| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Configure session parameters for LDP sessions established with the remote LFA node that are automatically targeted using the loopback addresses. Configure parameters of automatically targeted sessions for remote LFA only.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>maximum-sessions <i>seconds</i></b> —Specify the maximum number of auto-targeted LDP sessions allowed. Include this statement to optimize the use of router memory.<br/><b>Default:</b> 100<br/><b>Range:</b> 1 through 1000</p> <p><b>teardown-delay <i>seconds</i></b> —Specify the minimum time period for which the auto-targeted session must be alive before tearing down the auto-targeted LDP sessions to the remote LFA node. Include this statement to prevent rapid route-resolution in case of temporary change in IGP topology.<br/><b>Default:</b> 90 seconds<br/><b>Range:</b> 1 through 300 seconds</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | Enable LDP downstream on demand on the LDP session. LDP is widely deployed in downstream unsolicited advertisement mode. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between access and aggregation networks to minimize the workload for the access node (AN) control plane and to avoid the storage of tens of thousands of label bindings from upstream aggregation nodes. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Configure route and next-hop properties in the event of a BFD session failure event on an LDP LSP. The failure event could be an existing BFD session that has gone down or could be a BFD session that never came up. LDP adds back the route or next hop when the relevant BFD session comes back up.                                                                                                                            |
| <b>Options</b>                  | <p><b>remove-nexthop</b>—Remove a route corresponding to a next hop of the LSP's route at the ingress node when a BFD session failure event is detected.</p> <p><b>remove-route</b>—Remove the route corresponding to an LSP from the appropriate routing tables when a BFD session failure event is detected. If the LSP is configured with ECMP and a BFD session corresponding to any path goes down, the route is removed.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                     |

[edit protocols ldp oam]

**Release Information** Statement introduced in Junos OS Release 8.5.  
Statement introduced in Junos OS Release 12.2 for EX Series switches.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Allows you to configure BFD for a specific LDP forwarding equivalence class (FEC).

**Options** *fec-address*—Specify the FEC address.  
  
The other statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## graceful-restart (Protocols LDP)

|                            |                                                                                                                                                                                                                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre>graceful-restart {   disable;   helper-disable;   maximum-neighbor-recovery-time <i>value</i>;   reconnect-time <i>seconds</i>;   recovery-time <i>value</i>; }</pre>                                                                                                            |
| <b>Hierarchy Level</b>     | <pre>[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]</pre> |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>                                                                                                                                                  |
| <b>Description</b>         | Configure LDP graceful restart on the LDP master protocol instance or for a specific routing instance.                                                                                                                                                                                |

**NOTE:** When you alter the graceful restart configuration at either the [edit routing-options graceful-restart] or [edit protocols ldp graceful-restart] hierarchy levels, any running LDP session is automatically restarted to apply the graceful restart configuration. This behavior mirrors the behavior of BGP when you alter its graceful restart configuration.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 7.5.<br>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.                                                                                                                                                                                                |
| <b>Description</b>              | Cause OSPF to ignore the RSVP LSP metric.<br><br>Some other vendors use an OSPF metric of 1 for the loopback address. Juniper Networks routers use an OSPF metric of 0 for the loopback address. This can cause interoperability problems when you configure LDP tunneling over RSVP LSPs in heterogeneous networks. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                  |

| <b>Release Information</b> | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>         | Enable <b>mofrr-asm-starg</b> to include any-source multicast (ASM) for (*G) joins in the Multicast-only fast reroute (MoFRR).                                                                                                                                                                                                                                                                              |

**NOTE:** **mofrr-asm-starg** applies to IP-PIM only. When enabled for group G, \*G will undergo MoFRR as long as there is no S#,G for Group G. In other words, \*G MoFRR will cease and any old states will be torn down when S#,G is created. Note too, that **mofrr-asm-starg** is not supported for mLDP (since mLDP itself does not support \*G).

In a PIM domain with MoFRR enabled, the default for **stream-protection** is S,G routes only.

Context: Multicast-only fast reroute (MoFRR) can be used to reduce traffic loss in a multicast distribution tree in the event of link down. To employ MoFRR, a downstream router is configured with an alternative path back towards the source, over which it receives a backup live stream of the same multicast traffic. That router propagates the same (S,G) join toward both upstream neighbors in order to create duplicate multicast trees. If a failure is detected on the primary tree, the router switches to the backup tree to prevent packet loss.

| <b>Description</b>              | <p>When you configure multicast-only fast reroute (MoFRR) in a PIM domain, allow only a disjoint RPF (an RPF on a separate plane) to be selected as the backup RPF path.</p> <p>In a multipoint LDP MoFRR domain, the same label is shared between parallel links to the same upstream neighbor. This is not the case in a PIM domain, where each link forms a neighbor. The <b>mofrr-disjoint-upstream-only</b> statement does not allow a backup RPF path to be selected if the path goes to the same upstream neighbor as that of the primary RPF path. This ensures that MoFRR is triggered only on a topology that has multiple RPF upstream neighbors.</p> |

| <b>Description</b>              | <p>MoFRR is supported on both equal-cost multipath (ECMP) paths and non-ECMP paths. Unicast loop-free alternate (LFA) routes need to be enabled to support MoFRR on non-ECMP paths. LFA routes are enabled with the link-protection statement in the interior gateway protocol (IGP) configuration. When you enable link protection on an OSPF or IS-IS interface, Junos OS creates a backup LFA path to the primary next hop for all destination routes that traverse the protected interface.</p> <p>For Junos OS releases before 15.1R7, for both ECMP and Non-ECMP scenarios, the default MoFRR behavior was <i>sticky</i>, that is, if the Active link went down, the Active Path selection would give preference to Backup Path for the transition. The Active Path would not follow the unicast selected gateway</p> <p>Starting in Junos OS Release 15.1R7 however, the default behavior for non-EMCP scenarios is to be <i>nonsticky</i>, that is, the selection of Active Path strictly follows unicast selected gateway. MoFRR no longer chooses a unicast LFA path to become the MoFRR Active path; only a unicast LFA path can be selected to become MoFRR Backup.</p> |
| <b>Default</b>                  | By default, the backup path gets promoted to be the primary path when MoFRR is configured in a PIM domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols *ldp*]  
[edit protocols *ldp*]

**Release Information** Statement introduced in Junos OS Release 7.6.  
***lsp-ping-interval*** option introduced in Junos OS Release 9.4.

**Description** Configure Operation, Administration, and Maintenance (OAM) and Bidirectional Forwarding Detection (BFD) protocol for LDP.

**Options** ***fec fec-address***—Specify the forwarding equivalence class (FEC) address. You must either specify a FEC address or configure an OAM ingress policy to ensure that the BFD session comes up.

**lsp-ping-interval *seconds***—Specify the duration of the LSP ping interval in seconds. To issue a ping on an LDP-signaled LSP, use the **ping mpls ldp** command.

**Default:** 60 seconds

**Range:** 30 through 3,600 seconds

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## p2mp (Protocols LDP)

**Syntax** p2mp{  
    root-address *root-address*{  
        lsp-id *id*;  
    }

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],  
[edit protocols ldp],  
[edit routing-instances *routing-instance-name* protocols ldp]

**Release Information** Statement introduced in Junos OS Release 11.2.

**Description** Enable point-to-multipoint MPLS LSPs in an LDP-signaled LSP.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>         | <p>When you configure multicast-only fast reroute (MoFRR), apply a routing policy that filters for a restricted set of multicast streams to be affected by your MoFRR configuration. You can apply filters that are based on source or group addresses.</p>                                                                                                                                                 |

For example:

```

routing-options {
  multicast {
    stream-protection {
      policy mofrr-select;
    }
  }
}
policy-statement mofrr-select {
  term A {
    from {
      source-address-filter 225.1.1.1/32 exact;;
    }
    then {
      accept;
    }
  }
  term B {
    from {
      source-address-filter 226.0.0.0/8 orlonger;
    }
    then {
      accept;
    }
  }
  term C {
    from {
      source-address-filter 227.1.1.0/24 orlonger;
      source-address-filter 227.4.1.0/24 orlonger;
      source-address-filter 227.16.1.0/24 orlonger;
    }
    then {
      accept;
    }
  }
  term D {
    from {

```

```

        source-address-filter 227.1.1.1/32 exact
      }
    then {
      reject; #MoFRR disabled
    }
  }
  term E {
    from {
      route-filter 227.1.1.0/24 orlonger;
    }
    then accept;
  }
  ...
}

```

| <b>Description</b>              | <p>Multipoint LDP (M-LDP) in-band signaling enables you to carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.</p> <p>On the egress nodes of the point-to-multipoint LSP, specify an M-LDP join translation filter policy where PIM messages are translated into M-LDP FEC bindings. The policy statement is needed when internal BGP (IBGP) is not available in the core site or to override IBGP-based LSP root detection.</p> <p>The filter policy is configured at the <b>[edit policy-options]</b> hierarchy level. The policy generally specifies one or more source-address filters and the point-to-multipoint LDP root IP address using the <b>p2mp-lsp-root</b> policy action.</p> |
| <b>Options</b>                  | <i>policy-name</i> —Name of a policy configured at the <b>[edit policy-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Enable multicast-only fast reroute (MoFRR) on a routing device. MoFRR minimizes packet loss in a network when there is a link failure.                                                                                                                                                                                                   |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                           |

| <b>Description</b>         | Specify LDP protocol-level trace options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>             | The default LDP protocol-level trace options are inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>ldp-log</b>. We recommend that you place LDP tracing output in the file <b>ldp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"> <li>• <b>address</b>—Operation of address and address withdrawal messages</li> <li>• <b>binding</b>—Label-binding operations</li> <li>• <b>error</b>—Error conditions</li> <li>• <b>event</b>—Protocol events</li> </ul> |

- **initialization**—Operation of initialization messages
- **label**—Operation of label request, label map, label withdrawal, and label release messages
- **notification**—Operation of notification messages
- **nsr-synchronization**— Nonstop active routing synchronization events
- **p2mp-nsr-synchronization**—Point-to-multipoint nonstop active routing synchronization events
- **packets**—Equivalent to setting **address**, **initialization**, **label**, **notification**, and **periodic** flags (see also the **filter** flag modifier)
- **path**—Label-switched path operations
- **periodic**—Operation of hello and keepalive messages
- **route**—Operation of route messages
- **state**—Protocol state transitions

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable this trace flag.
- **filter**—Filter to apply to this flag. The **filter** flag modifier can be applied only to the **route**, **path**, and **binding** flags. This flag modifier has the following options:
  - **match-on**—Match on argument specified. The **match-on** option has the following suboptions:
    - **address**—Filter based on the source and destination addresses of packets. Available for the **packets** flag option only.
    - **fec**—Filter based on the FEC associated with the traced object.
    - **policy** *policy-name*—Specify the filter policy.
  - **receive**—Packets being received.
  - **send**—Packets being transmitted.

**no-world-readable**—(Optional) Prevent all users from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable any user to read the log file.

| <b>Description</b>         | LDP traffic statistics display the amount of traffic passed through a router for a particular FEC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the LDP statistics operation.<br/>Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of LDP statistics files. When a statistics file named <b><i>ldp-stat</i></b> reaches its maximum size, it is renamed <b><i>ldp-stat.0</i></b>, then <b><i>ldp-stat.1</i></b>, and so on, until the maximum number of LDP statistics files is reached. Then the oldest file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you also must include the <b>size</b> statement to specify the maximum file size.</p> <p><b>interval <i>seconds</i></b>—(Optional) Specify the interval at which the statistics are polled and written to the file.</p> <p><b>Default:</b> 300 seconds (5 minutes)</p> <p><b>no-penultimate-hop</b>—(Optional) Do not collect traffic statistics on the penultimate hop router.</p> <p><b>no-world-readable</b>—(Optional) Prevent all users from reading the log file.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each statistics file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a statistics file named <b><i>ldp-stat</i></b> reaches this size, it is renamed <b><i>ldp-stat.0</i></b>. When <b><i>ldp-stat</i></b> again reaches this size, <b><i>ldp-stat.0</i></b> is renamed <b><i>ldp-stat.1</i></b> and <b><i>ldp-stat</i></b> is renamed <b><i>ldp-stat.0</i></b>. This renaming scheme continues until the maximum number of statistics files is reached. Then the oldest statistics file is overwritten.</p> <p><b>Syntax:</b> <b><i>xk</i></b> to specify KB, <b><i>xm</i></b> to specify MB, or <b><i>xg</i></b> to specify GB</p> <p><b>Range:</b> 10 KB through the maximum file size supported on your system</p> |

**Default:** 1 MB

If you specify a maximum file size, you also must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable log file access for all users.

| <b>Description</b>              | Enables you to configure the IP address used to specify the TCP session for the LDP session. Routers must first establish a TCP session between one another before they can establish an LDP session. The TCP session enables the routers to exchange the label advertisements needed for the LDP session. To establish the TCP session, each router must learn the other router's transport address. The transport address is an IP address used to identify the TCP session over which the LDP session will run.                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>                  | <b>router-id</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <b>interface</b> —The first IP address on the interface is used as the transport address for any LDP sessions to neighbors that can be reached over that interface. You cannot specify the <b>interface</b> option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the <b>router-id</b> option.<br><br><b>router-id</b> —The router identifier is used as the transport address. Unless otherwise configured, the router identifier is the loopback address. |
| <b>Required Privilege Level</b> | <b>interface</b> —To view this statement in the configuration.<br><b>interface-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## connections (Circuits)

**Syntax**

```
connections {
  interface-switch connection-name {
    interface interface-name.unit-number;
  }
  lsp-switch connection-name {
    transmit-lsp label-switched-path;
    receive-lsp label-switched-path;
  }
  p2mp-receive-switch {
    output-interface [ interface-name.unit-number ];
    receive-p2mp-lsp receiving-point-to-multipoint-lsp;
  }
  p2mp-transmit-switch {
    input-interface interface-name.unit-number;
    transmit-p2mp-lsp transmitting-point-to-multipoint-lsp;
  }
  remote-interface-switch connection-name {
    interface interface-name.unit-number;
    receive-lsp label-switched-path;
    transmit-lsp label-switched-path;
  }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols],  
[edit protocols]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Define the connection between two circuits in a CCC connection.

**Options** The statements are explained separately.

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers ( <b>ethernet</b> , <b>vlan-ccc</b> , and <b>vlan-tcc</b> options only).<br>Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers. Only the <b>atm-ccc-cell-relay</b> and <b>atm-ccc-vc-mux</b> options are supported on ACX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>         | Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>atm-ccc-cell-relay</b>—Use ATM cell-relay encapsulation.</p> <p><b>atm-ccc-vc-mux</b>—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the <b>ccc</b> family only.</p> <p><b>atm-cisco-nlpid</b>—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-mlppp-llc</b>—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.</p> <p><b>atm-nlpid</b>—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-ppp-llc</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.</p> <p><b>atm-ppp-vc-mux</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.</p> <p><b>atm-snap</b>—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.</p> |

**atm-tcc-snap**—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

**atm-tcc-vc-mux**—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**atm-vc-mux**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the **inet** family only.

**ether-over-atm-llc**—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

**ether-vpls-over-atm-llc**—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**ether-vpls-over-fr**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

**NOTE:** The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

---

**ether-vpls-over-ppp**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

**ethernet**—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

**ethernet-ccc**—Use Ethernet CCC encapsulation on Ethernet interfaces.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

---

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ppp**—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the **ppp** family only.

**frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**gre-fragmentation**—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet's size exceeds the tunnel's maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

**multilink-frame-relay-end-to-end**—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**multilink-ppp**—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

**ppp-over-ether**—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

**ppp-over-ether-over-atm-llc**—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

**vxlan**—Use VXLAN data plane encapsulation for EVPN.

| <b>Description</b>         | Specify the physical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | <b>ppp</b> —Use serial PPP encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Options

**NOTE:** Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on the EX Series switches.

**atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.

**atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).

**cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:

- CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.
- TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

**cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.

**cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.

**ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.

**ethernet-ccc**—Use Ethernet CCC encapsulation on Ethernet interfaces that must accept packets carrying standard Tag Protocol ID (TPID) values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, CCC is not supported.

**ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDUs as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.

**ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

**ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the **ccc** family only.

**extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

**extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

**extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the **ccc** family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

**extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

**extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

**flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

**flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

**frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

**NOTE:** When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

---

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

**frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

**generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.

**multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.

**ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.

**vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

NOTE:

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
- Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure **family inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.

| <b>Description</b>              | Specify how long OSPF waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | Disable OSPF, an OSPF interface, or an OSPF virtual link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

By default, control packets sent to the remote end of a virtual link must be forwarded using the default topology. In addition, the transit area path consists only of links that are in the default topology. You can disable a virtual link for a configured topology, but not for a default topology. Include the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id* topology *name*]** hierarchy level.

**NOTE:** If you disable the virtual link by including the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id*]** hierarchy level, you disable the virtual link for all topologies, including the default topology. You cannot disable the virtual link only in the default topology.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.0.                                                                                                                                                                                             |
| <b>Description</b>              | Specify how long the Link Management Protocol (LMP) waits before declaring the control channel to be dead. This is an interval during which the router receives no LMP hello packets from the neighbor on a control that is active or up. |
| <b>Options</b>                  | <p><b><i>milliseconds</i></b>—Interval to wait before declaring the control channel to be dead.</p> <p><b>Range:</b> 500 through 300,000</p> <p><b>Default:</b> 500 milliseconds (three times the hello interval)</p>                     |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                       |

| <b>Description</b>              | Specify how often the routing device sends hello packets out the interface. The hello interval must be the same for all routing devices on a shared logical IP network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**NOTE:** You must configure LSA retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because Junos OS delays LSA acknowledgments by up to 2 seconds.

| Release Information | Statement introduced before Junos OS Release 7.4.<br>Support for <b>hello-packets</b> , <b>packets</b> , and <b>state</b> flags added in Junos OS Release 8.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description         | Trace options for the LMP protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all available operations</li><li>• <b>hello-packets</b>—Trace hello packets on any LMP control channel</li><li>• <b>init</b>—Output from the initialization messages</li><li>• <b>packets</b>—Trace all packets other than hello packets on any LMP control channel</li><li>• <b>parse</b>—Operation of the parser</li><li>• <b>process</b>—Operation of the general configuration</li><li>• <b>route-socket</b>—Operation of route socket events</li><li>• <b>routing</b>—Operation of the routing protocols</li><li>• <b>server</b>—Server processing operations</li><li>• <b>show</b>—<b>show</b> command servicing operations</li></ul> |

- **state**—Trace state transitions of the LMP control channels and traffic engineering links

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-world-readable**—(Optional) Prevent all users from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable log file access for all users.

## pcep

```

Syntax  pcep {
        message-rate-limit messages-per-minute;
        pce pce-id {
            delegation-cleanup-timeout seconds;
            delegation-priority priority-number;
            destination-ipv4-address ipv4-address;
            destination-port port-number;
            max-unknown-messages messages-per-minute;
            pce-group pce-group-name;
            pce-type {
                active stateful;
            }
            traceoptions {
                file filename <files number> <size size> <world-readable | no-world-readable>;
                flag (all | pcep);
                no-remote-trace;
            }
        }
        pce-group pce-group-id {
            delegation-cleanup-timeout seconds;
            max-unknown-messages messages-per-minute;
            pce-type {
                active stateful;
            }
            traceoptions {
                file filename <files number> <size size> <world-readable | no-world-readable>;
                flag (all | pcep);
                no-remote-trace;
            }
        }
        traceoptions {
            file filename <files number> <size size> <world-readable | no-world-readable>;
            flag flag;
            no-remote-trace;
        }
        update-rate-limit updates-per-minute;
    }

```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 12.3.  
Statement introduced in Junos OS Release 16.3R for QFX10000 switches.

**Description** Configure the Path Computation Client (PCC) parameters.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | Configure per-Path Computation Element (PCE) parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <p><b>pce-id</b>—IP address of the PCE.</p> <p><b>authentication-key</b> <i>key</i>—Authentication password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").</p> <p>It is recommended to define and bind an authentication key for securing a PCEP session, as opposed to binding an authentication keychain.</p> <p><b>authentication-key-chain</b> <i>key-chain</i>—Authentication keychain password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").</p> <p><b>local-address</b> <i>ip-address</i>—IP address of the local end of the PCEP session, the PCC.</p>                 |

**p2mp-lsp-report-capability**—Capability to report point-to-multipoint RSVP-TE LSPs to a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable reporting of point-to-multipoint LSPs to a PCE.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## pce-group (PCE)

---

**Syntax** `pce-group pce-group-name;`

**Hierarchy Level** [edit protocols pcep pce *pce-id*]

**Release Information** Statement introduced in Junos OS Release 12.3.  
Support for PTX Series added in Junos OS Release 14.2.  
Support for QFX10000 switches added in Junos OS Release 16.1R3.

**Description** Specify the Path Computation Element (PCE) group to which the configured PCE belongs.

**Options** *pce-group-name*—Name of the PCE group.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## pce-group (Protocols PCEP)

---

**Syntax**    `pce-group pce-group-id {  
                  delegation-cleanup-timeout seconds;  
                  max-unknown-messages messages-per-minute;  
                  pce-type {  
                    active stateful;  
                  }  
                  traceoptions {  
                    file filename <files number> <size size> <world-readable | no-world-readable>;  
                    flag (all | pcep);  
                    no-remote-trace;  
                  }  
                }`

**Hierarchy Level**    [edit protocols pcep]

**Release Information**    Statement introduced in Junos OS Release 12.3.  
                             Support for PTX Series added in Junos OS Release 14.2.  
                             Support for QFX10000 switches added in Junos OS Release 16.1R3.

**Description**    Configure the Path Computation Element (PCE) group parameters. A maximum of 10 PCE groups can be configured at any given point in time. The remaining statements are explained separately.

**NOTE:** A PCE group can include PCEs that are either only stateful or only active stateful. A combination of stateful PCEs and active stateful PCEs in one PCE group is not supported.

---

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                 routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the Path Computation Element Protocol (PCEP) tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b><i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <i>/var/log</i>.</p> <p><b><i>files number</i></b>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files. If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b><i>flag</i></b>—Area of path computation client process (pccd) to enable debugging output.</p> <ul style="list-style-type: none"><li>all—Trace all areas of PCD code.</li><li>pcep—Trace Path Computation Element Protocol (PCEP) operations.</li></ul> <p><b><i>no-remote-trace</i></b>—(Optional) Disable remote tracing options.</p> <p><b><i>no-world-readable</i></b>—(Optional) Allow only certain users to read the log file.</p> <p><b><i>size size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Syntax:</b> <i>xk</i> to specify KB, <i>xm</i> to specify MB, or <i>xg</i> to specify GB.</p> <p><b>Range:</b> 10 KB through the maximum file size supported on your system.</p> <p><b>Default:</b> 1 MB. If you specify a maximum file size, you must also include the <b>files</b> statement to specify the maximum number of files.</p> <p><b><i>world-readable</i></b>—(Optional) Allow any user to read the log file.</p> |
| <b>Required Privilege Level</b> | routing and trace—To view this statement in the configuration.<br>routing-control and trace-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>     | Configure the Path Computation Element Protocol (PCEP) tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>         | <p><b><i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <i>/var/log</i>.</p> <p><b><i>files number</i></b>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files. If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b><i>flag</i></b>—Area of path computation client process (pccd) to enable debugging output.</p> <p>PCEP Tracing Flags</p> <ul style="list-style-type: none"><li>• <b><i>all</i></b>—Trace all areas of PCCD code</li><li>• <b><i>pccd-config</i></b>—All configuration parsing operations</li><li>• <b><i>pccd-core</i></b>—PCCD core operations</li><li>• <b><i>pccd-functions</i></b>—PCCD function entries and outs</li><li>• <b><i>pccd-main</i></b>—PCCD main module</li><li>• <b><i>pccd-rpd</i></b>—PCCD communication with RPD</li><li>• <b><i>pccd-ui</i></b>—PCCD user interface handling</li></ul> <p><b><i>no-remote-trace</i></b>—(Optional) Disable remote tracing options.</p> <p><b><i>no-world-readable</i></b>—(Optional) Allow only certain users to read the log file.</p> <p><b><i>size size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches this size, it is renamed trace-file.0. When the trace-file again reaches this size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Syntax:</b> <i>xk</i> to specify KB, <i>xm</i> to specify MB, or <i>xg</i> to specify GB.</p> <p><b>Range:</b> 10 KB through the maximum file size supported on your system.</p> |

**Default:** 1 MB. If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## update-rate-limit

---

**Syntax** `update-rate-limit updates-per-minute;`

**Hierarchy Level** [edit protocols pcep]

**Release Information** Statement introduced in Junos OS Release 12.3.  
Support for PTX Series added in Junos OS Release 14.2.  
Support for QFX10000 switches added in Junos OS Release 16.1R3.

**Description** Specify the number of updates per minute that the Path Computation Client (PCC) can receive at maximum. Updates above this limit are ignored by the PCC.

**Options** ***updates-per-minute***—Number of updates per minute that the PCC can receive at maximum.  
**Range:** 1 through 16384  
**Default:** 0 (disabled or no limit)

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## clear mpls lsp

**List of Syntax**    [Syntax on page 1717](#)  
                          [Syntax \(EX and QFX Series Switches\) on page 1717](#)

**Syntax**    clear mpls lsp  
                  <all>  
                  <autobandwidth>  
                  <logical-system (all | *logical-system-name*)>  
                  <name *name*>  
                  <optimize | optimize-aggressive>  
                  <path *regular-expression*>  
                  <statistics>

**Syntax (EX and QFX Series Switches)**    clear mpls lsp  
                  <all>  
                  <autobandwidth>  
                  <name *name*>  
                  <optimize | optimize-aggressive>  
                  <path *regular-expression*>  
                  <statistics>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.5 for EX Series switches.  
                                  Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description**    Release the routes and states associated with MPLS label-switched paths (LSPs), and start new LSPs.

**CAUTION:** This command disconnects existing Resource Reservation Protocol (RSVP) sessions on the ingress routing device. If there is a time lag between the old path being torn down and the new path being set up, this command might impact traffic traveling along the LSPs.

**Options**    **all**—Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs.

**autobandwidth**—(Optional) Clear LSP autobandwidth counters.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name *name***—(Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the *Junos Network Interfaces Configuration Guide*.

**optimize | optimize-aggressive**—(Optional) Run nonpreemptive optimization or aggressive optimization computation now.

**path *regular-expression***—(Optional) Clear the specific LSP path matching the specified regular expression.

**statistics**—(Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (**name** and **path** options) on transit routers.

**Required Privilege Level**

clear

| <b>Release Information</b>      | Command introduced in Junos OS Release 14.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Perform an on-demand delay measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b><i>lsp-name</i></b>—Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.</p> <p><b>detail</b>—(Optional) Display detailed output of the LSP delay measurement.</p> <p><b>count <i>count</i></b>—(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.<br/><b>Default:</b> 10<br/><b>Range:</b> 1 through 1000000</p> <p><b>interval <i>seconds</i></b>—(Optional) Specify in seconds the interval between two successive query messages.<br/><b>Range:</b> 1 through 255 seconds</p> <p><b>padding-size <i>padding-size</i></b>—(Optional) Specify the length of padding TLV to be included in the query message.<br/><b>Range:</b> 0 through 1500</p> <p><b>traffic-class <i>traffic-class</i></b>—(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.<br/><b>Range:</b> 0 though 7</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Output Fields** [Table 51 on page 1723](#) describes the output fields for the **monitor mpls delay rsvp** command. Output fields are listed in the approximate order in which they appear.

**Table 51: monitor mpls delay rsvp Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                         | Level of Output |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Current two-way channel delay      | Sum of packet delays, excluding the processing time of the remote provider edge (PE) router.                                                                                                                                              | All Levels      |
| Current round-trip-time            | Total time taken for completing round-trip of packet.                                                                                                                                                                                     | All Levels      |
| Best two-way channel delay         | Best available two-way channel delay count.                                                                                                                                                                                               | All Levels      |
| Worst two-way channel delay        | Worst available two-way channel delay count.                                                                                                                                                                                              | All Levels      |
| Average two-way channel delay      | Average of the available two-way channel delay counts.                                                                                                                                                                                    | All Levels      |
| Best round-trip-time               | Best available round-trip-time count.                                                                                                                                                                                                     | All Levels      |
| Worst round-trip-time              | Worst available round-trip-time count.                                                                                                                                                                                                    | All Levels      |
| Average round-trip-time            | Average of the available round-trip-time counts.                                                                                                                                                                                          | All Levels      |
| Average forward delay variation    | Average of the variation in forward delay.                                                                                                                                                                                                | All Levels      |
| Average reverse delay variation    | Average of the variation in reverse delay.                                                                                                                                                                                                | All Levels      |
| DM queries sent                    | Number of queries sent for delay measurement.                                                                                                                                                                                             | All Levels      |
| DM responses received              | Number of responses received for delay measurement queries.                                                                                                                                                                               | All Levels      |
| DM queries timedout                | Number of timed out queries sent for delay measurement.                                                                                                                                                                                   | All Levels      |
| DM responses dropped due to errors | Number of loss measurement responses dropped due to errors.                                                                                                                                                                               | All Levels      |
| Response code                      | Status of the messages used for delay measurement. Response code can be one of the following: <ul style="list-style-type: none"> <li>• <b>Success</b>—Successful response code.</li> <li>• <b>Failed</b>—Failed response code.</li> </ul> | <b>detail</b>   |
| Querier transmit timestamp         | Timestamp on the query message when the message is sent out the ingress PE router (querier). This is done in the hardware before packet is sent out of an interface.                                                                      | <b>detail</b>   |

Table 51: monitor mpls delay rsvp Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                           | Level of Output |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Responder receive timestamp  | Timestamp on the response message when the message is received by the egress PE router (responder). This is done in the hardware before packet is received by an interface. | detail          |
| Responder transmit timestamp | Timestamp on the query message when the message is sent out the egress PE router (responder). This is done in the hardware before packet is sent out of an interface.       | detail          |
| Querier receive timestamp    | Timestamp on the response message when the message is received by the ingress PE router (querier). This is done in the hardware before packet is received by an interface.  | detail          |

## Sample Output

### monitor mpls lsp delay rsvp count

