/0/3            up    down

user@R1> show configuration interfaces so-0/0/2
unit 0 {
    family inet {
        address 10.1.13.1/30;
    }
    family iso; <<< family mpls is missing
}

```

**Meaning** The sample output shows that interface **so-0/0/2.0** on the ingress router does not have the **family mpls** statement configured at the **[edit interfaces type-fpc/pic/port]** hierarchy level, indicating that the interface is incorrectly configured to support the LSP. The LSP is configured correctly at the **[edit protocols mpls]** hierarchy level.

The output from the transit and egress routers (not shown) shows that the interfaces on those routers are configured correctly.

## Take Appropriate Action

**Problem** **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the **family mpls** statement, which was missing, is included in the configuration of ingress router **R1**.

**Solution** To correct the error in this example, enter the following commands:

```

[edit interfaces type-fpc/pic/port]
user@R1# set family mpls
user@R1# show
user@R1# commit

```

**Sample Output** [edit interfaces so-0/0/2 unit 0]  
user@R1# set family mpls

```

[edit interfaces so-0/0/2 unit 0]
user@R1# show
family inet {
    address 10.1.13.1/30;
}
family iso;
family mpls;

```

```

[edit interfaces so-0/0/2 unit 0]
user@R1# commit
commit complete

```

**Meaning** The sample output from ingress router **R1** shows that the **family mpls** statement is configured correctly for interface **so-0/0/2.0**, and that the LSP is now functioning as originally configured.

## Verify the LSP Again

- Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the physical layer has been resolved.
- Action** To verify that the LSP is up and traversing the network as expected, enter the following command:

**Meaning** Sample Output 1 from ingress router **R1** shows that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Sample Output 2 from ingress router **R1** shows that the LSP is forced to take the intended path because MPLS is deactivated on **R1** interfaces **so-0/0/0.0** and **so-0/0/1.0**. If these interfaces were not deactivated, even though the configuration is now correct, the LSP would still traverse the network through the alternate path.

## Checklist for Checking the Data Link Layer

**Problem** **Description:** This checklist provides the steps and commands for investigating a problem at the data link layer of the Multiprotocol Label Switching (MPLS) network. The checklist provides links to an overview of the data link layer and more detailed information about the commands used to investigate the problem.

**Solution** [Table 24 on page 967](#) provides commands for checking the data link layer.

**Table 24: Checklist for Checking the Data Link Layer**

Tasks	Command or Action
<b>“Checking the Data Link Layer” on page 968</b>	
1. <a href="#">Verify the LSP on page 969</a>	<code>show mpls lsp extensive</code>
2. <a href="#">Verify Interfaces on page 970</a>	<code>show interfaces type-fpc/pic/port extensive</code> <code>show interfaces type-fpc/pic/port</code>
3. <a href="#">Take Appropriate Action on page 974</a>	The following sequence of commands addresses the specific problem described in this topic:  <code>[edit interfaces type-fpc/pic/port]</code> <code>show</code> <code>delete encapsulation</code> <code>show</code> <code>commit</code>
4. <a href="#">Verify the LSP Again on page 975</a>	<code>show mpls lsp extensive</code>

## Checking the Data Link Layer

**Purpose** After you have configured the label-switched path (LSP), issued the **show mpls lsp extensive** command, and determined that there is an error, you might find that the error is not in the physical layer. Continue investigating the problem at the data link layer of the network.

Figure 99 on page 968 illustrates the data link layer of the layered MPLS model.

**Figure 99: Checking the Data Link Layer**

9015544

With this layer, you must check the encapsulation mode, for example, Point-to-Point Protocol (PPP) or Cisco High-Level Data Link Control (HDLC); PPP options, for example, header encapsulation; frame check sequence (FCS) size; and whether keepalive frames are enabled or disabled. Also, check the ingress, egress, and transit routers.

Figure 100 on page 969 illustrates the MPLS network used in this topic.

Figure 100: MPLS Network Broken at the Data Link Layer

The network shown in [Figure 100 on page 969](#) is a fully meshed configuration where every directly connected interface can receive and send packets to every other similar interface. The LSP in this network is configured to run from ingress router **R1**, through transit router **R3**, to egress router **R6**. In addition, a reverse LSP is configured to run from **R6** through **R3** to **R1**, creating bidirectional traffic.

However, in this example, the LSP is down without a path in either direction, from **R1** to **R6** or from **R6** to **R1**.

When you verify that the data link layer is not functioning correctly, you might find a mismatch with PPP or Cisco HDLC encapsulation, PPP options, or keepalive frames.

The cross shown in [Figure 100 on page 969](#) indicates where the LSP is broken because of a configuration error on ingress router **R1** that prevents the LSP from traversing the network as expected.

To check the data link layer, follow these steps:

1. [Verify the LSP on page 969](#)
2. [Verify Interfaces on page 970](#)
3. [Take Appropriate Action on page 974](#)
4. [Verify the LSP Again on page 975](#)

## Verify the LSP

**Purpose** Typically, you use the **show mpls lsp extensive** command to verify the LSP. However for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down, use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To determine whether the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

### Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From:10.0.0.1 , State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary State: Dn
    Will be enqueued for recomputation in 15 second(s).
    140 Sep 30 12:01:12 CSPF failed: no route toward 10.0.0.6[26 times]
    139 Sep 30 11:48:57 Deselected as active
    138 Sep 30 11:48:56 CSPF failed: no route toward 10.0.0.6
    137 Sep 30 11:48:56 Clear Call
    136 Sep 30 11:48:56 CSPF: link down/deleted
10.1.36.1(R3.00/10.0.0.3)->10.1.36.2(R6.00/10.0.0.6)
135 Sep 30 11:48:56 ResvTear received
    134 Sep 30 11:48:56 Down
    133 Sep 30 11:48:56 CSPF failed: no route toward 10.0.0.6
    132 Sep 30 11:48:56 10.1.13.2: No Route toward dest

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

**Meaning** The sample output from ingress router **R1** shows the LSPs within which it participates. The ingress LSP is down, without a path from **R1** to **R6**. Because a reverse LSP is configured in the network shown in [Figure 100 on page 969](#), we would expect an egress LSP session to be up. However, **R1** does not have any egress LSPs, indicating that the LSP from **R6** to **R1** is not functioning.

### Verify Interfaces

**Purpose** From your network topology, determine the adjacent interfaces through which the LSP is meant to traverse, and examine the output for the encapsulation type, PPP options, FCS size, and whether keepalive frames are enabled or disabled

**NOTE:** Before you proceed with this step, check the physical layer to ensure that the problem is not in the physical layer.

**Action** To verify the functioning of adjacent interfaces, enter the following commands from the relevant routers:

```
user@host> show interfaces type-fpc/pic/port extensive
user@host> show interfaces type-fpc/pic/port
```

### Sample Output 1

```
user@R6> show interfaces so-0/0/3 extensive

    Flags: None
  Protocol mpls, MTU: 4458
    Flags: None

```

**Meaning** Sample Output 1 from egress router **R6** shows that there are no SONET alarms or defects (**none**), the states are all **OK**, and the path trace shows the distant end (**R3 so-0.0.0**),

indicating that the physical link is up. However, the logical link is down, and the link-level type is Cisco HDLC.

Sample Output 2 from transit router **R3** shows that the link-level type is PPP, indicating that the encapsulation types are mismatched, resulting in the LSP going down.

### Take Appropriate Action

**Problem**    **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the encapsulation types are mismatched.

**Solution**    To correct the error in this example, enter the following commands:

```
[edit interfaces so-0/0/3]
user@R1# show
user@R1# delete encapsulation
user@R1# show
user@R1# commit
```

**Sample Output**

```
[edit interfaces so-0/0/3]
user@R6# show
encapsulation cisco-hdlc;
unit 0 {
    family inet {
        address 10.1.36.2/30;
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/3]
user@R6# delete encapsulation

[edit interfaces so-0/0/3]
user@R6# show
unit 0 {
    family inet {
        address 10.1.36.2/30;
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/3]
user@R6# commit
commit complete
```

**Meaning**    The sample output from egress router **R6** shows that the Cisco HDLC was incorrectly configured on interface **so-0/0/3** which prevented the LSP from using the intended path. The problem was corrected when the **encapsulation** statement was deleted and the configuration committed.

## Verify the LSP Again

- Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the data link layer has been resolved.
- Action** From the ingress, egress, and transit routers, verify that the LSP is up and traversing the network as expected:

```
user@host> show mpls lsp extensive
```

## Sample Output 1

```
user@R1> show mpls lsp extensive

    disable;
}
```

```
inactive: interface so-0/0/0.0;
inactive: interface so-0/0/1.0;
interface so-0/0/2.0;
interface so-0/0/3.0;
```

**Meaning** Sample Outputs 1 and 2 from ingress router **R1** and egress router **R6**, respectively, show that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Sample Output 3 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**.

Sample Output 4 shows the interfaces that were deactivated on the ingress, egress, and transit routers, forcing the LSP to take the intended path. If these interfaces were not deactivated, even though the configuration is now correct, the LSP would still traverse the network through the alternate path.

## Verify the LSP

**Purpose** Typically, you use the **show mpls lsp extensive** command to verify the LSP. However for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down, use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To determine whether the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

## Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From:10.0.0.1 , State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary State: Dn
    Will be enqueued for recomputation in 15 second(s).

```

**Meaning** The sample output from ingress router **R1** shows the LSPs within which it participates. The ingress LSP is down, without a path from **R1** to **R6**. Because a reverse LSP is configured in the network shown in [Figure 100 on page 969](#), we would expect an egress LSP session to be up. However, **R1** does not have any egress LSPs, indicating that the LSP from **R6** to **R1** is not functioning.

## Verify Interfaces

**Purpose** From your network topology, determine the adjacent interfaces through which the LSP is meant to traverse, and examine the output for the encapsulation type, PPP options, FCS size, and whether keepalive frames are enabled or disabled

**NOTE:** Before you proceed with this step, check the physical layer to ensure that the problem is not in the physical layer.

**Action** To verify the functioning of adjacent interfaces, enter the following commands from the relevant routers:

```
user@host> show interfaces type-fpc/pic/port extensive
user@host> show interfaces type-fpc/pic/port
```

## Sample Output 1

Protocol inet, MTU: 4470
Flags: None
Addresses, Flags: Is-Preferred Is-Primary
Destination: 10.1.36.0/30, Local: 10.1.36.1, Broadcast: 10.1.36.3
Protocol iso, MTU: 4470
Flags: None
Protocol mpls, MTU: 4458
Flags: None
```

**Meaning** Sample Output 1 from egress router **R6** shows that there are no SONET alarms or defects (**none**), the states are all **OK**, and the path trace shows the distant end (**R3 so-0.0.0**), indicating that the physical link is up. However, the logical link is down, and the link-level type is Cisco HDLC.

Sample Output 2 from transit router **R3** shows that the link-level type is PPP, indicating that the encapsulation types are mismatched, resulting in the LSP going down.

---

## Take Appropriate Action

**Problem** **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the encapsulation types are mismatched.

**Solution** To correct the error in this example, enter the following commands:

```
[edit interfaces so-0/0/3]
user@R1# show
user@R1# delete encapsulation
user@R1# show
user@R1# commit
```

**Sample Output**

```
[edit interfaces so-0/0/3]
user@R6# show
encapsulation cisco-hdlc;
unit 0 {
    family inet {
        address 10.1.36.2/30;
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/3]
user@R6# delete encapsulation

[edit interfaces so-0/0/3]
user@R6# show
unit 0 {
    family inet {
        address 10.1.36.2/30;
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/3]
user@R6# commit
commit complete
```

**Meaning** The sample output from egress router **R6** shows that the Cisco HDLC was incorrectly configured on interface **so-0/0/3** which prevented the LSP from using the intended path. The problem was corrected when the **encapsulation** statement was deleted and the configuration committed.

## Verify the LSP Again

**Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the data link layer has been resolved.

**Action** From the ingress, egress, and transit routers, verify that the LSP is up and traversing the network as expected:

```
user@host> show mpls lsp extensive
```

### Sample Output 1

inactive: interface so-0/0/1.0;
interface so-0/0/2.0;
interface so-0/0/3.0;
```

**Meaning** Sample Outputs 1 and 2 from ingress router **R1** and egress router **R6**, respectively, show that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Sample Output 3 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**.

Sample Output 4 shows the interfaces that were deactivated on the ingress, egress, and transit routers, forcing the LSP to take the intended path. If these interfaces were not deactivated, even though the configuration is now correct, the LSP would still traverse the network through the alternate path.

---

## Checklist for Verifying the IP and IGP Layers

<b>Problem</b>	<b>Description:</b> This checklist provides the steps and commands for investigating a problem at the Internet Protocol (IP) and interior gateway protocol (IGP) layers of the layered Multiprotocol Label Switching (MPLS) model. The checklist provides links to an overview
----------------	--

of the IP and IGP layers and more detailed information about the commands used to investigate the problem.

**Solution** Table 25 on page 987 provides commands for verifying the IP and IGP layers.

**Table 25: Checklist for Verifying the IP and IGP Layers**

Tasks	Command or Action
<b>“Verifying the IP and IGP Layers” on page 988</b>	
<b>“Verifying the IP Layer” on page 990</b>	
1. Verify the LSP on page 991	<code>show mpls lsp extensive</code>
2. Verify IP Addressing on page 992	<code>show interfaces terse</code>
3. Verify Neighbors or Adjacencies at the IP Layer on page 993	<code>show ospf neighbor extensive</code> <code>show isis adjacency extensive</code>
4. Take Appropriate Action on page 996	The following sequence of commands addresses the specific problem described in this topic:  [edit interfaces so-0/0/2] <code>show</code> rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30 <code>show</code> <code>commit</code>

## Verifying the IP and IGP Layers

- Problem**     **Description:** After you have configured the label-switched path (LSP), issued the `show mpls lsp extensive` command, and determined that there is an error, you might find that the error is not in the physical or data link layers. Continue investigating the problem at the IP and IGP layers of the network.
- [Figure 101 on page 989](#) illustrates the IP and IGP layers of the layered MPLS model.

Figure 101: IP and IGP Layers

MPLS Layer	show mpls lsp show mpls lsp extensive show route table mpls.0 show route <i>address</i> tracroute <i>address</i> ping mpls rsvp <i>lsp-name</i> detail
RSVP Layer	show rsvp session show rsvp neighbor show rsvp interface
<div>↩ IGP and IP Layers Functioning ↪</div>	
OSPF Layer show ospf neighbor show configuration protocols ospf show ospf interface	IS-IS Layer show isis adjacency show configuration protocols isis show isis interface
IP Layer show ospf neighbor extensive show interfaces terse	IP Layer show isis adjacency extensive show interfaces terse
Data Link Layer	show interfaces extensive <i>"JUNOS Interfaces Operations Guide"</i>
Physical Layer	show interfaces show interfaces terse ping <i>host</i>

9015545

**Solution** At the IP and IGP layers, you must check the following:

- Interfaces have correct IP addressing, and the IGP neighbors or adjacencies are established.
- Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS) protocols are configured and running correctly.
  - If the OSPF protocol is configured, check the IP layer first, then the OSPF configuration, making sure that the protocol, interfaces, and traffic engineering are configured correctly.
  - If the IS-IS protocol is configured, it doesn't matter whether you check IS-IS or IP first because both protocols are independent of each other. Verify that IS-IS adjacencies are up, and that the interfaces and IS-IS protocol are configured correctly.

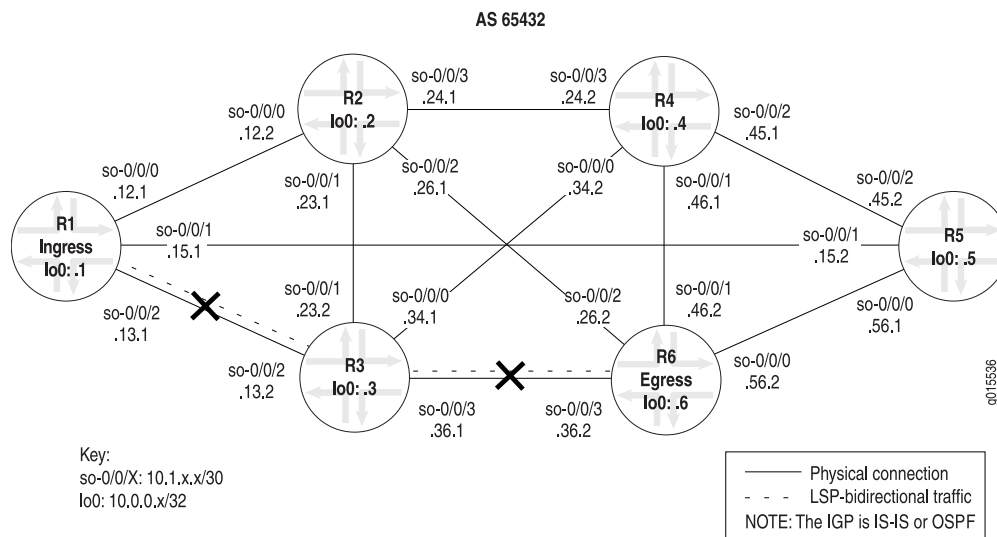

**NOTE:** The IS-IS protocol has traffic engineering enabled by default.

If the network is not functioning at the IP or IGP layers, the LSP does not work as configured.

Figure 102 on page 990 illustrates the MPLS network used in this topic.

Figure 102: MPLS Network Broken at the IP and IGP Layers

The network shown in [Figure 102 on page 990](#) is a fully meshed configuration where every directly connected interface can receive and send packets to every other similar interface. The LSP in this network is configured to run from ingress router **R1**, through transit router **R3**, to egress router **R6**. In addition, a reverse LSP is configured to run from **R6**, through **R3**, to **R1**, creating bidirectional traffic. The crosses in [Figure 102 on page 990](#) indicate where the LSP is not working because of the following problems at the IP and IGP layer:

- An IP address is configured incorrectly on the ingress router (**R1**).
- The OSPF protocol is configured with a router ID (RID) but without the loopback (**lo0**) interface, and traffic engineering is missing from the transit router (**R3**).
- Levels in the IS-IS network are mismatched.

#### Related Documentation

To check the IP and IGP layers, follow these steps:

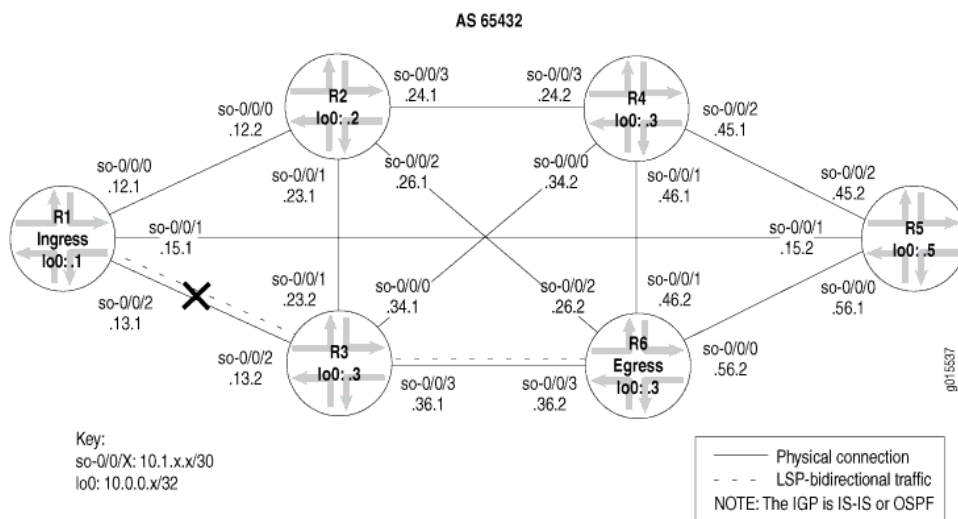

- [Verifying the IP Layer on page 990](#)
- [Verifying the OSPF Protocol on page 1009](#)
- [Verifying the IS-IS Protocol](#)

## Verifying the IP Layer

**Purpose** You can check the IP layer before or after you check the interior gateway protocol (IGP) layer, depending on whether you have OSPF or IS-IS configured as the IGP. If your MPLS network is configured with OSPF as the IGP, you must first verify the IP layer, checking that the interfaces have correct IP addressing and that the OSPF neighbors are established before you check the OSPF layer.

If you have IS-IS configured as the IGP in your MPLS network, you can verify either the IP layer or the IS-IS protocol layer first. The order in which you check the IP or IS-IS layer does not affect the results.

Figure 103: MPLS Network Broken at the IP Layer

The cross in Figure 103 on page 991 indicates where the LSP is broken because of the incorrect configuration of an IP address on ingress router R1.

1. [Verify the LSP on page 991](#)
2. [Verify IP Addressing on page 992](#)
3. [Verify Neighbors or Adjacencies at the IP Layer on page 993](#)
4. [Take Appropriate Action on page 996](#)
5. [Verify the LSP Again on page 997](#)

## Verify the LSP

**Purpose** After configuring the LSP, you must verify that the LSP is up. LSPs can be ingress, transit, or egress. Use the **show mpls lsp** command for quick verification of the LSP state, with the **extensive** option (**show mpls lsp extensive**) as a follow-up if the LSP is down. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To verify that the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

## Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6

Egress LSP: 0 sessions
Total 0 displayed , Up 0, Down 0

Transit LSP: 0 sessions
Total 0 displayed , Up 0, Down 0

```

**Meaning** The sample output from ingress router **R1** shows that an MPLS label allocation failure occurred and the Constrained Shortest Path First (CSPF) algorithm failed, resulting in no route to destination **10.0.0.6** on **R6**.

## Verify IP Addressing

**Purpose** When you investigate the IP layer, you verify that interfaces have correct IP addressing, and that OSPF neighbors or IS-IS adjacencies are established. In this example, an IP address is configured incorrectly on the ingress router (**R1**).

**Action** To verify IP addressing, enter the following command from the ingress, transit, and egress routers:

```
user@host> show interfaces terse
```

## Sample Output

```

user@R1> show interfaces terse
Interface      Admin Link Proto Local Remote
so-0/0/0       up   up   inet 10.1.12.1/30

                                iso
                                mpls

so-0/0/1       up    up
so-0/0/1.0     up    up    inet  10.1.46.2/30
                                iso
                                mpls

so-0/0/2       up    up
so-0/0/2.0     up    up    inet  10.1.26.2/30
                                iso
                                mpls

so-0/0/3       up    up
so-0/0/3.0     up    up    inet  10.1.36.2/30
                                iso
                                mpls

lo0.0          up    up    inet  10.0.0.6
                                iso  49.0004.1000.0000.0006.00

```

**Meaning** The sample output shows that the IP addresses for interface **so-0/0/2.0** on **R1** and interface **so-0/0/2.0** on **R3** are identical. Interface IP addresses within a network must be unique for the interface to be identified correctly.

## Verify Neighbors or Adjacencies at the IP Layer

**Purpose** If the IP addressing is configured incorrectly then the OSPF neighbors or IS-IS adjacencies both need to be checked to determine if one or both of them are established.

**Action** To verify neighbors (OSPF) or adjacencies (IS-IS), enter the following commands from the ingress, transit, and egress routers:

```

user@host> show ospf neighbor extensive
user@host> show isis adjacency extensive

```

## Sample Output 1

```

```

**Meaning** Sample Output 1 from the ingress, transit, and egress routers shows that **R1** and **R3** are not established OSPF neighbors. Considering that the two interfaces **so-0/0/2.0** (**R1** and **R3**) are configured with identical IP addresses, you would expect this. The OSPF protocol routes IP packets based solely on the destination IP address contained in the IP packet header. Therefore, identical IP addresses in the autonomous system (AS) result in neighbors not establishing.

Sample Output 2 from the ingress, transit, and egress routers shows that **R1** and **R3** have established an IS-IS adjacency despite the identical IP addresses configured on interfaces **so-0/0/2.0** on **R1** and **R3**. The IS-IS protocol behaves differently from the OSPF protocol because it does not rely on IP to establish an adjacency. However, if the LSP is not up, it is still useful to check the IP subnet addressing in case there is a mistake in that layer. Correcting the addressing error might bring the LSP back up.

## Take Appropriate Action

**Problem** **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, the IP address of an interface on transit router **R2** is incorrectly configured.

**Solution** To correct the error in this example, enter the following commands:

```
[edit interfaces so-0/0/2]
user@R1# show
```

```

user@R1# rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30
user@R1# show
user@R1# commit

```

**Sample Output**

```

[edit interfaces so-0/0/2]
user@R1# show
unit 0 {
  family inet {
    address 10.1.13.2/30; <<< Incorrect IP address
  }
  family iso;
  family mpls;
}

[edit interfaces so-0/0/2]
user@R1# rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30

[edit interfaces so-0/0/2]
user@R1# show
unit 0 {
  family inet {
    address 10.1.13.1/30; <<< Correct IP address.
  }
  family iso;
  family mpls;
}

[edit interfaces so-0/0/2]
user@R1# commit
commit complete

```

**Meaning** The sample output shows that interface **so-0/0/2** on ingress router **R1** is now configured with the correct IP address. This correction results in unique subnet IP addresses for all interfaces in the MPLS network in [Figure 102 on page 990](#), and the possibility that the LSP might come up.

**Verify the LSP Again**

**Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the OSPF protocol has been resolved.

**Action** To verify the LSP again, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

**Sample Output 1**

```

user@R1> show mpls lsp extensive

```

**Meaning** Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up. The output shows that the egress LSP session **R6-to-R1** received and sent a recovery label.

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

---

## Verify the LSP

**Purpose** After configuring the LSP, you must verify that the LSP is up. LSPs can be ingress, transit, or egress. Use the **show mpls lsp** command for quick verification of the LSP state, with the **extensive** option (**show mpls lsp extensive**) as a follow-up if the LSP is down. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To verify that the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

## Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6

```

Egress LSP: 0 sessions  
Total 0 displayed , Up 0, Down 0

Transit LSP: 0 sessions  
Total 0 displayed , Up 0, Down 0

**Meaning** The sample output from ingress router **R1** shows that an MPLS label allocation failure occurred and the Constrained Shortest Path First (CSPF) algorithm failed, resulting in no route to destination **10.0.0.6** on **R6**.

## Verify IP Addressing

**Purpose** When you investigate the IP layer, you verify that interfaces have correct IP addressing, and that OSPF neighbors or IS-IS adjacencies are established. In this example, an IP address is configured incorrectly on the ingress router (**R1**).

**Action** To verify IP addressing, enter the following command from the ingress, transit, and egress routers:

```
user@host> show interfaces terse
```

## Sample Output

```
user@R1> show interfaces terse
Interface      Admin Link Proto Local Remote
so-0/0/0       up   up   inet 10.1.12.1/30

so-0/0/3.0   up    up   iso
                                mpls
lo0.0        up    up   inet  10.0.0.6
                                iso  49.0004.1000.0000.0006.00

```

**Meaning** The sample output shows that the IP addresses for interface **so-0/0/2.0** on **R1** and interface **so-0/0/2.0** on **R3** are identical. Interface IP addresses within a network must be unique for the interface to be identified correctly.

## Verify Neighbors or Adjacencies at the IP Layer

**Purpose** If the IP addressing is configured incorrectly then the OSPF neighbors or IS-IS adjacencies both need to be checked to determine if one or both of them are established.

**Action** To verify neighbors (OSPF) or adjacencies (IS-IS), enter the following commands from the ingress, transit, and egress routers:

```

user@host> show ospf neighbor extensive
user@host> show isis adjacency extensive

```

### Sample Output 1

**Meaning** Sample Output 1 from the ingress, transit, and egress routers shows that **R1** and **R3** are not established OSPF neighbors. Considering that the two interfaces **so-0/0/2.0** (**R1** and **R3**) are configured with identical IP addresses, you would expect this. The OSPF protocol routes IP packets based solely on the destination IP address contained in the IP packet header. Therefore, identical IP addresses in the autonomous system (AS) result in neighbors not establishing.

Sample Output 2 from the ingress, transit, and egress routers shows that **R1** and **R3** have established an IS-IS adjacency despite the identical IP addresses configured on interfaces **so-0/0/2.0** on **R1** and **R3**. The IS-IS protocol behaves differently from the OSPF protocol because it does not rely on IP to establish an adjacency. However, if the LSP is not up, it is still useful to check the IP subnet addressing in case there is a mistake in that layer. Correcting the addressing error might bring the LSP back up.

## Take Appropriate Action

**Problem** **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, the IP address of an interface on transit router **R2** is incorrectly configured.

**Solution** To correct the error in this example, enter the following commands:

```

[edit interfaces so-0/0/2]
user@R1# show
user@R1# rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30
user@R1# show
user@R1# commit

```

**Sample Output**

```
[edit interfaces so-0/0/2]
user@R1# show
unit 0 {
    family inet {
        address 10.1.13.2/30; <<< Incorrect IP address
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/2]
user@R1# rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30

[edit interfaces so-0/0/2]
user@R1# show
unit 0 {
    family inet {
        address 10.1.13.1/30; <<< Correct IP address.
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/2]
user@R1# commit
commit complete
```

**Meaning** The sample output shows that interface **so-0/0/2** on ingress router **R1** is now configured with the correct IP address. This correction results in unique subnet IP addresses for all interfaces in the MPLS network in [Figure 102 on page 990](#), and the possibility that the LSP might come up.

---

## Verify the LSP Again

**Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the OSPF protocol has been resolved.

**Action** To verify the LSP again, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

### Sample Output 1

```
user@R1> show mpls lsp extensive

Total 1 displayed, Up 1 , Down 0

Transit LSP: 0 sessions  
Total 0 displayed, Up 0, Down 0

**Meaning** Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up. The output shows that the egress LSP session **R6-to-R1** received and sent a recovery label.

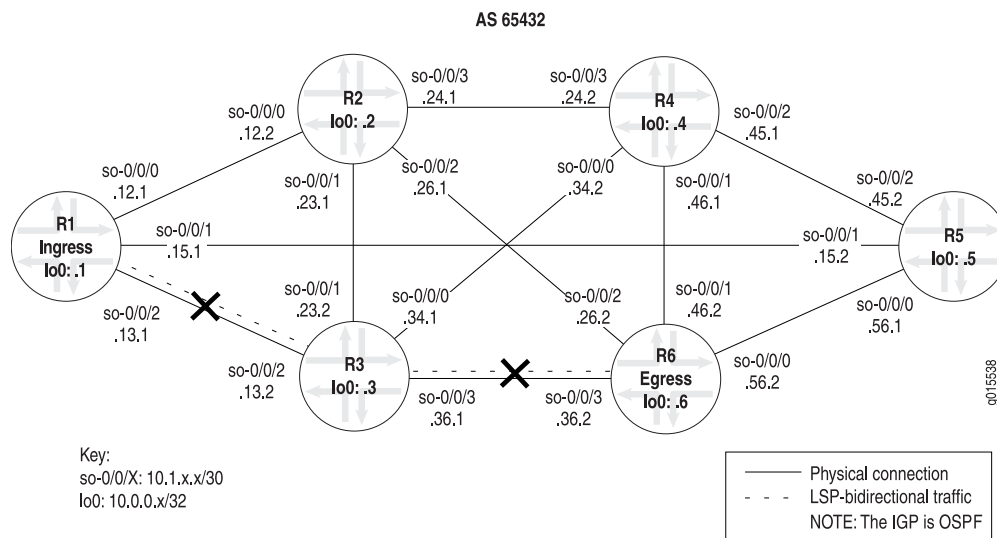

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

## Verifying the OSPF Protocol

**Purpose** After you have verified that the LSP is down, and the cause is not in the physical, datalink, or IP layer, verify the OSPF configuration. Check the routers in your network to ensure that the interfaces and the OSPF protocol are configured correctly, and that the neighbors are established.

Figure 104: MPLS Network Broken at the OSPF Protocol Layer

1. [Verify the LSP on page 1010](#)
2. [Verify OSPF Interfaces on page 1012](#)
3. [Verify OSPF Neighbors on page 1014](#)
4. [Verify the OSPF Protocol Configuration on page 1014](#)
5. [Take Appropriate Action on page 1015](#)
6. [Verify the LSP Again on page 1017](#)

## Verify the LSP

**Purpose** Confirm that interfaces are configured for OSPF, the OSPF protocol is configured correctly and that neighbors are established.

**Action** To verify the LSP, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

Total 0 displayed, Up 0, Down 0

**Meaning** Sample Outputs 1, 2, and 3 show that the LSP and the reverse LSP are down:

- Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** does not have a route towards the destination (**R6**).
- Sample Output 2 from transit router **R3** shows that there are no LSP sessions.
- Sample Output 3 from egress router **R6** also shows that reverse LSP **R6-to-R1** is down.

Sample Outputs 4, 5, and 6 show that the LSP is up and the reverse LSP is down:

- Sample Output 4 from ingress router **R1** shows that LSP **R1-to-R6** is up and there are no egress LSP sessions.
- Sample Output 5 from transit router **R3** shows that there is one ingress LSP session (**R1-to-R6**) and no egress LSP sessions.
- Sample Output 6 from egress router **R6** shows that LSP **R6-to-R1** is down due to an MPLS label allocation failure.

## Verify OSPF Interfaces

**Purpose** After you have verified that the LSP is down, and the cause is not in the physical, data link, or IP layer, check the routers in your network to determine that all relevant OSPF interfaces are configured correctly.

**Action** To verify OSPF interfaces, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf interface
```

### Sample Output 1

```
user@R1> show ospf interface

so-0/0/3.0     PtToPt     0.0.0.0       0.0.0.0       0.0.0.0         1
```

**Meaning** Sample Output 1 shows that all interfaces on all routers are in the correct area (0.0.0.0), and the loopback (lo0) interface is missing from the list of interfaces on all routers. The missing loopback (lo0) interface is a problem in this configuration.

In an MPLS network configured with OSPF as the IGP, when you manually configure the RID, it is important to explicitly configure the loopback interface at the [edit protocols ospf] hierarchy level. If the RID is not manually configured, OSPF automatically advertises

the loopback (lo0) interface. In the configuration of all the routers in this network, the RID is configured manually, therefore, the loopback (lo0) interface must be explicitly configured at the `[edit protocols ospf]` hierarchy level. In addition, the loopback (lo0) interface is configured with the `passive` statement to ensure that the protocols are not run over the loopback (lo0) interface and it is correctly advertised throughout the network.

Sample Output 2 shows that all the relevant interfaces on the ingress, transit, and egress routers, including the loopback (lo0) interface, are in the correct area (0.0.0.0). Because the configuration of the interfaces is correct, further investigation is required to determine the reason for the LSP problem.

## Verify OSPF Neighbors

**Purpose** After you have checked OSPF interfaces, check your network topology to determine that all relevant neighbors are established.

**Action** To verify OSPF neighbors, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf neighbor
```

## Sample Output

```
user@R1> show ospf neighbor
  Address      Interface      State      ID              Pri  Dead
  10.1.12.2     so-0/0/0.0     Full      10.0.0.2        128  39
  10.1.15.2     so-0/0/1.0     Full      10.0.0.5        128  39
  10.1.13.2     so-0/0/2.0     Full      10.0.0.3        128  33
```

```
user@R3> show ospf neighbor
  Address      Interface      State      ID              Pri  Dead
  10.1.34.2     so-0/0/0.0     Full      10.0.0.4        128  33
  10.1.23.1     so-0/0/1.0     Full      10.0.0.2        128  33
  10.1.13.1     so-0/0/2.0     Full      10.0.0.1        128  33
  10.1.36.2     so-0/0/3.0     Full      10.0.0.6        128  33
```

```
user@R6> show ospf neighbor
  Address      Interface      State      ID              Pri  Dead
  10.1.56.1     so-0/0/0.0     Full      10.0.0.5        128  30
  10.1.46.1     so-0/0/1.0     Full      10.0.0.4        128  38
  10.1.26.1     so-0/0/2.0     Full      10.0.0.2        128  34
  10.1.36.1     so-0/0/3.0     Full      10.0.0.3        128  35
```

**Meaning** The sample output shows that all neighbors are fully adjacent, indicating that each router has exchanged a full copy of its link-state database with the other routers, passed through several neighbor states, and become fully adjacent. These adjacencies are created by router link and network link advertisements.

## Verify the OSPF Protocol Configuration

**Purpose** After you have checked interfaces and neighbors, verify the OSPF protocol configuration.

**Action** To verify the OSPF protocol configuration, enter the following command from the ingress, transit, and egress routers:

```
user@host> show configuration protocols ospf
```

### Sample Output 1

```
user@R1> show configuration protocols ospf
traffic-engineering;
area 0.0.0.0 {
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;    <<< The loopback interface (lo0) is missing
}
```

### Sample Output 2

```
user@R3>show configuration protocols ospf
area 0.0.0.0 { <<< traffic engineering is missing
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;
    interface so-0/0/3.0;    <<< The loopback interface (lo0) is missing
}
```

### Sample Output 3

```
user@R6> show configuration protocols ospf
traffic-engineering;
area 0.0.0.0 {
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;
    interface so-0/0/3.0;    <<< The loopback interface (lo0) is missing
}
```

**Meaning** All three sample outputs show that the loopback interface is not included on any of the routers. Including the loopback (**lo0**) interface is important when you have the RID manually configured.

In addition, Sample Output 2 from transit router **R3** shows that traffic engineering is not configured. Traffic engineering must be manually enabled when you configure OSPF for an MPLS network.

Because the loopback interface and traffic engineering are missing from the OSPF protocol configuration, the LSP does not work as expected.

### Take Appropriate Action

**Problem** **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, the loopback (**lo0**) interface is missing from all routers, and traffic engineering is missing from the transit router (**R3**).

**Solution** To correct the errors in this example, follow these steps:

1. Include the loopback (**lo0**) interface on all routers that have the RID manually configured. Enter the following configuration mode commands:

```
[edit]
user@R3# edit protocols ospf area 0.0.0.0
[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0
user@R3# set interface lo0 passive
```

2. Move up one level of the configuration hierarchy:

```
[edit protocols ospf area 0.0.0.0]
user@R3# up
[edit protocols ospf]
user@R3#
```

3. Include traffic engineering on the transit router (**R3**). Enter the following configuration mode command:

```
[edit protocols ospf]
user@R3# set traffic-engineering
```

4. On all routers, verify and commit the configuration:

```
user@R3# show
user@R3# commit
```

**Sample Output**

```

user@R3> edit
Entering configuration mode

[edit]
user@R3# edit protocols ospf area 0.0.0.0

[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0

[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0 passive

[edit protocols ospf area 0.0.0.0]
user@R3# up

[edit protocols ospf]
user@R3# set traffic-engineering

[edit protocols ospf]
user@R3# show
traffic-engineering;
area 0.0.0.0 {
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;
    interface lo0.0; {
        passive
    }
}

[edit protocols ospf]
user@R3# commit
commit complete

```

**Meaning** The sample output shows that the loopback (**lo0**) interface and traffic engineering are now correctly configured on transit router **R3**. When traffic engineering is configured, OSPF advertises the traffic engineering capabilities of the links.

In the OSPF configuration, you must manually include the loopback (**lo0**) interface and set it to passive when you manually configure an RID. Setting the loopback (**lo0**) interface to passive ensures that protocols are not run over the loopback (**lo0**) interface and the loopback (**lo0**) interface is advertised correctly throughout the network.. If you do not manually configure an RID, there is no need to explicitly include the loopback interface because the OSPF protocol automatically includes the loopback (**lo0**) interface.

For more information about configuring LSPs and MPLS, see the *Junos MPLS Applications Configuration Guide*.

## Verify the LSP Again

**Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the IS-IS protocol has been resolved.

**Action** To verify that the LSP is up and traversing the network as expected, enter the following command from the ingress, egress, and transit routers:

```
user@host> show mpls lsp extensive
```

## Sample Output

```
user@R1> show mpls lsp extensive

**Meaning** The sample output from ingress router **R1** and egress router **R6** shows that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**. In addition, the sample output from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6**, and the other from **R6** to **R1**.

---

## Verify the LSP

**Purpose** Confirm that interfaces are configured for OSPF, the OSPF protocol is configured correctly and that neighbors are established.

**Action** To verify the LSP, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

### Sample Output 1

**Meaning** Sample Outputs 1, 2, and 3 show that the LSP and the reverse LSP are down:

- Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** does not have a route towards the destination (**R6**).
- Sample Output 2 from transit router **R3** shows that there are no LSP sessions.
- Sample Output 3 from egress router **R6** also shows that reverse LSP **R6-to-R1** is down.

Sample Outputs 4, 5, and 6 show that the LSP is up and the reverse LSP is down:

- Sample Output 4 from ingress router **R1** shows that LSP **R1-to-R6** is up and there are no egress LSP sessions.
- Sample Output 5 from transit router **R3** shows that there is one ingress LSP session (**R1-to-R6**) and no egress LSP sessions.
- Sample Output 6 from egress router **R6** shows that LSP **R6-to-R1** is down due to an MPLS label allocation failure.

## Verify OSPF Interfaces

**Purpose** After you have verified that the LSP is down, and the cause is not in the physical, data link, or IP layer, check the routers in your network to determine that all relevant OSPF interfaces are configured correctly.

**Action** To verify OSPF interfaces, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf interface
```

### Sample Output 1

```
user@R1> show ospf interface
Interface      State      Area      DR ID      BDR ID      Nbrs
so-0/0/0.0     PtToPt    0.0.0.0   0.0.0.0    0.0.0.0     1
so-0/0/1.0     PtToPt    0.0.0.0   0.0.0.0    0.0.0.0     1

```

**Meaning** Sample Output 1 shows that all interfaces on all routers are in the correct area (**0.0.0.0**), and the loopback (**lo0**) interface is missing from the list of interfaces on all routers. The missing loopback (**lo0**) interface is a problem in this configuration.

In an MPLS network configured with OSPF as the IGP, when you manually configure the RID, it is important to explicitly configure the loopback interface at the **[edit protocols ospf]** hierarchy level. If the RID is not manually configured, OSPF automatically advertises the loopback (**lo0**) interface. In the configuration of all the routers in this network, the RID is configured manually, therefore, the loopback (**lo0**) interface must be explicitly configured at the **[edit protocols ospf]** hierarchy level. In addition, the loopback (**lo0**) interface is configured with the **passive** statement to ensure that the protocols are not run over the loopback (**lo0**) interface and it is correctly advertised throughout the network.

Sample Output 2 shows that all the relevant interfaces on the ingress, transit, and egress routers, including the loopback (**lo0**) interface, are in the correct area (**0.0.0.0**). Because the configuration of the interfaces is correct, further investigation is required to determine the reason for the LSP problem.

## Verify OSPF Neighbors

**Purpose** After you have checked OSPF interfaces, check your network topology to determine that all relevant neighbors are established.

**Action** To verify OSPF neighbors, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf neighbor
```

## Sample Output

```

user@R1> show ospf neighbor
Address      Interface      State      ID          Pri  Dead
10.1.12.2    so-0/0/0.0     Full       10.0.0.2    128  39
10.1.15.2    so-0/0/1.0     Full       10.0.0.5    128  39
10.1.13.2    so-0/0/2.0     Full       10.0.0.3    128  33

user@R3> show ospf neighbor
Address      Interface      State      ID          Pri  Dead
10.1.34.2    so-0/0/0.0     Full       10.0.0.4    128  33
10.1.23.1    so-0/0/1.0     Full       10.0.0.2    128  33
10.1.13.1    so-0/0/2.0     Full       10.0.0.1    128  33
10.1.36.2    so-0/0/3.0     Full       10.0.0.6    128  33

user@R6> show ospf neighbor
Address      Interface      State      ID          Pri  Dead

```

10.1.56.1	so-0/0/0.0	Full	10.0.0.5	128	30
10.1.46.1	so-0/0/1.0	Full	10.0.0.4	128	38
10.1.26.1	so-0/0/2.0	Full	10.0.0.2	128	34
10.1.36.1	so-0/0/3.0	Full	10.0.0.3	128	35

**Meaning** The sample output shows that all neighbors are fully adjacent, indicating that each router has exchanged a full copy of its link-state database with the other routers, passed through several neighbor states, and become fully adjacent. These adjacencies are created by router link and network link advertisements.

## Verify the LSP Again

**Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the IS-IS protocol has been resolved.

**Action** To verify that the LSP is up and traversing the network as expected, enter the following command from the ingress, egress, and transit routers:

```
user@host> show mpls lsp extensive
```

## Sample Output

```
user@R1> show mpls lsp extensive

Transit LSP: 0 sessions  
Total 0 displayed, Up 0, Down 0

**Meaning** The sample output from ingress router **R1** and egress router **R6** shows that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**. In addition, the sample output from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6**, and the other from **R6** to **R1**.

## Verify the LSP

**Purpose** Confirm that interfaces are configured for IS-IS, that the IS-IS protocol is configured correctly, and that adjacencies are established.

**Action** To verify the label-switched path (LSP), enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

## Sample Output 1

```

user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

---

## Verify IS-IS Adjacencies and Interfaces

**Purpose** When you check the IS-IS layer, you verify that IS-IS adjacencies are up and that the IS-IS interfaces are included at the protocol level.

**Action** To verify the functioning of adjacent interfaces, enter the following commands from the relevant routers:

```
user@host> show isis adjacency
user@host> show isis interface
```

### Sample Output 1

```
user@R1> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
so-0/0/0.0         R2          2 Up         20
so-0/0/1.0         R5          2 Up         23
so-0/0/2.0         R3          2 Up         26
```

```
user@R3> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
so-0/0/0.0         R4          2 Up         23
so-0/0/1.0         R2          2 Up         21
so-0/0/2.0         R1          2 Up         19
so-0/0/3.0         R6          2 Down       0
```

```
user@R6> show isis adjacency
IS-IS instance is not running
```

### Sample Output 2

```
user@R1> show isis interface
IS-IS interface database:
Interface          L CirID Level 1 DR      Level 2 DR      L1/L2 Metric
lo0.0              0  0x1 Passive           Passive         0/0
so-0/0/0.0         2  0x1 Disabled         Point to Point  10/10
so-0/0/1.0         2  0x1 Disabled         Point to Point  10/10
so-0/0/2.0         2  0x1 Disabled         Point to Point  10/10
```

```
user@R3> show isis interface
IS-IS interface database:
Interface          L CirID Level 1 DR      Level 2 DR      L1/L2 Metric

so-0/0/0.0         2  0x1 Disabled         Point to Point  10/10
so-0/0/1.0         2  0x1 Disabled         Point to Point  10/10
so-0/0/2.0         2  0x1 Disabled         Point to Point  10/10
so-0/0/3.0         2  0x1 Disabled         Point to Point  10/10
```

```
user@R6> show isis interface
IS-IS interface database:
Interface          L CirID Level 1 DR      Level 2 DR      L1/L2 Metric
lo0.0              0  0x1 Passive           Passive         0/0
so-0/0/0.0         1  0x1 Point to Point    Disabled        10/10
so-0/0/1.0         1  0x1 Down              Disabled        10/10
so-0/0/2.0         1  0x1 Point to Point    Disabled        10/10
so-0/0/3.0         1  0x1 Point to Point    Disabled        10/10
```

**Meaning** Sample Output 1 shows that ingress router R1 has established adjacencies with the relevant routers. Transit router R3 does not have an adjacency with egress router R6, and egress router R6 has no adjacencies established in the network shown in [Figure 102 on page 990](#), indicating that the problem might be at the IS-IS protocol level.

Sample Output 2 shows that R1 and R2 are Level 2 routers, in contrast to R6 which is a Level 1 router. When a router is configured explicitly as a Level 1 or Level 2 router, it does not communicate with routers configured at a different level. Level 1 routers communicate with other Level 1 routers within their area, while Level 2 routers communicate with other Level 2 routers, and toward other autonomous systems. Because all the routers in this network are configured for Level 2, they cannot form an adjacency with R6, which is incorrectly configured as a Level 1 router.

---

## Verify the IS-IS Configuration

**Purpose** When you have determined that the problem is probably at the IS-IS protocol level, check the IS-IS configuration of the routers in your network.

**Action** To verify the IS-IS configuration, enter the following command from the relevant routers:

```
user@host> show configuration protocols isis
```

### Sample Output

```
user@R1> show configuration protocols isis
level 1 disable;
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface lo0.0; {
    passive
```

```
user@R3> show configuration protocols isis
level 1 disable;
interface all {
    level 2 metric 10;
}
interface fxp0.0 {
    disable;
}
interface lo0.0; {
    passive
```

```
user@R6> show configuration protocols isis
level 2 disable; <<< Incorrect level disabled
interface all {
    level 2 metric 10;
}
interface fxp0.0 {
    disable;
}
interface lo0.0; {
    passive
```

**Meaning** The sample output shows that R6 has Level 2 disabled, while R1 and R3 have Level 1 disabled. For IS-IS adjacencies to establish, routers need to be at the same level. Another

common configuration error is to omit the loopback interface (lo0) from the configuration at the **[edit protocols isis]** hierarchy level. IS-IS does not function correctly if the loopback interface (lo0) is not configured at this level. In addition, including the **passive** statement ensures that protocols are not run over the loopback interface (lo0) and that the loopback interface (lo0) is advertised correctly throughout the network.

## Verify the LSP Again

- Purpose** After taking the appropriate action to correct the error, the label-switched path (LSP) needs to be checked again to confirm that the problem in the RSVP layer has been resolved.
- Action** To verify that the LSP is up and traversing the network as expected, enter the following command from the ingress, egress, and transit routers:

```
user@host> show mpls lsp extensive
```

## Sample Output 1

```
user@R1> show mpls lsp extensive

**Meaning** Sample Outputs 1 and 3 from ingress router R1 and egress router R6 show that the LSP is now traversing the network along the expected path, from R1 through R3 to R6, and the reverse LSP, from R6 through R3 to R1. In addition, Sample Output 2 from transit router R3 shows that there are two transit LSP sessions, one from R1 to R6, and the other from R6 to R1.

## Checklist for Checking the RSVP Layer

**Problem** **Description:** This checklist provides the steps and commands for checking the Resource Reservation Protocol (RSVP) layer of the layered Multiprotocol Label Switching (MPLS) model. The checklist provides links to an overview of the RSVP layer and more detailed information about the commands used to investigate the problem.

[Table 26 on page 1033](#) provides commands for checking the RSVP layer.

**Table 26: Checklist for Checking the RSVP Layer**

Tasks	Command or Action
<b>“Checking the RSVP Layer” on page 1034</b>	
1. Verify the LSP on page 1036	<b>show mpls lsp extensive</b>

7. <a href="#">Verify the LSP Again on page 1044</a>	<code>show mpls lsp extensive</code>

## Checking the RSVP Layer

**Purpose** After you have configured the label-switched path (LSP), issued the `show mpls lsp extensive` command, and determined that there is an error, you might find that the error is not in the physical, data link, or Internet Protocol (IP) and interior gateway protocol (IGP) layers. Continue investigating the problem at the RSVP layer of the network.

[Figure 105 on page 1035](#) illustrates the RSVP layer of the layered MPLS model.

g015546

With this layer, you check that dynamic RSVP signaling is occurring as expected, neighbors are connected, and interfaces are configured correctly for RSVP. Check the ingress, egress, and transit routers.

If the network is not functioning at this layer, the LSP does not work as configured.

Figure 106 on page 1036 illustrates the MPLS network used in this topic.

Figure 106: MPLS Network Broken at the RSVP Layer

The network shown in [Figure 106 on page 1036](#) is a fully meshed configuration where every directly connected interface can receive and send packets to every other similar interface. The LSP in this network is configured to run from ingress router **R1**, through transit router **R3**, to egress router **R6**. In addition, a reverse LSP is configured to run from **R6** through **R3** to **R1**, creating bidirectional traffic.

However, in this example, the LSP is down without a path in either direction, from **R1** to **R6** or from **R6** to **R1**.

The crosses shown in [Figure 106 on page 1036](#) indicate where the LSP is broken. Some possible reasons the LSP is broken might include that dynamic RSVP signaling is not occurring as expected, neighbors are not connected, or interfaces are incorrectly configured for RSVP.

In the network in [Figure 106 on page 1036](#), a configuration error on transit router **R3** prevents the LSP from traversing the network as expected.

To check the RSVP layer, follow these steps:

1. [Verify the LSP on page 1036](#)
2. [Verify RSVP Sessions on page 1038](#)
3. [Verify RSVP Neighbors on page 1039](#)
4. [Verify RSVP Interfaces on page 1040](#)
5. [Verify the RSVP Protocol Configuration on page 1042](#)
6. [Take Appropriate Action on page 1043](#)
7. [Verify the LSP Again on page 1044](#)

## Verify the LSP

**Purpose** Typically, you use the **show mpls lsp extensive** command to verify the LSP. However for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down,

use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To determine whether the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

### Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6

  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn
    Will be enqueued for recomputation in 22 second(s).
    1 Oct 27 14:59:12  CSPF failed: no route toward 10.0.0.1 [4 times]
  Created: Wed Oct 27 14:57:44 2004
Total 1 displayed, Up 0,  Down 1

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

```
Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

**Meaning** The sample output shows that the LSP is down in both directions, from **R1** to **R6**, and from **R6** to **R1**. The output from **R1** shows that **R1** is using a no-cspf LSP since it tried to originate the call without being able to reach the destination. The output from **R6** shows that the Constrained Shortest Path First (CSPF) algorithm failed, resulting in no route to destination **10.0.0.1**.

## Verify RSVP Sessions

**Purpose** When an RSVP session is successfully created, the LSP is set up along the paths created by the RSVP session. If the RSVP session is unsuccessful, the LSP does not work as configured.

**Action** To verify currently active RSVP sessions, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp session
```

## Sample Output 1

```
user@R1> show rsvp session

```

```

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

**Meaning** Sample Output 1 from all routers shows that no RSVP sessions were successfully created, even though the LSP **R6-to-R1** is configured. Continue investigating the problem in [“Verify RSVP Neighbors” on page 1039](#).

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the output from the ingress, transit, and egress routers when the RSVP configuration is correct, and the LSP is traversing the network as configured. **R1** and **R6** both show an ingress and egress RSVP session, with the LSP **R1-to-R6**, and the reverse LSP **R6-to-R1**. Transit router **R3** shows two transit RSVP sessions.

## Verify RSVP Neighbors

**Purpose** Display a list of RSVP neighbors that were learned dynamically when exchanging RSVP packets. Once a neighbor is learned, it is never removed from the list of RSVP neighbors unless the RSVP configuration is removed from the router.

**Action** To verify RSVP neighbors, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp neighbor
```

### Sample Output 1

```
user@R1> show rsvp neighbor
RSVP neighbor: 1 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.2         10  1/0      9:22         9    64/64    32

user@R3> show rsvp neighbor
RSVP neighbor: 2 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.1         0  1/0      28:20        9   190/190   41
10.1.36.2        16:50 1/1      15:37        9   105/78    38

user@R6> show rsvp neighbor
RSVP neighbor: 1 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.36.1        17:30 1/1      16:15        9   104/78    39
```

### Sample Output 2

```
user@R3> show rsvp neighbor
RSVP neighbor: 2 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.1         5  1/0      9:14         9    63/63    33
10.1.36.2         5  1/0      9:05         9    62/62    32

user@R6> show rsvp neighbor
RSVP neighbor: 1 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.36.1         5  1/0      8:54         9    61/61    32
```

**Meaning** Sample Output 1 shows that **R1** and **R6** have one RSVP neighbor each, **R3**. However, the values in the **Up/Dn** field are different. **R1** has a value of **1/0** and **R6** has a value of **1/1**, indicating that **R1** is an active neighbor with **R3**, but **R6** is not. When the up count is one more than the down count, the neighbor is active; if the values are equal, the neighbor is down. The values for **R6** are equal, **1/1**, indicating that the neighbor **R3** is down.

Transit router **R3** knows about two neighbors, **R1** and **R6**. The **Up/Dn** field indicates that **R1** is an active neighbor and **R6** is down. At this point it is not possible to determine if the problem resides with **R3** or **R6**, because both neighbors are not active. Continue investigating the problem in [“Verify RSVP Interfaces” on page 1040](#).

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the correct neighbor relationship between transit router **R3** and egress router **R6**. The **Up/Dn** field shows the up count to be one more than the down count, **1/0**, indicating that the neighbors are active.

## Verify RSVP Interfaces

**Purpose** Display the status of each interface on which RSVP is enabled to determine where the configuration error occurred.

**Action** To verify the status of RSVP interfaces, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp interface
```

### Sample Output 1

```
user@R1> show rsvp interface
```

```
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R3> show rsvp interface
```

```
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
<<< Missing interface so-0/0/3.0
```

```
user@R6> show rsvp interface
```

```
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

### Sample Output 2

```
user@R1> show rsvp interface
```

```
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R3> show rsvp interface
```

```
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R6> show rsvp interface
```

```
RSVP interface: 4 active
```

Active	Subscr-	Static	Available	Reserved	Highwater
--------	---------	--------	-----------	----------	-----------

Interface	State	resv	ption	BW	BW	BW	mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

**Meaning** Sample Output 1 shows that even though each router has interfaces that are up and have RSVP active, there are no reservations (**Active resv**) on any of the routers. In this example, we would expect at least one reservation on the ingress and egress routers, and two reservations on the transit router.

In addition, interface **so-0/0/3** on transit router **R3** is not included in the configuration. The inclusion of this interface is critical to the success of the LSP.

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the relevant interfaces with active reservations.

## Verify the RSVP Protocol Configuration

**Purpose** After you have checked RSVP sessions, interfaces, neighbors, and determined that there might be a configuration error, verify the RSVP protocol configuration.

**Action** To verify the RSVP configuration, enter the following command from the ingress, transit, and egress routers:

```
user@host> show configuration protocols rsvp
```

## Sample Output

```
user@R1> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}

user@R3> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0; <<< Missing interface so-0/0/3.0
interface fxp0.0 {
    disable;
}

user@R6> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface so-0/0/3.0;
interface fxp0.0 {
    disable;
}
```

**Meaning** The sample output shows that **R3** has interface **so-0/0/3.0** missing from the RSVP protocol configuration. This interface is critical for the correct functioning of the LSP.

## Take Appropriate Action

**Problem** **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, an interface is missing from the configuration of router R3.

**Solution** To correct the error in this example, follow these steps:

1. Include the missing interface in the configuration of transit router R3:

```
user@R3> edit
user@R3# edit protocols rsvp
[edit protocols rsvp]
user@R3# show
user@R3# set interface so-0/0/3.0
```

2. Verify and commit the configuration:

```
[edit protocols rsvp]
user@R3# show
user@R3# commit
```

**Sample Output**

```
user@R3> edit
Entering configuration mode

[edit]
user@R3# edit protocols rsvp

[edit protocols rsvp]
user@R3# show
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0; <<< Missing interface so-0/0/3.0
interface fxp0.0 {
    disable;
}
[edit protocols rsvp]
user@R3# set interface so-0/0/3.0

[edit protocols rsvp]
user@R3# show
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}
interface so-0/0/3.0; <<< Interface now included in the configuration

[edit protocols rsvp]
user@R3# commit
commit complete
```

**Meaning** The sample output shows that the missing interface **so-0/0/3.0** on transit router **R3** is now correctly included at the **[edit protocols rsvp]** hierarchy level. This results in the possibility that the LSP might come up.

## Verify the LSP Again

- Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the MPLS layer has been resolved.
- Action** To verify the LSP again, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

## Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

```

Transit LSP: 0 sessions  
Total 0 displayed, Up 0, Down 0

**Meaning** Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up.

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

---

## Verify the LSP

**Purpose** Typically, you use the **show mpls lsp extensive** command to verify the LSP. However for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down, use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

**Action** To determine whether the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

### Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions
```

```

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn
    2 Oct 27 15:06:05 10.1.13.2: No Route toward dest [4 times]

```

10.0.0.1
  From: 10.0.0.6, State: Dn, ActiveRoute: 0, LSPname: R6-to-R1
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn
    Will be enqueued for recomputation in 22 second(s).
    1 Oct 27 14:59:12 CSPF failed: no route toward 10.0.0.1 [4 times]
  Created: Wed Oct 27 14:57:44 2004
Total 1 displayed, Up 0, Down 1

```

```

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

```

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

**Meaning** The sample output shows that the LSP is down in both directions, from **R1** to **R6**, and from **R6** to **R1**. The output from **R1** shows that **R1** is using a no-cspf LSP since it tried to originate the call without being able to reach the destination. The output from **R6** shows that the Constrained Shortest Path First (CSPF) algorithm failed, resulting in no route to destination **10.0.0.1**.

## Verify RSVP Sessions

**Purpose** When an RSVP session is successfully created, the LSP is set up along the paths created by the RSVP session. If the RSVP session is unsuccessful, the LSP does not work as configured.

**Action** To verify currently active RSVP sessions, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp session
```

### Sample Output 1

```
user@R1> show rsvp session
Ingress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

user@R3> show rsvp session
Ingress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress RSVP: 0 sessions

Total 1 displayed, Up 1 , Down 0

Egress RSVP: 1 sessions
To          From          State Rt Style Labelin Labelout LSPname
10.0.0.6    10.0.0.1    Up    0 1 FF      3      - R1-to-R6
Total 1 displayed, Up 1 , Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

**Meaning** Sample Output 1 from all routers shows that no RSVP sessions were successfully created, even though the LSP **R6-to-R1** is configured. Continue investigating the problem in “[Verify RSVP Neighbors](#)” on page 1039.

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the output from the ingress, transit, and egress routers when the RSVP configuration is correct, and the LSP is traversing the network as configured. **R1** and **R6** both show an ingress and egress RSVP session, with the LSP **R1-to-R6**, and the reverse LSP **R6-to-R1**. Transit router **R3** shows two transit RSVP sessions.

## Verify RSVP Neighbors

**Purpose** Display a list of RSVP neighbors that were learned dynamically when exchanging RSVP packets. Once a neighbor is learned, it is never removed from the list of RSVP neighbors unless the RSVP configuration is removed from the router.

**Action** To verify RSVP neighbors, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp neighbor
```

### Sample Output 1

```

user@R1> show rsvp neighbor
RSVP neighbor: 1 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.2        10 1/0      9:22          9    64/64    32

```

```

user@R3> show rsvp neighbor
RSVP neighbor: 2 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.1         0  1/0    28:20      9    190/190   41
10.1.36.2        16:50 1/1    15:37      9    105/78   38

user@R6> show rsvp neighbor
RSVP neighbor: 1 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.36.1        17:30 1/1    16:15      9    104/78   39

```

## Sample Output 2

```

user@R3> show rsvp neighbor
RSVP neighbor: 2 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.1         5  1/0     9:14      9     63/63   33
10.1.36.2         5  1/0     9:05      9     62/62   32

user@R6> show rsvp neighbor
RSVP neighbor: 1 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.36.1         5  1/0     8:54      9     61/61   32

```

**Meaning** Sample Output 1 shows that **R1** and **R6** have one RSVP neighbor each, **R3**. However, the values in the **Up/Dn** field are different. **R1** has a value of **1/0** and **R6** has a value of **1/1**, indicating that **R1** is an active neighbor with **R3**, but **R6** is not. When the up count is one more than the down count, the neighbor is active; if the values are equal, the neighbor is down. The values for **R6** are equal, **1/1**, indicating that the neighbor **R3** is down.

Transit router **R3** knows about two neighbors, **R1** and **R6**. The **Up/Dn** field indicates that **R1** is an active neighbor and **R6** is down. At this point it is not possible to determine if the problem resides with **R3** or **R6**, because both neighbors are not active. Continue investigating the problem in [“Verify RSVP Interfaces” on page 1040](#).

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the correct neighbor relationship between transit router **R3** and egress router **R6**. The **Up/Dn** field shows the up count to be one more than the down count, **1/0**, indicating that the neighbors are active.

## Verify RSVP Interfaces

**Purpose** Display the status of each interface on which RSVP is enabled to determine where the configuration error occurred.

**Action** To verify the status of RSVP interfaces, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp interface
```

## Sample Output 1

```

user@R1> show rsvp interface
RSVP interface: 3 active
Active Subscr- Static Available Reserved Highwater

```

Interface	State	resv	ption	BW	BW	BW	mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R3> show rsvp interface
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr-ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

<<< Missing interface so-0/0/3.0

```
user@R6> show rsvp interface
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr-ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

## Sample Output 2

```
user@R1> show rsvp interface
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr-ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R3> show rsvp interface
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr-ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R6> show rsvp interface
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr-ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

**Meaning** Sample Output 1 shows that even though each router has interfaces that are up and have RSVP active, there are no reservations (**Active resv**) on any of the routers. In this example,

we would expect at least one reservation on the ingress and egress routers, and two reservations on the transit router.

In addition, interface **so-0/0/3** on transit router **R3** is not included in the configuration. The inclusion of this interface is critical to the success of the LSP.

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the relevant interfaces with active reservations.

---

## Verify the RSVP Protocol Configuration

**Purpose** After you have checked RSVP sessions, interfaces, neighbors, and determined that there might be a configuration error, verify the RSVP protocol configuration.