```

user@host> monitor mpls lsp delay rsvp LSP-A count 2

(1)
Current two-way channel delay      : 44 usecs
Current round-trip-time           : 3243 usecs
(2)
Current two-way channel delay      : 45 usecs
Current round-trip-time           : 1752 usecs

Best two-way channel delay         : 44 usecs
Worst two-way channel delay        : 45 usecs
Average two-way channel delay      : 45 usecs
Best round-trip-time              : 1752 usecs
Worst round-trip-time             : 3243 usecs
Average round-trip-time           : 2498 usecs
Average forward delay variation    : 1 usecs
Average reverse delay variation    : 1 usecs

DM queries sent                   : 2
DM responses received              : 2
DM queries timeout                : 0
DM responses dropped due to errors : 0

```

### monitor mpls lsp delay rsvp count detail

```

user@host> monitor mpls lsp delay rsvp LSP-A count 2 detail

(1)
Response code                     : Success
Querier transmit timestamp        : 1404129122 secs, 479955401 nsecs
Responder receive timestamp       : 1404129122 secs, 468519022 nsecs
Responder transmit timestamp      : 1404129122 secs, 470255123 nsecs
Querier receive timestamp         : 1404129122 secs, 481736403 nsecs
Current two-way channel delay     : 44 usecs
Current round-trip-time           : 1781 usecs
(2)
Response code                     : Success
Querier transmit timestamp        : 1404129123 secs, 480926210 nsecs
Responder receive timestamp       : 1404129123 secs, 469488696 nsecs
Responder transmit timestamp      : 1404129123 secs, 471130706 nsecs
Querier receive timestamp         : 1404129123 secs, 482613911 nsecs
Current two-way channel delay     : 45 usecs

```

```

Current round-trip-time           : 1687 usecs

Best two-way channel delay       : 44 usecs
Worst two-way channel delay      : 45 usecs
Average two-way channel delay    : 45 usecs
Best round-trip-time            : 1687 usecs
Worst round-trip-time           : 1781 usecs
Average round-trip-time         : 1734 usecs
Average forward delay variation  : 1 usecs
Average reverse delay variation  : 1 usecs

DM queries sent                  : 2
DM responses received            : 2
DM queries timedout              : 0
DM responses dropped due to errors : 0

LDM responses received           : 3
LDM queries timedout             : 0
LDM responses dropped due to errors : 0

```

## monitor mpls loss rsvp

**Syntax**    `monitor mpls loss rsvp lsp-name`  
               `<detail>`  
               `<bytes>`  
               `<count count>`  
               `<interval seconds>`  
               `<traffic-class traffic-class>`

**Release Information**    Command introduced in Junos OS Release 14.2.

**Description**    Perform an on-demand loss measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

**Options**    *lsp-name*—Name of the associated bidirectional MPLS UHP LSP for which the loss measurement is performed.

*detail*—(Optional) Display detailed output of the LSP loss measurement.

*bytes*—(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

**NOTE:** The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

*count count*—(Optional) Specify the number of loss measurements to be carried out for the MPLS UHP LSP. For LSP loss measurement, the number of queries sent is the specified count number plus one additional query, because the LSP loss is measured using successive messages.

**Default:** 10

**Range:** 1 through 1000000

*interval seconds*—(Optional) Specify in seconds the interval between two successive query messages.

**Range:** 1 through 255 seconds

*traffic-class traffic-class*—(Optional) Specify the traffic class and enable traffic-class-statistics for the LSP loss measurement.

**Range:** 0 though 7

**Required Privilege Level**    view

**Output Fields** [Table 51 on page 1723](#) describes the output fields for the **monitor mpls loss rsvp** command. Output fields are listed in the approximate order in which they appear.

**Table 52: monitor mpls loss rsvp Output Fields**

| Field Name                        | Field Description                                                                                  | Level of Output |
|-----------------------------------|----------------------------------------------------------------------------------------------------|-----------------|
| Current forward loss              | Difference between the current forward transmit count and the current forward receive count.       | All Levels      |
| Current forward loss ratio        | Total packet loss (current forward loss divided by current forward transmit count).                | All Levels      |
| Current forward throughput        | Current forward transmit count divided by 1000.                                                    | All Levels      |
| Current reverse loss              | Difference between the current reverse transmit count and the current reverse receive count.       | All Levels      |
| Current reverse loss ratio        | Total packet loss (current reverse loss divided by current reverse transmit count).                | All Levels      |
| Current reverse throughput        | Current reverse transmit count divided by 1000.                                                    | All Levels      |
| Cumulative forward transmit count | Cumulative forward transmit counter value at the time the loss measurement message was originated. | All Levels      |
| Cumulative forward loss           | Cumulative forward loss counter value at the time the loss measurement message was originated.     | All Levels      |
| Average forward loss ratio        | Average packet loss (current forward loss divided by current forward transmit count).              | All Levels      |
| Average forward throughput        | Average forward transmit count divided by 1000.                                                    | All Levels      |
| Cumulative reverse transmit count | Cumulative reverse transmit counter value at the time the loss measurement message was originated. | All Levels      |
| Cumulative reverse loss           | Difference between the cumulative reverse transmit count and the cumulative reverse receive count. | All Levels      |
| Average reverse loss ratio        | Average packet loss (average reverse loss divided by average reverse transmit count).              | All Levels      |
| Average reverse throughput        | Average reverse transmit count divided by 1000.                                                    | All Levels      |
| LM queries sent                   | Number of queries sent for loss measurement.                                                       | All Levels      |
| LM responses received             | Number of responses received for loss measurement queries.                                         | All Levels      |

Table 52: monitor mpls loss rsvp Output Fields (*continued*)

| Field Name                         | Field Description                                                                                                                                                                                                                        | Level of Output |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| LM queries timedout                | Number of timed out queries sent for loss measurement.                                                                                                                                                                                   | All Levels      |
| LM responses dropped due to errors | Number of loss measurement responses dropped due to errors.                                                                                                                                                                              | All Levels      |
| Response code                      | Status of the messages used for loss measurement. Response code can be one of the following: <ul style="list-style-type: none"> <li>• <b>Success</b>—Successful response code.</li> <li>• <b>Failed</b>—Failed response code.</li> </ul> | <b>detail</b>   |
| Origin timestamp                   | Time and date the loss measurement message is originated without any specific format (NTP and PTP).                                                                                                                                      | <b>detail</b>   |
| Forward transmit count             | Forward transmit counter value at the time the loss measurement message was originated.                                                                                                                                                  | <b>detail</b>   |
| Forward receive count              | Forward receive counter value at the time the loss measurement message was originated.                                                                                                                                                   | <b>detail</b>   |
| Reverse transmit count             | Reverse transmit counter value at the time the loss measurement message was originated.                                                                                                                                                  | <b>detail</b>   |

## monitor mpls loss-delay rsvp

**Syntax**    `monitor mpls loss-delay rsvp lsp-name`  
               `<detail>`  
               `<bytes>`  
               `<count count>`  
               `<interval seconds>`  
               `<padding-size padding-size>`  
               `<traffic-class traffic-class>`

**Release Information**    Command introduced in Junos OS Release 14.2.

**Description**    Perform a simultaneous on-demand loss and delay measurement using combined loss and delay messages, and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

**Options**    *lsp-name*—Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.

**detail**—(Optional) Display detailed output of the LSP delay measurement.

**bytes**—(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

**NOTE:** The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

**count *count***—(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.

**Default:** 10

**Range:** 1 through 1000000

**interval *seconds***—(Optional) Specify in seconds the interval between two successive query messages.

**Range:** 1 through 255 seconds

**padding-size *padding-size***—(Optional) Specify the length of padding TLV to be included in the query message.

**Range:** 0 through 1500

**traffic-class *traffic-class***—(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

**Range:** 0 though 7

**Required Privilege Level** view

## ping mpls bgp

**Syntax** ping mpls bgp *fec*  
 <bottom-label-ttl>  
 <count *count*>  
 <destination *address*>  
 <detail>  
 <exp *forwarding-class*>  
 <instance *routing-instance-name*>  
 <logical-system (all | *logical-system-name*)>  
 <size *bytes*>  
 <source *source-address*>  
 <sweep>

**Release Information** Command introduced in Junos OS Release 11.1.

**Description** Check the operability of MPLS BGP-signaled label-switched path (LSP) connections. Press Ctrl+c to interrupt a **ping mpls bgp** command.

**NOTE:** The **ping mpls bgp fec** command only supports single paths.

- Options**
- bottom-label-ttl**—(Optional) Time-to-live (TTL) value for the bottom label in the label stack. The range of values is 1 through 255. The default value is **255**.
  - count *count***—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is **5**.
  - destination *address***—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.
  - detail**—(Optional) Display detailed information about the echo requests sent and received.
  - exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.
  - fec***—Ping a BGP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.
  - instance *routing-instance-name***—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
  - logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.
  - size *bytes***—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only BGP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls bgp fec count on page 1736](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately. To display the error codes, use the **detail** option (for example, **ping mpls bgp 10.255.245.222 detail**).

## Sample Output

### [ping mpls bgp fec count](#)

```
user@host> ping mpls bgp 10.255.245.222 count 10
!!!xxx...x--- 1sping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.
```

## ping mpls lsp-end-point

**Syntax** ping mpls lsp-end-point *prefix-name*  
 <count *count*>  
 <destination *address*>  
 <detail>  
 <exp *forwarding-class*>  
 <instance *routing-instance-name*>  
 <logical-system (all | *logical-system-name*)>  
 <size *bytes*>  
 <source *source-address*>  
 <sweep>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
 The **instance** option was introduced in Junos OS Release 10.0.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Check the operability of MPLS label-switched path (LSP) endpoint connections. Type Ctrl+c to interrupt a **ping mpls** command.

**Options** **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination** *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp** *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

**instance** *routing-instance-name*—(Optional) Ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP connection.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

**prefix-name**—LDP forwarding equivalence class (FEC) prefix or RSVP LSP endpoint address.

**size** *bytes*—(Optional) Size of the LSP ping request packet. If the endpoint is LDP-based, the minimum size of the packet is 88 bytes. If the endpoint is RSVP-based, the minimum size of the packet is 100 bytes. The maximum size in either case is 65468 bytes.

**source** *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls lsp-end-point detail on page 1738](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### [ping mpls lsp-end-point detail](#)

```
user@host> ping mpls lsp-end-point 10.255.245.119 detail
Route to end point address is via LDP FEC
Request for seq 1, to interface 67, label 100032
Reply for seq 1, return code: Egress-ok
Request for seq 2, to interface 67, label 100032
Reply for seq 2, return code: Egress-ok
Request for seq 3, to interface 67, label 100032
Reply for seq 3, return code: Egress-ok
Request for seq 4, to interface 67, label 100032
Reply for seq 4, return code: Egress-ok
Request for seq 5, to interface 67, label 100032
Reply for seq 5, return code: Egress-ok
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## request mpls container-lsp

| <b>Description</b>                         | <p>Manually trigger a bandwidth allocation adjustment for active label-switched paths (LSPs).</p> <p>Without running this command, the bandwidth adjustment is recomputed at a configurable interval. The default interval is 5 minutes. If you do not want to wait for the periodic adjustment (for example, during a software demonstration), this command is useful.</p> <p>During bandwidth allocation adjustment, the LSP stays up to enable the bandwidth to be changed without dropping any traffic. This functionality is often referred to as <i>make-before-break</i>.</p> |
| <b>Options</b>                             | <p><b>none</b>—Manually trigger a bandwidth allocation adjustment for all active LSP paths.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>name <i>lsp-name</i></b>—(Optional) Manually trigger a bandwidth allocation adjustment on the specified LSP only.</p>                                                                                                                                                                                              |
| <b>Additional Information</b>              | <p>For this command to work properly, the following conditions must exist:</p> <ul style="list-style-type: none"><li>• Automatic bandwidth allocation must be enabled on the LSP. The parameters for adjustment interval and maximum average bandwidth are not reset after you issue the <b>request mpls lsp adjust-autobandwidth</b> command.</li><li>• The difference between the adjusted bandwidth and the current LSP path bandwidth must be greater than the threshold limit.</li></ul>                                                                                        |
| <b>Required Privilege Level</b>            | clear, maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description**    Display information about the configured circuit cross-connect (CCC) connections.

**Options**    **none**—Display the standard level of output for all configured CCC connections.

**all**—(Optional) Display all connections.

**brief | extensive**—(Optional) Display the specified level of output. Use history to display information about connection history. Use labels to display labels used for transmit and receive LSPs. Use status to display information about the connection and interface status.

**interface-switch**—(Optional) Display interface switch connections only.

**lsp-switch**—(Optional) Display LSP switch connections only.

**p2mp-receive-switch**—(Optional) Display point-to-multipoint LSP to local interfaces switch connections only.

**p2mp-transmit-switch**—(Optional) Display local interface to point-to-multipoint LSP switch connections only.

**remote-interface-switch**—(Optional) Display remote interface switch connections only.

**down | up | up-down**—(Optional) Display nonoperational, operational, or both kinds of connections.

**history**—(Optional) Display information about connection history.

**labels**—(Optional) Display labels used for transmit and receive.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name**—(Optional) Display information about the specified connection only.

**status**—(Optional) Display information about the connection and interface status.

**Required Privilege Level** view

**Output Fields** [Table 53 on page 1743](#) describes the output fields for the **show connections** command. Output fields are listed in the approximate order in which they appear.

**Table 53: show connections Output Fields**

| Field Name                                         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Output Fields</b>            | <a href="#">Table 54 on page 1745</a> describes the output fields for the <b>show link-management</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                       |

**Table 54: show link-management Output Fields**

| Field Name        | Field Description                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------|
| Peer Name         | Name of the peer.                                                                                                 |
| System identifier | Internal identifier for the peer. The range of values is 0 through 64,000.                                        |
| State             | State of the peer: <b>Up</b> or <b>Down</b> .                                                                     |
| Control address   | Address to which a control channel is established.                                                                |
| CC local ID       | Identifier assigned to the control channel by the local peer. The range of values is 1 through 4,294,967,296.     |
| CC remote ID      | Identifier assigned to the control channel by the remote peer. The range of values is 1 through 4,294,967,296.    |
| State             | State of the control channel: <b>Up</b> or <b>Down</b> .                                                          |
| TxSeqNum          | Sequence number of the hello message being sent to the peer. The range of values is 1 through 4,294,967,295.      |
| RcvSeqNum         | Sequence number of the last hello message received from the peer. The range of values is 0 through 4,294,967,295. |

Table 54: show link-management Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                           |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Flags</b>               | Code that provides information about the control channel. Currently supports only code value <b>R</b> , which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts. |
| <b>TE links</b>            | Traffic-engineered links that are managed by their peer.                                                                                                                                                                                                                    |
| <b>TE link name</b>        | Name of the traffic-engineered link.                                                                                                                                                                                                                                        |
| <b>State</b>               | State of the traffic-engineered link: <b>Up</b> , <b>Down</b> , or <b>Init</b> .                                                                                                                                                                                            |
| <b>Local identifier</b>    | Identifier of the local side of the link.                                                                                                                                                                                                                                   |
| <b>Remote identifier</b>   | Identifier of the remote side of the link.                                                                                                                                                                                                                                  |
| <b>Local address</b>       | Address of the local side of the link.                                                                                                                                                                                                                                      |
| <b>Remote address</b>      | Address of the remote side of the link.                                                                                                                                                                                                                                     |
| <b>Encoding</b>            | Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , <b>Packet</b> , and <b>PDH</b> .                                                                               |
| <b>Switching</b>           | Type of switching that can be performed on the traffic-engineered link. Supported values are <b>PSC-1</b> and <b>Packet</b> .                                                                                                                                               |
| <b>Minimum bandwidth</b>   | Smallest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link (in bps).                                                                         |
| <b>Maximum bandwidth</b>   | Largest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).                                                                                              |
| <b>Total bandwidth</b>     | Sum of the bandwidth, in bits per second (bps) and megabits per second (Mbps), of all interfaces that are members of the link.                                                                                                                                              |
| <b>Available bandwidth</b> | Sum of the bandwidths of all interfaces that are members of the link and that are not yet allocated (in bps).                                                                                                                                                               |
| <b>Name</b>                | Name of the interface.                                                                                                                                                                                                                                                      |
| <b>State</b>               | State of the interface: <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                                          |
| <b>Local ID</b>            | Identifier of the local side of the interface.                                                                                                                                                                                                                              |
| <b>Remote ID</b>           | Identifier of the remote side of the interface.                                                                                                                                                                                                                             |
| <b>Bandwidth</b>           | Bandwidth, in bps or Mbps, of the member interface.                                                                                                                                                                                                                         |
| <b>Used</b>                | Whether the resource is allocated to an LSP: <b>Yes</b> or <b>No</b> .                                                                                                                                                                                                      |

Table 54: show link-management Output Fields (*continued*)

| Field Name | Field Description |
|------------|-------------------|
| LSP-name   | LSP name.         |

## Sample Output

| <b>Output Fields</b>            | <a href="#">Table 55 on page 1749</a> describes the output fields for the <b>show link-management peer</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                             |

**Table 55: show link-management peer Output Fields**

| Field Name          | Field Description                                                                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Peer Name           | Name of the peer.                                                                                                                                                                                          |
| System identifier   | Internal identifier for the peer. The range of values is 0 through 64,000.                                                                                                                                 |
| State               | State of the peer: <b>Up</b> or <b>Down</b> .                                                                                                                                                              |
| Control address     | Address to which a control channel is established.                                                                                                                                                         |
| Hello interval      | How often the routing device sends Link Management Protocol (LMP) hello packets.                                                                                                                           |
| Hello dead interval | How long LMP waits before declaring the control channel to be dead. This is an interval during which the routing device receives no LMP hello packets from the neighbor on a control that is active or up. |
| CC local ID         | Identifier assigned to the control channel by the local peer. The range of values is 1 through 4,294,967,296.                                                                                              |
| CC remote ID        | Identifier assigned to the control channel by the remote peer. The range of values is 1 through 4,294,967,296.                                                                                             |

Table 55: show link-management peer Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>State</b>     | State of the control channel: <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                                    |
| <b>TxSeqNum</b>  | Sequence number of the hello message being sent to the peer. The range of values is <b>1</b> through <b>4,294,967,295</b> .                                                                                                                                                 |
| <b>RcvSeqNum</b> | Sequence number of the last hello message received from the peer. The range of values is <b>0</b> through <b>4,294,967,295</b> .                                                                                                                                            |
| <b>Flags</b>     | Code that provides information about the control channel. Currently supports only code value <b>R</b> , which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts. |
| <b>TE links</b>  | Traffic-engineered links that are managed by their peer.                                                                                                                                                                                                                    |

## Sample Output

| <b>Output Fields</b>            | Table 56 on page 1751 describes the output fields for the <b>show link-management routing</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                       |

**Table 56: show link-management routing Output Fields**

| Field Name        | Field Description                                                          |
|-------------------|----------------------------------------------------------------------------|
| Peer Name         | Name of the peer.                                                          |
| System identifier | Internal identifier for the peer. The range of values is 0 through 64,000. |
| State             | State of the peer: Up or Down.                                             |
| Control address   | Address to which a control channel is established.                         |
| Control channel   | Interface over which control packets are sent.                             |

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>State</b>               | State of the control channel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>TE link name</b>        | Traffic-engineered link name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>State</b>               | State of the traffic-engineered link: <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Local identifier</b>    | Identifier of the local side of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Remote identifier</b>   | Identifier of the remote side of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Local address</b>       | Address of the local side of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Remote address</b>      | Address of the remote side of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Encoding</b>            | Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , and <b>Packet</b> .                                                                                                                                                                                                                                                                                                                                                   |
| <b>Minimum bandwidth</b>   | Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link.                                                                                                                                                                                                                                                                                |
| <b>Maximum bandwidth</b>   | Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).                                                                                                                                                                                                                                                                                                                                    |
| <b>Total bandwidth</b>     | Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Available bandwidth</b> | Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Resource</b>            | Forwarding adjacency LSP information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Type</b>                | Type of resource. The type is always a forwarding adjacency LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>State</b>               | State of the LSP: <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>System Identifier</b>   | Internal identifier for the peer. The range of values is <b>0</b> through <b>64,000</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Total bandwidth</b>     | Bandwidth resource, in bps or Mbps, on the TE-link learned from the routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Traffic parameters</b>  | <ul style="list-style-type: none"> <li>• <b>Encoding</b>—Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b>, <b>Ethernet</b>, and <b>Packet</b>.</li> <li>• <b>Switching</b>—Type of switching that can be performed on the traffic-engineered link: <b>PSC-1</b> and <b>Packet</b>.</li> <li>• <b>Granularity</b>—Layer 2 data for switching Layer 2 LSPs for this resource. Not supported. This value is always <b>unknown</b>.</li> </ul> |

## Sample Output

### show link-management routing

```

| <b>Output Fields</b>            | <a href="#">Table 57 on page 1754</a> describes the output fields for the <b>show link-management statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                 |

**Table 57: show link-management statistics Output Fields**

| Field Name                | Field Description                                                                                                                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Received packets          | Number of received packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.     |
| Received bad packets      | Number of received bad packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed. |
| Small packets             | Number of packets that are too small.                                                                                                                                                                 |
| Wrong protocol version    | Number of packets specifying the wrong LMP version.                                                                                                                                                   |
| Messages for unknown peer | Number of packets destined for an unknown peer.                                                                                                                                                       |
| Messages for bad state    | Number of packets indicating a state that does not match the recipient.                                                                                                                               |
| Stale acknowledgments     | Number of <b>configAck</b> and <b>LinkSummaryAck</b> packets received that have a stale message ID.                                                                                                   |

| <b>Output Fields</b>            | <a href="#">Table 58 on page 1756</a> describes the output fields for the <b>show link-management te-link</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                       |

**Table 58: show link-management te-link Output Fields**

| Field Name        | Field Description                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TE link name      | Traffic-engineered link name.                                                                                                                                                                 |
| State             | State of the traffic-engineered link: <b>Up</b> or <b>Down</b> .                                                                                                                              |
| Local identifier  | Identifier of the local side of the link.                                                                                                                                                     |
| Remote identifier | Identifier of the remote side of the link.                                                                                                                                                    |
| Local address     | Address of the local side of the link.                                                                                                                                                        |
| Remote address    | Address of the remote side of the link.                                                                                                                                                       |
| Encoding          | Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , <b>Packet</b> , and <b>PDH</b> . |

Table 58: show link-management te-link Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Switching</b>           | Type of switching that can be performed on the traffic-engineered link. Supported values are <b>PSC-1</b> and <b>Packet</b> .                                                                                                                       |
| <b>Minimum bandwidth</b>   | Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link. |
| <b>Maximum bandwidth</b>   | Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link.                                                              |
| <b>Total bandwidth</b>     | Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link (in bps).                                                                                                                                                      |
| <b>Available Bandwidth</b> | Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.                                                                                                                                |
| <b>Name</b>                | Name of the interface.                                                                                                                                                                                                                              |
| <b>State</b>               | State of the interface: <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                  |
| <b>Local ID</b>            | Identifier of the local side of the interface.                                                                                                                                                                                                      |
| <b>Remote ID</b>           | Identifier of the remote side of the interface.                                                                                                                                                                                                     |
| <b>Bandwidth</b>           | Bandwidth, in bps or Mbps, of the member interface.                                                                                                                                                                                                 |
| <b>Used</b>                | Whether the resource is allocated to an LSP: <b>Yes</b> or <b>No</b> .                                                                                                                                                                              |
| <b>LSP-name</b>            | LSP name.                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.1 for the M Series, MX Series, and T Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Display the Multiprotocol Label Switching (MPLS) label-switched paths (LSPs) based on the association with an incoming or outgoing LSP interface. The command output displays the list of RSVP-TE LSPs carrying traffic in and out of the same interface.                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><b>iif <i>incoming-interface-name</i></b>—Display list of RSVP-TE LSPs that share the specified incoming interface to bring in traffic. This option works on transit label-switching routers (LSRs) and egress label edge routers (LERs).</p> <p><b>oif <i>outgoing-interface-name</i></b>—Display list of RSVP-TE LSPs that share the specified outgoing interface to carry out traffic. This option works on ingress LERs and transit LSRs.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |

| <b>Description</b>                 | Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) call admission control (CAC) information.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                     | <p><b>none</b>—Display CAC information for all LSPs.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display MPLS LSP CAC information for the specified instance. If <b>instance-name</b> is omitted, MPLS LSP CAC information for the master instance is displayed.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>lsp-name</b>—(Optional) Display CAC information for the specified LSP only.</p> |
| <b>Additional Information</b>      | The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by any Layer 2 connection at that class type.                                                                                                                                                                                                                                                                                                                                 |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                |

**Table 61: show mpls call-admission-control Output Fields**

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available bandwidth | Current available bandwidth on each LSP path. Depending on whether the LSP is an E-LSP or a regular LSP, either per-class bandwidth or a single bandwidth value (corresponding to best-effort bandwidth at <b>ct0</b> ) is displayed. The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by some Layer 2 connections at that class type. |

Table 61: show mpls call-admission-control Output Fields (*continued*)

| Field Name         | Field Description                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------|
| Layer2 connections | Different Layer 2 connections that had some bandwidth requirement and were admitted into an LSP path. |
| LSP name           | LSP pathname.                                                                                         |
| Neighbor address   | Neighbor address from which CAC and bandwidth booking are configured for Layer 2 circuits.            |
| Circuit            | Interface name and circuit information.                                                               |
| Primary            | LSP's primary standby path.                                                                           |
| Standby            | LSP's secondary standby path.                                                                         |
| VC bandwidth       | Bandwidth constraints associated with a Layer 2 circuit route.                                        |

## Sample Output

### show mpls call-admission-control

```

user@host# show mpls call-admission-control

LSP name: pro1-be
*Primary
  Available bandwidth: 0bps

LSP name: pro1-be-1
*Primary
  Available bandwidth: 60kbps

LSP name: pro1-be-gold
*Primary
  Available bandwidth: <ct0 50kbps> <ct1 20kbps> <ct2 30kbps> <ct3 0bps>
  Layer2 connections:
    Neighbor address: 10.255.245.215, Circuit: so-0/3/0.0(vc 5)
    VC bandwidth: <ct0 50kbps> <ct1 40kbps> <ct2 40kbps>

LSP name: pro1-be-gold-2
*Primary
  Available bandwidth: <ct0 0bps> <ct1 40kbps> <ct2 40kbps> <ct3 0bps>

LSP name: pro1-be-silver
*Primary  prim1
  Available bandwidth: <ct0 10kbps> <ct1 20kbps> <ct2 0bps> <ct3 40kbps>
  Layer2 connections:
    Neighbor address: 10.255.245.215, Circuit: so-0/3/0.1(vc 3)
    VC bandwidth: <ct0 20kbps> <ct1 20kbps>
  Standby  sec1
  Available bandwidth: <ct0 10kbps> <ct1 10kbps> <ct2 20kbps> <ct3 0bps>
  Layer2 connections:
    Neighbor address: 10.255.245.215, Circuit: so-0/3/0.1(vc 3)
    VC bandwidth: <ct0 20kbps> <ct1 20kbps>

```

## show mpls container-lsp

---

**Syntax**    `show mpls container-lsp`  
              `<brief | detail | extensive | terse>`  
              `<count-active-routes>`  
              `<defaults>`  
              `<descriptions>`  
              `<down | up>`  
              `<egress>`  
              `<ingress>`  
              `<logical-system (all | logical-system-name)>`  
              `<name name>`  
              `<statistics>`  
              `<transit>`  
              `<unidirectional>`

**Release Information**    Command introduced in Junos OS Release 14.2.  
                              Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.

**Description**    Display information about configured and active Multiprotocol Label Switching (MPLS) container label-switched paths (LSPs).

**Options**    **none**—Display standard information about all configured and active member LSPs of the container LSP.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

**count-active-routes**—(Optional) Show active routes for the container LSP.

**defaults**—(Optional) Display the default settings of the container LSP.

**descriptions**—(Optional) Display the container LSP descriptions. To view this information, you must configure the description statement at the [**edit protocol mpls container-lsp**] hierarchy level. Only the LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**egress | ingress**—(Optional) Display the member LSPs ending at this routing device or originating from this routing device, respectively.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name *name***—(Optional) Display information about the specified LSP or group of LSPs.

**statistics**—(Optional) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing

device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

**transit**—(Optional) Display LSPs transiting this routing device.

**unidirectional**—(Optional) Display unidirectional LSP information.

**Required Privilege Level** view

**Output Fields** [Table 62 on page 1765](#) describes the output fields for the **show mpls container-lsp** command. Output fields are listed in the approximate order in which they appear.

**Table 62: show mpls container-lsp Output Fields**

| Field Name                | Field Description                                                                                                                                                                                                                               | Level of Output  |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Ingress LSP</b>        | Information about the member LSPs on the ingress routing device. Each LSP has one line of output.                                                                                                                                               | All levels       |
| <b>Container LSP name</b> | Name of the container LSP.                                                                                                                                                                                                                      | All levels       |
| <b>Member LSP count</b>   | Number of member LSPs in the container LSP.                                                                                                                                                                                                     | All levels       |
| <b>To</b>                 | Destination (egress routing device) of the session.                                                                                                                                                                                             | brief            |
| <b>From</b>               | Source (ingress routing device) of the session.                                                                                                                                                                                                 | brief detail     |
| <b>State</b>              | State of the LSP handled by this RSVP session: <ul style="list-style-type: none"> <li>• Up</li> <li>• Dn (down)</li> <li>• Restart</li> </ul>                                                                                                   | brief detail     |
| <b>Rt</b>                 | Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0). | brief            |
| <b>P</b>                  | Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.                                                                                                                                                          | brief            |
| <b>ActivePath</b>         | (Ingress LSP) Name of the active path: Primary or Secondary.                                                                                                                                                                                    | detail extensive |
| <b>LSPname</b>            | Name of the member LSP.                                                                                                                                                                                                                         | brief detail     |

Table 62: show mpls container-lsp Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Egress LSP</b>          | Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output.                                                                                                                                                                                                        | All levels      |
| <b>Transit LSP</b>         | Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.                                                                                                                                                                                                                          | All levels      |
| <b>Min LSPs</b>            | Minimum number of member LSPs.<br><br>Default: 1                                                                                                                                                                                                                                                                                                                                                                | extensive       |
| <b>Max LSPs</b>            | Number of member LSPs that the container LSP can have at maximum.<br><br>Default: 64 (due to ECMP limit)                                                                                                                                                                                                                                                                                                        | extensive       |
| <b>Aggregate bandwidth</b> | Sum of the bandwidths of all member LSPs.                                                                                                                                                                                                                                                                                                                                                                       | extensive       |
| <b>NormalizeTimer</b>      | Duration between two normalization events.<br><br>When not configured, 21600 seconds (6 hours) is set as the default value.                                                                                                                                                                                                                                                                                     | extensive       |
| <b>NormalizeThreshold</b>  | Change in aggregate LSP utilization to trigger splitting or merging expressed in percentage.                                                                                                                                                                                                                                                                                                                    | extensive       |
| <b>Max Signaling BW</b>    | Maximum bandwidth used to signal LSPs after a normalization event.<br><br>Default value is 0 bps. When not configured, the value is inherited from the splitting bandwidth configuration.<br><br><b>NOTE:</b> Between two normalization events, when auto-bandwidth adjustment happens, the per-LSP auto-bandwidth configuration and thresholds are used, instead of the maximum signaling bandwidth threshold. | extensive       |
| <b>Min Signaling BW</b>    | Minimum bandwidth used to signal LSPs after a normalization event.<br><br>Default value is 0 bps. When not configured, the value is inherited from the merging bandwidth configuration.<br><br><b>NOTE:</b> Between two normalization events, when auto-bandwidth adjustment happens, the per-LSP auto-bandwidth configuration and thresholds are used, instead of the minimum signaling bandwidth threshold.   | extensive       |
| <b>Splitting BW</b>        | Bandwidth used for LSP splitting and merging.<br><br>Default value is 0 bps. When not configured, the value is inherited from the auto-bandwidth maximum bandwidth configuration.                                                                                                                                                                                                                               | extensive       |
| <b>Merging BW</b>          | Bandwidth used for LSP splitting and merging.<br><br>Default value is 0 bps. When not configured, the value is inherited from the auto-bandwidth minimum bandwidth configuration.                                                                                                                                                                                                                               | extensive       |

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Received RRO</b>                          | <p>Received record route.</p> <p>RRO is a series of hops, each with an address followed by a flag. In most cases, the received RRO is the same as the computed ERO. If the received RRO is different from the computed ERO, there is a topology change in the network, and the route is taking a detour.</p> <p>The following flags identify the protection capability and status of the downstream node:</p> <ul style="list-style-type: none"> <li>• <b>0x01</b>—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding path message.</li> <li>• <b>0x02</b>—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).</li> <li>• <b>0x03</b>—Combination of <b>0x01</b> and <b>0x02</b>.</li> <li>• <b>0x04</b>—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.</li> <li>• <b>0x08</b>—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the local protection available bit is set but the node protection bit is cleared.</li> <li>• <b>0x09</b>—Detour is established. Combination of <b>0x01</b> and <b>0x08</b>.</li> <li>• <b>0x10</b>—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.</li> <li>• <b>0x20</b>—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.</li> <li>• <b>0xb</b>—Detour is in use. Combination of <b>0x01</b>, <b>0x02</b>, and <b>0x08</b>.</li> </ul> | extensive       |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                              |

**Table 63: show mpls lsp Output Fields**

| Field Name    | Field Description                                                                                                                                                       | Level of Output |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| ID            | Context identifier.                                                                                                                                                     | All levels      |
| Type          | Indicates node type: protector or primary                                                                                                                               | All levels      |
| Metric        | MPLS cost value of the context identifier route. This route appears in inet.0 on the protector and primary nodes. On the protector node, the metric is a larger number. | All levels      |
| Mode          | Indicates <b>advertise-mode</b> : proxy or alias                                                                                                                        | <b>detail</b>   |
| Context table | Name of the MPLS routing table created for egress protection.                                                                                                           | All levels      |

Table 63: show mpls lsp Output Fields (*continued*)

| Field Name   | Field Description                                                                                                                                | Level of Output |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Context LSPs | Names of the LSPs that have egress protection configured.<br><br>Loopback interface addresses of the devices from which the LSPs are originated. | <b>detail</b>   |
| Total        | Total number of primary and protector nodes.                                                                                                     | All levels      |
| Primary      | Number of primary nodes.                                                                                                                         | All levels      |
| Protector    | Number of protector nodes.                                                                                                                       | All levels      |

## Sample Output

### show mpls context-identifier detail (Protector)

```

user@host> show mpls context-identifier detail
ID: 166.1.3.1
Type: protector, Metric: 16777215, Mode: alias
Context table: __166.1.3.1__.mpls.0, Label out: 299968

```

## Sample Output

### show mpls context-identifier detail (Primary)

```

user@host> show mpls context-identifier detail

ID: 166.1.3.1
Type: primary, Metric: 1, Mode: alias

Total 1, Primary 1, Protector 0

```

show mpls correlation label

| Release Information      | Command introduced in Junos OS Release 15.2 for the M Series, MX Series, and T Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description              | Display the correlation information for the Multiprotocol Label Switching (MPLS) label-switched path (LSP) with the owner of the label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Options                  | <p><i>label-value</i>—Display information about the specified label.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.</p> <p><b>descriptions</b>—(Optional) Display the LSP descriptions. To view this information, you must configure the description statement at the <b>[edit protocol mpls lsp]</b> hierarchy level. Only the LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Required Privilege Level | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 65: show mpls correlation nexthop-id Output Fields

| Field Name | Field Description                                          |
|------------|------------------------------------------------------------|
| LSP name   | Name of the LSP associated with the specified next-hop ID. |

## Sample Output

### show mpls correlation nexthop-id

```

user@host> show mpls correlation nexthop-id nexthop-id
LSP name: LSP-ABC

```

## show mpls cspf

**List of Syntax** [Syntax on page 1776](#)  
[Syntax \(EX Series Switches\) on page 1776](#)

**Syntax** show mpls cspf  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show mpls cspf

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.5 for EX Series switches.  
*instance instance-name* option added in Junos OS Release 15.1.

**Description** Display Multiprotocol Label Switching (MPLS) Constrained Shortest Path First (CSPF) statistics.

**Options** none—Display MPLS CSFP statistics.

*instance instance-name*—(Optional) Display MPLS CSPF information for the specified instance. If *instance-name* is omitted, MPLS CSPF information for the master instance is displayed.

*logical-system (all | logical-system-name)*—(Optional) Perform this operation on all logical systems or on a particular logical system.

**List of Sample Output** [show mpls cspf on page 1777](#)

**Output Fields** [Table 66 on page 1776](#) describes the output fields for the **show mpls cspf** command. Output fields are listed in the approximate order in which they appear.

**Table 66: show mpls cspf Output Fields**

| Field Name   | Field Description                                     |
|--------------|-------------------------------------------------------|
| Queue length | Number of LSPs queued for automatic path computation. |
| current      | Current queue length.                                 |
| maximum      | Maximum queue length (high-water mark).               |
| dequeued     | Number of aborted computation attempts.               |
| Paths        | Counters for label-switched path computations.        |
| total        | Sum of the next four fields.                          |

Table 66: show mpls cspf Output Fields (*continued*)

| Field Name          | Field Description                                                                          |
|---------------------|--------------------------------------------------------------------------------------------|
| <b>successful</b>   | Number of path computations that were successfully completed.                              |
| <b>no route</b>     | Number of path computations that failed because the destination is unreachable.            |
| <b>Sys Error</b>    | Number of path computations that failed because of lack of memory.                         |
| <b>CSPFs</b>        | Total number of CSPF computations. A single path might require multiple CSPF computations. |
| <b>Time</b>         | Time, in seconds, required to perform the label-switched path computation.                 |
| <b>Total</b>        | Total amount of time consumed by the CSPF path computation algorithm.                      |
| <b>CSPFs</b>        | Total number of CSPF computations.                                                         |
| <b>Avg per CSPF</b> | Average amount of time required for each CSPF computation.                                 |
| <b>% of rpd</b>     | Percentage of routing process CPU used in the CSPF computation.                            |

## Sample Output

### show mpls cspf

```

user@host> show mpls cspf
CSPF statistics
Queue length  current      maximum      dequeued
              0            0            0
Paths          total      successful      no route      sys error      CSPFs
              0            0            0            0            0
Time (secs)    total      CSPFs      avg per CSPF      % of rpd
              0.000000    0.000000    0.000000        0.0000

```

**Table 67: show mpls diffserv-te Output Fields**

| Field Name             | Field Description                                                                                                                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Bandwidth model</b> | Bandwidth constraint model supported. The maximum allocation model (MAM) for EXP-inferred LSPs (E-LSPs) is currently supported.                                                                                                                                                         |
| <b>TE class</b>        | DiffServ traffic engineering class.                                                                                                                                                                                                                                                     |
| <b>Traffic class</b>   | <p>MPLS class type that corresponds to the DiffServ traffic engineering class:</p> <ul style="list-style-type: none"> <li>• <b>ct0</b>—Best effort</li> <li>• <b>ct1</b>—Assured forwarding</li> <li>• <b>ct2</b>—Expedited forwarding</li> <li>• <b>ct3</b>—Network control</li> </ul> |

Table 67: show mpls diffserv-te Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority   | MPLS preemption priority for this class type, a value from 0 through 7. Interior gateway protocols (IGPs) distribute information about the available bandwidth for each traffic engineering class. |

Sample Output

show mpls diffserv-te

```
user@host> show mpls diffserv-te
Bandwidth model: Maximum Allocation Model with support for E-LSPs.
TE class      Traffic class  Priority
te0           ct0           3
te1           ct1           2
```

## show mpls egress-protection

|                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                     |

| <b>Administrative groups</b> | Administratively assigned colors of the link.          |

Table 69: show mpls interface Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum labels                        | Maximum number of MPLS labels upon which MPLS can operate on a logical interface. This is configured using the <b>maximum-labels</b> statement at the [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls] or the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls] hierarchy levels.                                                                                                                                                                                                            |
| Static protection revert time         | Time (in seconds) that a static LSP must wait before traffic reverts from the bypass path to the original path. This is configured using the <b>protection-revert-time</b> statement at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels.                                                                                                                                                                                                                    |
| Always mark connection protection tlv | Enabled or Disabled: Enabled indicates that the <b>always-mark-connection-protection-tlv</b> statement is configured at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels. When this statement is configured, it marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, the <b>switch-away-lsps</b> statement must be configured. |
| Switch away lsps                      | Enabled or Disabled: Enabled indicates that the <b>switch-away-lsps</b> statement is configured at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels. This enables you to switch an LSP away from a network node using a bypass LSP. This feature can be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic.                |

## Sample Output

### show mpls interface

```
user@host> show mpls interface
```

```
Interface: ge-0/2/1.57
State: Up
Administrative group: <none>
Maximum labels: 5
Static protection revert time: 5 seconds
Always mark connection protection tlv: Disabled
Switch away lsps : Disabled
```

## show mpls label usage

**Syntax** `show mpls label usage`  
`<logical-system (all | logical-system-name)>`

**Release Information** Command introduced in Junos OS Release 15.1.

**Description** Show the available label space resource in RPD and also the applications that use the label space in RPD. There are four different label spaces currently used in MPLS—namely LSI, Dynamic, Block and Static. Each label space has a fixed number and cannot grow beyond the fixed value. Using this command, the administrator can monitor the available labels in each label space and the applications that are using the labels. Based on the availability of labels, the administrator can decide to stop any service and free some labels or use other service where the labels are available.

**Options** **none**— Display the available labels in each label space and the applications using the labels.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Additional Information** Once the label space crosses the threshold, a new syslog message is added.

“<label-space-name> label space usage crossed threshold limit of 90%”.

For instance, LSI label space usage crossed threshold limit of 90%

**Required Privilege Level** view

**List of Sample Output** [show mpls label usage on page 1784](#)

**Output Fields** [Table 70 on page 1784](#) describes the output fields for the **show mpls label usage** command. Output fields are listed in the order in which they appear.

**Table 70: show mpls label usage Fields**

| Field Name          | Field Description                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------|
| <b>Label Space</b>  | The label spaces currently used in MPLS.                                                              |
| <b>Available</b>    | Indicates the number of freely available labels and also the percentage of the label space available. |
| <b>Applications</b> | The applications that use the MPLS label spaces.                                                      |

## Sample Output

### show mpls label usage