**Action** To verify the RSVP configuration, enter the following command from the ingress, transit, and egress routers:

```
user@host> show configuration protocols rsvp
```

### Sample Output

```
user@R1> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}
```

```
user@R3> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0; <<< Missing interface so-0/0/3.0
interface fxp0.0 {
    disable;
}
```

```
user@R6> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface so-0/0/3.0;
interface fxp0.0 {
    disable;
}
```

**Meaning** The sample output shows that **R3** has interface **so-0/0/3.0** missing from the RSVP protocol configuration. This interface is critical for the correct functioning of the LSP.

---

## Take Appropriate Action

**Problem Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, an interface is missing from the configuration of router R3.

**Solution** To correct the error in this example, follow these steps:

1. Include the missing interface in the configuration of transit router R3:

```
user@R3> edit
user@R3# edit protocols rsvp
[edit protocols rsvp]
user@R3# show
user@R3# set interface so-0/0/3.0
```

2. Verify and commit the configuration:

```
[edit protocols rsvp]
user@R3# show
user@R3# commit
```

#### Sample Output

```
user@R3> edit
Entering configuration mode

[edit]
user@R3# edit protocols rsvp

[edit protocols rsvp]
user@R3# show
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0; <<< Missing interface so-0/0/3.0
interface fxp0.0 {
    disable;
}
[edit protocols rsvp]
user@R3# set interface so-0/0/3.0

[edit protocols rsvp]
user@R3# show
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}
interface so-0/0/3.0; <<< Interface now included in the configuration

[edit protocols rsvp]
user@R3# commit
commit complete
```

**Meaning** The sample output shows that the missing interface **so-0/0/3.0** on transit router **R3** is now correctly included at the **[edit protocols rsvp]** hierarchy level. This results in the possibility that the LSP might come up.

## Verify the LSP Again

**Purpose** After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the MPLS layer has been resolved.

**Action** To verify the LSP again, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

### Sample Output 1

```
user@R1> show mpls lsp extensive

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

**Meaning** Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up.

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

## Checklist for Determining LSP Status

**Purpose** This checklist provides the steps and commands to verify the state of a label-switched path (LSP) in an MPLS network. The checklist includes links to more detailed information about the commands to verify the LSP and supporting protocols. [Table 27 on page 1056](#) provides commands for determining the LSP state.

**Table 27: Checklist for Determining the LSP State**

Tasks	Command or Action
<b>“Determining LSP Status” on page 1210</b>	
1. <a href="#">Check the Status of the LSP on page 1210</a>	<b>show mpls lsp</b>
2. <a href="#">Display Extensive Status About the LSP on page 1211</a>	<b>show mpls lsp extensive</b>
<b>“Determining LSP Statistics” on page 1056</b>	
	<b>show rsvp session detail</b>

## Determining LSP Statistics

**Purpose** Display detailed information about RSVP objects to assist the diagnosis of an LSP problem.

**Action** To verify RSVP objects, enter the following Junos OS CLI operational mode command:

```
user@host> show rsvp session detail
```

### Sample Output

```
user@R1> show rsvp session detail
Ingress RSVP: 1 sessions

10.0.0.6
  From: 10.0.0.1, LSPstate: Up, ActiveRoute: 1
  LSPname: R1-to-R6 , LSPpath: Primary
  Suggested label received: -, Suggested label sent: -
  Recovery label received: -, Recovery label sent: 100064
  Resv style: 1 FF, Label in: -, Label out: 100064
  Time left: -, Since: Tue Aug 17 12:22:52 2004

Total 1 displayed, Up 1, Down 0

Egress RSVP: 1 sessions

10.0.0.1
  From: 10.0.0.6 , LSPstate: Up, ActiveRoute: 0
  LSPname: R6-to-R1, LSPpath: Primary
  Suggested label received: -, Suggested label sent: -
  Recovery label received: -, Recovery label sent: -
  Resv style: 1 FF, Label in: 3, Label out: -
  Time left: 135, Since: Tue Aug 17 12:23:14 2004
  Tspec: rate 0bps size 0bps peak Infbps m 20 M 1500
  Port number: sender 1 receiver 39024 protocol 0
  PATH rcvfrom: 10.1.15.2 (so-0/0/1.0) 158 pkts
  Adspec: received MTU 1500
  PATH sentto: localclient
  RESV rcvfrom: localclient
  Record route: 10.1.56.2 10.1.15.2 <self>
Total 1 displayed, Up 1, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

**Meaning** The sample output shows that there is one ingress and one egress RSVP session. The ingress session has a source address of **10.0.0.1 (R1)**, and the session is up, with one active route. The LSP name is **R1-to-R6** and it is the primary path for the LSP.

The recovery label (**100064**) is sent by a graceful restart router to its neighbor to recover a forwarding state. It is probably the old label that the router advertised before it went down.

This session is using the fixed filter (**FF**) reservation style (**Resv style**). Since this is an ingress router, there is no inbound label. The outbound label (provided by the next downstream router) is **100064**.

The **Time Left** field provides the number of seconds remaining in the RSVP session, and the **Tspec** object provides information about the controlled load rate (**rate**) and maximum burst size (**peak**), an infinite value (**Infbps**) for the guaranteed delivery option, and the indication that packets smaller than 20 bytes are treated as 20 bytes, while packets larger than 1500 bytes are treated as 1500 bytes.

The port number is the IPv4 tunnel ID, while the sender/receiver port number is the LSP ID. The IPv4 tunnel ID is unique for the life of the LSP, while the sender/receiver LSP ID can change, for example, with an SE style reservation.

The **PATH rcvfrom** field includes the source of the path message. Since this is the ingress router, the local client originated the path message.

The **PATH sentto** field includes the path message destination (**10.1.13.2**) and outgoing interface (**so-0/0/2.0**). The **RESV rcvfrom** field includes both the source of the Resv message received (**10.1.13.2**) and the incoming interface (**so-0/0/2.0**).

The RSVP explicit route and the route record values are identical: **10.1.13.2** and **10.1.36.2**. In most cases, the explicit route and the record route values are identical. Differences indicate that some path rerouting has occurred, typically during Fast-Reroute.

The **Total** fields indicate the total number of ingress, egress, and transit RSVP sessions, with the total being equal to the sum of the up and down sessions. In this example, there is one ingress session, one egress session, and no transit RSVP sessions.

## Checklist for Verifying LSP Use

**Purpose** This checklist provides the steps and commands to verify the use of the LSP in an MPLS network. The checklist includes links to more detailed information about verifying the LSP on the ingress and transit routers in the network.

This checklist describes how to verify the availability and valid use of a label-switched path (LSP) in your network.

**Table 28: Checklist for Verifying LSP Use**

Tasks	Command or Action
<a href="#">“Verifying LSP Use in Your Network” on page 1058</a>	
<a href="#">“Verifying an LSP on the Ingress Router” on page 1059</a>	<code>show route table inet.3</code>
<a href="#">“Verifying an LSP on a Transit Router” on page 1060</a>	<code>show route table mpls.0</code>

[Table 28 on page 1058](#) provides commands for verifying LSP use.

## Verifying LSP Use in Your Network

**Purpose** When you verify the valid use of an LSP on the ingress and transit routers in your network, you can determine if there is a problem with Multiprotocol Label Switching (MPLS) in your network. [Figure 107 on page 1059](#) describes the example network used in this topic.

Figure 107: MPLS Topology for Verifying LSP Use

The MPLS network in [Figure 107 on page 1059](#) illustrates a router-only network with SONET interfaces that consist of the following components:

- A full-mesh interior Border Gateway Protocol (IBGP) topology, using AS 65432
- MPLS and Resource Reservation Protocol (RSVP) enabled on all routers
- A **send-statics** policy on routers R1 and R6 that allows a new route to be advertised into the network
- An LSP between routers R1 and R6

The network shown in [Figure 107 on page 1059](#) is a Border Gateway Protocol (BGP) full-mesh network. Since route reflectors and confederations are not used to propagate BGP learned routes, each router must have a BGP session with every other router running BGP.

To verify LSP use in your network, follow these steps:

1. [Verifying an LSP on the Ingress Router on page 1059](#)
2. [Verifying an LSP on a Transit Router on page 1060](#)

## Verifying an LSP on the Ingress Router

**Purpose** You can verify the availability of an LSP when it is up by examining the **inet.3** routing table on the ingress router. The **inet.3** routing table contains the host address of each LSP's egress router. This routing table is used on ingress routers to route BGP packets to the destination egress router. BGP uses the **inet.3** routing table on the ingress router to help resolve next-hop addresses.

**Action** To verify an LSP on an ingress router, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show route table inet.3
```

## Sample Output

```
user@R1> show route table inet.3
inet.3: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.6/32          *[RSVP/7] 4w0d 22:40:57, metric 20
                    > via so-0/0/2.0, label-switched-path R1-to-R6
```

**Meaning** The sample output shows the **inet.3** routing table. By default, only BGP and MPLS virtual private networks (VPNs) can use the **inet.3** route table to resolve next-hop information. One destination is listed in the route table, **10.0.0.6**. This destination (**10.0.0.6**) is signaled by RSVP, and is the current active path, as indicated by the asterisk (\*). The protocol preference for this route is **7**, and the metric associated with it is **20**. The label-switched path is **R1-to-R6**, through interface **so-0/0/2.0**, which is the physical next-hop transit interface.

Typically, the penultimate router in the LSP either pops the packet's label or changes the label to a value of 0. If the penultimate router pops the top label and an IPv4 packet is underneath, the egress router routes the IPv4 packet, consulting the IP routing table **inet.0** to determine how to forward the packet. If another type of label (such as one created by Label Distribution Protocol (LDP) tunneling or VPNs, but not IPv4) is underneath the top label, the egress router does not examine the **inet.0** routing table. Instead, it examines the **mpls.0** routing table for forwarding decisions.

If the penultimate router changes the packet's label to a value of 0, the egress router strips off the 0 label, indicating that an IPv4 packet follows. The packet is examined by the **inet.0** routing table for forwarding decisions.

When a transit or egress router receives an MPLS packet, information in the MPLS forwarding table is used to determine the next transit router in the LSP or whether this router is the egress router.

When BGP resolves a next-hop prefix, it examines both the **inet.0** and **inet.3** routing tables, seeking the next hop with the lowest preference; for example, RSVP preference 7 is preferred over OSPF preference 10. The RSVP signaled LSP is used to reach the BGP next hop. This is the default when the BGP next hop equals the LSP egress address. Once the BGP next hop is resolved through an LSP, the BGP traffic uses the LSP to forward BGP transit traffic.

## Verifying an LSP on a Transit Router

**Purpose** You can verify the availability of an LSP when it is up by examining the **mpls.0** routing table on a transit router. MPLS maintains the **mpls.0** routing table, which contains a list of the next label-switched router in each LSP. This routing table is used on transit routers to route packets to the next router along an LSP.

**Action** To verify an LSP on a transit router, enter the following Junos OS CLI operational mode command:

```
user@host> show route table mpls.0
```

## Sample Output

```

user@R3> show route table mpls.0
mpls.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
1                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
2                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
100064            * [RSVP/7] 2w1d 04:17:36, metric 1
                  > via so-0/0/3.0, label-switched-path R1-to-R6
100064 (S=0)      * [RSVP/7] 2w1d 04:17:36, metric 1
                  > via so-0/0/3.0, label-switched-path R1-to-R6

```

**Meaning** The sample output from transit router **R3** shows route entries in the form of MPLS label entries, indicating that there is only one active route, even though there are five active entries.

The first three MPLS labels are reserved MPLS labels defined in RFC 3032. Packets received with these label values are sent to the Routing Engine for processing. Label 0 is the IPv4 explicit null label. Label 1 is the MPLS equivalent of the IP Router Alert label and Label 2 is the IPv6 explicit null label.

The two entries with the **100064** label are for the same LSP, **R1-to-R6**. There are two entries because the stack values in the MPLS header may be different. The second entry, **100064 (S=0)**, indicates that the stack depth is not 1 and additional label values are included in the packet. In contrast, the first entry of **100064** has an inferred S=1 which indicates a stack depth of 1 and makes it the last label in the packet. The dual entry indicates that this is the penultimate router. For more information on MPLS label stacking, see RFC 3032, *MPLS Label Stack Encoding*.

The incoming label is the MPLS header of the MPLS packet, and is assigned by RSVP to the upstream neighbor. Juniper Networks routers dynamically assign labels for RSVP traffic-engineered LSPs in the range from 100,000 through 1,048,575.

The router assigns labels starting at label 100,000, in increments of 16. The sequence of label assignments is 100,000, 100,016, 100,032, 100,048, and so on. At the end of the assigned labels, the label numbers start over at 100001, incrementing in units of 16. Juniper Networks reserves labels for various purposes. [Table 29 on page 1061](#) lists the various label range allocations for incoming labels.

**Table 29: MPLS Label Range Allocations**

Incoming Label	Status
0 through 15	Reserved by IETF
16 through 1023	Reserved for static LSP assignment

Table 29: MPLS Label Range Allocations (*continued*)

Incoming Label	Status
1024 through 9999	Reserved for internal use (for example, CCC labels)
10,000 through 99,999	Reserved for static LSP assignment
100,000 through 1,048,575	Reserved for dynamic label assignment

## Verifying an LSP on the Ingress Router

**Purpose** You can verify the availability of an LSP when it is up by examining the **inet.3** routing table on the ingress router. The **inet.3** routing table contains the host address of each LSP's egress router. This routing table is used on ingress routers to route BGP packets to the destination egress router. BGP uses the **inet.3** routing table on the ingress router to help resolve next-hop addresses.

**Action** To verify an LSP on an ingress router, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show route table inet.3
```

## Sample Output

```
user@R1> show route table inet.3
inet.3: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.6/32          *[RSVP/7] 4w0d 22:40:57, metric 20
                    > via so-0/0/2.0, label-switched-path R1-to-R6
```

**Meaning** The sample output shows the **inet.3** routing table. By default, only BGP and MPLS virtual private networks (VPNs) can use the **inet.3** route table to resolve next-hop information. One destination is listed in the route table, **10.0.0.6**. This destination (**10.0.0.6**) is signaled by RSVP, and is the current active path, as indicated by the asterisk (\*). The protocol preference for this route is **7**, and the metric associated with it is **20**. The label-switched path is **R1-to-R6**, through interface **so-0/0/2.0**, which is the physical next-hop transit interface.

Typically, the penultimate router in the LSP either pops the packet's label or changes the label to a value of 0. If the penultimate router pops the top label and an IPv4 packet is underneath, the egress router routes the IPv4 packet, consulting the IP routing table **inet.0** to determine how to forward the packet. If another type of label (such as one created by Label Distribution Protocol (LDP) tunneling or VPNs, but not IPv4) is underneath the top label, the egress router does not examine the **inet.0** routing table. Instead, it examines the **mpls.0** routing table for forwarding decisions.

If the penultimate router changes the packet's label to a value of 0, the egress router strips off the 0 label, indicating that an IPv4 packet follows. The packet is examined by the **inet.0** routing table for forwarding decisions.

When a transit or egress router receives an MPLS packet, information in the MPLS forwarding table is used to determine the next transit router in the LSP or whether this router is the egress router.

When BGP resolves a next-hop prefix, it examines both the **inet.0** and **inet.3** routing tables, seeking the next hop with the lowest preference; for example, RSVP preference 7 is preferred over OSPF preference 10. The RSVP signaled LSP is used to reach the BGP next hop. This is the default when the BGP next hop equals the LSP egress address. Once the BGP next hop is resolved through an LSP, the BGP traffic uses the LSP to forward BGP transit traffic.

## Verifying an LSP on a Transit Router

**Purpose** You can verify the availability of an LSP when it is up by examining the **mpls.0** routing table on a transit router. MPLS maintains the **mpls.0** routing table, which contains a list of the next label-switched router in each LSP. This routing table is used on transit routers to route packets to the next router along an LSP.

**Action** To verify an LSP on a transit router, enter the following Junos OS CLI operational mode command:

```
user@host> show route table mpls.0
```

## Sample Output

```
user@R3> show route table mpls.0
mpls.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
1                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
2                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
100064            * [RSVP/7] 2w1d 04:17:36, metric 1
                  > via so-0/0/3.0, label-switched-path R1-to-R6
100064 (S=0)      * [RSVP/7] 2w1d 04:17:36, metric 1
                  > via so-0/0/3.0, label-switched-path R1-to-R6
```

**Meaning** The sample output from transit router **R3** shows route entries in the form of MPLS label entries, indicating that there is only one active route, even though there are five active entries.

The first three MPLS labels are reserved MPLS labels defined in RFC 3032. Packets received with these label values are sent to the Routing Engine for processing. Label 0 is the IPv4 explicit null label. Label 1 is the MPLS equivalent of the IP Router Alert label and Label 2 is the IPv6 explicit null label.

The two entries with the **100064** label are for the same LSP, **R1-to-R6**. There are two entries because the stack values in the MPLS header may be different. The second entry, **100064 (S=0)**, indicates that the stack depth is not 1 and additional label values are included in the packet. In contrast, the first entry of **100064** has an inferred S=1 which

indicates a stack depth of 1 and makes it the last label in the packet. The dual entry indicates that this is the penultimate router. For more information on MPLS label stacking, see RFC 3032, *MPLS Label Stack Encoding*.

The incoming label is the MPLS header of the MPLS packet, and is assigned by RSVP to the upstream neighbor. Juniper Networks routers dynamically assign labels for RSVP traffic-engineered LSPs in the range from 100,000 through 1,048,575.

The router assigns labels starting at label 100,000, in increments of 16. The sequence of label assignments is 100,000, 100,016, 100,032, 100,048, and so on. At the end of the assigned labels, the label numbers start over at 100001, incrementing in units of 16. Juniper Networks reserves labels for various purposes. [Table 29 on page 1061](#) lists the various label range allocations for incoming labels.

**Table 30: MPLS Label Range Allocations**

Incoming Label	Status
0 through 15	Reserved by IETF
16 through 1023	Reserved for static LSP assignment
1024 through 9999	Reserved for internal use (for example, CCC labels)
10,000 through 99,999	Reserved for static LSP assignment
100,000 through 1,048,575	Reserved for dynamic label assignment

## Verify That Load Balancing Is Working

**Purpose** After configuring load balancing, check that traffic is load-balanced equally across paths. In this section, the command output reflects the load-balancing configuration of the example network shown in [Figure 108 on page 1068](#). The **clear** commands are used to reset LSP and interface counters to zero so that the values reflect the operation of the load-balancing configuration.

**Action** To verify load balancing across interfaces and LSPs, use the following command on the ingress router:

```
user@host# show configuration
```

To verify load balancing across interfaces and LSPs, use the following commands on a transit router:

```
user@host# show route
user@host# show route forwarding-table
user@host# show mpls lsp statistics
user@host# monitor interface traffic
user@host# clear mpls lsp statistics
user@host# clear interface statistics
```

## Sample Output

The following sample output is for the configuration on ingress router **R1**:

```
user@R1> show configuration | no-more
[...Output truncated...]
routing-options {
  [...Output truncated...]
  forwarding-table {
    export lbpp;
  }
}
[...Output truncated...]
policy-options {
  policy-statement lbpp {
    then {
      load-balance per-packet;
    }
  }
}
```

**Meaning** The sample output for the **show configuration** command on ingress router **R1** shows that load balancing is correctly configured with the **lbpp** policy statement. Also, the **lbpp** policy is exported into the forwarding table at the **[edit routing-options]** hierarchy level.

**Sample Output** The following sample output is from transit router **R2**:

```
user@R2> show route 192.168.0.1 terse

inet.0: 25 destinations, 27 routes (25 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
A Destination      P Prf  Metric 1   Metric 2   Next hop      AS path
* 192.168.0.1/32    0 10      3           so-0/0/1.0
                                >so-0/0/2.0

[...Output truncated...]
```

**Meaning** The sample output for the **show route** command issued on transit router **R2** shows the two equal-cost paths (**so-0/0/1** and **so-0/0/2**) through the network to the loopback address to **R0 (192.168.0.1)**. Even though the right angle bracket (**>**) usually indicates the active route, in this instance it does not, as shown in the following four sample outputs.

**Sample Output** The following sample output is from transit router R2:

```
user@R2> monitor interface traffic

R2                               Seconds: 65                Time: 11:41:14

Interface  Link  Input packets      (pps)  Output packets      (pps)
so-0/0/0   Up    0                  (0)    0                  (0)
so-0/0/1   Up    126                (0)    164659             (2128)
so-0/0/2   Up    85219              (1004)  164598             (2128)
so-0/0/3   Up    0                  (0)    0                  (0)
fe-0/1/0   Up    328954             (4265)  85475              (1094)
fe-0/1/1   Up    0                  (0)    0                  (0)
fe-0/1/2   Up    0                  (0)    0                  (0)
fe-0/1/3   Up    0                  (0)    0                  (0)
[...Output truncated...]
```

**Meaning** The sample output for the **monitor interface traffic** command issued on transit router R2 shows that output traffic is evenly distributed across the two interfaces **so-0/0/1** and **so-0/0/2**.

**Sample Output** The following sample output is from transit router R2:

```
user@R2> show mpls lsp statistics
Ingress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 5 sessions
To          From          State  Packets  Bytes  LSPname
192.168.0.1 192.168.1.1   Up     87997   17951388 lsp1
192.168.0.1 192.168.1.1   Up     87997   17951388 lsp2
192.168.0.1 192.168.1.1   Up     87997   17951388 lsp3
192.168.0.1 192.168.1.1   Up     87997   17951388 lsp4
192.168.6.1 192.168.0.1   Up      0      0 r0-r1
Total 5 displayed, Up 5, Down 0
```

**Meaning** The sample output for the **show mpls lsp statistics** command issued on transit router R2 shows that output traffic is evenly distributed across the four LSPs configured on ingress router R6.

**Sample Output** The following sample output is from transit router R2:

```
user@R2> show route forwarding-table destination 10.0.90.14
Routing table: inet
Internet:
Destination          Type RtRef Next hop          Type Index NhRef Netif
10.0.90.12/30        user   0                ulst 262144 6
                    ucst 345 5 so-0/0/1.0
                    ucst 339 2 so-0/0/2.0
```

**Meaning** The sample output for the **show route forwarding-table destination** command issued on transit router R2 shows **ulst** in the **Type** field, which indicates that load balancing is working. The two unicast (**ucst**) entries in the **Type** field are the two next hops for the LSPs.

**Sample Output** The following sample output is from transit router R2:

```
user@R2> show route forwarding-table | find mpls
Routing table: mpls
MPLS:
Destination          Type RtRef Next hop          Type Index NhRef Netif
default              perm   0                dscd   38   1
0                    user   0                recv   37   3
1                    user   0                recv   37   3
2                    user   0                recv   37   3
100112               user   0                Swap 100032 so-0/0/1.0
100128               user   0                Swap 100048 so-0/0/1.0
100144               user   0 10.0.12.13         Swap 100096 fe-0/1/0.0
100160               user   0                Swap 100112 so-0/0/2.0
100176               user   0                Swap 100128 so-0/0/2.0
```

**Meaning** The sample output for the **show route forwarding-table | find mpls** command issued on transit router R2 shows the MPLS routing table that contains the labels received and used by this router to forward packets to the next-hop router. This routing table is used mostly on transit routers to route packets to the next router along an LSP. The first three labels in the **Destination** column (Label 0, Label 1, and Label 2) are automatically entered by MPLS when the protocol is enabled. These labels are reserved MPLS labels defined in RFC 3032. Label 0 is the IPv4 explicit null label. Label 1 is the MPLS equivalent of the IP Router Alert label, and Label 2 is the IPv6 explicit null label.

The remaining five labels in the **Destination** column are nonreserved labels that the router uses to forward traffic, and the last column **Netif**, shows the interfaces used to send the labeled traffic. For nonreserved labels, the second **Type** column shows the operation performed on matching packets. In this example, all non-reserved packets are swapped for outgoing packet labels. For example, packets with the label **100112** have their label swapped for **100032** before they are pushed out of interface **so-0/0/1.0**.

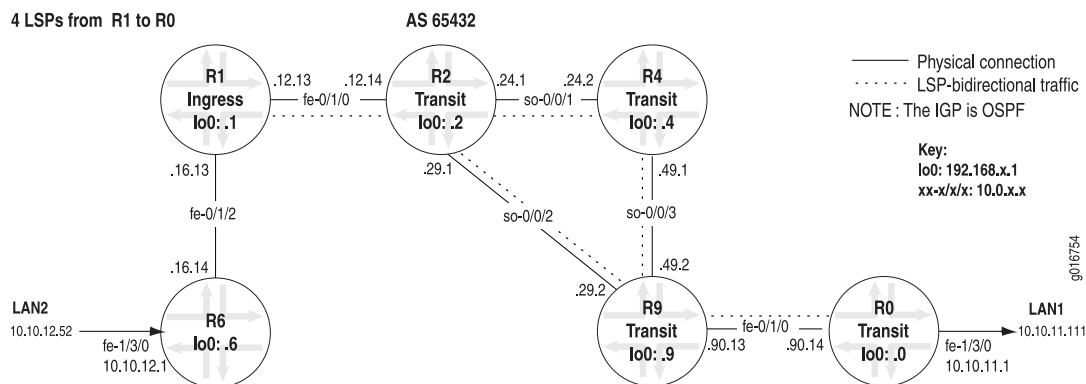

## Example: Load-Balanced MPLS Network

When you configure several RSVP LSPs to the same egress router, the LSP with the lowest metric is selected and carries all traffic. If all of the LSPs have the same metric,

one of the LSPs is selected at random and all traffic is forwarded over it. To distribute traffic equally across all LSPs, you can configure load balancing on the ingress or transit routers, depending on the type of load balancing configured.

Figure 108 on page 1068 illustrates an MPLS network with four LSPs configured to the same egress router (R0). Load balancing is configured on ingress router R1. The example network uses Open Shortest Path First (OSPF) as the interior gateway protocol (IGP) with OSPF area 0.0.0.0. An IGP is required for the Constrained Shortest Path First (CSPF) LSP, which is the default for the Junos OS. In addition, the example network uses a policy to create BGP traffic.

**Figure 108: Load-Balancing Network Topology**

The network shown in Figure 108 on page 1068 consists of the following components:

- A full-mesh interior BGP (IBGP) topology, using AS 65432
- MPLS and RSVP enabled on all routers
- A send-statics policy on routers R1 and R0 that allows a new route to be advertised into the network
- Four unidirectional LSPs between R1 and R0, and one reverse direction LSP between R0 and R1, which allows for bidirectional traffic
- Load balancing configured on ingress router R1

The network shown in Figure 108 on page 1068 is a BGP full-mesh network. Since route reflectors and confederations are not used to propagate BGP learned routes, each router must have a BGP session with every other router running BGP.

For complete configurations for all routers in the example MPLS network, see “Router Configurations for the Load-Balanced MPLS Network” on page 1068.

For a description of the situation before and after load balancing is configured in the network to use all four LSPs to forward traffic, see “Traffic Flows Before Load Balancing” on page 1080.

## Router Configurations for the Load-Balanced MPLS Network

**Purpose** The configurations in this topic are for the six routers in the example network illustrated in Figure 108 on page 1068.

**Action** To display the configuration of a router, use the following Junos OS CLI operational mode command:

```
user@host> show configuration | no-more
```

**Sample Output 1** The following configuration output is for edge router R6.

```
user@R6> show configuration | no-more
[...Output truncated...]
interfaces {
  fe-0/1/2 {
    unit 0 {
      family inet {
        address 10.0.16.14/30;
      }
      family mpls; #MPLS enabled on relevant interfaces
    }
  }
  fe-1/3/0 {
    unit 0 {
      family inet {
        address 10.10.12.1/24;
      }
    }
  }
  fxp0 {
    unit 0 {
      family inet {
        address 192.168.70.148/21;
      }
    }
  }
  lo0 {

        }
    }
}

```

**Meaning** Sample Outputs 1 through 6 show the base interfaces, routing options, protocols, and policy options configurations for all six routers in the example network illustrated in [Figure 108 on page 1068](#).

All routers in the network have MPLS, RSVP, and BGP enabled. OSPF is configured as the IGP, and relevant interfaces have basic IP information and MPLS support.

In addition, all routers have the router ID (RID) configured manually at the **[edit routing-options]** hierarchy level to avoid duplicate RID problems. The **passive** statement is included in the OSPF configuration to ensure that protocols are not run over the loopback (**lo0**) interface and that the loopback (**lo0**) interface is advertised correctly throughout the network.

Sample Outputs 1, 3, 4, and 5 for **R6**, **R2**, **R4**, and **R9** show the base configuration for transit label-switched routers. The base configuration includes all interfaces enabled for MPLS, the RID manually configured, and the relevant protocols (RSVP, MPLS, BGP, and OSPF).

Sample Output 2 from ingress router **R1** shows the base configuration plus four LSPs (**lsp1** through **lsp4**) configured to **R0**. The four LSPs are configured with different primary paths that specify a loose hop through **R4** for **lsp1** and **lsp4**, and through **R2** for **lsp2** and **lsp3**.

To create traffic, **R1** has a static route (**100.100.1.0/24**) configured at the **[edit routing-options static route]** hierarchy level. The prefix is included in the send-statics policy at the **[edit policy-options send statics]** hierarchy level so the routes can become BGP routes.

In addition, on the ingress router **R1**, load balancing is configured using the **per-packet** option, and the policy is exported at the **[edit routing-options forwarding-table]** hierarchy level.

Sample Output 6 from egress router **R0** shows one LSP (**r0-r6**) to **R6** used to create bidirectional traffic. OSPF requires bidirectional LSP reachability before it will advertise the LSP into the IGP. Although the LSP is advertised into the IGP, no hello messages or

routing updates occur over the LSP—only user traffic is sent over the LSP. The router uses its local copy of the IGP database to verify bidirectional reachability.

In addition, R0 has a static route (100.100.10.0/24) configured at the **[edit routing-options static route]** hierarchy level. The prefix is included in the send-statics policy at the **[edit policy-options send statics]** hierarchy level so the routes can become BGP routes.

---

## Traffic Flows Before Load Balancing

---

**Purpose** The following sample output illustrates the details to look for when you issue different **show** commands to check if traffic is balanced. The following output is before load balancing is configured and is taken from transit router R2 in the network shown in [Figure 108 on page 1068](#).

**Action** To check the distribution of traffic across interfaces and LSPs, use the following CLI operational mode commands:

```
user@host> show route | find mpls
user@host> monitor interface traffic
user@host> show mpls lsp statistics
```

**Sample Output 1** user@R2> show route | find mpls

```

mpls.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0          *[MPLS/0] 1d 00:12:08, metric 1
            Receive
1          *[MPLS/0] 1d 00:12:08, metric 1
            Receive
2          *[MPLS/0] 1d 00:12:08, metric 1
            Receive
100112     *[RSVP/7] 13:10:36, metric 1
            > via so-0/0/1.0, label-switched-path lsp1
100128     *[RSVP/7] 13:01:08, metric 1
            > via so-0/0/1.0, label-switched-path lsp4
100144     *[RSVP/7] 00:26:49, metric 1
            > to 10.0.12.13 via fe-0/1/0.0, label-switched-path r0-r6
100160     *[RSVP/7] 00:23:25, metric 1
            > via so-0/0/2.0, label-switched-path lsp2
100176     *[RSVP/7] 00:23:25, metric 1
            > via so-0/0/2.0, label-switched-path lsp3

```

**Sample Output 2** user@R2> monitor interface traffic

```

R2                      Seconds: 89                      Time: 14:33:09

Interface  Link  Input packets      (pps)  Output packets      (pps)
so-0/0/0   Up    0                  (0)    0                  (0)
so-0/0/1   Up    90 (1)  91 (1)            0                  (0)
so-0/0/2   Up    118 (1) 100122 (0)        0                  (0)
so-0/0/3   Up    0          (0)    0                  (0)
fe-0/1/0   Up    100119      (0)    115                 (0)
fe-0/1/1   Up    0          (0)    0                  (0)
fe-0/1/2   Up    0          (0)    0                  (0)
fe-0/1/3   Up    0          (0)    0                  (0)
[...Output truncated...]

```

**Sample Output 3** user@R2> show mpls lsp statistics

```

Ingress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 5 sessions
To          From          State  Packets  Bytes  LSPname
192.168.0.1 192.168.6.1 Up      0        0  lsp2
192.168.0.1 192.168.6.1 Up 112026 22853304 lsp1
192.168.0.1 192.168.6.1 Up      0        0  lsp3
192.168.0.1 192.168.6.1 Up      0        0  lsp4
192.168.6.1 192.168.0.1 Up      0        0  r0-r6
Total 5 displayed, Up 5, Down 0

```

**Meaning** Sample Outputs 1 through 3 from transit router R2 show that traffic is not balanced across LSPs or interfaces.

Sample Output 1 for the **show route** command shows that all LSPs have the same metric (1) to the destination, even though they are traversing different interfaces. **lsp1** and **lsp4** are using **so-0/0/1**, while **lsp2** and **lsp3** are using **so-0/0/2**.

Sample Output 2 for the **monitor interface traffic** command shows that traffic is not evenly balanced across interfaces **so-0/0/1** and **so-0/0/2**. Almost all traffic is going out **so-0/0/2**.

Sample Output 3 for the **show mpls lsp statistics** command shows that traffic across LSPs is not balanced. All traffic is going over **lsp1**.

---

## Verify the Operation of Uneven Bandwidth Load Balancing

**Purpose** When a router is performing unequal-cost load balancing between LSPs paths, the **show route detail** command displays a balance field associated with each next hop being used.

**Action** To verify that an RSVP LSP is unevenly load-balanced, use the following Junos OS CLI operational mode commands:

```
user@host> show route protocol rsvp detail
user@host> show mpls lsp statistics
```

### Sample Output

```
user@R1> show route protocol rsvp detail

inet.0: 25 destinations, 25 routes (25 active, 0 holddown, 0 hidden)
10.0.90.14/32 (1 entry, 1 announced)
  State: <FlashAll>

```

```
Transit LSP: 0 sessions
```

```
Total 0 displayed, Up 0, Down 0
```

**Meaning** The sample output from ingress router **R1** shows that traffic is distributed according to the LSP bandwidth configuration, as indicated by the **Balance: xx%** field. For example, **lsp1** has 10 Mbps of bandwidth configured, as reflected in the **Balance: 10%** field.

## Checklist for Collecting Crash Data

**Problem** **Description:** [Table 31 on page 1084](#) provides links commands for collection crash data.

**Table 31: Checklist for Collecting Crash Data**

Tasks	Command or Action
<b>“Understand Crash Data Collection” on page 1085</b>	
<b>“Collect Crash Data for a Routing Engine Kernel” on page 1086</b>	
1. <a href="#">Check the Routing Engine Core Files on page 1086</a>	<code>file list detail /var/crash</code>
2. <a href="#">Clear the NVRAM Contents on page 1102</a>	
a. <a href="#">List the Core Files on page 1087</a>	<pre>start shell su root password cd /var/crash ls -l</pre>
b. <a href="#">Compress the vmcore File on page 1087</a>	<pre>gzip vmcore.number</pre> <p>To unzip the vmcore file:</p> <pre>gzip -d vmcore.number.gz</pre>
c. <a href="#">Log Software Version Information on page 1090</a>	<code>show version</code>
d. <a href="#">Open a Case with JTAC on page 1089</a>	Send an e-mail to <a href="mailto:support@juniper.net">support@juniper.net</a> .
<b>“Collect Crash Data for Routing Engine Daemons” on page 1091</b>	
1. <a href="#">Check for Daemon Core Files on page 1091</a>	<code>file list detail /var/tmp</code>
2. <a href="#">Collect and Send Routing Engine Crash Data to JTAC on page 1095</a>	
a. <a href="#">List the Daemon Core Files on page 1093</a>	<pre>start shell su root password cd /var/tmp ls -l</pre>
b. <a href="#">Compress the Daemon Core Files on page 1093</a>	<code>gzip daemon-executable-name.core.number</code>
c. <a href="#">Log Software Version Information on page 1090</a>	<code>show version</code>
d. <a href="#">Open a Case with JTAC on page 1089</a>	Send an e-mail to <a href="mailto:support@juniper.net">support@juniper.net</a> .

Table 31: Checklist for Collecting Crash Data (*continued*)

Tasks	Command or Action
<b>“Collect Crash Data for the Packet Forwarding Engine Microkernel” on page 1098</b>	
1. Display the Crash Stack Traceback and Registration Information on page 1099	<b>start shell</b> <b>su</b> <i>root password</i> <b>vtty <i>component-executable-name</i></b> <b>show nvram</b> <b>show syslog messages</b>
2. Clear the NVRAM Contents on page 1102	<b>start shell</b> <b>su</b> <i>root password</i> <b>vtty <i>component-executable-name</i></b> <b>clear nvram</b>
3. Check Packet Forwarding Engine Microkernel Core Files on page 1103	<b>file list detail /var/crash</b>
4. Collect and Send Routing Engine Crash Data to JTAC on page 1095	
a. List the Core Files Generated by the Crash on page 1103	<b>start shell</b> <b>su</b> <i>root password</i> <b>cd /var/crash</b> <b>ls -l</b>
b. Compress the Core Files on page 1104	<b>gzip <i>filename</i></b>
c. Log Software Version Information on page 1090	<b>show version</b>
d. Open a Case with JTAC on page 1089	Send an e-mail to <b>support@juniper.net</b> .

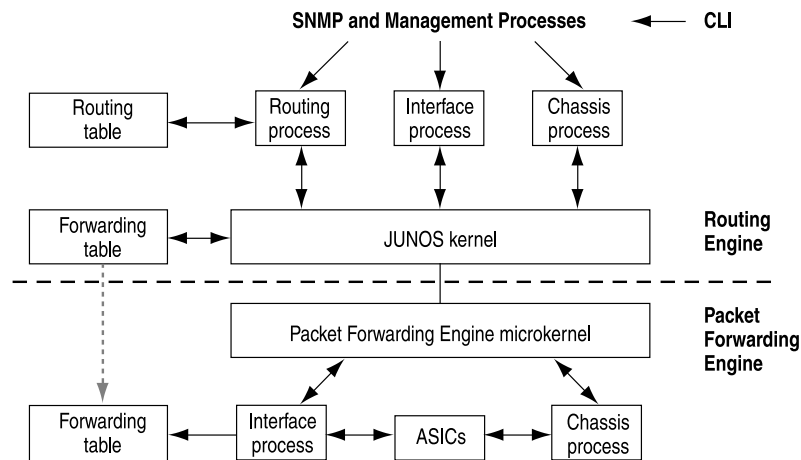

## Understand Crash Data Collection

A crash can occur in one of three areas in the Junos OS architecture (see [Figure 109 on page 1086](#)):

- Routing Engine kernel
- Routing Engine daemons (processes)
- Packet Forwarding Engine microkernel

Figure 109: Three Areas Where a Software Crash Can Occur

## Software Architecture

## Collect Crash Data for a Routing Engine Kernel

**Purpose** When a Routing Engine kernel crashes, the Routing Engine automatically reboots. By default, the Juniper Networks router does not attempt to dump a core if the Routing Engine kernel crashes. As a result, there is no crash data on the router to help investigate the crash. In addition, the system log messages are similar to those generated when the router is powered down and restarted, so you cannot tell if the Routing Engine restart was caused by a kernel crash or a normal power restart.

To collect crash data for a Routing Engine kernel crash, follow these steps:

1. [Check the Routing Engine Core Files on page 1086](#)
2. [List the Core Files on page 1087](#)
3. [Compress the vmcore File on page 1087](#)
4. [Log Software Version Information on page 1088](#)
5. [Open a Case with JTAC on page 1089](#)

## Check the Routing Engine Core Files

**Purpose** If you observe disruption to the Routing Engine kernel, check the `/var/crash` directory for any core files created around the time of the crash.

**Action** To check the `/var/crash` directory, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> file list detail /var/crash
```

## Sample Output

```
user@host> file list detail /var/crash
total 1577912
drwxr-x---  2 root  wheel   512 Sep  9 11:59 ./
drwxr-xr-x 22 root  wheel   512 Oct 29 2001 ../
-rw-r--r--  1 root  wheel    2 Jul 20 01:11 bounds
```

```
-rw-r--r-- 1 root wheel 2166913 Jul 20 01:11 kernel.0
-rw-r--r-- 1 root wheel 5 Feb 15 2002 minfree
-rw----- 1 root wheel 805306368 Jul 20 01:11 vmcore.0
```

**Meaning** The sample output lists the contents of the `/var/crash/` directory. Check the date and timestamp for any kernel core files created around the time of the crash. In the example above, two core files are listed: **kernel.0** and **vmcore.0**.

## List the Core Files

**Purpose** To list the core files, follow these steps:

**Action** 1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is % instead of >, for example:

```
% su
Password: ****
```

3. Change the directory to `/var/crash` and type **ls -l**, for example:

```
root@host% cd /var/crash
root@host% ls -l
```

4. Look for any core files created around the time of the crash.

## Sample Output

```
user@host> start shell
% su
Password: ****
root@host% cd /var/crash
root@host% ls -l
total 1577908
-rw-r--r-- 1 root wheel 2 Jul 20 01:11 bounds
-rw-r--r-- 1 root wheel 2166913 Jul 20 01:11 kernel.0
-rw-r--r-- 1 root wheel 5 Feb 15 2002 minfree
-rw----- 1 root wheel 805306368 Jul 20 01:11 vmcore.0
```

**Meaning** The sample output lists the contents of the `/var/crash` directory and shows the current core files **kernel.0** and **vm.core.0**.

## Compress the vmcore File

**Purpose** The gzip compression utility is used to compress files. Compress the **vmcore** file if it is larger than 50 MB. Files created using the **gzip** command end with the file extension **.gz**.

**NOTE:** Use lowercase for the **gzip** command when you are in the shell.

**Action** To compress the **vmcore** file with gzip, use the following command from the shell:

```
root@host% gzip vmcore .number
```

To unzip the **vmcore** file with gzip, use the following command from the shell:

```
root@host% gzip -d vmcore .number.gz
```

**Meaning** The contents of the **vmcore** file are compressed into a single compressed file named **vmcore.number.gz**. The **gzip** command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

## Log Software Version Information

**Purpose** To log the Junos OS version information.

**Action** To log the Junos OS version information, use the following Junos OS CLI operational mode command:

```
user@host> show version
```

### Sample Output

```
user@host> show version
Hostname: host
Model: m10
JUNOS Base OS boot [5.0R5]
JUNOS Base OS Software Suite [5.0R5]

```

**Meaning** The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

## Open a Case with JTAC

**Problem Description:** To open a case with JTAC, call one of the Support phone numbers or create a case via [Case Manager](#).

## Check the Routing Engine Core Files

**Purpose** If you observe disruption to the Routing Engine kernel, check the `/var/crash` directory for any core files created around the time of the crash.

**Action** To check the `/var/crash` directory, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> file list detail /var/crash
```

## Sample Output

```
user@host> file list detail /var/crash
total 1577912
drwxr-x---  2 root  wheel      512 Sep  9 11:59 ./
drwxr-xr-x 22 root  wheel      512 Oct 29 2001 ../
-rw-r--r--  1 root  wheel        2 Jul 20 01:11 bounds
-rw-r--r--  1 root  wheel    2166913 Jul 20 01:11 kernel.0
-rw-r--r--  1 root  wheel         5 Feb 15 2002 minfree
-rw-----  1 root  wheel   805306368 Jul 20 01:11 vmcore.0
```

**Meaning** The sample output lists the contents of the `/var/crash/` directory. Check the date and timestamp for any kernel core files created around the time of the crash. In the example above, two core files are listed: `kernel.0` and `vmcore.0`.

## List the Core Files

**Purpose** To list the core files, follow these steps:

**Action** 1. Exit from the CLI environment and create a UNIX-level shell by entering the `start shell` command:

```
user@host> start shell
```

2. Type `su` and the root password when prompted. You are now in the shell and the prompt is `%` instead of `>`, for example:

```
% su
Password: ****
```

3. Change the directory to `/var/crash` and type `ls -l`, for example:

```
root@host% cd /var/crash
root@host% ls -l
```

4. Look for any core files created around the time of the crash.

## Sample Output

```
user@host> start shell
% su
Password: ****
root@host% cd /var/crash
root@host% ls -l
total 1577908
-rw-r--r-- 1 root wheel 2 Jul 20 01:11 bounds
-rw-r--r-- 1 root wheel 2166913 Jul 20 01:11 kernel.0
-rw-r--r-- 1 root wheel 5 Feb 15 2002 minfree
-rw----- 1 root wheel 805306368 Jul 20 01:11 vmcore.0
```

**Meaning** The sample output lists the contents of the `/var/crash` directory and shows the current core files `kernel.0` and `vmcore.0`.

---

## Compress the vmcore File

**Purpose** The gzip compression utility is used to compress files. Compress the `vmcore` file if it is larger than 50 MB. Files created using the `gzip` command end with the file extension `.gz`.

**NOTE:** Use lowercase for the `gzip` command when you are in the shell.

**Action** To compress the `vmcore` file with gzip, use the following command from the shell:

```
root@host% gzip vmcore .number
```

To unzip the `vmcore` file with gzip, use the following command from the shell:

```
root@host% gzip -d vmcore .number.gz
```

**Meaning** The contents of the `vmcore` file are compressed into a single compressed file named `vmcore.number.gz`. The `gzip` command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

---

## Log Software Version Information

**Purpose** To log the JUNOS software version information.

**Action** To log the JUNOS software version information, use the following JUNOS CLI operational mode command:

```
user@host> show version
```

**Sample Output**    `user@host> show version`

```

Hostname: host
Model: m10
JUNOS Base OS boot [5.0R5]
JUNOS Base OS Software Suite [5.0R5]
JUNOS Kernel Software Suite [5.0R5]

jdocs-dd release 5.0R5 built by builder on 2002-03-02 04:39:11 UTC

```

**Meaning**    The sample output shows the hostname, router model, and the different JUNOS software packages, processes, and documents.

## Open a Case with JTAC

**Problem**    **Description:** To open a case with JTAC, call one of the Support phone numbers or create a case via [Case Manager](#).

## Collect Crash Data for Routing Engine Daemons

To collect crash data for Routing Engine daemons, follow these steps:

1. [Check for Daemon Core Files on page 1091](#)
2. [List the Daemon Core Files on page 1093](#)
3. [Compress the Daemon Core Files on page 1093](#)
4. [Log Software Version Information on page 1094](#)
5. [Open a Case with JTAC on page 1095](#)

## Check for Daemon Core Files

**Purpose**    If you observe disruption to routing protocol operation, system log operation, Simple Network Management Protocol (SNMP) operation, or other operations handled by

Routing Engine daemons, check the **/var/tmp** directory for any daemon core files created around the time of the crash.

**Action** To check the **/var/tmp** directory, use the following Junos OS CLI operational mode command:

```
user@host> file list detail /var/tmp
```

## Sample Output

```
user@host> file list detail /var/tmp
total 1292622
drwxrwxrwt  3 root  field      512 Dec 31 06:48 ./
drwxr-xr-x 21 root  field      512 Mar  5 1999 ../
-rw-rw----  1 root  field 119713792 Nov 17 21:58 rpd.core.0
-rw-rw----  1 root  field 120782848 Nov 17 22:12 rpd.core.1
```

**Meaning** The sample output lists the contents of the **/var/tmp/** directory. Look for any daemon core files created around the time of the crash. In the example above, two core files are listed: **rpd.core.0** and **rpd.core.1**.

[Table 32 on page 1092](#) lists the major Routing Engine daemons supported by the Junos OS.

**Table 32: Major Routing Engine Daemons**

Executable Name	Definition	Description
rpd	Routing protocol daemon	Provides routing protocol intelligence (Border Gateway Protocol [BGP], Intermediate System-to-Intermediate System [ISIS], Open Shortest Path First [OSPF], and so on).
dcd	Device control daemon	Manages all interface devices.
mgd	Management daemon	Provides user configuration access to the system. The CLI is a client of <b>mgd</b> .
snmpd	Simple Network Management Protocol daemon	Provides remote network management information to the network management system.
chassisd	Chassis daemon	Monitors and manages Flexible PIC Concentrator (FPC) slots and other environmental components.
alarmd	Alarm daemon	Manages system alarm notifications.
apsd	Automatic protection switching daemon	Provides SONET Automatic Protection Switching (APS) functionality.
sampled	Traffic sampling daemon	Gathers traffic sampling information.
vrrpd	Virtual Router Redundancy Protocol daemon	Provides Virtual Router Redundancy Protocol (VRRP) functionality.
syslogd	System log daemon	Manages the router system logging operation.

Table 32: Major Routing Engine Daemons (*continued*)

Executable Name	Definition	Description
mib2d	MIB2 daemon	Management Information Base (MIB) subagent for MIB2.

## List the Daemon Core Files

**Purpose** To list the daemon core files.

**Action** To list the daemon core files, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Change the directory to **/var/tmp** and type **ls -l**, for example:

```
root@host% cd /var/tmp
root@host% ls -l
```

4. Look for any daemon core files created around the time of the crash.

## Sample Output

```
user@host> start shell
% su
Password: ****
root@host% cd /var/tmp
root@host% ls -l
total 1292618
-rw-rw---- 1 root field 119713792 Nov 17 21:58 rpd.core.0
-rw-rw---- 1 root field 120782848 Nov 17 22:12 rpd.core.1
```

**Meaning** The sample output lists the contents of the **/var/tmp** directory and shows the current core file (**rpdc.core.1**) and one previous core file (**rpdc.core.0**) for the routing protocol daemon (**rpdc**). For each daemon, you can have a total of five core files in the **/var/tmp** directory: the current core file and the four previous core files numbered 0 through 4 (from oldest to newest).

## Compress the Daemon Core Files

**Purpose** The gzip compression utility is used to compress the files if they are large. Files created using the **gzip** command end with the file extension **.gz**. Compress the core file if it is over 50 MB.

**NOTE:** Use lowercase for the `gzip` command when you are in the shell.

You only need to compress the daemon core files when the tarball file is not created.

**Action** To compress the daemon core file with `gzip`, use the following command from the shell:

```
root@host% gzip daemon-executable-name.core.number
```

**Sample Output**

```
root@host% gzip rpd.core.0
gzip rpd.core.0
```

**Meaning** The contents of the daemon core file are compressed into a single compressed file named `daemon.number.gz`. The `gzip` command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

## Log Software Version Information

**Purpose** To log the Junos OS version information.

**Action** To log the Junos OS version information, use the following Junos OS CLI operational mode command:

```
user@host> show version
```

**Sample Output**

```

user@host> show version

```

**Meaning** The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

## Open a Case with JTAC

**Problem Description:** To open a case with JTAC, call one of the Support phone numbers or create a case via [Case Manager](#).

## Collect and Send Routing Engine Crash Data to JTAC

**Problem Description:** If a Routing Engine kernel crash occurs on your router, collect the following data for JTAC evaluation and instruction.

**Solution** To collect and send Routing Engine crash data to JTAC, follow these steps:

1. [List the Core Files on page 1087](#)
2. [Compress the vmcore File on page 1087](#)
3. [Log Software Version Information on page 1090](#)
4. [Open a Case with JTAC on page 1089](#)

- Related Documentation**
- [Understand Crash Data Collection on page 1085](#)
  - [Checklist for Collecting Crash Data on page 1084](#)

## Check for Daemon Core Files

**Purpose** If you observe disruption to routing protocol operation, system log operation, Simple Network Management Protocol (SNMP) operation, or other operations handled by Routing Engine daemons, check the **/var/tmp** directory for any daemon core files created around the time of the crash.

**Action** To check the **/var/tmp** directory, use the following Junos OS CLI operational mode command:

```
user@host> file list detail /var/tmp
```

## Sample Output

```
user@host> file list detail /var/tmp
total 1292622
drwxrwxrwt  3 root  field      512 Dec 31 06:48 ./
drwxr-xr-x 21 root  field      512 Mar  5 1999 ../
-rw-rw----  1 root  field 119713792 Nov 17 21:58 rpd.core.0
-rw-rw----  1 root  field 120782848 Nov 17 22:12 rpd.core.1
```

**Meaning** The sample output lists the contents of the **/var/tmp/** directory. Look for any daemon core files created around the time of the crash. In the example above, two core files are listed: **rpdc.core.0** and **rpdc.core.1**.

[Table 32 on page 1092](#) lists the major Routing Engine daemons supported by the Junos OS.

**Table 33: Major Routing Engine Daemons**

Executable Name	Definition	Description
rpdc	Routing protocol daemon	Provides routing protocol intelligence (Border Gateway Protocol [BGP], Intermediate System-to-Intermediate System [ISIS], Open Shortest Path First [OSPF], and so on).
dcd	Device control daemon	Manages all interface devices.
mgd	Management daemon	Provides user configuration access to the system. The CLI is a client of <b>mgd</b> .
snmpd	Simple Network Management Protocol daemon	Provides remote network management information to the network management system.
chassisd	Chassis daemon	Monitors and manages Flexible PIC Concentrator (FPC) slots and other environmental components.
alarmd	Alarm daemon	Manages system alarm notifications.

Table 33: Major Routing Engine Daemons (*continued*)

Executable Name	Definition	Description
apspd	Automatic protection switching daemon	Provides SONET Automatic Protection Switching (APS) functionality.
sampld	Traffic sampling daemon	Gathers traffic sampling information.
vrpd	Virtual Router Redundancy Protocol daemon	Provides Virtual Router Redundancy Protocol (VRRP) functionality.
syslogd	System log daemon	Manages the router system logging operation.
mib2d	MIB2 daemon	Management Information Base (MIB) subagent for MIB2.

## List the Daemon Core Files

**Purpose** To list the daemon core files.

**Action** To list the daemon core files, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Change the directory to **/var/tmp** and type **ls -l**, for example:

```
root@host% cd /var/tmp
root@host% ls -l
```

4. Look for any daemon core files created around the time of the crash.

## Sample Output

```
user@host> start shell
% su
Password: ****
root@host% cd /var/tmp
root@host% ls -l
total 1292618
-rw-rw---- 1 root field 119713792 Nov 17 21:58 rpd.core.0
-rw-rw---- 1 root field 120782848 Nov 17 22:12 rpd.core.1
```

**Meaning** The sample output lists the contents of the **/var/tmp** directory and shows the current core file (**rpdc.core.1**) and one previous core file (**rpdc.core.0**) for the routing protocol daemon (**rpdc**). For each daemon, you can have a total of five core files in the **/var/tmp** directory:

the current core file and the four previous core files numbered 0 through 4 (from oldest to newest).

---

## Compress the Daemon Core Files

**Purpose** The gzip compression utility is used to compress the files if they are large. Files created using the **gzip** command end with the file extension **.gz**. Compress the core file if it is over 50 MB.

**NOTE:** Use lowercase for the **gzip** command when you are in the shell.

You only need to compress the daemon core files when the tarball file is not created.

**Action** To compress the daemon core file with gzip, use the following command from the shell:

```
root@host% gzip daemon-executable-name.core.number
```

**Sample Output** root@host% gzip rpd.core.0  
gzip rpd.core.0

**Meaning** The contents of the daemon core file are compressed into a single compressed file named **daemon.number.gz**. The **gzip** command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

---

## Collect Crash Data for the Packet Forwarding Engine Microkernel

**Purpose** Each of the following Packet Forwarding Engine components of a Juniper Networks router runs a microkernel:

- Flexible PIC Concentrator (FPC) on M-series platforms except for the M5 and M10 Internet routers
- Gibson Flexible PIC Concentrator (GFPC) on T640 and T320 Internet routing nodes
- Switched Printed Mezzanine Board (SPMB) on T640 and T320 Internet routing nodes
- Forwarding Engine Board (FEB) on M5 and M10 Internet routers
- System Switching Board (SSB) on an M20 Internet router
- System Control Board (SCB) on an M40 Internet router
- Switching and Forwarding Module (SFM) on M160 and M40e Internet routers

When a crash occurs, crash stack traceback and registration information is placed into nonvolatile random access memory (NVRAM) on the different components.

[Table 34 on page 1099](#) shows where the NVRAM is located for the components for each router.

**Table 34: NVRAM Location on the Microkernel of the Packet Forwarding Engine Components**

Router Type	NVRAM Location
M5 and M10	FEB
M20	SSB and crash stack traceback and register information for the FPC
M40	SCB and crash stack traceback and register information for the FPC
M40e	FPC SFM
M160	FPC SFM
T320	GFPC SPMB
T640	GFPC SPMB

To collect crash data for the Packet Forwarding Engine microkernel, follow these steps:

1. [Display the Crash Stack Traceback and Registration Information on page 1099](#)
2. [Clear the NVRAM Contents on page 1102](#)
3. [Check Packet Forwarding Engine Microkernel Core Files on page 1103](#)
4. [List the Core Files Generated by the Crash on page 1103](#)
5. [Compress the Core Files on page 1104](#)
6. [Log Software Version Information on page 1104](#)
7. [Open a Case with JTAC on page 1105](#)

## Display the Crash Stack Traceback and Registration Information

**Purpose** To display the crash stack traceback and registration information.

**Action** To display the crash stack traceback and registration information, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:  
  

```
user@host> start shell
```
2. Type **su** and the root password when prompted. You are now in the shell and prompt is **%** instead of **>**, for example:  
  

```
% su
Password: ****
```
3. Establish a vty session to the appropriate component. Use the **vtty** command followed by the executable name for the component; for example, **scb**, **ssb0**, **ssb1**, **fpc0**, or **fpc1**:

```
root@host% vty sfm0
```

**NOTE:** For the M40e and M160 routers, you can also create a cty session to the components if the components are not online.

4. Type the **show nvram** command to view the NVRAM information.
5. Type the **show syslog messages** command to view the system log messages.

## Sample Output 1

```
user@host> start shell
% su
Password: ****
root@host% vty sfm0

FPC1(host vty)# show syslog messages
[0+00:00:00.780 LOG: Info] Version 4.0R5 by tlim on 2000-08-10 04:45:54 UTC
[0+00:00:00.780 LOG: Info] On-board NVRAM contains diagnostic information.
[0+00:00:03.175 LOG: Info] PFEMAN: Established connection to Master
[Jan 30 21:53:05.804 LOG: Info] SNTPD: Initial time of day set.
```

**Meaning** Sample output 1 and 2 show the stack trace from the microkernel crash. Save the output from the **show nvram** and **show syslog** commands so that you can send them to JTAC when you open a case.

## Clear the NVRAM Contents

**Purpose** Currently the storage area for the logs on the NVRAM is limited to 4 KB. You need to delete old NVRAM logs to make room for new ones.

**Action** To clear the content of the NVRAM after you have captured the necessary information, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Establish a vty session to the appropriate component. Use the **vtty** command followed by the abbreviation for the component, for example:

```
root@host% vtty sfm0
SFM3(host vty)#
FPC1(host vty)#
```

4. Type the **clear nvram** command, for example:

```
SFM3(host vty)# clear nvram
FPC1(host vty)# clear nvram
```

## Check Packet Forwarding Engine Microkernel Core Files

**Purpose** If you observe disruption to the Packet Forwarding Engine microkernel, check the **/var/crash** directory for any core files created around the time of the crash.

**Action** To check the **/var/crash** directory, use the following Junos OS CLI operational mode command:

```
user@host> file list detail /var/crash
```

## Sample Output

```
user@host> file list detail /var/crash
var/crash:
total 456630
-rw-r--r--  1 root  wheel   6814720 Dec 18 08:03 core-FPC4.100111808032
-rw-r--r--  1 root  wheel   65613824 Dec 10 04:58 core-SCB.100111004570
-rw-r--r--  1 root  wheel   65613824 Dec 19 00:23 core-SCB.100111900221
-rw-r--r--  1 root  wheel   65545216 Feb  9 20:46 core-SCB.101010920452
```

**Meaning** The sample output lists the contents of the **/var/crash/** directory. Check the date and timestamp for any core files created around the time of the crash. In the example above, four core files are listed.

## List the Core Files Generated by the Crash

**Purpose** To list the core files generated by the crash.

**Action** To list the core files, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Change the directory to **/var/crash** and type **ls -l**, for example:

```
root@host% cd /var/crash
root@host% ls -l
```

4. Look for any core files created around the time of the crash.

**Sample Output**

```
user@host> start shell
% su
Password: ****
root@host% cd /var/crash
root@host% ls -l
total 456630
-rw-r--r--  1 root  wheel   6814720 Dec  18 08:03 core-FPC4.100111808032
-rw-r--r--  1 root  wheel   65613824 Dec  10 04:58 core-SCB.100111004570
-rw-r--r--  1 root  wheel   65613824 Dec  19 00:23 core-SCB.100111900221
-rw-r--r--  1 root  wheel   65545216 Feb  9 20:46 core-SCB.101010920452
```

**Meaning** The sample output shows the current core files for the different components on the router; for example, **core-FPC4.100111808032** and **core-SCB.100111004570**.

## Compress the Core Files

**Purpose** gzip is a compression utility used to compress the core files. Files created using the **gzip** command end with the file extension **.gz**. Compress the core files if they are larger than 50 MB.

**Action** To compress the core files with gzip, use the following command from the shell:

```
root@host% gzip filename
```

**Sample Output**

```
root@host% gzip core-SCB.101010920452
```

**Meaning** The contents of the core file are compressed into a single compressed file named **core-SCB.10101092045.gz**. The **gzip** command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

## Log Software Version Information

**Purpose** To log the Junos OS version information.

**Action** To log the Junos OS version information, use the following Junos OS CLI operational mode command:

```
user@host> show version
```

**Sample Output**

```

user@host> show version
Hostname: host
Model: m10
JUNOS Base OS boot [5.0R5]

```

**Meaning** The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

## Open a Case with JTAC

**Problem Description:** To open a case with JTAC, call one of the Support phone numbers or create a case via [Case Manager](#).

## Display the Crash Stack Traceback and Registration Information

**Purpose** To display the crash stack traceback and registration information.

**Action** To display the crash stack traceback and registration information, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Establish a vty session to the appropriate component. Use the **vtty** command followed by the executable name for the component; for example, **scb**, **ssb0**, **ssb1**, **fpc0**, or **fpc1**:

```
root@host% vty sfm0
```

**NOTE:** For the M40e and M160 routers, you can also create a **cty** session to the components if the components are not online.

4. Type the **show nvram** command to view the NVRAM information.
5. Type the **show syslog messages** command to view the system log messages.

## Sample Output 1

```
user@host> start shell
```

```
% su
```

```
Password: ****
```

```
root@host% vty sfm0

```

## Check Packet Forwarding Engine Microkernel Core Files

**Purpose** If you observe disruption to the Packet Forwarding Engine microkernel, check the **/var/crash** directory for any core files created around the time of the crash.

**Action** To check the **/var/crash** directory, use the following Junos OS CLI operational mode command:

```
user@host> file list detail /var/crash
```

### Sample Output

```
user@host> file list detail /var/crash
var/crash:
total 456630
-rw-r--r--  1 root  wheel   6814720 Dec 18 08:03 core-FPC4.100111808032
-rw-r--r--  1 root  wheel   65613824 Dec 10 04:58 core-SCB.100111004570
-rw-r--r--  1 root  wheel   65613824 Dec 19 00:23 core-SCB.100111900221
-rw-r--r--  1 root  wheel   65545216 Feb  9 20:46 core-SCB.101010920452
```

**Meaning** The sample output lists the contents of the **/var/crash/** directory. Check the date and timestamp for any core files created around the time of the crash. In the example above, four core files are listed.

## List the Core Files Generated by the Crash

**Purpose** To list the core files generated by the crash.

**Action** To list the core files, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Change the directory to `/var/crash` and type `ls -l`, for example:

```
root@host% cd /var/crash
root@host% ls -l
```

4. Look for any core files created around the time of the crash.

**Sample Output**

```
user@host> start shell
% su
Password: ****
root@host% cd /var/crash
root@host% ls -l
total 456630
-rw-r--r--  1 root  wheel   6814720 Dec 18 08:03 core-FPC4.100111808032
-rw-r--r--  1 root  wheel   65613824 Dec 10 04:58 core-SCB.100111004570
-rw-r--r--  1 root  wheel   65613824 Dec 19 00:23 core-SCB.100111900221
-rw-r--r--  1 root  wheel   65545216 Feb  9 20:46 core-SCB.101010920452
```

**Meaning** The sample output shows the current core files for the different components on the router; for example, `core-FPC4.100111808032` and `core-SCB.100111004570`.

---

## Compress the Core Files

**Purpose** `gzip` is a compression utility used to compress the core files. Files created using the `gzip` command end with the file extension `.gz`. Compress the core files if they are larger than 50 MB.