```
user@host> show mpls label usage
```

| Label space            | Available     | Applications                                         |
|------------------------|---------------|------------------------------------------------------|
| LSI<br>vrf-table-label | 155331(75%)   | BGP/LDP VPLS with no-tunnel-services, BGP L3VPN with |
| Dynamic                | 265645(50%)   | RSVP, LDP, PW, L3VPN                                 |
| Block                  | 46189(30%)    | BGP/LDP VPLS with tunnel-services, BGP L2VPN         |
| Static                 | 38575(67.12%) | Static LSP, Static PW                                |

                              **defaults** option added in Junos OS Release 8.5.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.  
                              **autobandwidth** option added in Junos OS Release 11.4.  
                              **externally-controlled** option added in Junos OS Release 12.3.  
                              **externally-provisioned** option added in Junos OS Release 13.3.  
                              Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.  
                              **instance *instance-name*** option added in Junos OS Release 15.1.

**Description**    Display information about configured and active dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

**Options**    **none**—Display standard information about all configured and active dynamic MPLS LSPs.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

**autobandwidth**—(Optional) Display automatic bandwidth information. This option is explained separately (see [show mpls lsp autobandwidth](#)).

**bidirectional | unidirectional**—(Optional) Display bidirectional or unidirectional LSP information, respectively.

**bypass**—(Optional) Display LSPs used for protecting other LSPs.

**count-active-routes**—(Optional) Display active routes for LSPs.

**defaults**—(Optional) Display the MPLS LSP default settings.

**descriptions**—(Optional) Display the MPLS label-switched path (LSP) descriptions. To view this information, you must configure the description statement at the **[edit protocol mpls lsp]** hierarchy level. Only LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**externally-controlled**—(Optional) Display the LSPs that are under the control of an external Path Computation Element (PCE).

**externally-provisioned**—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

**instance *instance-name***—(Optional) Display MPLS LSP information for the specified instance. If *instance-name* is omitted, MPLS LSP information is displayed for the master instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

**name *name***—(Optional) Display information about the specified LSP or group of LSPs.

**p2mp**—(Optional) Display information about point-to-multipoint LSPs.

**statistics**—(Optional) (Ingress and transit routers only) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the

packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

**NOTE:** If a bypass LSP is configured for the primary static LSP, display cumulative statistics of packets traversing through the protected LSP and bypass LSP when traffic is re-optimized when the protected LSP link is restored. (Bypass LSPs are not supported on QFX Series switches.)

When used with the **bypass** option (**show mpls lsp bypass statistics**), display statistics for the traffic that flows only through the bypass LSP.

**transit**—(Optional) Display LSPs transiting this routing device.

**Output Fields** [Table 71 on page 1788](#) describes the output fields for the **show mpls lsp** command. Output fields are listed in the approximate order in which they appear.

**Table 71: show mpls lsp Output Fields**

| Field Name         | Field Description                                                                                                                                                                                        | Level of Output |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Ingress LSP</b> | Information about LSPs on the ingress routing device. Each session has one line of output.                                                                                                               | All levels      |
| <b>Egress LSP</b>  | Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output. | All levels      |

Table 71: show mpls lsp Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                     | Level of Output         |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Transit LSP</b>          | Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.                                                                                                | All levels              |
| <b>P2MP name</b>            | Name of the point-to-multipoint LSP. Dynamically generated P2MP LSPs used for VPLS flooding use dynamically generated P2MP LSP names. The name uses the format <i>identifier:vpls:router-id:routing-instance-name</i> . The <i>identifier</i> is automatically generated by Junos OS. | All levels              |
| <b>P2MP branch count</b>    | Number of destination LSPs the point-to-multipoint LSP is transmitting to.                                                                                                                                                                                                            | All levels              |
| <b>P</b>                    | An asterisk (*) under this heading indicates that the LSP is a primary path.                                                                                                                                                                                                          | All levels              |
| <b>address</b>              | ( <b>detail</b> and <b>extensive</b> ) Destination (egress routing device) of the LSP.                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>To</b>                   | Destination (egress routing device) of the session.                                                                                                                                                                                                                                   | <b>brief</b>            |
| <b>From</b>                 | Source (ingress routing device) of the session.                                                                                                                                                                                                                                       | <b>brief detail</b>     |
| <b>State</b>                | State of the LSP handled by this RSVP session: <b>Up</b> , <b>Dn</b> (down), or <b>Restart</b> .                                                                                                                                                                                      | <b>brief detail</b>     |
| <b>Active Route</b>         | Number of active routes (prefixes) installed in the forwarding table. For ingress LSPs, the forwarding table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table ( <b>mpls.0</b> ).                     | <b>detail extensive</b> |
| <b>Rt</b>                   | Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ).                     | <b>brief</b>            |
| <b>P</b>                    | Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.                                                                                                                                                                                                | <b>brief</b>            |
| <b>ActivePath</b>           | (Ingress LSP) Name of the active path: <b>Primary</b> or <b>Secondary</b> .                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>LSPname</b>              | Name of the LSP.                                                                                                                                                                                                                                                                      | <b>brief detail</b>     |
| <b>Statistics</b>           | Displays the number of packets and the number of bytes transmitted over the LSP. These counters are reset to zero whenever the LSP path is optimized (for example, during an automatic bandwidth allocation).                                                                         | <b>extensive</b>        |
| <b>Aggregate statistics</b> | Displays the number of packets and the number of bytes transmitted over the LSP. These counters continue to iterate even if the LSP path is optimized. You can reset these counters to zero using the <b>clear mpls lsp statistics</b> command.                                       | <b>extensive</b>        |
| <b>Packets</b>              | Displays the number of packets transmitted over the LSP.                                                                                                                                                                                                                              | <b>brief extensive</b>  |
| <b>Bytes</b>                | Displays the number of bytes transmitted over the LSP.                                                                                                                                                                                                                                | <b>brief extensive</b>  |

Table 71: show mpls lsp Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                             | Level of Output         |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>DiffServInfo</b>                 | Type of LSP: multiclass LSP ( <b>multiclass diffServ-TE LSP</b> ) or Differentiated-Services-aware traffic engineering LSP ( <b>diffServ-TE LSP</b> ).                                                                                                                                                                        | <b>detail</b>           |
| <b>LSPtype</b>                      | Type of LSP: <ul style="list-style-type: none"> <li>• <b>Static configured</b>—Static</li> <li>• <b>Dynamic configured</b>—Dynamic</li> <li>• <b>Externally controlled</b>—External path computing entity</li> </ul> Also indicates if the LSP is a <b>Penultimate hop popping</b> LSP or an <b>Ultimate hop popping</b> LSP. | <b>detail extensive</b> |
| <b>Bypass</b>                       | (Bypass LSP) Destination address (egress routing device) for the bypass LSP.                                                                                                                                                                                                                                                  | All levels              |
| <b>LSPpath</b>                      | Indicates whether the RSVP session is for the primary or secondary LSP path. <b>LSPpath</b> can be either <b>primary</b> or <b>secondary</b> and can be displayed on the ingress, egress, and transit routing devices.                                                                                                        | <b>detail</b>           |
| <b>Bidir</b>                        | (GMPLS) The LSP allows data to travel in both directions between GMPLS devices.                                                                                                                                                                                                                                               | All levels              |
| <b>Bidirectional</b>                | (GMPLS) The LSP allows data to travel both ways between GMPLS devices.                                                                                                                                                                                                                                                        | All levels              |
| <b>FastReroute desired</b>          | Fast reroute has been requested by the ingress routing device.                                                                                                                                                                                                                                                                | <b>detail</b>           |
| <b>Link protection desired</b>      | <b>detail</b>                                                                                                                                                                                                                                                                                                                 |                         |
| <b>Node/Link protection desired</b> | Link protection has been requested by the ingress routing device.                                                                                                                                                                                                                                                             | <b>detail</b>           |
| <b>LoadBalance</b>                  | (Ingress LSP) CSPF load-balancing rule that was configured to select the LSP's path among equal-cost paths: <b>Most-fill</b> , <b>Least-fill</b> , or <b>Random</b> .                                                                                                                                                         | <b>detail extensive</b> |
| <b>Signal type</b>                  | Signal type for GMPLS LSPs. The signal type determines the peak data rate for the LSP: <b>DS0</b> , <b>DS3</b> , <b>STS-1</b> , <b>STM-1</b> , or <b>STM-4</b> .                                                                                                                                                              | All levels              |
| <b>Encoding type</b>                | LSP encoding type: <b>Packet</b> , <b>Ethernet</b> , <b>PDH</b> , <b>SDH/SONET</b> , <b>Lambda</b> , or <b>Fiber</b> .                                                                                                                                                                                                        | All levels              |
| <b>Switching type</b>               | Type of switching on the links needed for the LSP: <b>Fiber</b> , <b>Lambda</b> , <b>Packet</b> , <b>TDM</b> , or <b>PSC-1</b> .                                                                                                                                                                                              | All levels              |
| <b>GPID</b>                         | Generalized Payload Identifier (identifier of the payload carried by an LSP): <b>HDLC</b> , <b>Ethernet</b> , <b>IPv4</b> , <b>PPP</b> , or <b>Unknown</b> .                                                                                                                                                                  | All levels              |
| <b>Protection</b>                   | Configured protection capability desired for the LSP: <b>Extra</b> , <b>Enhanced</b> , <b>none</b> , <b>One plus one</b> , <b>One to one</b> , or <b>Shared</b> .                                                                                                                                                             | All levels              |
| <b>Upstream label in</b>            | (Bidirectional LSPs) Incoming label for reverse direction traffic for this LSP.                                                                                                                                                                                                                                               | All levels              |

Table 71: show mpls lsp Output Fields (*continued*)

| Field Name                                          | Field Description                                                                                                                                                                       | Level of Output         |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Upstream label out</b>                           | (Bidirectional LSPs) Outgoing label for reverse direction traffic for this LSP.                                                                                                         | All levels              |
| <b>Suggested label received</b>                     | (Bidirectional LSPs) Label the upstream node suggests to use in the Resv message that is sent.                                                                                          | All levels              |
| <b>Suggested label sent</b>                         | (Bidirectional LSPs) Label the downstream node suggests to use in the Resv message that is returned.                                                                                    | All levels              |
| <b>Autobandwidth</b>                                | (Ingress LSP) The LSP is performing autobandwidth allocation.                                                                                                                           | <b>detail extensive</b> |
| <b>MinBW</b>                                        | (Ingress LSP) Configured minimum value of the LSP, in bps.                                                                                                                              | <b>detail extensive</b> |
| <b>MaxBW</b>                                        | (Ingress LSP) Configured maximum value of the LSP, in bps.                                                                                                                              | <b>detail extensive</b> |
| <b>Dynamic MinBW</b>                                | (Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps.                                                                              | <b>detail extensive</b> |
| <b>Dynamic MinBW</b>                                | (Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps.                                                                              | <b>detail extensive</b> |
| <b>AdjustTimer</b>                                  | (Ingress LSP) Configured value for the <b>adjust-timer</b> statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.              | <b>detail extensive</b> |
| <b>Adjustment Threshold</b>                         | (Ingress LSP) Configured value for the <b>adjust-threshold</b> statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization. | <b>detail extensive</b> |
| <b>Time for Next Adjustment</b>                     | (Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.                                                                                            | <b>detail extensive</b> |
| <b>Time of Last Adjustment</b>                      | (Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.                                                                                                | <b>detail extensive</b> |
| <b>MaxAvgBW util</b>                                | (Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.                                                                                                | <b>detail extensive</b> |
| <b>Overflow limit</b>                               | (Ingress LSP) Configured value of the threshold overflow limit.                                                                                                                         | <b>detail extensive</b> |
| <b>Overflow sample count</b>                        | (Ingress LSP) Current value for the overflow sample count.                                                                                                                              | <b>detail extensive</b> |
| <b>Bandwidth Adjustment in <i>nnn</i> second(s)</b> | (Ingress LSP) Current value of the bandwidth adjustment timer, indicating the amount of time remaining until the bandwidth adjustment will take place, in seconds.                      | <b>detail extensive</b> |
| <b>Underflow limit</b>                              | (Ingress LSP) Configured value of the threshold underflow limit.                                                                                                                        | <b>detail extensive</b> |

Table 71: show mpls lsp Output Fields (*continued*)

| Field Name                                              | Field Description                                                                                                                                                                                                                                                                                                                           | Level of Output         |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Underflow sample count</b>                           | (Ingress LSP) Current value for the underflow sample count.                                                                                                                                                                                                                                                                                 | <b>detail extensive</b> |
| <b>Underflow Max AvgBW</b>                              | (Ingress LSP) The highest sample bandwidth among the underflow samples recorded currently. This is the signaling bandwidth if an adjustment occurs because of an underflow.                                                                                                                                                                 | <b>detail extensive</b> |
| <b>Active path indicator</b>                            | (Ingress LSP) A value of * indicates that the path is active. The absence of * indicates that the path is not active. In the following example, "long" is the active path.<br><br>*Primary long<br>Standby short                                                                                                                            | <b>detail extensive</b> |
| <b>Primary</b>                                          | (Ingress LSP) Name of the primary path.                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Secondary</b>                                        | (Ingress LSP) Name of the secondary path.                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Standby</b>                                          | (Ingress LSP) Name of the path in standby mode.                                                                                                                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>State</b>                                            | (Ingress LSP) State of the path: <b>Up</b> or <b>Dn</b> (down).                                                                                                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>COS</b>                                              | (Ingress LSP) Class-of-service value.                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>Bandwidth per class</b>                              | (Ingress LSP) Active bandwidth for the LSP path for each MPLS class type, in bps.                                                                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Priorities</b>                                       | (Ingress LSP) Configured value of the setup priority and the hold priority respectively (the setup priority is displayed first), where 0 is the highest priority and 7 is the lowest priority. If you have not explicitly configured these values, the default values are displayed (7 for the setup priority and 0 for the hold priority). | <b>detail extensive</b> |
| <b>OptimizeTimer</b>                                    | (Ingress LSP) Configured value of the optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>SmartOptimizeTimer</b>                               | (Ingress LSP) Configured value of the smart optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Reoptimization in xxx seconds</b>                    | (Ingress LSP) Current value of the optimize timer, indicating the amount of time remaining until the path will be reoptimized, in seconds.                                                                                                                                                                                                  | <b>detail extensive</b> |
| <b>Computed ERO (S [L] denotes strict [loose] hops)</b> | (Ingress LSP) Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (S) or loose (L).                                                                                                                                                                   | <b>detail extensive</b> |
| <b>CSPF metric</b>                                      | (Ingress LSP) Constrained Shortest Path First metric for this path.                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |

Table 71: show mpls lsp Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output               |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <b>Received RRO</b> | <p>(Ingress LSP) Received record route. A series of hops, each with an address followed by a flag. (In most cases, the received record route is the same as the computed explicit route. If <b>Received RRO</b> is different from <b>Computed ERO</b>, there is a topology change in the network, and the route is taking a detour.) The following flags identify the protection capability and status of the downstream node:</p> <ul style="list-style-type: none"> <li>• <b>0x01</b>—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the Local protection flag was set in the <b>SESSION_ATTRIBUTE</b> object of the corresponding Path message.</li> <li>• <b>0x02</b>—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).</li> <li>• <b>0x03</b>—Combination of <b>0x01</b> and <b>0x02</b>.</li> <li>• <b>0x04</b>—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.</li> <li>• <b>0x08</b>—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the <b>Local protection available</b> bit is set but the <b>Node protection</b> bit is cleared.</li> <li>• <b>0x09</b>—Detour is established. Combination of <b>0x01</b> and <b>0x08</b>.</li> <li>• <b>0x10</b>—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.</li> <li>• <b>0x20</b>—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.</li> <li>• <b>0xb</b>—Detour is in use. Combination of <b>0x01</b>, <b>0x02</b>, and <b>0x08</b>.</li> </ul> | <b>detail extensive</b>       |
| <b>Index number</b> | (Ingress LSP) Log entry number of each LSP path event. The numbers are in chronological descending order, with a maximum of 50 index numbers displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b>              |

| <b>LSPname</b>                 | Name of the LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>brief detail</b> |
| <b>Time left</b>               | Number of seconds remaining in the lifetime of the reservation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail</b>       |
| <b>Since</b>                   | Date and time when the RSVP session was initiated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>       |
| <b>Tspec</b>                   | Sender's traffic specification, which describes the sender's traffic parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b>       |
| <b>Port number</b>             | Protocol ID and sender or receiver port used in this RSVP session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>       |
| <b>PATH rcvfrom</b>            | Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this router, and number of packets received from the upstream neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail</b>       |
| <b>PATH sentto</b>             | Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor, and number of packets sent to the downstream routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>       |
| <b>RESV rcvfrom</b>            | Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor. The output in this field, which is consistent with that in the <b>PATH rcvfrom</b> field, indicates that the RSVP negotiation is complete.                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b>       |
| <b>Record route</b>            | Recorded route for the session, taken from the record route object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail</b>       |
| <b>Soft preempt</b>            | Number of soft preemptions that occurred on a path and when the last soft preemption occurred. Only successful soft preemptions are counted (those that actually resulted in a new path being used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail</b>       |
| <b>Soft preemption pending</b> | Path is in the process of being soft preempted. This display is removed once the ingress router has calculated a new path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail</b>       |
| <b>MPLS-TE LSP Defaults</b>    | Default settings for MPLS traffic engineered LSPs: <ul style="list-style-type: none"> <li>• <b>LSP Holding Priority</b>—Determines the degree to which an LSP holds on to its session reservation after the LSP has been set up successfully.</li> <li>• <b>LSP Setup Priority</b>—Determines whether a new LSP that preempts an existing LSP can be established.</li> <li>• <b>Hop Limit</b>—Specifies the maximum number of routers the LSP can traverse (including the ingress and egress).</li> <li>• <b>Bandwidth</b>—Specifies the bandwidth in bits per second for the LSP.</li> <li>• <b>LSP Retry Timer</b>—Length of time in seconds that the ingress router waits between attempts to establish the primary path.</li> </ul> | <b>defaults</b>     |

The XML tag name of the **bandwidth** tag under the **auto-bandwidth** tag has been updated to **maximum-average-bandwidth**. You can see the new tag when you issue the **show mpls lsp extensive** command with the **| display xml** pipe option. If you have any scripts that use the **bandwidth** tag, ensure that they are updated to **maximum-average-bandwidth**.

## Sample Output

### show mpls lsp defaults

```
user@host> show mpls lsp defaults
MPLS-TE LSP Defaults
  LSP Holding Priority      0
  LSP Setup Priority       7
  Hop Limit                255
  Bandwidth                 0
  LSP Retry Timer          30 seconds
```

### show mpls lsp descriptions

```
user@host> show mpls lsp descriptions

Table 72: show mpls lsp autobandwidth Output Fields

| Field Name            | Field Description                                                                        | Level of Output  |
|-----------------------|------------------------------------------------------------------------------------------|------------------|
| To                    | Destination (egress routing device) of the session.                                      | All Levels       |
| From                  | Source (ingress routing device) of the session.                                          | All Levels       |
| LSPname               | Name of the LSP.                                                                         | All Levels       |
| Min BW                | (Ingress LSP) Configured minimum value of the LSP, in bps.                               | detail extensive |
| Max BW                | (Ingress LSP) Configured maximum value of the LSP, in bps.                               | detail extensive |
| Max AvgBW util        | (Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps. | detail extensive |
| Overflow limit        | (Ingress LSP) Configured value of the threshold overflow limit.                          | detail extensive |
| Overflow sample count | (Ingress LSP) Current value for the overflow sample count.                               | detail extensive |
| Underflow limit       | (Ingress LSP) Configured value of the threshold underflow limit.                         | detail extensive |

Table 72: show mpls lsp autobandwidth Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                | Level of Output         |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Underflow sample count</b>   | (Ingress LSP) Current value for the underflow sample count.                                                                                                                      | <b>detail extensive</b> |
| <b>Adjustment Timer</b>         | (Ingress LSP) Configured value for the adjust-timer statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.              | <b>detail extensive</b> |
| <b>Adjustment Threshold</b>     | (Ingress LSP) Configured value for the adjust-threshold statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization. | <b>detail extensive</b> |
| <b>Time for Next Adjustment</b> | (Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.                                                                                     | <b>detail extensive</b> |
| <b>Time of Last Adjustment</b>  | (Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.                                                                                         | <b>detail extensive</b> |
| <b>Last BW</b>                  | Previous active bandwidth of the LSP.                                                                                                                                            | <b>detail extensive</b> |
| <b>Last Requested BW</b>        | Bandwidth requested in the previous automatic bandwidth adjustment.                                                                                                              | <b>detail extensive</b> |
| <b>Last Signaled BW</b>         | Bandwidth signaled in the previous automatic bandwidth adjustment.                                                                                                               | <b>detail extensive</b> |
| <b>Highest Watermark BW</b>     | Maximum bandwidth used by the LSP.                                                                                                                                               | <b>detail extensive</b> |
| <b>Total AutoBw Adjustments</b> | Total number of attempts to adjust automatic bandwidth including failed and successful adjustments.                                                                              | <b>detail extensive</b> |
| <b>Successful Adjustments</b>   | Number of successful automatic bandwidth adjustments.                                                                                                                            | <b>detail extensive</b> |
| <b>Failed Adjustments</b>       | Number of failed automatic bandwidth adjustments.                                                                                                                                | <b>detail extensive</b> |

## Sample Output

### show mpls lsp autobandwidth

```

user@host> show mpls lsp autobandwidth extensive
To: 10.255.106.133,
From: 10.255.106.135, LSPname: r0-r1

## show mpls path

**List of Syntax** [Syntax on page 1807](#)  
[Syntax \(EX Series Switches\) on page 1807](#)

**Syntax** show mpls path  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>  
 <path-name>

**Syntax (EX Series Switches)** show mpls path  
 <path-name>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.5 for EX Series switches.  
**instance** *instance-name* option added in Junos OS Release 15.1.

**Description** Display dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

**Options** **none**—Display standard information about all MPLS LSPs.

**instance** *instance-name*—(Optional) Display the dynamic MPLS LSP for the specified instance. If *instance-name* is omitted, dynamic MPLS LSP for the master instance is displayed.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**path-name**—(Optional) Display information about the specified LSP only.

**Required Privilege Level** view

**List of Sample Output** [show mpls path on page 1808](#)

**Output Fields** [Table 73 on page 1807](#) describes the output fields for the **show mpls path** command. Output fields are listed in the approximate order in which they appear.

**Table 73: show mpls path Output Fields**

| Field Name                  | Field Description                                                 |
|-----------------------------|-------------------------------------------------------------------|
| <b>Path name</b>            | Information about ingress LSPs. Each path has one line of output. |
| <b>Address</b>              | Addresses of the routing devices that form the LSP.               |
| <b>Strict/loose address</b> | Whether the address is configured as a strict or loose address.   |

## Sample Output

### show mpls path

```
user@host> show mpls path
Path name      Address          Strict/loose address
p1             123.456.55.6    Strict
               123.456.1.6     Loose
p2             191.456.1.4     Strict
```

## show mpls srlg

**Syntax** `show mpls srlg`  
`<logical-systems (all | logical-system-name)>`

**Release Information** Command introduced before Junos OS Release 11.4.

**Description** Display Shared Risk Link Group (SRLG) cost and value configuration information.

**NOTE:** If an SRLG is associated with a link that is used by an ingress LSP in the router, then on deleting the SRLG configuration from that router, the SRLG gets removed from the SRLG table only on the next reoptimization of the LSP. Until then, the output of the run `show mpls srlg` command displays `Unknown-XXX` instead of the SRLG name and a non zero `srlg-cost` for that SRLG.

**Options** `logical-system (all | logical-system-name)`—(Optional) View SRLG configuration information for all logical systems or a particular logical system.

**Required Privilege Level** view

**Related Documentation** • [Example: Configuring SRLG on page 92](#)

**Output Fields** [Table 74 on page 1809](#) lists the output fields for the `show mpls srlg` command. Output fields are listed in the approximate order in which they appear.

**Table 74: show mpls srlg Output Fields**

| Field Name | Field Description                                                          |
|------------|----------------------------------------------------------------------------|
| SRLG       | Name of the SRLG.                                                          |
| Value      | A group ID for the SRLG ranging from 1 through 4294967295.                 |
| Cost       | A cost for the Shared Risk Link Group (SRLG) ranging from 1 through 65535. |

## Sample Output

```
user@host> show mpls srlg
```

```
SRLG      Value      Cost
srlg-a    101        10
```

## show mpls static-lsp

---

**Syntax**    `show mpls static-lsp`  
              `<brief | detail | extensive | terse>`  
              `<bypass>`  
              `<descriptions>`  
              `<down | up>`  
              `<ingress>`  
              `<instance instance-name>`  
              `<logical-system (all | logical-system-name)>`  
              `<lsp-type>`  
              `<name name>`  
              `<statistics>`  
              `<transit>`

**Release Information**    Command introduced in Junos OS Release 10.1.  
                              Command updated in Junos OS Release 14.1X53-D25 to accommodate the stitching feature of MPLS.  
                              Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.  
                              Statement introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.

**Description**    Display information about configured and active static Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

**Options**    **none**—Display standard information about all configured and active static MPLS LSPs.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output. The **extensive** option displays the same information as the **detail** option, but covers the most recent 50 events.

**bypass**—(Optional) Display LSPs used for protecting other static LSPs.

**descriptions**—(Optional) Display the MPLS static LSP descriptions. To view this information, you must configure the description statement at the **[edit protocols mpls static-label-switched-path *path-name* bypass]**, **[edit protocols mpls static-label-switched-path *path-name* ingress]**, or **[edit protocols mpls static-label-switched-path *path-name* transit *incoming-label*]** hierarchy levels. Only static LSPs with a description are displayed.

**down | up**—(Optional) Display only static LSPs that are inactive or active, respectively.

**instance *instance-name***—(Optional) Display information about all configured and active static MPLS LSPs for the specified routing instance. If ***instance-name*** is omitted, information about all configured and active static MPLS LSPs for the master instance is displayed.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

**name *name***—(Optional) Display information about the specified static LSP or group of LSPs.

**statistics**—(Optional) Display accounting information about static LSPs.

**transit**—(Optional) Display static LSPs transiting this routing device.

**Required Privilege Level** view

**List of Sample Output** [show mpls static-lsp extensive on page 1812](#)  
[show mpls static-lsp statistics ingress on page 1812](#)  
[show mpls static-lsp \(when MPLS stitching is used\) on page 1812](#)

**Output Fields** [Table 62 on page 1765](#) describes the output fields for the **show mpls static-lsp** command. Output fields are listed in the approximate order in which they appear.

**Table 75: show mpls static-lsp Output Fields**

| Field Name                     | Field Description                                                                                                                                                                             | Level of Output          |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>Ingress LSPs</b>            | Information about the static LSPs on the ingress routing device. Each session has one line of output.                                                                                         | All levels               |
| <b>Transit LSPs</b>            | Number of static LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. | All levels               |
| <b>Bypass LSPs</b>             | Information about the bypass LSPs configured on the routing device. Each session has one line of output.                                                                                      | All levels               |
| <b>LSPname</b>                 | Name of the static LSP.                                                                                                                                                                       | All levels               |
| <b>To</b>                      | Destination (egress routing device) of the session.                                                                                                                                           | All levels               |
| <b>State</b>                   | State of the static LSP handled by this RSVP session: <b>Up</b> , <b>Dn</b> (down), or <b>Restart</b> .                                                                                       | All levels               |
| <b>Packets</b>                 | Number of packet transiting the static LSP ( <b>statistics</b> option only).                                                                                                                  | All levels               |
| <b>Bytes</b>                   | Number of bytes transiting the static LSP ( <b>statistics</b> option only).                                                                                                                   | All levels               |
| <b>Nexthop</b>                 | IP address for the next-hop router for the static LSP.                                                                                                                                        | <b>detail, extensive</b> |
| <b>Bypass</b>                  | (Bypass LSP) Destination address (egress routing device) for the bypass LSP.                                                                                                                  | All levels               |
| <b>Link protection desired</b> | Link protection has been requested by the ingress routing device.                                                                                                                             | <b>detail, extensive</b> |

Table 75: show mpls static-lsp Output Fields (*continued*)

| Field Name            | Field Description                                                                                                                                                                                                                   | Level of Output          |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>LabelOperation</b> | Label operation to perform: <b>Push</b> , <b>Pop</b> , <b>Swap</b> .                                                                                                                                                                | <b>detail, extensive</b> |
| <b>Outgoing-label</b> | Outgoing label to use for the MPLS packet in either push or swap label operations.                                                                                                                                                  | <b>detail, extensive</b> |
| <b>Created</b>        | (Ingress LSP) Date and time the static LSP was created.                                                                                                                                                                             | <b>extensive</b>         |
| <b>Bandwidth</b>      | Bandwidth configured for the static LSP.                                                                                                                                                                                            | <b>detail, extensive</b> |
| <b>Resv style</b>     | (Bypass) RSVP reservation style. This field consists of two parts: the number of active reservations and the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter). | All levels               |

## Sample Output

### show mpls static-lsp extensive

```

user@host> show mpls static-lsp extensive
Ingress LSPs:
LSPname: alpha-to-beta, To: 192.168.14.1
  State: Dn
  Nexthop: 192.168.10.1
  LabelOperation: Push, Outgoing-label: 1000001
  Created: Thu Jan 14 16:44:43 2010
  Bandwidth: 0 bps
Total 1, displayed 1, Up 0, Down 1

Transit LSPs:
Total 0, displayed 0, Up 0, Down 0

Bypass LSPs:
Total 0, displayed 0, Up 0, Down 0

```

### show mpls static-lsp statistics ingress

```

user@host> show mpls static-lsp statistics ingress
Ingress LSPs:
LSPname                To           State    Packets    Bytes
alpha-to-beta          192.168.14.1 Dn        NA         NA
Total 1, displayed 1, Up 0, Down 1

```

### show mpls static-lsp (when MPLS stitching is used)

The show mpls static-lsp command was extended in Junos release 14.1X53-D25 to accommodate the stitching feature of MPLS. This example shows the LSP state as 'InProgress' because the LSP is waiting for protocol next-hop resolution. For more information, see

```

user@host> show mpls static-lsp
Ingress LSPs:
Total 0, displayed 0, Up 0, Down 0
Transit LSPs: LSPname                Incoming-label  State

```

|                       | Forward loss measurement        | Average packet loss       | Average packet loss (total loss of packets divided by the total number of samples used since the session is up). | All Levels      |
|                       |                                 | Average packet throughput | Total number of packets sent divided by the time considered for measurement.                                     | All Levels      |
|                       | Reverse loss measurement        | Average packet loss       | Average packet loss (total loss of packets divided by the total number of samples used since the session is up). | All Levels      |
|                       |                                 | Average packet throughput | Total number of packets sent divided by the time considered for measurement.                                     | All Levels      |

Table 76: show performance-monitoring mpls lsp Output Fields (*continued*)

| Field Name             | Display Data                    | Field Description                                                                            | Level of Output          |
|------------------------|---------------------------------|----------------------------------------------------------------------------------------------|--------------------------|
| Delay measurement Data | Traffic-class                   | Traffic class for which delay measurement is performed.                                      | All Levels               |
|                        | Queries sent                    | Total number of queries sent for delay measurement.                                          | All Levels               |
|                        | Responses received              | Total number of responses received for delay measurement queries.                            | All Levels               |
|                        | Responses dropped due to errors | Total number of delay measurement responses dropped due to errors.                           | All Levels               |
|                        | Queries timeout                 | Number of timed out queries sent for delay measurement.                                      | All Levels               |
|                        | Best 2-way channel delay        | Best available two-way channel delay.                                                        | All Levels               |
|                        | Worst 2-way channel delay       | Worst available two-way channel delay.                                                       | All Levels               |
|                        | Best round trip time            | Best available round-trip time.                                                              | All Levels               |
|                        | Worst round trip time           | Worst available round-trip time.                                                             | All Levels               |
|                        | Avg absolute fw delay variation | Average of the variation in forward delay.                                                   | All Levels               |
|                        | Avg absolute rv delay variation | Average of the variation in reverse delay.                                                   | All Levels               |
|                        | Two-way channel delay           | Sum of packet delays, excluding the processing time of the remote provider edge (PE) router. | <b>detail, extensive</b> |
|                        | Two-way round trip delay        | Total time taken for completing round-trip of packet.                                        | <b>detail, extensive</b> |

## Sample Output

### show performance-monitoring mpls lsp

```

user@host> show performance-monitoring mpls lsp
Session Total: 3 Up: 3 Down: 0
LSP name:to_bad, PM State:Up
Loss measurement Data:
Duration: 00:04:43
Traffic-class: None
Queries sent: 282
Responses received: 282

```

```

Responses dropped due to errors: 0
Queries timeout: 0
Forward loss measurement:
  Average packet loss: 0
  Average packet throughput: 554338
Reverse loss measurement:
  Average packet loss: 0
  Average packet throughput: 1352077
LSP name:to_bad, PM State:Up
Delay measurement Data:
  Duration: 00:04:43
  Traffic-class: 0
  Queries sent: 282
  Responses received: 282
  Responses dropped due to errors: 0
  Queries timeout: 0
  Best 2-way channel delay: 72 usecs
  Worst 2-way channel delay: 365 usecs
  Best round trip time: 843 usecs
  Worst round trip time: 105523 usecs
  Avg absolute fw delay variation: 1619 usecs
  Avg absolute rv delay variation: 1619 usecs
LSP name:to_bad, PM State:Up
Loss measurement Data:
  Duration: 00:04:43
  Traffic-class: None

| <b>Output Fields</b>               | <p><a href="#">Table 77 on page 1820</a> describes the output fields for the <b>show ted database</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 77: show ted database Output Fields**

| Field Name   | Field Description                                                               | Level of Output |
|--------------|---------------------------------------------------------------------------------|-----------------|
| TED database | Number of nodes and pseudonodes participating in IS-IS and OSPF domain routing. | All levels      |

Table 77: show ted database Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                           | Level of Output         |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| ID                             | Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode. If the node contains a router ID, it is displayed in parentheses. | <b>brief</b>            |
| NodeID                         | Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.                                                                   | <b>extensive</b>        |
| Type                           | Type of node. It can be either <b>Rtr</b> (router) or <b>Net</b> (pseudonode).                                                                                                                                                                                                              | All levels              |
| Age(s)                         | How long since the node was last refreshed, in seconds.                                                                                                                                                                                                                                     | All levels              |
| LnkIn                          | Number of nodes pointing toward this node.                                                                                                                                                                                                                                                  | All levels              |
| LnkOut                         | Number of nodes to which this node points.                                                                                                                                                                                                                                                  | All levels              |
| Protocol                       | Protocol that reported the node information: <ul style="list-style-type: none"> <li>• <b>IS-IS(1)</b>—IS-IS Level 1.</li> <li>• <b>IS-IS(2)</b>—IS-IS Level 2.</li> <li>• <b>OSPF (area-number)</b>—OSPF from the specified area.</li> </ul>                                                | All levels              |
| To                             | Address on the far end of a link.                                                                                                                                                                                                                                                           | <b>detail extensive</b> |
| Local                          | Address of the local interface being used to reach the remote node.                                                                                                                                                                                                                         | <b>detail extensive</b> |
| Remote                         | Address of the interface on the remote node.                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| Local interface index          | The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.                                                                                                                                                                                 | <b>detail extensive</b> |
| Remote interface index         | The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.                                                                                                                                                                                 | <b>detail extensive</b> |
| Metric                         | Configured traffic engineering metric.                                                                                                                                                                                                                                                      | <b>extensive</b>        |
| IGP metric                     | Configured interior gateway protocol metric.                                                                                                                                                                                                                                                | <b>extensive</b>        |
| Static BW                      | Total interface bandwidth in bps.                                                                                                                                                                                                                                                           | <b>extensive</b>        |
| Reservable bandwidth           | Subscription factor for the interface, which is the percentage of the link bandwidth that can be used for the RSVP reservation process. You configure this by including the <b>subscription</b> statement when configuring RSVP.                                                            | <b>extensive</b>        |
| <b>Available BW [priority]</b> | (Must include <b>diffserv-te</b> statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each priority level. The bandwidth shown is for the entire interface, not for each individual LSP.                                                                      | <b>extensive</b>        |

| <b>Output Fields</b>               | <a href="#">Table 78 on page 1828</a> describes the output fields for the <b>show ted link</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                      |

Table 78: show ted link Output Fields

| Field Name | Field Description                                                                                                                                                                                                         | Level of Output |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| ID         | Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode. | <b>brief</b>    |
| -->ID      | Hostname and address of the node that the link is going to. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.    | <b>brief</b>    |

Table 78: show ted link Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                         | Level of Output         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>hostname</i>        | Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode. | <b>detail</b>           |
| <i>hostname</i>        | Hostname and address of the node that the link is going to. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.    | <b>detail</b>           |
| Local Path             | Number of paths CSPF on the local routing device has placed on the link.                                                                                                                                                  | All levels              |
| Metric                 | Configured traffic engineering metric.                                                                                                                                                                                    | <b>extensive</b>        |
| IGP metric             | Configured interior gateway protocol metric.                                                                                                                                                                              | <b>detail</b>           |
| Local BW               | Amount of bandwidth the local routing device has placed on the link.                                                                                                                                                      | All levels              |
| Local                  | Address of the local interface being used to reach the remote node.                                                                                                                                                       | <b>detail extensive</b> |
| Remote                 | Address of the interface on the remote node.                                                                                                                                                                              | <b>detail extensive</b> |
| Local interface index  | The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.                                                                                                               | <b>detail</b>           |
| Remote interface index | The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.                                                                                                               | <b>detail</b>           |

**Table 79: show ted protocol Output Fields**

| Field Name           | Field Description                                                                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Protocol name</b> | <p>Protocol that reported the node information:</p> <ul style="list-style-type: none"> <li><b>IS-IS(1)</b>—IS-IS Level 1.</li> <li><b>IS-IS(2)</b>—IS-IS Level 2.</li> <li><b>OSPF (<i>area-number</i>)</b>—OSPF from the specified area.</li> </ul> |
| <b>Credibility</b>   | If the protocols provide conflicting information about a node, the protocol with the highest credibility value is the one that the traffic engineering database uses.                                                                                |
| <b>Self node</b>     | Address the protocol uses as the local address.                                                                                                                                                                                                      |

## Sample Output

show ted protocol

```
user@host> show ted protocol
Protocol name      Credibility Self node
IS-IS(2)           2 (highest) corriedale.00(123.456.1.11)
IS-IS(1)           1          corriedale.00(123.456.1.11)
```

## traceroute mpls bgp

**Syntax** `traceroute mpls bgp fec`  
`<destination destination-address>`  
`<detail>`  
`<exp exp>`  
`<fanout fanout-number>`  
`<logical-system logical system-name>`  
`<no-resolve>`  
`<paths paths-number>`  
`<pipe-mode>`  
`<retries retries-number>`  
`<routing-instance routing-instance-name>`  
`<source source-address>`  
`<ttl value>`  
`<wait seconds>`

**Release Information** Command introduced in Junos OS Release 14.2.

**Description** Trace route to a remote host for an MPLS label-switched path (LSP) signaled by the Border Gateway Protocol (BGP). Use **traceroute mpls bgp** as a debugging tool to locate MPLS BGP forwarding issues in a network. (Currently supported for IPv4 packets only.)

**NOTE:** The `traceroute mpls bgp fec` command only supports single paths.

**Options** **fec**—Specify the IP address and optional prefix of the forwarding equivalence class (FEC). Suppose you are at PE1, you would want to use the IP address of PE2 to trace the BGP path to that router.

**destination destination-address**—(Optional) Specify the destination address to use when sending probes.

**detail**—(Optional) Display detailed output.

**exp exp**—(Optional) Specify the class of service to use when sending probes.

**Range:** 0 through 7

**Default:** 7

**fanout fanout-number**—(Optional) Specify the maximum number of next hops to search per node.

**Range:** 1 through 16

**Default:** 16

**logical-system logical-system-name**—(Optional) Specify the name of the logical system for the traceroute attempt.

**no-resolve**—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

**paths** *paths-number*—(Optional) Specify the number of paths to search.

**Range:** 1 through 255

**Default:** 16

**pipe-mode**—(Optional) Specify to trace only the outermost FEC.

**retries** *retries-number*—(Optional) Specify the number of times to resend probe values.

**Range:** 1 through 9

**Default:** 3

**routing-instance** *routing-instance-name*—(Optional) Specify the name of the routing instance for the trace route attempt.

**source** *source-address*—(Optional) Specify the source address of the outgoing traceroute packets.

**ttl** *value*—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

**Range:** 1 through 125

**Default:** 64

**wait** *seconds*—(Optional) Specify the number of seconds to wait before resending a probe.

**Range:** 5 through 15

**Default:** 10

**Required Privilege Level** network

**Output Fields** [Table 80 on page 1834](#) describes the output fields for the **traceroute mpls bgp fec** command and the **traceroute mpls bgp fec detail** command. Output fields are listed in the approximate order in which they appear.

**Table 80: traceroute mpls bgp Output Fields**

| Field Name    | Field Description                                                             | Level of Output |
|---------------|-------------------------------------------------------------------------------|-----------------|
| Probe options | Probe options specified in the <b>traceroute mpls bgp fec</b> command.        | All levels      |
| ttl           | Time to live value of the labeled packet.                                     | None            |
| Label         | Outgoing label used for forwarding the packet along the label-switched paths. | None            |

Table 80: traceroute mpls bgp Output Fields (*continued*)

| Field Name     | Field Description                                                                                                        | Level of Output |
|----------------|--------------------------------------------------------------------------------------------------------------------------|-----------------|
| Protocol       | Signaling protocol used. For this command, it is BGP.                                                                    | None            |
| Address        | Address of the next hop.                                                                                                 | None            |
| Previous Hop   | Address of the previous hop. Previous hop address of the first hop is <b>null</b> .                                      | None            |
| Probe status   | Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).  | None            |
| Hop            | Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop. | <b>detail</b>   |
| Parent         | Address of the previous hop. Parent value for the first hop is <b>null</b> .                                             | <b>detail</b>   |
| Return Code    | Return code for reporting the result of processing the echo request by the receiver.                                     | <b>detail</b>   |
| Response time  | Time for the echo request to reach the receiver.                                                                         | <b>detail</b>   |
| Multipath type | Labels or addresses used by the specified multipath type. If multipaths are not used, the value is <b>none</b> .         | <b>detail</b>   |
| Label Stack    | Label stack used to forward the packet.                                                                                  | <b>detail</b>   |

Operation: PUSH Protocol RSVP

## transit (Chained Composite Next Hops)

**Syntax** transit {  
 (all | no-all);  
 (l2vpn | no-l2vpn);  
 (l3vpn | no-l3vpn);  
 (labeled-bgp | no-labeled-bgp);  
 (ldp | no-ldp);  
 (ldp-p2mp | no-ldp-p2mp);  
 lsp-statistics-from-route;  
 (rsvp | no-rsvp);  
 (rsvp-p2mp | no-rsvp-p2mp);  
 (static | no-static);  
 }

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-options forwarding-table  
 chained-composite-next-hop],  
 [edit routing-options forwarding-table chained-composite-next-hop]

**NOTE:** The [edit logical-systems] hierarchy level is not supported on the QFX10000 switches.

**Release Information** Statement introduced in Junos OS Release 12.1.  
 Statement introduced in Junos OS Release 15.1 for QFX10000 Series switches.

**Description** Allows you to configure the chained composite next hops transit configuration options for devices handling transit traffic in the network. This statement and the associated functionality is available on PTX Packet Transport Routers and QFX10000 switches.

**Default** All of the **transit** statement options are enabled on PTX transport routers and QFX10000 switches. However, you can disable any of the statements with a **no** option.

**Options** **all | no-all**—Enable or disable chained composite next-hops for all of the possible packet transit protocols and applications. The **all | no-all** statements do not apply to the **lsp-statistics-from-route** statement.

**l2vpn | no-l2vpn**—Enable or disable chained composite next-hops for Layer 2 VPNs.

**l3vpn | no-l3vpn**—Enable or disable chained composite next-hops for Layer 3 VPNs.

**labeled-bgp | no-labeled-bgp**—Enable or disable chained composite next-hops for labeled BGP.

**ldp | no-ldp**—Enable or disable chained composite next-hops for LDP.

**ldp-p2mp | no-ldp-p2mp**—Enable or disable chained composite next-hops for LDP-signaled P2MP LSPs.

**NOTE:** On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `rsvp-p2mp` and `ldp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current master logical system to fail at the time of a Routing Engine switchover.

**`lsp-statistics-from-route`**—Enable LSP statistics collection from the route.

**`rsvp` | `no-rsvp`**—Enable or disable chained composite next-hops for RSVP.

**`rsvp-p2mp` | `no-rsvp-p2mp`**—Enable or disable chained composite next-hops for RSVP-signaled P2MP LSPs.

**NOTE:** On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `rsvp-p2mp` and `ldp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current master logical system to fail at the time of a Routing Engine switchover.

**`static` | `no-static`**—Chained composite next hops are enabled for transit static LSPs by default. You can also disable this functionality for transit static LSPs.

**Required Privilege Level**    `routing`—To view this statement in the configuration.  
                                  `routing-control`—To add this statement to the configuration.

                                                  <name *name*>  
                                                  <optimize-fast-reroute>  
                                                  <tunnel-id *identifier*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description**    Reset and restart Resource Reservation Protocol (RSVP) sessions.

**Options**    **all**—Clear all RSVP sessions for which this routing device is the ingress, transit, or egress routing device.

**connection-source *address***—(Optional) Source address for GMPLS and MPLS LSPs from the RSVP sender template.

**connection-destination *address***—(Optional) Destination address for GMPLS and MPLS LSPs from the RSVP sender template.

**gracefully**—(Optional) Gracefully reset an RSVP session for a nonpacket LSP in two passes. In the first pass, the Admin-Status object is signaled along the path to the other endpoint of the RSVP session. In the second pass, the path used by the RSVP session is torn down. This option can only be used on the ingress or egress routing device of the RSVP session and is only valid for nonpacket LSPs.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsp-id *identifier***—(Optional) LSP identifier (source port) for the RSVP sender template.

**name *name***—(Optional) Reset and restart the specified RSVP session.

**optimize-fast-reroute**—(Optional) Begin fast reroute optimization.

**tunnel-id *identifier***—(Optional) Tunnel identifier (destination port) for the RSVP session.

## Sample Output

### clear rsvp statistics

```
user@host> clear rsvp statistics
```

## monitor label-switched-path

**Syntax** `monitor label-switched-path lsp-name`  
`<logical-system (logical-system-name)>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Logical system support introduced in Junos OS Release 9.4.  
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description** Display the real-time status of the specified RSVP label-switched path (LSP). You can also use this command to monitor LSPs configured within logical systems.

**Options** `logical-system ( logical-system-name )`—(Optional) Perform this operation on all logical systems or on a particular logical system.

*lsp-name*—Name of the LSP.

**Additional Information** You can track the amount of traffic traversing an RSVP LSP and observe its essential parameters, such as uptime, ingress and egress addresses, labels, routes, and ports. Values are typically sampled every second. The display also allows you to scroll to other currently running LSPs. You cannot use this command to display information about static LSPs or LDP-signaled LSPs.

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the `c` key. To control the output of the **monitor label-switched-path** command while it is running, use the keys listed in [Table 81 on page 1843](#). The keys are not case-sensitive.

**Table 81: Output Control Keys for the monitor label-switched-path Command**

| Key      | Action                                                                                                                            |
|----------|-----------------------------------------------------------------------------------------------------------------------------------|
| c        | Clears the screen and refreshes the display for this LSP.                                                                         |
| f        | Freezes the display, preventing new information from being displayed.                                                             |
| l        | Monitors a different LSP. After you type l, you can type the new LSP name.                                                        |
| n        | Displays information about the next LSP (whose name is alphabetically higher than the current LSP name) configured on the router. |
| p        | Goes to the previous LSP (whose name is alphabetically lower than the current LSP name) configured on the router.                 |
| q or Esc | Quits the command and returns to the command prompt.                                                                              |
| t        | Thaws, or restarts, the data display for this LSP.                                                                                |

**Required Privilege Level** trace

**List of Sample Output** [monitor label-switched-path on page 1845](#)

**Output Fields** [Table 82 on page 1844](#) describes the output fields for the **monitor label-switched-path** command. Output fields are listed in the approximate order in which they appear.

**Table 82: monitor label-switched-path Output Fields**

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (1)        | Displays the following information: <ul style="list-style-type: none"> <li>• <b>hostname</b>—Name of the router.</li> <li>• <b>Seconds</b>—Time elapsed since this display was started.</li> <li>• <b>Time</b>—Current local time.</li> </ul>                                                                                                                                                               |
| (2)        | <b>Delay</b> —Length of the time delay, in milliseconds, required to obtain the information in the monitor display. The first number shows the current sampling delay. The second number shows the shortest delay recorded to date. The third number shows the worst delay recorded to date. This delay can vary substantially depending on the system load.                                                |
| (3)        | Displays the following: <ul style="list-style-type: none"> <li>• <b>To</b>—Destination address of the LSP.</li> <li>• <b>From</b>—Originating address of the LSP.</li> <li>• <b>State</b>—Current state of the LSP: <b>Up</b> or <b>Down</b>.</li> </ul>                                                                                                                                                    |
| (4)        | Displays the following: <ul style="list-style-type: none"> <li>• <b>LSPName</b>—Name of the LSP.</li> <li>• <b>Type</b>—Type of LSP: <b>Ingress</b>, <b>Egress</b>, or <b>Transit</b>.</li> </ul>                                                                                                                                                                                                           |
| (5)        | Displays the following: <ul style="list-style-type: none"> <li>• <b>Label in</b>—Incoming label of the LSP.</li> <li>• <b>Label out</b>—Outgoing label of the LSP.</li> </ul>                                                                                                                                                                                                                               |
| (6)        | <b>Port number</b> —Port number for the sending router, the port number for the receiving router, and the protocol ID. For MPLS traffic engineering applications, the protocol ID is always 0.                                                                                                                                                                                                              |
| (7/8)      | <b>Record route</b> —All intermediate and egress router addresses for this LSP.                                                                                                                                                                                                                                                                                                                             |
| (9/10/11)  | Displays traffic statistics: <ul style="list-style-type: none"> <li>• <b>Output packets</b>—Number of packets that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.</li> <li>• <b>Output bytes</b>—Number of bytes that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.</li> </ul> |
| (12)       | Displays any errors the router encountered while attempting to retrieve information on the LSP.                                                                                                                                                                                                                                                                                                             |
| (13)       | Lists the keyboard commands you can use to navigate to other LSPs. For a description of the keyboard commands, see <a href="#">Table 81 on page 1843</a> .                                                                                                                                                                                                                                                  |

## ping mpls rsvp

---

**Syntax**    ping mpls rsvp  
             <lsp-name>  
             <count count>  
             <destination address>  
             <detail>  
             <dynamic-bypass>  
             <egress egress-address>  
             <exp forwarding-class>  
             <interface interface-name>  
             <logical-system (all | logical-system-name)>  
             <manual-bypass>  
             <multipoint>  
             <size bytes>  
             <source source-address>  
             <standby standby-path-name>  
             <sweep>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              The **egress** and **multipoint** options were introduced in Junos OS Release 9.2.  
                              The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
                              The **dynamic-bypass** and **manual-bypass** options were introduced in Junos OS Release 10.2.  
                              Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**            Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections.  
                              Type Ctrl+c to interrupt a **ping mpls** command.

**Options**                **count count**—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination address**—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**NOTE:** When using the **detail** option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the **detail** option (even when synchronized using NTP).