**Action** To compress the core files with `gzip`, use the following command from the shell:

```
root@host% gzip filename
```

**Sample Output**

```
root@host% gzip core-SCB.101010920452
```

**Meaning** The contents of the core file are compressed into a single compressed file named `core-SCB.10101092045.gz`. The `gzip` command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

---

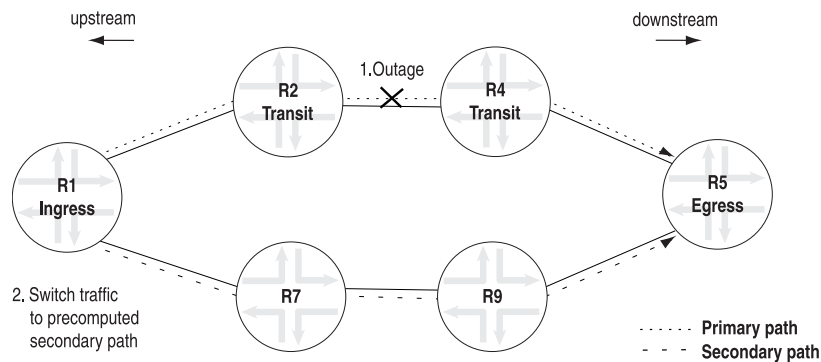

## Path Protection Overview

The main advantages of path protection are control over where the traffic goes after a failure and minimum packet loss when combined with fast reroute (one-to-one backup or link protection). Path protection is the configuration, within a label-switched path (LSP), of two types of paths: a primary path, used in normal operations, and a secondary path used when the primary fails, as shown in [Figure 110 on page 1111](#).

In [Figure 110 on page 1111](#), an MPLS network consisting of eight routers has a primary path between **R1** and **R5** which is protected by the secondary path between **R1** and **R5**. When a failure is detected, such as an interface down event, an Resource Reservation Protocol

(RSVP) error message is sent to the ingress router which switches traffic to the secondary path, maintaining traffic flow.

**Figure 110: Path Protection**

If the secondary path is pre-sigaled or on standby, recovery time from a failure is faster than if the secondary path is not pre-sigaled. When the secondary path is not pre-sigaled a call-setup delay occurs during which the new physical path for the LSP is established, extending the recovery time. If the failure in the primary path is corrected, and after a few minutes of hold time, the ingress router switches traffic back from the secondary path to the primary path.

Because path protection is provided by the ingress router for the entire path, there can be some disadvantages, for example, double-booking of resources and unnecessary protection of links. By protecting a single resource at a time, local protection can remedy these disadvantages.

#### Related Documentation

### Configure a Primary Path

**Action** To configure a primary path with an ERO list, bandwidth, and priority, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols mpls
```

2. Configure the primary ERO list:

```
[edit protocols mpls]
user@host# set path path-name address strict
```

For example:

```
[edit protocols mpls]
user@R1# set path via-r2 10.0.12.14 strict
user@R1# set path via-r2 10.0.24.2 strict
```

3. Configure the LSP:

```
[edit protocols mpls]
```

```
user@host# set label-switched-path lsp-path-name to destination;
```

For example:

```
[edit protocols mpls]  
user@R1# set label-switched-path r1-to-r5 to 192.168.5.1;
```

4. Configure the primary path:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# set primary primary-name
```

For example:

```
[edit protocols mpls label-switched-path r1-to-r5]  
user@R1# set primary via-r2
```

5. Configure the bandwidth:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# set primary primary-name bandwidth bandwidth
```

For example:

```
[edit protocols mpls label-switched-path r1-to-r5]  
user@R1# set primary via-r2 bandwidth 35m
```

6. Configure the priority value:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# set primary primary-name priority reservation-priority setup-priority
```

For example:

```
[edit protocols mpls label-switched-path r1-to-r5]  
user@R1# set primary via-r2 priority 6 6
```

7. Verify and commit the configuration:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# show  
user@host# commit
```

**Sample Output** The sample output below illustrates the configuration of the primary path on ingress router R1.

```
[edit protocols mpls]
user@R1# show
label-switched-path r1-to-r5 {
  to 192.168.5.1;
  primary via-r2 { # Bandwidth and priority configured at the primary path

    bandwidth 35m; # level of the hierarchy
    priority 6 6; # Priority setup and hold values
  }
}
path via-r2 { # Primary ERO list
  10.0.12.14 strict;
  10.0.24.2 strict;
[...Output truncated...]

[edit protocols mpls]
user@R1# commit
commit complete
```

**Meaning** The sample output shows a label-switched path (LSP) with bandwidth and priority applied to only one primary path. The same parameters specified one level up in the hierarchy, at the `[edit protocols mpls label-switched-path lsp-path-name]` hierarchy level, affect all paths.

The path, **via-r2**, specifies the complete strict path from the ingress to the egress routers through **10.0.12.14**, **10.0.24.2**, in that order. There cannot be any intermediate routers except the ones specified. However, there can be intermediate routers between **10.0.24.2** and the egress router because the egress router is not specifically listed in the path statement. To prevent intermediate routers before egress, configure the egress router as the last router, with a strict type.

## Ensuring That Secondary Paths Establish When Resources Are Diminished

The Junos OS does not require that a primary and secondary path share the same parameters. You may decide to configure your primary paths with strict resource requirements, and configure your secondary paths with less strict requirements, allowing your secondary paths to establish more readily during periods of diminished resources.

**Action** To ensure that secondary paths establish when resources are diminished, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit protocols mpls]
user@host# edit label-switched-path lsp-path-name
```

For example:

```
[edit protocols mpls]
user@R1# edit label-switched-path r1-to-r4
```

2. Configure the bandwidth for the primary path, and do not configure any bandwidth for the secondary path:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# set primary primary-name bandwidth bandwidth
```

For example:

```
[edit protocols mpls label-switched-path r1-to-r4]  
user@R1# set primary via-r2 bandwidth 35m
```

3. Verify and commit the configuration:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# show  
user@host# commit
```

**Sample Output** The sample output below illustrates a bandwidth configuration on ingress router R1.

```
[edit protocols mpls]  
user@R1# show  
label-switched-path r1-to-r4 {  
  to 192.168.4.1;  
  primary via-r2 {  
    bandwidth 35m;  
  }  
  secondary via-r7 { # In this example, bandwidth is not configured for the  
    secondary path.  
    standby;        # However you could configure a bandwidth value different  
    from            # that on the primary path.  
  }  
}  
[...Output truncated...]
```

**Meaning** The sample output shows the primary path **via-r2** requires 35 Mbps of bandwidth, while secondary path **via-r7** has no constraints. The primary path is configured with strict resource requirements, while the secondary path is configured with no bandwidth requirements, allowing the secondary path to establish more readily during periods of diminished resources. One thing to keep in mind when configuring a secondary path without bandwidth requirements is that it can be subject to traffic loss due to congestion.

---

## One-to-One Backup Overview

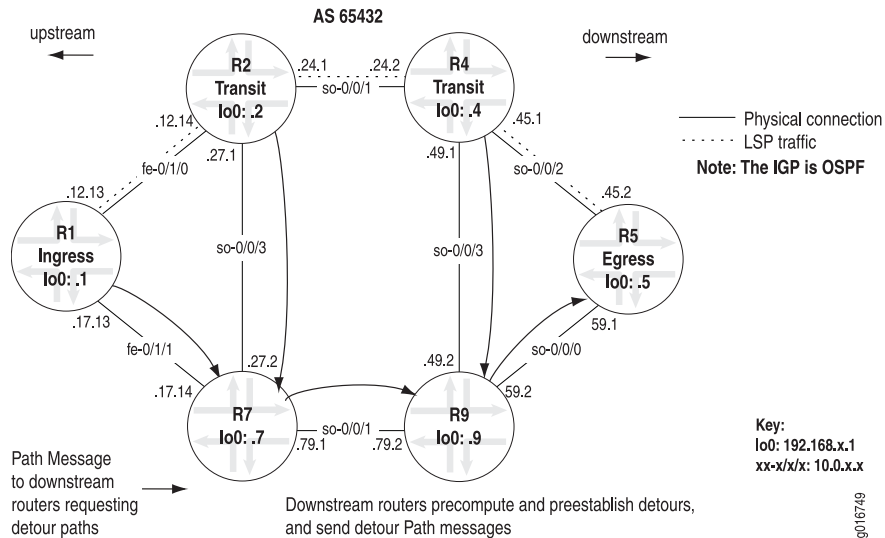

Fast reroute or one-to-one backup is a short-term solution to reduce packet loss associated with a particular LSP. One-to-one backup is appropriate under the following circumstances:

- Protection of a small number of LSPs relative to the total number of LSPs.
- Path selection criteria, such as bandwidth, priority, and link coloring for detour paths is critical.
- Control of individual LSPs is important.

In one-to-one backup, the ingress router adds the fast reroute object to the RSVP Path message requesting that downstream routers establish detours. Downstream routers generate Path messages and establish detours to avoid the downstream link or node. Detours are always calculated to avoid the immediate downstream link and node, providing against both link and node failure, as shown in [Figure 111 on page 1115](#).

**Figure 111: One-to-One Backup Detours**

[Figure 111 on page 1115](#) shows a network with one LSP configured from the ingress router **R1** to the egress router **R5**, transiting **R2** and **R4**. The following detours are established:

- **R1** creates a detour to **R5** via **R7** and **R9**
- **R2** creates a detour to **R5** via **R7** and **R9**
- **R4** creates a detour to **R5** via **R9**

Each detour is dedicated to a particular LSP traversing the router (one detour to one LSP). If the network topology has insufficient links and nodes, it may be impossible to establish a detour. Also, detour paths are not meant for long-term use because they may provide inadequate bandwidth and can result in congestion on the links. As soon as the ingress router calculates a new path avoiding the failure, traffic is redirected along the new path, detours are torn down, and new detours established.

## Configure Link Protection

**Purpose** Configuring link protection is a two-part process. The first part involves configuring link protection on the RSVP interface, and the second part sets link protection for any LSPs traversing the protected link that require use of the bypass path.

**Action** To configure link protection, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit protocols rsvp interface type-fpc/pic/port
```

For example:

```
[edit]
user@R1# edit protocols rsvp interface fe-0/1/0
```

2. Configure link protection for the interface:

```
[edit protocols rsvp interface type-fpc/pic/port]
user@R1# set link-protection
```

3. Verify the link protection configuration for the interface:

```
[edit protocols rsvp interface type-fpc/pic/port]
user@R1# show
```

4. Configure link protection for LSPs requiring use of the bypass path:

```
[edit protocols rsvp interface fe-0/1/0.0]
user@R1# top
[edit]
user@R1# edit protocols mpls label-switched-path lsp-path-name
```

For example:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp2-r1-to-r5
```

5. Configure link protection for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# set link-protection
```

6. Verify and the link protection configuration for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# show
user@R1# commit
```

**Sample Output** The following sample output illustrates the configuration of the link protection on ingress router R1 in the network shown in [Figure 92 on page 909](#):

```
[edit protocols rsvp]
user@R1# show
interface fe-0/1/0.0 {
    link-protection; #Protection for the RSVP interface
}

[edit protocols mpls label-switched-path lsp2-r1-to-r5]
user@R1# up

[edit protocols mpls]
user@R1# show
label-switched-path lsp2-r1-to-r5 { #Path level of the hierarchy
    #to 192.168.5.1;
    link-protection;

[edit protocols mpls]
user@R1# commit
commit complete
```

**Meaning** The sample output shows link protection for a specific interface. After link protection is configured, a bypass path is signaled to avoid that link in case of a failure. Having a bypass path available does not in itself provide protection for LSPs that traverse the protected link. You must configure link protection on the ingress router for each LSP that will benefit from the bypass path.

## Configuring and Verifying Link Protection

The following sections describe the steps you must take to configure and verify link protection (many-to-one backup):

1. [Configure Link Protection on page 1117](#)
2. [Verify That Link Protection Is Up on page 1119](#)

### Configure Link Protection

**Purpose** Configuring link protection is a two-part process. The first part involves configuring link protection on the RSVP interface, and the second part sets link protection for any LSPs traversing the protected link that require use of the bypass path.

**Action** To configure link protection, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit protocols rsvp interface type-fpc/pic/port
```

For example:

```
[edit]
user@R1# edit protocols rsvp interface fe-0/1/0
```

2. Configure link protection for the interface:

```
[edit protocols rsvp interface type-fpc/pic/port]
user@R1# set link-protection
```

3. Verify the link protection configuration for the interface:

```
[edit protocols rsvp interface type-fpc/pic/port]
user@R1# show
```

4. Configure link protection for LSPs requiring use of the bypass path:

```
[edit protocols rsvp interface fe-0/1/0.0]
user@R1# top
[edit]
user@R1# edit protocols mpls label-switched-path lsp-path-name
```

For example:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp2-r1-to-r5
```

5. Configure link protection for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# set link-protection
```

6. Verify and the link protection configuration for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# show
user@R1# commit
```

**Sample Output** The following sample output illustrates the configuration of the link protection on ingress router R1 in the network shown in [Figure 92 on page 909](#):

```
[edit protocols rsvp]
user@R1# show
interface fe-0/1/0.0 {
    link-protection; #Protection for the RSVP interface
}

[edit protocols mpls label-switched-path lsp2-r1-to-r5]
user@R1# up

[edit protocols mpls]
user@R1# show
label-switched-path lsp2-r1-to-r5 { #Path level of the hierarchy
    #to 192.168.5.1;
    link-protection;

[edit protocols mpls]
user@R1# commit
commit complete
```

**Meaning** The sample output shows link protection for a specific interface. After link protection is configured, a bypass path is signaled to avoid that link in case of a failure. Having a bypass path available does not in itself provide protection for LSPs that traverse the protected link. You must configure link protection on the ingress router for each LSP that will benefit from the bypass path.

## Verify That Link Protection Is Up

**Purpose** When you verify link protection, you must check that the bypass LSP is up. You can also check the number of LSPs protected by the bypass. In the network shown in [Figure 92 on page 909](#), a bypass path should be up to protect the link between R1 and R2, or next-hop 10.0.12.14, and the two LSPs traversing the link, `lsp2-r1-to-r5` and `lsp1-r6-to-r0`.

**Action** To verify link protection (many-to-one backup), enter the following Junos OS CLI operational mode commands on the ingress router:

```
user@host> show mpls lsp extensive
user@host> show rsvp session detail
user@host> show rsvp interface
```

## Sample Output

```

```

**Meaning** The sample output from ingress router **R1** shows the ingress, egress, and transit LSPs for **R1**. Some information is similar to that found in the **show mpls lsp** command. However, because link protection is an RSVP feature, information about bypass paths is provided. The bypass path appears as a separate RSVP ingress session for the protected interface, as indicated by the **Type** field.

The bypass path name is automatically generated. By default, the name appears as **Bypass > interface-address**, where the interface address is the next downstream router's interface (**10.0.12.14**). The explicit route **10.0.17.14 10.0.27.1** for the session shows **R7** as the transit node and **R2** as the egress node.

Within the ingress RSVP section of the output, the LSP originating at **R1** (**lsp2-r1-to-r5**) is shown requesting link protection. Since a bypass path is in place to protect the downstream link, **lsp2-r1-to-r5** is associated with the bypass, as indicated by the **Link protected LSP** field.

The egress section of the output shows the return LSP **r5-to-r1**, which is not protected.

The transit section of the output shows link protection requested by **lsp1-r6-to-r0**. Since a bypass path is in place to protect the downstream link, **lsp1-r6-to-r0** is associated with the bypass, as indicated by the **Link protected LSP** field. Also included in the transit section of the output is the return LSP **r0-to-r6**, which is not protected.

**Sample Output** `user@R1> show rsvp interface`

```

RSVP interface: 4 active

```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
fe-0/1/0.0	Up	2	100%	100Mbps	100Mbps	0bps	35Mbps
fe-0/1/1.0	Up	1	100%	100Mbps	100Mbps	0bps	0bps
fe-0/1/2.0	Up	0	100%	100Mbps	100Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

**Meaning** The sample output from ingress router **R1** shows the number of LSPs going through the interfaces configured on **R1**. The **Active resv** field shows the number of LSPs for each interface. For example, interface **fe-0/1/0.0** between **R1** and **R2** has two active reservations, **lsp1-r6-to-r0** and **lsp2-r1-to-r5**; interface **fe-0/1/1.0** between **R1** and **R7** has one, the bypass (**10.0.12.14**); interface **fe-0/1/2.0** between **R6** and **R1** has no LSP reservations; and interface **so-0/0/3.0** between **R6** and **R1** has one LSP reservation, **lsp1-r6-to-r0**.

## Configure Node-Link Protection

Configuring node-link protection is a two-part process. The first part involves configuring node-link protection for any LSPs traversing the protected node that require use of the bypass path, and the second part sets link protection on the outgoing RSVP interface on routers in the LSP.

**Action** To configure node-link protection, follow these steps:

1. In configuration mode, go to the following hierarchy level:  

```

[edit]
user@R1# edit protocols mpls label-switched-path lsp-path-name

```

For example:

```

[edit]
user@R1# edit protocols mpls label-switched-path lsp2-r1-to-r5

```

2. Configure node-link protection for the LSP:  

```

[edit protocols mpls label-switched-path lsp-path-name]
user@R1# set node-link-protection

```
3. Verify the node-link protection configuration for the LSP:  

```

[edit protocols mpls label-switched-path lsp-path-name]
user@R1# show

```

4. Configure link protection for the interface:  

```

[edit protocols]
user@R1# edit protocols rsvp interface interface-name

```

For example:

```

[edit protocols]
user@R1# edit protocols rsvp interface fe-0/1/0

```

5. Configure link protection:

```
[edit protocols rsvp interface interface-name]  
user@R1# set link-protection
```

6. Verify the link protection configuration for the interface, and commit both configurations:

```
[edit protocols rsvp interface interface-name]  
user@R1# show  
user@R1# commit
```

7. Repeat Step 1 through Step 3 on any other ingress routers that have LSPs requiring use of the bypass path.
8. Repeat Step 4 and Step 5 on routers with outgoing interfaces in the LSP.

**Sample Output** The following sample output shows the configuration of node-link protection on ingress router R1 in the network shown in [Figure 92 on page 909](#):

```
[edit protocols mpls label-switched-path lsp2-r1-to-r5]  
user@R1# up  
  
[edit protocols mpls]  
user@R1# show  
label-switched-path lsp2-r1-to-r5 { #Label-switched-path level of the hierarchy  
  
    to 192.168.5.1;  
    node-link-protection; #LSP node-link protection  
  
[edit protocols rsvp]  
user@R1# show  
interface fe-0/1/0.0 {  
    link-protection; #Link protection for the RSVP interface  
}  
  
[edit protocols rsvp]  
user@R1# commit  
commit complete
```

**Meaning** The sample output shows the configuration of node-link protection for an LSP. After node-link protection is configured, bypass paths are signaled to avoid the protected link or node in case of failure. Having bypass paths available does not in itself provide protection for LSPs that traverse the protected node. You must include the **node-link-protection** statement on the ingress router for each LSP that will benefit from the bypass path.

---

## Configuring and Verifying Node-Link Protection

The following section describes the steps you must take to configure and verify many-to-one backup.

1. [Configure Node-Link Protection on page 1125](#)
2. [Verify That Node-Link Protection Is Up on page 1126](#)

## Configure Node-Link Protection

Configuring node-link protection is a two-part process. The first part involves configuring node-link protection for any LSPs traversing the protected node that require use of the bypass path, and the second part sets link protection on the outgoing RSVP interface on routers in the LSP.

**Action** To configure node-link protection, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp-path-name
```

For example:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp2-r1-to-r5
```

2. Configure node-link protection for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# set node-link-protection
```

3. Verify the node-link protection configuration for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# show
```

4. Configure link protection for the interface:

```
[edit protocols]
user@R1# edit protocols rsvp interface interface-name
```

For example:

```
[edit protocols]
user@R1# edit protocols rsvp interface fe-0/1/0
```

5. Configure link protection:

```
[edit protocols rsvp interface interface-name]
user@R1# set link-protection
```

6. Verify the link protection configuration for the interface, and commit both configurations:

```
[edit protocols rsvp interface interface-name]
user@R1# show
user@R1# commit
```

7. Repeat Step 1 through Step 3 on any other ingress routers that have LSPs requiring use of the bypass path.
8. Repeat Step 4 and Step 5 on routers with outgoing interfaces in the LSP.

**Sample Output** The following sample output shows the configuration of node-link protection on ingress router R1 in the network shown in [Figure 92 on page 909](#):

```
[edit protocols mpls label-switched-path lsp2-r1-to-r5]
user@R1# up

[edit protocols mpls]
user@R1# show
label-switched-path lsp2-r1-to-r5 { #Label-switched-path level of the hierarchy

    to 192.168.5.1;
    node-link-protection; #LSP node-link protection

[edit protocols rsvp]
user@R1# show
interface fe-0/1/0.0 {
    link-protection; #Link protection for the RSVP interface
}

[edit protocols rsvp]
user@R1# commit
commit complete
```

**Meaning** The sample output shows the configuration of node-link protection for an LSP. After node-link protection is configured, bypass paths are signaled to avoid the protected link or node in case of failure. Having bypass paths available does not in itself provide protection for LSPs that traverse the protected node. You must include the **node-link-protection** statement on the ingress router for each LSP that will benefit from the bypass path.

## Verify That Node-Link Protection Is Up

**Purpose** After you configure node-link protection, you must check that bypass paths are up. You can also check the number of LSPs protected by the bypass paths. In the network shown in [Figure 91 on page 904](#), two bypass paths should be up: one next-hop bypass path protecting the link between R1 and R2 (or next-hop 10.0.12.14), and a next-next-hop bypass path avoiding R2.

**Action** To verify node-link protection (many-to-one backup), enter the following Junos OS CLI operational mode commands on the ingress router. You can also issue the commands on transit routers and other routers used in the bypass path for slightly different information.

```
show mpls lsp (See Sample Output on page ?)
show mpls lsp extensive (See Sample Output on page 898)
show rsvp interface (See Sample Output on page 899)
show rsvp interface extensive (See Sample Output on page 900)
show rsvp session detail (See Sample Output on page 901)
```

## Sample Output

```
user@R1> show mpls lsp
Ingress LSP: 1 sessions
```

To	From	State	Rt	ActivePath	P	LSPname
----	------	-------	----	------------	---	---------

```

192.168.5.1    192.168.1.1    Up    0 via-r2          *    lsp2-r1-to-r5
Total 1 displayed, Up 1 , Down 0

```

#### Egress LSP: 1 sessions

To	From	State	Rt	Style	Labelin	Labelout	LSPName
192.168.1.1	192.168.5.1	Up	0	1 FF	3		- r5-to-r1

Total 1 displayed, Up 1 , Down 0

#### Transit LSP: 2 sessions

To	From	State	Rt	Style	Labelin	Labelout	LSPName
192.168.0.1	192.168.6.1	Up	0	1 FF	100464	101952	lsp1-r6-to-r0
192.168.6.1	192.168.0.1	Up	0	1 FF	100448	3	r0-to-t6

Total 2 displayed, Up 2, Down 0

**Meaning** Sample output from **R1** for the **show mpls lsp** command shows a brief description of the state of configured and active LSPs for which **R1** is the ingress, transit, and egress router. All LSPs are up. **R1** is the ingress router for **lsp2-r1-to-r5**, and the egress router for return LSP **r5-to-r1**. Two LSPs transit **R1**, **lsp1-r6-to-r0** and the return LSP **r0-to-t6**. For more detailed information about the LSP, include the **extensive** option when you issue the **show mpls lsp** command.

```

```

**Meaning** Sample output from R1 for the **show mpls lsp extensive** command shows detailed information about all LSPs for which R1 is the ingress, egress, or transit router, including all past state history and the reason why an LSP failed. All LSPs are up. The main two LSPs **lsp2-r1-to-r5** and **lsp1-r6-to-r0** have node-link protection as indicated by the **Node/Link protection desired** field in the ingress and transit sections of the output. In the ingress section of the output, the **Link-protection Up** field shows that **lsp2-r1-to-r5** has link protection up. In the transit section of the output, the **Type: Node/Link protected LSP** field shows that **lsp1-r6-to-r0** has node-link protection up, and in case of failure will use the bypass **LSP Bypass->10.0.12.14->10.0.24.2**.

**Sample Output**

```

user@R1> show rsvp interface
RSVP interface: 4 active

```

Interface	State	Active resv	Subscr-ption	Static BW	Available BW	Reserved BW	Highwater mark
fe-0/1/0.0	Up	2	100%	100Mbps	100Mbps	0bps	0bps
fe-0/1/1.0	Up	1	100%	100Mbps	100Mbps	0bps	0bps
fe-0/1/2.0	Up	0	100%	100Mbps	100Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

**Meaning** Sample output from R1 for the **show rsvp interface** command shows four interfaces enabled with RSVP (**Up**). Interface **fe-0/1/0.0** has two active RSVP reservations (**Active resv**) that might indicate sessions for the two main LSPs, **lsp1-r6-to-r0** and **lsp2-r1-to-r5**. Interface **fe-0/1/0.0** is the connecting interface between R1 and R2, and both LSPs are configured with a strict path through **fe-0/1/0.0**. For more detailed information about what is happening on interface **fe-0/1/0.0**, issue the **show rsvp interface extensive** command.

**Sample Output**

```

user@R1> show rsvp interface extensive
RSVP interface: 3 active
fe-0/1/0.0 Index 67, State Ena/Up
  NoAuthentication, NoAggregate, NoReliable, LinkProtection
  HelloInterval 9(second)

    2 Jul 14 14:50:04 CSPF: computation result accepted
    1 Jul 14 14:49:34 CSPF failed: no route toward 10.0.24.2
[...Output truncated...]

```

**Meaning** Sample output from R1 for the **show rsvp interface extensive** command shows more detailed information about the activity on all RSVP interfaces (3). However, only output for **fe-0/1/0.0** is shown. Protection is enabled (**Protection: On**), with two bypass paths (**Bypass: 2**) protecting two LSPs (**Protected LSP: 2**). All LSPs are protected, as indicated by the **Unprotected LSP: 0** field. The first bypass **Bypass->10.0.12.14** is a link protection bypass path (**Type: LP**), protecting the link between R1 and R2 **fe-0/1/0.0**. The second bypass path **10.0.12.14->10.0.24.2** is a node-link protected LSP, avoiding R2 in case of node failure.

```

**Meaning** Sample output from **R1** shows detailed information about the RSVP sessions active on **R1**. All sessions are up, with two ingress sessions, one egress session, and two transit sessions.

Within the ingress section, the first session is a bypass path, as indicated by the **Type: Bypass LSP** field; and the second session is a protected LSP (**lsp2-r1-to-r5**) originating on **R1**, as indicated by the **Type: Node/Link protected LSP** field.

**Conclusion** Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection and node-link protection are facility-based methods used to reduce the amount of time needed to reroute LSP traffic. These protection methods are often compared to fast reroute—the other Junos OS LSP protection method.

While fast reroute protects LSPs on a one-to-one basis, link protection and node-link protection protect multiple LSPs by using a single, logical bypass LSP. Link protection provides robust backup support for a link, node-link protection bypasses a node or a link, and both types of protection are designed to interoperate with other vendor equipment.

Such functionality makes link protection and node-link protection excellent choices for scalability, redundancy, and performance in MPLS-enabled networks.

## Configure IS-IS as the IGP

Before you can run MPLS on your network, you should have an IGP running on all specified routers and interfaces. The IGP can be either IS-IS or OSPF. For the steps to configure OSPF, see “[Configure OSPF as the IGP](#)” on page 1140.

Figure 112: IS-IS Network Topology

The IS-IS IGP in the MPLS network in [Figure 112 on page 1133](#) consists of the following:

- All routers are configured for Level 2, therefore default CSPF LSPs can occur.
- All routers are in IS-IS area 49.0004. However, the routers in this network could be in any area because Level 2 adjacencies occur between all directly connected Level 2 routers regardless of which area they are in.
- Level 2 adjacencies between all directly connected Level 2 routers as follows:

- R1 is adjacent to R2, R3, and R5
- R2 is adjacent to R1, R3, R4, and R6
- R3 is adjacent to R1, R2, R4, and R6
- R4 is adjacent to R2, R3, R5, and R6
- R5 is adjacent to R1, R4, and R6
- R6 is adjacent to R2, R3, R4, and R5

When you configure IS-IS as the IGP, you must enable IS-IS on the router, configure International Organization for Standardization (ISO) addressing, and enable IS-IS on all router interfaces.

You can enable IS-IS throughout the rest of the network by repeating Step 1, “[Enable IS-IS on Routers in Your Network](#)” on page 1134 through Step 3, “[Enable IS-IS on Router Interfaces](#)” on page 1137 as appropriate on other routers until all routers and interfaces establish IS-IS adjacencies.

To configure IS-IS and establish IS-IS adjacencies, follow these steps:

1. [Enable IS-IS on Routers in Your Network](#) on page 1134
2. [Configure ISO Addressing](#) on page 1136
3. [Enable IS-IS on Router Interfaces](#) on page 1137
4. [Verify That IS-IS Adjacencies Are Established](#) on page 1138

## Enable IS-IS on Routers in Your Network

**Action** To enable IS-IS on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:  

```
[edit]  
user@host# edit protocols isis
```
2. Disable Level 1 if appropriate for your network:  

```
[edit protocols isis]  
user@host# set level 1 disable
```
3. Configure the interface:  

```
[edit protocols isis]  
user@host# edit interface type-fpc/pic/port level level-number metric metric
```
4. Disable the management interface if you have included the **interface all** statement, as shown in [Sample Output 2 on page 1135](#):  

```
[edit protocols isis]  
user@host# set interface fxp0.0 disable
```
5. Include the loopback interface (**lo0**) if you have listed all interfaces separately, as shown in [Sample Output 1 on page 1135](#):  

```
[edit protocols isis]  
user@host# set interface lo0.0
```

6. Set the loopback interface (lo0) to passive:

```
[edit protocols isis]
user@R1# set interface lo0 passive
```

7. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

### Sample Output 1

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit protocols isis

[edit protocols isis]
user@R1# set level 1 disable

[edit protocols isis]
user@host# edit interface all level 2 metric 10

[edit protocols isis]
user@host# set interface lo0.0

[edit protocols isis]
user@host# set interface lo0 passive

[edit protocols isis]
user@R1# show
level 1 disable;
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface lo0.0;
    passive;
}

[edit protocols isis]
user@R1# commit
commit complete
```

### Sample Output 2

```
[edit protocols isis]
user@R6# show
level 1 disable;
interface all {
    level 2 metric 15;
}
interface fxp0.0 {
    disable;
}
interface lo0.0 {
    passive;
}
```

**Meaning** Sample Output 1 shows that IS-IS Level 1 is disabled, making this a Level 2 router. When all routers in the network are running at one IS-IS level (Level 2), default CSPF LSPs can occur.

Because **R1** in Sample Output 1 has all IS-IS enabled interfaces listed, including the loopback interface (**lo0**), you do not need to include the **disable** statement for the management interface (**fxp0**). All interfaces have unit number **0**, the default if a unit number is not specified. When you configure an interface at the **[edit protocols isis]** hierarchy level, and you do not include the logical unit, the default **0** is appended to the interface name, for example, **so-0/0/1.0**.

Sample Output 2 does not list the interfaces configured with IS-IS; instead, all interfaces are configured, including the loopback interface (**lo0**) and the management interface (**fxp0**). Therefore, you do not need to include a separate statement for the loopback (**lo0**) interface. However, in this instance, it is best practice to disable the management interface (**fxp0**) so that IS-IS packets are not sent over it. If you do not disable the management interface (**fxp0**) when you include the **interface-all** statement, the IS-IS protocol can form adjacencies over the management backbone, but traffic does not flow because transit traffic does not go out of the management interface.

Sample Output 2 also shows that all interfaces on **R6** are configured with a metric of **15**. A metric is not required to configure IS-IS on your interfaces. The default metric value is **10** (with the exception of the loopback [**lo0**] interface, which has a default metric of **0**). A metric is included to demonstrate that you can configure a metric for IS-IS if the default (**10**) is not appropriate for your network.

Both sample outputs show the **passive** statement included in the configuration of the loopback (**lo0**) interface. Including the **passive** statement is considered best practice and ensures the following:

- Protocols are not run over the loopback (**lo0**) interface
- When the router ID (RID) is configured manually, ensures that the loopback (**lo0**) interface is advertised to other networks.

**NOTE:** It is considered best practice to configure the RID manually to avoid duplicate RID problems.

---

## Configure ISO Addressing

**Purpose** For a router to support IS-IS, you must configure an ISO network entity title (NET) address on one of the router's interfaces, preferably the loopback interface (**lo0**).

**Action** To configure ISO addressing, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Include a NET address for the loopback interface:

```
[edit interfaces]
user@host# set lo0 unit number family iso address address
```

3. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

### Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit interfaces

[edit interfaces]
user@R1# set lo0 unit 0 family iso address 49.0004.1000.0000.0001.00

[edit interfaces]
user@R1# show
[...Output truncated...]
lo0 {
    unit 0 {
        family inet {
            address 10.0.0.1/32;
        }
        family iso {
            address 49.0004.1000.0000.0001.00;
        }
    }
}

[edit interfaces]
user@R1# commit
commit complete
```

**Meaning** The sample output shows that the loopback (**lo0**) interface is configured with the NET address **49.0004.1000.0000.0001.00**. The loopback interface (**lo0**) becomes a point of connection from the router to the IS-IS network. Every router in an IS-IS network must have at least one ISO NET address that identifies a point of connection to the IS-IS network. The NET address is generally configured on the loopback (**lo0**) interface. Routers that participate in multiple areas can have multiple NET addresses.

All the routers in the network share a Level 2 database containing identical information. A common Level 2 database occurs in this case because all adjacencies are Level 2, and all routers are within the same IS-IS area (**49.0004**). Level 2 LSP flooding reaches all routers in the network due to the presence of a single level. For more information on determining the NET address, see the *Junos Routing Protocols Configuration Guide*.

### Enable IS-IS on Router Interfaces

**Purpose** Enable reception and transmission of ISO protocol data units (PDUs) on each router interface in the network with the **family** statement, which identifies which protocol packets

are accepted into the interfaces. For example, valid IS-IS packets are dropped if the interface is not configured with the **family iso** statement.

**Action** To configure support for IS-IS on router interfaces in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure IS-IS:

```
[edit interfaces]
user@host# set type-fpc/pic/port unit number family iso
```

3. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

### Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit interfaces

[edit interfaces]
user@R1# set so-0/0/2 unit 0 family iso

[edit interfaces]
user@R1# show
[...Output truncated...]
so-0/0/2 {
  unit 0 {
    family inet {
      address 10.1.13.1/30;
    }
    family iso;
  }
}

[edit interfaces]
user@R1# commit
commit complete
```

**Meaning** The sample output shows that the interface **so-0/0/2** is configured with IS-IS.

### Verify That IS-IS Adjacencies Are Established

**Purpose** After configuring IS-IS, you must verify that neighboring routers have formed adjacencies with each other.

**Action** To verify IS-IS adjacencies, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show isis adjacency
```

## Sample Output

```
user@R1> show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
so-0/0/0.0	R2	2 Up	25	
so-0/0/1.0	R5	2 Up	23	
so-0/0/2.0	R3	2 Up	20	

```
user@R3> show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
so-0/0/0.0	R4	2 Up	25	
so-0/0/1.0	R2	2 Up	25	
so-0/0/2.0	R1	2 Up	26	
so-0/0/3.0	R6	2 Up	25	

```
user@R6> show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
so-0/0/0.0	R5	2 Up	19	
so-0/0/1.0	R4	2 Up	22	
so-0/0/2.0	R2	2 Up	22	
so-0/0/3.0	R3	2 Up	19	

## Sample Output

```
user@R1> show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
so-0/0/0.0	R2	2 Up	25	
so-0/0/1.0	R5	2 Up	23	
so-0/0/2.0	R3	2 Up	20	

```
user@R3> show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
so-0/0/0.0	R4	2 Up	25	
so-0/0/1.0	R2	2 Up	25	
so-0/0/2.0	R1	2 Up	26	
so-0/0/3.0	R6	2 Up	25	

```
user@R6> show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
so-0/0/0.0	R5	2 Up	19	
so-0/0/1.0	R4	2 Up	22	
so-0/0/2.0	R2	2 Up	22	
so-0/0/3.0	R3	2 Up	19	

**Meaning** The sample output from the ingress, transit, and egress routers shows that all routers in the network have formed IS-IS adjacencies.

## Verify That IS-IS Adjacencies Are Established

**Purpose** After configuring IS-IS, you must verify that neighboring routers have formed adjacencies with each other.

**Action** To verify IS-IS adjacencies, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show isis adjacency
```

## Sample Output

```
user@R1> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R2           2 Up         25
so-0/0/1.0     R5           2 Up         23
so-0/0/2.0     R3           2 Up         20
```

```
user@R3> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R4           2 Up         25
so-0/0/1.0     R2           2 Up         25
so-0/0/2.0     R1           2 Up         26
so-0/0/3.0     R6           2 Up         25
```

```
user@R6> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R5           2 Up         19
so-0/0/1.0     R4           2 Up         22
so-0/0/2.0     R2           2 Up         22
so-0/0/3.0     R3           2 Up         19
```

## Sample Output

```
user@R1> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R2           2 Up         25
so-0/0/1.0     R5           2 Up         23
so-0/0/2.0     R3           2 Up         20
```

```
user@R3> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R4           2 Up         25
so-0/0/1.0     R2           2 Up         25
so-0/0/2.0     R1           2 Up         26
so-0/0/3.0     R6           2 Up         25
```

```
user@R6> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R5           2 Up         19
so-0/0/1.0     R4           2 Up         22
so-0/0/2.0     R2           2 Up         22
so-0/0/3.0     R3           2 Up         19
```

**Meaning** The sample output from the ingress, transit, and egress routers shows that all routers in the network have formed IS-IS adjacencies.

---

## Configure OSPF as the IGP

Before you can run MPLS on your network, you must have an IGP running on all specified routers and interfaces. The IGP can be either OSPF or IS-IS. For the steps to configure IS-IS, see [“Configure IS-IS as the IGP” on page 1133](#).

Figure 113: OSPF Network Topology

The OSPF IGP in the MPLS network in [Figure 112 on page 1133](#) consists of the following:

- All routers are configured for the backbone OSPF area 0.0.0.0.
- All routers have the RID manually configured to avoid possible problems when the OSPF RID changes; for example, when multiple loopback addresses are configured.
- All routers have traffic engineering enabled. When traffic engineering is enabled for OSPF, the SPF algorithm takes into account the various LSPs configured under MPLS and configures OSPF to generate link-state advertisements (LSAs) that carry traffic engineering parameters. These routes are installed into the primary routing table **inet.0**, but the LSPs are installed by default into the **inet.3** routing table.
- Adjacencies between all OSPF neighbors are as follows:
  - R1 is adjacent to R2, R3, and R5
  - R2 is adjacent to R1, R3, R4, and R6
  - R3 is adjacent to R1, R2, R4, and R6
  - R4 is adjacent to R2, R3, R5, and R6
  - R5 is adjacent to R1, R4, and R6
  - R6 is adjacent to R2, R3, R4, and R5

When you configure OSPF as the IGP, you must enable OSPF and traffic engineering on the router. We also recommend that you manually configure the RID and include the loopback interface (**lo0**) at the **[edit protocols ospf]** hierarchy level.

You can enable OSPF throughout the rest of the network by repeating this step as appropriate on other routers until all routers and interfaces establish OSPF neighbors.

To configure OSPF and establish OSPF neighbors, follow these steps:

1. [Enable OSPF on Routers in Your Network on page 1142](#)
2. [Verify That OSPF Neighbors Are Established on page 1144](#)

## Enable OSPF on Routers in Your Network

**Action** To enable OSPF on routers in your MPLS network, follow these steps:

1. In configuration mode, go to the following hierarchy level:  

```
[edit]
user@host# edit protocols ospf
```
2. Configure the area and the interface:  

```
[edit protocols ospf]
user@host# set area area-id interface type-fpc/pic/port
```
3. Disable the management interface if you have included the **interface all** statement in the previous step:  

```
[edit protocols ospf]
user@host# set interface fxp0.0 disable
```
4. Include the loopback (lo0) interface if you intend to manually configure the RID:  

```
[edit protocols ospf]
user@host# set area 0.0.0.0 interface lo0
```
5. Set the loopback interface (lo0) to passive:  

```
[edit protocols ospf]
user@host# set area 0.0.0.0 interface lo0 passive
```
6. Configure traffic engineering:  

```
[edit protocols ospf]
user@host# set traffic-engineering
```
7. Manually configure the RID at the [**routing-options**] hierarchy level:  

```
[edit]
user@host# edit routing-options
[edit routing-options]
user@host# set router-id router-id
```
8. Verify and commit the entire configuration:  

```
user@host# show
user@host# commit
```

## Sample Output

```
user@R6> edit
Entering configuration mode

[edit]
```

```

user@R6# edit protocols ospf

[edit protocols ospf]
user@R6# set area 0.0.0.0 interface so-0/0/0.0

[edit protocols ospf]
user@R6# set area 0.0.0.0 interface lo0

[edit protocols ospf]
user@R6# set area 0.0.0.0 interface lo0 passive

[edit protocols ospf]
user@R6# set traffic-engineering

[edit protocols ospf]
user@R6# show
traffic-engineering;
area 0.0.0.0 {
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;
    interface so-0/0/3.0;
    interface lo0.0 {
        passive;
    }
}

user@R6# commit
commit complete

```

**Meaning** The sample output shows that OSPF, with traffic engineering, is enabled on the interfaces on egress router **R6**. In addition, the RID is configured manually to avoid possible problems when the OSPF RID changes; for example, when multiple loopback addresses are configured. The RID uniquely identifies the router within the OSPF network. It is transmitted within the LSAs used to populate the link-state database and calculate the shortest-path tree. In a link-state network, it is important that two routers do not share the same RID value, otherwise IP routing problems may occur.

The sample outputs also shows the **passive** statement included in the configuration of the loopback (**lo0**) interface. Including the **passive** statement is considered best practice and ensures the following:

- Protocols are not run over the loopback (**lo0**) interface
- When the router ID (RID) is configured manually, ensures that the loopback (**lo0**) interface is advertised to other networks.

## Verify That OSPF Neighbors Are Established

**Purpose** After configuring OSPF, you must verify that neighboring routers have formed adjacencies with each other.

**Action** To verify OSPF neighbors, enter the following Junos OS CLI operational mode command:

```
user@host> show ospf neighbor
```

## Sample Output

```
user@R1> show ospf neighbor
  Address      Interface      State      ID           Pri    Dead
  10.1.12.2     so-0/0/0.0     Full      10.0.0.2     128    37
  10.1.15.2     so-0/0/1.0     Full      10.0.0.5     128    35
  10.1.13.2     so-0/0/2.0     Full      10.0.0.3     128    38
```

```
user@R3> show ospf neighbor
  Address      Interface      State      ID           Pri    Dead
  10.1.34.2     so-0/0/0.0     Full      10.0.0.4     128    38
  10.1.23.1     so-0/0/1.0     Full      10.0.0.2     128    35
  10.1.13.1     so-0/0/2.0     Full      10.0.0.1     128    37
  10.1.36.2     so-0/0/3.0     Full      10.0.0.6     128    36
```

```
user@R6> show ospf neighbor
  Address      Interface      State      ID           Pri    Dead
  10.1.56.1     so-0/0/0.0     Full      10.0.0.5     128    39
  10.1.46.1     so-0/0/1.0     Full      10.0.0.4     128    37
  10.1.26.1     so-0/0/2.0     Full      10.0.0.2     128    36
  10.1.36.1     so-0/0/3.0     Full      10.0.0.3     128    37
```

**Meaning** The sample output from the ingress, transit, and egress routers shows that all routers in the network have formed OSPF neighbor adjacencies.

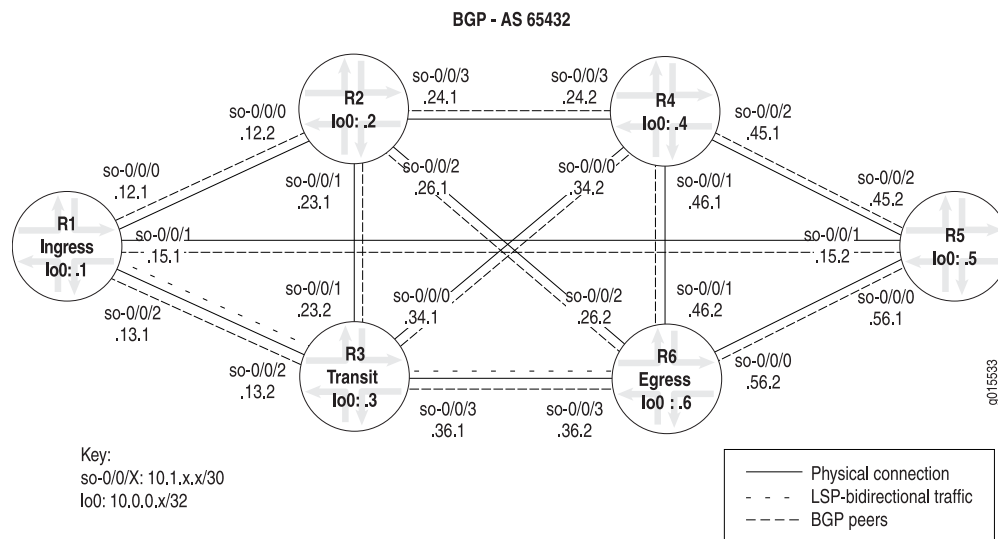

---

## Set Up BGP on Routers in Your Network

Before BGP can function in your MPLS network, you must define the autonomous system (AS) number on the routers in your network, and configure at least one group that includes at least one peer.

Optionally, you can configure a routing policy. The routing policy allows you to control the information shared with BGP neighbors and provides the opportunity to filter and modify the information you receive.

Figure 114: BGP Network Topology

The BGP configuration in the MPLS network in [Figure 114 on page 1145](#) consists of the following:

- A full-mesh IBGP topology, using AS 65432.
- All IBGP sessions peer between loopback addresses because significant stability advantages are gained.
- All routers are configured with one group, **group internal**.
- A **send-statics** policy on routers R1 and R6 allows a new route to be advertised into the network.

The example network uses IS-IS Level 2 and a policy to create routes that are reachable through the LSP. However, IS-IS Level 1 or an OSPF area can be used and the policy omitted if the network has existing BGP traffic.

You can set up BGP throughout the rest of the network by repeating Step 1, “[Define the Local Autonomous System on page 1145](#)” through Step 3, “[Configure a Simple Routing Policy on page 1148](#)” as appropriate on other routers until all routers are set up with BGP.

To set up BGP on routers in your network, follow these steps:

1. [Define the Local Autonomous System on page 1145](#)
2. [Configure BGP Neighbor Connections on page 1146](#)
3. [Configure a Simple Routing Policy on page 1148](#)
4. [Verify That BGP Sessions Are Up on page 1149](#)

## Define the Local Autonomous System

**Purpose** Before BGP can function, you need to define a local AS number on the routers in your network. In the example network in [Figure 114 on page 1145](#), all routers are in AS 65432.

**Action** To define an AS number on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit routing-options
```

2. Configure all interfaces to a specific AS:

```
[edit routing-options]
user@host# set autonomous-system as-number
```

3. Verify the configuration:

```
user@host# show
user@host# commit
```

### Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit routing-options

[edit routing-options]
user@R1# set autonomous-system 65432

[edit routing-options]
user@R1# show
[...Output truncated...]
autonomous-system 65432;

[edit routing-options]
user@R6# commit
commit complete
```

**Meaning** The output shows that router R1 resides in AS 65432. All other routers in the example network shown in [Figure 114 on page 1145](#) also reside in AS 65432.

## Configure BGP Neighbor Connections

**Purpose** You must configure at least one group that includes at least one peer for BGP to run in your network. First determine which neighbors are internal or external to your local AS boundary. Internal neighbors are inside your local AS boundary. In the example network shown in [Figure 114 on page 1145](#), all the routers are in one AS and are therefore internal. In this example, all IBGP sessions peer between loopback addresses because significant stability advantages are gained. For more information about configuring BGP neighbor connections, see the *Junos Routing Protocols Configuration Guide*.

**Action** To configure BGP neighbor connections, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols bgp
```

2. Configure the group and peer's IP address:

```
[edit protocols bgp]
user@host# set group group-name type type neighbor neighbor-address
```

**NOTE:** For external neighbors, use the following form of the command that includes the peer's AS number:

```
user@host# set group group-name neighbor neighbor-address peer-as
peer-as-number
```

3. Configure the local address:

```
[edit protocols bgp]
user@host# set group group-name local-address local-address
```

4. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

### Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit protocols bgp

[edit protocols bgp]
user@R1# set group internal type internal neighbor 10.0.0.2

[edit protocols bgp]
users@R1# set group internal local-address 10.0.0.1

[edit protocols bgp]
user@R1# show
group internal {
    type internal;
    local-address 10.0.0.1;
    neighbor 10.0.0.2;
    neighbor 10.0.0.3;
    neighbor 10.0.0.5;
    neighbor 10.0.0.4;
    neighbor 10.0.0.6;
}

[edit protocols bgp]
user@R1# commit
commit complete
```

**Meaning** The sample output shows that router **R1** is in an internal group with five BGP neighbors. The **local-address** statement is included in this example configuration because IBGP is used. It is considered best practice to configure a local address when you use an IBGP. BGP messages are sourced from the loopback address because the **local-address**

statement is included in the configuration. Generally, you would not configure a local address when external BGP is configured.

## Configure a Simple Routing Policy

**Purpose** Routing policy allows you to control the information shared with BGP neighbors and provides the opportunity to filter and modify the information you receive. Typically, a network is injected into BGP using a policy. This may also be done through a static route. In the network in [Figure 114 on page 1145](#), a static route export policy is used to inject routes into BGP.

**Action** To configure a simple routing policy, follow these steps:

1. In configuration mode, go to the following hierarchy level:  

```
[edit]
user@host# edit routing-options
```
2. Configure a static route for redistribution to other autonomous systems:  

```
[edit routing-options]
user@host# set static route destination/24 reject
```
3. Configure a routing policy that matches and accepts the configured static routes into BGP updates:  

```
[edit]
user@host# edit policy-options
[edit policy-options]
user@host# set policy-statement policy-name term term-name from route-filter
address exact
user@host# set policy-statement policy-name term term-name then accept
```
4. Apply the policy created in Step 3 to all BGP neighbors:  

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# set export policy-name
```
5. Verify and commit the configuration:  

```
user@host# show
user@host# commit
```

## Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit routing-options

[edit routing-options]
user@R1# set static route 100.100.1.0/24 reject

[edit routing-options]
user@R1# show
```

```

[...Output truncated...]
    route 100.100.1.0/24 reject;
}
router-id 10.0.0.1;
autonomous-system 65432;

[edit routing-options]
user@R1# top

[edit]
user@R1# edit policy-options

[edit policy-options]
user@R1# set policy-statement send-statics term statics from route-filter 100.100.1.0/24 exact

[edit policy-options]
user@R1# set policy-statement send-statics term statics then accept

[edit policy-options]
user@R1# top

[edit]
user@R1# edit protocols bgp

[edit protocols bgp]
user@R1# set export send-statics

[edit protocols bgp]
user@R1# show
export send-statics;
group internal {
    type internal;
    local-address 10.0.0.1;
    neighbor 10.0.0.2;
    neighbor 10.0.0.3;
    neighbor 10.0.0.5;
    neighbor 10.0.0.4;
    neighbor 10.0.0.6;
}

[edit protocols bgp]
user@R1# commit
commit complete

```

**Meaning** The sample output shows that routing policy **send-statics** is configured on the router. The routing policy matches and accepts the configured static routes into the routing table and injects the routes into BGP updates. Typically, a routing policy is applied at the group level, although it can be applied at the global level, as shown in this example.

## Verify That BGP Sessions Are Up

**Purpose** After configuring BGP, you must verify that BGP peers are established and the sessions are up.

**Action** To verify BGP peers and sessions, enter the following Junos OS CLI operational mode command:

```
user@host> show bgp summary
```

## Sample Output

user@R1> show bgp summary

Groups: 1 Peers: 5 Down peers: 0

Table	Tot Paths	Act Paths	Suppressed	History	Damp	State	Pending
inet.0	1	1	0	0	0	0	0
Peer	AS	InPkt	OutPkt	OutQ	Flaps	Last Up/Dwn	State #Active/Received/Damped...
10.0.0.2	65432	1369	1373	0	0	11:25:11	0/0/0 0/0/0
10.0.0.3	65432	1369	1372	0	0	11:24:55	0/0/0 0/0/0
10.0.0.4	65432	1369	1372	0	0	11:25:03	0/0/0 0/0/0
10.0.0.5	65432	1369	1372	0	0	11:25:07	0/0/0 0/0/0
10.0.0.6	65432	1343	1344	0	1	11:10:55	1/1/0 0/0/0

user@R3> show bgp summary

Groups: 1 Peers: 4 Down peers: 0

Table	Tot Paths	Act Paths	Suppressed	History	Damp	State	Pending
inet.0	2	2	0	0	0	0	0

10.0.0.1	65432	1375	1375	0	6	11:26:57	1/1/0 0/0/0
10.0.0.2	65432	43016	43016	0	0	2w0d22h	0/0/0 0/0/0
10.0.0.4	65432	74460	74461	0	0	3w4d20h	0/0/0 0/0/0
10.0.0.6	65432	1347	1347	0	6	11:13:10	1/1/0 0/0/0

user@R6> show bgp summary

Groups: 1 Peers: 5 Down peers: 0

Table	Tot Paths	Act Paths	Suppressed	History	Damp	State	Pending
inet.0	1	1	0	0	0	0	0
Peer	AS	InPkt	OutPkt	OutQ	Flaps	Last Up/Dwn	State #Active/Received/Damped...
10.0.0.1	65432	1348	1350	0	0	11:13:46	1/1/0 0/0/0
10.0.0.2	65432	1347	1351	0	0	11:14:02	0/0/0 0/0/0
10.0.0.3	65432	1347	1350	0	0	11:13:58	0/0/0 0/0/0
10.0.0.4	65432	1347	1350	0	0	11:13:54	0/0/0 0/0/0
10.0.0.5	65432	1347	1350	0	0	11:13:50	0/0/0 0/0/0

**Meaning** The sample output from the ingress, transit, and egress routers shows that all routers in the network shown in [Figure 114 on page 1145](#) have BGP peers established and sessions up.

## Define the Local Autonomous System

**Purpose** Before BGP can function, you need to define a local AS number on the routers in your network. In the example network in [Figure 114 on page 1145](#), all routers are in AS 65432.

**Action** To define an AS number on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit routing-options
```

2. Configure all interfaces to a specific AS:

```
[edit routing-options]
user@host# set autonomous-system as-number
```

3. Verify the configuration:

```
user@host# show
```

```
user@host# commit
```

### Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit routing-options

[edit routing-options]
user@R1# set autonomous-system 65432

[edit routing-options]
user@R1# show
[...Output truncated...]
autonomous-system 65432;

[edit routing-options]
user@R1# commit
commit complete
```

**Meaning** The output shows that router R1 resides in AS 65432. All other routers in the example network shown in [Figure 114 on page 1145](#) also reside in AS 65432.

## Enable MPLS and RSVP

You can enable MPLS and RSVP throughout the rest of the network by repeating Step 1, “[Enable MPLS and RSVP on Routers](#)” on page 1151 and Step 2, “[Enable MPLS on Transit Router Interfaces](#)” on page 1152 as appropriate on other routers until all routers are enabled with MPLS and RSVP.

1. [Enable MPLS and RSVP on Routers](#) on page 1151
2. [Enable MPLS on Transit Router Interfaces](#) on page 1152

### Enable MPLS and RSVP on Routers

**Action** To enable MPLS and RSVP on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols
```

2. Configure MPLS and RSVP:

```
[edit protocols]
user@host# set mpls interface all
user@host# set rsvp interface all
```

3. Disable the management interface for MPLS and RSVP:

```
[edit protocols mpls]
user@host# set interface fxp0.0 disable
[edit protocols rsvp]
user@host# set interface fxp0.0 disable
```

4. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

**Sample Output**

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit protocols

[edit protocols]
user@R1# set mpls interface all

[edit protocols]
user@R1# set rsvp interface all

[edit protocols]
user@R1# show
rsvp {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
mpls {
  interface all;
  interface fxp0.0 {
    disable;
  }
}

[edit protocols]
user@R1# commit
commit complete
```

**Meaning** The sample output shows that router **R1** has MPLS and RSVP enabled on all interfaces, except for the management interface (**fxp0.0**), which is disabled. It is considered best practice to disable the management interlace (**fxp0.0**) for MPLS and RSVP to preempt any problems.

Typically every interface that you want to use is listed. For an example of a router configured with specific interfaces, see ["Enable IS-IS on Routers in Your Network" on page 1134](#).

## Enable MPLS on Transit Router Interfaces

**Purpose** Even though transit interfaces are enabled with MPLS when you include the **family mpls** statement in the configuration, MPLS as a whole is not configured on your router or in your network. You must complete all five steps in this topic to have the MPLS protocol running on your network.

**NOTE:** The management interface (fxp0) and the loopback interface (lo0) are not transit interfaces.

**Action** To configure transit interfaces to support MPLS, follow these steps:

1. In configuration mode, go to the following hierarchy level:  

```
[edit]
user@host# edit interfaces
```
2. Configure MPLS:  

```
[edit interfaces]
user@host# set type-fpc/pic/port unit number family mpls
```
3. Verify and commit the configuration:  

```
user@host# show
user@host# commit
```

**Sample Output**

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit interfaces

[edit interfaces]
user@R1# set so-0/0/2 unit 0 family mpls

[edit interfaces]
user@R1# show
so-0/0/2 {
  unit 0 {
    family inet {
      address 10.1.13.1/30;
    }
    family iso;
    family mpls;
  }
}

[edit interfaces]
user@R1# commit
commit complete
```

**Meaning** The sample output shows that the interface **so-0/0/2** is configured to support MPLS. The **family** statement identifies which protocol packets are accepted into the interfaces. For example, valid MPLS packets are dropped if the interface is not configured with the MPLS protocol.

## Enable MPLS and RSVP on Routers

**Action** To enable MPLS and RSVP on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols
```

2. Configure MPLS and RSVP:

```
[edit protocols]
user@host# set mpls interface all
user@host# set rsvp interface all
```

3. Disable the management interface for MPLS and RSVP:

```
[edit protocols mpls]
user@host# set interface fxp0.0 disable
[edit protocols rsvp]
user@host# set interface fxp0.0 disable
```

4. Verify and commit the configuration:

```
user@host# show

user@host# commit
```

**Sample Output**

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit protocols

[edit protocols]
user@R1# set mpls interface all

[edit protocols]
user@R1# set rsvp interface all

[edit protocols]
user@R1# show
rsvp {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
mpls {
  interface all;
  interface fxp0.0 {
    disable;
  }
}

[edit protocols]
user@R1# commit
commit complete
```

**Meaning** The sample output shows that router **R1** has MPLS and RSVP enabled on all interfaces, except for the management interface (**fxp0.0**), which is disabled. It is considered best practice to disable the management interlace (**fxp0.0**) for MPLS and RSVP to preempt any problems.

Typically every interface that you want to use is listed. For an example of a router configured with specific interfaces, see [“Enable IS-IS on Routers in Your Network”](#) on page 1134.

## Enable MPLS on Transit Router Interfaces

**Purpose** Even though transit interfaces are enabled with MPLS when you include the **family mpls** statement in the configuration, MPLS as a whole is not configured on your router or in your network. You must complete all five steps in this topic to have the MPLS protocol running on your network.

**NOTE:** The management interface (fxp0) and the loopback interface (lo0) are not transit interfaces.

**Action** To configure transit interfaces to support MPLS, follow these steps:

1. In configuration mode, go to the following hierarchy level:  

```
[edit]
user@host# edit interfaces
```
2. Configure MPLS:  

```
[edit interfaces]
user@host# set type-fpc/pic/port unit number family mpls
```
3. Verify and commit the configuration:  

```
user@host# show
user@host# commit
```

**Sample Output**

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit interfaces

[edit interfaces]
user@R1# set so-0/0/2 unit 0 family mpls

[edit interfaces]
user@R1# show
so-0/0/2 {
    unit 0 {
        family inet {
            address 10.1.13.1/30;
        }
        family iso;
        family mpls;
    }
}

[edit interfaces]
user@R1# commit
commit complete
```

**Meaning** The sample output shows that the interface **so-0/0/2** is configured to support MPLS. The **family** statement identifies which protocol packets are accepted into the interfaces. For example, valid MPLS packets are dropped if the interface is not configured with the MPLS protocol.

---

## Verifying the MPLS Configuration

After configuring MPLS on your network, you must verify the correct configuration of both the MPLS and RSVP protocols. Incorrect configuration of either protocol prevents successful LSP creation.

[Figure 115 on page 1157](#) illustrates the network with the example configurations used in this topic.

Figure 115: MPLS Network Topology

To verify the MPLS configuration, follow these steps:

1. [Verify MPLS Interfaces on page 1157](#)
2. [Verify the RSVP Protocol on page 1159](#)
3. [Verify RSVP Interfaces on page 1160](#)
4. [Verify Protocol Families on page 1162](#)

## Verify MPLS Interfaces

**Purpose** If the MPLS protocol is not configured correctly on the routers in your network, the interfaces are not able to perform MPLS switching.

**Action** To verify MPLS interfaces, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show mpls interface
```

## Sample Output 1

The following sample output is for all routers in the network shown in *MPLS Network Topology*.

```
user@R1> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0     Up         <none>
so-0/0/1.0     Up         <none>
so-0/0/2.0     Up         <none>

user@R2> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0     Up         <none>
so-0/0/1.0     Up         <none>
so-0/0/2.0     Up         <none>
```

```

so-0/0/3.0      Up      <none>

user@R3> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/2.0      Up      <none>
so-0/0/3.0      Up      <none>

user@R4> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/2.0      Up      <none>
so-0/0/3.0      Up      <none>

user@R5> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/2.0      Up      <none>

user@R6> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/2.0      Up      <none>
so-0/0/3.0      Up      <none>

```

## Sample Output 2

```

user@R6> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/3.0      Up      <none>      # so-0/0/2.0 is missing

```

## Sample Output 3

```

user@host> show mpls interface
MPLS not configured

```

**Meaning** Sample Output 1 shows that all MPLS interfaces on all routers in the network are enabled (**Up**) and can perform MPLS switching. If you fail to configure the correct interface at the **[edit protocols mpls]** hierarchy level or include the **family mpls** statement at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level, the interface cannot perform MPLS switching, and does not appear in the output for the **show mpls interface** command.

Administrative groups are not configured on any of the interfaces shown in the example network in *MPLS Network Topology*. However, if they were, the output would indicate which affinity class bits are enabled on the router.

Sample Output 2 shows that interface **so-0/0/2.0** is missing and therefore might be incorrectly configured. For example, the interface might not be included at the **[edit protocols mpls]** hierarchy level, or the **family mpls** statement might not be included at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level. If the interface is

configured correctly, RSVP might not have signaled over this interface yet. For more information on determining which interface is incorrectly configured, see [“Verify Protocol Families” on page 1162](#).

Sample Output 3 shows that the MPLS protocol is not configured at the `[edit protocols mpls]` hierarchy level.

## Verify the RSVP Protocol

**Purpose** If the RSVP protocol is not enabled on the routers in your network, the interface cannot signal LSPs.

**Action** To verify that the RSVP protocol is enabled, enter the following Junos OS CLI command:

```
user@host> show rsvp version
```

## Sample Output

```
user@R1> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol           = Enabled
  R(refresh timer)        = 30 seconds
  K(keep multiplier)      = 3
  Preemption              = Normal
  Soft-preemption cleanup = 30 seconds
  Graceful restart        = Disabled
  Restart helper mode     = Enabled
  Restart time            = 0 msec
```

**Meaning** The sample output shows that the RSVP protocol is enabled on **R1**. The supported RSVP protocol is version 1, as defined in RFC 2205.

The RSVP refresh timer is set to 30 seconds, indicating that every 30 seconds, plus or minus 50 percent, the router will refresh the RSVP state with its directly connected neighbors by sending either a **Path** or a **Resv** message. The variable refresh time helps prevent harmonic oscillations in network traffic caused by periodic protocol updates.

The keepalive multiplier, **K(keep multiplier)**, is input to a formula that helps determine the lifetime of an RSVP session. The session lifetime is reset each time the state is updated. The lifetime represents the duration of an RSVP session that does not receive any state updates (**Path** or **Resv** messages). The formula is:

$$\text{RSVP session lifetime} = (\text{keep-multiplier} + 0.5) * 1.5 * \text{refresh-time}$$

The RSVP **preemption** state is currently configured for normal preemption, indicating that only an LSP with a stronger priority can preempt an existing session; that is, the setup value of the new LSP is lower than the hold value of the existing LSP. Other options include **aggressive** preemption, which always preempts when there is insufficient bandwidth, and **disabled**, which prevents any preemption, regardless of LSP priority values.

**Graceful restart** is currently disabled and **Restart helper mode** is enabled. There are four combinations for **Graceful restart** and **restart helper mode**:

1. Both **Graceful restart** and **Restart helper mode** are enabled.
2. **Graceful restart** is enabled but **Restart helper mode** is disabled. An LSR with this configuration can restart gracefully but cannot help a neighbor with its restart and recovery procedures.
3. **Graceful restart** is disabled but **Restart helper mode** is enabled. An LSR with this configuration can only help a restarting neighbor. It cannot restart gracefully itself.
4. **Graceful restart** and **Restart helper mode** are both disabled. This configuration completely disables RSVP graceful restart (including restart and recovery procedures and helper mode). It is the same as an LSR that is not supported by RSVP graceful restart.

**Restart time** is the estimated time (in milliseconds) for an LSR to restart the RSVP traffic engineering component. In the example output, the restart time is 0 milliseconds, indicating that it is disabled.

The output is identical for all routers in the network shown in *MPLS Network Topology*.

## Verify RSVP Interfaces

**Purpose** If the RSVP protocol is not configured correctly on the routers in your network, the interfaces cannot signal LSPs.

**Action** To verify RSVP interfaces, enter the following Junos OS CLI operational mode command:

```
user@host> show rsvp interface
```

## Sample Output 1

```
user@R1> show rsvp interface
```

```
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	2	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R2> show rsvp interface
```

```
RSVP interface: 5 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark

so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```

user@R4> show rsvp interface
RSVP interface: 5 active

```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```

user@R5> show rsvp interface
RSVP interface: 4 active

```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```

user@R6> show rsvp interface
RSVP interface: 5 active

```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

## Sample Output 2

```

user@R6> show rsvp interface
RSVP interface: 3 active

```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

#so-0/0/3.0 is missing

## Sample Output 3

```

user@host# show rsvp interface
RSVP not configured

```

**Meaning** Sample Output 1 shows that all interfaces on all routers in the network are enabled with RSVP, including the management interface (**fxp0**). The output for all routers in the network includes similar information, so we will examine R6 in detail.

R6 has five interfaces enabled with RSVP (**Up**). Interface **so-0/1/1.0** has a single active RSVP reservation (**Active resv**) that did not change the default subscription percentage of 100 percent (**Subscription**). Interface **so-0/1/1.0** did not assign a static bandwidth (**Static BW**) to the logical unit and therefore inherited 100 percent of the physical interface rate as the bandwidth available (**Available BW**) for RSVP sessions. Interface **so-0/1/1.0** has no bandwidth assigned (**Reserved BW**), and no RSVP bandwidth allocation at any single instant in time (**Highwater mark**).

Sample Output 2 shows that interface **so-0/0/3.0** is missing. If you do not configure the correct interface at the **[edit protocols rsvp]** hierarchy level, the interface cannot signal LSPs, and does not appear in the output for the **show rsvp interface** command.

Sample Output 3 shows that the RSVP protocol is not configured at the **[edit protocols rsvp]** hierarchy level.

## Verify Protocol Families

**Purpose** If a logical interface does not have MPLS enabled, it cannot perform MPLS switching. This step allows you to quickly determine which interfaces are configured with MPLS and other protocol families.

**Action** To verify the protocol families configured on the routers in your network, enter the following Junos OS CLI operational mode command:

```
user@host> show interfaces terse
```

### Sample Output 1

```
user@R1> show interfaces terse
Interface      Admin Link Proto Local Remote
so-0/0/0       up   up   inet  10.1.12.1/30

                        iso
                        mpls

```

**Meaning** Sample Output 1 shows the interface, the administrative status of the link (**Admin**), the data link layer status of the link (**Link**), the protocol families configured on the interface (**Proto**), and the local and remote addresses on the interface.

All interfaces on all routes in the network shown in [Figure 115 on page 1157](#) are administratively enabled and functioning at the data link layer with MPLS and IS-IS, and have an **inet** address. All are configured with an IPv4 protocol family (**inet**), and have the IS-IS (**iso**) and MPLS (**mpls**) protocol families configured at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level.

Sample Output 2 shows that interface **so-0/0/2.0** on **R6** does not have the **mpls** statement included at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level.

## Verify the RSVP Protocol

**Purpose** If the RSVP protocol is not enabled on the routers in your network, the interface cannot signal LSPs.

**Action** To verify that the RSVP protocol is enabled, enter the following Junos OS CLI command:

```
user@host> show rsvp version
```

## Sample Output

```

user@R1> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol           = Enabled

```

```

R(refresh timer)           = 30 seconds
K(keep multiplier)         = 3
Preemption                  = Normal
Soft-preemption cleanup    = 30 seconds
Graceful restart           = Disabled
Restart helper mode        = Enabled
Restart time                = 0 msec

```

**Meaning** The sample output shows that the RSVP protocol is enabled on **R1**. The supported RSVP protocol is version 1, as defined in RFC 2205.

The RSVP refresh timer is set to 30 seconds, indicating that every 30 seconds, plus or minus 50 percent, the router will refresh the RSVP state with its directly connected neighbors by sending either a **Path** or a **Resv** message. The variable refresh time helps prevent harmonic oscillations in network traffic caused by periodic protocol updates.

The keepalive multiplier, **K(keep multiplier)**, is input to a formula that helps determine the lifetime of an RSVP session. The session lifetime is reset each time the state is updated. The lifetime represents the duration of an RSVP session that does not receive any state updates (**Path** or **Resv** messages). The formula is:

RSVP session lifetime = (keep-multiplier + 0.5) \* 1.5 \* refresh-time

The RSVP **preemption** state is currently configured for normal preemption, indicating that only an LSP with a stronger priority can preempt an existing session; that is, the setup value of the new LSP is lower than the hold value of the existing LSP. Other options include **aggressive** preemption, which always preempts when there is insufficient bandwidth, and **disabled**, which prevents any preemption, regardless of LSP priority values.

**Graceful restart** is currently disabled and **Restart helper mode** is enabled. There are four combinations for **Graceful restart** and **restart helper mode**:

1. Both **Graceful restart** and **Restart helper mode** are enabled.
2. **Graceful restart** is enabled but **Restart helper mode** is disabled. An LSR with this configuration can restart gracefully but cannot help a neighbor with its restart and recovery procedures.
3. **Graceful restart** is disabled but **Restart helper mode** is enabled. An LSR with this configuration can only help a restarting neighbor. It cannot restart gracefully itself.
4. **Graceful restart** and **Restart helper mode** are both disabled. This configuration completely disables RSVP graceful restart (including restart and recovery procedures and helper mode). It is the same as an LSR that is not supported by RSVP graceful restart.

**Restart time** is the estimated time (in milliseconds) for an LSR to restart the RSVP traffic engineering component. In the example output, the restart time is 0 milliseconds, indicating that it is disabled.

The output is identical for all routers in the network shown in *MPLS Network Topology*.

## Define a Load-Balancing Policy

---

**Purpose** On the ingress or transit router, you can include a policy statement that performs load balancing on all routes. For information on including a policy statement that performs load balancing on specific routes, see “Configuring Per-Packet Load Balancing” in the *Junos Routing Protocols Configuration Guide*.

**Action** On the ingress or transit router, to define a load-balancing policy for all routes, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit policy-options
```

2. Define the load-balance policy and action:

```
[edit policy-options]
user@host# set policy-statement policy-name then load-balance per-packet
```

3. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

**Sample Output**

```
user@R6> edit
Entering configuration mode

[edit]
user@R6# edit policy-options

[edit policy-options]
user@R6# set policy-statement load-balance-traffic then load-balance per-packet

[edit policy-options]
user@R6# show
policy-statement load-balance-traffic {
  then {
    load-balance per-packet;
  }
}

[edit policy-options]
user@R6# commit
commit complete
```

**Meaning** The sample output from ingress router **R6** shows the process for configuring load balancing. On an Internet Processor I ASIC, packets with the same parameters are spread across multiple equal-cost next hops; while an Internet Processor II ASIC sends packets with the same parameters to the same next hop, since they are in the same flow. The Junos OS command to turn on load balancing uses the action **load-balance per-packet**, which is misnamed in relation to the Internet Processor II ASIC. On the Internet Processor II ASIC, this command actually enables per-flow load balancing.

## Use the traceroute Command to Verify MPLS Labels

**Purpose** You can use the **traceroute** command to verify that packets are being sent over the LSP.

**Action** To verify MPLS labels, enter the following Junos OS CLI operational mode command, where *host-name* is the IP address or the name of the remote host:

```
user@host> traceroute host-name
```

### Sample Output 1

```
user@R1> traceroute 100.100.6.1
traceroute to 100.100.6.1 (100.100.6.1), 30 hops max, 40 byte packets
 1  10.1.12.2 (10.1.12.2)  0.861 ms  0.718 ms  0.679 ms
    MPLS Label=100048 CoS=0 TTL=1 S=1
 2  10.1.24.2 (10.1.24.2)  0.822 ms  0.731 ms  0.708 ms
    MPLS Label=100016 CoS=0 TTL=1 S=1
 3  10.1.46.2 (10.1.46.2)  0.571 ms !N  0.547 ms !N  0.532 ms !N
```

### Sample Output 2

```
user@R1> traceroute 10.0.0.6
traceroute to 10.0.0.6 (10.0.0.6), 30 hops max, 40 byte packets
 1  10.1.13.2 (10.1.13.2)  0.605 ms  0.548 ms  0.503 ms
 2  10.0.0.6 (10.0.0.6)  0.761 ms  0.676 ms  0.675 ms
```

**Meaning** Sample Output 1 shows that MPLS labels are used to forward packets through the network. Included in the output is a label value (**MPLS Label=100048**), the time-to-live value (**TTL=1**), and the stack bit value (**S=1**).

The **MPLS Label** field is used to identify the packet to a particular LSP. It is a 20-bit field, with a maximum value of ( $2^{20}-1$ ), or approximately 1,000,000.

The TTL value contains a limit on the number of hops that this MPLS packet can travel through the network (1). It is decremented at each hop, and if the TTL value drops below one, the packet is discarded.

The bottom of the stack bit value (**S=1**) indicates that is the last label in the stack and that this MPLS packet has one label associated with it. The MPLS implementation in the Junos OS supports a stacking depth of 3 on the M-series routers and up to 5 on the T-series platforms. For more information on MPLS label stacking, see RFC 3032, *MPLS Label Stack Encoding*.

MPLS labels appear in Sample Output 1 because the **traceroute** command is issued to a BGP destination where the BGP next hop for that route is the LSP egress address. The Junos OS default behavior uses LSPs for BGP traffic when the BGP next hop equals the LSP egress address.

Sample Output 2 shows that MPLS labels do not appear in the output for the **traceroute** command. If the BGP next hop does not equal the LSP egress address or the destination is an IGP route, the BGP traffic does not use the LSP. Instead of using the LSP, the BGP traffic is using the IGP (IS-IS, in this case) to reach the egress address (**R6**).

## Apply the Load-Balancing Policy to the Forwarding Table

---

**Purpose** Apply the policy configured in Step 1 to routes exported from the routing table to the forwarding table.

**Action** To apply a load-balancing policy to the forwarding table, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit routing-options
```

2. Define a load-balance per packet action:

```
[edit routing-options]
user@host# set forwarding-table export policy-name
```

3. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

**Sample Output**

```
[edit]
user@R6# edit routing-options

[edit routing-options]
user@R6# set forwarding-table export load-balance-traffic

[edit routing-options]
user@R6# show
static {
[...Output truncated...]
}
router-id 192.168.6.1;
autonomous-system 65432;
forwarding-table {
    export load-balance-traffic;
}

[edit routing-options]
user@R6# commit
commit complete
```

**Meaning** The sample output shows the process for applying a load-balancing policy to export routes from the routing table to the forwarding table.

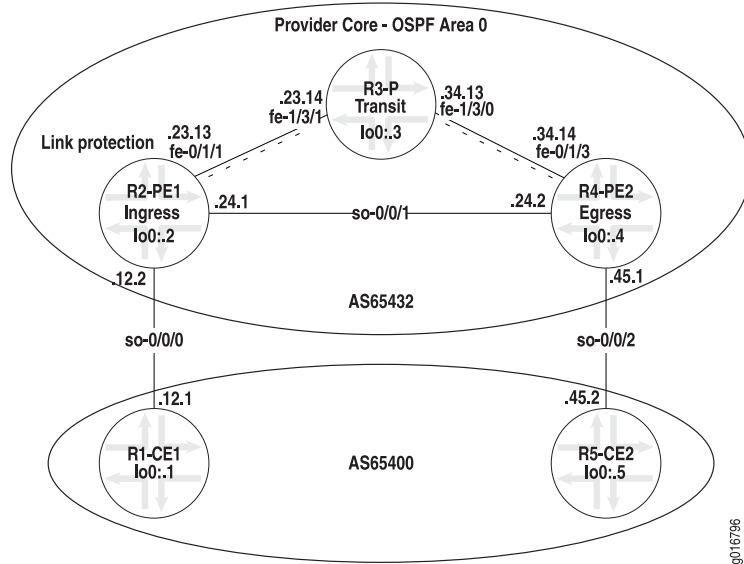

## Fast Reroute Problem Overview

---

**Problem Description:** Incorrect configuration is a common mistake when trying to establish protection for an MPLS LSP. Protection with either fast reroute or link protection requires a **per-packet load-balance policy** exported at the **[edit routing-options forwarding-table]** hierarchy level. Correctly configured protection for an MPLS LSP results in two next-hop forwarding table entries per destination, either an incoming MPLS label or an IP destination.

Figure 116 on page 1169 illustrates a network topology with link protection and load balancing enabled to ensure that routes are correctly placed in to the forwarding table.

Figure 116: Fast Reroute Problem Network

The network shown in Figure 116 on page 1169 illustrates an MPLS-based VPN with traffic protection and load balancing, consisting of the following:

- All physical interfaces addresses are from the 10.0.x.x/30 address space.
- All loopback addresses are from the 192.168.x.1/32 block.
- The IGP is a single-area (Area 0) OSPF.
- RSVP is deployed as the MPLS signaling protocol between PE routers.
- LSPs (r2-r4 and r4-r2) established between PE routers.
- MP-IBGP mesh between PE routers, loopback peering, and VPN-IPv4 NLRI.
- CE-PE link running EBGp.
- Full-mesh Layer 3 VPN between CE1 and CE2.
- Traffic protection for the link between the PE1 and P routers.
- Load balancing on PE1.

The overall goal of this network is to provide point-to-point connectivity between the two CE routers and traffic protection in the core of the network.

**Symptom** In the network shown in Figure 116 on page 1169, the external symptom is that local repair is taking about one second to complete, which is slow. Use the **show route forwarding-table vpn vpn-a destination** command to check that the correct routes are included in the forwarding table. In the example output below, there is only one route installed in the forwarding table, when for fast local repair, there should be multiple next hops installed.

**Sample Output**    user@R2-PE1> show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive

```
Routing table: vpn-a.inet [Index 2]
Internet:

Destination: 192.168.5.0/24
Route type: user
Route reference: 0                               Route interface-index: 0
Flags: sent to PFE, prefix load balance
Next-hop type: indirect                           Index: 262142   Reference: 2
Next-hop type: Push 100160
Next-hop interface: so-0/0/1.0 #Only one next hop in the forwarding table.
```

**Cause**    Slow local repair is caused by the forwarding table not including the necessary next-hops to support local repair. The forwarding table shows only a single next-hop, when local repair requires additional next-hops for fast recovery.

**Troubleshooting Commands**    The Junos OS includes commands that are useful when troubleshooting a problem. This topic provides a brief description of each command followed by sample output, and a discussion of the output in relation to the problem.

The following commands can be used when troubleshooting a fast reroute error in an MPLS-VPN network:

```
user@R2-PE1> show configuration routing-instances vpn-a
user@R2-PE1> show configuration routing-options
user@R2-PE1> show bgp summary instance vpn-a
user@R2-PE1> show configuration protocols mpls
user@R2-PE1> show mpls lsp ingress
user@R2-PE1> show rsvp session ingress
user@R2-PE1> show rsvp session ingress detail
user@R2-PE1> show route table vpn-a 192.168.5.1 detail
user@R2-PE1> show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive
```

**Sample Output** The `show configuration statement-path` command is used to display a specific configuration hierarchy; in this case, to verify the correct configuration of a specific routing instance named `vpn-a`.

```
user@R2-PE1> show configuration routing-instances vpn-a
instance-type vrf ;
interface so-0/0/0.0 ;
vrf-target {
    import target:65432:100;
    export target:65432:100;
}
protocols {
    bgp {
        group CE1 {
            type external;
            peer-as 65400;
            neighbor 10.0.12.1 ;
        }
    }
}
```

**Meaning** The sample output for the `show configuration` command shows the current running configuration of the specific routing instance named `vpn-a` configured on the ingress PE1 router. The `vpn-a` instance configuration has a VRF table that supports EBGp routing on the PE-CE link (`so-0/0/0.0`). This interface is the correct interface for the CE1-PE1 link in the network topology shown in [Figure 116 on page 1169](#).

The VRF instance is linked to a VFR target community configured at the [edit policy-options] hierarchy level, allowing advertising of L3 VPN routes between PE routers. (See the PE1 configuration in ["Router Configurations" on page 1178](#) for the policy options configuration.) The import statement places, into the `vpn-a.inet.0` table, all received L3 VPN MP-BGP routes tagged with the correct target community. The export statement advertises and tags all routes in the `vpn-a.inet.0` table with the listed target community to all MP-BGP peers.

The BGP protocols configuration within the routing instance applies the BGP import and export policies to the exchange of BGP routes on the PE-CE routing instance.

**Sample Output** The **show bgp summary** command is used to display summary information about BGP and its neighbors to determine if routes are received from peers in the autonomous system (AS). In this case, information for the specified instance **vpn-a** is displayed.

```
user@R2-PE1> show bgp summary instance vpn-a
Groups: 1 Peers: 1 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
vpn-a.inet.0 11 7 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Damped...
10.0.12.1 65400 2471 2473 0 0 20:35:20 Establ
vpn-a.inet.0: 5/5/0
```

**Meaning** The sample output for the **show bgp summary instance vpn-a** command shows that the peering session between the CE1 and PE1 routers is established, indicating that the peers are exchanging update messages.

**Sample Output** The **show configuration statement-path** command is used to display a specific configuration hierarchy; in this case, the MPLS hierarchy.

```
user@R2-PE1> show configuration protocols mpls
label-switched-path r2-r4 {
    to 192.168.4.1;
    link-protection ;
    primary direct ;
}
path direct {
    10.0.24.2 strict;
}
interface all;
interface fxp0.0 {
    disable;
}
```

**Meaning** The sample output for the **show configuration protocols mpls** command shows the current running MPLS configuration on the ingress PE1 router. The configuration include the LSP **r2-r4**, link protection, and the strict primary path **direct**.

**Sample Output** The **show mpls lsp** command is used to display summarized information about the configured and active LSPs on a router; in this case, the command shows only the ingress LSPs on the ingress PE1 router.

```
user@R2-PE1> show mpls lsp ingress
Ingress LSP: 1 sessions
To From State Rt ActivePath P LSPname
192.168.4.1 192.168.2.1 Up 0 direct * r2-r4
Total 1 displayed, Up 1, Down 0
```

**Meaning** The sample output for the **show mpls lsp ingress** command shows that the ingress LSP **r2-r4** is up and following the configured path **direct**.

**Sample Output** The `show rsvp session` command is used to display summarized information about active RSVP sessions on a router; in this case, the command shows summarized information about ingress RSVP sessions on the PE1 router

```
user@R2-PE1> show rsvp session ingress
Ingress RSVP: 2 sessions
To          From          State   Rt  Style Labelin Labelout LSPname
192.168.4.1 192.168.2.1 Up      0  1  SE      -       3  r2-r4
192.168.4.1 192.168.2.1 Up      0  1  SE      -    100064
Bypass->10.0.24.2
Total 2 displayed, Up 2, Down 0
```

**Meaning** The sample output for the `show rsvp session ingress` command shows two RSVP sessions are up; the main LSP `r2-r4` and a bypass path protecting the main LSP. Both RSVP sessions are in the Shared Explicit (**SE**) style, creating a shared reservation among for the two paths.

**Sample Output** The `show rsvp session ingress detail` command is used to display more detailed information about the two ingress RSVP sessions on the PE1 router.

```

user@R2-PE1> show rsvp session ingress detail
Ingress RSVP: 2 sessions

192.168.4.1
  From: 192.168.2.1, LSPstate: Up , ActiveRoute: 0

  Record route: <self> 10.0.23.14 10.0.34.14
Total 2 displayed, Up 2, Down 0

```

**Meaning** The sample output for the `show rsvp session ingress detail` command shows the RSVP session for the ingress LSP and the bypass path, which appears as a separate RSVP ingress session for the protected interface **10.0.24.2**. The bypass path is automatically generated. By default, the name appears as **Bypass > interface-address**, where the interface address is the next downstream router's interface (**10.0.24.2**). The explicit route **10.0.23.14 10.0.34.14** for the session shows **R3** as the transit node and **R4** as the egress node.

**Sample Output** The **show route table *routing-table-name*** command is used to display information about a particular routing table. In this case, the **vpn-a.inet.0** routing table.

```
user@R2-PE1> show route table vpn-a 192.168.5.1 detail
vpn-a.inet.0: 9 destinations, 13 routes (9 active, 0 holddown, 0 hidden)
192.168.5.0/24 (1 entry, 1 announced)
  *BGP      Preference: 170/-101
              Route Distinguisher: 192.168.4.1:4
              Next-hop reference count: 11
              Source: 192.168.4.1
              Next hop: via so-0/0/1.0 weight 0x1, selected
              Label-switched-path r2-r4
              Label operation: Push 100160
              Next hop: 10.0.23.14 via fe-0/1/1.0 weight 0x8001
              Label-switched-path r2-r4
              Label operation: Push 100160, Push 100064(top)
              Protocol next hop: 192.168.4.1
              Push 100160
              Indirect next hop: 8791000 262142
              State: <Secondary Active Int Ext>
              Local AS: 65432 Peer AS: 65432
              Age: 1d 5:22:31      Metric2: 1
              Task: BGP_65432.192.168.4.1+2056
              Announcement bits (1): 0-KRT
              AS path: 65400 I
              Communities: target:65432:100
              VPN Label: 100160
              Localpref: 100
              Router ID: 192.168.4.1
              Primary Routing Table bgp.13vpn.0
```

**Meaning** The sample output for the **show route table vpn-a 192.168.5.1 detail** command shows routes associated with the remote PE-CE location as indicated by the loopback address of the PE2 router **192.168.5.1**. In this case, there are different next hops with unequal weights (**0x1** and **0x8001**) associated with the remote location. For correct traffic protection, those two routes must appear in the forwarding table.

**Sample Output** The **show route forwarding-table** command displays the route entries in the kernel's forwarding table. This is the version of the forwarding table in the Routing Engine. The Routing Engine copies this table to the Packet Forwarding Engine. In this case, the set of routes installed in the forwarding table to verify that the routing protocol process (rpd) has relayed the correct information to the forwarding table for the specified destination.

```
user@R2-PE1> show route forwarding-table vpn vpn-a destination 192.168.5.1
extensive
Routing table: vpn-a.inet [Index 2]
Internet:

Destination: 192.168.5.0/24
Route type: user
Route reference: 0                               Route interface-index: 0
Flags: sent to PFE, prefix load balance
Next-hop type: indirect                           Index: 262142   Reference: 2
Next-hop type: Push 100160
Next-hop interface: so-0/0/1.0
```

**Meaning** The sample output for the **show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive** command shows only one next hop **so-0/0/1.0** is installed in the forwarding table, indicating that the information in the forwarding table is not correct. We would expect to see the same paths installed in the forwarding table as appear in the routing table in the output for the **show route table vpn-a 192.168.5.1 detail**.

**Solution** The solution is to enable load-balancing and ensure that multiple next-hop forwarding table entries appear in the forwarding table for each destination. The forwarding-table entries can be an incoming MPLS label or an IP destination.

A load-balancing policy applied to the forwarding-table is the same mechanism required for ECMP (equal-cost multipath) load-balancing to install multiple next-hops into the forwarding-table. The extra paths installed for local repair are not used for load-balancing, because the paths are differently weighted, as demonstrated in the sample output for the **show routing table** and the **show route forwarding-table** commands.

**NOTE:** The load-balancing policy must be applied to all provider (P) and provider-edge (PE) routers that are required to support local repair.

The following sample output shows an example load-balancing configuration and the commands used to verify that the required two next-hop entries appear in the forwarding table.

**Sample Output** Use the following two **show configuration *statement-path*** commands to display a specific configuration hierarchy; in this case, policy-options and routing-options.

```
user@R2-PE1> show configuration policy-options
policy-statement lbpf {
    then {
        load-balance per-packet ;
    }
}
[...Output truncated...]

user@R2-PE1> show configuration routing-options
static {
    [...Output truncated...]
    route 100.100.1.0/24 reject;
}
router-id 192.168.2.1;
route-distinguisher-id 192.168.2.1;
autonomous-system 65432;
forwarding-table {
    export lbpf ;
}
```

**Meaning** The sample output for the **show configuration policy-options** and **show configuration routing-options** commands shows the two parts required to configure a load balancing policy. The **lbpf** policy includes the **load-balance per-packet** statement. The policy is then applied at the **[edit routing options forwarding-table]** hierarchy level with the **export lbpf** statement. Enabling load balancing results in the export of routes from the routing table to the forwarding table, and a solution to the problem.

**NOTE:** The load-balance per-packet statement is named *per-packet* for historical reasons. When the Packet Forwarding Engine was an IP Processor-I (before Junos 4.0), Junos supported only per-packet load balancing. When the IP Processor-II was introduced the behavior was changed to per-flow load balancing without changing the statement.

**Sample Output** Use the **show route forwarding-table** command to display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. In this case, the option **vpn vpn** is used to display routing table entries for the specified VPN **vpn-a**.

```
user@R2-PE1> show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive
```

```
Routing table: vpn-a.inet [Index 2]  
Internet:
```

```
Destination: 192.168.5.0/24  
Route type: user  
Route reference: 0                               Route interface-index: 0  
Flags: sent to PFE  
Next-hop type: indirect                           Index: 262142   Reference: 2  
Next-hop type: unilist                             Index: 262146   Reference: 1  
Next-hop type: Push 100160  
Next-hop interface: so-0/0/1.0   Weight: 0x1  
Nexthop: 10.0.23.14  
Next-hop type: Push 100160, Push 100064(top)  
Next-hop interface: fe-0/1/1.0   Weight: 0x8001
```

**Meaning** The sample output for the **show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive** command shows the correct two routes were relayed from the routing table to the forwarding table.

**Conclusion** In conclusion, a load balancing policy is required for link protection to work effectively. The principles are the same for the configuration of the **fast reroute** and the **node-link protection** statements.

**Router Configurations** The following output shows the configurations of all routers in the network. The **no-more** option entered after the pipe ( | ) prevents the output from being paginated if the output is longer than the length of the terminal screen.

**Sample Output** The following sample output is for the customer edge (CE) 1 router:

```

user@R1-CE1> show configuration | no-more
[...Output truncated...]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        address 10.0.12.1/30;
      }
      family iso;
      family mpls;
    }
  }
  fxp0 {
    unit 0 {
      family inet {
        address 192.168.70.143/21;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 192.168.1.1/32;
      }
    }
  }
}
routing-options {
  static {
    /* corporate and alpha net */
    route 172.16.0.0/12 {
      next-hop 192.168.71.254;
      retain;
      no-readvertise;
    }
    /* old lab nets */
    route 192.168.0.0/16 {

            passive;
        }
    }
}
}
policy-options {
    policy-statement stat {
        term 1 {
            from protocol static;
            then accept;
        }
        term 2 {
            then reject;
        }
    }
}
}

```

**Sample Output** The following sample output is for the provider edge (PE) 1 ingress router :

```

user@R2-PE1> show configuration | no-more
[...Output truncated...]
interfaces {
    so-0/0/0 {
        description to-r1;
        unit 0 {

## Problem Establishing a GRE Tunnel Checklist

**Problem** **Description:** This checklist provides the links and commands for troubleshooting a case study about a problem establishing a Generalized Multiprotocol Label Switching (GMPLS) label-switched path (LSP). Specifically, the configuration of the data channel is incorrect because the configuration includes different interface types at both ends of the tunnel. The principles and solution used in this case study also apply to control channel configuration.

The checklist includes the links to a brief summary of GRE tunnels within the context of GMPLS, an example network scenario, and more detailed information about the commands used to troubleshoot and resolve the problem.

The troubleshooting process described in this case study should not be followed rigidly; it is a basis from which you can develop your own process to suit your particular situation. (See [Table 35 on page 1190](#))

**Table 35: Problem Establishing a GRE Tunnel Checklist**

Tasks	Command or Action
<a href="#">“Troubleshooting GMPLS and GRE Tunnel” on page 1190</a>	
<a href="#">“Symptom” on page 1193</a>	<pre>show mpls lsp show rsvp session</pre>
<a href="#">“Cause” on page 1193</a>	The cause of the problem with the GMPLS LSP is the configuration of different interface types at both ends of the GMPLS data channel.
<a href="#">“Troubleshooting Commands” on page 1193</a>	<pre>show mpls lsp extensive show rsvp session detail show link-management peer show link-management te-link show configuration protocols mpls monitor start filename show log filename</pre>
<a href="#">“Solution” on page 1199</a>	<p>Configure both ends of the data channel with the same switching type.</p> <pre>show configuration protocols link-management show mpls lsp show link-management te-link</pre>
<a href="#">“Conclusion” on page 1200</a>	Both ends of a GMPLS data must be the same encapsulation or interface type.
<a href="#">“Router Configurations” on page 1200</a>	<code>show configuration   no-more</code>

## Troubleshooting GMPLS and GRE Tunnel

**Problem** **Description:** The logical control channel for GMPLS must be a point-to-point link and must have some form of IP reachability. On broadcast interfaces or when there are multiple hops between control channel peers, use a GRE tunnel for the control channel.

For more detailed information on GMPLS and GRE tunnels see the *Junos MPLS Applications Configuration Guide* and the *Junos Feature Guide*.

A tunnel PIC is *not* required to configure a GRE tunnel for the GMPLS control channel. Instead, use the software-based **gre** interface, rather than the hardware-based **gr-fpc/pic/port** interface.

**CAUTION:** Due to restrictions to the software-based **gre** interface, the GMPLS control channel is the only supported use of the software-based **gre** interface. Any other use is expressly unsupported and might cause an application failure.

The following example shows a basic **gre** interface configuration. In this case, the tunnel source is the loopback address of the local router and the destination address is the loopback destination of the remote router. Traffic that has a next hop of the tunnel destination will use the tunnel. The tunnel is not automatically used by all the traffic passing through the interface. Only traffic with the tunnel destination as the next hop uses the tunnel.

**Sample Output**

```
user@R1> show configuration interfaces
[...Output truncated...]
gre {
  unit 0 {
    tunnel {
      source 10.0.12.13;
      destination 10.0.12.14;
    }
    family inet {
      address 10.35.1.6/30;
    }
    family mpls;
  }
}
```

**Sample Output** The following sample output for the **show interfaces** command shows the encapsulation type and header, the maximum speed, packets through the logical interface, the destination, and logical address.

```
user@R1> show interfaces gre
Physical interface: gre, Enabled, Physical link is Up
  Interface index: 10, SNMP ifIndex: 8
  Type: GRE, Link-level type: GRE, MTU: Unlimited, Speed: Unlimited
  Device flags : Present Running
  Interface flags: Point-To-Point SNMP-Traps
    Input packets : 0
    Output packets: 0

  Logical interface gre.0 (Index 70) (SNMP ifIndex 47)
    Flags: Point-To-Point SNMP-Traps 0x4000
    IP-Header 10.0.12.14:10.0.12.13:47:df:64:0000000000000000
    Encapsulation: GRE-NULL
    Input packets : 171734
    Output packets: 194560
    Protocol inet, MTU: 1476
    Flags: None
```

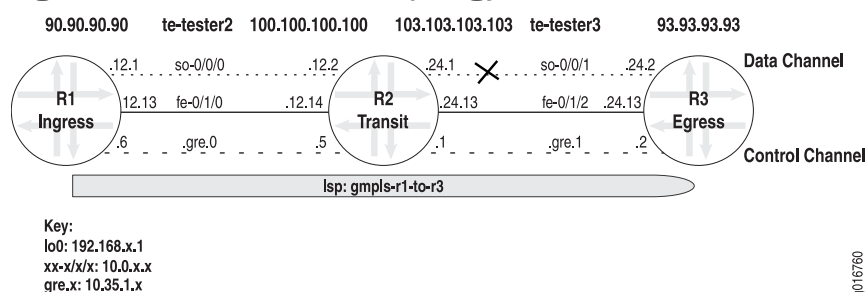

Addresses, Flags: Is-Preferred Is-Primary  
 Destination: 10.35.1.4/30, Local: 10.35.1.6, Broadcast: 10.35.1.7  
 Protocol mpls, MTU: 1464  
 Flags: None

The following are various requirements when you configure a GMPLS LSP using a GRE tunnel:

- The data channel must start and end on the same type of interface.
- The control channel can be a GRE tunnel that starts and ends on the same or different interface type.
- The GRE tunnel must be configured indirectly with the **peer-interface peer-name** statement at the **[edit protocol ospf]** hierarchy level.
- The GRE interface must be disabled at the **[edit protocols ospf]** and **[edit protocols rsvp]** hierarchy levels.
- Data and control channels must be defined correctly in the LMP configuration .
- It is optional to disable Constrained Shortest Path First (CSPF) with the **no-cspf** statement.

This case focuses on the incorrect configuration of the endpoints of the GRE tunnel. However, you can use a similar process and commands to diagnose other GRE tunnel problems. [Figure 117 on page 1192](#) illustrates a network topology with MPLS tunneled through a GRE interface.

**Figure 117: GMPLS Network Topology**

The MPLS network topology in [Figure 117 on page 1192](#) shows Juniper Networks routers configured with a GRE tunnel that consists of the following components:

- A strict GMPLS LSP path from the ingress router to the egress router.
- On the ingress router, CSPF disabled with the **no-cspf** statement at the **[edit protocol mpls label-switched-path lsp-name]** hierarchy level.
- Traffic-engineering links and control channels within the **peer** statement at the **[edit protocols link-management]** hierarchy level on all routers.
- OSPF and OSPF traffic engineering configured on all routers.
- A reference to the **peer-interface** in both OSPF and RSVP on all routers.
- A switching-type problem between R2 and R3.

**Symptom** The LSP in the network shown in [Figure 117 on page 1192](#) is down, as indicated by the output from the **show mpls lsp** and **show rsvp session** commands, which display very similar information. The **show mpls lsp** command shows all LSPs configured on the router, as well as all transit and egress LSPs. The **show rsvp session** command displays summary information about RSVP sessions. You can use either command to verify the state of the LSP. In this case, LSP **gmpls-r1-to-r3** is down (**Dn**).

**Sample Output**

```

user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPName

Egress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

**Cause** The cause of the problem with the GMPLS LSP is the configuration of different interface types at both ends of the GMPLS data channel.

**Troubleshooting Commands** The Junos OS includes commands that are useful when troubleshooting a problem. This topic provides a brief description of each command, followed by sample output, and a discussion of the output in relation to the problem.

You can use the following commands when troubleshooting a GMPLS problem:

```

user@host> show mpls lsp extensive
user@host> show rsvp session detail
user@host> show link-management peer
user@host> show link-management te-link
user@host> show configuration protocols mpls
user@host> monitor start filename
user@host> show log filename

```

**Sample Output** Use the **show mpls lsp extensive** command on transit router R1 to display detailed information about all LSPs transiting, terminating, and configured on the router.

```

user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

```

```

192.168.4.1
  From: 192.168.1.1, State: Dn, ActiveRoute: 0, LSPname: gmpls-r1-to-r3
  Bidirectional

    SmartOptimizeTimer: 180
    8 Dec 20 18:08:02 192.168.4.1: MPLS label allocation failure [3 times]
    7 Dec 20 18:07:53 Originate Call
    6 Dec 20 18:07:53 Clear Call
    5 Dec 20 18:07:53 Deselected as active
    4 Dec 20 18:06:13 Selected as active path
    3 Dec 20 18:06:13 Record Route: 100.100.100.100 93.93.93.93
    2 Dec 20 18:06:13 Up
    1 Dec 20 18:06:13 Originate Call
  Created: Wed Dec 20 18:06:12 2006
Total 1 displayed, Up 0, Down 1

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

**Meaning** The sample output for the `show mpls lsp extensive` command shows an error message (**MPLS label allocation failure**) in the log section of the output. This LSP event indicates that the MPLS protocol or the `family mpls` statement were not configured properly. When the LSP event is preceded by an IP address, the address is typically the router that has the MPLS configuration error. In this case, it appears that the router with the `lo0` address of **192.168.4.1 (R3)** has an MPLS configuration error.

**Sample Output** Use the `show rsvp session detail` command to display detailed information about RSVP sessions.

```

user@R1> show rsvp session detail
Ingress RSVP: 1 sessions

192.168.4.1
  From: 192.168.1.1, LSPstate: Dn, ActiveRoute: 0
  LSPname: gmpls-r1-to-r3, LSPpath: Primary
  Bidirectional, Upstream label in: 21253, Upstream label out: -
  Suggested label received: -, Suggested label sent: 21253
  Recovery label received: -, Recovery label sent: -
  Resv style: 0 - , Label in: -, Label out: -
  Time left: -, Since: Wed Dec 20 18:07:53 2006

  Port number: sender 2 receiver 46115 protocol 0
  PATH rcvfrom: localclient
  Adspec: sent MTU 1500
  Path MTU: received 0
  PATH sentto: 10.35.1.5 (tester2) 3 pkts
  Explct route: 100.100.100.100 93.93.93.93
  Record route: <self> ...incomplete
Total 1 displayed, Up 0, Down 1

Egress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

```
Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

**Meaning** The sample output for the `show rsvp session detail` command shows that LSP `gmpls-r1-to-r3` is down (`LSPstate:Dn`). The route record is incomplete, indicating a problem with the explicit route `100.100.100.100 93.93.93.93`. The address `100.100.100.100` is the data channel on `R2 so-0/0/0`, and the address `93.93.93.93` is the data channel on `R3`.

**Sample Output** Use the `show link-management peer` command to display MPLS peer link information.

```
user@R1> show link-management peer
Peer name: tester2, System identifier: 48428
  State: Up, Control address: 10.35.1.5
    Control-channel      State
    gre.0                Active
  TE links:
    tester2
```

```
user@R2> show link-management peer
Peer name: tester2, System identifier: 48428
  State: Up, Control address: 10.35.1.6
    Control-channel      State
    gre.0                Active
  TE links:
    te-tester2
```

```
Peer name: tester3 , System identifier: 48429
  State: Up , Control address: 10.35.1.2
    Control-channel      State
    gre.1                Active
  TE links:
    te-tester3
```

```
user@R3> show link-management peer
Peer name: tester3, System identifier: 48429
  State: Up, Control address: 10.35.1.1
    Control-channel      State
    gre.0                Active
  TE links:
    te-tester3
```

**Meaning** The sample output from all routers in the example network in [Figure 117 on page 1192](#) for the `show link-management peer` command shows that all control channels are up and active. A detailed analysis of the output shows the following information:

- Name of the peer, `tester2` or `tester3`, which is the same on neighboring routers for ease of troubleshooting.
- Internal identifier for the peer, `48428` for `tester2` and `48429` for `tester3`. The internal identifier is a range of values from 0 through 64,000.
- The state of the peer, which can be up or down. In this case, all peers are up.
- The address to which a control channel is established, for example, `10.35.1.5`.

- The state of the control channel, which can be up, down, or active.
- The traffic-engineered links that are managed by their peer, indicating that control channel **gre.0** is managed by **tester3**.

**Sample Output** Use the show link-management te-link command to display the resources used to set up Multiprotocol Label Switching (MPLS) traffic-engineered forwarding paths.

```
user@R1> show link-management te-link
TE link name:  tester2, State: Up
  Local identifier: 2005, Remote identifier: 21253, Local address: 90.90.90.90,

  Remote address: 103.103.103.103,
  Encoding: SDH/SONET, Switching: PSC-1, Minimum bandwidth: 0bps, Maximum
  bandwidth: 0bps, Total bandwidth: 0bps,
  Available bandwidth: 0bps
    Name      State Local ID Remote ID      Bandwidth Used   LSP-name
    so-0/0/1  Dn    21252  21252      155.52Mbps No
```

**Meaning** The sample output for the **show link-management te-link** command issued on the three routers in the network in [Figure 117 on page 1192](#) shows the resources allocated to the traffic-engineered links **te-tester2** and **te-tester3**. The resources are the SONET interfaces **so-0/0/0** and **so-0/0/1**. On **R1** and **R2**, the SONET interfaces are used for the LSP **gmpls-r1-to-r3**, as indicated by **Yes** in the **Used** field. However, the SONET interface **so-0/0/1** on **R3** is down (**Dn**) and is not used for the LSP (**Used No**). Further investigation is required to discover why the SONET interface on **R3** is down.

**Sample Output** Use the show log *filename* command to display the contents of the specified log file. In this case, the log file *rsvp.log* is configured at the [edit protocols rsvp traceoptions]

hierarchy level. When the log file is configured, you must issue the `monitor start filename` command to begin logging messages to the file.

```
user@R1> show configuration protocols rsvp
traceoptions {
    file rsvp.log size 3m world-readable;
    flag state detail;
    flag error detail;
    flag packets detail;
}

user@R1> monitor start rsvp.log
```

**NOTE:** The `find Error` option entered after the pipe (|) searches the output for an instance of the term *Error*.

#### Sample Output

```
user@R3>
show log rsvp.log | find Error

```

**Meaning** The sample output from the egress router **R3** for the `show log rsvp.log` command is a snippet taken from the log file. The snippet shows a Link Management Protocol (LMP) resource request for the LSP **gmpls-r1-to-r3**. The request has problems with the encoding type (SDH/SONET), indicating a possible error with the SONET interface connecting **R2** and **R3**. Further investigation of the configuration of the LMP on **R2** and **R3** is required.

**Sample Output** Use the `show configuration statement-path` command to display a specific configuration hierarchy; in this instance, link-management.

```
user@R2> show configuration protocols link-management
```

```
te-link te-tester2 {
    local-address 100.100.100.100;
    remote-address 90.90.90.90;
    remote-id 22292;
    interface so-0/0/0 {
        local-address 100.100.100.100;
        remote-address 90.90.90.90;
        remote-id 21253;
    }
}
te-link te-tester3 {
    local-address 103.103.103.103;
    remote-address 93.93.93.93;
    remote-id 21254;
    interface so-0/0/1 {
        local-address 103.103.103.103;
        remote-address 93.93.93.93;
        remote-id 21252;
    }
}
peer tester2 {
    address 10.35.1.6;
    control-channel gre.0;
    te-link te-tester2;
}
peer tester3 {
    address 10.35.1.2;
    control-channel gre.1;
    te-link te-tester3;
}
```

```
user@R3> show configuration protocols link-management
```

```
te-link te-tester3 {
    local-address 93.93.93.93;
    remote-address 103.103.103.103;
    remote-id 21254;
}
interface at-0/3/1 {
    local-address 93.93.93.93;
    remote-address 103.103.103.103;
    remote-id 21252;
}
}
peer tester3 {
    address 10.35.1.1;
    control-channel gre.0;
    te-link te-tester3;
}
```

**Meaning** The sample output from transit router **R2** and ingress router **R3** for the **show configuration protocols link-management** command shows that the interface type on the two routers is different. The resource allocated to **te-tester3** on transit router **R2** is a SONET interface, while the resource allocated to **te-tester3** on egress router **R3** is an ATM interface. The interface type on each end of the data or control channels must be of the same type. In this case, both ends should be SONET or ATM.

**Solution** The solution to the problem of different interface or encapsulation types at either end of the GMPLS LSP is to make sure that the interface type is the same at both ends. In this case, the ATM interface was deleted from the link-management configuration on **R3**, and a SONET interface was configured instead.

The following commands illustrate the correct configuration and commands to verify that the GMPLS LSP is up and using the data channel:

```
user@R3> show configuration protocols link-management
user@R3> show mpls lsp
user@R3> show link-management te-link
```

**Sample Output**

```
user@R3> show configuration protocols link-management
te-link te-tester3 {
    local-address 93.93.93.93;
    remote-address 103.103.103.103;
    remote-id 21254;
    interface so-0/0/1 { # SONET interface replaces the incorrect ATM interface
        local-address 93.93.93.93;
        remote-address 103.103.103.103;
        remote-id 21252;
    }
}
peer tester3 {
    address 10.35.1.1;
    control-channel gre.0;
    te-link te-tester3;
}

user@R3> show mpls lsp
Ingress LSP: 0 sessions

Bidir
Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

user@R3> show link-management te-link
TE link name: te-tester3, State: Up
Local identifier: 7003, Remote identifier: 21254, Local address: 93.93.93.93,
Remote address: 103.103.103.103,
Encoding: SDH/SONET, Switching: PSC-1, Minimum bandwidth: 155.52Mbps, Maximum
bandwidth: 155.52Mbps, Total bandwidth: 155.52Mbps,
Available bandwidth: 0bps
Name          State Local ID Remote ID   Bandwidth Used LSP-name
so-0/0/1 Up      21252  21252  155.52Mbps Yes gmpls-r1-to-r3
```

**Meaning** The sample output for the **show protocols link-management**, **show mpls lsp**, and **show link-management te-link** commands from ingress router **R3** show that the problem is solved. LMP is correctly configured, and the LSP **gmpls-r1-to-r3** is up and using the data channel **so-0/0/1**.

**Conclusion** In conclusion, both ends of a GMPLS data channel must be the same encapsulation or interface type. This case illustrates the correct configuration of the data channel. The principles are the same for the control channel.

**Router Configurations** Output that shows the configurations of the ingress router in the network. The **no-more** option entered after the pipe (|) prevents the output from being paginated if the output is longer than the length of the terminal screen.

**Sample Output** The following sample output is for ingress router R1:

```
user@R1> show configuration | no-more
[...Output truncated...]
interfaces {
  so-0/0/0 {

## Verify Protocol Families

**Purpose** If a logical interface does not have MPLS enabled, it cannot perform MPLS switching. This step allows you to quickly determine which interfaces are configured with MPLS and other protocol families.

**Action** To verify the protocol families configured on the routers in your network, enter the following Junos OS CLI operational mode command:

```
user@host> show interfaces terse
```

### Sample Output 1

```

                        mpls

```

**Meaning** Sample Output 1 shows the interface, the administrative status of the link (**Admin**), the data link layer status of the link (**Link**), the protocol families configured on the interface (**Proto**), and the local and remote addresses on the interface.

All interfaces on all routes in the network shown in [Figure 115 on page 1157](#) are administratively enabled and functioning at the data link layer with MPLS and IS-IS, and have an **inet** address. All are configured with an IPv4 protocol family (**inet**), and have the IS-IS (**iso**) and MPLS (**mpls**) protocol families configured at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level.

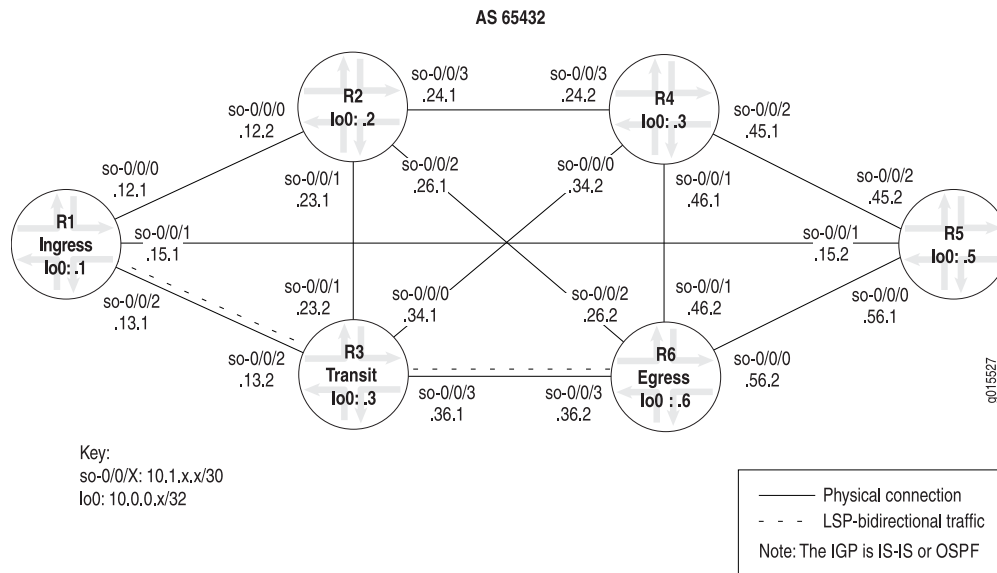

Sample Output 2 shows that interface **so-0/0/2.0** on **R6** does not have the **mpls** statement included at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level.

## Determining LSP Status

Display detailed information about Resource Reservation Protocol (RSVP) objects and the label-switched path (LSP) history to pinpoint a problem with the LSP.

Figure 118 on page 1210 illustrates the network topology used in this topic.

Figure 118: MPLS Network Topology

To determine the LSP state, follow these steps:

1. [Check the Status of the LSP on page 1210](#)
2. [Display Extensive Status About the LSP on page 1211](#)

## Check the Status of the LSP

**Purpose** Display the status of the label-switched path (LSP).

**Action** To determine the LSP status, on the ingress router, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show mpls lsp
```

## Sample Output

```
user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPname
10.0.0.6    10.0.0.1    Up    1      *    R1-to-R6
Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions
To          From          State Rt Style  Labelin Labelout LSPname
10.0.0.1    10.0.0.6    Up    01 FF  3      -    R6-to-R1
Total 1 displayed, Up 1, Down 0
```

```
Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

**Meaning** The sample output is from the ingress router (**R1**), and shows ingress, egress, and transit LSP information. Ingress information is for the sessions that originate from this router, egress information is for sessions that terminate on this router, and transit information is for sessions that transit through this router.

There is one ingress route from **R1 (10.0.0.1)** to **R6 (10.0.0.6)**. This route is currently up, and is an active route installed in the routing table (**Rt**). The LSP **R1-to-R6** is the primary path (**P**) as opposed to the secondary path, and is indicated by an asterisk (**\***). The route to **R6** does not contain a named path (**ActivePath**).

There is one egress LSP from **R6** to **R1**. The **State** is up, with no routes installed in the routing table. RSVP reservation style (**Style**) consists of two parts. The first is the number of active reservations (**1**). The second is the reservation style, which is **FF** (fixed filter). The reservation style can be **FF**, **SE** (shared explicit), or **WF** (wildcard filter). There are three incoming labels (**Labelin**) and no labels going out (**Labelout**) for this LSP.

There are no transit LSPs.

For more information on checking the LSP state, see [“Checklist for Working with the Layered MPLS Troubleshooting Model”](#) on page 948.

## Display Extensive Status About the LSP

**Purpose** Display extensive information about LSPs, including all past state history and the reasons why an LSP might have failed.

**Action** To display extensive information about LSPs, on the ingress router, enter the following Junos OS CLI operational mode command:

```
user@host> show mpls lsp extensive
```

## Sample Output

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

```

**Meaning** The sample output is from the ingress router (**R1**), and shows ingress, egress, and transit LSP information in detail, including all past state history and the reasons why an LSP failed. Ingress information is for sessions that originate from this router, egress information is for sessions that terminate on this router, and transit information is for sessions that transit through this router.

There is one ingress route from **R1 (10.0.0.1)** to **R6 (10.0.0.6)**. This route is currently up (**State**), with one route actively using the LSP, **R1-to-R6**. The LSP active path is the primary path. Even if the LSP does not contain a **primary** or **secondary** keyword, the router still treats the LSP as a primary LSP, indicating that if the LSP fails, the router will attempt to signal inactive LSPs at 30-second intervals, by default.

Load balancing is **Random**, which is the default, indicating that when selecting the physical path for an LSP, the router randomly selects among equal-cost paths that have an equal hop count. Other options that you can configure are **Least-fill** and **Most-fill**. **Least-fill** places the LSP over the least utilized link of the equal-cost paths with equal hop count. **Most-fill** places the LSP over the most utilized link of the equal-cost paths sharing an equal hop count. Utilization is based on the percentage of available bandwidth.

The **Encoding type** field shows Generalized MPLS (GMPLS) signaling parameters (**Packet**), indicating IPv4. The **Switching type** is **Packet**, and the Generalized Payload Identifier (**GPID**) is IPv4.

The primary path is the active path, as indicated by an asterisk (\*). The state of the LSP is **Up**.

The Explicit Route Object (**ERO**) includes the Constrained Shortest Path First (CSPF) cost (**20**) for the physical path that the LSP follows. The presence of the CSPF metric indicates that this is a CSPF LSP. The absence of the CSPF metric indicates a no-CSPF LSP.

The field **10.1.13.2 S** indicates the actual ERO. The RSVP signaling messages went to **10.1.13.2** strictly (as a next hop) and finished at **10.1.36.2** strictly. All ERO addresses are strict hops when the LSP is a CSPF LSP. Loose hops can only display in a no-CSPF LSP.

The received Record Route Object (**RRO**) has the following protection flags:

- **0x01**—Local protection available. The link downstream of this node is protected by a local repair mechanism. This flag can only be set if the Local protection flag was set in the SESSION\_ATTRIBUTE object of the corresponding path message.
- **0x02**—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).
- **0x04**—Bandwidth protection. The downstream router has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.
- **0x08**—Node protection. The downstream router has a backup path providing protection against link and node failure on the corresponding path section. If the downstream router can set up only a link-protection backup path, the “Local protection available” bit is set but the “Node protection” bit is cleared.
- **0x10**—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engineered LSP. This indicates to the ingress label edge router (LER) of this LSP that it should be rerouted.

For more information on protection flags, see the *Junos Routing Protocols and Policies Command Reference*.

The field **10.1.13.2.10.1.36.2** is the actual received record route (**RRO**). Note that the addresses in the **RRO** field match those in the **ERO** field. This is the normal case for CSPF LSPs. If the RRO and ERO addresses do not match for a CSPF LSP, the LSP has to reroute or detour.

The lines numbered 91 through 42 contain the 49 most recent entries to the history log. Each line is time stamped. The most recent entries have the largest log history number and are at the top of the log, indicating that line 91 is the most recent history log entry. When you read the log, start with the oldest entry (**42**) to the most recent (**91**).

The history log was started on July 10, and displays the following sequence of activities: an LSP was selected as active, was found to be down, MPLS label allocation failed several times, was deleted several times, was preempted because of an ResvTear, was deselected as active, and was cleared. In the end, the router computed a CSPF ERO, signaled the call, the LSP came up with the listed RRO (line 90), and was listed as active.

For more information on error messages, see the *Junos MPLS Network Operations Guide Log Reference*.

The total number of ingress LSPs displayed is **1**, with **1** up and **0** down. The number in the **Up** field plus the number in the **Down** field should equal the total.

There is one egress LSP session from **R6** to **R1**. The **State** is up, with no routes installed in the routing table. RSVP reservation style (**Style**) consists of two parts. The first is the number of active reservations (**1**). The second is the reservation style, which is **FF** (fixed filter). The reservation style can be **FF**, **SE** (shared explicit), or **WF** (wildcard filter). There are three incoming labels (**Labelin**) and no labels going out (**Labelout**) for this LSP.

There are no transit LSPs.

For more information on checking the LSP state, see [“Checklist for Working with the Layered MPLS Troubleshooting Model” on page 948](#).

## Check the Status of the LSP

- Purpose** Display the status of the label-switched path (LSP).
- Action** To determine the LSP status, on the ingress router, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show mpls lsp
```

### Sample Output

```
user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPName
10.0.0.6    10.0.0.1    Up    1      *  R1-to-R6
Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions
To          From          State Rt Style  Labelin Labelout LSPName

Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

- Meaning** The sample output is from the ingress router (**R1**), and shows ingress, egress, and transit LSP information. Ingress information is for the sessions that originate from this router, egress information is for sessions that terminate on this router, and transit information is for sessions that transit through this router.

There is one ingress route from **R1** (**10.0.0.1**) to **R6** (**10.0.0.6**). This route is currently up, and is an active route installed in the routing table (**Rt**). The LSP **R1-to-R6** is the primary path (**P**) as opposed to the secondary path, and is indicated by an asterisk (**\***). The route to **R6** does not contain a named path (**ActivePath**).

There is one egress LSP from **R6** to **R1**. The **State** is up, with no routes installed in the routing table. RSVP reservation style (**Style**) consists of two parts. The first is the number of active reservations (**1**). The second is the reservation style, which is **FF** (fixed filter). The reservation style can be **FF**, **SE** (shared explicit), or **WF** (wildcard filter). There are three incoming labels (**Labelin**) and no labels going out (**Labelout**) for this LSP.

There are no transit LSPs.

For more information on checking the LSP state, see [“Checklist for Working with the Layered MPLS Troubleshooting Model” on page 948](#).

## Display Extensive Status About the LSP

- Purpose** Display extensive information about LSPs, including all past state history and the reasons why an LSP might have failed.

**Action** To display extensive information about LSPs, on the ingress router, enter the following Junos OS CLI operational mode command:

Total 0 displayed, Up 0, Down 0

**Meaning** The sample output is from the ingress router (**R1**), and shows ingress, egress, and transit LSP information in detail, including all past state history and the reasons why an LSP failed. Ingress information is for sessions that originate from this router, egress information is for sessions that terminate on this router, and transit information is for sessions that transit through this router.

There is one ingress route from **R1 (10.0.0.1)** to **R6 (10.0.0.6)**. This route is currently up (**State**), with one route actively using the LSP, **R1-to-R6**. The LSP active path is the primary path. Even if the LSP does not contain a **primary** or **secondary** keyword, the router still treats the LSP as a primary LSP, indicating that if the LSP fails, the router will attempt to signal inactive LSPs at 30-second intervals, by default.

Load balancing is **Random**, which is the default, indicating that when selecting the physical path for an LSP, the router randomly selects among equal-cost paths that have an equal hop count. Other options that you can configure are **Least-fill** and **Most-fill**. **Least-fill** places the LSP over the least utilized link of the equal-cost paths with equal hop count. **Most-fill** places the LSP over the most utilized link of the equal-cost paths sharing an equal hop count. Utilization is based on the percentage of available bandwidth.

The **Encoding type** field shows Generalized MPLS (GMPLS) signaling parameters (**Packet**), indicating IPv4. The **Switching type** is **Packet**, and the Generalized Payload Identifier (**GPID**) is IPv4.

The primary path is the active path, as indicated by an asterisk (\*). The state of the LSP is **Up**.

The Explicit Route Object (**ERO**) includes the Constrained Shortest Path First (CSPF) cost (**20**) for the physical path that the LSP follows. The presence of the CSPF metric indicates that this is a CSPF LSP. The absence of the CSPF metric indicates a no-CSPF LSP.

The field **10.1.13.2 S** indicates the actual ERO. The RSVP signaling messages went to **10.1.13.2** strictly (as a next hop) and finished at **10.1.36.2** strictly. All ERO addresses are strict hops when the LSP is a CSPF LSP. Loose hops can only display in a no-CSPF LSP.

The received Record Route Object (**RRO**) has the following protection flags:

- **0x01**—Local protection available. The link downstream of this node is protected by a local repair mechanism. This flag can only be set if the Local protection flag was set in the SESSION\_ATTRIBUTE object of the corresponding path message.
- **0x02**—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).
- **0x04**—Bandwidth protection. The downstream router has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.
- **0x08**—Node protection. The downstream router has a backup path providing protection against link and node failure on the corresponding path section. If the downstream router can set up only a link-protection backup path, the “Local protection available” bit is set but the “Node protection” bit is cleared.
- **0x10**—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engineered LSP. This indicates to the ingress label edge router (LER) of this LSP that it should be rerouted.

For more information on protection flags, see the *Junos Routing Protocols and Policies Command Reference*.

The field **10.1.13.2.10.1.36.2** is the actual received record route (**RRO**). Note that the addresses in the **RRO** field match those in the **ERO** field. This is the normal case for CSPF LSPs. If the RRO and ERO addresses do not match for a CSPF LSP, the LSP has to reroute or detour.

The lines numbered 91 through 42 contain the 49 most recent entries to the history log. Each line is time stamped. The most recent entries have the largest log history number and are at the top of the log, indicating that line 91 is the most recent history log entry. When you read the log, start with the oldest entry (**42**) to the most recent (**91**).

The history log was started on July 10, and displays the following sequence of activities: an LSP was selected as active, was found to be down, MPLS label allocation failed several times, was deleted several times, was preempted because of an ResvTear, was deselected

as active, and was cleared. In the end, the router computed a CSPF ERO, signaled the call, the LSP came up with the listed RRO (line 90), and was listed as active.

For more information on error messages, see the *Junos MPLS Network Operations Guide Log Reference*.

The total number of ingress LSPs displayed is **1**, with **1** up and **0** down. The number in the **Up** field plus the number in the **Down** field should equal the total.

There is one egress LSP session from **R6** to **R1**. The **State** is up, with no routes installed in the routing table. RSVP reservation style (**Style**) consists of two parts. The first is the number of active reservations (**1**). The second is the reservation style, which is **FF** (fixed filter). The reservation style can be **FF**, **SE** (shared explicit), or **WF** (wildcard filter). There are three incoming labels (**Labelin**) and no labels going out (**Labelout**) for this LSP.

There are no transit LSPs.

For more information on checking the LSP state, see “[Checklist for Working with the Layered MPLS Troubleshooting Model](#)” on page 948.

## Checking That RSVP Path Messages Are Sent and Received

**Purpose** The presence or absence of various RSVP messages can help determine if there is a problem with Multiprotocol Label Switching (MPLS) in your network. For example, if path messages occur in the output without Resv messages, it might indicate that label-switched paths (LSPs) are not being created.