---

**dynamic-bypass**—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

**egress *egress-address***—(Optional) Only the specified egress router or switch responds to the ping request.

**exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.

**interface**—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the **manual-bypass** option.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.

***lsp-name***—Ping an RSVP-signaled LSP using an LSP name.

**manual-bypass**—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the **interface** option.

**multipoint**—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the **egress** option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

**size *bytes***—(Optional) Size of the LSP ping request packet (100 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

**standby *standby-path-name***—(Optional) Name of the standby path.

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls rsvp \(Echo Reply Received\) on page 1848](#)  
[ping mpls rsvp \(Echo Reply with Error Code\) on page 1848](#)

[ping mpls rsvp detail on page 1848](#)

[ping mpls rsvp multipoint egress detail count on page 1848](#)

[ping mpls rsvp multipoint detail count on page 1848](#)

[ping mpls rsvp destination detail count size on page 1849](#)

[ping mpls rsvp destination detail sweep size on page 1849](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls rsvp (Echo Reply Received)

```
user@host> ping mpls rsvp test1
!!!!!--- lsping statistics ---5 packets transmitted, 5 packets received, 0% packet
loss
```

### ping mpls rsvp (Echo Reply with Error Code)

```
user@host> ping mpls rsvp test2
!!xxx--- lsping statistics ---5 packets transmitted, 2 packets received, 60%
packet loss3 packets received with error status, not counted as received.
```

### ping mpls rsvp detail

```
user@host> ping mpls rsvp to-green detail

| <b>Output Fields</b>               | <p><a href="#">Table 83 on page 1852</a> lists the output fields for the <b>show rsvp interface</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 83: show rsvp interface Output Fields

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                    | Level of Output  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>RSVP interface</b>         | Number of interfaces on which RSVP is active. Each interface has one line of output.                                                                                                                                                                                                                                 | All levels       |
| <b>Interface</b>              | Name of the interface.                                                                                                                                                                                                                                                                                               | All levels       |
| <b>Index</b>                  | Index of the interface.                                                                                                                                                                                                                                                                                              | <b>detail</b>    |
| <b>State</b>                  | State of the interface. <ul style="list-style-type: none"> <li>• <b>Disabled</b>—No traffic engineering information is displayed.</li> <li>• <b>Down</b>—Interface is not operational.</li> <li>• <b>Enabled</b>—Displays traffic engineering information.</li> <li>• <b>Up</b>—Interface is operational.</li> </ul> | All levels       |
| <b>NoAuthentication</b>       | Interface does not support RSVP authentication.                                                                                                                                                                                                                                                                      | <b>detail</b>    |
| <b>NoAggregate</b>            | Interface does not support refresh reduction.                                                                                                                                                                                                                                                                        | <b>detail</b>    |
| <b>NoReliable</b>             | Interface does not support refresh reduction message ID extension.                                                                                                                                                                                                                                                   | <b>detail</b>    |
| <b>NoLinkProtection</b>       | Interface does not support link protection.                                                                                                                                                                                                                                                                          | <b>detail</b>    |
| <b>HelloInterval</b>          | Frequency at which RSVP hellos are sent on this interface (in seconds).                                                                                                                                                                                                                                              | <b>detail</b>    |
| <b>Address</b>                | IP address of the local interface.                                                                                                                                                                                                                                                                                   | <b>detail</b>    |
| <b>Active control channel</b> | Next-hop link address to transmit messages.                                                                                                                                                                                                                                                                          | None specified   |
| <b>TELink</b>                 | Traffic-engineered links that are managed by the peer they are associated with.                                                                                                                                                                                                                                      | None specified   |
| <b>Active resv</b>            | Number of reservations that are actively reserving bandwidth on the interface.                                                                                                                                                                                                                                       | All levels       |
| <b>PreemptionCnt</b>          | Number of times an RSVP session was preempted on this interface.                                                                                                                                                                                                                                                     | <b>detail</b>    |
| <b>Update threshold</b>       | Percentage change in reserved bandwidth to trigger an IGP update.                                                                                                                                                                                                                                                    | <b>detail</b>    |
| <b>Subscription</b>           | User-configured subscription factor.                                                                                                                                                                                                                                                                                 | All levels       |
| <b>bc number</b>              | Bandwidth allocated for the specified bandwidth constraint.                                                                                                                                                                                                                                                          | <b>extensive</b> |
| <b>ct number</b>              | Bandwidth allocated for the specified class type.                                                                                                                                                                                                                                                                    | <b>extensive</b> |
| <b>Static BW</b>              | Total interface bandwidth, in bps.                                                                                                                                                                                                                                                                                   | All levels       |
| <b>Available BW</b>           | Amount of bandwidth that RSVP is allowed to reserve, in bps. It is equal to (static bandwidth * subscription factor).                                                                                                                                                                                                | al levels        |

Table 83: show rsvp interface Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                               | Level of Output  |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Reserved BW</b>             | Currently reserved bandwidth, in bps.                                                                                                                           | All levels       |
| <b>SoftPreemptionCnt</b>       | Number of times a soft preemption occurred on this interface. This number is not included in the <b>PreemptionCnt</b> value.                                    | <b>detail</b>    |
| <b>Overbooked BW</b>           | Currently overbooked bandwidth, in bps, by class type ( <b>ct0</b> through <b>ct3</b> ).                                                                        | <b>detail</b>    |
| <b>Highwater mark</b>          | Highest bandwidth that has ever been reserved on this interface, in bps.                                                                                        | <b>brief</b>     |
| <b>PacketType</b>              | Type of RSVP packet.                                                                                                                                            | <b>detail</b>    |
| <b>Total Sent</b>              | Total number of packets sent.                                                                                                                                   | <b>detail</b>    |
| <b>Total Received</b>          | Total number of packets received since RSVP was enabled.                                                                                                        | <b>detail</b>    |
| <b>Last 5 seconds Sent</b>     | Number of packets sent in the last 5 seconds.                                                                                                                   | <b>detail</b>    |
| <b>Last 5 seconds Received</b> | Number of packets received in the last 5 seconds.                                                                                                               | <b>detail</b>    |
| <b>Path</b>                    | Statistics about Path messages, which are sent from the RSVP sender along the data paths and store path state information in each node along the path.          | <b>detail</b>    |
| <b>PathErr</b>                 | Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.                                                            | <b>detail</b>    |
| <b>PathTear</b>                | Statistics about PathTear messages, which remove path states and dependent reservation states in any routers along a path.                                      | <b>detail</b>    |
| <b>Resv</b>                    | Statistics about Resv messages, which are sent from the RSVP receiver along the data paths and store reservation state information in each node along the path. | <b>detail</b>    |
| <b>ResvErr</b>                 | Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.                                  | <b>detail</b>    |
| <b>ResvTear</b>                | Statistics about ResvTear messages, which remove reservation states along a path.                                                                               | <b>detail</b>    |
| <b>Hello</b>                   | Number of RSVP hello packets that have been sent to and received from the neighbor.                                                                             | <b>detail</b>    |
| <b>Ack</b>                     | Acknowledge message for refresh reductions.                                                                                                                     | <b>detail</b>    |
| <b>Srefresh</b>                | Summary refresh messages.                                                                                                                                       | <b>detail</b>    |
| <b>EndtoEnd RSVP</b>           | Statistics for the number of end-to-end RSVP messages sent.                                                                                                     | <b>detail</b>    |
| <b>Queue</b>                   | CoS transmit queue number and its associated forwarding class designation.                                                                                      | <b>extensive</b> |

Table 83: show rsvp interface Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                 | Level of Output  |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>TxRate</b>               | Configured bandwidth in Mbps and configured bandwidth as a percentage of the specified queue.                                                     | <b>extensive</b> |
| <b>Priority</b>             | Weight of the queue relative to other configured queues, in percentage.                                                                           | <b>extensive</b> |
| <b>queue-priority-value</b> | <b>Low, High, None, or Exact.</b> <b>None</b> indicates no rate limiting. <b>Exact</b> indicates the queue transmits at the configured rate only. | <b>extensive</b> |

## Sample Output

### show rsvp interface brief

```

user@host> show rsvp interface brief
RSVP interface: 1 active

```

| Interface | State | Active resv | Subscr-<br>ption | Static<br>BW | Available<br>BW | Reserved<br>BW | Highwater<br>mark |
|-----------|-------|-------------|------------------|--------------|-----------------|----------------|-------------------|
| de0.0     | Up    | 1           | 23%              | 10Mbps       | 989.992kbps     | 1.31Mbps       | 1.31Mbps          |

### show rsvp interface detail

Starting in Junos OS Release 15.2, this command also shows conditional PathTear statistics and Node Hellos.

```

| <b>Output Fields</b>               | <a href="#">Table 84 on page 1856</a> lists the output fields for the <b>show rsvp neighbor</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                              |

**Table 84: show rsvp neighbor Output Fields**

| Field Name           | Field Description                                                                                                                                                    | Level of Output |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>RSVP neighbor</b> | Number of neighbors that the routing device has learned of. Each neighbor has one line of output.                                                                    | All levels      |
| <b>via</b>           | Name of the interface where the neighbor has been detected. In the case of generalized MPLS (GMPLS) LSPs, the name of the peer where the neighbor has been detected. | <b>detail</b>   |
| <b>Address</b>       | Address of a learned neighbor.                                                                                                                                       | All levels      |

Table 84: show rsvp neighbor Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Level of Output |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Idle</b>                | Length of time the neighbor has been idle, in seconds.<br><br><b>NOTE:</b> Until Junos OS Release 15.1, in the output of the show rsvp neighbor command, the value under the Idle field immediately reflects the changed idle time when a link in the neighboring router is brought down. Starting with Junos OS Release 15.2, a router does not declare a neighbor as idle when a hello adjacency exists and has not timed out. When an interface is brought down, RSVP brings down the neighbor because of the notification it receives from IGP. The reason for considering the IGP-down notification is to support BFD-triggered fast reroute (FRR) and RSVP-TE is not directly a client for BFD notifications. When RSVP brings down the neighbor, the input/output process is not impacted. As a result, the idle time in the output of the show command is not immediately updated.                                                                                                        | All levels      |
| <b>Up/Dn</b>               | Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | All levels      |
| <b>Up cnt and Down cnt</b> | Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail</b>   |
| <b>status</b>              | State of the RSVP neighbor: <ul style="list-style-type: none"> <li><b>Up</b>—Routing device can detect RSVP Hello messages from the neighbor.</li> <li><b>Down</b>—Routing device has received one of the following indications: <ul style="list-style-type: none"> <li>Communication failure from the neighbor.</li> <li>Communication from IGP that the neighbor is unavailable.</li> <li>Change in the sequence numbers in the RSVP Hello messages sent by the neighbor.</li> </ul> </li> <li><b>Restarting</b>—RSVP neighbor is unavailable and might be restarting. The neighbor remains in this state until it has restarted or is declared dead. This state is possible only when graceful restart is enabled.</li> <li><b>Restarted</b>—RSVP neighbor has restarted and is undergoing state recovery (graceful restart) procedures.</li> <li><b>Dead</b>—Routing device has lost all communication with the RSVP neighbor. Any RSVP sessions with that neighbor are torn down.</li> </ul> | <b>detail</b>   |
| <b>LastChange</b>          | Time elapsed since the neighbor state changed either from up to down or from down to up. The format is <b>hh:mm:ss</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |

| <b>Refresh reduction</b> | <p>Measure of processing overhead requests of refresh messages. Refresh reduction extensions improve routing device performance by reducing the process overhead, thus increasing the number of LSPs a routing device can support. <b>Refresh reduction</b> can have the following values:</p> <ul style="list-style-type: none"> <li>• <b>operational</b>—All four RSVP refresh reduction extensions—message ack, bundling, summary refresh, and staged refresh timer—are functional between the two neighboring routing devices. For a detailed explanation of these extensions, see RFC 2961.</li> <li>• <b>incomplete</b>—Some RSVP refresh reduction extensions are functional between the two neighboring routing devices.</li> <li>• <b>no operational</b>—Either the refresh reduction feature has been turned off, or the remote routing device cannot support the refresh reduction extensions.</li> </ul> | <b>detail</b>   |
| <b>Remote end</b>        | <p>Neighboring routing device's status with regard to refresh reduction:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Remote routing device has requested refresh reduction during RSVP message exchanges.</li> <li>• <b>disabled</b>—Remote routing device does not require refresh reduction.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail</b>   |
| <b>Ack-extension</b>     | <p>An RSVP refresh reduction extension:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Both local and remote routing devices support the ack-extension (RFC 2961).</li> <li>• <b>disabled</b>—Remote routing device does not support the ack-extension.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>   |
| <b>Link protection</b>   | <p>Status of the MPLS fast reroute mechanism that protects traffic from link failure:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Link protection feature has been turned on, protecting the neighbor with a bypass LSP.</li> <li>• <b>disabled</b>—No link protection feature has been enabled for this neighbor.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b>   |
| <b>LSP name</b>          | Name of the bypass LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail</b>   |

Table 84: show rsvp neighbor Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Bypass LSP</b>            | Status of the bypass LSP. It can have the following values: <ul style="list-style-type: none"> <li>• <b>does not exist</b>—Bypass LSP is not available.</li> <li>• <b>connecting</b>—Routing device is in the process of establishing a bypass LSP, and the LSP is not available for link protection at the moment.</li> <li>• <b>operational</b>—Bypass LSP is up and running.</li> <li>• <b>down</b>—Bypass LSP has gone down, with the most probable cause a node or a link failure on the bypass path.</li> </ul> | <b>detail</b>   |
| <b>Backup routes</b>         | Number of user LSPs (or routes) that are being protected by a bypass LSP (before link failure).                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail</b>   |
| <b>Backup LSPs</b>           | Number of LSPs that have been temporarily established to maintain traffic by refreshing the downstream LSPs during link failure (not a one-to-one correspondence).                                                                                                                                                                                                                                                                                                                                                    | <b>detail</b>   |
| <b>Bypass explicit route</b> | Explicit route object's (ERO) path that is taken by the bypass LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail</b>   |
| <b>Restart time</b>          | Length of time a neighbor waits to receive a Hello from the restarting node before declaring the node dead and deleting the states (in milliseconds).                                                                                                                                                                                                                                                                                                                                                                 | <b>detail</b>   |
| <b>Recovery time</b>         | Length of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds). Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.                                                                                                                                                                                        | <b>detail</b>   |

## Sample Output

### show rsvp neighbor

```
user@host> show rsvp neighbor
RSVP neighbor: 2 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx
192.168.207.203   0 3/2    13:01      3   366/349
192.168.207.207   0 1/0    22:49      3   448/448
```

### show rsvp neighbor detail

Starting in Junos OS Release 16.1, this command also shows whether enhanced FRR procurers are enabled on the neighbor. Neighbors with Point of Local Repair (PLR) or Node Protecting Merge Point (NP-MP) also show the Hellos sent /received count.

```
user@host> show rsvp neighbor detail

| <b>Description</b>                         | Display information about Resource Reservation Protocol (RSVP) sessions.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                             | <p><b>none</b>—Display standard information about all RSVP sessions.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>bidirectional   unidirectional</b>—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.</p> <p><b>bypass</b>—(Optional) Display RSVP sessions for bypass LSPs.</p> <p><b>down   up</b>—(Optional) Display only LSPs that are inactive or active, respectively.</p> |

**externally-provisioned**—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

**instance *instance-name***—(Optional) Display RSVP sessions for the specified instance. If **instance-name** is omitted, RSVP session information is displayed for the master instance.

**interface *interface-name***—(Optional) Display RSVP sessions for the specified interface only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about RSVP sessions with regard to LSPs:

- **bypass**—Sessions used for bypass LSPs.
- **lsp**—Sessions used to set up LSPs.
- **nolsp**—Sessions not used to set up LSPs.

**name *session-name***—(Optional) Display information about the named session.

**p2mp**—(Optional) Display point-to-multipoint information.

***session-type***—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that transit through this routing device.

**statistics**—(Optional) Display packet statistics.

**te-link *te-link***—(Optional) Display sessions with reservations on the specified TE link.

**Required Privilege  
Level**

**Output Fields** [Table 85 on page 1863](#) describes the output fields for the **show rsvp session** command. Output fields are listed in the approximate order in which they appear.

**Table 85: show rsvp session Output Fields**

| Field Name               | Field Description                                                                                                                                                                                                                                                                                        | Level of Output     |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Ingress RSVP</b>      | Information about ingress RSVP sessions.                                                                                                                                                                                                                                                                 | <b>detail</b>       |
| <b>Ingress RSVP</b>      | Information about ingress RSVP sessions. Each session has one line of output.                                                                                                                                                                                                                            | All levels          |
| <b>Egress RSVP</b>       | Information about egress RSVP sessions.                                                                                                                                                                                                                                                                  | All levels          |
| <b>Transit RSVP</b>      | Information about the transit RSVP sessions.                                                                                                                                                                                                                                                             | All levels          |
| <b>P2MP name</b>         | (Appears only when the <b>p2mp</b> option is specified). Name of the point-to-multipoint LSP path.                                                                                                                                                                                                       | All levels          |
| <b>P2MP branch count</b> | (Appears only when the <b>p2mp</b> option is specified). Number of LSPs receiving packets from the point-to-multipoint LSP.                                                                                                                                                                              | All levels          |
| <b>To</b>                | Destination (egress routing device) of the session.                                                                                                                                                                                                                                                      | All levels          |
| <b>From</b>              | Source (ingress routing device) of the session.                                                                                                                                                                                                                                                          | All levels          |
| <b>State</b>             | State of the path: <b>Up</b> , <b>Down</b> , or <b>AdminDn</b> . <b>AdminDn</b> indicates that the LSP is being taken down gracefully.                                                                                                                                                                   | All levels          |
| <b>Address</b>           | Destination (egress routing device) of the LSP.                                                                                                                                                                                                                                                          | <b>detail</b>       |
| <b>From</b>              | Source (ingress routing device) of the session.                                                                                                                                                                                                                                                          | <b>detail</b>       |
| <b>LSPstate</b>          | State of the LSP that is being handled by this RSVP session. It can be either <b>Up</b> , <b>Dn</b> (down), or <b>AdminDn</b> . <b>AdminDn</b> indicates that the LSP is being taken down gracefully.                                                                                                    | <b>brief detail</b> |
| <b>Rt</b>                | Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ).                         | <b>brief</b>        |
| <b>Active Route</b>      | Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table ( <b>mpls.0</b> ).                | <b>detail</b>       |
| <b>LSPname</b>           | Name of the LSP.                                                                                                                                                                                                                                                                                         | <b>brief detail</b> |
| <b>LSPpath</b>           | Indicates whether the RSVP session is for the primary or secondary LSP path. <b>LSPpath</b> can be either <b>primary</b> or <b>secondary</b> and can be displayed on the ingress, egress, and transit routing devices. <b>LSPpath</b> can also indicate when a graceful LSP deletion has been triggered. | <b>detail</b>       |

Table 85: show rsvp session Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                  | Level of Output     |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Bypass</b>                   | (Egress routing device) Destination address for the bypass LSP.                                                                                                                                                                                    | <b>detail</b>       |
| <b>Bidir</b>                    | (When LSP is bidirectional) LSP will allow data to travel in both directions between GMPLS devices.                                                                                                                                                | <b>detail</b>       |
| <b>Bidirectional</b>            | (When LSP is bidirectional) LSP will allow data to travel both ways between GMPLS devices.                                                                                                                                                         | <b>detail</b>       |
| <b>Upstream label in</b>        | (When LSP is bidirectional) Incoming label for reverse direction traffic for this LSP.                                                                                                                                                             | <b>detail</b>       |
| <b>Upstream label out</b>       | (When LSP is bidirectional) Outgoing label for reverse direction traffic for this LSP.                                                                                                                                                             | <b>detail</b>       |
| <b>Recovery label received</b>  | (When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.                                                                                                                                             | <b>detail</b>       |
| <b>Recovery label sent</b>      | (When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned.                                                                                                                                      | <b>detail</b>       |
| <b>Suggested label received</b> | (When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.                                                                                                                                             | <b>detail</b>       |
| <b>Suggested label sent</b>     | (When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned.                                                                                                                                       | <b>detail</b>       |
| <b>Resv style or Style</b>      | RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter). | <b>brief detail</b> |
| <b>Label in</b>                 | Incoming label for this LSP.                                                                                                                                                                                                                       | <b>brief detail</b> |
| <b>Label out</b>                | Outgoing label for this LSP.                                                                                                                                                                                                                       | <b>brief detail</b> |
| <b>Time left</b>                | Number of seconds remaining in the lifetime of the reservation.                                                                                                                                                                                    | <b>brief detail</b> |
| <b>Since</b>                    | Date and time when the RSVP session was initiated.                                                                                                                                                                                                 | <b>detail</b>       |
| <b>Tspec</b>                    | Sender's traffic specification, which describes the sender's traffic parameters.                                                                                                                                                                   | <b>detail</b>       |
| <b>DiffServ info</b>            | Indicates whether the LSP is a multiclass LSP ( <b>multiclass diffServ-TE LSP</b> ) or a Differentiated-Services-aware traffic engineering LSP ( <b>diffServ-TE LSP</b> ).                                                                         | <b>detail</b>       |
| <b>bandwidth</b>                | Bandwidth for each class type ( <b>ct0</b> , <b>ct1</b> , <b>ct2</b> , or <b>ct3</b> ).                                                                                                                                                            | <b>detail</b>       |
| <b>Port number</b>              | Protocol ID and sender/receiver port used in this RSVP session.                                                                                                                                                                                    | <b>detail</b>       |
| <b>Attrib flags</b>             | <b>Non-PHP</b> indicates that ultimate hop popping has been requested by the LSP using this RSVP session                                                                                                                                           | <b>extensive</b>    |

#### show rsvp session extensive

Starting in Junos OS Release 16.1, this command includes additional details for both the incoming and outgoing Path and Resv messages. The information includes the internal message handle and revision number, as well as the message ID included by the neighbor in the signaling message.

```

user@host> show rsvp session extensive

#### show rsvp session extensive transit

Starting in Junos OS Release 16.1, this command also shows node-related details, including whether enhanced local protection is enabled for the LSP and whether the node is a merge point. If the latter is true, both the IP address of the Point of Local Repair (PLR) and the status (LP-MP, NP-MP, or Non-MP) are shown.

```

user@host> show rsvp session extensive transit

Table 86: show rsvp statistics Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Path</b>                   | Statistics about Path messages, which are sent from the RSVP sender along the data paths and which store path state information in each node along the path. |
| <b>PathErr</b>                | Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.                                                         |
| <b>PathTear</b>               | Statistics about PathTear messages, which remove path states and dependent reservation states in any routing devices along a path.                           |
| <b>Resv FF</b>                | Statistics about fixed-filter reservation style messages, which consist of distinct reservations among explicit senders.                                     |
| <b>Resv WF</b>                | Statistics about wildcard-filter reservation style messages, which consist of shared reservations among wildcard senders.                                    |
| <b>Res SE</b>                 | Statistics about shared-explicit reservation style messages, which consist of shared reservations among explicit senders.                                    |
| <b>ResvErr</b>                | Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.                               |
| <b>ResvTear</b>               | Statistics about ResvTear messages, which remove reservation states along a path.                                                                            |
| <b>ResvConf</b>               | Statistics about ResvConfirm messages, which are responses to confirm a reservation request.                                                                 |
| <b>Ack</b>                    | Acknowledge message for refresh reductions.                                                                                                                  |
| <b>SRefresh</b>               | Summary refresh messages.                                                                                                                                    |
| <b>Hello</b>                  | Number of RSVP hello packets that have been sent to and received from the neighbor.                                                                          |
| <b>EndtoEnd RSVP</b>          | Statistics for the number of End-to-end RSVP messages.                                                                                                       |
| <b>Errors</b>                 | Statistics about errored RSVP packets.                                                                                                                       |
| <b>Rcv pkt bad length</b>     | The packet was not processed because its length is inappropriate.                                                                                            |
| <b>Rcv pkt unknown type</b>   | The packet is not one of the well-known RSVP types, as defined in RFC 2205, <i>Resource ReSerVation Protocol (RSVP)</i> .                                    |
| <b>Rcv pkt bad version</b>    | The packet is not an RSVP version 1 packet.                                                                                                                  |
| <b>Rcv pkt auth fail</b>      | The packet failed authentication checks.                                                                                                                     |
| <b>Rcv pkt bad checksum</b>   | The RSVP checksum check failed.                                                                                                                              |
| <b>Rcv pkt bad format</b>     | General packet processing failed because the packet was badly formed.                                                                                        |
| <b>Memory allocation fail</b> | An internal resource failure occurred.                                                                                                                       |

Table 86: show rsvp statistics Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No path information         | A reservation was received, but no sender is active.                                                                                                                                                                                                                                                                                  |
| Resv style conflict         | The same session contains inconsistent reservation styles.                                                                                                                                                                                                                                                                            |
| Port conflict               | There were inconsistent port numbers for the same session.                                                                                                                                                                                                                                                                            |
| Resv no interface           | An interface for the receive reservation packets cannot be located.                                                                                                                                                                                                                                                                   |
| PathErr to client           | Number of PathErr packets delivered to the local client.                                                                                                                                                                                                                                                                              |
| ResvErr to client           | Number of ResvErr packets delivered to the local client.                                                                                                                                                                                                                                                                              |
| Path timeout                | Number of times the sender timed out because the path was removed.                                                                                                                                                                                                                                                                    |
| Resv timeout                | Number of times the receiver timed out because the reservation was removed.                                                                                                                                                                                                                                                           |
| Message out-of-order        | Records the number of RSVP incoming messages that are considered out of order. This is detected from the message ID object's sequence number.                                                                                                                                                                                         |
| Unknown ack msg             | A neighboring routing device replies with an ACK object that contains an unknown message ID. This can indicate a message ID handshake problem. For example, a router receives an ACK for message IDs 1, 2, and 3. However, it only has state for message IDs 1 and 3. The router increments the unknown ack counter by 1.             |
| Recv nack                   | If a neighboring router receives an unknown message ID in an RSVP refresh message, the router sends a Resv nack message back to the sender. This can happen if that neighbor has been rebooted. For this case, the router sends a regular RSVP refresh message to recover the state and start the message-ID handshake process again. |
| Recv duplicated msg-id      | Number of times the same message ID is used by two different RSVP messages. This duplication is usually caused when a neighboring routing device restarts.                                                                                                                                                                            |
| No TE-link to rcv Hop       | Counter of packets discarded because a TE link was not found.                                                                                                                                                                                                                                                                         |
| Rcv pkt disabled interface  | Number of RSVP packets received on an interface that is not enabled for RSVP.                                                                                                                                                                                                                                                         |
| Transmit buffer full        | Number of times the buffer for assembling an outgoing RSVP message was not large enough.                                                                                                                                                                                                                                              |
| Transmit failure            | Number of times the RSVP task failed to send out a packet.                                                                                                                                                                                                                                                                            |
| Receive failure             | Number of times the RSVP task failed to read an incoming packet.                                                                                                                                                                                                                                                                      |
| P2MP RESV discarded by appl | Number of Resv messages discarded because the MPLS label is not valid for the P2MP LSP application.                                                                                                                                                                                                                                   |
| Rate limit                  | Number of RSVP packets dropped due to rate limiting.                                                                                                                                                                                                                                                                                  |

Table 86: show rsvp statistics Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Err msg loop detected</b> | Number of RSVP error messages that have looped back to their originator. This is detected by checking the error node address in the ERROR_SPEC object. |

## Sample Output

### show rsvp statistics

Starting in Junos OS Release 16.1, this command also shows conditional PathTear statistics and the number of times an LSP state has been retained because of Link Protecting Merge Point (LP-MP) or Node Protecting Merge Point (NP-MP) determination.