**Action** To check that RSVP Path messages are sent and received, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show rsvp statistics
```

### Sample Output

```
user@R1> show rsvp statistics
  PacketType      Sent      Received      Total      Last 5 seconds
                        Sent      Received
Path      114523      80185      1          0          0
PathErr      5          10          0          0
PathTear     12          6           0          0
Resv FF      80515      111476      0          0
Resv WF           0           0          0          0
Resv SE           0           0          0          0
ResvErr       0           0          0          0
ResvTear      0           5           0          0
ResvConf       0           0          0          0
Ack            0           0          0          0
SRefresh       0           0          0          0
Hello      915851      915881      0          0
EndtoEnd RSVP      0           0          0          0

Errors                        Total      Last 5 seconds
Rcv pkt bad length           0          0
Rcv pkt unknown type         0          0
Rcv pkt bad version          0          0
```

Rcv pkt auth fail	0	0
Rcv pkt bad checksum	0	0
Rcv pkt bad format	0	0
Memory allocation fail	0	0
No path information	0	0
Resv style conflict	0	0
Port conflict	0	0
Resv no interface	0	0
<b>PathErr to client</b>	<b>15</b>	<b>0</b>
ResvErr to client	0	0
Path timeout	0	0
Resv timeout	0	0
Message out-of-order	0	0
Unknown ack msg	0	0
Recv nack	0	0
Recv duplicated msg-id	0	0
No TE-link to recv Hop	0	0

**Meaning** The sample output shows RSVP messages sent and received. The total number of RSVP Path messages is 11,4532 sent and 80,185 received. Within the last 5 seconds, no messages have been sent or received.

A total of 5 **PathErr** messages were sent and 10 received. When path errors occur (usually because of parameter problems in a path message), the router sends a unicast PathErr message to the sender that issued the path message. In this case, **R1** sent at least 10 path messages with an error, as indicated by the 10 PathErr messages that **R1** has received. The downstream router sent **R1** five path messages with an error, as indicated by the five PathErr messages that **R1** has sent. PathErr messages transmit in the opposite direction to path messages.

A total of 12 **PathTear** messages were sent and 6 received, none in the last 5 seconds. In contrast to PathErr messages, PathTear messages travel in the same direction as path messages. Since path messages are both sent and received, PathTear messages are also sent and received. However, if only path messages are sent, then only the PathTear messages that are sent appear in the output.

A total of 80,515 reservation (**Resv**) messages with the fixed filter (**FF**) reservation style were sent and 111,476 received, none in the last 5 seconds. An **FF** reservation style indicates that within each session, each receiver establishes its own reservation with each upstream sender, and that all selected senders are listed. No messages for the wildcard filter (**WF**) or shared explicit (**SE**) reservation styles are sent or received. For more information on RSVP reservation styles, see the *Junos MPLS Applications Configuration Guide*.

Other RSVP message types are not sent or received. For information on the ResvErr, ResvTear, and Resvconf message types, see the *Junos MPLS Applications Configuration Guide*.

Ack and summary refresh (SRefresh) messages do not appear in the output. Ack and summary refresh messages are defined in RFC 2961 and are part of the RSVP extensions. Ack messages are used to reduce the amount of RSVP control traffic in the network.

A total of 915,851 hello messages were sent and 915,881 received, with none transmitted or received in the last 5 seconds. The RSVP hello interval is 9 seconds. If more than one

hello message is sent or received in the last 5 seconds, it implies that more than one interface supports RSVP.

**EndtoEnd** RSVP messages are legacy RSVP messages that are not used for RSVP traffic engineering. These counters increment only when RSVP forwards legacy RSVP messages issued by a virtual private network (VPN) customer for transit across the backbone to the other site(s) in the VPN. They are called end-to-end messages because they are intended for the opposite side of the network and only have meaning at the two ends of the provider network.

The **Errors** section of the output shows statistics about RSVP packets with errors. A total of 15 **PathErr to client** packets were sent to the Routing Engine. The total combines the sent and received **PathErr** packets. For more information about error statistics and packets, see the *Junos System Basics and Services Command Reference*.

## Determining the Current RSVP Neighbor State

**Purpose** Display a list of RSVP neighbors that were learned dynamically when exchanging RSVP packets. Once a neighbor is learned, it is never removed from the list of RSVP neighbors.

**Action** To determine the current RSVP neighbor state, enter the following Junos OS CLI operational mode command:

```
user@host> show rsvp neighbor
```

### Sample Output

```
user@R6> show rsvp neighbor
RSVP neighbor: 2 learned
Address  Idle Up/Dn LastChange  HelloInt  HelloTx/Rx  MsgRcvd
10.1.36.1   5  1/0  1w5d 6:30:50    9      116734/116734  23558
10.1.56.1  10  1/0  2w2d 23:44:15    9      161600/161600  23570
```

**Meaning** The sample output shows that **R6** has learned about two different RSVP neighbors. Each neighbor has one line of output that includes the neighbor RSVP address, the length of time the interface was idle, the current interface up/down counter, the time of the last interface state change, the current RSVP hello interval, the total number of RSVP hello messages transmitted and received, and the total number of RSVP messages received on the interface.

The **show rsvp neighbor** command only indicates a neighbor after a session is established. Once an interface is displayed in this command output, it always appears, even if the RSVP neighbor state is down.

The RSVP neighbor **10.1.36.1** was idle for 5 seconds, came up once and has not gone down, indicating that the interface is currently in an **Up** state. As long as the up counter is one greater than the down counter, the RSVP interface is up. If the up/down counters are equal, the interface is down.

The last state change occurred 6 hours and 30 minutes ago. The current hello interval is 9 seconds. A total of 116,734 hello messages were transmitted and received on this interface, and a total of 23,558 RSVP Path/Resv messages were processed.

The RSVP neighbor **10.1.56.1** was idle for 10 seconds, came up once and has not gone down, indicating that the interface is currently in an **Up** state. The last state change occurred 23 hours and 44 minutes ago. The current Hello interval is 9 seconds. A total of 161,600 hello messages were transmitted and received on this interface, and a total of 23,570 RSVP Path/Resv messages were processed.

## Take Appropriate Action

---

**Problem**    **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the routers are configured to function at different levels of the IS-IS protocol.

**Solution**    To correct the error in this example, enter the following commands:

### Sample Output

```
[edit protocols isis]
user@R6# show
level 2 disable;
interface all {
    level 2 metric 10;
}
interface fxp0.0 {
    disable;
}
interface lo0.0; {
    passive
```

```
[edit protocols isis]
user@R6# delete level 2
```

```
[edit protocols isis]
user@R6# set level 1 disable
```

```
[edit protocols isis]
user@R6# show
level 1 disable;
interface all {
    level 2 metric 10;
}
interface fxp0.0 {
    disable;
}
interface lo0.0; {
    passive
```

```
[edit protocols isis]
user@R6# commit
commit complete
```

```
[edit protocols isis]
user@R6# run show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
so-0/0/0.0	R5	2 Up	22	
so-0/0/1.0	R4	2 Up	22	
so-0/0/2.0	R2	2 Up	22	
so-0/0/3.0	R3	2 Up	22	

## Meaning

The sample output shows that the configuration error on egress router R6 has been corrected, and IS-IS adjacencies are now established.

**Related Documentation**

- *IS-IS Feature Guide*

## Examine BGP Routes

**Purpose** You can examine the BGP path selection process to determine the single, active path when BGP receives multiple routes to the same destination. In this step, we examine the reverse LSP **R6-to-R1**, making **R6** the ingress router for that LSP.

**Action** To examine BGP routes and route selection, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix detail
```

## Sample Output 1

```
user@R6> show route 100.100.1.1 detail
inet.0: 30 destinations, 46 routes (29 active, 0 holddown, 1 hidden)
100.100.1.0/24 (1 entry, 1 announced)
  *BGP      Preference: 170/-101
             Source: 10.1.13.1
             Next hop: via so-0/0/3.0, selected
             Protocol next hop: 10.1.13.1 Indirect next hop: 8671594 304
             State: <Active Int Ext>
             Local AS: 65432 Peer AS: 65432
             Age: 4d 5:15:39 Metric2: 2
             Task: BGP_65432.10.1.13.1+3048
             Announcement bits (2): 0-KRT 4-Resolve inet.0
             AS path: I
             Localpref: 100
             Router ID: 10.0.0.1
```

## Sample Output 2

```
user@R6> show route 100.100.1.1 detail
inet.0: 30 destinations, 46 routes (29 active, 0 holddown, 1 hidden)
100.100.1.0/24 (1 entry, 1 announced)
  *BGP      Preference: 170/-101
             Source: 10.0.0.1
             Next hop: via so-0/0/3.0 weight 1, selected
             Label-switched-path R6-to-R1
             Label operation: Push 100000
             Protocol next hop: 10.0.0.1 Indirect next hop: 8671330 301
             State: <Active Int Ext>
             Local AS: 65432 Peer AS: 65432
             Age: 24:35 Metric2: 2
             Task: BGP_65432.10.0.0.1+179
             Announcement bits (2): 0-KRT 4-Resolve inet.0
             AS path: I
             Localpref: 100
             Router ID: 10.0.0.1
```

**Meaning** Sample Output 1 shows that the BGP next hop (10.1.13.1) does not equal the LSP destination address (10.0.0.1) in the **to** statement at the **[edit protocols mpls label-switched-path label-switched-path-name]** hierarchy level when the BGP configuration of R6 and R1 is incorrect.

Sample Output 2, taken after the configurations on R1 and R6 are corrected, shows that the BGP next hop (10.0.0.1) and the LSP destination address (10.0.0.1) are the same, indicating that BGP can use the LSP to forward BGP traffic.

## CLI Operational Mode Top-Level Commands

In operational mode, you enter commands to monitor and diagnose the software, network connectivity, and the router. When you log in to the router and the CLI starts, you are at the top level of the CLI operational mode. At this level, there are several broad groups of CLI commands. [Table 36 on page 1224](#) lists the top-level CLI operational mode commands and describes the options available for each command. The commands are listed in alphabetical order.

**Table 36: CLI Operational Mode Top-Level Commands**

Command	Description
<b>clear</b>	Clear statistics and protocol database information.  Syntax: <b>clear</b> (arp   bgp   firewall   helper   igmp   ike   ilmi   interfaces   ipsec   ipv6   isis   ldp   log   mpls   msdp   multicast   ospf   pim   rip   ripng   route   rsvp   snmp   system   vrrp)
<b>configure</b>	Enter CLI configuration mode.  Alternative commands: <b>configure</b> <exclusive> <private>
<b>file</b>	Perform file manipulation operations, such as copy, delete, list, rename, and show.  Syntax: <b>file</b> (compare   copy   delete   list   rename   show)
<b>help</b>	Provide help information.  Syntax: <b>help</b> (reference   syslog   topic)
<b>monitor</b>	Monitor a log file or interface traffic in real time.  Syntax: <b>monitor</b> (interface   list   start   stop   traffic)
<b>mtrace</b>	Display trace information about a multicast path from a source to a receiver.  Syntax: <b>mtrace</b> (from-source   monitor   to-gateway)

Table 36: CLI Operational Mode Top-Level Commands (*continued*)

Command	Description
<b>ping</b>	<p>Verify IP connectivity to another IP host or Asynchronous Transfer Mode (ATM) connectivity (ping ATM) using Operation Administration and Maintenance (OAM) cells to an ATM endstation.</p> <p>Syntax: <b>ping host</b> &lt;interface <i>source-interface</i>&gt; &lt;bypass-routing&gt; &lt;count <i>requests</i>&gt; &lt;do-not-fragment&gt; &lt;interval <i>seconds</i>&gt; &lt;pattern <i>string</i>&gt; &lt;record-route&gt; &lt;routing-instance <i>routing-instance-name</i>&gt; &lt;size <i>bytes</i>&gt; &lt;strict&gt; &lt;tos <i>type-of-service</i>&gt; &lt;ttl <i>value</i>&gt; &lt;via <i>route</i>&gt; &lt;rapid   detail&gt;</p> <p>Syntax: <b>ping atm interface</b> <i>interface</i> &lt;count <i>count</i>&gt; &lt;end-to-end   segment&gt; &lt;interval <i>interval</i>&gt; &lt;sequence-number <i>sequence-number</i>&gt; &lt;vci <i>vci</i>&gt; &lt;brief&gt;</p> <p>Syntax: <b>ping vpn-interface</b> <i>vpn-interface host</i> &lt;local <i>echo-address</i>&gt;</p>
<b>pipe</b>	<p>Filter the output of an operational mode or configuration mode command.</p> <p>Syntax:   (compare   count   display &lt;detail   inheritance   xml&gt;   except <i>pattern</i>   find <i>pattern</i>   last <i>lines</i>   match <i>pattern</i>   no-more   resolve &lt;<i>file-names</i>&gt;   save <i>filename</i>   trim <i>columns</i>)</p>
<b>quit</b>	<p>Log out from the CLI process.</p> <p>Syntax: <b>quit</b></p>
<b>request</b>	<p>Make system-level requests, such as halt or reboot the router, load software packages, and back up the router's file systems.</p> <p>Syntax: <b>request system</b> (halt   reboot   snapshot   software)</p>
<b>restart</b>	<p>Restart the router hardware or software processes.</p> <p>Syntax: <b>restart</b> (fpc   class-of-service   gracefully   immediately   interface-control   mib-process   network-access-service   remote-operations   routing   sampling   sfm   snmp   soft)</p>
<b>set</b>	<p>Set CLI properties, the router's date and time, and the craft interface display text.</p> <p>Syntax: <b>set</b> (chassis   cli   date)</p>
<b>show</b>	<p>Show information about all aspects of the software, including interfaces and routing protocols.</p> <p>Syntax: <b>show</b> (accounting   aps   arp   as-path   bgp   chassis   cli   configuration   connections   dvmrp   firewall   helper   host   igmp   ike   ilmi   interfaces   ipsec   ipv6   isis   l2circuit   l2vpn   ldp   link-management   log   mpls   msdp   multicast   ntp   ospf   pfe   pim   policer   policy   rip   ripng   route   rsvp   sap   snmp   system   task   ted   version   vrrp)</p>
<b>ssh</b>	<p>Open a secure shell to another host.</p> <p>Syntax: <b>ssh host</b> &lt;bypass-routing&gt; &lt;routing-instance <i>routing-instance-name</i>&gt; &lt;source <i>address</i>&gt; &lt;vpn-interface <i>vpn-interface</i>&gt; &lt;v1   v2&gt;</p>
<b>start</b>	<p>Start a software process.</p> <p>Syntax: <b>start shell</b></p>

Table 36: CLI Operational Mode Top-Level Commands (*continued*)

Command	Description
<b>telnet</b>	Start a telnet session to another host.  Syntax: <b>telnet</b> <i>host</i> <8bit> <bypass-routing> <inet   inet6> <noresolve> <port <i>port</i> > <interface <i>interface-name</i> > <routing-instance <i>routing-instance-name</i> > <source address > <vpn-interface <i>vpn-interface</i> >
<b>test</b>	Run various diagnostic debugging commands.  Syntax: <b>test</b> (configuration   interface   msdp   policy)
<b>traceroute</b>	Trace the route to a remote host.  Syntax: <b>traceroute</b> <i>host</i> <as-number-lookup> <bypass-routing> <gateway address > <inet   inet6> <noresolve> <routing-instance <i>routing-instance-name</i> > <source address > <tos value > <ttl value > <vpn-interface <i>vpn-interface</i> > <wait seconds>

## CLI Keyboard Shortcuts

In the CLI, you can use keyboard sequences to move around and edit a command line. You can also use keyboard sequences to scroll through a list of recently executed commands.

Table 15 on page 23 lists some of the CLI keyboard sequences.

Table 37: CLI Keyboard Shortcuts

Keyboard sequence	Action
<b>Ctrl+b</b>	Move the cursor back one character.
<b>Esc+b</b> or <b>Alt+b</b>	Move the cursor back one word.
<b>Ctrl+f</b>	Move the cursor forward one character.
<b>Esc+f</b> or <b>Alt+f</b>	Move the cursor forward one word.
<b>Ctrl+a</b>	Move the cursor to the beginning of the command line.
<b>Ctrl+e</b>	Move the cursor to the end of the command line.
<b>Ctrl+h</b> , <b>Delete</b> , or <b>Backspace</b>	Delete the character before the cursor.
<b>Ctrl+d</b>	Delete the character at the cursor.
<b>Ctrl+k</b>	Delete the all characters from the cursor to the end of the command line.
<b>Ctrl+u</b> or <b>Ctrl+x</b>	Delete the all characters from the command line.
<b>Ctrl+w</b> , <b>Esc+Backspace</b> , or <b>Alt+Backspace</b>	Delete the word before the cursor.

Table 37: CLI Keyboard Shortcuts (*continued*)

Keyboard sequence	Action
<b>Esc+d</b> or <b>Alt+d</b>	Delete the word after the cursor.
<b>Ctrl+y</b>	Insert the most recently deleted text at the cursor.
<b>Ctrl+l</b>	Redraw the current line.
<b>Ctrl+p</b>	Scroll backward through the list of recently executed commands.
<b>Ctrl+n</b>	Scroll forward through the list of recently executed commands.
<b>Ctrl+r</b>	Search the CLI history incrementally in reverse order for lines matching the search string.
<b>Esc+/</b> or <b>Alt+/</b>	Search the CLI history for words for which the current word is a prefix.
<b>Esc-1</b> through <b>Esc-9</b> or <b>Alt-1</b> through <b>Alt-9</b>	Specify the number of times to execute a keyboard sequence.

## Manage Output at the ---(more)--- Prompt

If the output is longer than the screen length, it appears one screen at a time with the UNIX **---(more)---** prompt at the end of the screen. The **---(more)---** prompt indicates that more output is available. The following table lists the keyboard sequences you can use at the **---(more)---** prompt.

Table 38: Keyboard Shortcuts at the ---(more)--- Prompt

Keyboard Shortcut	Action
<b>Enter</b> , <b>Return</b> , <b>k</b> , <b>Ctrl+m</b> , <b>Ctrl+n</b> , or <b>down arrow</b>	Scroll down one line.
<b>Tab</b> , <b>d</b> , <b>Ctrl+d</b> , or <b>Ctrl+x</b>	Scroll down one-half screen.
<b>Space</b> or <b>Ctrl+f</b>	Scroll down one whole screen.
<b>Ctrl+e</b> or <b>g</b>	Scroll down to the bottom of the output.
<b>n</b> (or <b>no-more</b> )	Display the output all at once instead of one screen at a time.
<b>j</b> , <b>Ctrl-h</b> , <b>Ctrl-p</b> , or <b>up arrow</b>	Scroll up one line.
<b>u</b> or <b>Ctrl-u</b>	Scroll up one-half screen.
<b>b</b> or <b>Ctrl-b</b>	Scroll up one whole screen.
<b>Ctrl-a</b> or <b>g</b>	Scroll up to the bottom of the output.
<b>/string</b>	Search forward for a string.

Table 38: Keyboard Shortcuts at the ---(more)--- Prompt (*continued*)

Keyboard Shortcut	Action
? <i>string</i>	Search backward for a string.
n	Repeat previous search for a string.
m or M (or   <i>match string</i> )	Find a text string. You are prompted for the string to match
e or E (or   <i>except string</i> )	Find, ignoring a text string. You are prompted for the string to ignore.
Ctrl-C, q, Q, or Ctrl-k	Interrupt the display of output.
H (Same as specifying   <i>hold</i> )	Hold the CLI at the <b>—more—</b> prompt after displaying all output.
c or C	Clear any match conditions and display the complete output.
Ctrl-l	Redraw the output on the screen.
s or S (or   <i>save filename</i> )	Save the command output to a file. You are prompted for a filename.

## Working with Problems on Your Network

**Problem**    **Description:** This checklist provides links to troubleshooting basics, an example network, and includes a summary of the commands you might use to diagnose problems with the router and network.

Table 39: Checklist for Working with Problems on Your Network

Tasks	Command or Action
<b>"Isolating a Broken Network Connection" on page 1229</b>	
1. <a href="#">Identifying the Symptoms of a Broken Network Connection on page 1230</a>	ping ( <i>ip-address</i>   <i>hostname</i> ) show route ( <i>ip-address</i>   <i>hostname</i> ) traceroute ( <i>ip-address</i>   <i>hostname</i> )
2. <a href="#">Isolating the Causes of a Network Problem on page 1231</a>	show < configuration   interfaces   protocols   route >
3. <a href="#">Taking Appropriate Action for Resolving the Network Problem on page 1232</a>	[edit] delete routing options static route <i>destination-prefix</i> commit and-quit show route <i>destination-prefix</i>
4. <a href="#">Evaluating the Solution to Check Whether the Network Problem Is Resolved on page 1232</a>	show route ( <i>ip-address</i>   <i>hostname</i> ) ping ( <i>ip-address</i>   <i>hostname</i> ) count 3 traceroute ( <i>ip-address</i>   <i>hostname</i> )

## Isolating a Broken Network Connection

By applying the standard four-step process illustrated in [Figure 119 on page 1229](#), you can isolate a failed node in the network. Note that the functionality described in this section is not supported in versions 15.1X49, 15.1X49-D30, or 15.1X49-D40.

**Figure 119: Process for Diagnosing Problems in Your Network**

Before you embark on the four-step process, however, it is important that you are prepared for the inevitable problems that occur on all networks. While you might find a solution to a problem by simply trying a variety of actions, you can reach an appropriate solution more quickly if you are systematic in your approach to the maintenance and monitoring of your network. To prepare for problems on your network, understand how the network functions under normal conditions, have records of baseline network activity, and carefully observe the behavior of your network during a problem situation.

[Figure 120 on page 1229](#) shows the network topology used in this topic to illustrate the process of diagnosing problems in a network.

**Figure 120: Network with a Problem**

The network in [Figure 120 on page 1229](#) consists of two autonomous systems (ASs). AS 65001 includes two routers, and AS 65002 includes three routers. The border router (R1) in AS 65001 announces aggregated prefixes **100.100/24** to the AS 65002 network. The

problem in this network is that **R6** does not have access to **R5** because of a loop between **R2** and **R6**.

To isolate a failed connection in your network, follow these steps:

1. [Identifying the Symptoms of a Broken Network Connection on page 1230](#)
2. [Isolating the Causes of a Network Problem on page 1231](#)
3. [Taking Appropriate Action for Resolving the Network Problem on page 1232](#)
4. [Evaluating the Solution to Check Whether the Network Problem Is Resolved on page 1232](#)

## Identifying the Symptoms of a Broken Network Connection

**Problem** **Description:** The symptoms of a problem in your network are usually quite obvious, such as the failure to reach a remote host.

**Solution** To identify the symptoms of a problem on your network, start at one end of your network and follow the routes to the other end, entering all or one of the following Junos OS command-line interfaces (CLI) operational mode commands:

```
user@host> ping (ip-address | host-name)
user@host> show route (ip-address | host-name)
user@host> traceroute (ip-address | host-name)
```

### Sample Output

```
user@R6> ping 10.0.0.5
PING 10.0.0.5 (10.0.0.5): 56 data bytes
36 bytes from 10.1.26.1: Time to live exceeded
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
 4 5 00 0054 e2db 0 0000 01 01 a8c6 10.1.26.2 10.0.0.5

36 bytes from 10.1.26.1: Time to live exceeded
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
 4 5 00 0054 e2de 0 0000 01 01 a8c3 10.1.26.2 10.0.0.5

36 bytes from 10.1.26.1: Time to live exceeded
Vr HL TOS Len ID Flg off TTL Pro cks Src Dst
 4 5 00 0054 e2e2 0 0000 01 01 a8bf 10.1.26.2 10.0.0.5

^C
--- 10.0.0.5 ping statistics ---
3 packets transmitted, 0 packets received, 100% packet loss

user@R6> show route 10.0.0.5

inet.0: 20 destinations, 20 routes (20 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.5/32          *[IS-IS/165] 00:02:39, metric 10
                    > to 10.1.26.1 via so-0/0/2.0

user@R6> traceroute 10.0.0.5
traceroute to 10.0.0.5 (10.0.0.5), 30 hops max, 40 byte packets
 1  10.1.26.1 (10.1.26.1)  0.649 ms  0.521 ms  0.490 ms
 2  10.1.26.2 (10.1.26.2)  0.521 ms  0.537 ms  0.507 ms
 3  10.1.26.1 (10.1.26.1)  0.523 ms  0.536 ms  0.514 ms
```

```

4 10.1.26.2 (10.1.26.2) 0.528 ms 0.551 ms 0.523 ms
5 10.1.26.1 (10.1.26.1) 0.531 ms 0.550 ms 0.524 ms

```

### Meaning

The sample output shows an unsuccessful **ping** command in which the packets are being rejected because the time to live is exceeded. The output for the **show route** command shows the interface (**10.1.26.1**) that you can examine further for possible problems. The **traceroute** command shows the loop between **10.1.26.1 (R2)** and **10.1.26.2 (R6)**, as indicated by the continuous repetition of the two interface addresses.

## Isolating the Causes of a Network Problem

**Problem Description:** A particular symptom can be the result of one or more causes. Narrow down the focus of your search to find each individual cause of the unwanted behavior.

**Solution** To isolate the cause of a particular problem, enter one or all of the following Junos OS CLI operational mode command:

```
user@host> show < configuration | bgp | interfaces | isis | ospf | route >
```

Your particular problem may require the use of more than just the commands listed above. See the appropriate command reference for a more exhaustive list of commonly used operational mode commands.

### Sample Output

```

user@R6> show interfaces terse
Interface           Admin Link Proto Local Remote
so-0/0/0            up   up   inet 10.1.56.2/30
so-0/0/0.0           up   up   inet 10.1.56.2/30
                    up   up   iso
so-0/0/2            up   up   inet 10.1.26.2/30
so-0/0/2.0           up   up   inet 10.1.26.2/30
                    up   up   iso
so-0/0/3            up   up   inet 10.1.36.2/30
so-0/0/3.0           up   up   inet 10.1.36.2/30
                    up   up   iso
[...Output truncated...]

```

The following sample output is from **R2**:

```

user@R2> show route 10.0.0.5

inet.0: 22 destinations, 25 routes (22 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.5/32          *[Static/5] 00:16:21
                    > to 10.1.26.2 via so-0/0/2.0
                    [BGP/170] 3d 20:23:35, MED 5, localpref 100
                    AS path: 65001 I
                    > to 10.1.12.1 via so-0/0/0.0

```

### Meaning

The sample output shows that all interfaces on **R6** are up. The output from **R2** shows that a static route **[Static/5]** configured on **R2** points to **R6 (10.1.26.2)** and is the preferred

route to **R5** because of its low preference value. However, the route is looping from **R2** to **R6**, as indicated by the missing reference to **R5 (10.1.15.2)**.

## Taking Appropriate Action for Resolving the Network Problem

**Problem**    **Description:** The appropriate action depends on the type of problem you have isolated. In this example, a static route configured on **R2** is deleted from the **[routing-options]** hierarchy level. Other appropriate actions might include the following:

**Solution**

- Check the local router's configuration and edit it if appropriate.
- Troubleshoot the intermediate router.
- Check the remote host configuration and edit it if appropriate.
- Troubleshoot routing protocols.
- Identify additional possible causes.

To resolve the problem in this example, enter the following Junos OS CLI commands:

```
[edit]
user@R2# delete routing-options static route destination-prefix
user@R2# commit and-quit
user@R2# show route destination-prefix
```

## Sample Output

```
[edit]
user@R2# delete routing-options static route 10.0.0.5/32

[edit]
user@R2# commit and-quit
commit complete
Exiting configuration mode

user@R2> show route 10.0.0.5

inet.0: 22 destinations, 24 routes (22 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.5/32          *[BGP/170] 3d 20:26:17, MED 5, localpref 100
                    AS path: 65001 I
                    > to 10.1.12.1 via so-0/0/0.0
```

## Meaning

The sample output shows the static route deleted from the **[routing-options]** hierarchy and the new configuration committed. The output for the **show route** command now shows the BGP route as the preferred route, as indicated by the asterisk (\*).

## Evaluating the Solution to Check Whether the Network Problem Is Resolved

**Problem**    **Description:** If the problem is solved, you are finished. If the problem remains or a new problem is identified, start the process over again.

You can address possible causes in any order. In relation to the network in “[Isolating a Broken Network Connection](#)” on page 1229, we chose to work from the local router toward the remote router, but you might start at a different point, particularly if you have reason to believe that the problem is related to a known issue, such as a recent change in configuration.

**Solution** To evaluate the solution, enter the following Junos OS CLI commands:

```
user@host> show route (ip-address | host-name)
user@host> ping (ip-address | host-name)
user@host> traceroute (ip-address | host-name)
```

### Sample Output

```
user@R6> show route 10.0.0.5

inet.0: 20 destinations, 20 routes (20 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.5/32          *[BGP/170]  00:01:35, MED 5, localpref 100, from 10.0.0.2
                    AS path: 65001 I
                    > to 10.1.26.1 via so-0/0/2.0

user@R6> ping 10.0.0.5
PING 10.0.0.5 (10.0.0.5): 56 data bytes
64 bytes from 10.0.0.5: icmp_seq=0 ttl=253 time=0.866 ms
64 bytes from 10.0.0.5: icmp_seq=1 ttl=253 time=0.837 ms
64 bytes from 10.0.0.5: icmp_seq=2 ttl=253 time=0.796 ms
^C
--- 10.0.0.5 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.796/0.833/0.866/0.029 ms

user@R6> traceroute 10.0.0.5
traceroute to 10.0.0.5 (10.0.0.5), 30 hops max, 40 byte packets
 1 10.1.26.1 (10.1.26.1) 0.629 ms 0.538 ms 0.497 ms
 2 10.1.12.1 (10.1.12.1) 0.534 ms 0.538 ms 0.510 ms
 3 10.0.0.5 (10.0.0.5) 0.776 ms 0.705 ms 0.672 ms
```

### Meaning

The sample output shows that there is now a connection between **R6** and **R5**. The **show route** command shows that the BGP route to **R5** is preferred, as indicated by the asterisk (\*). The **ping** command is successful and the **traceroute** command shows that the path from **R6** to **R5** is through **R2** (10.1.26.1), and then through **R1** (10.1.12.1).

## Display Junos OS Information

**Purpose** Display Junos OS information and status to determine if the version of Junos OS that you are running supports particular features or hardware. You can also determine whether particular software bugs will affect your version of Junos OS.

**Action** To display Junos OS information, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show version
```

**Sample Output**    user@host> show version  
Hostname: my-router.net  
Model: m160

jcrypto-dd release 5.5R2.3 built by builder on 2002-11-21 22:27:46 UTC

**Meaning**    The sample output shows the hostname, the version information for the Junos OS packages installed on the machine, and the version information for each software process.

---

## Display Version Information for Junos OS Packages

---

**Purpose**    Display version information for Junos OS packages to determine if they support particular features or hardware. You can also determine whether particular software bugs will affect your version of Junos OS.

**Action**    To display brief information and status for the kernel and Packet Forwarding Engine, use the following CLI operational mode command:

user@host> show version brief

The following sample output is for worldwide nonencrypted Junos OS:

**Sample Output**

```
user@host> show version brief
  Hostname: my-router.net
  Model: m10
  JUNOS Base OS boot [5.5R2.3]
  JUNOS Base OS Software Suite [5.5R2.3]
  JUNOS Kernel Software Suite [5.5R2.3]
  JUNOS Packet Forwarding Engine Support [5.5R2.3]
  JUNOS Routing Software Suite [5.5R2.3]
  JUNOS Online Documentation [5.5R2.3]
```

The following sample output is for Canada and USA encrypted Junos OS:

```
user@host> show version brief
  Hostname: my-router.net
  Model: m10
  JUNOS Base OS boot [5.5R2.3]
  JUNOS Base OS Software Suite [5.5R2.3]
  JUNOS Kernel Software Suite [5.5R2.3]
  JUNOS Packet Forwarding Engine Support [5.5R2.3]
  JUNOS Routing Software Suite [5.5R2.3]
  JUNOS Online Documentation [5.5R2.3]
  JUNOS Crypto Software Suite [5.5R2.3]
```

**Meaning** The sample output shows version information for the Junos OS packages installed on the router. If the **Junos Crypto Software Suite** is listed, the router has Canada and USA encrypted Junos OS. If the **Junos Crypto Software Suite** is not listed, the router is running worldwide nonencrypted Junos OS.

## Display the Current Active Router Configuration

**Purpose** Examine the current active router configuration.

**Action** To display the current, active router configuration, use the following command-line interface (CLI) operational mode command:

```
user@host> show configuration
```

### Sample Output

```
user@host> show configuration
version "10.4R2";
groups {
  global {

```

**Meaning** The sample output shows the current, active configuration for the router. When displaying the configuration, the CLI indents each subordinate hierarchy level, inserts braces to indicate the beginning and end of each hierarchy level, and places semicolons at the end of statements that are at the lowest level of the hierarchy.

The configuration statements appear in a fixed order. Interfaces appear alphabetically by type, and then in numerical order by slot number, Physical Interface Card (PIC) number, and port number.

## Copy Junos OS to the Router

**Action** Copy the software packages from the server to the router. We recommend that you copy them to the **/var/tmp** directory, which is on the rotating medium (hard disk) and is a large file system. Use the following CLI command:

```

user@host> file copy ftp://username: prompt@ftp.hostname.
net/jinstall-package-name/var/tmp/jinstall-package-name

```

## Add New Software

**Action** To add new software packages, use the following Junos OS CLI operational mode command:

```

user@host> request system software add /var/tmp/jinstall-package--name

```

**package-name** is the full URL to the file and **release-number** is the major software release number; for example, 4.2R1. Before the new software is added, the existing software is automatically deleted.

**NOTE:** Even though you are adding the new software, the changes do not take effect until the router has completed rebooting.

**Sample Output**

```
user@host> request system software add /var/tmp/jinstall-5.2R2.3-domestic.tgz
Installing package '/var/tmp/jinstall-5.2R2.3-domestic.tgz
Auto-deleting old jroute...
Auto-deleting old jdocs...
Auto-deleting old jpfe...
Auto-deleting old jkernel...
Adding JUNOS base software 5.2R2.3
Adding jkernel...
Adding jpfe...
Adding jdocs...
Adding jroute...
NOTICE: uncommitted changes have been saved in
/var/db/config/juniper.conf.pre-install
Saving package file in /var/sw/pkg/jinstall-5.2R2.3-domestic.tgz
```

---

## Compare Information Logged Before and After the Upgrade

**Purpose** Compare the operation of the system before and after the upgrade to ensure that everything is working as expected.

**Action** To obtain system information, use the following Junos OS CLI operational mode commands:

```
user@host> show version
user@host> show chassis hardware
user@host> show configuration
user@host> show interface terse
user@host> show bgp summary
user@host> show isis adjacency brief
user@host> show ospf neighbor brief
user@host> show system storage
```

Compare the information from these commands with the information you logged before the upgrade.

---

## Displaying LSP Status Events

**Purpose** Display extensive information about LSPs, including the 50 most recent history events and the reasons why an LSP might have failed.

**Action** To examine status messages, enter the following Junos OS command-line interface (CLI) operational mode command from the ingress router:

```
user@host> show mpls lsp extensive
```

### Sample Output 1

```
user@R1# run show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)

    10.35.38.2 (flag=0x09) 192.168.135.29 (flag=0x10) 10.35.39.1
    (flag=0x01) 10.35.40.2 (flag=0x01) 10.35.41.1 (flag=0x01)
[...Output truncated...]

```

**Meaning** Sample Output 1 from ingress router R1 shows extensive ingress LSP information, including LSP events that led to an LSP failure and the 50 most recent state events.

LSP events in bold are described in this topic. Descriptions include sample output of the LSP event, an explanation of what the event means, the possible cause of the event, and any possible actions that you can take.

For completeness, events not included in this example output are also described in this topic to show LSP events that did not occur in the example network configuration, but might occur in your network. The LSP events are organized alphabetically.

Sample Output 2 shows the state of the route received in the Received Record Route (**Received RRO**) created by fast reroute configurations in the network. The **Received RRO** indicates a series of hops. Each hop has an address followed by a flag. For more information on flags, see the *Junos MPLS Network Operations Guide*. In most cases, the **Received RRO** is the same as the computed Explicit Route Object (ERO).

Sample Output 3 shows a **Computed ERO** and a **Received RRO**. In this instance they are the same. However, if **Received RRO** is different from the **Computed ERO**, there is a topology change in the network, and the route is taking a detour.

## Call Was Cleared by RSVP Event

**LSP Event** Call was cleared by RSVP

**Sample Output**

```
user@R1> show mpls lsp extensive
[...Output truncated...]
10.0.0.6
From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
ActivePath: (none)
LoadBalance: Random
Encoding type: Packet, Switching type: Packet, GPID: IPv4
Primary State: Dn
Will be enqueued for recomputation in 10 second(s).
11 Jan 26 14:58:32 CSPF failed: no route toward 10.0.0.6
10 Jan 26 14:58:25 Deselected as active
9 Jan 26 14:58:25 CSPF failed: no route toward 10.0.0.6
8 Jan 26 14:58:25 Call was cleared by RSVP
7 Jan 26 14:58:25 Session preempted
6 Jan 26 14:58:25 Down
[...Output truncated...]
```

**Meaning** This LSP event indicates that the Resource Reservation Protocol (RSVP) session corresponding to the LSP path was preempted and the corresponding RSVP state deleted.

**Cause** This LSP event occurs when you issue the **clear rsvp session** command or trigger preemption of an RSVP session at the ingress router. Depending on the timer value, Constrained Shortest Path First (CSPF) recomputes the path and the LSP comes up again.

**Action** Not applicable.

## Change in Active Path Event

**LSP Event** Change in active path

<b>Sample Output</b>	<pre>user@R1&gt; show mpls lsp extensive [...Output truncated...] 13 Sep 19 00:02:20 Deselected as active 12 Sep 19 00:02:20 ResvTear received 11 Sep 19 00:02:20 Down 10 Sep 19 00:02:20  Change in active path 9 Sep 19 00:02:20 8 Sep 19 00:02:20 10.222.28.2: Explicit Route: bad strict routeChange in active path 7 Sep 19 00:02:20 CSPF failed: no route toward 192.168.32.1 6 Sep 19 00:02:20 10.222.28.2: No Route toward dest 5 Sep 19 00:00:54 Selected as active path 4 Sep 19 00:00:54 Record Route: 10.222.28.2 10.222.4.2 10.222.44.2 3 Sep 19 00:00:54 Up 2 Sep 19 00:00:54 Originate Call 1 Sep 19 00:00:54 CSPF: computation result accepted [...Output truncated...]</pre>
<b>Meaning</b>	This LSP event indicates that even though the active physical path has changed, the LSP stays up. Because this network configuration has an alternate (fast-reroute) path available, the event is a <b>Change in active path</b> rather than a <b>Session preempted</b> event.
<b>Cause</b>	The active path might have failed.
<b>Action</b>	Not applicable.

---

## Clear Call Event

<b>LSP Event</b>	Clear call
<b>Sample Output</b>	<pre>user@R1&gt; show mpls lsp extensive [...Output truncated...] 65 Jan 5 09:58:33  Clear Call 64 Jan 5 09:58:33 Session preempted 63 Jan 5 09:58:33 Down [...Output truncated...]</pre>
<b>Meaning</b>	This LSP event indicates that the LSP was disconnected and restarted.
<b>Cause</b>	The <b>clear mpls lsp</b> command was issued on the ingress router to disconnect existing RSVP sessions, release the routes and states associated with the LSP, and then start a new LSP. Issuing this command might impact traffic travelling along the LSP, because a time lag might occur between tearing down the old path and setting up a new path.
<b>Action</b>	Not applicable.

---

## Deselected as Active Event

<b>LSP Event</b>	Deselected as active
------------------	----------------------

**Sample Output**    user@R1> show mpls lsp extensive  
[...Output truncated...]  
Will be enqueued for recomputation in 18 second(s).  
53 Jan 4 18:11:28 CSPF failed: no route toward 10.0.0.6[2 times]  
52 Jan 4 18:10:44   **Deselected as active**  
51 Jan 4 18:10:44 CSPF failed: no route toward 10.0.0.6  
50 Jan 4 18:10:44 CSPF: link down/deleted  
[...Output truncated...]

**Meaning**    This LSP event indicates that the LSP is no longer the active path.

**Cause**    Typically, other events, similar to those in lines 50 and 51, indicate the reason that the LSP is no longer the active path.

**Action**    Refer to events on either side of this event to determine the appropriate action.

---

## Link Protection Down Event

**LSP Event**    Link protection down

**Sample Output 1**

```

user@R1> show configuration protocols mpls
label-switched-path R1-to-R6 {
    to 10.0.0.6;
    link-protection;
}
interface fxp0.0 {
    disable;
}
interface all;

```

**Sample Output 2**

```

user@R1> show mpls lsp extensive
[...Output truncated...]

50 Feb 10 10:56:58 Link-protection Down
49 Feb 10 10:56:35 10.1.56.2: MPLS label allocation failure[2 times]
48 Feb 10 10:48:32 Link-protection Up
47 Feb 10 10:48:32 Selected as active path
[...Output truncated...]

```

**Meaning** Sample Output 1 shows the MPLS link-protection configuration on R1 for the LSP **R1-to-R6**.

Sample Output 2 shows that link protection came up and down several times. Link protection comes up when the LSP signals. Line 60 shows the result when RSVP is disabled on all alternate paths out of R6. Lines 68 to 70 are the result when the **clear mpls lsp** command is issued.

**Cause** This LSP event is caused by a failure or configuration change that deletes or resignals the bypass LSP. For example, you clear the LSP using the **clear mpls lsp** command, or you disable RSVP on all alternate paths for the LSP. The bypass LSP does not use the primary path, instead it looks for an alternate path.

**Action** Include the **family mpls** statement for all alternate paths for the LSP at the [edit interfaces type-fpc/pic/port.unit] hierarchy level.

## Originate Call Event

**LSP Event** Originate call

**Sample Output**

```
user@R1> show mpls lsp extensive
[...Output truncated...]
 43 Jan  4 18:06:09 Record Route: 10.1.13.2 10.1.36.2
 42 Jan  4 18:06:09 Up
 41 Jan  4 18:06:09 Originate Call
 40 Jan  4 18:06:09 CSPF: computation result accepted
 39 Jan  4 18:05:40 CSPF failed: no route toward 10.0.0.6[2 times]
[...Output truncated...]
```

**Meaning** This LSP event indicates that the router is issuing an RSVP Path message.

**Cause** A Path message is transmitted by the ingress router toward the egress router to establish an LSP.

**Action** To analyze the contents of the Path message, enable RSVP tracing. To configure RSVP tracing, include the **traceoptions** statement at the [edit protocols rsvp] hierarchy level. Use the **file** statement to specify the name of the file that receives the output of the tracing operation. All files are placed in the directory **/var/log**. We recommend that you place RSVP tracing output in the file **rsvp-log**. To examine the contents of the **rsvp-log** file, issue the **file show /var/log/rsvp-log** command.

## ResvTear Received Event

**LSP Event** ResvTear received

**Sample Output**

```
user@R1> show mpls lsp extensive
[...Output truncated...]
 23 Dec 28 13:46:39 CSPF failed: no route toward 10.0.0.6
 22 Dec 28 13:46:39 Clear Call
 21 Dec 28 13:46:39 ResvTear received
 20 Dec 28 13:46:39 Down
 19 Dec 28 13:46:39 10.1.13.2: Session preempted
 18 Dec 28 13:42:07 Selected as active path
[...Output truncated...]
```

**Meaning** This LSP event indicates that an RSVP ResvTear message was received. ResvTear messages remove RSVP reservation states along a path. These messages travel upstream

toward senders of the session. This message usually appears in the middle of a run of messages that tear the LSP down.

**Cause** In some cases, an ResvTear event is received because a router's reservation state times out. In other cases, when the downstream link fails, the upstream node must eliminate all RSVP states and initiates a ResvTear event. If you are running Fast ReRoute, the upstream node initiates a PathErr message, not a ResvTear message. It is beyond the scope of this document to include all possible reasons for an ResvTear event.

**Action** Analyze the status to determine if this is the required behavior. If this is not the required behavior, verify the surrounding LSP events to identify the cause of the problem.

---

## Session Preempted Event

---

**LSP Event** Session preempted

**Sample Output 1**

```
user@R1> show mpls lsp extensive
[...Output truncated...]
 21 Dec 28 13:46:39 ResvTear received
 20 Dec 28 13:46:39 Down
 19 Dec 28 13:46:39 10.1.13.2: Session preempted
 18 Dec 28 13:42:07 Selected as active path
 17 Dec 28 13:42:07 Record Route: 10.1.13.2 10.1.36.2
[...Output truncated...]
```

**Sample Output 2**

```
user@R1> show mpls lsp extensive
[...Output truncated...]
 66 Jan 5 09:58:33 CSPF failed: no route toward 10.0.0.6
 65 Jan 5 09:58:33 Clear Call
 64 Jan 5 09:58:33 Session preempted
 63 Jan 5 09:58:33 Down
 62 Jan 5 09:58:32 CSPF failed
: no route toward 10.0.0.6[2 times]
 61 Jan 5 09:57:55 10.1.36.2: Explicit Route: wrong delivery
 60 Jan 5 09:57:34 CSPF failed: no route toward 10.0.0.6[2 times]
 59 Jan 5 09:57:28 CSPF: link down/deleted
10.1.36.1(R3.00/10.0.0.3)->10.1.36.2(R6.00/10.0.0.6)
[...Output truncated...]
```

**Meaning** This LSP event indicates that the LSP session was taken over. Sample Output 1 shows the IP address (10.1.13.2) included with the event, indicating the IP address of the router that sent the message. Sample Output 2 does not include an IP address, indicating that the message originated on the ingress router.

**Cause** The state of the network might have changed, as shown in Sample Output 1, or an LSP with a higher priority might be using the bandwidth of the LSP.

**Action** Refer to the events preceding this event in the history log for more information on what might have caused the preemption. For example, in line 62, the **CSPF failed** message may indicate that you specified a disable constrained-path (**no-cspf**) LSP and an explicit

route address that is strict and not directly connected. Additionally, the egress router might have changed its configuration, making the destination address unreachable.

## Displaying General LSP Error Events

**Purpose** Display extensive information about LSPs, including the 50 most recent history events and the possible reasons why an LSP failed.

**Action** To examine error messages, enter the following Junos OS command-line interface (CLI) operational mode command from the ingress router:

```
user@host> show mpls lsp extensive
```

### Sample Output

```
user@R1# run show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn, No-decrement-ttl
    Bandwidth: 100Mbps
    14 Jan 21 15:43:39 Requested bandwidth unavailable[3 times]
    13 Jan 21 15:43:21 Deselected as active
    12 Jan 21 15:43:21 Requested bandwidth unavailable
    11 Jan 21 15:43:21 Clear Call
    10 Jan 21 15:42:32 Selected as active path
    9 Jan 21 15:42:32 Record Route: 10.1.12.2 10.1.26.2
    8 Jan 21 15:42:32 Up
[...Output truncated...]
```

**Meaning** The sample output from ingress router R1 is a section from the complete output. Typically, the output includes LSP events that led to an LSP failure and the 50 most recent state events. Only one example of a general LSP error event is displayed because it is impossible to provide all of the events described in this topic in one sequence of log history.

For completeness, events not generated by the example network used throughout this book are described to show LSP events that might occur in your network. The output for these events includes the prompt **user@host** rather than the usual **user@R1** prompt.

## Admission Control Failure Event

**LSP Event** Admission control failure

**Sample Output** Not available.

**Meaning** This LSP error event indicates that a Resource Reservation Protocol (RSVP) Admission control failure occurred along the LSP path. This event is logged because of an error notification (PathErr message) received from RSVP for the label-switched path.

**Cause** This LSP event is caused by inadequate bandwidth on a link along the LSP path. The available bandwidth could not satisfy the requested traffic parameters and no other sessions were pre-empted to accommodate this request.

**Action** This error event is not generated by Juniper Networks routers. However, when this event is received by a Juniper Networks router, it appears in the log output of the **show mpls lsp extensive** command.

---

## Explicit Route: Bad Loose Route Event

---

**LSP Event** Explicit Route: bad loose route

**Sample Output 1** user@R1# run show mpls lsp extensive  
 Ingress LSP: 1 sessions

```

  disable;  
}  
interface all;
```

**Meaning** This LSP error event indicates that there is an error in the loose hop specified in the Explicit Route Object (ERO) of a Path message received by a label-switched router (LSR) along the LSP path, indicating an LSP setup failure.

**Cause** This LSP error event is caused by control plane unreachability or data plane incompatibility.

**Action** Check the LSP configuration at the `[edit protocols mpls]` hierarchy level.

---

## Explicit Route: Bad Strict Route Event

---

**LSP Event** Explicit route: bad strict route

**Sample Output 1** user@R1> show mpls lsp extensive

 [20 times]  
 16 Jun 27 00:39:49 204.70.192.26: Routing loop detected [3370 times]  
 [...Output truncated...]

**Meaning** This LSP event indicates that a poorly formed ERO was generated. Sample Outputs 1 and 2 show that this LSP event was caused by different situations described below.

**Cause** This LSP event can be caused by several factors:

- A strict hop address specified for an LSP on a link that does not have RSVP enabled.
- The **no-cspf** statement included in the LSP configuration.

- An error with the configuration of constraints on a Constrained Shortest Path First (CSPF) LSP generates the **CSPF: No route towards dest** message, followed by the **Explicit Route: bad strict route** event.
- An ERO that causes a routing loop. See Sample Output 2.

**Action** Examine the strict hop address, remove the **no-cspf** statement, or examine the path and verify that RSVP is enabled on each interface.

---

### Explicit Route: Format Error Event

---

**LSP Event** Explicit route: format error

**Sample Output**

```
user@R1> show mpls lsp extensive
[...Output truncated...]
10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary   to-R6           State: Dn, No-decrement-ttl
    5 Jan 21 14:37:06 10.1.34.2: Explicit Route: format error [2 times]
    4 Jan 21 14:37:03 Originate Call
    3 Jan 21 14:37:03 Clear Call
[...Output truncated...]
```

**Meaning** This LSP event indicates an LSP setup failure in which a Path message error in the the ERO was received by a router along the LSP path.

**Cause** This LSP event can be caused by several factors:

- An incorrectly formed ERO in the RSVP Path message.
- A strict hop address specified in the middle of an ERO that is not contiguous.
- An unsupported subobject in the ERO of a router along the LSP path.
- The hop indicated by the RSVP hop object does not match the hop indicated by the ERO.

**Action** Examine the strict hop address configuration and make any necessary changes.

---

### Explicit Route: Wrong Delivery Event

---

**LSP Event** Explicit route: wrong delivery

**Sample Output 1** user@host> show mpls lsp extensive  
 [...Output truncated...]  
 Primary use-TOKYO State: Dn, No-decrement-ttl  
   3 Sep 19 00:25:45 10.222.45.2: Explicit Route: wrong delivery  
   2 Sep 19 00:25:34 No Route[8 times]  
   1 Sep 19 00:23:01 Originate Call  
 [...Output truncated...]

**Sample Output 2** user@host> show mpls lsp extensive  
 [...Output truncated...]  
 10.0.0.6  
 From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6  
 ActivePath: (none)  
 LoadBalance: Random  
 Encoding type: Packet, Switching type: Packet, GPID: IPv4  
 Primary to-R6 State: Dn  
   40 Jan 26 16:35:26 10.1.36.2: Explicit Route: wrong delivery [2 times]  
   39 Jan 26 16:35:23 Originate Call  
   38 Jan 26 16:35:23 Clear Call  
 [...Output truncated...]

**Sample Output 3** user@R1> show configuration protocols mpls  
 label-switched-path R1-to-R6 {  
   to 10.0.0.6;  
   no-cspf;  
   primary to-R6;  
 }  
 path to-R6 {  
   10.1.13.2 strict;  
   10.1.56.1 strict;     <<< IP address not directly connected to 10.1.13.2  
   10.1.26.1 strict;

**Meaning** This LSP event indicates that a RSVP message with an ERO arrived at the wrong router, even though a strict route was specified. The receiving router determines that the address is inconsistent with the ERO, and generates the error message. Note that the IP address of the sending router precedes the error event; for example, **10.222.45.2** in Sample Output 1, and **10.1.36.2** in Sample Output 2.

**Cause** This LSP event can be caused by several factors:

- The loopback (**lo0**) interface on the ingress router is not configured at the **[edit protocols isis]** hierarchy level. After the loopback (**lo0**) interface is included in the Intermediate System-to-Intermediate System (IS-IS) configuration, and while IS-IS is forming adjacencies, an RSVP packet is forwarded to an incorrect destination, **10.222.45.2**, as shown in Sample Output 1.
- A strict path is configured to a directly connected router, then another strict path is configured to an IP address that is not directly connected. For example, Sample Output 3 shows that the path **to-R6** includes three IP addresses, one of which (**10.1.56.1**) is not directly connected to the other IP addresses in the path.

**Action** Take appropriate action. On the ingress router, include the loopback (**lo0**) interface at the **[edit protocols isis]** hierarchy level, change the definition of the strict path at the **[edit**

`protocols mpls path path-name`] hierarchy level, or verify the validity of all IP addresses listed in the named path referenced by the LSP hop by hop.

---

## Invalid Destination Address Event

<b>LSP Event</b>	Invalid Dest addr
<b>Sample Output</b>	<pre>user@R1&gt; show mpls lsp extensive Ingress LSP: 1 sessions  10.0.0.1   From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6   ActivePath: (none)   LoadBalance: Random   Metric: 100   Encoding type: Packet, Switching type: Packet, GPID: IPv4   Primary                               State: Dn     4 Apr 22 10:22:15 Invalid Dest Addr     3 Apr 22 10:22:15 Originate Call     2 Apr 22 10:22:15 Invalid Dest Addr     1 Apr 22 10:22:15 Originate Call   Created: Fri Apr 22 10:22:16 2005 Total 1 displayed, Up 0, Down 1</pre>
<b>Meaning</b>	This LSP event indicates that the <b>to</b> address configured at the <code>[edit protocols mpls labeled-switched-path name]</code> hierarchy level is invalid.
<b>Cause</b>	This LSP event is caused when the <b>to</b> address of the LSP is the loopback address of the ingress router. A contributing factor may be that the <b>no-cspf</b> statement is included in the LSP configuration.
<b>Action</b>	Verify that the LSP destination address is not the local router's loopback address, and check that the addresses on the local router are correctly configured.

---

## Invalid Filter for Policing Event

<b>LSP Event</b>	Invalid filter for policing
<b>Sample Output</b>	Not available. This LSP event indicates an abnormal condition and is difficult to recreate.
<b>Meaning</b>	Although a policer was configured on the LSP, the corresponding firewall filter index was not found, indicating a failure in the routing protocol process (rpd) or the firewall process (dfwd).
<b>Cause</b>	A possible cause is that the routing protocol process (rpd) or the firewall process (dfwd) were restarted in a situation in which the LSP was established.
<b>Action</b>	Not applicable.

## MPLS Graceful Restart: Recovery Failed Event

<b>LSP Event</b>	MPLS graceful restart: recovery failed
<b>Sample Output</b>	Not available.
<b>Meaning</b>	This LSP event indicates unsuccessful recovery of an LSP path after graceful restart, resulting in potential traffic loss.
<b>Cause</b>	<p>This LSP event is caused by several factors:</p> <ul style="list-style-type: none"> <li>• MPLS graceful restart procedures may have been aborted by this LSR.</li> <li>• MPLS graceful restart is disabled, by configuration, during the recovery period.</li> <li>• An MPLS LSP path is disabled either due to a configuration change or due to an error during the recovery period.</li> <li>• CSPF computation failed for the restarted LSP path with parameters and constraints preserved across the restart.</li> <li>• A signaling failure occurred and an RSVP PathErr was received on the LSP path signaled after a restart.</li> <li>• A network failure occurred on some hop that the LSP was traversing during the recovery period.</li> </ul>
<b>Action</b>	Check the MPLS logs for more details about the failure.

## MPLS Label Allocation Failure Event

<b>LSP Event</b>	MPLS label allocation failure
<b>Sample Output</b>	<pre>user@R1&gt; show mpls lsp extensive [...Output truncated...]  24 Jan 20 09:25:35 CSPF failed: no route toward 10.0.0.6  23 Jan 20 09:25:35 Clear Call  22 Jan 20 09:25:35 Deselected as active  21 Jan 20 09:25:35 10.1.13.1: MPLS label allocation failure  20 Jan 20 09:25:34 MPLS label allocation failure  19 Jan 20 09:25:34 Down [...Output truncated...]</pre>
<b>Meaning</b>	This LSP event indicates that the MPLS protocol or the <b>family mpls</b> statement were not configured properly. When the LSP event is preceded by an IP address, the address is typically the router that has the MPLS configuration error.
<b>Cause</b>	This LSP event is caused by the omission of interfaces at the <code>[edit protocols mpls]</code> hierarchy level or failure to configure the <b>family mpls</b> statement at the <code>[edit interfaces type-fpc/pic/port]</code> hierarchy level. The <b>family mpls</b> statement specifies to the interface ASICs to permit protocol code 0x8847 (unicast MPLS) into the router.

**Action** Include interfaces at the `[edit protocols mpls]` hierarchy level, or include the `family mpls` statement at the `[edit interfaces type-fpc/pic/port]` hierarchy level. You must configure the `family mpls` statement, in the same way that you must configure the `family iso` statement for IS-IS.

**NOTE:** Do not configure the `family mpls` statement on the loopback (lo0) interface.

---

---

## Non-RSVP Capable Router Detected Event

---

**LSP Event** Non-RSVP capable router detected

**Sample Output**

```
user@host> show mpls lsp extensive
[...Output truncated...]
10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn, No-decrement-ttl
    19 Jan 21 15:05:37 10.1.24.2: Non-RSVP capable router detected
    18 Jan 21 15:04:52 10.1.26.2: Non-RSVP capable router detected [4 times]
    17 Jan 21 15:04:34 Originate Call
    16 Jan 21 15:04:34 Clear Call
[...Output truncated...]
```

**Meaning** This LSP event indicates that a router, forwarding packets to the egress router, was not configured for RSVP.

**Cause** This LSP event might be caused when a router not configured for RSVP forwards an RSVP packet toward the egress router without decrementing the `Send_TTL` value in the RSVP common header. The next downstream router detects that the `Send_TTL` value and the `IP_TTL` value are different, and generates this LSP event. Note that two different routers generated the same error message at different times.

**Action** Configure the router in question with RSVP.

---

## No Route Toward Destination Event

---

**LSP Event** No route toward destination

**Sample Output 1** user@R1> show mpls lsp extensive  
 [...Output truncated...]

 7 Oct 25 16:29:27 **No Route toward dest**  
 6 Oct 25 16:29:27 Down  
 [...Output truncated...]

**Meaning** This LSP event indicates that the router at address **10.1.36.1** in Sample Output 1 does not have a route to the specified destination. Sample Output 2 shows that the local router, ingress router **10.0.0.1**, does not have a route to the specified destination.

**Cause** This LSP event is caused by different factors. The egress interface of a transit router might not have RSVP enabled, or IP reachability to the destination (either the egress router or the next address in the ERO) does not exist.

**Action** Enable RSVP on the transit router's egress interface, or examine the IP configuration of the relevant router.

## Unsupported Traffic Class Event

**LSP Event** Unsupported traffic class

**Sample Output** Not available. This LSP event indicates an abnormal condition and is difficult to recreate.

**Meaning** This LSP error event is a Juniper Networks proprietary error, indicating that a DiffServ-traffic engineering (TE) LSP was signaled with one or more traffic classes with values greater than the four traffic classes currently supported.

**Cause** Not available.

**Action** Not available.

---

## CSPF: Computation Result Accepted Event

---

**LSP Event** CSPF: computation result accepted

**Sample Output** user@R1> show mpls lsp extensive  
[...Output truncated...]  
57 Jan 5 09:54:37 Record Route: 10.1.13.2 10.1.36.2  
56 Jan 5 09:54:37 Up  
55 Jan 5 09:54:37 Originate Call  
54 Jan 5 09:54:37 **CSPF: computation result accepted**  
[...Output truncated...]

**Meaning** This LSP event indicates that CSPF pruned the traffic engineering database of noncompliant links and found a shortest path. CSPF generated an ERO, which was then passed to the RSVP.

**Cause** Not applicable.

**Action** Not applicable

---

## CSPF: Reroute Due to Re-Optimization Event

---

**LSP Event** CSPF: Reroute due to re-optimization

**Sample Output** user@host> show mpls lsp extensive  
[...Output truncated...]  
9 Dec 11 17:32:35 Up  
8 Dec 11 17:32:35 Clear Call  
7 Dec 11 17:32:35 CSPF: computation result accepted  
6 Dec 11 17:32:35 **CSPF: Reroute due to re-optimization**  
5 Dec 11 17:28:29 CSPF: computation result ignored  
4 Dec 11 17:24:23 Record Route: 10.35.38.2 S 192.168.135.29 S  
10.35.39.1 S 10.35.40.2 S 10.35.41.1 S  
3 Dec 11 17:24:23 Up  
[...Output truncated...]

**Meaning** This LSP event indicates that CSPF found an optimal path for LSP traffic, and switched over to the new path.

**Cause** This is a periodic or one-time reoptimization event.

**Action** Not applicable.

---

## Retry Limit Exceeded Event

---

**LSP Event** Retry limit exceeded

**Sample Output 1**

```

user@R1> show mpls lsp extensive
[...Output truncated...]
10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn
    RetryCount: 13
    RetryLimit: 1
    12 Jan 14 15:39:30 Clear Call
    11 Jan 14 15:39:30  Retry limit exceeded
    10 Jan 14 15:39:10 10.1.12.1: MPLS label allocation failure[11 times]
[...Output truncated...]

```

**Sample Output 2**

```

user@R1> show mpls lsp extensive
[...Output truncated...]
10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn
    14 Jan 14 15:44:07 10.1.12.1: MPLS label allocation failure[3 times]
    13 Jan 14 15:43:58 Originate Call
    12 Jan 14 15:39:30 Clear Call
    11 Jan 14 15:39:30  Retry limit exceeded
    10 Jan 14 15:39:10 10.1.12.1: MPLS label allocation failure[11 times]
[...Output truncated...]

```

- Meaning** This LSP event indicates that the number of CSPF path computations for a particular path exceeded a configured retry limit. After this point, the path is not recomputed or signaled, unless the user intervenes.
- Cause** The number of CSPF path computations for an LSP path exceeded the configured non-zero retry limit. Sample Output 1 shows that a configured retry limit of 1 was exceeded by the retry count of 13.
- Action** Enter the **clear mpls lsp** command to disconnect and restart the LSP. Sample Output 2 shows that events 13 and 14 were generated after the **clear mpls lsp** command was issued. This operation disconnects existing RSVP sessions on the ingress router, releases the routes and states associated with the LSPs, and starts a new LSP. Issuing this command might impact traffic travelling along the LSP, because of a time lag that can occur between the old path being torn down and the new path being set up.

## Log the Software Version Information

**Purpose** The purpose of this action is to log the Junos OS version information.

**Action** Use the following Junos OS CLI operational mode command:

```
user@host> show version | save filename
```

## Sample Output

```
user@host> show version | save test
Wrote 39 lines of output to 'test'

user@host> show version
Hostname: my-router.net
Model: m10

**Documentation**

---

## Log the Hardware Version Information

**Purpose** You should log hardware version information in the rare event that a router cannot successfully reboot and you cannot obtain the Routing Engine serial number. The Routing Engine serial number is necessary for Juniper Networks Technical Assistance Center (JTAC) to issue a return to manufacturing authorization (RMA). Without the Routing Engine serial number, an onsite technician must be dispatched to issue the RMA.

**Action** To log the router chassis hardware version information, use the following Junos OS CLI operational mode command:

```
user@host> show chassis hardware | save filename
```

**Sample Output** The output for the M-series routers varies depending on the chassis components of each router. All routers have a chassis, midplanes or backplanes, power supplies, and Flexible PIC Concentrators (FPCs). Refer to the hardware guides for information about the different chassis components.

```
user@host> show chassis hardware | save test
Wrote 43 lines of output to 'test'
```

```
user@host> show chassis hardware
```

Item	Version	Part number	Serial number	Description

PIC 0	REV 01			1x OC-192 SM SR-2

**Meaning** The sample output shows the hardware inventory for an M160 router with a chassis serial number of 101. For each component, the output shows the version number, part number, serial number, and description.

## Log the System Boot-Message Information

**Action** To log the system boot-message information, use the following Junos OS CLI operational mode command:

```
user@host> show system boot-messages | save filename
```

```

Sample Output user@host> show system boot-messages | save test
Wrote 80 lines of output to 'test'

user@host> show system boot-messages

```

**Meaning** The sample output shows the initial messages generated by the system kernel upon boot. This is the content of the `/var/run/dmesg.boot` file.

## Log the BGP, IS-IS, and OSPF Adjacency Information

**Purpose** The following commands log useful information about Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Open Shortest Path First (OSPF) protocols. If you have other protocols installed, such as Multiprotocol Label Switching (MPLS), Resource Reservation Protocol (RSVP), or Protocol Independent Multicast (PIM), you also might log summary information for them.

**Action** To log the protocol peer information, use the following Junos OS CLI operational mode commands:

```

user@host> show bgp summary | save filename
user@host> show isis adjacency brief | save filename
user@host> show ospf neighbor brief | save filename

```

**Sample Output 1** user@host> show bgp summary | save test  
Wrote 45 lines of output to 'test'

```
user@host> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table          Tot Paths  Act Paths Suppressed    History Damp State   Pending
inet.0          4          4          0          0          0          0

10.1.2.81       fxp0.0    Full       10.250.240.10 128 33
```

**Meaning** Sample output 1 displays summary information about BGP and its neighbors. Sample output 2 displays information about IS-IS neighbors. Sample output 3 displays information about all OSPF neighbors.

## Back Up the Currently Running and Active File System

**Action** To back up the currently running and active file system so that you can recover to a known, stable environment in case there is a problem during the reinstall, use the following Junos OS CLI operational mode command:

```
user@host> request system snapshot
```

**Sample Output**

```
user@host> request system snapshot
umount: /altroot: not currently mounted
Copying / to /altroot.. (this may take a few minutes)
umount: /altconfig: not currently mounted
Copying /config to /altconfig.. (this may take a few minutes)
The following filesystems were archived: / /config
```

**Meaning** The root file system is backed up to **/altroot**, and **/config** is backed up to **/altconfig**. The root and **/config** file systems are on the router's internal flash drive, and the **/altroot** and **/altconfig** file systems are on the router's hard drive.

**NOTE:** After you issue the **request system snapshot** command, you cannot return to the previous version of the software because the running and backup copies of the software are identical.

## Reinstall Junos OS

**Action** To reinstall Junos OS, follow these steps:

1. Insert the removable medium (boot floppy) into the router.
  2. Reboot the router, either by power-cycling it or by issuing the **request system reboot** command from the CLI.
  3. At the following prompt, type **y**:  
  

```
WARNING: The installation will erase the contents of your disk. Do you wish
to continue (y/n)?
```

The router copies the software from the removable medium onto your system, occasionally displaying status messages. This can take up to 10 minutes.
  4. Remove the removable medium when prompted.
- The router reboots from the primary boot device on which the software is installed. When the reboot is complete, the router displays the login prompt.

## Reconfigure Junos OS

**Purpose** After you have reinstalled the software, you must copy the router's configuration files back to the router. (You also can configure the router from scratch, as described in *Junos System Basics Configuration Guide*.) However, before you can copy the configuration files, you must establish network connectivity.

To reconfigure the software, follow these steps:

1. [Configure Host Names, Domain Names, and IP Addresses on page 1268](#)
2. [Protecting Network Security by Configuring the Root Password on page 1269](#)
3. [Check Network Connectivity on page 1270](#)
4. [Copy Backup Configurations to the Router on page 1271](#)

## Configure Host Names, Domain Names, and IP Addresses

**Action** To configure the machine name, domain name, and various addresses, follow these steps:

1. Log in as **root**. There is no password.
2. Start the CLI:

```
root# cli
root@>
```

3. Enter configuration mode:

```
cli> configure
[edit]
root@#
```

4. Configure the name of the machine. If the name includes spaces, enclose the entire name in quotation marks (" "):

```
[edit]
root@# set system host-name host-name
```

5. Configure the machine's domain name:

```
[edit]
root@# set system domain-name domain-name
```

6. Configure the IP address and prefix length for the router's management Ethernet interface:

```
[edit]
root@# set interfaces fxp0 unit 0 family inet address address / prefix-length
```

7. Configure the IP address of a default router. This system is called the backup router because it is used only while the routing protocol process is not running.

```
[edit]
root@# set system backup-router address
```

8. Configure the IP address of a Domain Name Server (DNS) server:

```
[edit]
root@# set system name-server address
```

## Protecting Network Security by Configuring the Root Password

Configuring the root password on your Junos OS-enabled router helps prevent unauthorized users from making changes to your network. The root user (also referred to as superuser) has unrestricted access and full permissions within the system, so it is crucial to protect these functions by setting a strong password when setting up a new router.

After a new router is initially powered on, you log in as the user **root** with no password. Junos OS requires configuration of the root password before it accepts a commit operation. On a new device, the root password must always be a part of the configuration submitted with your initial commit.

To set the root password, you have a few options as shown in Step 1 of the following procedure.

- Enter a plain-text password that Junos OS encrypts.
- Enter a password that is already encrypted.
- Enter a secure shell (ssh) public key string.

The most secure options of these three are using an already encrypted password or an ssh public key string. Pre-encrypting your password or using a ssh public key string means the plain-text version of your password will never be transferred over the internet, protecting it from being intercepted by a man-in-the-middle attack.

**BEST PRACTICE:** Optionally, instead of configuring the root password at the [edit system] hierarchy level, you can use a configuration group to strengthen security, as shown in Step 2 of this procedure. This step uses a group called **global** as an example.

To set the root password:

1. Use one of these methods to configure the root password:

- To enter a plain-text password that the system encrypts for you:

```
[edit groups global system]
root@# set root-authentication plain-text-password
New Password: type password here
Retype new password: retry password here
```

If you use a plain-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see it. As you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt the password as in some other systems. Plain-text passwords are hidden and marked as **## SECRET-DATA** in the configuration.

- To enter a password that is already encrypted:

**CAUTION:** Do not use the **encrypted-password** option unless the password is *already* encrypted, and you are entering the encrypted version of the password.

If you accidentally configure the **encrypted-password** option with a plain-text password or with blank quotation marks (" "), you will not be able to log in to the device as root, and you will need to complete the root password recovery process.

```
[edit groups global system]
root@# set root-authentication encrypted-password password
```

- To enter an ssh public key string:

```
[edit groups global system]
root@# set root-authentication (ssh-dsa | ssh-eccdsa | ssh-rsa key)
```

2. (Optional) Strengthen security by only allowing root access from the console port.

```
[edit groups global system]
root@# set services ssh root-login deny
```

3. If you used a configuration group in Step 2, apply the configuration group, substituting **global** with the appropriate group name.

```
[edit]
user@host# set apply-groups global
```

4. Commit the changes.

```
root@# commit
```

## Check Network Connectivity

**Purpose** Establish that the router has network connectivity.

**Action** To check that the router has network connectivity, issue a **ping** command to a system on the network:

```
root@> ping address
```

If there is no response, verify that there is a route to the ***address*** using the **show route** command. If the address is outside your **fxp0** subnet, add a static route. Once the backup configuration is loaded and committed, the static route is no longer needed and should be deleted.

## Copy Backup Configurations to the Router

**Action** To copy backup configurations to the router, follow these steps:

1. To copy the existing configuration and any backup configurations back onto the router, use the **file copy** command. Place the files in the **/var/tmp** directory.

```
user@host> file copy var/tmp/filename
```

2. Load and activate the desired configuration:

```
root@> configure
[edit]
root@# load merge/config/filename or load replace/config/filename
[edit]
root@# commit
```

## Configure Host Names, Domain Names, and IP Addresses

**Action** To configure the machine name, domain name, and various addresses, follow these steps:

1. Log in as **root**. There is no password.
2. Start the CLI:

```
root# cli
root@>
```

3. Enter configuration mode:

```
cli> configure
[edit]
root@#
```

4. Configure the name of the machine. If the name includes spaces, enclose the entire name in quotation marks (" "):

```
[edit]
root@# set system host-name host-name
```

5. Configure the machine's domain name:

```
[edit]
root@# set system domain-name domain-name
```

6. Configure the IP address and prefix length for the router's management Ethernet interface:

```
[edit]
root@# set interfaces fxp0 unit 0 family inet address address / prefix-length
```

7. Configure the IP address of a default router. This system is called the backup router because it is used only while the routing protocol process is not running.

[edit]

```
root@# set system backup-router address
```

8. Configure the IP address of a Domain Name Server (DNS) server:

[edit]

```
root@# set system name-server address
```

---

## Check Network Connectivity

**Purpose** Establish that the router has network connectivity.

**Action** To check that the router has network connectivity, issue a **ping** command to a system on the network:

```
root@> ping address
```

If there is no response, verify that there is a route to the ***address*** using the **show route** command. If the address is outside your **fxp0** subnet, add a static route. Once the backup configuration is loaded and committed, the static route is no longer needed and should be deleted.

---

## Automatic Autobandwidth Adjustment Failed Event

**LSP Event** Autobw adjustment failed

**Sample Output 1**

```

user@R1> show configuration protocols mpls
statistics {
    file auto-bw.log;
    interval 5;
    auto-bandwidth;
}
label-switched-path R1-to-R6 {
    to 10.0.0.6;
    auto-bandwidth {
        adjust-interval 300;
        adjust-threshold 10;
        minimum-bandwidth 5m;
        maximum-bandwidth 80m;
    }
}
label-switched-path R1-to-R3 {
    to 10.0.0.3;
    auto-bandwidth {
        adjust-interval 300;
        adjust-threshold 10;
        minimum-bandwidth 155m;
        maximum-bandwidth 155m;
    }
}

```

**Sample Output 2**

```

user@R1> show mpls lsp extensive
Ingress LSP: 3 sessions

10.0.0.3
  From: 10.0.0.1, State: Up, ActiveRoute: 5, LSPname: R1-to-R3
  ActivePath: (primary)
  LoadBalance: Random
  Metric: 1
  Autobandwidth
  MinBW: 155Mbps MaxBW: 155Mbps
  AdjustTimer: 300 secs AdjustThreshold: 10%
  Max AvgBW util: 192bps, Bandwidth Adjustment in 219 second(s).
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  *Primary State: Up
    Computed ERO (S [L] denotes strict [loose] hops): (CSPF metric: 10)
10.1.13.2 S
  Received RRO (ProtectionFlag 1=Available 2=InUse 4=B/W 8=Node 10=SoftPreempt):

    10.1.13.2
      7 Feb 17 15:41:12 Autobw adjustment failed
      6 Feb 17 15:41:12 CSPF failed: no route toward 10.0.0.3
      5 Feb 17 15:36:23 Selected as active path

      1 Feb 17 15:36:23 CSPF: computation result accepted
  Created: Thu Feb 17 15:36:23 2005
[...Output truncated...]

```

**Meaning** This LSP event indicates that a periodic (timer-based) autobandwidth adjustment for the LSP is triggered at the end of the adjust interval. The adjustment fails, and the LSP stays up on the existing path with its current bandwidth.

**Cause** Adjustment failure may be due to a path CSPF computation failure with the adjust bandwidth or a signaling failure on the new path.

At the end of the time interval specified at the **[edit protocols mpls label-switched-path auto-bandwidth]** hierarchy level, the current maximum average bandwidth usage is compared to the allocated bandwidth for the LSP. If the LSP needs more bandwidth, an attempt is made to set up a new path where bandwidth is equal to the current maximum average usage. If the attempt is successful, the LSP's traffic is routed through the new path and the old path is removed. If the attempt fails, the LSP continues to use its current path.

**Action** Take action appropriate to the situation:

- Verify the MPLS and RSVP configuration on all available paths to the LSP endpoint.
- Check available bandwidth on alternate paths using the **show rsvp interface** command. If not enough bandwidth is available on any available paths, adjust the minimum-bandwidth parameter for the LSP in order to establish or adjust the priority to allow the LSP to preempt another LSP of lesser priority. For an LSP to be preempted, its hold priority must be lower than the LSP you are trying to establish.

---

## Displaying DiffServ-Aware Traffic-Engineered LSP Events

---

**Purpose** A DiffServ-aware traffic-engineered LSP is configured with a bandwidth reservation for a specific class type, and carries traffic for a single class type. On the packets, the class type is specified by the experimental (EXP) bits (also known as the class-of-service bits) and the per-hop behavior (PHB) associated with the EXP bits. The mapping between the EXP bits and the PHB is static, instead of being signaled in Resource Reservation Protocol (RSVP).

The class type must be configured consistently across the DiffServ domain, and must be consistent from router to router in the network. You can unambiguously map a class type to a queue. On each node router, the class-of-service queue configuration for an interface translates to the available bandwidth for a particular class type on that link. For more information about forwarding classes and class of service, see the Junos Class of Service Configuration Guide. For more information about differentiated services, see RFC 3270, *MPLS Applications Feature Guide Support of Differentiated Services*.

When the configuration of a DiffServ-aware traffic-engineered LSP is incorrect, an even or error message might occur in the output of the **show mpls lsp extensive** command.

**Action** To display LSP events that can occur with a DiffServ-aware LSP, enter the following Junos OS command-line interface (CLI) operational mode command from the ingress router:

```
user@host> show mpls lsp extensive
```

## Sample Output

Not available.

## Unsupported Traffic Class Event

---

**LSP Event** Unsupported traffic class

**Sample Output** Not available.

**Meaning** This LSP error event is a Juniper Networks proprietary error indicating that a Diffserv traffic engineering LSP was signaled with one or more traffic classes with values greater than the four traffic classes currently supported by the Junos OS.

**Cause** Not available.

**Action** Not available.

## Traffic Class Value Out of Allowed Range Event

---

**LSP Event** Traffic class value out of allowed range

**Sample Output** Not available.

**Meaning** This LSP error event is a Juniper Networks proprietary error indicating that a single class, IETF-style DiffServ traffic engineering LSP was signaled with a traffic class value of zero, which is invalid.

**Cause** Not available.

**Action** Not available.

## The Combination of Setup Priority and Traffic Class Is Not One of the Configured TE Classes Event

---

**LSP Event** The combination of setup-priority and traffic class is not one of the configured TE-classes

**Sample Output** Not available.

**Meaning** This LSP error event is a Juniper Networks proprietary error that indicates the setup priority signaled in the Path message for the LSP does not match the supported Diffserv traffic engineering classes configured on a label-switching router (LSR) along the LSP path.

**Cause** This LSP error event is caused by incorrect configuration of the LSP setup priority on the ingress LSR, or the incorrect configuration of a DiffServ traffic engineering class on an LSR along the LSP path.

**Action** Correct the configuration depending on the supported traffic engineering classes.

## RSVP Error, Subcode 7, Signal Type Does Not Match Link Encoding Event

---

**LSP Event** RSVP error, subcode 7, signal-type does not match link encoding

**Sample Output** Not available

**Meaning** This LSP error event is a Juniper Networks proprietary error reported for GMPLS LSPs when the configured signal bandwidth does not match the encoding type of the traffic engineering link selected on the first hop.

**Cause** An incorrect Sender Tspec is used with a particular LSP switching or encoding type.

**Action** Not available.

## Unacceptable Label Value Event

---

**LSP Event** Unacceptable label value event

**Sample Output** Not available.

**Meaning** This LSP error event indicates that the label value signaled in either the Path or Resv message was unacceptable to a label-switched router (LSR) along the LSP path.

**Cause** For GMPLS LSPs, this LSP error event is generated by incorrect label mapping configured on one of the LSRs, or by deletion of a resource that was being used by an LSP.

**Action** Not available.

## Unsupported Switching Type Event

---

**LSP Event** Unsupported switching type

**Sample Output** Not available.

**Meaning** This LSP error event indicates that the switching type requested in the generalized label request for a GMPLS LSP is unsupported on the corresponding selected traffic engineering link.

**Cause** Not available.

**Action** Not available.

## Gather Component Alarm Information

**Purpose** When you obtain information about component alarms and error messages, you determine when a problem with a component first appeared and the details of the situation.

To gather component alarm information, follow these steps:

1. [Display the Current Router Alarms on page 1277](#)
2. [Display Error Messages in the Messages Log File on page 1277](#)
3. [Display Error Messages in the Chassis Process Log File on page 1278](#)

## Display the Current Router Alarms

**Purpose** To determine the details of the alarms and when they first appeared in the component.

**Action** To display the current router component alarms, use the following CLI command:

```
user@host> show chassis alarms
```

The command output displays the number of alarms currently active, the time when the alarm began, the severity level, and an alarm description. Note the date and time of an alarm so that you can correlate it with error messages in the **messages** system log file.

For examples of sample output, see the *Junos System Basics and Services Command Reference*.

## Display Error Messages in the Messages Log File

**Purpose** To determine the details of the error messages in the Messages Log File.

**Action** To display router component error messages in the **messages** system log file, use the following CLI command:

```
user@host> show log messages
```

The **messages** system log file records the time the failure or event occurred, the severity level, a code, and a message description. Error messages in the **messages** system log file are logged at least 5 minutes before and after the alarm event.

To search for specific information in the log file, use the **| match component-name** command; for example, use **show log messages | match fpc**. If there is a space in the component name, enclose the component name in quotation marks; for example, **| match "power supply"**.

To search for multiple items in the log file, use the **| match** command followed by the multiple items, separated by the **|** (pipe), and enclosed in quotation marks; for example, **| match "fpc | sfm | kernel | tnp"**.

To monitor the **messages** file in real time, use the **monitor start messages** CLI command. This command displays the new entries in the file until you stop monitoring by using the **monitor stop messages** CLI command.

For more information about system log messages, see the *Junos System Log Messages Reference*.

## Display Error Messages in the Chassis Process Log File

**Purpose** To determine the details of the error messages in the Chassis Process Log File.

**Action** To display router component errors in the chassis process (**chassisd**) system log file, use the following CLI command:

```
user@host> show log chassisd
```

The chassis process (**chassisd**) log file tracks the state of each chassis component. For examples of sample output, see the *Junos System Basics and Services Command Reference*.

To search for specific information in the log file, use the **| match component-name** command; for example, **show log messages | match fpc**. If there is a space in the component name, enclose the component name in quotation marks; for example, **| match "power supply"**.

To search for multiple items in the log file, use the **| match** command followed by the multiple items, separated by the **|** (pipe), and enclosed in quotation marks; for example, **| match "fpc | sfm | kernel | tnp"**.

To monitor the **chassisd** file in real time, use the **monitor start chassisd** CLI command. This command displays the new entries in the file until you stop monitoring by using the **monitor stop chassisd** CLI command.

---

## Case Study for a CSPF Failure

**Purpose** This case study presents a Multiprotocol Label Switching (MPLS) network topology and CSPF failure scenario designed to demonstrate techniques and commands that are particularly useful when addressing CSPF problems in your network. The focus of the study is the incorrect association of user-provided constraints, specifically administrative groups (also known as link coloring).

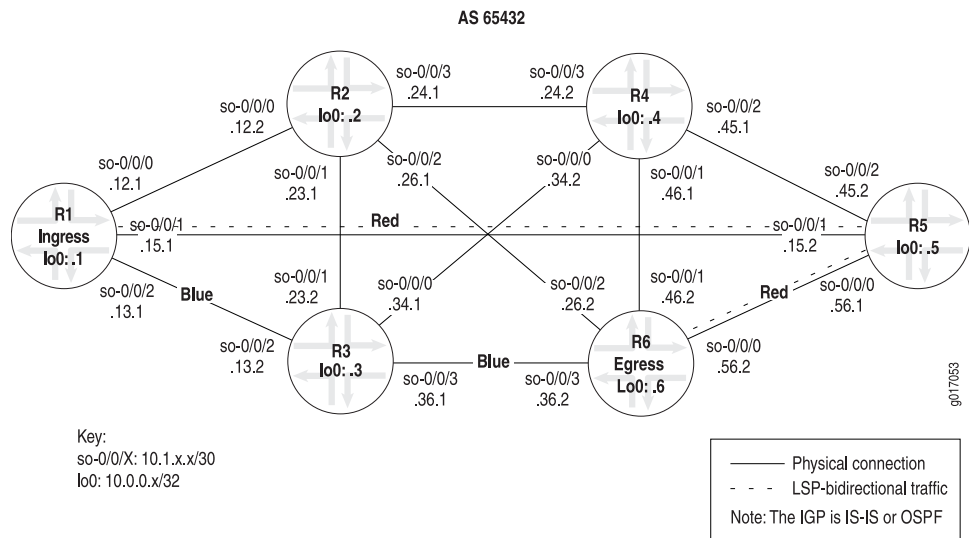

When calculating a path, the CSPF algorithm factors in user-provided constraints. The ingress router determines the physical path for each LSP by applying a CSPF algorithm to the information in the traffic engineering database. CSPF is a shortest-path-first (SPF) algorithm that has been modified to take into account constraints when calculating the shortest path across the network. Links that do not comply with the restrictions are removed from the tree and cannot be factored into the resulting SPF calculations.

CSPF integrates topology link-state information that is learned from interior gateway protocol (IGP) traffic engineering extensions and is maintained in the traffic engineering database. The information stored in the traffic engineering database includes attributes associated with the state of network resources.

The network topology shown in [Figure 121 on page 1279](#) illustrates a network in which the LSP is constrained by administrative group coloring (also known as link coloring), and

CSPF tracing is configured on the ingress router **R1**. In this example, the LSP is forced to transit **R5** in accordance with the restrictions imposed.

**Figure 121: CSPF Topology with Administrative Group Coloring**

The network shown in [Figure 121 on page 1279](#) is an MPLS router-only network with SONET interfaces.

The MPLS network shown in [Figure 121 on page 1279](#) is configured with administrative group coloring as follows:

- The LSP **R1-to-R6** is established with **R1** as the ingress router and **R6** as the egress router.
- The required path to **R6** transits **R5** on the redlinks. The inclusion of red coloring is not strictly necessary. To force the LSP to transit **R5**, you could color the links on **R3** and **R2** blue and then exclude the blue links.
- Both red and blue colors are used with the **include** and **exclude** statements to ensure that the LSP always transits **R5**. For information on configuring administrative group coloring, see the *MPLS Applications Feature Guide*.

To check that the network is configured correctly and the LSP is established, follow these steps:

1. [Verify That the LSP Is Established on page 1279](#)
2. [Check the Administrative Group Configuration on page 1281](#)

## Verify That the LSP Is Established

**Purpose** Check that the LSP shown in [Figure 121 on page 1279](#) is established and traversing the path from **R1** to **R6** through the red links.

**Action** To verify that the LSP is established, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show mpls lsp extensive
user@host> show mpls lsp
```

## Sample Output

```
user@R1> show mpls lsp extensive | no-more
Ingress LSP: 1 sessions

10.0.0.6

```

## Sample Output 2

```
[edit protocols mpls]
user@R5# run show mpls lsp
Ingress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 2 sessions
To          From          State   Rt Style Labelin Labelout LSPname
10.0.0.1    10.0.0.6             Up      1  1 FF 100352      3 R6-to-R1
10.0.0.6    10.0.0.1 Up 1 1 FF 100384    3 R1-to-R6
Total 2 displayed, Up 2, Down 0
```

**Meaning** Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** is successfully established as indicated by the Explicit Route Object (ERO) **10.1.15.2 S 10.1.56.2 S**, the log message **CSPF: computation result accepted**, and **State: Up**. Also, the LSP is routing packets correctly over the red links, avoiding the blue links or the links without any coloring.

Sample Output 2 from transit router **R5** shows that LSP **R1-to-R6** is transiting **R5** as expected.

## Check the Administrative Group Configuration

- Purpose** Check that the administrative group coloring is correct and the relevant interfaces are associated with each administrative group correctly
- Action** To check the administrative group configuration, enter the following Junos OS CLI operational mode commands, or issue the **show** command at the **[edit protocols mpls]** hierarchy level, as shown in the example below:
- ```
user@host> show configuration protocols mpls
user@host> show mpls interface
user@host> show ted database extensive nodeID
```

## Sample Output 1

```

**Meaning** Sample Output 1 shows that administrative group coloring is correctly configured on all relevant routers. Administrative groups red and blue are configured at the `[edit protocols mpls]` hierarchy level, and relevant interfaces are associated with each administrative group correctly.

**R3** is configured with blue coloring and the `include` and `exclude` statements are included in the configuration of **R1** to ensure that LSP **R1-to-R6** always transits **R5**. The inclusion of red coloring is not strictly necessary. To force the LSP to transit **R5**, you could color the links on **R2** and **R3** blue and then exclude the blue links. Red coloring is included in this example to demonstrate the fact that the CSPF algorithm excludes links that do not have a color configured, when the `include` statement is configured at the `[edit protocols mpls]` hierarchy level.

In addition, ingress router **R1** has CSPF tracing configured in preparation for gathering information when the CSPF algorithm fails later in this example.

Sample Output 2 shows that the correct interfaces are associated with the red and blue administration groups on **R1**, **R3**, **R5**, and **R6**.

Sample Output 3 confirms that link coloring is correctly reported in the traffic engineering database for **R1**. Not shown is the traffic engineering database output for the remaining routers, which is similar to the **R1** output, and correct.

---

## Examining a CSPF Failure

When a local CSPF failure indicates that no path meets the constraints configured for the LSP, you must perform CSPF-based tracing and be familiar with the contents of the traffic engineering database to resolve the problem. See [“Examine the Traffic Engineering Database” on page 1287](#) for an analysis of the traffic engineering database.

**NOTE:** If an LSP does not establish immediately, wait at least a minute or so before taking diagnostic or corrective action. This is because the RSVP retry timer is set to a 30-second default, resulting in a slight delay before the correct state of the LSP is available.

---

To examine a CSPF failure, follow these steps:

1. [Verify the CSPF Failure on page 1284](#)
2. [Examine the CSPF Log File on page 1286](#)
3. [Examine the Traffic Engineering Database on page 1287](#)
4. [Check the Administrative Group Configuration on R5 on page 1290](#)

## Verify the CSPF Failure

**Purpose** To simulate a configuration error on the network, router **R5** has the administrative group coloring removed from interface `so-0/0/0`. The result is a CSPF failure at **R5** because there is no longer a path between **R1** and **R6** that includes the red color.

**Action** To confirm that the LSP is down and verify the configuration on routers **R1** and **R5**, enter the following Junos OS CLI operational mode commands:

```
user@host> clear mpls lsp
user@host> show mpls lsp extensive
```

### Sample Output 1

```
user@R1> clear mpls lsp

Total 1 displayed, Up 1
, Down 0
```

**Meaning** Sample Output 1 from ingress router **R1** shows that the **clear mpls lsp** command was issued to confirm that **R1** cannot reestablish LSP **R1-to-R6**. The sample output from the **show mpls lsp extensive** command shows that LSP **R1-to-R6** is down, **State: Dn** and **ActivePath: (None)**; and that the CSPF has failed, **CSPF failed: no route toward 10.0.0.6**.

Sample Output 2 from transit router **R5** shows that LSP **R1-to-R6** is not included in the output, indicating that the LSP is not transiting **R5**.

Most network problems appear as a local CSPF failure, as shown in the sample output. The CSPF failure indicates that no path meeting the constraints for the LSP can be found in the router's traffic engineering database. To resolve these problems effectively, use CSPF tracing on the ingress router, and analyze the traffic engineering database to locate the node that should meet the constraints.

## Examine the CSPF Log File

**Purpose** After you have confirmed that the LSP is down, obtain more information about the possible cause of the failure.

**NOTE:** To obtain useful information from the CSPF log file, make sure that CSPF tracing is configured on the ingress router.

**Action** To examine the CSPF log file, enter the following Junos OS CLI operational mode commands:

```
user@host> monitor start filename
user@host> show log filename
```

**NOTE:** To stop monitoring CSPF, issue the `monitor stop` command.

## Sample Output

```
user@R1> monitor start cspf

[edit protocols mpls]
user@R1# run show log cspf-failed3

May 27 10:22:29      CSPF for R1-to-R6 done!
monitor stop

```

**Meaning** The sample output shows that the **monitor start cspf** command was issued to start displaying entries in the **cspf** log file in real time. The **cspf** log file is generated by the routing protocol process after the file is configured with the **traceoptions** statement at the **[edit protocols mpls]** hierarchy level. In this example, the **cspf** log file is configured with the **cspf**, **cspf-node**, and **cspf-link** flags to provide the most granular information about the steps taken by the CSPF algorithm.

The only link that passes the color constraint is between **R1** and **R5**, **10.1.15.0/32**. The CSPF algorithm is a locally run algorithm, which makes its calculations on a given router. When the CSPF algorithm runs on **R5**, it prunes **10.1.15.2** and selects **10.1.56.1** to send the message to **R6**. The link between **R5** and **R6** **10.1.56.0/32** does not pass the color constraints, indicating a problem with **R5**. At this stage, it is useful to examine the traffic engineering database to determine which link on **R5** should be associated with the red color.

## Examine the Traffic Engineering Database

**Purpose** Examining the traffic engineering database is another way to locate the node that should meet the constraints but does not. Once identified, you can concentrate your troubleshooting efforts on why that node is not being represented accurately in the database.

The contents of the traffic engineering database are consistent among all routers within a given traffic engineering domain. Therefore, you can issue the **show ted database**

command from any router in the same traffic engineering domain to obtain more granular information about the CSPF failure.

CSPF integrates topology link-state information that is learned from the IGP traffic engineering extensions and maintained in the traffic engineering database. The information stored in the traffic engineering database includes attributes associated with the state of the network resources (such as total link bandwidth, reserved link bandwidth, available link bandwidth, and link color). When calculating a path, the CSPF algorithm factors in user-provided information such as bandwidth requirements, maximum allowed hop count, and administrative groups, all of which are obtained from user configuration. (See [Figure 122 on page 1288](#)).

**Figure 122: User-Provided Constraints**

**Action** To examine the traffic engineering database, enter the following Junos OS CLI operational mode commands:

```

user@host> show ted database extensive
user@host> show ted database extensive NodeID | match "(NodeID|To:|Color)"

```

### Sample Output 1

```

[edit protocols mpls]

To: R6.00(10.0.0.6), Local: 10.1.56.1, Remote: 10.1.56.2
Color: 0 <none>

```

**Meaning** Sample Output 1 from ingress router **R1** shows a wealth of information on each node in the network, although only a portion is included in this example. The output shows the total number of IS-IS and INET nodes in the traffic engineering domain. The portion of the traffic engineering database shown represents a node (**R5**), and the **Type** field indicates **Rtr** (router). The **Type** field could also indicate Net (network) if the node were a pseudo node. The node (**R5**) has three input and output links that are running IS-IS Level 2, **Protocol: IS-IS(2)**. The links lead to nodes **R1**, **R4**, and **R6**. The local address and

remote address for each link is specified. The information on each node includes administrative groups (**Color:**), metrics, static bandwidth, reservable bandwidth, and available bandwidth priority level. The information contained in the traffic engineering database should be the same across all routers in the same traffic engineering domain. For a detailed description of the fields in the output of the **show ted database extensive** command, see the *Junos Routing Protocols and Policies Command Reference*.

Sample Output 2 shows filtered output that allows you to focus on exactly what is missing or incorrect.

Both outputs confirm that the link between R1 and R5, 10.1.15.0/32, is associated with the red color, while the link between R5 and R6, 10.1.56.0/32, is not associated with a color. In the network shown in [Figure 121 on page 1279](#), for the LSP to establish correctly, link 10.1.56.1 must be associated with the red color.

### Check the Administrative Group Configuration on R5

**Purpose** Focus on R5 to determine which interfaces are associated with the red color, and make any necessary corrections.

**Action** To check the administrative group configuration on R5 and make any necessary corrections, enter the following Junos OS CLI commands:

```
user@R5> edit
[edit protocols mpls]
user@R5# show
user@R5# delete interface so-0/0/1 admin-group
user@R5# set interface so-0/0/0 admin-group red
user@R5# show
user@R5# commit
```

### Sample Output 1

```
user@R5> edit
Entering configuration mode

[edit protocols mpls]
user@R5# show
admin-groups {
    red 8;
}
interface fxp0.0 {
    disable;
}
interface so-0/0/0.0;
interface so-0/0/1.0 { <<<incorrect interface configured with admin-group
    admin-group red;
}
interface so-0/0/2.0;
```

### Sample Output 2

```
[edit protocols mpls]
user@R5# delete interface so-0/0/1 admin-group
```

```

[edit protocols mpls]
user@R5# set interface so-0/0/0 admin-group red

[edit protocols mpls]
user@R5# show
admin-groups {
    red 8;
    blue 4;
}
interface fxp0.0 {
    disable;
}
interface so-0/0/0.0 { <<<correct interface configured with admin-group
    admin-group red;
}
interface so-0/0/1.0;
interface so-0/0/2.0;

[edit protocols mpls]
user@R5# commit
commit complete

```

### Sample Output 3

```

user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPname
10.0.0.6    10.0.0.1    Up 1      *  R1-to-R6
Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions
To          From          State Rt Style Labelin Labelout LSPname
10.0.0.1    10.0.0.6    Up   0  1 FF      3      - R6-to-R1
Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

**Meaning** Sample Output 1 from transit router **R5** shows that at the `[edit protocols mpls]` hierarchy level, interface **so-0/0/1** is incorrectly configured with the **admin-group red** statement. The **so-0/0/0** interface should be configured with the **admin-group red** statement.

Sample Output 2 shows the steps taken to correct the configuration. The administration group has been deleted from **so-0/0/1** and **so-0/0/0** is now associated with the red color.

Sample Output 3 shows that LSP **R1-to-R6** is established.

### Verify the CSPF Failure

**Purpose** To simulate a configuration error on the network, router **R5** has the administrative group coloring removed from interface **so-0/0/0**. The result is a CSPF failure at **R5** because there is no longer a path between **R1** and **R6** that includes the red color.

**Action** To confirm that the LSP is down and verify the configuration on routers **R1** and **R5**, enter the following Junos OS CLI operational mode commands:

```

user@host> clear mpls lsp
user@host> show mpls lsp extensive

```

### Sample Output 1

```

user@R1> clear mpls lsp
[edit protocols mpls]
user@R1# run show mpls lsp extensive
Ingress LSP: 1 sessions

```

**Meaning** Sample Output 1 from ingress router **R1** shows that the **clear mpls lsp** command was issued to confirm that **R1** cannot reestablish LSP **R1-to-R6**. The sample output from the **show mpls lsp extensive** command shows that LSP **R1-to-R6** is down, **State: Dn** and **ActivePath: (None)**; and that the CSPF has failed, **CSPF failed: no route toward 10.0.0.6**.

Sample Output 2 from transit router **R5** shows that LSP **R1-to-R6** is not included in the output, indicating that the LSP is not transiting **R5**.

Most network problems appear as a local CSPF failure, as shown in the sample output. The CSPF failure indicates that no path meeting the constraints for the LSP can be found

in the router's traffic engineering database. To resolve these problems effectively, use CSPF tracing on the ingress router, and analyze the traffic engineering database to locate the node that should meet the constraints.

## Examining the Hello Message

**Purpose** RSVP monitors the status of the interior gateway protocol (IGP) (Intermediate System-to-Intermediate System [ISIS] or Open Shortest Path First [OSPF]) neighbors and relies on the IGP protocols to detect when a node fails. If an IGP protocol declares a neighbor down (because Hello messages are no longer being received), RSVP also brings down that neighbor. However, the IGP protocols and RSVP still act independently when bringing a neighbor up.

RSVP Hello messages are exchanged between neighbors. The destination address is the neighbor node. RSVP Hello messages are used to determine loss of interface more quickly than determined by the RSVP state timeout.

**NOTE:** RSVP Hello messages are required to establish the protocol or to maintain adjacency information. RSVP Hello messages do not establish state.

Figure 123 on page 1293 shows two RSVP Hello messages exchanged between routers R1 and R3.

**Figure 123: RSVP Hello Message**

To ensure that Hello messages are displayed in the output, include the **packets** flag at the [edit protocols rsvp traceoptions] hierarchy level.

**Action** To examine the Hello message, enter the following Junos OS CLI command:

```
user@R1> monitor start filename
```

**Sample Output 1**

```
[edit protocols rsvp]
user@R1# show
traceoptions {
  file rsvp-log;
  flag packets detail;
}
interface so-0/0/2.0;
interface fxp0.0 {
  disable;
}
```

**Sample Output 2**

```
user@R1> clear log rsvp-log

user@R1> monitor start rsvp-log

user@R1>
*** rsvp-log ***
[...Output truncated...]
Jun 29 15:48:59  RSVP send Hello New 10.1.13.1->10.1.13.2 Len=32 so-0/0/2.0
Jun 29 15:48:59  HelloReq Len 12
Jun 29 15:48:59  RestartCap Len 12 restart time 0, recovery time 0
Jun 29 15:48:59  RSVP rcv Hello New 10.1.13.2->10.1.13.1 Len=32 so-0/0/2.0
Jun 29 15:48:59  HelloRply Len 12
Jun 29 15:48:59  RestartCap Len 12 restart time 0, recovery time 0
monitor stop
```

**Meaning** Sample Output 1 shows the configuration of RSVP tracing on ingress router **R1**. The **packets** flag is included at the **[edit protocols rsvp traceoptions]** hierarchy level to provide information about RSVP traffic. The **detail** option is included to show granular details about the configured flag.

Sample Output 2 shows **clear** commands, the output for the **rsvp-log** file, and that monitoring was started and then stopped. The **rsvp-log** output shows two RSVP Hello messages exchanged between **R1** and **R3**.

The first Hello message in the **rsvp-log** output is a request sent from **R1** (10.1.13.1) to **R3** (10.1.13.2). The outgoing interface is **so-0/0/2.0** on **R1**. The second Hello message was a reply sent from **R3** to **R1**, also through the outgoing interface **so-0/0/2.0** on **R3**.

The next two lines of output indicate object values for the two Hello messages, and are indented in the output. To facilitate this discussion, each line of output for each object is displayed before the corresponding explanation.

- **HelloReq Len 12**

The Hello request (**HelloReq**) object indicates that this is a Hello request. RFC 3209 defines the RSVP Hello message. An RSVP Hello message can either be a request or a reply. Every request should generate a reply.

- **RestartCap Len 12 restart time 0, recovery time 0**

The restart object (**RestartCap**) indicates the graceful restart capability of the sender node. The restart time of 0 milliseconds is the length of time that this node takes to restart its RSVP traffic engineering functionality. At the end of this time, the node can send and receive RSVP messages again. The recovery time of 0 milliseconds indicates

the length of time the LSR retains MPLS forwarding information. A recovery time of 0 in this case indicates that no forwarding state was preserved across a restart. Because both values are set to 0, graceful restart was not enabled for this RSVP session.

- **HelloRply Len 12**

The **Hello** reply (**HelloRply**) object indicates that this is an RSVP Hello message sent from **R3** to **R1** out of interface **so-0/0/2.0**.

In standard RSVP, node failure detection occurs as a consequence of the RSVP soft-state timeout model. However, detection typically requires several minutes to time out the soft state. Hello packets allow the detection of the neighboring node state changes more quickly.

In Junos OS, RSVP Hello messages are optional and are backward-compatible with RSVP implementations that do not support Hello messages. For neighboring routers that do not support Hello messages or on which RSVP Hello is disabled, RSVP uses the soft-state timeout for loss detection and cannot benefit from fast IGP Hello detection.

Configuring a short time for the IS-IS or OSPF Hello timers allows these protocols to detect node failures more quickly. RSVP also benefits from early detection by the IGP protocols. It is not necessary to explicitly configure a short RSVP Hello timer. If you do configure the RSVP Hello timer, you can configure a longer value and can still expect the failure of a neighboring router to be quickly detected by IGP.

Between Hello-capable neighbors, Hello messages are sent unicast toward each other. A loss of (2 x keep-multiplier + 1) consecutive Hello messages causes the neighbor's state to go down, and all RSVP sessions to and from that neighbor are declared to be down.

By default, RSVP sends Hello messages every 9 seconds.

## Displaying the Status of IS-IS Adjacencies

### Purpose

Assuming that all the routers are correctly configured for IS-IS, you can verify which neighbors are adjacent and able to exchange IS-IS data. In addition, you can examine the set of routes installed in the forwarding table to verify that the routing protocol process (rpd) has relayed the correct information into the forwarding table.

[Figure 124 on page 1296](#) illustrates the example IS-IS topology used for the procedures in this topic.

Figure 124: IS-IS Network Topology

The network consists of Level 1 and Level 2 adjacencies. Level 1 adjacencies are within areas 49.0001 and 49.0002. Level 2 adjacencies occur between all directly connected Level 2 routers regardless of which area they are in. For example, R5 is in area 49.0001, R6 is in area 49.0003, R1 is in area 49.0004, and R2 is in area 49.0002. The network in [Figure 124 on page 1296](#) should have the following adjacencies:

- Level 2 adjacencies between all directly connected Level 2 routers (R1, R2, R5, and R6).
- Level 1 adjacencies between routers in area 49.0001 (R4 and R5) and between routers in area 49.0002 (R2 and R3).

To verify that routers are adjacent and able to exchange IS-IS data, follow these steps:

1. [Verifying Adjacent Routers on page 1296](#)
2. [Examine the Forwarding Table on page 1297](#)

## Verifying Adjacent Routers

**Purpose** Verify that routers are adjacent and able to exchange IS-IS data.

**Action** To verify that routers are adjacent and able to exchange IS-IS data, enter the following CLI operational mode command:

```
user@host> show isis adjacency
```

The following sample output shows the adjacencies that formed for all routers shown in ["Displaying the Status of IS-IS Adjacencies" on page 1295](#).

## Sample Output

```

user@R1> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
so-0/0/0.0         R2          2 Up         19
so-0/0/1.0         R5          2 Up         18

user@R2> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
so-0/0/0.0         R1          2 Up         19
so-0/0/1.0         R3          1 Up         26
so-0/0/2.0         R6          2 Up         21

user@R3> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
so-0/0/1.0         R2          1 Up         24

user@R4> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
so-0/0/2.0         R5          1 Up         23

user@R5> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
so-0/0/0.0         R6          2 Up         22
so-0/0/1.0         R1          2 Up         20
so-0/0/2.0         R4          1 Up         20

user@R6> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
so-0/0/0.0         R5          2 Up         21
so-0/0/2.0         R2          2 Up         20

```

**Meaning** The sample output shows the adjacencies that formed in the network illustrated in [“Displaying the Status of IS-IS Adjacencies” on page 1295](#). The Level 1/Level 2 routers (R2 and R5) formed Level 1 adjacencies with Level 1 routers (R3 and R4), and Level 2 adjacencies with the Level 2 routers (R1 and R6). To view the status of the adjacency, examine the State column. In this example, all adjacencies in the network are up.

If the state is not **Up** for a particular neighbor, you must first examine the IS-IS configuration for the particular interface. Make sure that the NET address is correct and that the loopback interface (lo0) is configured. Use the **show isis interface** or **show isis interface detail** command to display the IS-IS parameters for all interfaces configured with IS-IS. With these two commands, you can see which interfaces are configured for IS-IS, whether they are configured for Level 1 or Level 2, the IS-IS metric, and other IS-IS information.

## Examine the Forwarding Table

**Purpose** You can display the set of routes installed in the forwarding table to verify that the routing protocol process (rpd) has relayed the correct information into the forwarding table. This is especially important when there are network problems, such as connectivity. In this procedure, you verify that the routes displayed in Step 2 appear in the forwarding table for Router R5.

**Action** To examine the forwarding table for a router, enter the following CLI command:

```
user@host> show route forwarding-table destination destination-prefix
```

### Sample Output

```
user@R5> show route forwarding-table destination 10.0.0.3
Routing table: inet
Internet:
Destination      Type RtRef Next hop          Type Index NhRef Netif
10.0.0.3/32      user  0 10.1.15.0          ucst  285   7  so-0/0/1.0
user@R5> show route forwarding-table destination 10.0.0.3
Routing table: inet
Internet:
Destination      Type RtRef Next hop          Type Index NhRef Netif
10.0.0.3/32      user  0 10.1.56.0          ucst  281   9  so-0/0/0.0
```

**Meaning** The sample output shows the selected next hop between Routers R5 and R3 sent from the inet routing table and installed into the forwarding table. The first instance shows the route through Router R1, and the second instance shows the route through Router R6. In both instances, the preferred route displayed in Step 2 is installed in the forwarding table.

In general, the sample output includes the destination address and destination type, the next-hop address and next-hop type, the number of references to the next hop, an index number into an internal next-hop database, and the interface used to reach the next hop.

## Check OSPF on a Stub Router

**Purpose** To verify the OSPF configuration on a stub router.

**Action** To verify the OSPF configuration on a stub router in your network, enter the following commands:

```
user@host> show configuration
user@host> show ospf interface
```

The following sample output is for an OSPF configuration on **R5**, a stub router:

### Sample Output

```
user@R5> show configuration
[...Output truncated...]
interfaces {
    so-0/0/2 {
        unit 0 {
            family inet {
                address 10.1.45.2/30;
            }
        }
    }
    lo0 {
        unit 0 {
            family inet {
```

```

        address 10.0.0.5/32;
    }
}
}
routing-options {
    router-id 10.0.0.5;
}
protocols {
    ospf {
        area 0.0.0.2 {
            stub;
            interface so-0/0/2.0;
            interface lo0.0 {
                passive;
            }
        }
    }
}
}

```

```
user@R5> show ospf interface
```

| Interface  | State   | Area    | DR ID   | BDR ID  | Nbrs |
|------------|---------|---------|---------|---------|------|
| lo0.0      | DRother | 0.0.0.2 | 0.0.0.0 | 0.0.0.0 | 0    |
| so-0/0/2.0 | PtToPt  | 0.0.0.2 | 0.0.0.0 | 0.0.0.0 | 1    |

**Meaning** The sample output shows a basic OSPF configuration at the `[edit protocols ospf]` and `[edit interfaces]` hierarchy levels on **R5**, a stub router.

**R5** has two interfaces included at the `[edit protocols ospf]` hierarchy level, and those interfaces have the **family inet** statement included at the `[edit interfaces]` hierarchy level. Both interfaces, **so-0/0/2.0** and the loopback interface (**lo0**), are in the stub area (**0.0.0.2**).

**R5** has the router ID configured manually to avoid possible problems when the OSPF router ID (RID) changes; for example, when multiple loopback addresses are configured. The RID uniquely identifies the router within the OSPF network. It is transmitted within the LSAs used to populate the link-state database and calculate the shortest-path tree. In a link-state network, it is important that two routers do not share the same RID value, otherwise IP routing problems may occur.

A stub area does not allow AS external advertisements to flood within that area. **R5** relies on a default route (**0.0.0.0/0**) to reach destinations outside the AS. The default route can be statically configured on **R5** or advertised by an ABR (**R4**). In this network, the default LSA is advertised by **R4**.

A stub area is useful if you want to reduce the size of the topological database and therefore the amount of memory required from the routers in the stub area. However, some restrictions apply to a stub area. You cannot create a virtual link through a stub area, and a stub area cannot contain an ASBR.

## Checklist for Verifying the BGP Protocol and Peers

**Purpose** [Table 40 on page 1300](#) provides links and commands for verifying whether the Border Gateway Protocol (BGP) is configured correctly on a Juniper Networks router in your network, the internal Border Gateway Protocol (IBGP) and exterior Border Gateway

Protocol (EBGP) sessions are properly established, the external routes are advertised and received correctly, and the BGP path selection process is working properly.

### Action

## Verify BGP Peers

### Purpose

Assuming that all the routers are correctly configured for BGP, you can verify if IBGP and EBGP sessions are properly established, external routes are advertised and received correctly, and the BGP path selection process is working properly.

[Figure 125 on page 1301](#) illustrates an example BGP network topology used in this topic.

Figure 125: BGP Network Topology

The network consists of two directly connected ASs consisting of external and internal peers. The external peers are directly connected through a shared interface and are running EBGP. The internal peers are connected through their loopback (lo0) interfaces through IBGP. AS 65001 is running OSPF and AS 65002 is running IS-IS as its underlying IGP. IBGP routers do not have to be directly connected, the underlying IGP allows neighbors to reach one another.

The two routers in AS 65001 each contain one EBGP link to AS 65002 (R2 and R4) over which they announce aggregated prefixes: 100.100.1.0, 100.100.2.0, 100.100.3.0, and 100.100.4.0. Also, R1 and R5 are injecting multiple exit discriminator (MED) values of 5 and 10, respectively, for some routes.

The internal routers in both ASs are using a full mesh IBGP topology. A full mesh is required because the networks are not using confederations or route reflectors, so any routes learned through IBGP are not distributed to other internal neighbors. For example, when R3 learns a route from R2, R3 does not distribute that route to R6 because the route is learned through IBGP, so R6 must have a direct BGP connection to R2 to learn the route.

In a full mesh topology, only the border router receiving external BGP information distributes that information to other routers within its AS. The receiving router does not redistribute that information to other IBGP routers in its own AS.

From the point of view of AS 65002, the following sessions should be up:

- The four routers in AS 65002 should have IBGP sessions established with each other.
- R2 should have an EBGP session established with R1.
- R4 should have an EBGP session established with R5.

To verify BGP peers, follow these steps:

1. [Verify BGP on an Internal Router on page 1302](#)
2. [Verify BGP on a Border Router on page 1304](#)
3. [Verify Advertised BGP Routes on page 1307](#)
4. [Verify That a Particular BGP Route Is Received on Your Router on page 1308](#)
5. [Examine the EBGP over IBGP Selection on page 1308](#)

## Verify BGP on an Internal Router

**Purpose** To verify the BGP configuration of an internal router.

**Action** To verify the BGP configuration of an internal router, enter the following Junos OS command-line interface (CLI) command:

```
user@host> show configuration
```

The following sample output is for a BGP configuration on R3, as shown in *Verify the BGP Protocol*:

## Sample Output

```

            type internal;
            local-address 10.0.0.6;
            neighbor 10.0.0.2;
            neighbor 10.0.0.3;
            neighbor 10.0.0.4;
        }
    }
    isis {
        level 1 disable;
        interface all {
            level 2 metric 10;
        }
        interface lo0.0;
    }
}

```

**Meaning** The sample output shows a basic BGP configuration on routers **R3** and **R6**. The local AS (65002) and one group (**internal**) are configured on both routers. **R3** has three internal peers—**10.0.0.2**, **10.0.0.4**, and **10.0.0.6**—included at the [**protocols bgp group group**] hierarchy level. **R6** also has three internal peers: **10.0.0.2**, **10.0.0.3**, and **10.0.0.4**. The underlying IGP protocol is Intermediate System-to-Intermediate System (IS-IS), and relevant interfaces are configured to run IS-IS.

Note that in this configuration the router ID is manually configured to avoid any duplicate router ID problems.

## Verify BGP on a Border Router

**Purpose** To verify the BGP configuration of a border router.

**Action** To verify the BGP configuration of a border router, enter the following Junos OS CLI operational mode command:

```
user@host> show configuration
```

## Sample Output

The following sample output is for a BGP configuration on two border routers from AS 65002 (R2 and R4 as shown in *Verify the BGP Protocol*):

```

user@R2> show configuration
[...Output truncated...]
interfaces {
    so-0/0/0 {
        unit 0 {
            family inet {
                address 10.1.12.2/30;
            }
            family iso;
        }
    }
    so-0/0/1 {
        unit 0 {

            then {
                next-hop self;
            }
        }
    }
}

```

**Meaning** The sample output shows a basic BGP configuration on border routers **R2** and **R4**. Both routers have the AS (65002) included at the [routing-options] hierarchy level. Each router has two groups included at the [protocols bgp group group] hierarchy level. External peers are included in the external group, either *toR1* or *toR5*, depending on the router. Internal peers are included in the **internal** group. The underlying IGP protocol is IS-IS on both routers, and relevant interfaces are configured to run IS-IS.

Note that in the configuration on both routers, the router ID is manually configured to avoid duplicate router ID problems, and the **next-hop-self** statement is included to avoid any BGP next-hop reachability problems.

## Verify Advertised BGP Routes

**Purpose** You can determine if a particular route that you have configured is being advertised to a neighbor.

**Action** To verify the routing information as it has been prepared for advertisement to the specified BGP neighbor, enter the following Junos OS CLI operational mode command:

```
user@host> show route advertising-protocol bgp neighbor-address
```

## Sample Output

```

user@R2> show route advertising-protocol bgp 10.0.0.4\
inet.0: 20 destinations, 22 routes (20 active, 0 holddown, 0 hidden)
  Prefix                Nexthop        MED      Lclpref   AS path
* 100.100.1.0/24         Self           5         200       65001 I
* 100.100.2.0/24         Self           5         100       65001 I
* 100.100.3.0/24         Self           100       100       65001 I
* 100.100.4.0/24         Self           100       100       65001 I

```

**Meaning** The sample output shows the BGP routes advertised from **R2** to its neighbor, **10.0.0.4** (**R4**). Out of 22 total routes in the **inet.0** routing table, 20 are active destinations. No routes are **hidden** or in the **hold-down** state. Routes reside in the **hold-down** state prior to being declared active, and routes rejected by a routing policy can be placed into the **hidden** state. The information displayed reflects the routes that the routing table exported to the BGP routing protocol.

## Verify That a Particular BGP Route Is Received on Your Router

**Purpose** Display the routing information as it is received through a particular BGP neighbor and advertised by the local router to the neighbor.

**Action** To verify that a particular BGP route is received on your router, enter the following Junos OS CLI operational mode command:

```
user@host> show route receive-protocol bgp neighbor-address
```

## Sample Output

```
user@R6> show route receive-protocol bgp 10.0.0.2
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref    AS path
*100.100.1.0/24    10.0.0.2         5      200      65001 I
*100.100.2.0/24    10.0.0.2         5      100      65001 I
  100.100.3.0/24    10.0.0.2         100           65001 I
  100.100.4.0/24    10.0.0.2         100           65001 I
iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

user@R6> show route receive-protocol bgp 10.0.0.4
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref    AS path
*100.100.3.0/24    10.0.0.4         100           65001 I
*100.100.4.0/24    10.0.0.4         100           65001 I
iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
```

**Meaning** The sample output shows four BGP routes from **R2** and two from **R4**. Of the four routes from **R2**, only two are active in the routing table, as indicated by the asterisk (\*), while both routes received from **R4** are active in the routing table. All BGP routes came through AS 65001.

## Examine the EBGP over IBGP Selection

**Purpose** To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path.

**Action** To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

## Sample Output

```
user@R4> show route 100.100.3.0 detail
```

```

inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.3.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-101
    Source: 10.1.45.2
    Next hop: 10.1.45.2 via so-0/0/2.0, selected
    State: <Active Ext>
    Local AS: 65002 Peer AS: 65001
    Age: 5d 0:31:25
    Task: BGP_65001.10.1.45.2+179
    Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

    AS path: 65001 I
    Localpref: 100
    Router ID: 10.0.0.5
  BGP      Preference: 170/-101
    Source: 10.0.0.2
    Next hop: 10.1.24.1 via so-0/0/3.0, selected
    Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277
    State: <NotBest Int Ext>
    Inactive reason: Interior > Exterior > Exterior via Interior
    Local AS: 65002 Peer AS: 65002
    Age: 2:48:18    Metric2: 10
    Task: BGP_65002.10.0.0.2+179
    AS path: 65001 I
    Localpref: 100
    Router ID: 10.0.0.2

```

**Meaning** The sample output shows that **R4** received two instances of the **100.100.3.0** route: one from **10.1.45.2** (**R5**) and one from **10.0.0.2** (**R2**). **R4** selected the path from **R5** as its active path, as indicated by the asterisk (\*). The selection is based on a preference for routes learned from an EBGp peer over routes learned from an IBGP. **R5** is an EBGp peer.

You can determine if a path is received from an EBGp or IBGP peer by examining the **Local As** and **Peer As** fields. For example, the route from **R5** shows the local AS is 65002 and the peer AS is 65001, indicating that the route is received from an EBGp peer. The route from **R2** shows that both the local and peer AS is 65002, indicating that it is received from an IBGP peer.

The reason that the inactive path is not selected is displayed in the **Inactive reason** field, in this case, **Interior > Exterior > Exterior via Interior**. The wording of this reason shows the order of preferences applied when the same route is received from two routers. The route received from a strictly internal source (IGP) is preferred first, the route received from an external source (EBGP) is preferred next, and any route which comes from an external source and is received internally (IBGP) is preferred last.

## Examine BGP Routes and Route Selection

### Purpose

You can examine the BGP path selection process to determine the single, active path when BGP receives multiple routes to the same destination prefix.

Figure 126: BGP Network Topology

The network in [Figure 126 on page 1310](#) shows that **R1** and **R5** announce the same aggregate routes to **R2** and **R4**, which results in **R2** and **R4** receiving two routes to the same destination prefix. The route selection process on **R2** and **R4** determines which of the two BGP routes received is active and advertised to the other internal routers (**R3** and **R6**).

Before the router installs a BGP route, it must make sure that the BGP **next-hop** attribute is reachable. If the BGP next hop cannot be resolved, the route is not installed. When a BGP route is installed in the routing table, it must go through a path selection process if multiple routes exist to the same destination prefix. The BGP path selection process proceeds in the following order:

1. Route preference in the routing table is compared. For example, if an OSPF and a BGP route exist for a particular destination, the OSPF route is selected as the active route because the OSPF route has a default preference of 110, while the BGP route has a default preference of 170.
2. Routes are compared for local preference. The route with the highest local preference is preferred. For example, see [“Examine the Local Preference Selection” on page 1311](#).
3. The AS path attribute is evaluated. The shorter AS path is preferred.
4. The origin code is evaluated. The lowest origin code is preferred ( **I (IGP)** < **E (EGP)** < **? (Incomplete)** ).

5. The MED value is evaluated. By default, if any of the routes are advertised from the same neighboring AS, the lowest MED value is preferred. The absence of a MED value is interpreted as a MED of 0. For an example, see [“Examine the Multiple Exit Discriminator Route Selection” on page 1312](#).
6. The route is evaluated as to whether it is learned through EBGP or IBGP. EBGP learned routes are preferred to IBGP learned routes. For an example, see [“Examine the EBGP over IBGP Selection” on page 1308](#).
7. If the route is learned from IBGP, the route with the lowest IGP cost is preferred. For an example, see [“Examine the IGP Cost Selection” on page 1314](#). The physical next hop to the IBGP peer is installed according to the following three rules:
  - a. After BGP examines the **inet.0** and **inet.3** routing tables, the physical next hop of the route with the lowest preference is used.
  - b. If the preference values in the **inet.0** and the **inet.3** routing tables are a tie, the physical next hop of the route in the **inet.3** routing table is used.
  - c. When a preference tie exists in the same routing table, the physical next hop of the route with more paths is installed.
8. The route reflection cluster list attribute is evaluated. The shortest length cluster list is preferred. Routes without a cluster list are considered to have a cluster list length of 0.
9. The router ID is evaluated. The route from the peer with the lowest router ID is preferred (usually the loopback address).
10. The peer address value is examined. The peer with the lowest peer IP address is preferred.

To determine the single, active path when BGP receives multiple routes to the same destination prefix, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

The following steps illustrate the inactive reason displayed when BGP receives multiple routes to the same destination prefix and one route is selected as the single, active path:

1. [Examine the Local Preference Selection on page 1311](#)
2. [Examine the Multiple Exit Discriminator Route Selection on page 1312](#)
3. [Examine the EBGP over IBGP Selection on page 1313](#)
4. [Examine the IGP Cost Selection on page 1314](#)

## Examine the Local Preference Selection

**Purpose** To examine a route to determine if local preference is the selection criteria for the single, active path.

**Action** To examine a route to determine if local preference is the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

## Sample Output

```
user@R4> show route 100.100.1.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.1.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-201
    Source: 10.0.0.2
    Next hop: 10.1.24.1 via so-0/0/3.0, selected
    Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277
    State: <Active Int Ext>
    Local AS: 65002 Peer AS: 65002
    Age: 2:22:34 Metric: 5 Metric2: 10
    Task: BGP_65002.10.0.0.2+179
    Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

    AS path: 65001|
    Localpref: 200
    Router ID: 10.0.0.2
  BGP      Preference: 170/-101
    Source: 10.1.45.2
    Next hop: 10.1.45.2 via so-0/0/2.0, selected
    State: <Ext>
    Inactive reason: Local Preference
    Local AS: 65002 Peer AS: 65001
    Age: 2w0d 1:28:31 Metric: 10
    Task: BGP_65001.10.1.45.2+179
    AS path: 65001|
    Localpref: 100
    Router ID: 10.0.0.5
```

**Meaning** The sample output shows that R4 received two instances of the 100.100.1.0 route: one from 10.0.0.2 (R2) and one from 10.1.45.2 (R5). R4 selected the path from R2 as its active path, as indicated by the asterisk (\*). The selection is based on the local preference value contained in the **Localpref** field. The path with the *highest* local preference is preferred. In the example, the path with the higher local preference value is the path from R2, 200.

The reason that the route from R5 is not selected is in the **Inactive reason** field, in this case, **Local Preference**.

Note that the two paths are from the same neighboring network: AS 65001.

## Examine the Multiple Exit Discriminator Route Selection

**Purpose** To examine a route to determine if the MED is the selection criteria for the single, active path.

**Action** To examine a route to determine if the MED is the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

## Sample Output

```
user@R4> show route 100.100.2.0 detail
```

```

inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.2.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-101
    Source: 10.0.0.2
    Next hop: 10.1.24.1 via so-0/0/3.0, selected
    Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277
    State: <Active Int Ext>
    Local AS: 65002 Peer AS: 65002
    Age: 2:32:01      Metric: 5      Metric2: 10
    Task: BGP_65002.10.0.0.2+179
    Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

    AS path: 65001|
    Localpref: 100
    Router ID: 10.0.0.2
  BGP      Preference: 170/-101
    Source: 10.1.45.2
    Next hop: 10.1.45.2 via so-0/0/2.0, selected
    State: <NotBest Ext>
    Inactive reason: Not Best in its group
    Local AS: 65002 Peer AS: 65001
    Age: 2w0d 1:37:58      Metric: 10
    Task: BGP_65001.10.1.45.2+179
    AS path: 65001|
    Localpref: 100
    Router ID: 10.0.0.5

```

**Meaning** The sample output shows that **R4** received two instances of the **100.100.2.0** route: one from **10.0.0.2 (R2)**, and one from **10.1.45.2 (R5)**. **R4** selected the path from **R2** as its active route, as indicated by the asterisk (\*). The selection is based on the MED value contained in the **Metric** field. The path with the lowest MED value is preferred. In the example, the path with the lowest MED value (5) is the path from **R2**. Note that the two paths are from the same neighboring network: AS 65001.

The reason that the inactive path is not selected is displayed in the **Inactive reason** field, in this case, **Not Best in its group**. The wording is used because the Junos OS uses the process of deterministic MED selection, by default.

## Examine the EBGP over IBGP Selection

**Purpose** To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path.

**Action** To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

## Sample Output

```

user@R4> show route 100.100.3.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.3.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-101
    Source: 10.1.45.2
    Next hop: 10.1.45.2 via so-0/0/2.0, selected

  Inactive reason: Interior > Exterior > Exterior via Interior
  Local AS: 65002 Peer AS: 65002
Age: 2:48:18 Metric2: 10
Task: BGP_65002.10.0.0.2+179
AS path: 65001 I
Localpref: 100
Router ID: 10.0.0.2

```

**Meaning** The sample output shows that **R4** received two instances of the **100.100.3.0** route: one from **10.1.45.2 (R5)** and one from **10.0.0.2 (R2)**. **R4** selected the path from **R5** as its active path, as indicated by the asterisk (\*). The selection is based on a preference for routes learned from an EBGP peer over routes learned from an IBGP. **R5** is an EBGP peer.

You can determine if a path is received from an EBGP or IBGP peer by examining the **Local As** and **Peer As** fields. For example, the route from **R5** shows the local AS is 65002 and the peer AS is 65001, indicating that the route is received from an EBGP peer. The route from **R2** shows that both the local and peer AS is 65002, indicating that it is received from an IBGP peer.

The reason that the inactive path is not selected is displayed in the **Inactive reason** field, in this case, **Interior > Exterior > Exterior via Interior**. The wording of this reason shows the order of preferences applied when the same route is received from two routers. The route received from a strictly internal source (IGP) is preferred first, the route received from an external source (EBGP) is preferred next, and any route which comes from an external source and is received internally (IBGP) is preferred last.

## Examine the IGP Cost Selection

**Purpose** To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path.

**Action** To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

## Sample Output

```

user@R6> show route 100.100.4.0 detail
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)
100.100.4.0/24 (2 entries, 1 announced)

```

```

          Router ID: 10.0.0.2

```

**Meaning** The sample output shows that **R6** received two instances of the **100.100.4.0** route: one from **10.0.0.4 (R4)** and one from **10.0.0.2 (R2)**. **R6** selected the path from **R4** as its active route, as indicated by the asterisk (\*). The selection is based on the IGP metric, displayed in the **Metric2** field. The route with the lowest IGP metric is preferred. In the example, the path with the lowest IGP metric value is the path from **R4**, with an IGP metric value of 10, while the path from **R2** has an IGP metric of 20. Note that the two paths are from the same neighboring network: AS 65001.

The reason that the inactive path was not selected is displayed in the **Inactive reason** field, in this case, **IGP metric**.

## Examine the Local Preference Selection

**Purpose** To examine a route to determine if local preference is the selection criteria for the single, active path.

**Action** To examine a route to determine if local preference is the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

## Sample Output

```

user@R4> show route 100.100.1.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.1.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-201

```

**Meaning** The sample output shows that **R4** received two instances of the **100.100.1.0** route: one from **10.0.0.2 (R2)** and one from **10.1.45.2 (R5)**. **R4** selected the path from **R2** as its active path, as indicated by the asterisk (\*). The selection is based on the local preference value contained in the **Localpref** field. The path with the *highest* local preference is preferred. In the example, the path with the higher local preference value is the path from **R2**, 200.

The reason that the route from **R5** is not selected is in the **Inactive reason** field, in this case, **Local Preference**.

Note that the two paths are from the same neighboring network: AS 65001.

## Examine the Multiple Exit Discriminator Route Selection

**Purpose** To examine a route to determine if the MED is the selection criteria for the single, active path.

**Action** To examine a route to determine if the MED is the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

## Sample Output

```

user@R4> show route 100.100.2.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.2.0/24 (2 entries, 1 announced)
  *BGP    Preference: 170/-101

```

```

      AS path: 65001 I
      Localpref: 100
      Router ID: 10.0.0.2
BGP   Preference: 170/-101
      Source: 10.1.45.2
      Next hop: 10.1.45.2 via so-0/0/2.0, selected
      State: <NotBest Ext>
      Inactive reason: Not Best in its group
      Local AS: 65002 Peer AS: 65001
      Age: 2w0d 1:37:58      Metric: 10
      Task: BGP_65001.10.1.45.2+179
      AS path: 65001 I
      Localpref: 100
      Router ID: 10.0.0.5

```

**Meaning** The sample output shows that **R4** received two instances of the **100.100.2.0** route: one from **10.0.0.2 (R2)**, and one from **10.1.45.2 (R5)**. **R4** selected the path from **R2** as its active route, as indicated by the asterisk (\*). The selection is based on the MED value contained in the **Metric** field. The path with the lowest MED value is preferred. In the example, the path with the lowest MED value (5) is the path from **R2**. Note that the two paths are from the same neighboring network: AS 65001.

The reason that the inactive path is not selected is displayed in the **Inactive reason** field, in this case, **Not Best in its group**. The wording is used because the Junos OS uses the process of deterministic MED selection, by default.

## Examine the EBGW over IBGP Selection

**Purpose** To examine a route to determine if EBGW is selected over IBGP as the selection criteria for the single, active path.