```

user@host> show rsvp statistics
  PacketType          Total          Last 5 seconds
                   Sent      Received      Sent      Received

Table 87: show rsvp version Output Fields

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resource ReSerVation Protocol, version | RSVP software version.                                                                                                                                                                                                                                                                                                                          |
| RSVP protocol                          | Status of RSVP: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                             |
| R(refresh timer)                       | Configured time interval used to generate periodic RSVP messages.                                                                                                                                                                                                                                                                               |
| K(keep multiplier)                     | Number of RSVP messages that can be lost before an RSVP state is declared stale.                                                                                                                                                                                                                                                                |
| Preemption                             | Currently configured preemption capability: <b>Aggressive</b> , <b>Disabled</b> , or <b>Normal</b> . The default is <b>Normal</b> .                                                                                                                                                                                                             |
| Soft-preemption cleanup                | Time, in seconds, that an LSP is kept after it has been soft preempted. This is a global property of the RSVP protocol.                                                                                                                                                                                                                         |
| Graceful deleting timeout              | Currently configured value for the <b>graceful-deletion-timeout</b> statement. The router that initiates the graceful deletion procedure for an RSVP session waits for the graceful deletion timeout interval to ensure that all routers along the path (especially the ingress and egress routers) have prepared for the LSP to be taken down. |

Table 87: show rsvp version Output Fields (*continued*)

| Field Name                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NSR Mode</b>                      | Status of the nonstop active routing feature for RSVP on the restarting device: <b>Disabled</b> , <b>Enabled/Master</b> , or <b>Enabled/Standby</b> .                                                                                                                                                                                                                                                                                |
| <b>NSR State</b>                     | <p>State of the nonstop active routing feature for RSVP on the restarting device.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>Idle</b></li> <li>• <b>TE-link sync complete</b></li> <li>• <b>Neighbor sync complete</b></li> <li>• <b>Path state sync complete</b></li> <li>• <b>Resv state sync complete</b></li> <li>• <b>Bypass sync complete</b></li> <li>• <b>Init sync complete</b></li> </ul> |
| <b>Setup protection</b>              | Status of point-to-point and point-to-multipoint LSP setup protection configuration on the device: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                               |
| <b>Route Session-Id count</b>        | Total count of session IDs associated with the combination of all the RSVP ingress routes.                                                                                                                                                                                                                                                                                                                                           |
| <b>Graceful restart</b>              | Status of the graceful restart feature for RSVP on the restarting routing device: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                |
| <b>Restart helper mode</b>           | Status of the helper mode feature: <b>Enabled</b> or <b>Disabled</b> . When this feature is enabled, the restarting routing device can help the neighbor with its RSVP restart procedures.                                                                                                                                                                                                                                           |
| <b>Maximum helper restart time</b>   | Number of milliseconds (ms) configured for the maximum helper restart time. The maximum helper restart time is the length of time the routing device waits before declaring that an RSVP neighbor attempting to restart gracefully is down.                                                                                                                                                                                          |
| <b>Maximum helper recovery time</b>  | Number of milliseconds configured for the maximum helper recovery time. The maximum helper recovery time is the amount of time the routing device maintains the state of an RSVP neighbor attempting to restart gracefully.                                                                                                                                                                                                          |
| <b>Restart time</b>                  | Number of milliseconds that a neighbor waits to receive a Hello message from the restarting node before declaring the node dead and deleting the states.                                                                                                                                                                                                                                                                             |
| <b>Recovery time</b>                 | Number of milliseconds during which the restarting node attempts to recover its lost states with help from its neighbors. Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.                                                                                                                 |
| <b>P2p transit LSP nexthop mode</b>  | Point-to-point transit LSP next-hop mode on PTX Series devices. The possible values are <b>Chained</b> or <b>Unchained</b> .                                                                                                                                                                                                                                                                                                         |
| <b>P2mp transit LSP nexthop mode</b> | Point-to-multipoint transit LSP next-hop mode on PTX Series devices. The possible values are <b>Chained</b> or <b>Unchained</b> .                                                                                                                                                                                                                                                                                                    |

## Sample Output

### show rsvp version

Starting with Junos OS Release 16.1, this command also shows whether enhanced FRR procurers are enabled on the router.

```
user@host> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol:           Enabled
  R(refresh timer):        30 seconds
  K(keep multiplier):      3
  Preemption:             Normal
  Soft-preemption cleanup:  30 seconds
  Graceful deletion timeout: 30 seconds
  NSR mode:               Enabled/Master
  NSR state:              Init sync complete
  Setup protection:        Disabled
  Route Session-Id count:  1
  Graceful restart:        Disabled
  Restart helper mode:     Enabled
  Maximum helper restart time: 20000 msec
  Maximum helper recovery time: 180000 msec
  Restart time:            0 msec
  P2p transit LSP nexthop mode: Unchained
  P2mp transit LSP nexthop mode: Unchained
  Enhanced FRR local protection: Enabled
```

## traceroute mpls rsvp

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | <p>Trace route to a remote host for an MPLS LSP signaled by RSVP. Use <b>traceroute mpls rsvp</b> as a debugging tool to locate MPLS label-switched path (LSP) forwarding issues in a network. (Currently supported for IPv4 packets only.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b><i>lsp-name</i></b>—Specify the name of the LSP to be traced.</p> <p><b>detail</b>—(Optional) Display detailed output.</p> <p><b>egress</b>—(Optional) Request that a specific point-to-multipoint egress node reply to the trace route. The trace route would follow the associated sub-LSP to the egress node.</p> <p><b>exp</b>—(Optional) Specify the class of service to use when sending probes. The range of values is 0 through 7. The default value is 7.</p> <p><b>logical-system</b>—(Optional) Specify the name of the logical system for the traceroute attempt.</p> <p><b>multipoint</b>—(Optional) Perform a trace route on a point-to-multipoint LSP.</p> <p><b>no-resolve</b>—(Optional) Specify not to resolve the hostname that corresponds to the IP address.</p> <p><b>retries</b>—(Optional) Specify the number of times to resend probe. The range of values is 1 through 9. The default value is 3.</p> <p><b>source <i>source-address</i></b>—(Optional) Specify the source address of the outgoing traceroute packets.</p> <p><b>ttl</b>—(Optional) Specify the number of hops to follow before forcing the trace route to quit.</p> |
| <b>Required Privilege Level</b> | network                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

[traceroute mpls rsvp multipoint \(single-hop sub-LSPs\) on page 1882](#)

**Output Fields** Table 88 on page 1880 describes the output fields for the **traceroute mpls rsvp *lsp-name*** and **traceroute mpls rsvp *lsp-name* detail** commands. Output fields are listed in the approximate order in which they appear.

**Table 88: traceroute mpls rsvp Output Fields**

| Field Name         | Field Description                                                                                                                                                                                                                                          | Level of Output |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Probe options      | Probe options specified in the <b>traceroute mpls rsvp <i>lsp-name</i></b> command.                                                                                                                                                                        | all levels      |
| ttl                | Time-to-live value of the labeled packet.                                                                                                                                                                                                                  | none specified  |
| Label              | MPLS label used to forward the packets along the LSP.                                                                                                                                                                                                      | none specified  |
| Protocol           | Signaling protocol used. For this command, it is RSVP-TE.                                                                                                                                                                                                  | none specified  |
| Address            | Address of the next hop.                                                                                                                                                                                                                                   | none specified  |
| Previous Hop       | Address of the previous hop. Previous hop address of the first hop is null.                                                                                                                                                                                | none specified  |
| Probe status       | Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). Displays <b>Success</b> if the trace to a hop is successful or <b>Egress</b> if the trace has reached the last router on the path. | none specified  |
| Hop                | Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.                                                                                                                                   | <b>detail</b>   |
| Parent             | Address of the previous hop. Parent value for the first hop is null.                                                                                                                                                                                       | <b>detail</b>   |
| Return Code        | Return code for reporting the result of processing the echo request by the receiver.                                                                                                                                                                       | <b>detail</b>   |
| Sender timestamp   | Displays the timestamp when the MPLS echo request is sent to the next hop.                                                                                                                                                                                 | <b>detail</b>   |
| Receiver timestamp | Timestamp when the echo request from the previous hop is received and acknowledged with an echo response by the next hop.                                                                                                                                  | <b>detail</b>   |
| Response time      | Time for the echo request to reach the receiver.                                                                                                                                                                                                           | <b>detail</b>   |
| MTU                | Size of the largest packet that includes the label stack forwarded to the next hop.                                                                                                                                                                        | <b>detail</b>   |

Table 88: traceroute mpls rsvp Output Fields (*continued*)

| Field Name     | Field Description                                                                                        | Level of Output |
|----------------|----------------------------------------------------------------------------------------------------------|-----------------|
| Multipath type | Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none. | <b>detail</b>   |
| Label stack    | Label stack used to forward the packet.                                                                  | <b>detail</b>   |
| Path           | Displays the sub-lsp path number for this traceroute, the interface used, and the destination address.   | all levels      |

## Sample Output

### traceroute mpls rsvp

```
user@host> traceroute mpls rsvp lsp-chicago-atlanta
```

```
Probe options: retries 3, exp 7
```

| ttl | Label  | Protocol | Address     | Previous Hop | Probe Status |
|-----|--------|----------|-------------|--------------|--------------|
| 1   | 299792 | RSVP-TE  | 192.168.1.2 | (null)       | Success      |
| 2   | 299803 | RSVP-TE  | 192.168.2.3 | 192.168.1.2  | Success      |
| 3   | 3      | RSVP-TE  | 192.168.3.4 | 192.168.2.3  | Egress       |

```
Path 1 via ge-0/0/0.1 destination 127.0.0.64
```

### traceroute mpls rsvp detail

```
user@host> traceroute mpls rsvp lsp-chicago-atlanta detail
```

```
Probe options: retries 3, exp 7
```

```
Hop 192.168.1.2 Depth 1
```

```
Probe status: Success
```

```
Parent: (null)
```

```
Return code: Label-switched at stack-depth 1
```

```
Sender timestamp: 2008-04-17 09:35:27 EDT 400.88 msec
```

```
Receiver timestamp: 2008-04-17 09:35:27 EDT 427.87 msec
```

```
Response time: 26.99 msec
```

```
MTU: Unknown
```

```
Multipath type: IP bitmask
```

```
Address Range 1: 127.0.0.64 ~ 127.0.0.127
```

```
Label Stack:
```

```
Label 1 Value 299792 Protocol RSVP-TE
```

```
Hop 192.168.2.3 Depth 2
```

```
Probe status: Success
```

```
Parent: 192.168.1.2
```

```
Return code: Upstream interface index unknown label-switched at stack-depth
```

```
1
```

```

| <b>Description</b>         | <p>Check the operability of MPLS LDP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a <b>ping mpls</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>count</b> <i>count</i>—(Optional) Number of ping requests to send. If <b>count</b> is not specified, five ping requests are sent. The range of values is 1 through <b>1,000,000</b>. The default value is <b>5</b>.</p> <p><b>destination</b> <i>address</i>—(Optional) Specify an address other than the default (<b>127.0.0.1/32</b>) for the ping echo requests. The address can be anything within the <b>127/8</b> subnet.</p> <p><b>detail</b>—(Optional) Display detailed information about the echo requests sent and received.</p> <p><b>exp</b> <i>forwarding-class</i>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p><b>fec</b>—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.</p> <p><b>instance</b> <i>routing-instance-name</i>—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.</p> <p><b>logical-system</b> (all   <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p><b>p2mp root-addr</b> <i>ip-address</i> <b>lsp-id</b> <i>identifier</i>—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.</p> <p><b>size</b> <i>bytes</i>—(Optional) Size of the LSP ping request packet (<b>88</b> through <b>65468</b> bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller</p> |

than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. For more information, see the *MPLS Applications Feature Guide*.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls ldp fec count on page 1888](#)  
[ping mpls ldp p2mp root-addr lsp-id on page 1888](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.
```

### ping mpls ldp p2mp root-addr lsp-id

```
user@host> ping mpls ldp p2mp root-addr 10.1.1.1/32 lsp-id 1 count 1

[show ldp database \(Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs\) on page 1897](#)  
[show ldp database summary on page 1898](#)

**Output Fields** [Table 89 on page 1891](#) describes the output fields for the **show ldp database** command. Output fields are listed in the approximate order in which they appear.

**Table 89: show ldp database Output Fields**

| Field Name                   | Field Description                                                                | Level of Output |
|------------------------------|----------------------------------------------------------------------------------|-----------------|
| <b>Input label database</b>  | Label received from the other router.                                            | All levels      |
| <b>Output label database</b> | Label advertised to the other router.                                            | All levels      |
| <i>session-identifier</i>    | Session identifier, which includes the local and remote label space identifiers. | All levels      |
| <b>Labels received</b>       | Number of labels received from the other router.                                 | All levels      |
| <b>Labels advertised</b>     | Number of labels advertised to the other router.                                 | All levels.     |
| <b>Label</b>                 | Label binding to a route prefix.                                                 | All levels      |

Table 89: show ldp database Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output  |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Prefix</b>                          | <p>Route prefix.</p> <p>It can be one of the following values:</p> <ul style="list-style-type: none"> <li>• IP prefix.</li> <li>• Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</li> <li>• Layer 2 encapsulation type.</li> </ul> <p>Layer 2 encapsulation types are displayed in the format <b>L2CKT control word status encapsulation-type vc-number</b>, for example, <b>L2CKT CtrlWord FRAME RELAY VC 2</b></p> <ul style="list-style-type: none"> <li>• <b>control-word-status</b>—Displays whether the use of the control word has been negotiated for this virtual circuit: <ul style="list-style-type: none"> <li>• <b>NoCtrlWord</b></li> <li>• <b>CtrlWord</b></li> </ul> </li> <li>• <b>encapsulation-type</b>—Encapsulation type: <ul style="list-style-type: none"> <li>• <b>FRAME RELAY</b></li> <li>• <b>ATM AAL5</b></li> <li>• <b>ATM CELL</b></li> <li>• <b>VLAN</b></li> <li>• <b>ETHERNET</b></li> <li>• <b>CISCO_HDLC</b></li> <li>• <b>PPP</b></li> </ul> </li> <li>• <b>VC number</b>—Virtual circuit number. It can have any numeric value.</li> <li>• <b>(Stale)</b>—When you display the LDP database for the neighbor of a restarting router, the bindings learned from the restarting neighbor are displayed as (Stale). Stale bindings are deleted if they are not refreshed within the recovery time.</li> </ul> | All levels       |
| <b>MTU</b>                             | MTU of the Layer 2 circuit. MTU is displayed for all encapsulation types except ATM cell encapsulations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail</b>    |

| <b>List of Sample Output</b>    | <a href="#">show ldp interface extensive on page 1901</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Output Fields</b>            | <a href="#">Table 91 on page 1900</a> describes the output fields for the <b>show ldp interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                               |

Table 91: show ldp interface Output Fields

| Field Name            | Field Description                                                                                                                                                              | Level of Output                   |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| <b>Interface</b>      | Interface name.                                                                                                                                                                | All levels                        |
| <b>Label space ID</b> | Label space identifier that the router is advertising on the interface.                                                                                                        | All levels                        |
| <b>Nbr count</b>      | Number of neighbors on the interface.                                                                                                                                          | All levels                        |
| <b>Next hello</b>     | How long until the next hello packet is sent on this interface, in seconds.                                                                                                    | All levels                        |
| <b>Hello interval</b> | One-third of the negotiated hold time (in seconds). If the user-configured value for the hello interval is smaller than the computed value, the user-configured value is used. | <b>detail</b><br><b>extensive</b> |
| <b>Hold time</b>      | Configured hold time, in seconds.                                                                                                                                              | <b>detail</b><br><b>extensive</b> |

Table 91: show ldp interface Output Fields (*continued*)

| Field Name           | Field Description                                                                 | Level of Output |
|----------------------|-----------------------------------------------------------------------------------|-----------------|
| Transport address    | Address to which the neighbor wants the local route to establish the LDP session. | extensive       |
| Local hello interval | Locally configured hello interval.                                                | extensive       |

## Sample Output

### show ldp interface extensive

```
user@host> show ldp interface extensive
Interface          Label space ID      Nbr count  Next hello
fe-0/0/3.0         10.255.245.6:0      2          0
Hello interval: 1, Hold time: 15, Transport address: 10.255.245.6
Local hello interval: 2, Index: 69
```

## show ldp neighbor

Table 92: show ldp neighbor Output Fields

| Field Name     | Field Description                                  | Level of Output |
|----------------|----------------------------------------------------|-----------------|
| Address        | IP address of the neighbor.                        | All levels      |
| Interface      | Interface over which the neighbor was discovered.  | All levels      |
| Label space ID | Label space identifier advertised by the neighbor. | All levels      |

Table 92: show ldp neighbor Output Fields (*continued*)

| Field Name             | Field Description                                                                                           | Level of Output  |
|------------------------|-------------------------------------------------------------------------------------------------------------|------------------|
| Hold time              | Remaining hold time before the neighbor expires, in seconds.                                                | All levels       |
| Transport address      | Address to which the neighbor wants the local route to establish the LDP session.                           | detail           |
| Configuration sequence | Counter that increments whenever the neighbor changes its configuration.                                    | detail           |
| Up for                 | Length of time the LDP neighbor has been in operation.                                                      | detail extensive |
| Reference count        | Reference count for the LDP neighbor.                                                                       | extensive        |
| Hold time              | Displays the neighbor's hold time. The hold time is the proposed hold times for the local and peer routers. | extensive        |
| Proposed local/peer    | Hold time value proposed by the local router and the peer router.                                           | extensive        |

## Sample Output

### show ldp neighbor extensive

```

user@host> show ldp neighbor extensive
Address          Interface      Label space ID      Hold Time
192.168.37.23    so-1/0/0.0    10.255.245.5:0      44
Transport address: 10.255.245.5, Configuration sequence: 6
Up for 00:03:37
Reference count: 1
Hold time: 45, Proposed local/peer: 15/45

```

### show ldp neighbor auto-targeted extensive

```

user@host> show ldp neighbor auto-targeted extensive
Address          Interface      Label space ID      Hold time
10.255.107.236   lo0.0         10.255.107.236:0    41
Transport address: 10.255.107.236, Configuration sequence: 14
Up for 00:10:53
Reference count: 2
Hold time: 45, Proposed local/peer: 45/45
Hello interval: 15
Hello flags: targeted
Neighbor types: Auto-targeted

```

**Table 94: show ldp path Output Fields**

| Field Name                    | Field Description                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Output Session (label)</b> | Session ID and labels that this system has sent using LDP. These correspond to MPLS packets received.        |
| <b>Input Session (label)</b>  | Session ID and labels that this system has received using LDP. These correspond to MPLS packets transmitted. |
| <b>route</b>                  | MPLS route.                                                                                                  |
| <b>Attached route</b>         | Route corresponding to the LSP.                                                                              |
| <b>Ingress route</b>          | The router acts as the ingress for the LSP.                                                                  |
| <b>Reference count</b>        | Reference count for the LDP neighbor.                                                                        |

Table 94: show ldp path Output Fields (*continued*)

| Field Name    | Field Description                                                               |
|---------------|---------------------------------------------------------------------------------|
| Transit route | Names of the forwarding equivalence class (FEC) filters on the transit routers. |
| Global label  | MPLS label that is used globally.                                               |

## Sample Output

### show ldp path extensive

```
user@host> show ldp path extensive

| <b>Description</b>              | Display the entries in the Label Distribution Protocol (LDP) internal topology table. The internal topology table contains routes from inet.0 and inet.3 and is used when binding a label to a forwarding equivalence class (FEC).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>none</b>—Display standard information about all entries in the LDP internal topology table for all routing instances.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>destination</b>—(Optional) Restrict the output to entries that are longer than the specified destination prefix and prefix length.</p> <p><b>fec-and-route</b>—Display the show routes and the FECs.</p> <p><b>fec-only</b>—Display only LDP FECs.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display entries for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Output Fields</b>            | Table 95 on page 1912 describes the output fields for the <b>show ldp route</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 95: show ldp route Output Fields

| Field Name              | Field Description                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination             | Destination prefix.                                                                                                                                             |
| Next-hop intf/lsp/table | Interface that is the next hop to the destination prefix.                                                                                                       |
| Next-hop address        | IP address of the next hop.                                                                                                                                     |
| Session ID              | LDP session ID.                                                                                                                                                 |
| Route flags             | Information about the route. For example, the <b>Ingress TTL propagate</b> flag indicates that the time-to-live (TTL) value is being propagated with the route. |
| Bound to outgoing label | The route has been bound to LSPs with the label being distributed for that LSP.                                                                                 |
| Topology entry          | The topology that the route is bound to.                                                                                                                        |
| Ingress route status    | Status of the ingress route. For example, it could be <b>Active</b> or <b>Inactive</b> .                                                                        |
| Last modified           | The length of time since the ingress route status last changed.                                                                                                 |
| Last event(s)           | The last event that occurred.                                                                                                                                   |

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 96: show ldp session Output Fields**

| Field Name | Field Description                                                                                                                                                                                                                                                                           | Level of Output |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Address    | Transport address of the session.                                                                                                                                                                                                                                                           | any             |
| State      | State of the session: <b>Nonexistent</b> , <b>Connecting</b> , <b>Initialized</b> , <b>OpenRec</b> , <b>OpenSent</b> , <b>Operational</b> , or <b>Closing</b> . The states correspond to the state diagram specified in Internet Draft LDP Specification draft-ietf-mpls-rfc3036bis-01.txt. | any             |