**Action** To examine a route to determine if EBGW is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

## Sample Output

```

user@R4> show route 100.100.3.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)

**Meaning** The sample output shows that **R6** received two instances of the **100.100.4.0** route: one from **10.0.0.4 (R4)** and one from **10.0.0.2 (R2)**. **R6** selected the path from **R4** as its active route, as indicated by the asterisk (\*). The selection is based on the IGP metric, displayed in the **Metric2** field. The route with the lowest IGP metric is preferred. In the example, the path with the lowest IGP metric value is the path from **R4**, with an IGP metric value of 10, while the path from **R2** has an IGP metric of 20. Note that the two paths are from the same neighboring network: AS 65001.

The reason that the inactive path was not selected is displayed in the **Inactive reason** field, in this case, **IGP metric**.

## Examine Routes in the Forwarding Table

**Purpose** When you run into problems, such as connectivity problems, you may need to examine routes in the forwarding table to verify that the routing protocol process has relayed the correct information into the forwarding table.

**Action** To display the set of routes installed in the forwarding table, enter the following Junos OS CLI operational mode command:

```
user@host> show route forwarding-table
```

## Sample Output

```

user@R2> show route forwarding-table
Routing table: inet
Internet:

```

| Destination  | Type | RtRef | Next hop  | Type | Index | NhRef | Netif      |

[...Output truncated...]

```

**Meaning** The sample output shows the network-layer prefixes and their next hops installed in the forwarding table. The output includes the same next-hop information as in the **show route detail** command (the next-hop address and interface name). Additional information includes the destination type, the next-hop type, the number of references to this next hop, and an index into an internal next-hop database. (The internal database contains additional information used by the Packet Forwarding Engine to ensure proper encapsulation of packets sent out an interface. This database is not accessible to the user.

For detailed information about the meanings of the various flags and types fields, see the *Routing Policies, Firewall Filters, and Traffic Policers*.

## Ping the Egress Router

**Purpose** Ping the egress router to confirm that communication over the network is operational.

**Action** To ping the egress router, enter the following Junos OS CLI operational mode command:

```
user@host> ping ip-address-interface
```

**Sample Output**

```

[edit protocols mpls]
user@R1# run ping 10.1.56.1
PING 10.1.56.1 (10.1.56.1): 56 data bytes
64 bytes from 10.1.56.1: icmp_seq=0 ttl=255 time=0.837 ms
64 bytes from 10.1.56.1: icmp_seq=1 ttl=255 time=0.792 ms
64 bytes from 10.1.56.1: icmp_seq=2 ttl=255 time=0.856 ms
^C
--- 10.1.56.1 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.792/0.828/0.856/0.027 ms

```

**Meaning** The sample output confirms that communication between router **R1** and the IP address of the relevant interface on router **R5 (10.1.56.1)** is operational.

## View the RSVP Log File on Transit Routers

**Purpose** Transit router messages that appear in the RSVP log file can help you analyze the problem with an RSVP session. You may need to issue the **clear rsvp session** and **clear log filename** commands to ensure that your records are current. However, if your network is large with many RSVP sessions, this may not be advisable because it may take a while for all sessions to reestablish. However, the **clear rsvp session** command has various options you can

include to minimize the effect on your network. For more information about the **clear rsvp session** command, see the *Junos Routing Protocols and Policies Command Reference*.

**Action** To view the RSVP log file, enter the following Junos OS CLI operational mode commands:

```
user@host> clear rsvp session (Optional)
user@host> clear log filename (Optional)
user@host> show log filename
```

### Sample Output 1

```
user@R3> clear rsvp session

user@R3> clear log rsvp-log

user@R3> show log rsvp-log
Jul 21 16:51:23 R3 clear-log[30656]: logfile cleared

```

**Meaning** Sample Output 1 from transit router **R3** shows that **R3** ( **so-0/0/2.0**) correctly received a Path request message (**rcv Path**) from **R1**, and correctly sent the Path message (**send Path**) through interface **so-0/0/3.0** to **R6**. The route record object (**RecRoute**) indicates the list of addresses this Path message transited, in this case, **10.1.36.1** and **10.1.13.1**.

Sample Output 2 from transit router **R6** shows that **R6** (**so-0/0/3.0**) correctly received a Path request message (**rcv Path**) from **R3**, and correctly sent the Path message (**send Path**) through interface **so-0/0/0** to **R5**. The route record object (**RecRoute**) indicates the list of addresses this Path message transited, in this case, **10.1.56.2**, **10.1.36.1**, and **10.1.13.1**.

With the information above, the focus shifts to egress router **R5** as the source of the problem, with indications that **R5** ignored the RSVP message.

## Check the RSVP Log File on the Egress Router

**Purpose** After placing an RSVP tracing configuration on router **R5** similar to that on routers **R3** and **R6**, display the RSVP log file for useful information about the problem on router **R5**.

**Action** To check the RSVP log file, enter the following Junos OS CLI operational mode command:

```
user@host> show log rsvp-log
```

## Sample Output

```

user@R5> show log rsvp-log
Jul 21 10:53:16 R5 clear-log[40071]: logfile cleared
Jul 21 11:02:37 trace_on: Tracing to "/var/log/rsvp-log" started
Jul 21 11:03:07 RSVP error, send to DISABLED interface ? Hello New
10.1.56.1->10.1.56.2 Len=8 so-0/0/0.0

```

**Meaning** The sample output shows that **R5** did not receive the Path message because of a disabled interface, **so-0/0/0.0**.

## Determine and Correct the Problem on the Egress Router

**Problem Description:** Check the configuration of interface **so-0/0/0.0** on egress router **R5** to determine the reason it was disabled.

**Solution** To determine the problem on **R5**, enter the following Junos OS CLI commands:

```
user@R5> show configuration protocols rsvp
user@R5> edit
[edit protocols rsvp]
user@R5# rename interface so-0/0/3 to interface so-0/0/0
user@R5# show
user@R5# commit
user@R5# run show rsvp session ingress detail
```

**Sample Output 1**

```
user@R5> show configuration protocols rsvp
traceoptions {
    file rsvp-log;
    flag error detail;
    flag path detail;
    flag pathtear detail;
}
interface so-0/0/3.0;      <<< so-0/0/3 incorrectly included
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}
```

**Sample Output 2**

```
[edit protocols rsvp]
user@R5# rename interface so-0/0/3 to interface so-0/0/0

[edit protocols rsvp]
user@R5# show
traceoptions {
    file rsvp-log;
    flag packets detail;
    flag error detail;
}
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}

[edit protocols rsvp]
user@R5# commit
commit complete
```

**Sample Output 3**

```
[edit protocols mpls]
user@R5# run show rsvp session ingress detail
Ingress RSVP: 1 sessions
To          From          State   Rt Style Labelin Labelout LSPname
10.0.0.1    10.0.0.5                Up      1 1 FF      -    103104 R5-to-R1
Total 1 displayed, Up 1, Down 0
Egress RSVP: 1 sessions
To          From          State   Rt Style Labelin Labelout LSPname
10.0.0.5    10.0.0.1    Up      0 1 FF      3    - R1-to-R5
Total 1 displayed, Up 1, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

**Meaning** Sample Output 1 from egress router **R5** shows three interfaces configured at the `[edit protocols rsvp]` hierarchy level, non of which is **so-0/0/0.0**. On examination of the network topology, it is apparent that the **so-0/0/0.0** interface was configured incorrectly as **so-0/0/3.0**.

Sample Output 2 shows the correct configuration of interfaces at the `[edit protocols rsvp]` hierarchy level, and the **rename** command issued to correct the configuration error.

Sample Output 3 shows that the RSVP-signaled LSP (**R1-to-R5**) is correctly established after the changes to the RSVP configuration are committed.

## Check the Routing CPU Memory Usage

**Purpose** Software processes on the router can consume a considerable amount of CPU and memory. The routing protocol process (rpd) can consume enormous amounts of memory to store information needed for the operation of routing and related protocols, such as Border Gateway Protocol (BGP), Open Shortest Path First (OSPF), Intermediate System-to-Intermediate System (ISIS), Resource Reservation Protocol (RSVP), Label Distribution Protocol (LDP), and Multiprotocol Label Switching (MPLS).

To verify the traffic passing through the router and check memory utilization, follow these steps:

1. [Check Overall CPU and Memory Usage on page 1325](#)
2. [Check Routing Protocol Process \(rpd\) Memory Usage on page 1327](#)
3. [Display Tasks on page 1330](#)

## Check Overall CPU and Memory Usage

**Purpose** You can display exhaustive system process information about software processes that are running on the router and have controlling terminals. This command is equivalent to the UNIX **top** command. However, the UNIX **top** command shows real-time memory usage, with the memory values constantly changing, while the **show system processes extensive** command provides a snapshot of memory usage in a given moment.

**Action** To check overall CPU and memory usage, enter the following Junos OS command-line interface (CLI) command:

```
user@host> show system processes extensive
```

## Sample Output

```
user@R1> show system processes extensive

**Meaning** The sample output shows the amount of virtual memory used by the Routing Engine and software processes. For example, 118 MB of physical memory is free and 512 MB of the swap file is free, indicating that the router is not short of memory. The **processes** field shows that most of the 58 processes are in the **sleeping** state, with 1 in the **running** state. The process or command that is running is the **top** command.

The **commands** column lists the processes that are currently running. For example, the chassis process (chassisd) has a process identifier (**PID**) of 4480, with a current priority (**PRI**) of 2. A lower priority number indicates a higher priority.

The processes are listed according to level of activity, with the most active process at the top of the output. For example, the chassis (chassisd) process is consuming the largest amount of CPU resource at 2.34 percent.

The memory field (**Mem**) shows the virtual memory managed by the Routing Engine and used by processes. The value in the memory field is in KB and MB, and is broken down as follows:

- **Active**—Memory that is allocated and actually in use by programs.
- **Inact**—Memory that is either allocated but not recently used or memory that was freed by programs. Inactive memory is still mapped in the address space of one or more processes and, therefore, counts toward the resident set size of those processes.
- **Wired**—Memory that is not eligible to be swapped, and is usually used for Routing Engine memory structures or memory physically locked by a process.
- **Cache**—Memory that is not associated with any program and does not need to be swapped before being reused.
- **Buf**—The size of the memory buffer used to hold data recently called from disk.
- **Free**—Memory that is not associated with any programs. Memory freed by a process can become **Inactive**, **Cache**, or **Free**, depending on the method used by the process to free the memory.

When the system is under memory pressure, the pageout process reuses memory from the free, cache, inactive and, if necessary, active pages.

The **Swap** field shows the total swap space available and how much is unused. In the example, the output shows 512 MB of total swap space and 512 MB of free swap space.

Finally, the memory usage of each process is listed. The **SIZE** field indicates the size of the virtual address space, and the **RES** field indicates the amount of the program in physical memory, which is also known as RSS or Resident Set Size. In the sample output, the chassis (chassisd) process has 3728 KB of virtual address space and 1908 KB of physical memory.

## Check Routing Protocol Process (rpd) Memory Usage

**Purpose** When you notice a lot of memory usage, you can obtain detailed information about the memory utilization of routing tasks to get an idea of what is going on. The routing process (rpd) is the main task that uses Routing Engine memory.

**Action** To check routing process memory usage, enter the following Junos OS CLI operational mode commands:

```
user@host> show route summary
user@host> show task memory detail
```

## Sample Output

```
user@host> show route summary
Autonomous system number: 209
Router ID: 205.175.0.170
inet.0: 179783 destinations, 898393 routes (179771 active, 146 holddown, 157
hidden)
      Direct:    17 routes,    17 active
      Local:    18 routes,    18 active
```

```

      BGP: 896632 routes, 178010 active
      Static: 32 routes, 31 active
      IS-IS: 1694 routes, 1694 active
inet.2: 8766 destinations, 22700 routes (8766 active, 124 holddown, 73 hidden)
      Direct: 17 routes, 17 active
      Local: 18 routes, 18 active
      BGP: 20939 routes, 7006 active
      Static: 32 routes, 31 active
      IS-IS: 1694 routes, 1694 active
inet.3: 1614 destinations, 1719 routes (1614 active, 0 holddown, 0 hidden)
      IS-IS: 1613 routes, 1551 active
      RSVP: 45 routes, 45 active
      LDP: 61 routes, 18 active
iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
      Direct: 1 routes, 1 active
mpls.0: 371 destinations, 371 routes (371 active, 0 holddown, 0 hidden)
      MPLS: 3 routes, 3 active
      RSVP: 303 routes, 303 active
      LDP: 65 routes, 65 active

```

user@R1> show task memory detail

```

```

**Meaning** The sample output shows summary statistics about the entries in the routing table (**show route summary** command) and the memory usage breakdown (**show task memory detail** command) for the routing process (rpd). The two commands provide a comprehensive picture of the memory utilization of the routing protocol process.

The **show route summary** command shows the number of routes in the various routing tables. In the sample output, the routing tables represented are **inet.0**, **inet.2**, **inet.3**, **iso.0**, and **mpls.0**. Within each routing table, all of the active, hold-down, and hidden destinations and routes are summarized for all the protocols from which routes are learned. Routes are in the **hold-down** state prior to being declared inactive, and **hidden** routes are not used because of routing policy. Routes in the **hold-down** and **hidden** states are still using memory because they appear in the routing table.

In addition, routes are summarized in the following categories: those directly connected to the network (**Direct**), local routes (**Local**), and routes learned from configured routing protocols, such as BGP and IS-IS.

The **show task memory detail** command lists the data structures within the tasks run by the routing protocol process (rpd). Tasks are enabled depending on the router's configuration. For example, **isis\_area\_addr** is a data structure resulting from the IS-IS configuration. The **AllocBytes** field indicates the highest amount of memory used by the

data structure. For example, the `isis_area_addr` data structure has 544 blocks of allocated memory, each block is allocated a value of 16 bytes, resulting in allocated bytes of 8704. The maximum allocated blocks and bytes are high-water marks for a data structure. For more information on displaying task-related information, see [“Display Tasks” on page 1330](#).

The **Total bytes in use** field shows the total amount of memory used by the routing protocol process (rpd).

## Display Tasks

**Purpose** You can display information about tasks to further your investigation of a memory problem on the router.

**Action** To display a list of tasks that are enabled on the router, enter the following Junos OS CLI operational mode commands:

```
user@host> show task
user@host> show task memory
user@host> show task task-name
```

## Sample Output

KRT  0      0        2      0      0
Redirect                                  0      0        0      0      0
MGMT.local                                0      0        0      0      0
MGMT_Listen./var/run/rpd_mgmt             23      0        0      0      0
SNMP Subagent./var/run/snmpd_s            23      0        0      0      0
IF Delete                                 0      0        0      0      0

```

**Meaning** The sample output shows a list of routing, routing protocol, and interface tasks that are currently running on the router (**show task**), a summary of memory utilization (**show task memory**), and the memory utilization of a particular task (**show task io**). Tasks can be baseline tasks performed regardless of the router configuration, and other tasks that depend on the router configuration. For example, the **BGP\_Group\_internal** task is the result

of the configuration of BGP on the router, while the **INET6** task is a base task associated with the routing process (rpd).

Each task in the **show task** command output has a priority and a task name. For example, the current priority is 10 for **LMP Client** and 80 for **IF Delete**. A lower number indicates a higher priority.

Some tasks have flags attached to them. For example, the **BGP.0.0.0.0+179** task has two flags, **Accept** and **LowPrio**. The **Accept** flag indicates that the task is waiting for incoming connections, and the **LowPrio** flag indicates that the task will be dispatched to read its socket after other, higher priority tasks. Two additional flags are **Connect**, which indicates that a task is waiting for a connection to complete, and **Delete**, which indicates that a task has been deleted and is being cleaned up.

The **show task io** command shows the statistics gathered for each IO operation. The counters show the following:

- **Reads**—This counter increments when a datagram arrives on a connected socket of the task and the task's read callback is called.
- **Writes**—This counter increments when a connected socket of a task becomes writable and the task's callback is called.
- **Rcvd**—This counter increments when the task calls the Routing Engine to read a datagram from a socket which may or may not be connected.
- **Sent**—This counter increments when a task attempts to read or write a datagram on an existing or nonexisting socket.
- **Drops**—This counter increments when a task attempts to read or write a datagram through the Routing Engine on a prebuilt socket, but the request fails for any reason.

---

## Run Snmpwalk from an NMS System to a Juniper Router

---

**Purpose** Snmpwalk is an SNMP application that you can use to query a MIB for information about the functioning of a router in your network. Snmpwalk uses **GetNext** requests to retrieve the specified information. Object identifiers (OIDs) are used to query the MIB. If the OID argument is not present, Snmpwalk searches MIB-2.

**Action** To run Snmpwalk for a specific OID, from a management station that has access to the router, and using a tool such as Snmpwalk, enter the following command:

```
user-nms# snmpwalk [common arguments] hostname community object-id
```

**Sample Output**

```

user-nms % snmpwalk -Os -M /volume/~ /mibs -m all tp1 public .1.3.6.1.2.1.4
ipForwarding.0 = forwarding(1)
ipDefaultTTL.0 = 64
ipInReceives.0 = Counter32: 9262713
ipInHdrErrors.0 = Counter32: 0
ipInAddrErrors.0 = Counter32: 0
ipForwDatagrams.0 = Counter32: 614171
ipInUnknownProtos.0 = Counter32: 0
ipInDiscards.0 = Counter32: 0
ipInDelivers.0 = Counter32: 8648408
ipOutRequests.0 = Counter32: 1226483
ipOutDiscards.0 = Counter32: 0
ipOutNoRoutes.0 = Counter32: 0
ipReasmTimeout.0 = 60
ipReasmReqds.0 = Counter32: 0
ipReasmOKs.0 = Counter32: 0
ipReasmFails.0 = Counter32: 0
ipFragOKs.0 = Counter32: 0
ipFragFails.0 = Counter32: 0
ipFragCreates.0 = Counter32: 0
ipAdEntAddr.10.0.0.1 = IPAddress: 10.0.0.1
ipAdEntAddr.10.1.12.1 = IPAddress: 10.1.12.1
ipAdEntAddr.10.1.15.1 = IPAddress: 10.1.15.1
ipAdEntAddr.10.168.70.143 = IPAddress: 10.168.70.143
[...Output truncated...]

```

**Meaning** The sample output shows that the user is on a network management station (**user-nms** %) that has access to the router, **tp1**. In the command, the following options are used:

- **Os**—Deletes all but the last symbolic part of the OID **sysUpTime.0**. For example, Timeticks: (14096763) 1 day, 15:09:27.63.
- **-M**—Compiles the MIB and gives a path or location to the MIBs.
- **-m**—Uses the files in the directory pointed to by the **-M** option.
- **all**—Uses all the files in the directory pointed to by the **-M** option.

In addition, the command includes the hostname **tp1**, the community string **public**, and the OID **.1.3.6.1.2.1.4**.

The OID in this example is from RFC 2096, *IP Forwarding Table MIB*, which displays multipath IP routes that have the same network number but different network masks.

Before you can retrieve SNMP information from a router, you must have the minimum SNMP configuration for that router. Following is the minimum SNMP configuration required:

```

[edit]
snmp {
  community public {
    authorization read-only;
  }
}

```

With this configuration, the system responds to SNMP **Get**, **GetNext**, and **GetBulk** commands that contain the community string **public**.

For more detailed information on configuring SNMP on a router, see the *Junos Network Management Configuration Guide*.

---

## Configure Trace Operations for SNMP

---

**Purpose** Define tracing for SNMP to access more granular information about the packets sent and received through SNMP.

**Action** To configure SNMP tracing operations, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit snmp
```

2. Configure trace operations:

```
[edit snmp]
user@R1# set traceoptions flag pdu
```

3. Commit the configuration:

```
user@R1# commit and-quit
commit complete
Exiting configuration mode
```

**Sample Output**

```
user@R1> show configuration snmp
view all {
    oid .1 include;
}
view system {
    oid system;
}
community public {
    view all;
    authorization read-only;
}
community private {
    view system;
    authorization read-write;
}
traceoptions {
    flag pdu;
}
```

**Meaning** The sample output shows a configuration for SNMP that includes traceoptions. The **pdu** flag is configured, which results in the generation of SNMP request and response packets. The output for the tracing operation is placed into various log files in the **/var/log** directory.

Protocol-specific tracing operations override any equivalent operations that you specify in the global **traceoptions** statement. If there are no equivalent operations, they supplement the global tracing options. If you do not specify any protocol-specific tracing, the routing protocol inherits all the global tracing operations.

---

## Query a MIB With SNMPGet

---

**Purpose** Send an SNMP request to check that the SNMP configuration is correct.

**Action** To query a MIB with **SNMPGet**, enter the following command:

```
user@nms % snmpget hostname community oid
```

### Sample Output

```
user-nms % snmpget tp1 public .1.3.6.1.2.1.1.0  
system.sysDescr.0 = m7i internet router, kernel 6.0R1.5
```

```
user-nms % snmpget tp1 public sysDescr.0  
system.sysDescr.0 = m7i internet router, kernel 6.0R1.5
```

**Meaning** The sample output shows a query from a network management station (**nms**) for the description of the system running on the router **tp1**. The OID is entered in numerical form in the command line, and a description (**sysDescr.0**) is obtained in the output. You can also use **sysDescr.0** in the command line to obtain the same output.

---

## Check CPU Utilization

---

**Purpose** The enterprise-specific chassis MIB provides information about the router and its components. Within the chassis MIB, the **jnxMIBs** branch contains one main subbranch, **jnxBoxAnatomy**, which in turn contains a section, **jnxOperatingTable**. Within **jnxOperatingTable**, and under the **jnxOperatingEntry**, you can use the **jnxOperatingCPU** object to monitor the CPU on your router. (See [Figure 127 on page 1336](#).)

Figure 127: Chassis MIB Tree

```

+--juniperMIB(2636)¶
|  +--jnxProducts(1)¶
|  +--jnxServices(2)¶
|  +--jnxMibs(3)¶

|  |  |  |  |  +-- jnxOperatingStateOrdered(16)¶
|  |  |  +--jnxRedundancyTable(14)¶
|  |  +--jnxFruTable(15)¶

```

After each object description is a value in parenthesis, such as (1). This value can be used to enter an OID for the specific object. For example, to gather information on the CPU, you can type the object description (**jnxOperatingCPU**) or the OID (.1.3.6.1.4.1.2636.3.1.13.1.8).

**Action** To check CPU utilization using the Juniper Networks enterprise chassis MIB, from a management station that has access to the router, and using a tool such as Snmpwalk, enter the following command:

```
user-bsd# snmpwalk [common arguments] hostname community object-id
```

## Sample Output

```

user-nms % snmpwalk -Os -M /volume/~ /mibs -m all tp1 public jnxOperatingCPU
jnxOperatingCPU.1.1.1.0 = Gauge32: 0
jnxOperatingCPU.1.1.2.0 = Gauge32: 0
jnxOperatingCPU.1.1.3.0 = Gauge32: 0
jnxOperatingCPU.2.1.0.0 = Gauge32: 0
jnxOperatingCPU.4.1.1.0 = Gauge32: 0
jnxOperatingCPU.4.1.2.0 = Gauge32: 0
jnxOperatingCPU.4.1.3.0 = Gauge32: 0
jnxOperatingCPU.4.1.4.0 = Gauge32: 0
jnxOperatingCPU.6.1.1.0 = Gauge32: 224
jnxOperatingCPU.6.1.2.0 = Gauge32: 224
jnxOperatingCPU.7.1.0.0 = Gauge32: 2
jnxOperatingCPU.7.2.0.0 = Gauge32: 2
jnxOperatingCPU.8.1.1.0 = Gauge32: 0
jnxOperatingCPU.8.2.3.0 = Gauge32: 0

```

```

jnxOperatingCPU.8.2.4.0 = Gauge32: 0
jnxOperatingCPU.9.1.0.0 = Gauge32: 6
jnxOperatingCPU.9.1.1.0 = Gauge32: 0

user-nms % snmpwalk -Os -M /volume/~ /mibs -m all tp1 public jnxOperatingDesc
jnxOperatingDescr.1.1.1.0 = midplane
jnxOperatingDescr.1.1.2.0 = midplane
jnxOperatingDescr.1.1.3.0 = midplane
jnxOperatingDescr.2.1.0.0 = Power Supply A
jnxOperatingDescr.4.1.1.0 = Left Tray front fan
jnxOperatingDescr.4.1.2.0 = Left Tray second fan
jnxOperatingDescr.4.1.3.0 = Left Tray third fan
jnxOperatingDescr.4.1.4.0 = Left Tray fourth fan
jnxOperatingDescr.6.1.1.0 = CFEB Internet Processor IIv1
jnxOperatingDescr.6.1.2.0 = CFEB Internet Processor IIv1
jnxOperatingDescr.7.1.0.0 = FPC @ 0/*/*
jnxOperatingDescr.7.2.0.0 = FPC @ 1/*/*
jnxOperatingDescr.8.1.1.0 = PIC: 4x OC-3 SONET, MM @ 0/0/*
jnxOperatingDescr.8.2.3.0 = PIC: 1x Tunnel @ 1/2/*
jnxOperatingDescr.8.2.4.0 = PIC: 1x G/E, 1000 BASE-SX @ 1/3/*
jnxOperatingDescr.9.1.0.0 = Routing Engine
jnxOperatingDescr.9.1.1.0 = Routing Engine PCMCIA Card

```

**Meaning** The sample output shows the percentage CPU utilization on router, **tp1**. The Routing Engine (**9.1.0.0**) has 6 percent CPU utilization, the two CFEB Internet Processors IIv1 (**6.1.1.0** and **6.1.2.0**) have 22 percent each, and the FPCs (**7.1.0.0** and **7.2.0.0**) have 2 percent each. Components with a value of zero indicate that the information is either unavailable or inapplicable.

The output for the **jnxOperatingDesc** object provides a description of the separate instances in the **jnxOperatingCPU** object. For example, **9.1.0.0** represents the Routing Engine.

## Check CPU Utilization per Process

**Purpose** The standard system application MIB (RFC 2287, *Definitions of System-Level Managed Objects for Applications*), describes a set of managed objects that are restricted to information that can be determined from the system itself. The object **sysAppElmtRunCPU** provides information about applications and associated elements that have run or are currently running on the host system. (See [Figure 128 on page 1338](#).)

### Figure 128: System Application MIB Tree

```

```

**Meaning** The sample output shows the number of centi-seconds of total system CPU resources consumed by a particular process. For example, the chassis process (**chassisd, 3.2.2163**) has consumed 3 days, or 33,548,776 centi-seconds of total system CPU resources.

The **sysAppElmtRunName** object retrieves the name of the OID. For example, **sysAppElmtRunCPU.3.2.2163** represents the chassis process.

## Retrieve Version Information about Router Software Components

**Purpose** RFC 2790, *Host Resources MIB*, describes a set of managed objects that are useful for managing host systems, including routers.

**Action** To retrieve version information about software components on the router, from a management station that has access to the router and using a tool, such as Snmpwalk, enter the following command:

```
user-bsd# snmpwalk [common arguments] hostname community object-id
```

### Sample Output

```

user-nms % snmpwalk -Os -M /volume/~ /mibs -m all tp1 public
.1.3.6.1.2.1.25.6.3hrSWInstalledIndex.2 = 2
hrSWInstalledIndex.3 = 3

hrSWInstalledDate.6 = 2003-8-10,20:36:51.0,-7:0
hrSWInstalledDate.9 = 2003-11-22,4:8:47.0,-8:0a1

```

**Meaning** The sample output shows the version information for various software components on the router.

## Checklist for Displaying Basic Chassis Information

**Purpose** Table 41 on page 1341 provides links and commands for displaying basic chassis information, including a list of all Flexible PIC Concentrators (FPCs) and Physical Interface Cards (PICs) installed in the router chassis, the hardware version level, and the serial number.

### Action

Table 41: Checklist for Displaying Basic Chassis Information

| Task                                             | Command or Action                                 |
|--------------------------------------------------|---------------------------------------------------|
| "Display Basic Chassis Information" on page 1341 | <code>show chassis hardware &lt;detail&gt;</code> |

## Display Basic Chassis Information

**Purpose** Before you return a router component to Juniper Networks, you must contact the Juniper Networks Technical Assistance Center (JTAC) with the serial number of the failed component and failure information. JTAC will then grant a Return Materials Authorization (RMA).

**Action** To display a list of the serial numbers of components installed in the router chassis, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show chassis hardware <detail>
```

## Sample Output

```

user@host> show chassis hardware
Hardware inventory:
Item          Version  Part number  Serial number  Description
Chassis

```

**Meaning** The sample output is for an M20 and an M40 router. It shows a list of all FPCs and PICs installed in the router chassis, including the hardware version level and serial number.

The **detail** option displays detailed information about hardware, including memory, hardware version level, serial number, and additional information about memory.

If the Routing Engine is identified by a 10- and 16-digit serial number, both numbers are displayed in the output for the **detail** option, and are especially important when processing an RMA for such a Routing Engine. In addition, when you request an RMA for the M40 router, include the **maxicab** serial number.

Table 42 on page 1343 provides a description of all the output fields for the **show chassis hardware** command.

**Table 42: Output fields for the show chassis hardware command**

| Output field         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Information is displayed about the backplane, power supplies, midplane, Control Board (CB), Connector Interface Panel (CIP), FPC, Front Panel Module (FPM) (craft interface), Power Entry Module (PEM), PIC, SONET Clock Generator (SCG), Small Form-factor Pluggable (SFP) modules, Switch Interface Board (SIB), and Switch Processor Mezzanine Board (SPMB).</p> |
| <b>Version</b>       | Revision level of the chassis component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Part number</b>   | Part number of the chassis component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Serial number</b> | Serial number of the chassis component. For all RMAs, the chassis serial number must be provided to JTAC. If the RMA is for the chassis itself, you must obtain the backplane or midplane serial number as well.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>   | Brief description of the hardware item.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**NOTE:** When you request an RMA, you must also include output from the **show chassis environment** command, the **show version** command, and the troubleshooting output used to identify the failure.

## Maintain a Single Configuration File for Both Routing Engines

---

**Purpose** For routers that support multiple Routing Engines, you can specify **re0** and **re1** as group names to ensure that the correct IP addresses are used for each Routing Engine and to maintain a single configuration file for both Routing Engines. It is important that the names of the Routing Engines correspond to a slot position because the names **re0** and **re1** are special group names that you must use for the Routing Engines to recognize which configuration statement to use. Routing Engine 0 must be in slot position 0 and must be named **re0**, and Routing Engine 1 must be in slot position 1 and must be named **re1**.

To maintain a single configuration file for both Routing Engines, follow these steps:

1. [Configure the New Group on page 1344](#)
2. [Apply the New Group on page 1345](#)

### Configure the New Group

**Purpose** Each **re0** or **re1** group typically contains, at a minimum, the configuration for the hostname and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group must also contain the configuration for the backup router and static routes.

**Action** To configure the **re0** and **re1** groups, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit groups
```

2. Configure the group:

```
[edit groups]
user@host# set group-name
```

For example:

```
[edit groups]
user@host# set re0
```

3. To configure the management interface, go to the following hierarchy level:

```
[edit groups]
user@host# edit groups re0
```

4. Include the following statement:

```
[edit groups re0]
user@host# set interfaces interface-name unit unit family inet address address
```

For example:

```
[edit groups re0]
user@host# set interfaces fxp0 unit 0 family inet address 1.1.1.1/24
```

5. To configure the hostname, go to the following hierarchy level:

```
[edit groups re0]
user@host# edit groups re0 system
```

6. Include the following statement:

```
[edit groups re0 system]
user@host# set host-name hostname
```

For example:

```
[edit groups re0 system]
user@host# set host-name foo-re0
```

7. Verify the configuration:

```
[edit groups re0]
user@host# show
re0 {
  system {
    host-name foo-re0;
  }
  interfaces {
    fxp0 {
      unit 0 {
        family inet {
          address 1.1.1.1/24;
        }
      }
    }
  }
}
```

8. Commit the configuration:

```
user@host# commit
```

9. Repeat Step 1 through Step 8 for the **re1** group.

**Meaning** The sample output in Step 7 shows that the **re0** group contains the minimum configuration for a group, the hostname, and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group must also contain the configuration for the backup router and static routes.

## Apply the New Group

**Action** To apply the **re0** group to maintain a single configuration file for both Routing Engines, follow these steps:

1. In configuration mode, go to the top hierarchy level and include the following statement:

```
user@host# [edit]
user@host# set apply-groups group-name
```

For example:

```
user@host# [edit]
user@host# set apply-groups re0
```

2. Verify the configuration:

```
user@host# show
groups {
  re0 {
    system {
      host-name foo-re0;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address 1.1.1.1/24;
          }
        }
      }
    }
  }
  re1 {
    system {
      host-name foo-re1;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address 1.1.1.2/24;
          }
        }
      }
    }
  }
}
apply-groups [ re0 re1 ];
```

3. Commit the configuration:

```
user@host# commit
```

**Meaning** The sample output shows that each group, **re0** and **re1**, has its own IP address that is used for each Routing Engine to maintain a single configuration file.

---

## Configure the New Group

**Purpose** Each **re0** or **re1** group typically contains, at a minimum, the configuration for the hostname and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group must also contain the configuration for the backup router and static routes.

**Action** To configure the **re0** and **re1** groups, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit groups
```

2. Configure the group:

```
[edit groups]
user@host# set group-name
```

For example:

```
[edit groups]
user@host# set re0
```

3. To configure the management interface, go to the following hierarchy level:

```
[edit groups]
user@host# edit groups re0
```

4. Include the following statement:

```
[edit groups re0]
user@host# set interfaces interface-name unit unit family inet address address
```

For example:

```
[edit groups re0]
user@host# set interfaces fxp0 unit 0 family inet address 1.1.1.1/24
```

5. To configure the hostname, go to the following hierarchy level:

```
[edit groups re0]
user@host# edit groups re0 system
```

6. Include the following statement:

```
[edit groups re0 system]
user@host# set host-name hostname
```

For example:

```
[edit groups re0 system]
user@host# set host-name foo-re0
```

7. Verify the configuration:

```
[edit groups re0]
user@host# show
re0 {
  system {
    host-name foo-re0;
  }
  interfaces {
    fxp0 {
      unit 0 {
        family inet {
          address 1.1.1.1/24;
        }
      }
    }
  }
}
```

8. Commit the configuration:

```
user@host# commit
```

9. Repeat Step 1 through Step 8 for the **re1** group.

**Meaning** The sample output in Step 7 shows that the **re0** group contains the minimum configuration for a group, the hostname, and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group must also contain the configuration for the backup router and static routes.

---

## Apply the New Group

**Action** To apply the **re0** group to maintain a single configuration file for both Routing Engines, follow these steps:

1. In configuration mode, go to the top hierarchy level and include the following statement:

```
user@host# [edit]
```

```
user@host# set apply-groups group-name
```

For example:

```
user@host# [edit]
```

```
user@host# set apply-groups re0
```

2. Verify the configuration:

```
user@host# show
```

```
groups {
  re0 {
    system {
      host-name foo-re0;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address 1.1.1.1/24;
          }
        }
      }
    }
  }
}
re1 {
  system {
    host-name foo-re1;
  }
  interfaces {
    fxp0 {
      unit 0 {
        family inet {
          address 1.1.1.2/24;
        }
      }
    }
  }
}
```

```

    }
  }
}
}
apply-groups [ re0 re1 ];

```

3. Commit the configuration:

```
user@host# commit
```

**Meaning** The sample output shows that each group, **re0** and **re1**, has its own IP address that is used for each Routing Engine to maintain a single configuration file.

## List Files and Directories on a Router

**Problem** **Description:** If a system board crashes, you must check that certain files are in specific directories.

**Solution** To display files in the **/var/tmp** and **var/crash** directories, use the following CLI operational mode command:

```
user@host> file list filename or directory
```

**Sample Output**

```

sampled.pkts
vi.recover/
user@host> file list /var/crash/
bounds
minfree
vmcore.0

```

**Meaning** The sample output shows the files in the **/var/tmp/** and **/var/crash/** directories. The Juniper Networks Technical Assistance Center (JTAC) can ask you to verify the existence of similar files.

## Display File Contents

**Purpose** To display the contents of a file on the local router.

**Action** To display the contents of a file on the local router, use the following CLI operational mode command:

```
user@host> file show filename
```

### Sample Output

```

user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
Apr 13 21:07:36 romney /kernel: so-1/1/2: loopback suspected; going to standby.

```

```
Apr 13 21:08:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.  
...Output truncated...
```

**Meaning** The sample output shows the contents of the `/var/log/messages` file.

---

## Rename a File on a Router

**Action** To rename a file on the local router, use the following CLI operational mode command:

```
user@host> file rename source destination
```

**Sample Output**

```
user@host> file list /var/tmp  
dcd.core  
rpd.core  
snmpd.core  
  
user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413  
user@host> file list /var/tmp  
dcd.core.990413  
rpd.core  
snmpd.core
```

**Meaning** The sample output shows that the `dcd.core` file was renamed to `dcd.core.990413`. The original name of the file is the *source* and the new name for the file is the *destination*.

---

## Delete a File on a Router

**Action** To delete a file on the local router, use the following CLI operational mode command:

```
user@host> file delete filename
```

**Sample Output**

```
user@host> file list /var/tmp  
dcd.core  
rpd.core  
snmpd.core  
  
user@host> file delete /var/tmp/snmpd.core  
user@host> file list /var/tmp  
dcd.core  
rpd.core
```

**Meaning** The sample output shows that the `snmpd.core` file was deleted.

---

## Check the Time on a Router

**Purpose** Display the current time on a router and display information about how long the router, router software, and routing protocols have been running.

**Action** To check time on a router, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show system uptime
```

## Sample Output

```
user@host> show system uptime
Current time:      1998-10-13 19:45:47 UTC
System booted:    1998-10-12 20:51:41 UTC (22:54:06 ago)
Protocols started: 1998-10-13 19:33:45 UTC (00:12:02 ago)
Last configured:  1998-10-13 19:33:45 UTC (00:12:02 ago) by abc
12:45PM up 22:54, 2 users, load averages: 0.07, 0.02, 0.01
```

**Meaning** The sample output shows the current system time in UTC, the date and time when the router was last booted and how long it has been running, when the routing protocols were last started and how long they have been running, when a configuration was last committed, and the name of the user who issued the last **commit** command. If a different time zone is configured, the output shows that time zone. For information on configuring the time zone, see the *Junos System Basics Configuration Guide*.

The sample output shows that the current time is 12:45 PM, the router has been operational for 22:54 hours, and two users are logged in to the router. The output also shows that the load average is 0.07 seconds for the last minute, 0.02 seconds for the last 5 minutes, and 0.01 seconds for the last 15 minutes.

## Check for Users in Configuration Mode

**Purpose** Before you change the configuration or commit a candidate configuration, it is a good idea to check for users in configuration mode.

**Action** To display users currently editing the configuration, follow these steps:

1. To enter configuration mode, type the following command:

```
user@host> edit
```

2. Enter the following configuration mode command:

```
[edit]
user@host# status
```

For example:

```
user@host> show system users
4:58PM PST up 5 days, 9:52, 5 users, load averages: 0.01, 0.01, 0.00
USER      TTY      FROM                LOGIN@  IDLE WHAT
mwazna    p0       bigpunk.juniper.net 4:58PM   - -cli (cli)
jgchan    p1       bigpunk.juniper.net 2:25PM  2:32 -csh (csh)
jgchan    p2       bigpunk.juniper.net 2:35PM  2:18 cli
taffy     p3       bigpunk.juniper.net 3:28PM   5 -cli (cli)
tmauro    p4       bigpunk.juniper.net 4:16PM  37 cli
```

## Sample Output

**Meaning** The sample output lists the users who are currently logged in to the router. Five users are logged in to the router, with one user logged in twice, **igchan**. Each user is logged in through a different terminal (**TTY**—**p0**, **p1**, **p2**, **p3**, and **p4**) from the system **bigpunk.juniper.net**. A hyphen in the **FROM** field indicates that the user logged in through the console.

Additional information includes the time when the user logged in (**LOGIN**), the amount of time the user is not active on the router (**IDLE**), and the processes that the user is running (**WHAT**). In this example, the users are running the command-line interface (**cli**) and the UNIX-level shell (**csh**).

---

## Check the Commands That Users Are Entering

**Purpose** A common set of operations you can check is when users log in to the router and the CLI commands they issue.

To check the commands that users are entering, follow these steps:

1. [Configure the Log File for Tracking CLI Commands on page 1352](#)
2. [Display the Configured Log File on page 1353](#)

## Configure the Log File for Tracking CLI Commands

**Action** To configure the log file for tracking CLI commands, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit system syslog
```

2. Configure the log file:

```
[edit system syslog]
user@host# edit file filename
```

For example:

```
[edit system syslog]
user@host# edit file cli-commands
```

3. Configure the interactive-commands facility and severity level:

```
[edit system syslog filename]
user@host# set interactive-commands info
```

4. Verify the configuration:

```
[edit system syslog]
user@host# show
file cli-commands {
    interactive-commands info;
}
```

5. Commit the configuration:

```
user@host# commit
```

**Meaning** The configuration example shows that the log file **cli-commands** is configured with the **interactive-commands** facility at the **info** severity level. [Table 43 on page 1353](#) lists and describes the severity levels.

**Table 43: Severity Levels**

| Severity Level | Description                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------|
| <b>info</b>    | Log all top-level CLI commands, including the <b>configure</b> command, and all configuration mode commands. |
| <b>notice</b>  | Log the configuration mode commands <b>rollback</b> and <b>commit</b> .                                      |
| <b>warning</b> | Log when any software process restarts.                                                                      |

## Display the Configured Log File

**Purpose** To display the log file in configuration mode, enter the following command:

**Action** [edit system syslog]  
user@host# run show log *filename*

For example:

[edit system syslog]  
user@host# run show log cli-commands

## Sample Output

```
[edit system syslog]
user@host# run show log cli-commands
Sep 16 11:24:25 nut mgd[3442]: UI_COMMIT_PROGRESS: commit: signaling 'Syslog
daemon', pid 2457, signal 1, status 0
Sep 16 11:24:25 nut mgd[3442]: UI_COMMIT_PROGRESS: commit: signaling 'SNMP
daemon', pid 2592, signal 31, status 0
Sep 16 11:28:36 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'run
show log cli-commands '
Sep 16 11:30:39 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'run
show log security '
Sep 16 11:31:26 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'run
show log messages '
Sep 16 11:41:21 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'edit
file cli-commands '
Sep 16 11:41:25 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'show
'
Sep 16 11:44:57 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'set
interactive-commands info '
Sep 16 14:32:15 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'run
show log cli-commands '
```

**Meaning** The sample output shows the CLI commands that were entered since the log file was configured.

## Configure the Log File for Tracking CLI Commands

**Action** To configure the log file for tracking CLI commands, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit system syslog
```

2. Configure the log file:

```
[edit system syslog]
user@host# edit file filename
```

For example:

```
[edit system syslog]
user@host# edit file cli-commands
```

3. Configure the interactive-commands facility and severity level:

```
[edit system syslog filename]
user@host# set interactive-commands info
```

4. Verify the configuration:

```
[edit system syslog]
user@host# show
file cli-commands {
    interactive-commands info;
}
```

5. Commit the configuration:

```
user@host# commit
```

**Meaning** The configuration example shows that the log file **cli-commands** is configured with the **interactive-commands** facility at the **info** severity level. [Table 43 on page 1353](#) lists and describes the severity levels.

**Table 44: Severity Levels**

| Severity Level | Description                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------|
| info           | Log all top-level CLI commands, including the <b>configure</b> command, and all configuration mode commands. |
| notice         | Log the configuration mode commands <b>rollback</b> and <b>commit</b> .                                      |
| warning        | Log when any software process restarts.                                                                      |

## Check When the Last Configuration Change Occurred

**Purpose** When a problem occurs on a router, it is a good idea to check when the last configuration change was made because it may have had some influence on the problem.

To check when the last configuration change occurred, follow these steps:

1. [Configure Configuration Change Tracking on page 1355](#)
2. [Display the Configured Log File on page 1355](#)

## Configure Configuration Change Tracking

**Action** To configure this type of logging, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit system syslog
```

2. Configure the log file:

```
[edit system syslog]
user@host# edit file filename
```

For example:

```
[edit system syslog]
user@host# edit file mw-configuration-changes
```

3. Configure the change-log facility and severity level:

```
[edit system syslog filename]
user@host# set change-log info
```

4. Verify the configuration:

```
[edit system syslog]
user@host# show
file mw-configuration-changes {
  change-log info;
}
```

5. Commit the configuration:

```
user@host# commit
```

## Display the Configured Log File

**Purpose** To display the log file in configuration mode.

**Action** To display the log file in configuration mode, enter the following command:

```
[edit system syslog]
user@host# run show log filename
```

For example:

```
[edit system syslog]
user@host# run show log mw-configuration-changes
```

## Sample Output

```
[edit system syslog]
user@host# run show log mw-configuration-changes
Sep 17 07:03:22 nut mgd[7793]: UI_CFG_AUDIT_OTHER: User 'root' override:
```

```
/config/juniper.conf
Sep 17 07:07:21 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [interfaces
  lo0 unit 0 family inet address 127.0.0.1/32]
Sep 17 07:07:21 nut mgd[2751]: UI_CFG_AUDIT_SET: User 'root' set: [system
  domain-name] "englab.company.net" -> "englab.company.net"
Sep 17 07:07:21 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [system
  name-server 172.17.28.101]
Sep 17 07:07:22 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [system
  domain-search] "englab.company.net"
Sep 17 07:07:22 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [system
  domain-search] "company.net"
Sep 17 07:07:22 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [system
  domain-search] "jnpr.net"
```

**Meaning** The sample output shows the contents of the log file and that the last configuration change was on September 17 at 07:07:22.

---

## Configure Configuration Change Tracking

---

**Action** To configure this type of logging, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit system syslog
```

2. Configure the log file:

```
[edit system syslog]
user@host# edit file filename
```

For example:

```
[edit system syslog]
user@host# edit file mw-configuration-changes
```

3. Configure the change-log facility and severity level:

```
[edit system syslog filename]
user@host# set change-log info
```

4. Verify the configuration:

```
[edit system syslog]
user@host# show
file mw-configuration-changes {
  change-log info;
}
```

5. Commit the configuration:

```
user@host# commit
```

---

## Display a Log File

---

**Purpose** To look at a log or trace file.

**Action** To look at a log or trace file, use the following Junos OS CLI operational mode command:

```
user@host> show log filename
```

## Sample Output

```
user@host> show log messages
Sep 10 07:00:00 host newsyslog[7249]: logfile turned over
Sep 10 07:01:49 host rpd[6451]: bgp_listen_accept: Connection attempt from

unconfigured neighbor: 10.0.8.1+1349
Sep 10 07:06:45 host rpd[6451]: bgp_listen_accept: Connection attempt from
unconfigured neighbor: 10.0.8.1+1350
Sep 10 07:07:53 host login: 2 LOGIN FAILURES FROM 172.24.16.21
Sep 10 07:07:53 host login: 2 LOGIN FAILURES FROM 172.24.16.21, show configuration
| no-more
Sep 10 07:08:25 host inetd[2785]: /usr/libexec/telnetd[7251]: exit status 0x100
Sep 10 07:09:13 host rpd[6451]: bgp_listen_accept: Connection attempt from
unconfigured neighbor: 10.0.8.1+1351
Sep 10 07:11:41 host rpd[6451]: bgp_listen_accept: Connection attempt from
unconfigured neighbor: 10.0.8.1+1352
Sep 10 07:14:09 host rpd[6451]: bgp_listen_accept: Connection attempt from
unconfigured neighbor: 10.0.8.1+1353
Sep 10 07:16:37 host rpd[6451]: bgp_listen_accept: Connection attempt from
unconfigured neighbor: 10.0.8.1+1354
Sep 10 07:19:05 host rpd[6451]: bgp_listen_accept: Connection attempt from
unconfigured neighbor: 10.0.8.1+1355
Sep 10 07:21:33 host rpd[6451]: bgp_listen_accept: Connection attempt from
unconfigured neighbor:
```

**Meaning** The sample output shows the **rpd** log messages in the **messages** file for September 10 from 7:00 to 7:21 AM.

**NOTE:** Local log files are saved in the `/var/log` directory.

## Configure IS-IS-Specific Options

**Purpose** When unexpected events or problems occur, or if you want to diagnose IS-IS adjacency establishment issues, you can view more detailed information by configuring options specific to IS-IS.

To configure IS-IS options, follow these steps:

1. [Displaying Detailed IS-IS Protocol Information on page 1357](#)
2. [Displaying Sent or Received IS-IS Protocol Packets on page 1360](#)
3. [Analyzing IS-IS Link-State PDUs in Detail on page 1361](#)

### Displaying Detailed IS-IS Protocol Information

**Action** To trace IS-IS messages in detail, follow these steps:

1. Configure the flag to display detailed IS-IS protocol messages.

```
[edit protocols isis traceoptions]
user@host# set flag hello detail
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello detail;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog
```

```
Nov 29 23:17:50 trace_on: Tracing to "/var/log/isislog" started
Nov 29 23:17:50 Sending PTP IIH on so-1/1/1.0
Nov 29 23:17:53 Sending PTP IIH on so-1/1/0.0

## Displaying Sent or Received IS-IS Protocol Packets

To configure the tracing for only sent or received IS-IS protocol packets, follow these steps:

1. Configure the flag to display sent, received, or both sent and received packets.

```
[edit protocols isis traceoptions]
user@host# set flag hello send
```

or

```
[edit protocols isis traceoptions]
user@host# set flag hello receive
```

or

```
[edit protocols isis traceoptions]
user@host# set flag hello
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello send;
```

or

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello receive;
```

or

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello send receive;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog
Sep 27 18:17:01 ISIS periodic xmit to 01:80:c2:00:00:15 (IFL 2)
Sep 27 18:17:01 ISIS periodic xmit to 01:80:c2:00:00:14 (IFL 2)
Sep 27 18:17:03 ISIS periodic xmit to 01:80:c2:00:00:15 (IFL 2)
Sep 27 18:17:04 ISIS periodic xmit to 01:80:c2:00:00:14 (IFL 2)
Sep 27 18:17:06 ISIS L2 hello from 0000.0000.0008 (IFL 2) absorbed
Sep 27 18:17:06 ISIS periodic xmit to 01:80:c2:00:00:15 (IFL 2)
Sep 27 18:17:06 ISIS L1 hello from 0000.0000.0008 (IFL 2) absorbed
```

## Analyzing IS-IS Link-State PDUs in Detail

To analyze IS-IS link-state PDUs in detail, follow these steps:

1. Configure IS-IS open messages.

```
[edit protocols isis traceoptions]
user@host# set flag lsp detail
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 5m world-readable;
flag error;
flag lsp detail;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog

## Displaying Detailed IS-IS Protocol Information

**Action** To trace IS-IS messages in detail, follow these steps:

1. Configure the flag to display detailed IS-IS protocol messages.

```
[edit protocols isis traceoptions]
user@host# set flag hello detail
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello detail;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog
```

```
Nov 29 23:17:50 trace_on: Tracing to "/var/log/isislog" started
Nov 29 23:17:50 Sending PTP IIH on so-1/1/1.0
Nov 29 23:17:53 Sending PTP IIH on so-1/1/0.0
Nov 29 23:17:54 Received PTP IIH, source id abc-core-01 on so-1/1/0.0
Nov 29 23:17:54   from interface index 11
Nov 29 23:17:54   max area 0, circuit type 12, packet length 4469
Nov 29 23:17:54   hold time 30, circuit id 6
Nov 29 23:17:54   neighbor state up
Nov 29 23:17:54   speaks IP
Nov 29 23:17:54   area address 99.0008 (1)
Nov 29 23:17:54   IP address 10.10.10.29
Nov 29 23:17:54   4396 bytes of total padding
Nov 29 23:17:54   updating neighbor abc-core-01
Nov 29 23:17:55 Received PTP IIH, source id abc-core-02 on so-1/1/1.0
Nov 29 23:17:55   from interface index 12
Nov 29 23:17:55   max area 0, circuit type 12, packet length 4469
Nov 29 23:17:55   hold time 30, circuit id 6
Nov 29 23:17:55   neighbor state up
Nov 29 23:17:55   speaks IP
Nov 29 23:17:55   area address 99.0000 (1)
Nov 29 23:17:55   IP address 10.10.10.33
Nov 29 23:17:55   4396 bytes of total padding
Nov 29 23:17:55   updating neighbor abc-core-02
```

**Meaning** [Table 45 on page 1359](#) lists tracing flags that can be configured specific to IS-IS and presents example output for some of the flags.

Table 46: IS-IS Protocol Tracing Flags

| Tracing Flags         | Description                                | Example Output                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Analyzing IS-IS Link-State PDUs in Detail

To analyze IS-IS link-state PDUs in detail, follow these steps:

1. Configure IS-IS open messages.

```
[edit protocols isis traceoptions]
user@host# set flag lsp detail
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 5m world-readable;
flag error;
flag lsp detail;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog
Nov 28 20:17:24 Received L2 LSP abc-core-01.00-00, interface so-1/1/0.0

## Configure OSPF-Specific Options

**Purpose** When unexpected events or problems occur, or if you want to diagnose OSPF neighbor establishment issues, you can view more detailed information by configuring options specific to OSPF.

To configure OSPF options, follow these steps:

1. [Diagnose OSPF Session Establishment Problems on page 1367](#)
2. [Analyze OSPF Link-State Advertisement Packets in Detail on page 1371](#)

## Diagnose OSPF Session Establishment Problems

**Action** To trace OSPF messages in detail, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols ospf traceoptions
```

2. Configure OSPF hello messages:

```
[edit protocols ospf traceoptions]
user@host# set flag hello detail
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit protocols ospf traceoptions]
user@host# show
file ospf size 5m world-readable;
flag hello detail;
```

4. Commit the configuration:

```
user@host# commit
```

5. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
user@host# run show log ospf
```

```

### Analyze OSPF Link-State Advertisement Packets in Detail

**Action** To analyze OSPF link-state advertisement packets in detail, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols ospf traceoptions
```

2. Configure OSPF link-state packages:

```
[edit protocols ospf traceoptions]
user@host# set flag lsa-update detail
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit protocols ospf traceoptions]
user@host# show
file ospf size 5m world-readable;
flag hello detail;
flag lsa-update detail;
```

4. Commit the configuration:

```
user@host# commit
```

5. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
user@host# run show log ospf
```

```
Dec 2 16:23:47 OSPF sent LSUpdate (4) -> 224.0.0.5 (so-1/1/0.0) ec 2 16:23:47
Version 2, length 196, ID 10.0.0.6, area 0.0.0.0
Dec 2 16:23:47 checksum 0xcc46, authtype 0
```

```
Dec 2 16:23:47 adv count 6 Dec 2 16:23:47 OSPF sent LSUpdate (4) -> 224.0.0.5
(so-1/1/1.0)
Dec 2 16:23:47 Version 2, length 196, ID 10.0.0.6, area 0.0.0.0 Dec 2 16:23:47
checksum 0xcc46, authtype 0
Dec 2 16:23:47 adv count 6
```

## Diagnose OSPF Session Establishment Problems

**Action** To trace OSPF messages in detail, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols ospf traceoptions
```

2. Configure OSPF hello messages:

```
[edit protocols ospf traceoptions]
user@host# set flag hello detail
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit protocols ospf traceoptions]
user@host# show
file ospf size 5m world-readable;
flag hello detail;
```

4. Commit the configuration:

```
user@host# commit
```

5. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
user@host# run show log ospf
```

```
Dec 2 16:14:24 Version 2, length 44, ID 10.0.0.6, area 1.0.0.0

## Analyze OSPF Link-State Advertisement Packets in Detail

**Action** To analyze OSPF link-state advertisement packets in detail, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols ospf traceoptions
```

2. Configure OSPF link-state packages:

```
[edit protocols ospf traceoptions]
user@host# set flag lsa-update detail
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit protocols ospf traceoptions]
```

```

## Chassis

Chassis dimensions are listed in the physical specifications table for each router. For more information about chassis dimensions, see the router platform-specific hardware guide.

Each Juniper Networks router features a rigid sheet metal chassis that houses all of the router components. The chassis are designed to install into a variety of racks, including standard 19-inch equipment racks, telco center-mount racks, and four-post racks and cabinets. See [Table 49 on page 1376](#) for the maximum number of each router type that can be installed into a rack. Each chassis includes mounting ears or support posts to facilitate rack mounting, and one or more points for connecting an electrostatic discharge (ESD) wrist strap for use when servicing the router.

**Table 49: Maximum Number of Routers per Rack**

| Router or Routing Node | Maximum in Standard Rack |
|------------------------|--------------------------|
| T640                   | 2                        |
| T320                   | 3                        |
| M160                   | 2                        |
| M40e                   | 2                        |
| M40                    | 2                        |
| M20                    | 5                        |

**Table 49: Maximum Number of Routers per Rack** (*continued*)

| Router or Routing Node | Maximum in Standard Rack |
|------------------------|--------------------------|
| M5 and M10             | 14                       |

Each chassis includes a midplane (called the backplane on an M40 router). The midplane transfers data packets to and from the FPCs, distributes power to router components, and provides signal connectivity to the router components for system monitoring and control.

## Physical Interface Cards

Juniper Networks M-series routers and T-series platforms use PICs to connect to a wide variety of network media. PICs receive incoming packets from the network and transmit outgoing packets to the network, performing framing and line-speed signaling for their specific media type. Before transmitting outgoing data packets, the PICs encapsulate the packets received from the FPCs. Each PIC is equipped with an ASIC that performs control functions specific to the PIC's media type. For information about PICs, see the specific PIC guide.

## Routing Engine

The Routing Engine consists of an Intel-based PCI platform running the Junos OS. The Routing Engine maintains the routing tables used by the router in which it is installed and controls the routing protocols on the router. The T640 routing node, and the T320, M160, M40e, and M20 routers support up to two Routing Engines, while the M40, M10, and M5 routers support a single Routing Engine.

Each Routing Engine consists of a CPU; SDRAM for storage of the routing and forwarding tables and other processes; a compact flash disk for primary storage of software images, configuration files, and microcode; a hard disk for secondary storage; a PC card slot (on some M40 routers, a floppy disk) for storage of software upgrades; and interfaces for out-of-band management access.

## Compare Information Logged Before and After the Reinstall

**Purpose** Compare the operation of the system before and after the reinstall to ensure that everything is working as expected.

**Action** To obtain system information, use the following commands:

```

user@host> show version
user@host> show chassis hardware
user@host> show chassis environment
user@host> show system boot-messages
user@host> show configuration
user@host> show interface terse
user@host> show bgp summary
user@host> show isis adjacency brief
user@host> show ospf neighbor brief

```

```
user@host> show system storage
```

Compare the information from these commands with the information you obtained before the reinstall.

---

## Back Up the New Software

**Purpose** After a week or so, when you are satisfied that the new software is running successfully, we recommend that you back up the reinstalled software.

**Action** To back up the reinstalled software, use the following Junos OS CLI operational mode command:

```
user@host> request system snapshot
```

The root file system is backed up to `/altroot`, and `/config` is backed up to `/altconfig`. The root and `/config` file systems are on the router's internal flash drive, and the `/altroot` and `/altconfig` file systems are on the router's hard drive.

**NOTE:** After you issue the `request system snapshot` command, you cannot return to the previous version of the software because the running and backup copies of the software are identical.

---

---

## Monitor Hardware Components

**Purpose**

**NOTE:** If the System Control Board (SCB), System and Switch Board (SSB), or Forwarding Engine Board (FEB) is not running, information about chassis components is not available through the command-line interface (CLI).

---

**Action** To use the CLI to monitor Juniper Networks routers, follow these steps:

1. Log in to the router. The CLI operational mode prompt (`>`) appears.

If the operational mode prompt does not appear when you log in to the router, type `cli` to start the Junos OS and enter operational mode. The prompt changes to `>`, indicating that you are in operational mode.

2. Use one of the operational mode CLI commands listed in *Operational Mode CLI Commands for Router Monitoring* to monitor router hardware.

---

## Log Software Version Information

**Purpose** To log the Junos OS version information.

**Action** To log the Junos OS version information, use the following Junos OS CLI operational mode command:

```
user@host> show version
```

**Sample Output**

```
user@host> show version
Hostname: host
Model: m10

```

**Meaning**

The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

## Hardware Components

Each Juniper Networks router consists of a chassis and a set of components, including FPCs, PICs, Routing Engines, power supplies, cooling system, and cable management system. Many of the components are field-replaceable units. The following major components are discussed in this topic:

- [Chassis on page 1380](#)
- [Flexible PIC Concentrators on page 1380](#)
- [Physical Interface Cards on page 1380](#)
- [Routing Engine on page 1381](#)
- [Power Supplies on page 1381](#)
- [Cooling System on page 1381](#)

## Chassis

Chassis dimensions are listed in the physical specifications table for each router. For more information about chassis dimensions, see the router platform-specific hardware guide.

Each Juniper Networks router features a rigid sheet metal chassis that houses all of the router components. The chassis are designed to install into a variety of racks, including standard 19-inch equipment racks, telco center-mount racks, and four-post racks and cabinets. See [Table 49 on page 1376](#) for the maximum number of each router type that can be installed into a rack. Each chassis includes mounting ears or support posts to facilitate rack mounting, and one or more points for connecting an electrostatic discharge (ESD) wrist strap for use when servicing the router.

**Table 50: Maximum Number of Routers per Rack**

| Router or Routing Node | Maximum in Standard Rack |
|------------------------|--------------------------|
| T640                   | 2                        |
| T320                   | 3                        |
| M160                   | 2                        |
| M40e                   | 2                        |
| M40                    | 2                        |
| M20                    | 5                        |
| M5 and M10             | 14                       |

Each chassis includes a midplane (called the backplane on an M40 router). The midplane transfers data packets to and from the FPCs, distributes power to router components, and provides signal connectivity to the router components for system monitoring and control.

## Flexible PIC Concentrators

The FPCs house the PICs used in the router and connect them to other router components. FPCs install into the front of the router in either a vertical or horizontal orientation, depending on the router. A compatible FPC can be installed into any available FPC slot, regardless of the PICs it contains. If a slot is not occupied by an FPC, a blank FPC panel must be installed to shield the empty slot and allow cooling air to circulate properly through the FPC card cage. For information about FPCs, see the specific hardware guide.

## Physical Interface Cards

Juniper Networks M-series routers and T-series platforms use PICs to connect to a wide variety of network media. PICs receive incoming packets from the network and transmit outgoing packets to the network, performing framing and line-speed signaling for their

specific media type. Before transmitting outgoing data packets, the PICs encapsulate the packets received from the FPCs. Each PIC is equipped with an ASIC that performs control functions specific to the PIC's media type. For information about PICs, see the specific PIC guide.

## Routing Engine

The Routing Engine consists of an Intel-based PCI platform running the Junos OS. The Routing Engine maintains the routing tables used by the router in which it is installed and controls the routing protocols on the router. The T640 routing node, and the T320, M160, M40e, and M20 routers support up to two Routing Engines, while the M40, M10, and M5 routers support a single Routing Engine.

Each Routing Engine consists of a CPU; SDRAM for storage of the routing and forwarding tables and other processes; a compact flash disk for primary storage of software images, configuration files, and microcode; a hard disk for secondary storage; a PC card slot (on some M40 routers, a floppy disk) for storage of software upgrades; and interfaces for out-of-band management access.

## Power Supplies

Each Juniper Networks M-series router, T-series platform, or MX-series router has one to four load-sharing power supplies depending on the platform. If a power supply in a redundant configuration is removed or fails, the other power supplies assume the electrical load. For more information about the power supplies in each router, see the router platform-specific hardware guide.

The power supplies are connected to the router midplane, which distributes the different output voltages throughout the router and its components. Some routers can operate using either AC or DC power; other routers operate with DC power only. For information about the type of power used by each router, see the platform-specific hardware guide.

## Cooling System

Each Juniper Networks M-series router and T-series platform features a cooling system designed to keep all router components within recommended operating temperature limits. If one component of the cooling system fails or is removed, the system automatically adjusts the speed of the remaining components to keep the temperature within the acceptable range. The cooling system for each router is unique and can consist of fans, impellers, and air filters. For information about the cooling system components of each router, see the "Major Hardware Components" table in the router platform-specific hardware guide.

| <b>Description</b>              | <p>Enables you to configure extended administrative groups, represented by a 32-bit value, expanding the number of administrative groups supported in the network beyond just 32. In MPLS traffic engineering, a link can be configured with a set of administrative groups (also known as colors or resource classes). Administrative groups are carried in IGP (OSPFv2 and IS-IS) as a 32-bit value assigned to each link. By default, Juniper Networks routers interpret this 32-bit value as a bit mask with each bit representing a group. This normally limits each network to a total of 32 distinct administrative groups (value range 0 through 31).</p> <p>The extended administrative groups configuration accepts a set of interfaces with a corresponding set of extended administrative group names. It converts the names into a set of 32-bit values and propagates this information into the IGP. The extended administrative group values are global and must be identically configured on all the supported routers participating in the network. The domain-wide extended administrative groups database, learned from other routers through IGP flooding, is used by CSPF for path computation.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Configure the method for the interior gateway protocol (IGP) to advertise egress protection availability.</p> <p>Egress protection availability is advertised in the IGP. Label protocols along with CSPF use this information to do egress protection.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>stub-alias</b>—Context identifier has an alias.</p> <p>In the alias method, the LSP end-point address has an explicit backup egress node where the backup node can be learned or configured on the penultimate hop node (PHN) of a protected LSP. With this model, the PHN of a protected LSP sets up the bypass LSP tunnel to back up the egress node by avoiding the primary egress node. This model requires a Junos OS upgrade in core nodes, but is flexible enough to support all traffic engineering constraints.</p> <p><b>stub-proxy</b>—Context-identifier has a stub proxy node.</p> <p>A stub node is one that only appears at the end of an AS path, which means it does not provide transit service. In this mode, known as the virtual or proxy mode, the LSP end-point address is represented as a node with bidirectional links, with the LSP's primary egress node and backup egress node. With this representation, the penultimate hop of the LSP primary egress point can behave like a PLR in setting up a bypass tunnel to back up the egress by avoiding the primary egress node. This model has the advantage that you do not need to upgrade Junos OS on core nodes and thereby helps operators to deploy this technology.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>(MX Series routers only) Enable you to switch an LSP away from a network node using a bypass LSP. This feature could be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic.</p> <p>This statement marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, you then need to configure the <b>switch-away-lsps</b> statement.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Enable an LSP to monitor the status of its destination PE router. You can configure multiple backup PE router groups using the same router's address. Backup PE router groups provide ingress PE router redundancy when point-to-multipoint LSPs are configured for multicast distribution. A failure of this LSP indicates to all of the backup PE router groups that the destination PE router is down. This statement is not tied to a specific backup PE router group. It applies to all groups that are interested in the status of the LSP to the destination address.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>         | <p>When configuring an LSP, specify the traffic rate associated with the LSP.</p> <p>When configuring fast reroute, allocate bandwidth for the reroute path. By default, no bandwidth is reserved for the rerouted path. The fast reroute bandwidth does not need to be identical to that allocated for the LSP itself.</p> <p>When configuring a multiclass LSP, use the <b>ctnumber bandwidth</b> statements to specify the bandwidth to be allocated for each class type.</p>                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>bps</b>—Bandwidth, in bits per second. You can specify this as an integer value. You can also use the abbreviations <b>k</b> (for a thousand), <b>m</b> (for a million), or <b>g</b> (for a billion).</p> <p><b>Range:</b> Any positive integer</p> <p><b>Default:</b> 0 (no bandwidth is reserved)</p>                                                                                                                                                                                                                                                                                                                                                                                                               |

**NOTE:** On the ACX Series, *bps* is the only supported option.

**ctnumber bps**—Bandwidth for the specified class type, in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations **k** (for a thousand), **m** (for a million), or **g** (for a billion [also called a thousand million]).

**Range:** Any positive integer

**Default:** 0 (no bandwidth is reserved)

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                              |
| <b>Description</b>              | Specify that the label-switched path be a passive LSP associated with a bidirectional LSP when it is signaled at the ingress router. This passive LSP enables the MPLS application to utilize the reverse LSP. You cannot configure this statement at the same time as the <b>corouted-bidirectional</b> statement. |
| <b>Default</b>                  | This statement is disabled by default.                                                                                                                                                                                                                                                                              |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1 for the M320 Series, MX Series, and PTX Series.                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Configure to allow Junos LDP to establish the TCP connection over IPv4 with IPv4 neighbors, and over IPv6 with IPv6 neighbors as a single-stack LSR. <b>inet-lsr-id</b> and <b>inet6-lsr-id</b> are the two LSR IDs that have to be configured to establish an LDP session over IPv4 and IPv6 TCP transport. These two IDs should be non-zero and must be configured with different values. |
| <b>Options</b>                  | <p><b>inet-lsr-id <i>inet-lsr-id</i></b>— Configure the LSR ID to establish an LDP session over IPv4 TCP transport.</p> <p><b>inet6-lsr-id <i>inet6-lsr-id</i></b>— Configure the LSR ID to establish an LDP session over IPv6 TCP transport.</p>                                                                                                                                           |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Assists the transit router in load-balancing MPLS traffic across ECMP paths or Link Aggregation groups by introducing the entropy label to the MPLS label stack. The entropy label allows routers to load balance MPLS traffic by using a hash-input without the need to perform deep packet inspection. Deep packet inspection requires more of the router's processing power and is not a capability shared by all routers. |

| <b>Description</b>              | <p>Exclude Shared Risk Link Group (SRLG) links for the secondary path for critical links where it is imperative to keep the secondary and primary label-switched paths completely disjoint from any common SRLG.</p> <p>When specified, the Constrained Shortest Path First (CSPF) algorithm excludes any link belonging to the set of SRLGs in the primary path. When not specified and if a link belongs to the set of SRLGs in the primary path, CSPF adds the SRLG cost to the metric, but still accepts the link for computing the path.</p>                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Allow an LSP to traverse multiple OSPF areas within a service provider's network.</p> <p>Allows a point-to-multipoint LSP to span multiple domains in a network. Effectively, this allows you to configure one or more sub-LSPs (branches) in separate network domains. Examples of such domains include OSPF areas and autonomous systems (ASs). A sub-LSP of an inter-domain point-to-multipoint LSP can be intra-area, inter-area, or inter-AS, depending on the location of the egress node (leaf) with respect to the ingress node (source). Only OSPF areas are supported for inter-domain point-to-multipoint LSPs. IS-IS levels are not supported.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Configure route and next-hop properties in the event of a Bidirectional Forwarding Detection (BFD) protocol session failure event on an RSVP label-switched path (LSP). The failure event could be an existing BFD session that has gone down or a BFD session that never came up. RSVP adds back the route or next hop when the relevant BFD session comes back up.</p>                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>make-before-break</b>—When a BFD session fails for an RSVP LSP, an attempt is made to signal a new LSP path before tearing down the old LSP path.</p> <p><b>teardown</b>—When a BFD session fails for an RSVP LSP, the associated LSP path is taken down and resigaled immediately.</p> <p><b>teardown-timeout <i>seconds</i></b>—When you configure the <b>make-before-break</b> option, you can specify a time in seconds for the <b>teardown-timeout</b> option. At the end of the time specified, the associated RSVP LSP is automatically torn down and resigaled.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

                zero-control-word;
            }
            ip {
                disable;
                layer-3-only;
                port-data {
                    source-msb;
                    source-lsb;
                    destination-msb;
                    destination-lsb;
                }
            }
        }
    }
```

**Hierarchy Level** [edit forwarding-options hash-key]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**no-label-1-exp** option introduced in Junos OS Release 8.0.  
**label-3** and **no-labels** options introduced in Junos OS Release 8.1.  
**ether-pseudowire** statement introduced in Junos OS Release 9.1 (M320 and T Series routers only); support extended to M120 and MX Series routers in Junos OS Release 9.4.  
**all-labels** and **payload ip disable** options introduced in Junos OS Release 12.1X48R2. (PTX Series Packet Transport Routers only).  
**zero-control-word** option introduced in Junos OS Release 16.1 for the M Series, MX Series, and PTX Series.

**Description** For aggregated Ethernet and SONET/SDH interfaces only, configure load balancing based on MPLS labels and payload. Only the IPv4 protocol is supported.

**Options** **family mpls**—(Aggregated Ethernet interfaces, aggregated SONET/SDH interfaces, and multiple equal-cost MPLS next hops only) Incorporate MPLS label and payload information into the hash key for per-flow load balancing. Only the IPv4 protocol is supported.

- **all-labels**—(PTX Series Packet Transport Routers only) Up to eight MPLS labels are included in the hash key to identify the uniqueness of a flow in the Packet Forwarding Engine. This is the default setting.

- **label-1**—(M120, M320, MX Series, and T Series routers only) Include the first MPLS label into the hash key. This is used for a one-label packet for per-flow load balancing IPv4 VPLS traffic based on IP information and MPLS labels.
- **label-2**—(M120, M320, MX Series, and T Series routers only) Include the second MPLS label into the hash key. This is used for a two-label packet for per-flow load balancing IPv4 VPLS traffic based on IP information and MPLS labels. To use the second MPLS label in the hash key, include both the **label-1** and **label-2** statements at the **[edit forwarding-options hash-key family mpls]** hierarchy level. By default, the router provides hashing on the first and second labels. If both labels are specified, the entire first label and the first 16 bits of the second label are hashed.
- **label-3**—(M120, M320, MX Series, and T Series routers only) Include the third MPLS label into the hash key. To use the third MPLS label, include the **label-1**, **label-2**, and **label-3** statements at the **[edit forwarding-options hash-key family mpls]** hierarchy level.
- **no-labels**—Include no MPLS labels into the hash key.

- **no-label-1-exp**—(M120, M320, MX Series, and T Series routers only) The EXP bit of the first label is not used in the hash calculation to avoid reordering complications.
- **payload**—Incorporate bits from the IP payload into the hash key for per-flow load balancing Layer 2 information based on MPLS labels.
  - **disable**—(PTX Series Packet Transport Routers only) Exclude IP payload from the hash key.
  - **ether-pseudowire**—(M120, M320, MX Series, and T Series routers only) Load-balance IPv4 traffic over Layer 2 Ethernet pseudowires.
  - **zero-control-word**—(M Series, MX Series, and PTX Series) Precedes Ethernet packet to indicate the start of an Ethernet frame in an MPLS ether-pseudowire payload.
  - **ip**—Include the IP address of the IPv4 or IPv6 payload into the hash key for per-flow load balancing Layer 2 information based on MPLS labels. For the PTX Series Packet Transport Routers, this is the default setting with both Layer 3 and Layer 4 IP information included in the hash key.
    - **disable**—(PTX Series Packet Transport Routers only) Exclude IP payload from the hash key.
    - **layer-3-only**—Include only Layer 3 IP information from the IP payload data into the hash key for per-flow load balancing Layer 2 information based on MPLS labels.
    - **port-data**—(M120, M320, MX Series, and T Series routers only) Include the source and destination port field information into the hash key. By default, the most significant byte and least significant byte of the source and destination port fields are hashed. To select specific bytes to be hashed, include one or more of the **source-msb**, **source-lsb**, **destination-msb**, and **destination-lsb** options at the [edit forwarding-options hash-key family mpls payload ip port-data] hierarchy level. To prevent all four bytes from being hashed, include the **layer-3-only** statement at the [edit forwarding-options hash-key family mpls payload ip] hierarchy level.
      - **destination-lsb**—Include the least-significant byte of the destination port.
      - **destination-msb**—Include the most-significant byte of the destination port.
      - **source-lsb**—Include the least-significant byte of the source port.
      - **source-msb**—Include the most-significant byte of the source port.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify a backup path in case the primary path becomes unusable.</p> <p>You specify one or more objects with common characteristics within a group. All objects are treated as /32 host addresses. The objects can be a LAN interface, a router ID, or a point-to-point link. Sequence is insignificant.</p> <p>Changing the fate-sharing database does not affect existing established LSPs until the next CSPF reoptimization. The fate-sharing database does affect fast-reroute detour path computations.</p>                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>cost <i>value</i></b>—Cost assigned to the group.<br/> <b>Range:</b> 1 through 65,535<br/> <b>Default:</b> 1</p> <p><b>from <i>address</i></b>—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate <b>from</b> addresses in the group.</p> <p><b>group <i>group-name</i></b>—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.</p> <p><b>to <i>address</i></b>—(Optional) Address of egress router. For point-to-point link objects, you must specify both a <b>from</b> and a <b>to</b> address.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | Enable generic routing encapsulation (GRE) type for IPv4 to automatically establish label-switched paths (LSPs) for any new provider edge (PE) router added to a full mesh of LSPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <b>next-hop-based-tunnel</b> —Create a tunnel composite next hop for every dynamic GRE tunnel configured. The tunnel composite next hop includes the dynamic tunnel's encapsulation data and a VPN label (when chained composite next hop is not enabled). When this option is not configured, the default interface-based tunnel mode is enabled. By configuring this option, a device can scale up to 32,000 IP tunnels, which is otherwise restricted to the system limit on the number of interfaces supported.<br><br>At a given point in time, either the next-hop-based dynamic tunnel or the default interface-based dynamic GRE tunnel can exist on a device. A switchover from one tunnel mode to another deletes the existing tunnels and creates new tunnels in the new tunnel mode. As a result, a tunnel mode switchover can impact network performance. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | <p>Specify the maximum number of routers that an LSP can traverse. This limit can be applied to any of the following:</p> <ul style="list-style-type: none"> <li>• LSPs—The configured hop limit includes the ingress and egress routers. You can specify a hop limit for an LSP and for both primary and secondary paths.</li> <li>• Fast reroute detour—Specify the number of additional routers a fast reroute detour can traverse relative to the protected LSP. For example, if an LSP traverses 4 routers, any detour for the LSP can be no more than 10 router hops, including the ingress and egress routers.</li> <li>• Link protection bypass—Specify the maximum number of routers that a link protection bypass can traverse.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>number</b>—Maximum number of hops.</p> <p><b>Range:</b> 2 through 255 (for an LSP or for a link protection bypass); 0 through 255 (for fast reroute)</p> <p><b>Default:</b> 255 (for an LSP or for a link protection bypass); 6 (for fast reroute)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Configure the system to enable anti-spoofing protection for next-hop-based dynamic tunnels, where reverse path forwarding checks are placed to ensure that the tunnel traffic is received from a legitimate source on the designated tunnels. When the tunnel traffic comes from a non-existing source or from a source on a non-designated tunnel, the reverse path forwarding check fails, and the traffic is not forwarded on that tunnel.</p> <p>By default, the reverse path forwarding check is in the strict mode, where the packets are not forwarded if the source of the packet is from a non-designated tunnel.</p> |
| <b>Options</b>                  | <p><b>mode (<i>strict</i>   <i>loose</i>)</b>—(Optional) Specify the mode of reverse path forwarding check to enable anti-spoofing protection for next-hop-based dynamic tunnels.</p> <p><b>Default:</b> If you omit the mode statement, the default behavior is strict mode.</p> <p><b>fail-filter <i>filter-name</i></b>—(Optional) Attach a filter to the Layer 3 VPN to log packets that failed the reverse path forwarding check.</p>                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Description              | Configure an LSP to use in dynamic MPLS. When configuring an LSP, you must specify the address of the egress router in the <b>to</b> statement. All remaining statements are optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Options                  | <p><b>lsp-name</b>—Name that identifies the LSP. The name can be up to 64 characters and can contain letters, digits, periods, and hyphens. To include other characters, enclose the name in quotation marks. The name must be unique within the ingress router.</p> <p><b>link-protection</b>—Enable protection for LSP from link faults only.</p> <p><b>no-self-ping</b>—Disable self-ping for the LSP.</p> <p><b>self-ping-duration seconds</b>—Specify the duration (in seconds) for which to run the self-ping mechanism unless the ping succeeds sooner.</p> <p>LSP self-ping for an LSP starts at the ingress label edge router (LER), once a Resv message for that LSP has been received. The configured self-ping time indicates the duration for which the self-ping mechanism runs once the LSP instance is signaled to be UP. The self-ping mechanism runs until the self-ping probe is received back, or until the configured self-ping duration for the LSP is over. If any other event causes the LSP to be torn down, then the self-ping mechanism is terminated.</p> <p><b>Range:</b> 1 through 65535 seconds</p> <p>The remaining statements are explained separately.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Disable Bidirectional Forwarding Detection (BFD) sessions to trigger fast reroute (FRR) using MPLS-FRR and loop-free alternates (LFAs). When this statement is configured, no BFD-triggered local repair is supported. However, logical interface down-based local repair is in force.</p> <p>When using this statement to disable local repair, you also must restart routing to ensure proper behavior. To restart routing, include the <b>graceful-restart</b> command for the interior gateway protocol (IGP) used in your configuration. For example, if your IGP is OSPF, include the <b>graceful-restart</b> statement at the [edit protocols ospf] hierarchy level.</p> |
| <b>Default</b>                  | BFD-triggered local repair is the default behavior. The loss of a neighbor results in BFD local repair for all next hops that derive themselves from the base next hop with which the BFD session is established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Disable constrained-path LSP computation.</p> <p>An explicit-path LSP is completely configured through operator action. Once configured, it is initiated only along the explicitly specified path.</p> <p>A constrained-path LSP relies on an ingress router to compute the complete path. The ingress router takes into account the following information during the computation:</p> <ul style="list-style-type: none"><li>• Interior gateway protocol (IGP) topology database</li><li>• Link utilization information from extensions in the IGP link-state database</li><li>• Administrative group information from extensions in the IGP link-state database</li><li>• LSP requirements, including bandwidth, hop count, and administrative group</li></ul> <p>Constrained-path LSPs can generally avoid link failures and congested links. They also permit recomputation (therefore, a new path) during topology changes or unsuccessful setup.</p> |
| <b>Default</b>                  | Constrained-path LSP computation enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | <p>Disable normal time-to-live (TTL) decrementing, which decrements the TTL field in the IP header by 1. This statement decrements the IP TTL by 1 before encapsulating the IP packet within an MPLS packet. When the penultimate router pops off the top label, it does not use the standard write-back procedure of writing the MPLS TTL into the IP TTL field. Therefore, the IP packet is decremented by 1. The ultimate router then decrements the packet by one more for a total cloud appearance of 2, thus hiding the network topology.</p>                                                                                                                                                             |
| <b>Default</b>                  | Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | For point-to-multipoint LSPs configured on T Series routers, protect the Packet Forwarding Engine (PFE) from bandwidth saturation. When a PFE does not need to replicate traffic, the PFE's bandwidth is less likely to become saturated. When you include the <b>no-mcast-replication</b> statement, the PFE is forced to be a leaf node in the binary tree. Leaf nodes, unlike branch nodes, do not replicate traffic in the process of forwarding traffic. Because leaf nodes have no children, they do not need to replicate traffic, and thus are less likely to become saturated with traffic. |
| <b>Default</b>                  | If you omit the <b>no-mcast-replication</b> statement, the PFE can become a branch node or a leaf node. When the PFE becomes a branch node, the PFE must replicate traffic.                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | <p>Disable normal time-to-live (TTL) decrementing. You configure this statement once per router, and it affects all RSVP-signaled or LDP-signaled LSPs. When this router acts as an ingress router for an LSP, it pushes an MPLS header with a TTL value of 255, regardless of the IP packet TTL. When the router acts as the penultimate router, it pops the MPLS header without writing the MPLS TTL into the IP packet.</p> <p>When you add the <b>no-propagate-ttl</b> statement to the configuration or delete it from the configuration, the effect takes place immediately. There is no need to clear existing RSVP LSPs or LDP sessions.</p> |
| <b>Default</b>                  | Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Perform normalization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>failover-normalization</b>—Enable the ingress router to pro-actively normalize or re-distribute traffic when a link or node failure happens on a member LSP. A member LSP can go down between two scheduled normalization events because of a link-failure or pre-emption.<br/><b>Default:</b> Disabled</p> <p><b>no-incremental-normalize</b>—Disables automatic switchover by the ingress router to a new instance of the container LSP until the desired demand is satisfied, although the given number of LSPs can be successfully signaled such that the new aggregate bandwidth value exceeds the old aggregate bandwidth value.<br/><b>Default:</b> False (disabled)</p> <p><b>normalization-retry-duration <i>seconds</i></b>—Specifies the duration before which the ingress router performs a normalization reattempt when the previous normalization has not been successful. Normalization is done until a sufficient number of LSPs come up with an aggregate bandwidth that is more than the current aggregate or desired bandwidth.<br/><b>Default:</b> 30 seconds</p> <p><b>normalization-retry-limits <i>number</i></b>—Specifies the maximum number of times the ingress router performs normalization reattempts until a sufficient number of LSPs come up successfully with new bandwidth values.<br/><b>Default:</b> 1</p> <p><b>normalize-interval <i>seconds</i></b>—Specifies the duration between two normalization events.<br/><b>Range:</b> 21600 seconds through 6 hours<br/><b>Default:</b> 21600 seconds</p> |

 [edit protocols mpls [label-switched-path](#) *lsp-name* primary *path-name*]

**Release Information** Statement introduced in Junos OS Release 7.6.  
**lsp-ping-interval** option introduced in Junos OS Release 9.4.  
 Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.  
**performance-monitoring** configuration statement introduced in Junos OS Release 15.1.

**Description** Enable Operation, Administration, and Maintenance (OAM) for RSVP-signaled LSPs.

**Options** **lsp-ping-interval** *seconds*—Specify the duration of the LSP ping interval in seconds. To issue a ping on an RSVP-signaled LSP, use the **ping mpls rsvp** command.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

## optimize-adaptive-teardown

**Syntax** optimize-adaptive-teardown {  
     p2p:  
 }

**Hierarchy Level** [edit protocols mpls]

**Release Information** Statement introduced in Junos OS Release 15.1R1.

**Description** Make use of a new feedback mechanism from TAG library which relies on RPD infrastructure to decide when all the routes using the old LSP instance have fully shifted to the new LSP instance after MBB switchover. When this statement is configured, the **optimize-hold-dead-delay** statement, which delays the teardown of the old LSP instance after MBB switchover, is ignored.

**Options** **p2p**—This is the only option. Only point-to-point LSPs configured in the system will be affected.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

| <b>Description</b>              | Allows you to specify the amount of time to delay the tear down of old paths after the router has switched traffic to new optimized paths. You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that old paths are not torn down before all routes have been switched over to the new optimized paths. This delay timer starts when the timer specified by the <b>optimize-switchover-dealy</b> statement has elapsed. |
| <b>Options</b>                  | <b><i>seconds</i></b> —Configure the time in seconds to wait before tearing down the old paths that were in use prior to the last LSP optimization.<br><b>Default:</b> 60 seconds<br><b>Range:</b> 0 through 65,535 seconds                                                                                                                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Enable periodic reoptimization of an LSP that is already set up. If topology changes occur, an existing path might become suboptimal, and a subsequent recomputation might be able to determine a better path. This feature is useful only on LSPs for which constrained-path computation is enabled; that is, for which the <b>no-cspf</b> statement is not configured. Also, you only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers).</p> <p>To avoid extensive resource consumption that might result because of frequent path recomputations, or to avoid destabilizing the network as a result of constantly changing LSPs, we recommend that you either leave the timer value sufficiently large or disable the timer value.</p> |
| <b>Default</b>                  | The optimize timer is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Create a named path and optionally specify the sequence of explicit routers that form the path.</p> <p>You must include this statement when configuring explicit LSPs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>address</b>—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is <b>loose</b>. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.</p> <p><b>Default:</b> If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.</p> <p><b>hostname</b>—See <b>address</b>.</p> <p><b>Default:</b> If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.</p> <p><b>loose</b>—(Optional) Indicate that the next address in the <b>path</b> statement is a loose link. This means that the LSP can traverse through other routers before reaching this router.</p> <p><b>Default:</b> <b>strict</b></p> <p><b>path-name</b>—Name that identifies the sequence of nodes that form an LSP. The name can contain up to 32 characters and can include letters, digits, periods, and hyphens. To include other characters or use a longer name, enclose the name in quotation marks. The name must be unique within the ingress router.</p> <p><b>strict</b>—(Optional) Indicate that the LSP must go to the next address specified in the <b>path</b> statement without traversing other nodes. This is the default.</p> |

| <b>Description</b>              | <p>Allocate a unique label for each prefix. The <b>per-prefix-label</b> statement helps minimize packet loss in most deployments.</p> <p>Although allocating a label for each prefix is not generally ideal for scaling, it is assumed that a small number of labels are used for BGP labeled-unicast. When labeled BGP is used to set up transport label-switched paths (LSPs), the common case is that each prefix has a unique next hop. Thus, the use of per-prefix labels does not have an adverse scaling impact. On the contrary, the use of per-prefix labels reduces churn in the network when multipath load balancing is enabled for IPv4 labeled-unicast, and a subset of the paths are withdrawn for some reason.</p> <p>The advantage of per-prefix labeling is that the advertised upstream label is more stable during network changes. That is, if the downstream label changes, the advertised upstream label remains the same under most scenarios. This way, the upstream router is isolated from the downstream network change, and the overall network is more stable. The greater stability of the advertised upstream label helps to reduce traffic loss during many different network change scenarios.</p> |
| <b>Default</b>                  | By default, label allocation is per next-hop router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## policing (Protocols MPLS)

---

**Syntax**     policing {  
                 filter *filter-name*;  
                 no-auto-policing;  
                 }

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name*],  
[edit logical-systems *logical-system-name* protocols mpls static-label-switched-path *lsp-name* ingress],  
[edit protocols mpls label-switched-path *lsp-name*],  
[edit protocols mpls static-label-switched-path *lsp-name* ingress]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Specify the policing filter for the LSP.

**Options**     filter *filter-name*—Specify the name of the policing filter.  
  
                 no-auto-policing—Disable automatic policing on this LSP.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Preference for the route.</p> <p>You can optionally configure multiple LSPs between the same pair of ingress and egress routers. This is useful for balancing the load among the LSPs because all LSPs, by default, have the same preference level. To prefer one LSP over another, set different preference levels for individual LSPs. The LSP with the lowest preference value is used. The default preference for LSPs is lower (more preferred) than all learned routes except direct interface routes.</p>                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>preference</b>—Preference to assign to the route. | <b>Description</b>              | Configure the setup priority and reservation priority for an LSP. If insufficient link bandwidth is available during session establishment, the setup priority is compared with other setup priorities for established sessions on the link to determine whether some of them should be preempted to accommodate the new session. Sessions with lower hold priorities are preempted.                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b><i>reservation-priority</i></b>—Reservation priority, used to keep a reservation after it has been set up. A smaller number has a higher priority. The priority must be greater than or equal to the setup priority to prevent preemption loops.</p> <p><b>Range:</b> 0 through 7, where 0 is the highest and 7 is the lowest priority.</p> <p><b>Default:</b> 0 (Once the session is set up, no other session can preempt it.)</p> <p><b><i>setup-priority</i></b>—Setup priority.</p> <p><b>Range:</b> 0 through 7, where 0 is the highest and 7 is the lowest priority.</p> <p><b>Default:</b> 7 (The session cannot preempt any existing sessions.)</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Specify whether an LSP should actively record the routes in the path. Recording routes requires that all transit routers support the RSVP Record Route object. Recording routes can be useful for diagnostics and loop detection.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | Record routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>BFD behavior modified in Junos OS Release 9.0.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Specify the amount of time (in seconds) that an LSP must wait before traffic reverts to a primary path. If during this time the primary path experiences any connectivity problem or stability problem, the timer is restarted.</p> <p>If you have configured BFD on the LSP, the Junos OS waits until the BFD session is restored before starting the revert timer counter.</p> <p>If you have configured a value of 0 seconds for the <b>revert-timer</b> statement and traffic is switched to the secondary path, the traffic remains on that path indefinitely. It is never switched back to the primary path unless you intervene.</p> |
| <b>Options</b>                  | <p><b>seconds</b>—Time in seconds.</p> <p><b>Range:</b> 0 through 65,535 seconds</p> <p><b>Default:</b> 60 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Enable you to control whether a reverse path forwarding (RPF) check is performed for a source and group entry before installing a route in the multicast forwarding cache. This makes it possible to use point-to-multipoint LSPs to distribute multicast traffic to Protocol Independent Multicast (PIM) islands situated downstream from the egress routers of the point-to-multipoint LSPs. |
| <b>Options</b>                  | <i>policy</i> —Name of the RPF check routing policy.                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations. The more time you configure, the more time a source node (ingress of an RSVP LSP) can have to learn about the failures of its LSP by monitoring PathErr messages transmitted from downstream nodes.</p> <p>Information from the PathErr messages is incorporated into subsequent LSP computations, which can improve the accuracy and speed of LSP setup. Some PathErr messages are also used to update traffic engineering database bandwidth information, reducing inconsistencies between the database and the network.</p> |

| Release Information      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description              | <p>Specify one or more secondary paths to use for the LSP. You can configure more than one secondary path. All secondary paths are equal, and the first one that is available is chosen.</p> <p>You can specify secondary paths even if you have not specified any primary paths.</p> <p>Optionally, you can specify preference, CoS, and bandwidth values for the secondary path, which override any equivalent values that you configure for the LSP (at the [edit mpls label-switched-path] hierarchy level).</p>                                                                                                        |
| Options                  | <p><b><i>path-name</i></b>—Name of a path that you created with the <b>path</b> statement.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | <p>Enable the smart optimization timer. When you enable the smart optimization timer on a router, the Junos OS operates on the assumption that the original LSP path is preferable to any alternate or secondary path. When you enable the smart optimization timer and an LSP fails and its traffic is switched to an alternate path, the smart optimization timer starts and waits 3 minutes (this time is configurable). After 3 minutes have passed, the LSP is switched back to the original path. If the original path fails again and the LSP is switched to an alternate path again, the router waits 1 hour before attempting to switch the LSP back to its original path.</p> <p>If you want to disable the smart optimizer, you can set it to zero. The <b>smart-optimize-timer</b> value in seconds indicates the time before which the LSP is switched back to its primary path in case the primary path becomes available. Otherwise, the time to wait is controlled by the <b>optimize-timer</b>, which is usually set to a high value. Some ISPs have the <b>optimize-timer</b> set to once a day. Sometimes after the smart optimizer causes the LSP to be placed back on its primary path, the primary path goes down again within 60 minutes. When this happens, the <b>smart-optimize-timer</b> is disabled automatically, and the <b>optimize-timer</b> (regular path optimization) goes into effect. This is to protect against a flapping link being used.</p> |
| <b>Default</b>                  | The smart optimization timer is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>seconds</b>—(Optional) Specify the number of seconds to wait before switching an LSP back to its original path. If you do not specify the number of seconds, the default value is used.</p> <p><b>Range:</b> 0 through 65,535 seconds</p> <p><b>Default:</b> 180 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>         | Perform splitting and merging.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>maximum-member-lsps <i>number</i></b>—Number of label-switched paths (LSPs) that a container LSP can have as member LSPs at maximum.</p> <p><b>Default:</b> 1</p> <p><b>maximum-signaling-bandwidth <i>bandwidth</i></b>—Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at maximum after normalization. When <b>maximum-signaling-bandwidth</b> is not configured, the value is derived from the <b>splitting-bandwidth</b>.</p> <p>When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the <b>splitting-bandwidth</b>.</p> <p><b>Default:</b> 1 bps</p> <p><b>merging-bandwidth <i>bandwidth</i></b>—Amount of bandwidth in bits per second (bps) that is used for merging during normalization.</p> <p><b>Default:</b> 1 bps</p> <p><b>minimum-member-lsps <i>number</i></b>—Number of LSPd that a container LSP can have as member LSPs at minimum.</p> <p><b>Default:</b> 64</p> <p><b>minimum-signaling-bandwidth <i>bandwidth</i></b>—Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at minimum after normalization. When <b>minimum-signaling-bandwidth</b> is not configured, the value is derived from the <b>merging-bandwidth</b>.</p> <p>When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the <b>merging-bandwidth</b>.</p> <p><b>Default:</b> 1 bps</p> |

**splitting-bandwidth *bandwidth***—Amount of bandwidth in bits per second (bps) that can be used for splitting during normalization.

**Default:** 1 bps

**splitting-merging-threshold *percent***—Percentage changes in aggregate bandwidth relevant for splitting and merging.

**Default:** 0%

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## srlg

---

**Syntax**

```
srlg {  
    srlg-name {  
        srlg-cost srlg-cost;  
        srlg-value srlg-value;  
    }  
}
```

**Hierarchy Level** [edit routing-options],  
[edit logical-systems *logical-system-name* routing-options]  
[edit protocols mpls interface *interface-name*]

**Release Information** Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Configure Shared Risk Link Group (SRLG) parameters.

**Options** **srlg-cost *srlg-cost***—Specify a cost for the SRLG ranging from 1 through 65535.  
**srlg-values *srlg-value***—Specify a Group ID for the SRLG ranging from 1 through 4294967295.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | Enable MPLS statistics collection and reporting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—(Optional) Name of the file to receive the output. We recommend that you place MPLS tracing output in the file <code>mpls-stat</code> in the <code>/var/log</code> directory.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <i>file</i> reaches its maximum size, it is renamed <i>file.0</i>, then <i>file.1</i>, and so on, until the maximum number of files is reached. Then, the oldest file is overwritten.</p> <p><b>Range:</b> 2 or more</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>interval <i>seconds</i></b>—Interval at which to periodically collect statistics.</p> <p><b>Range:</b> 1 through 65,535</p> <p><b>Default:</b> 300 seconds</p> <p><b>no-world-readable</b>—(Optional) Prevent users from reading the log file.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a file named <i>file</i> reaches this size, it is renamed <i>file.0</i>. When the <i>file</i> again reaches its maximum size, <i>file.0</i> is renamed <i>file.1</i> and <i>file</i> is renamed <i>file.0</i>. This renaming scheme continues until the maximum number of files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum file size, you also must specify a maximum number of files with the <b>files</b> option.</p> <p><b>world-readable</b>—(Optional) Enable users to read the log file.</p> <p><b>Syntax:</b> Syntax: <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB</p> <p><b>Range:</b> 10 KB through the maximum file size supported on your system</p> |

**Default:** 1 MB

**traffic-class-statistics**—(Optional) Create counters that maintain data traffic statistics per traffic class at the ingress of all types of LSPs and egress of ultimate hop popping (UHP) point-to-point LSPs. These counters are not created by default and are required to be configured to perform traffic-class-scoped loss measurement.

**transit-statistics-polling**—(Optional) Enable the polling and display of MPLS statistics for LSPs transiting the router. By default, RSVP does not periodically poll for transit LSP statistics. You cannot configure this statement and the **no-transit-statistics** statement at the same time.

The remaining statements are explained separately.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

| <b>Description</b>              | <p>(MX Series routers only) Enable you to switch an LSP away from a network node using a bypass LSP. This feature could be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic. Configure this statement only after you have configured and committed the <b>always-mark-connection-protection-tlv</b> statement.</p> <p>The <b>always-mark-connection-protection-tlv</b> statement marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. When you configure the <b>switch-away-lsps</b> statement, traffic is switched to the bypass LSP.</p> |

| <b>Description</b>              | <p>When you have a primary and a secondary path configuration, specify that a path needs to be signaled with the active-path bandwidth when the auto-bandwidth adjustment happens and that the secondary path synchronizes the bandwidth reservations to that of the primary path.</p> <p>When a primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. If you include the <b>sync-active-path-bandwidth</b> statement, the secondary path releases the bandwidth it has reserved and adjusts its bandwidth after the primary path begins carrying traffic.</p> <p>For example, suppose the active path is a secondary path with a reserved bandwidth of 10 GB as a result of the automatic bandwidth adjustment. Then suppose there is a switchover from the secondary path to the primary path. After some time the primary path reserves 5 GB as a result of a new automatic adjustment. Without the <b>sync-active-path-bandwidth</b> statement, the secondary path does not release the 10 GB after a switchover occurs. That bandwidth is wasted. If the <b>sync-active-path-bandwidth</b> is included in the configuration, the secondary path adjusts its bandwidth to 5 GB along with the primary path.</p> |
| <b>Default</b>                  | When you have a primary and a secondary path configuration, and the primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. When the primary path comes back and the traffic switches over, the secondary path does not release its bandwidth reservations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | Specify the traffic engineering class matrix for a multiclass LSP or a DiffServ-aware traffic engineering LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>                  | <p>The default traffic engineering class matrix is:</p> <pre>te-class-matrix {   te0 traffic-class ct0 priority 7;   te1 traffic-class ct1 priority 7;   te2 traffic-class ct2 priority 7;   te3 traffic-class ct3 priority 7;   te4 traffic-class ct0 priority 0;   te5 traffic-class ct1 priority 0;   te6 traffic-class ct2 priority 0;   te7 traffic-class ct3 priority 0; }</pre> <p>If you define any of the traffic engineering classes, all the default values are dropped.</p>                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>ctnumber</b>—Specify the number of the class type. It can be one of four values: <b>ct0</b>, <b>ct1</b>, <b>ct2</b>, or <b>ct3</b>.</p> <p><b>priority <i>priority</i></b>—Specify the priority of the class type. It can be one of eight values from 0 through 7.</p> <p><b>tenumber</b>—Specify the number of the traffic engineering class. It can be one of eight values: <b>te0</b>, <b>te1</b>, <b>te2</b>, <b>te3</b>, <b>te4</b>, <b>te5</b>, <b>te6</b>, or <b>te7</b>. You must configure the traffic engineering classes in order, starting with <b>te0</b>.</p> <p><b>traffic-class</b>—Specify the traffic class for the traffic engineering class.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>         | Configure MPLS tracing options at the protocol level or for a label-switched path.<br><br>To specify more than one tracing operation, include multiple <b>flag</b> statements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>             | The default MPLS protocol-level tracing options are inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>filename</b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <b>/var/log</b>. We recommend that you place MPLS tracing output in the file <b>mpls-log</b>.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>MPLS Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations</li><li>• <b>autobw-state</b>—Automatic bandwidth events.</li><li>• <b>connection</b>—All circuit cross-connect (CCC) activity</li><li>• <b>connection-detail</b>—Detailed CCC activity</li></ul> |

- **cspf**—CSPF computations
- **cspf-link**—Links visited during CSPF computations
- **cspf-node**—Nodes visited during CSPF computations
- **error**—MPLS error packets
- **graceful-restart**—Trace MPLS graceful restart events
- **lsp-history**—Trace LSP history events
- **lsping**—Trace lsping packets and return codes
- **nsr-synchronization**—Trace NSR synchronization events
- **nsr-synchronization-detail**—Trace NSR synchronization events in detail
- **state**—All LSP state transitions
- **static**—Trace static label-switched path
- **ted-export**—Trace leaking of entries from **lsdist.0** table into the traffic engineering database
- **ted-import**—Trace leaking traffic engineering database entries into the **lsdist.0** table
- **timer**—Timer usage

**no-world-readable**—(Optional) Allow only certain users to read the log file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | <p>Configure traffic class specific options.</p> <p>Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the <i>tc-all tc-0 tc-1 tc-2 tc-3 tc-4 tc-5 tc-6 tc-7 tc-none</i> traffic-class values. For each traffic class, you can configure the respective parameters.</p> <p>To enable traffic-class parameters, configure the <b>traffic-class-statistics</b> configuration statement under the <b>[edit protocol mpls statistic]</b> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>average-sample-size <i>sample size</i></b>—(Optional) Specify the number of samples used for calculating the average of various metrics.</p> <p><b>Default:</b> 5</p> <p><b>Range:</b> 1 through 30</p> <p><b>padding-size <i>size</i></b>—(Optional) Specify the delay-measurement message length, which is used to calculate the delay experienced by messages of different sizes.</p> <p><b>Default:</b> 0</p> <p><b>Range:</b> 1 through 1500</p> <p><b>query-interval <i>milliseconds</i></b>—Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.</p> <p><b>Default:</b> 10 seconds</p> <p><b>Range:</b> 1000 through 4294967295 milliseconds</p> <p><b>rtt-delay-threshold <i>rtt threshold value</i></b>—Specify the round-trip delay threshold value.</p> <p><b>Range:</b> 1 through 4294967295 microseconds</p> <p><b>twcd-delay-threshold <i>twcd threshold value</i></b>—Specify the two-way channel delay threshold value.</p> <p><b>Range:</b> 1 through 4294967295 microseconds</p> |

| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | <p>Configure traffic class specific options.</p> <p>Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the <i>tc-all tc-0 tc-1 tc-2 tc-3 tc-4 tc-5 tc-6 tc-7 tc-none</i> traffic-class values. For each traffic class, you can configure the respective parameters.</p> <p>To enable traffic-class parameters, configure the <b>traffic-class-statistics</b> configuration statement under the <b>[edit protocol mpls statistic]</b> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>average-sample-size</b> <i>sample size</i>—(Optional) Specify the number of samples used for calculating the average of various metrics.<br/> <b>Default:</b> 5<br/> <b>Range:</b> 1 through 30</p> <p><b>loss-threshold</b> <i>loss threshold value</i>—Specify the threshold value that will be used with <b>loss-threshold-window</b> to calculate loss within specified window size.<br/> <b>Range:</b> 1 through 4294967295</p> <p><b>loss-threshold-window</b> <i>number of samples for loss threshold</i>—Specify the number of samples used for loss threshold calculation.<br/> <b>Range:</b> 1 through 30</p> <p><b>measurement-quantity</b> <i>bytes packets</i>—(Optional) Specify whether packet or byte loss is being measured at the querier.<br/> <b>Default:</b> packets</p> <p><b>padding-size</b> <i>size</i>—(Optional) Specify the delay-measurement message length, which is used to calculate the delay experienced by messages of different sizes.</p> |

**Default:** 0

**Range:** 1 through 1500

**query-interval *milliseconds***—Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.

**Default:** 10 seconds

**Range:** 1000 through 4294967295 milliseconds

**rtt-delay-threshold *rtt threshold value***—Specify the round-trip delay threshold value.

**Range:** 1 through 4294967295 microseconds

**twcd-delay-threshold *twcd threshold value***—Specify the two-way channel delay threshold value.

**Range:** 1 through 4294967295 microseconds

| <b>Description</b>              | Select whether MPLS performs traffic engineering on BGP destinations only or on both BGP and IGP destinations. Affects only LSPs originating from this routing device, not transit or egress LSPs.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Default</b>                  | bgp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <b>bgp</b> —On BGP destinations only. Ingress routes are installed in the inet.3 routing table.<br><br><b>bgp-igp</b> —On both BGP and IGP destinations. Ingress routes are installed in the inet.0 routing table. If IGP shortcuts are enabled, the shortcut routes are automatically installed in the inet.0 routing table.<br><br><b>bgp-igp-both-ribs</b> —On both BGP and IGP destinations. Ingress routes are installed in the inet.0 and inet.3 routing tables. This option is used to support VPNs.<br><br><b>mpls-forwarding</b> —On both BGP and IGP destinations. Use ingress routes for forwarding only, not for routing. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Enable traffic engineering address family. This generates a multiprotocol address family indicator (AFI) and a subsequent address family identifier (SAFI) to be negotiated with the BGP peers.</p> <p>The BGP network layer reachability information (NLRI) information is exchanged between the peers only when the traffic engineering AFI and SAFI are shared between them. If the peers do not agree on the use of the AFI and SAFI, the connection between the peers is terminated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.</p> <p>Be aware of the following platform requirements and restrictions:</p> <ul style="list-style-type: none"> <li>• UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.</li> <li>• UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.</li> <li>• UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.</li> <li>• UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.</li> <li>• UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the <i>no-tunnel-services</i> statement at the [edit routing-instances <i>routing-instance-name</i> protocols vpls] hierarchy level.</li> </ul> |
| <b>Default</b>                  | Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Control the use of RSVP aggregate messages on an interface or peer interface, as described below.</p> <p>Note that starting in Junos OS Release 15.2, this statement has been deprecated at the [edit protocols rsvp interface <i>interface-name</i>] and [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i>] hierarchy levels for MX Series and PTX Series routers.</p> <ul style="list-style-type: none"><li>• <b>aggregate</b>—Use RSVP aggregate messages.</li><li>• <b>no-aggregate</b>—Do not use RSVP aggregate messages.</li></ul> <p>Aggregate messages can pack multiple RSVP messages into a single transmission, thereby reducing network overhead and enhancing efficiency. The number of supportable sessions and processing overhead are significantly improved when aggregation is enabled.</p> <p>Not all routers connected to a subnet need to support aggregation simultaneously. Each RSVP router negotiates its intention to use aggregate messages on a per-neighbor basis. Only when both routers agree are aggregate messages sent.</p> <p>To have refresh reduction and reliable delivery, you must include the <b>aggregate</b> and <b>reliable</b> statements.</p> |
| <b>Default</b>                  | Aggregation is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Authentication key (password). Neighboring routers use the password to verify the authenticity of packets sent from this interface or peer interface. To authenticate node hellos or remote messages between the Point of Local Repair (PLR) to the Merge Point (MP), enable <b>authentication-key</b> at the [edit protocols rsvp] hierarchy level.</p> <p>RSVP uses HMAC-MD5 authentication, which is defined in RFC 2104, <i>HMAC: Keyed-Hashing for Message Authentication</i>.</p> <p>All routers that are connected to the same IP subnet must use the same authentication scheme and password.</p> |
| <b>Options</b>                  | <b>key</b> —Authentication password. It can be 1 through 16 contiguous digits or letters. Separate decimal digits with periods. Separate hexadecimal digits with periods and precede the string with 0x. If you include spaces in the password, enclose the entire password in quotation marks (" ").                                                                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>For certain logical interfaces (such as Asynchronous Transfer Mode [ATM], Permanent Virtual Circuit [PVC], or Frame Relay), you cannot determine the correct bandwidth from the hardware. This statement enables you to specify the actual available bandwidth.</p> <p>This statement also enables you to specify the bandwidth for a bypass label switched path (LSP). If you have configured multiple bypasses, this statement is mandatory and is applied to all of the bypass LSPs.</p>                                                                                                                                                                                                                             |
| <b>Default</b>                  | The hardware raw bandwidth is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><b><i>bps</i></b>—Bandwidth in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations <b>k</b> (for a thousand), <b>m</b> (for a million), or <b>g</b> (for a billion [also called a thousand million]).</p> <p><b>Range:</b> Any positive integer</p> <p><b>Default:</b> 0 (no bandwidth is reserved)</p>                                                                                                                                                                                                                                                                                                                               |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>              | <p>Enables you to configure specific bandwidth and path constraints for a bypass LSP. It is possible to individually configure multiple bypass LSPs. If you do not configure the bypass LSPs individually, they all share the same path and bandwidth constraints.</p> <p>If you specify the <b>bandwidth</b>, <b>hop-limit</b>, and <b>path</b> statements for the bypass LSP, these values take precedence over the values configured at the [edit protocols rsvp interface <i>interface-name</i> link-protection] hierarchy level. The other attributes (<b>subscription</b>, <b>no-node-protection</b>, and <b>optimize-timer</b>) are inherited from the general constraints.</p>                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>bypass-name</b>—(Required) Specify a name for the bypass LSP. The name can be up to 64 characters.</p> <p><b>description</b>—Provides a textual description of the bypass LSP. Enclose any descriptive text that includes spaces in quotation marks (" "). Any descriptive text you include is displayed in the output of the <b>show mpls lsp bypass detail</b> command and has no effect on the operation of the bypass LSP. The description text can be no more than 80 characters in length.</p> <p><b>to address</b>—(Required) Specify the address for the interface of the immediate next-hop node (for link protection) or the next-next-hop node (for node-link protection). The address specified determines whether this is a link protection bypass or a node-link protection bypass. On multiaccess networks (for example, a LAN), this address is also used to specify which next-hop node is being protected.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Class-of-service (CoS) value given to all packets in the bypass LSP. You can specify a single CoS value for all the bypass LSPs traversing an interface. You can also configure CoS values for specific bypass LSPs traversing an interface.</p> <p>The CoS value might affect the scheduling or queuing algorithm of traffic traveling along an LSP.</p>                                                                                                     |
| <b>Options</b>                  | <p><b><i>cos-value</i></b>—CoS value. A higher value typically corresponds to a higher level of service.</p> <p><b>Range:</b> 0 through 7</p> <p><b>Default:</b> If you do not specify a CoS value, the IP precedence bits from the packet's IP header are used as the packet's CoS value.</p>                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.1.                                                                                                                                                                                        |
| <b>Description</b>              | Specifies one of the virtual tunnel (VT) interfaces to de-encapsulate the egress traffic for ultimate-hop popping on point-to-multipoint LSPs. If no device is specified, the selection process is performed automatically.          |
| <b>Default</b>                  | The device selection process is performed automatically if no device is configured. Junos OS selects one of the available VT interfaces to de-encapsulate the egress traffic.                                                        |
| <b>Options</b>                  | <b><i>device-names</i></b> —Specify which VT interfaces are used to handle the RSVP traffic.<br><b>Range:</b> 0 to 8 devices                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                           |
| <b>Description</b>              | Enable hello messages from nonsession neighbors to be acknowledged with a hello acknowledgment message. Once hello acknowledgments are enabled, the router continues to acknowledge hello messages from any nonsession RSVP neighbors unless the interface itself goes down or the configuration is changed by an administrator. |
| <b>Default</b>                  | Hello acknowledgments are disabled.                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Specify the maximum number of routers that an LSP can traverse. This limit can be applied to any of the following:</p> <ul style="list-style-type: none"> <li>• LSPs—The configured hop limit includes the ingress and egress routers. You can specify a hop limit for an LSP and for both primary and secondary paths.</li> <li>• Fast reroute detour—Specify the number of additional routers a fast reroute detour can traverse relative to the protected LSP. For example, if an LSP traverses 4 routers, any detour for the LSP can be no more than 10 router hops, including the ingress and egress routers.</li> <li>• Link protection bypass—Specify the maximum number of routers that a link protection bypass can traverse.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b><i>number</i></b>—Maximum number of hops.</p> <p><b>Range:</b> 2 through 255 (for an LSP or for a link protection bypass); 0 through 255 (for fast reroute)</p> <p><b>Default:</b> 255 (for an LSP or for a link protection bypass); 6 (for fast reroute)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | <p>Set the keep multiplier value.</p> <p>Starting in Junos OS Release 16.1, for MX Series routers and PTX Series routers, the default RSVP message refresh time, to which this multiplier is applied, has increased from 30 seconds to 20 minutes. The higher message refresh time provides support for RSVP Refresh Reduction Extensions, and improved scaling for MPLS traffic-engineered LSPs, as defined in RFC 2961. The changes are backward compatible so if any nodes in the two-hop neighborhood do not support the higher refresh time, the updated node will automatically fall back to the previous default refresh time to prevent error or tear down messages.</p> |
| <b>Options</b>                  | <p><i>number</i>—Multiplier value.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 3</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                                 | <div> <b>NOTE:</b> For MX Series routers and PTX Series routers (running Junos OS release 16.1 or later), this multiplier is applied to a default refresh time of 20 minutes. In earlier Junos OS releases, and for other platforms, the default refresh time remains 30 seconds.</div>                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Specify the LSP template. An LSP template is used as the basis for other dynamically generated LSPs. This feature can be used for a number of applications, including point-to-multipoint LSPs, flooding VPLS traffic, configuring ingress replication for IP multicast using MBGP MVPNs, and to enable RSVP automatic mesh. There is no default setting for the <b>label-switched-path-template</b> statement, so you must configure either the default-template using the <b>default-template</b> option, or you must specify the name of your preconfigured LSP template.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>         | Enable link protection on the specified interface. Using link protection, you can configure a network to reroute traffic quickly around broken links. To fully enable link protection, you also need to configure the <b>link-protection</b> statement at the [edit protocols mpls label-switched-path <i>lsp-name</i> ] hierarchy level. You can configure single or multiple bypasses for protected interface.                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>             | Link protection is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Options**    **no-node-protection**—Disable node-link protection on the RSVP interface. Link protection remains active. When this option is configured, the router can only initiate a next-hop bypass, not a next-next-hop bypass.

The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                         routing-control—To add this statement to the configuration.

## load-balance (Protocols RSVP)

---

**Syntax**    load-balance {  
                 bandwidth;  
                 }

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols rsvp],  
                                 [edit protocols rsvp]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                                 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**    Load-balance traffic between RSVP LSPs.

**Options**    **bandwidth**—Load-balance traffic between RSVP LSPs based on the bandwidth configured for each LSP.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                         routing-control—To add this statement to the configuration.

| <b>Description</b>              | Specify the maximum number of dynamic bypass LSPs permitted for protecting this interface. When this option is configured, multiple bypasses for link protection are enabled. Call admission control (CAC) is also enabled. The limit on bypasses configured applies only to dynamically generated bypass LSPs. By default, this option is disabled and only one dynamic bypass LSP is enabled for each interface. If you configure <b>max-bypasses</b> , you must also configure the <b>bandwidth</b> statement. |
| <b>Options</b>                  | <b>number</b> —Configure the maximum number of bypass LSPs. If you configure a value of 0, no dynamic bypass LSPs are allowed to be established for the interface. Only static bypass LSPs can be configured.<br><b>Range:</b> 0 through 99<br><b>Default:</b> 1                                                                                                                                                                                                                                                  |

| <b>Release Information</b> | Statement introduced in Junos OS Release 10.4.                                                                          |
| <b>Description</b>         | Disable RSVP local revertive mode as specified in RFC 4090, <i>Fast Reroute Extensions to RSVP-TE for LSP Tunnels</i> . |

**NOTE:** For Junos OS Release 16.1 running on MX Series or PTX Series routers, **no-local-reversion** is enabled by default, that is, local reversion is not running, and the statement has been deprecated. To enable local reversion, use the **local-reversion** statement.

---

RSVP local revertive mode is supported on all Juniper Networks routers running Junos OS. It is the default behavior. If you include this statement, the Juniper Networks router uses global revertive mode instead. You might need to disable RSVP local revertive mode on Juniper Networks routers if your network includes equipment that does not support this mode.

The following information can also be found in RFC 4090. Refer to the RFC for additional information. When an LSP fails, the connection can be repaired locally using a traffic protection mechanism such as fast reroute. To restore the LSP to a full working path, RFC 4090 specifies the following strategies:

- Local revertive mode—Upon detecting that the path is restored, the point of local repair (PLR) resignals each of the LSPs that were formerly routed over the restored path. Every LSP successfully resingaled along the restored path is switched back.
- Global revertive mode—The ingress router of each tunnel is responsible for reoptimizing the LSPs that used the failed path. There are several potential reoptimization triggers: RSVP error messages, inspection of OSPF LSAs or IS-IS LSPs, and timers. This re-optimization process can proceed as soon as the failure is detected. It is not tied to the restoration of the failed path.

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Enable node-ID based RSVP hellos globally on all of the RSVP interfaces on the router to allow Juniper Networks routers to interoperate with the equipment of other vendors. By default, the Junos OS uses interface-based RSVP hellos; node-ID based RSVP hellos are disabled. If you have not enabled RSVP node IDs on the router, Junos OS does not accept any node-ID hello packets. |
| <div>  <p><b>NOTE:</b> For Junos OS Release 16.1 running on MX Series or PTX Series routers, when using enhanced FRR, node-ID based hellos are enabled by default. Disabling the enhanced fast reroute (FRR) profile by using the <a href="#">no-enhanced-frr-profile</a> command also disables the node-hello command. To re-enable node hellos after the enhanced FRR profile has been disabled, use the node-hello command.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                          |
| <div>  <p><b>NOTE:</b> If <a href="#">link-protection</a> is enabled, remote node hellos that are initiated by the Point of Local Repair (PLR) to Node Protecting Merge Point (NP-MP) are enabled automatically. Similarly, if no-enhanced-frr-profile is enabled (that is, enhanced FRR is off), remote node hellos are automatically disabled. There is no command to explicitly enable or disable remote-node hellos.</p> </div>     |                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | <p>Disable adjacency down notification for IS-IS to allow for migration from IS-IS to OSPF without disruption of the RSVP neighbors and associated RSVP-signaled label-switched paths (LSPs).</p> <p>Whenever IS-IS is deactivated, the IS-IS adjacencies are brought down. IS-IS signals to RSVP to bring down any RSVP neighbors associated with the IS-IS adjacencies, and this further causes the associated LSPs signaled by RSVP to go down as well.</p> <p>A similar process occurs whenever OSPF is deactivated. The OSPF neighbors are brought down. OSPF signals to RSVP to bring down any of the RSVP neighbors associated with the OSPF neighbors, and this further causes the associated LSPs signaled by RSVP to go down as well.</p> <p>If you need to migrate from IS-IS to OSPF or from OSPF to IS-IS, the internal gateway protocol (IGP) notification to RSVP for an adjacency or neighbor down event needs to be ignored. Using the <b>no-adjacency-down-notification</b> or <a href="#">no-neighbor-down-notification</a> statements, you can disable IS-IS adjacency down notification or OSPF neighbor down notification, respectively, until the migration is complete. The network administrator is responsible for configuring the statements before the migration, and then removing them from the configuration afterward, so that IGP notification can function normally.</p> |

## no-interface-hello

---

|                            |                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | no-interface-hello;                                                                                                    |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols rsvp],<br>[edit protocols rsvp]                             |
| <b>Release Information</b> | Statement introduced in Junos OS Release 10.0.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series. |
| <b>Description</b>         | Explicitly disable RSVP interface hellos globally on the router.                                                       |

**NOTE:** For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling RSVP interface hellos globally, the `no-interface-hello` command triggers a switch back to the previous profile for all label-switched paths (LSPs.)

---

This type of configuration might be necessary in networks where the Juniper Networks router has numerous RSVP connections with equipment from other vendors. However, if you disable RSVP interface hellos globally, you can also configure a hello interval on an RSVP interface using the [hello-interval](#) statement. This configuration disables RSVP interface hellos globally but enables RSVP interface hellos on the specified interface. This configuration might be necessary in a heterogeneous network where some devices support RSVP node-ID hellos and other devices support RSVP interface hellos.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.0.                                                                                                                                                        |
| <b>Description</b>              | Disable neighbor down notification for OSPF to allow for migration from OSPF to IS-IS without disruption of the RSVP neighbors and associated RSVP-signaled LSPs.                                    |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                  |

## no-node-id-subobject

|                            |                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | no-node-id-subobject;                                                                                                 |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> protocols rsvp],<br>[edit protocols rsvp]                            |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.4.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series. |
| <b>Description</b>         | Disable the record route object (RRO) node-ID subobject for compatibility with earlier versions of Junos OS.          |

**NOTE:** For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling the record route object (RRO) node ID sub-object, the **no-node-id-subobject** command triggers a switch back to the previous profile for all label-switched paths (LSPs).

To interoperate with other vendors' equipment, Junos OS supports the RRO node-ID subobject for use in inter-AS link and node protection configurations.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Reject Resv messages that include the S2L_SUB_LSP object. By default, Resv messages that include the S2L_SUB_LSP object are accepted. However, in a network which includes Juniper Networks devices running both Junos OS Release 9.2 and later and Junos OS Release 9.1 and earlier, it is necessary to configure the <b>no-p2mp-sublsp</b> statement on devices running Junos OS Release 9.2 and later to ensure that point-to-multipoint LSPs function properly. |
| <b>Default</b>                  | Resv messages that include the S2L_SUB_LSP object are accepted.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | Configure an optimize timer for a bypass LSP. The optimize timer initiates a periodic optimization process that reshuffles data LSPs among bypass LSPs to achieve the most efficient use of network resources. The optimization process attempts to either minimize the number of bypasses currently in use, minimize the total amount of bandwidth reserved for all bypasses, or both. |
| <b>Options</b>                  | <p><b><i>seconds</i></b>—Specify the number of seconds between optimizations.</p> <p><b>Range:</b> 0 through 65,535 seconds</p> <p><b>Default:</b> 0 (disabled)</p>                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                          |

| <b>Description</b>              | Configure an explicit path (a sequence of strict or loose routes) to control where and how a bypass LSP is established. If multiple bypasses are configured, they all will use the same explicit path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>                  | No path is configured. CSPF automatically calculates the path the bypass LSP takes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>address</b>—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is <b>loose</b>. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.</p> <p><b>Default:</b> If you do not specify any routers explicitly, no routing limitations are imposed on the bypass LSP.</p> <p><b>loose</b>—(Optional) The next address in the <b>path</b> statement is loose. The LSP can traverse other routers before reaching this router.</p> <p><b>Default:</b> <b>strict</b></p> <p><b>strict</b>—(Optional) The LSP must go to the next address specified in the <b>path</b> statement without traversing other nodes. This is the default.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Configure the amount of bandwidth subscribed to a class type (when you have enabled Differentiated Services) or bypass LSP (when you have enabled link protection).  
**subscription** is the percentage of the link bandwidth that can be used for the RSVP reservation process.

**Options** ***ctnumber percentage***—Percentage of the class-type bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type. You can specify bandwidth subscriptions for class types 0 through 3. This option is not available for bypass LSPs.

**Range:** 0 through 65,000

**Default:** 100 percent

***percentage***—Percentage of the class-type or bypass LSP bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type or bypass LSP.

**Range:** 0 through 65,000

**Default:** 100 percent

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | Enable RSVP-level trace options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>             | The default RSVP-level trace options are those inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>enhanced-frr</b> —(Optional) Enable this option to trace internal events and state changes related to the FRR facility protection enhancements associated with the increased RSVP scaling introduced in Junos OS Release 16.1.</p> <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place RSVP tracing output in the file <b>rsvp-log</b>.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"> <li><b>all</b>—All tracing operations</li> <li><b>error</b>—All detected error conditions</li> <li><b>event</b>—RSVP-related events</li> </ul> |

- **io-event [detail] [disable]** —Enable tracing of events that occur within the RSVP I/O task; can only be configured for the master routing instance. The trace output is generally independent of routing instance.
- **io-packets [detail] [disable] [receive] [send]** —Enable tracing of messages as they are received from the network or as they are sent out. This flag can be configured independently for each routing instance. Both bundled and individual messages are identified. Use *detail* to show all objects contained in the message. Use *send* and *receive* to limit tracing to outgoing or incoming packets.
- **lmp**—RSVP-LMP interactions
- **packets**—All RSVP packets
- **path**—All path messages
- **pathtear**—PathTear messages
- **resv**—Resv messages
- **resvtear**—ResvTear messages
- **route**—Routing information
- **state**—Session state transitions, including when RSVP-signaled LSPs come up and go down.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-world-readable**—(Optional) Enable only certain users to read the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable any user to read the log file.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.1.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                 |
| <b>Description</b>              | Enable ultimate-hop popping on point-to-multipoint LSPs. The Junos OS selects one of the available virtual tunnel (VT) interfaces to de-encapsulate the egress traffic. By default, the selection process is performed automatically. |
| <b>Default</b>                  | Ultimate-hop popping is disabled.                                                                                                                                                                                                     |
| <b>Options</b>                  | <b>devices</b> <i>device-names</i> —Specify which VT interfaces are used to handle the RSVP traffic.<br><b>Range:</b> 0 to 8 devices                                                                                                  |

| <b>Description</b>              | <p>Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.</p> <p>Be aware of the following platform requirements and restrictions:</p> <ul style="list-style-type: none"> <li>• UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.</li> <li>• UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.</li> <li>• UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.</li> <li>• UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.</li> <li>• UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the <i>no-tunnel-services</i> statement at the [edit routing-instances <i>routing-instance-name</i> protocols vpls] hierarchy level.</li> </ul> |
| <b>Default</b>                  | Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information** Statement introduced in Junos OS Release 7.6.  
 Statement introduced for BGP in Junos OS Release 8.0.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.3.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure an authentication algorithm type.

**NOTE:** Keep the following points in mind when you configure the authentication algorithm in an IPsec proposal:

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, an error occurs and the tunnel is not established in this scenario. For example, if one end of the tunnel contains router 1 configured with the authentication algorithm as hmac-sha-256-128 and the other end of the tunnel contains router 2 configured with the authentication algorithm as hmac-md5-96, the VPN tunnel is not established.

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, and when one end of the tunnel contains two IPsec proposals to check whether a less secure algorithm is selected or not, an error occurs and the tunnel is not established. For example, if you configure two authentication algorithms for an IPsec proposal as `hmac-sha-256-128` and `hmac-md5-96` on one end of the tunnel, router 1, and if you configure the algorithm for an IPsec proposal as `hmac-md5-96` on the other end of the tunnel, router 2, the tunnel is not established and the number of proposals mismatch.
  - When you configure two IPsec proposals at both ends of a tunnel, such as the `authentication-algorithm hmac-sha-256-128` and `authentication-algorithm hmac-md5-96` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 1 (with the algorithms in two successive statements to specify the order), and the `authentication-algorithm hmac-md5-96` and `authentication-algorithm hmac-sha-256-128` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 2 (with the algorithms in two successive statements to specify the order, which is the reverse order of router 1), the tunnel is established in this combination as expected because the number of proposals is the same on both ends and they contain the same set of algorithms. However, the authentication algorithm selected is `hmac-md5-96` and not the stronger algorithm of `hmac-sha-256-128`. This method of selection of the algorithm occurs because the first matching proposal is selected. Also, for a default proposal, regardless of whether the router supports the Advanced Encryption Standard (AES) encryption algorithm, the `3des-cbc` algorithm is chosen and not the `aes-cfb` algorithm, which is because of the first algorithm in the default proposal being selected. In the sample scenario described here, on router 2, if you reverse the order of the algorithm configuration in the proposal so that it is the same order as the one specified on router 1, `hmac-sha-256-128` is selected as the authentication method.
  - You must be aware of the order of proposals in an IPsec policy at the time of configuration if you want the matching of proposals to happen in a certain order of preference, such as the strongest algorithm to be considered first when a match is made when both policies from the two peers have a proposal.
-

- Options** *algorithm*—Specify one of the following types of authentication algorithms:
- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
  - **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
  - **md5**—Message digest 5.
- Default:** hmac-sha-1-96

**NOTE:** The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.