Table 96: show ldp session Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                     | Level of Output  |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Connection             | TCP connection state: <b>Closed</b> , <b>Opening</b> , or <b>Open</b> .                                                                                                                                               | any              |
| Hold time              | Time remaining until the session will be closed, in seconds.                                                                                                                                                          | any              |
| Session ID             | LDP identifiers of the peers of this session.                                                                                                                                                                         | detail extensive |
| Next keepalive         | Time until next keepalive is sent, in seconds.                                                                                                                                                                        | detail extensive |
| Active                 | Whether the local router is playing the active role in the session and during session establishment.                                                                                                                  | detail extensive |
| Passive                | Whether the local router is playing the passive role in the session and during session establishment.                                                                                                                 | detail extensive |
| Maximum PDU            | Maximum protocol data unit (PDU) size (packet size) for the session.                                                                                                                                                  | detail extensive |
| Hold time              | Time remaining until the session will be closed, in seconds. This value corresponds to the one configured using the <b>keepalive-timeout</b> statement configured at the <b>[edit protocols ldp]</b> hierarchy level. | detail extensive |
| Neighbor count         | Number of neighbors that are contributing to the session.                                                                                                                                                             | detail extensive |
| Neighbor types         | Category of LDP session: <b>discovered</b> or <b>auto-targeted</b> .                                                                                                                                                  | any              |
| Keepalive interval     | Keepalive interval, in seconds.                                                                                                                                                                                       | detail extensive |
| Connect retry interval | TCP connection retry interval, in seconds.                                                                                                                                                                            | detail extensive |
| Local address          | Local transport address.                                                                                                                                                                                              | detail extensive |
| Remote address         | Remote transport address.                                                                                                                                                                                             | detail extensive |
| Up for                 | Time that this session has been up.                                                                                                                                                                                   | detail extensive |
| Last down              | Time since the session last went down.                                                                                                                                                                                | detail extensive |

Table 97: show ldp statistics Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Message type</b> | <p>LDP message types:</p> <ul style="list-style-type: none"> <li>• <b>Hello</b>—Messages that enable LDP nodes to discover one another and to detect the failure of a neighbor or of the link to the neighbor.</li> <li>• <b>Initialization</b>—Messages that indicate an LDP session has started.</li> <li>• <b>Keepalive</b>—Messages that ensure that the keepalive timeout is not exceeded.</li> <li>• <b>Notification</b>—Advisory information and signal error information.</li> <li>• <b>Address</b>—Messages with address information.</li> <li>• <b>Address withdrawal</b>—Messages regarding address withdrawal.</li> <li>• <b>Label mapping</b>—Messages with label mapping information.</li> <li>• <b>Label request</b>—Request for a label mapping from a neighboring router.</li> <li>• <b>Label withdrawal</b>—Withdrawal message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.</li> <li>• <b>Label release</b>—Message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.</li> <li>• <b>Label abort</b>—Messages about label interruptions.</li> <li>• <b>All UDP</b>—All hello messages sent by LSRs to the well-known UDP port, 646.</li> <li>• <b>All TCP</b>—All LDP session messages.</li> </ul> |

Table 97: show ldp statistics Output Fields (*continued*)

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Event type</b>     | <p>LDP events and errors:</p> <ul style="list-style-type: none"> <li>• <b>Sessions opened</b>—Number of LDP sessions that have been opened.</li> <li>• <b>Sessions closed</b>—Number of LDP sessions that have been closed.</li> <li>• <b>Topology changes</b>—Number of changes to the known LDP topology.</li> <li>• <b>No interface</b>—Number of missing interface address messages. When a new LDP session is initialized and before sending label lapping or label request messages, the LSR advertises its interface addresses with one or more address messages.</li> <li>• <b>No session</b>—Number of missing session messages. Session messages are used to establish, maintain, and terminate sessions between LDP peers.</li> <li>• <b>No adjacency</b>—The exchange of hello adjacency messages results in the creation of an adjacency. The LDP identifier, together with the sender's LDP identifier in the PDU header, enables the receiver to match the initialization message with one of its hello adjacencies. If there is no matching hello adjacency, the LSR sends a session the initialization message is rejected.</li> <li>• <b>Unknown version</b>—The LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.</li> <li>• <b>Malformed PDU</b>—An LDP PDU received on a TCP connection for an LDP session is malformed if the LDP identifier in the PDU header is unknown to the receiver, or if it is known but is not the LDP identifier associated by the receiver with the LDP peer for this LDP session.<br/> An LDP PDU is considered to be malformed if the LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.<br/> An LDP PDU is considered malformed if the PDU length field is too small (less than 14) or too large (greater than maximum PDU length).</li> <li>• <b>Malformed message</b>—Malformed LDP messages that are part of the LDP discovery mechanism are handled by silently discarding them.<br/> An LDP message is malformed if the message type is unknown. If the message type is less than 0x8000 (high order bit = 0), it is an error signaled by the unknown message type status code.<br/> An LDP message is considered to be malformed if the message length is too large, meaning that the message extends beyond the end of the containing LDP PDU.<br/> The LDP message is considered to be malformed if the message length is too small, meaning that it is smaller than the smallest possible value component.<br/> The LDP message is considered to be malformed if the message is missing one or more mandatory parameters.</li> <li>• <b>Unknown message type</b>—If the message type is less than 0x8000 (high order bit = 0) or greater than or equal to 0x8000 (high order bit = 1) it is considered to be an unknown message.</li> <li>• <b>Inappropriate message</b>—The message is not of the type that the receiver expects to receive.</li> <li>• <b>Malformed TLV</b>—The TLV Length is too large or the receiver cannot decode the TLV value. This can indicate an issue in either the sending or receiving LSR.</li> <li>• <b>Bad TLV value</b>—The TLV Length is too large.</li> <li>• <b>Missing TLV</b>—The TLV is missing one or more mandatory parameters.</li> <li>• <b>PDU too large</b>—The PDF is greater than the maximum PDU length. Section "Initialization Message" in RFC 5036 describes how the maximum PDU length for a session is determined.</li> </ul> |
| <b>Total</b>          | Total number of each event or error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Shared</b>       | Whether a label is shared by prefixes: <b>Yes</b> or <b>No</b> . A <b>Yes</b> value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Nexthop</b>      | The next hop address for P2MP LSPs. (This is the downstream LDP Session ID.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Label</b>        | For multipoint LDP with multicast-only fast reroute (MoFRR), the multipoint LDP node selects two separate upstream peers and sends two separate labels, one to each upstream peer. The same algorithm described in RFC 6388 is used to select the primary upstream path. The backup upstream path selection again uses the same algorithm but excludes the primary upstream LSR as a candidate. Two streams of MPLS traffic are sent to the egress node from the two different upstream peers. The MPLS traffic from only one of the upstream neighbors is selected as the primary path to accept the traffic, and the other becomes the backup path. The traffic on the backup path is dropped. When the primary upstream path fails, the traffic from the backup path is then accepted. The multipoint LDP node selects the two upstream paths based on the interior gateway protocol (IGP) root node next hop.<br><br>Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label. |
| <b>Backup route</b> | For multipoint LDP with MoFRR, the route that is used if the primary route becomes unavailable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Output Fields</b>            | <a href="#">Table 99 on page 1934</a> describes the output fields for the <b>show security keychain</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                  |

**Table 99: show security keychain Output Fields**

| Field Name               | Field Description                                                                        | Level of Output |
|--------------------------|------------------------------------------------------------------------------------------|-----------------|
| <b>keychain</b>          | The name of the keychain in operation.                                                   | All levels      |
| <b>Active-ID Send</b>    | Number of routing protocols packets sent with the active key.                            | All levels      |
| <b>Active-ID Receive</b> | Number of routing protocols packets received with the active key.                        | All levels      |
| <b>Next-ID Send</b>      | Number of routing protocols packets sent with the next key.                              | All levels      |
| <b>Next-ID Receive</b>   | Number of routing protocols packets received with the next key.                          | All levels      |
| <b>Transition</b>        | Amount of time until the current key will be replaced with the next key in the keychain. | All levels      |
| <b>Tolerance</b>         | Configured clock-skew tolerance, in seconds, for accepting keys for a key chain.         | All levels      |
| <b>Id</b>                | Identification number configured for the current key.                                    | <b>detail</b>   |
| <b>Algorithm</b>         | Authentication algorithm configured for the current key.                                 | <b>detail</b>   |

Table 99: show security keychain Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>State</b>      | <p>State of the current key.</p> <p>The value can be:</p> <ul style="list-style-type: none"> <li>• <b>receive</b></li> <li>• <b>send</b></li> <li>• <b>send-receive</b></li> </ul> <p>For the active key, the <b>State</b> can be <b>send-receive</b>, <b>send</b>, or <b>receive</b>. For keys that have a future start time, the <b>State</b> is <b>inactive</b>. Compare the <b>State</b> field to the <b>Mode</b> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>   |
| <b>Option</b>     | <p>For IS-IS only, the option determines how Junos OS encodes the message authentication code in routing protocol packets.</p> <p>The values can be:</p> <ul style="list-style-type: none"> <li>• <b>basic</b>—Based on RFC 5304.</li> <li>• <b>isis-enhanced</b>—Based on RFC 5310.</li> </ul> <p>The default value is <b>basic</b>. When you configure the <b>isis-enhanced</b> option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.</p> <p>When you configure <b>basic</b> (or do not include the <b>options</b> statement in the key configuration) Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.</p> <p>Because this setting is for IS-IS only, the TCP and the BFD protocol ignore the encoding option configured in the key.</p> | <b>detail</b>   |
| <b>Start-time</b> | Time that the current key became active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail</b>   |
| <b>Mode</b>       | <p>Mode of each key (Informational only.)</p> <p>The value can be</p> <ul style="list-style-type: none"> <li>• <b>receive</b></li> <li>• <b>send</b></li> <li>• <b>send-receive</b></li> </ul> <p>The mode of the key is based on the configuration. Suppose you configure two keys, one with a start-time of today and the other with a start-time of next week. For both keys, the <b>Mode</b> can be <b>send-receive</b>, <b>send</b>, or <b>receive</b>, regardless of the configured start-time. Compare the <b>Mode</b> field to the <b>State</b> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b>   |

## traceroute mpls ldp

**Syntax** `traceroute mpls <ldp> fec`  
`<destination>`  
`<detail>`  
`<exp>`  
`<fanout>`  
`<logical-system>`  
`<no-resolve>`  
`<paths>`  
`<retries>`  
`<routing-instance>`  
`<source>`  
`<ttl>`  
`<update>`  
`<wait>`

**Release Information** Command introduced in Junos OS Release 8.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Trace route to a remote host for an MPLS label-switched path signaled by the LDP. Use **traceroute mpls ldp** as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

**Options** *fec*—Specify the IP address and optional prefix of the forwarding equivalence class (FEC).  
*destination*—(Optional) Specify the destination address to use when sending probes.  
*detail*—(Optional) Display detailed output.  
*exp*—(Optional) Specify the class-of-service to use when sending probes. The range of values is 0 through 7. The default value is 7.  
*fanout*—(Optional) Specify the maximum number of nexthops to search per node. The range of values is 1 through 16. The default value is 16.  
*logical-system*—(Optional) Specify the name of the logical system for the traceroute attempt.  
*no-resolve*—(Optional) Specify not to resolve the hostname that corresponds to the IP address.  
*paths*—(Optional) Specify the number of paths to search. The range of values is 1 through 255. The default value is 16.  
*retries*—(Optional) Specify the number of times to resend probe. values. The range of values is 1 through 9. The default value is 3.  
*routing-instance routing-instance-name*—(Optional) Specify the name of the routing instance for the traceroute attempt.  
*source source-address*—(Optional) Specify the source address of the outgoing traceroute packets.

**ttl value**—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds. The range of values is **1** through **125** and the default value is **64**.

**update**—(Optional) Update database contents with traceroute results.

**wait seconds**—(Optional) Specify the number of seconds to wait before resending a probe. The range of values is **5** through **15** and the default value is **10** seconds.

**Required Privilege Level**

network

**List of Sample Output**

[traceroute mpls ldp on page 1939](#)  
[traceroute mpls ldp detail on page 1939](#)

**Output Fields**

[Table 80 on page 1834](#) describes the output fields for the **traceroute mpls ldp fec** command and the **traceroute mpls ldp fec detail** commands. Output fields are listed in the approximate order in which they appear.

**Table 100: traceroute mpls ldp Output Fields**

| Field Name    | Field Description                                                                                                        | Level of Output |
|---------------|--------------------------------------------------------------------------------------------------------------------------|-----------------|
| Probe options | Probe options specified in the <b>traceroute mpls ldp fec</b> command.                                                   | all levels      |
| ttl           | Time to live value of the labeled packet.                                                                                | none specified  |
| Label         | Outgoing label used for forwarding the packet along the label-switched paths.                                            | none specified  |
| Protocol      | Signaling protocol used. For this command, it is LDP.                                                                    | none specified  |
| Address       | Address of the next hop.                                                                                                 | none specified  |
| Previous Hop  | Address of the previous hop. Previous hop address of the first hop is <b>null</b> .                                      | none specified  |
| Probe status  | Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).  | none specified  |
| Hop           | Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop. | <b>detail</b>   |
| Parent        | Address of the previous hop. Parent value for the first hop is <b>null</b> .                                             | <b>detail</b>   |
| Return Code   | Return code for reporting the result of processing the echo request by the receiver.                                     | <b>detail</b>   |
| Response time | Time for the echo request to reach the receiver.                                                                         | <b>detail</b>   |

Table 100: traceroute mpls ldp Output Fields (*continued*)

| Field Name     | Field Description                                                                                                | Level of Output |
|----------------|------------------------------------------------------------------------------------------------------------------|-----------------|
| Multipath type | Labels or addresses used by the specified multipath type. If multipaths are not used, the value is <b>none</b> . | <b>detail</b>   |
| Label Stack    | Label stack used to forward the packet.                                                                          | <b>detail</b>   |

## CHAPTER 33

# CCC and TCC Operational Commands

- `show connections`
- `show route ccc`
- `show route forwarding-table`

## show connections

---

**List of Syntax**   [Syntax on page 1942](#)  
[Syntax \(EX Series Switches\) on page 1942](#)

**Syntax**   `show connections`  
          `<brief | extensive>`  
          `<all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch |`  
          `remote-interface-switch>`  
          `<down | up | up-down>`  
          `<history>`  
          `<labels>`  
          `<logical-system (all | logical-system-name)>`  
          `<name>`  
          `<status>`

**Syntax (EX Series Switches)**   `show connections`  
                                  `<brief | extensive>`  
                                  `<all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch |`  
                                  `remote-interface-switch>`  
                                  `<down | up | up-down>`  
                                  `<history>`  
                                  `<labels>`  
                                  `<name>`  
                                  `<status>`

**Release Information**   Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description**   Display information about the configured circuit cross-connect (CCC) connections.

**Options**   **none**—Display the standard level of output for all configured CCC connections.

**all**—(Optional) Display all connections.

**brief | extensive**—(Optional) Display the specified level of output. Use history to display information about connection history. Use labels to display labels used for transmit and receive LSPs. Use status to display information about the connection and interface status.

**interface-switch**—(Optional) Display interface switch connections only.

**lsp-switch**—(Optional) Display LSP switch connections only.

**p2mp-receive-switch**—(Optional) Display point-to-multipoint LSP to local interfaces switch connections only.

**p2mp-transmit-switch**—(Optional) Display local interface to point-to-multipoint LSP switch connections only.

**remote-interface-switch**—(Optional) Display remote interface switch connections only.

**down | up | up-down**—(Optional) Display nonoperational, operational, or both kinds of connections.

**history**—(Optional) Display information about connection history.

**labels**—(Optional) Display labels used for transmit and receive.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name**—(Optional) Display information about the specified connection only.

**status**—(Optional) Display information about the connection and interface status.

**Required Privilege Level** view

**Output Fields** [Table 53 on page 1743](#) describes the output fields for the **show connections** command. Output fields are listed in the approximate order in which they appear.

**Table 101: show connections Output Fields**

| Field Name                                         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CCC and TCC connections [Link Monitoring On   Off] | Whether link monitoring is enabled: <b>On</b> or <b>Off</b> .                                                                                                                                                                                                                                                                                                                                                                             |
| Legend for Status (St)                             | Connection or circuit status. See the output's legend for an explanation of the status field values.                                                                                                                                                                                                                                                                                                                                      |
| Legend for connection types                        | Type of connection: <ul style="list-style-type: none"> <li><b>if-sw</b>—Layer 2 switching cross-connect.</li> <li><b>rmt-if</b>—Remote interface switch. While graceful restart is in progress, <b>rmt-if</b> will display a state (<b>St</b>) of <b>Restart</b>.</li> <li><b>lsp-sw</b>—LSP stitching cross-connect. While graceful restart is in progress, <b>lsp-sw</b> will display a state (<b>St</b>) of <b>Restart</b>.</li> </ul> |
| Legend for circuit types                           | Type of circuits: <ul style="list-style-type: none"> <li><b>intf</b>—Interface circuit.</li> <li><b>tlsp</b>—Transmit LSP circuit.</li> <li><b>rlsp</b>—Receive LSP circuit.</li> </ul>                                                                                                                                                                                                                                                   |
| Connection/Circuit                                 | Name of the configured CCC connection.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Type                                               | Type of connection.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| St                                                 | State of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Time last up                                       | Time that the connection or circuit last transitioned to the <b>Up</b> (operational) state.                                                                                                                                                                                                                                                                                                                                               |

Table 101: show connections Output Fields (*continued*)

| Field Name | Field Description                                                                              |
|------------|------------------------------------------------------------------------------------------------|
| # Up trans | Number of times that the connection or circuit has transitioned to the Up (operational) state. |

## Sample Output

### show connections

Options **all** and **vlan** introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** (**default** | *logical-system-name/routing-instance-name* | *routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the **show route instance** command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege  
Level**

view

**Output Fields** [Table 102 on page 1949](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

**Table 102: show route forwarding-table Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output         |

| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive none |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | extensive             |
| Reference (NhRef)          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive none |
| Next-hop interface (Netif) | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive none |

Table 102: show route forwarding-table Output Fields (*continued*)

| Field Name    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                 | Level of Output |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Weight        | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description). | extensive       |
| Balance       | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                    | extensive       |
| RPF interface | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                       | extensive       |

**show route forwarding-table extensive (RPF)**

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;
      address 192.0.2.2/30;
    }
  }
}
```

```
user@host> show route forwarding-table extensive
```

```
Routing table: inet [Index 0]
```

```
Internet:
```

```
...
```

```
...
```

```
Destination: 192.0.2.3/32
```

```
Route type: destination
```

```
Route reference: 0
```

```
Route interface-index: 67
```

```
Flags: sent to PFE
```

```

| <b>Output Fields</b>            | <a href="#">Table 103 on page 1964</a> describes the output fields for the <b>show path-computation-client active-pce</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 103: show path-computation-client active-pce Output Fields**

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| IP address | IP address of the current active PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| Priority   | Active PCE priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| PCE status | Active PCE state: <ul style="list-style-type: none"> <li>PCE_STATE_NEW—Initial PCEP session state.</li> <li>PCE_STATE_RECONNECT—Trying to re-establish TCP connection with the PCEP peer.</li> <li>PCE_STATE_CONNECTING—Establishing TCP connection with the PCEP peer.</li> <li>PCE_STATE_CONNECTED—TCP connection established with the PCEP peer.</li> <li>PCE_STATE_SYNC—Open messages exchanged with the PCEP peer and entering SYNC state.</li> <li>PCE_STATE_UP—PCEP session established.</li> </ul> | All levels      |

Table 103: show path-computation-client active-pce Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Session type            | Active PCE type: <ul style="list-style-type: none"> <li>PCE_TYPE_STATELESS—Does not learn LSP state information from PCC.</li> <li>PCE_TYPE_STATEFUL—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update LSP state. A PCC maintains synchronization with the PCE.</li> <li>PCE_TYPE_STATEFULACTIVE—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegate control of their LSPs to the PCE.</li> </ul> | All levels      |
| PCE-mastership          | PCE mastership state: <ul style="list-style-type: none"> <li>main—Current active PCE.</li> <li>backup—Backup PCE.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| PCRpts                  | Number of PC report (PCRpt) messages sent by PCC to a stateful PCE to report current state of LSP(s).                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |
| PCUpdates               | Number of PC update (PCUpd) messages sent by a PCE to a PCC to update LSP parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |
| Local Keepalive timer   | Keepalive timer used by or for the PCC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |
| Local Dead timer        | Dead timer used by or for the PCC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| Remote Keepalive timer  | Keepalive timer used by or for the PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |
| Remote Dead timer       | Dead timer used by or for the PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| PCErr-recv              | Information about type, value, and number of PC Error messages received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels      |
| Max unknown messages    | Maximum number of unknown messages received for a PCEP session. Recommended value is 5. If the number of unknown messages received by a PCC or PCE is greater than or equal to the maximum number, the PCEP session is closed.                                                                                                                                                                                                                                                                                                                   | detail          |
| Keepalives received     | Number of Keepalive messages received by a PCC from a PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail          |
| Keepalives sent         | Number of Keepalive messages sent by a PCC to a PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | detail          |
| Dead timer              | Dead timer used by the current active PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail          |
| Elapsed as main current | Time (in seconds) the PCE is in the main mastership state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail          |
| Elapsed as main total   | Time (in seconds) the PCE became main from the last PCCD restart.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | detail          |

Table 103: show path-computation-client active-pce Output Fields (*continued*)

| Field Name               | Field Description                                                    | Level of Output |
|--------------------------|----------------------------------------------------------------------|-----------------|
| Unknown<br>msgs/min rate | Number of unknown messages received per minute.                      | detail          |
| Session failures         | Number of PCEP session failures with the PCE.                        | detail          |
| Delegation timeout<br>in | Time (in seconds) left for LSP delegation to timeout.                | detail          |
| Delegation failures      | Number of LSP delegation failures.                                   | detail          |
| Connection down          | Time (in seconds) since the PCEP session is down.                    | detail          |
| PCErr-sent               | Information about type, value, and number of PC Error messages sent. | All levels      |

| <b>Output Fields</b>            | Table 104 on page 1968 describes the output fields for the <b>show path-computation-client statistics</b> command. Output fields are listed in the approximate order in which they appear.                                       |

Table 104: show path-computation-client statistics Output Fields

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| IP address | IP address of the PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels      |
| Priority   | PCE priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| PCE status | PCE state: <ul style="list-style-type: none"> <li>• PCE_STATE_NEW— Initial PCEP session state.</li> <li>• PCE_STATE_RECONNECT—Trying to re-establish TCP connection with the PCEP peer.</li> <li>• PCE_STATE_CONNECTING—Establishing TCP connection with the PCEP peer.</li> <li>• PCE_STATE_CONNECTED—TCP connection established with the PCEP peer.</li> <li>• PCE_STATE_SYNC—Open messages exchanged with the PCEP peer and entering SYNC state.</li> <li>• PCE_STATE_UP—PCEP session established.</li> </ul> | All levels      |

**Table 104: show path-computation-client statistics Output Fields (*continued*)**

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Session type           | Active PCE type: <ul style="list-style-type: none"> <li>• PCE_TYPE_STATELESS—Does not learn LSP state information from PCC.</li> <li>• PCE_TYPE_STATEFUL—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update LSP state. A PCC maintains synchronization with the PCE.</li> <li>• PCE_TYPE_STATEFULACTIVE—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegate control of their LSPs to the PCE.</li> </ul> | All levels      |
| PCE-mastership         | PCE mastership state: <ul style="list-style-type: none"> <li>• main</li> <li>• primary</li> <li>• backup</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| PCRpts                 | Number of PC report (PCRpt) messages sent by PCC to a stateful PCE to report current state of LSP(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| PCUpdates              | Number of PC update (PCUpd) messages sent by a PCE to a PCC to update LSP parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| Local Keepalive timer  | Keepalive timer used by or for the PCC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels      |
| Local Dead timer       | Dead timer used by or for the PCC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| Remote Keepalive timer | Keepalive timer used by or for the PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels      |
| Remote Dead timer      | Dead timer used by or for the PCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| PCErr-recv             | Information about type, value, and number of PC Error messages received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| PCErr-sent             | Information about type, value, and number of PC Error messages sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| Max unknown messages   | Maximum number of unknown messages received for a PCEP session. Recommended value is 5. If the number of unknown messages received by a PCC or PCE is greater than or equal to the maximum number, the PCEP session is closed.                                                                                                                                                                                                                                                                                                                         | detail          |

**Table 104: show path-computation-client statistics Output Fields (*continued*)**

| Field Name              | Field Description                                                 | Level of Output |
|-------------------------|-------------------------------------------------------------------|-----------------|
| Keepalives received     | Number of Keepalive messages received by a PCC from a PCE.        | detail          |
| Keepalives sent         | Number of Keepalive messages sent by a PCC to a PCE.              | detail          |
| Elapsed as main current | Time (in seconds) the PCE is in the main mastership state.        | detail          |
| Elapsed as main total   | Time (in seconds) the PCE became main from the last PCCD restart. | detail          |
| Unknown msgs/min rate   | Number of unknown messages received per minute.                   | detail          |
| Session failures        | Number of PCEP session failures with the PCE.                     | detail          |
| Delegation timeout in   | Time (in seconds) left for LSP delegation to timeout.             | detail          |
| Delegation failures     | Number of LSP delegation failures.                                | detail          |
| Connection down         | Time (in seconds) since the PCEP session is down.                 | detail          |

## Sample Output

### show path-computation-client statistics all

```

user@host> show path-computation-client statistics all
PCE pce1
