| <b>Description</b>              | <p>Set the order in which AAA tries different authentication methods when verifying that a client can access the router or switch. For each login attempt, AAA tries the authentication methods in order, from first to last.</p> <p>A given subscriber does not undergo both authentication and authorization as separate steps. When both <b>authentication-order</b> and <b>authorization-order</b> are specified, DHCP subscribers honor the configured authorization order, all other subscribers use the configured authentication-order.</p>                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b><i>authentication-methods</i></b>—Ordered list of methods to use for authentication attempts. The list includes one or more of the following methods in any combination:</p> <ul style="list-style-type: none"> <li>• <b>nasreq</b>—Verify the client using NASREQ authentication services.</li> <li>• <b>none</b>—No authentication is performed. Grants authentication without examining the client credentials. Can be used, for example, when the Diameter function Gx-Plus is employed for notification during subscriber provisioning.</li> <li>• <b>password</b>—Verify the client using the information configured at the <code>[edit access profile <i>profile-name</i> client <i>client-name</i>]</code> hierarchy level.</li> <li>• <b>radius</b>—Verify the client using RADIUS authentication services.</li> </ul> |
|                                 | <p> <b>NOTE:</b> Subscriber access management does not support the <b>password</b> option, and authentication fails when no method (<b>none</b>) is specified.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Specify a list of the RADIUS authentication servers used to authenticate DHCP, L2TP, and PPP clients. The servers in the list are also used as RADIUS dynamic-request servers, from which the router accepts and processes RADIUS disconnect requests, CoA requests, and dynamic service activations and deactivations. |
| <b>Options</b>                  | <i>ip-address</i> —IPv4 address.                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Set the order in which AAA tries different methods to verify that a client is authorized access to the router or switch. For each login attempt, AAA tries the authorization methods in order, from first to last.</p> <p>A given subscriber does not undergo both authentication and authorization as separate steps. When both <b>authentication-order</b> and <b>authorization-order</b> are specified, DHCP subscribers honor the configured authorization order, all other subscribers use the configured authentication-order.</p>                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b><i>authorization-methods</i></b>—Ordered list of methods to use for authorization attempts. The list includes one or more of the following methods in any combination:</p> <ul style="list-style-type: none"> <li>• <b>jsrc</b>—Use the JSRC application in an SRC environment to request authorization from the SAE when verifying that a DHCP subscriber can access the router or switch. When you include this option, AAA ignores any configured authentication order settings. This option is ignored for non-DHCP subscribers.</li> <li>• <b>nasreq</b>—Use the NASREQ application to communicate with a NASREQ server for authorization of any subscriber type as an alternative to RADIUS authorization.</li> <li>• <b>none</b>—No authorization is performed. Can be used, for example, when the Diameter function Gx-Plus is employed for notification during subscriber provisioning.</li> </ul> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0.                                                                                                                                                                                                                             |
| <b>Description</b>              | Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete DHCP setup. This configuration is equivalent to DHCP Option 67. |
| <b>Options</b>                  | <i>filename</i> —Location of the boot file on the boot server. The filename can include a pathname.                                                                                                                                                                       |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.1.                                                                                                                                                                                                                                 |
| <b>Description</b>              | Specify the character that the router uses as a separator between the concatenated values in the Calling-Station-ID (RADIUS IETF attribute 31) string. The router uses the delimiter when you configure more than one value in the <b>calling-station-id-format</b> statement. |
| <b>Default</b>                  | The hash (#) character.                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <b><i>delimiter-character</i></b> —Character to use for the delimiter. You must enclose the delimiter character in quotation marks (" ").                                                                                                                                      |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                |

## chap-challenge-in-request-authenticator (Subscriber Management)

---

**Syntax** chap-challenge-in-request-authenticator;

**Hierarchy Level** [edit access profile *profile-name* radius **options**]

**Release Information** Statement introduced in Junos OS Release 15.1.

**Description** Configure the **authd** process to insert the random challenge generated by the NAS into the Request Authenticator field of Access-Request packets, if the challenge value is 16 bytes long.

If you enable the **chap-challenge-in-request-authenticator** statement and the random challenge is not 16 bytes long, **authd** ignores the statement and uses the default behavior, which inserts the random challenge as the CHAP-Challenge attribute (RADIUS attribute 60) in Access-Request packets.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## charging-id (OCS Partition)

---

**Syntax** charging-id *number*;

**Hierarchy Level** [edit access **ocs partition** *partition-name*]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Include the 3GPP-Charging-Id AVP value in all CCR-GY messages.

**Options** *number*—3GPP-Charging-Id AVP value to include in all CCR-GY messages.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Specify the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option (option 82) to include in DHCP packets destined for a DHCP server. Optionally specify that the suboption includes a prefix, textual description, or VLAN tag.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**NOTE:** For Layer 3 interfaces, when you configure **relay-option-82** only, the Agent Circuit ID is the default. If no VLAN tags are configured, then the default is the logical interface device (IFL) name. For integrated routing and bridging (IRB) interfaces, the default is the Layer 2 IFL name and bridge domain name.

The interface to bridge domain relationship may be implicit (the interface is mapped to the bridge domain by the system based on VLAN tag) or explicit (the interface is mapped to the bridge domain by configuring it in the bridge domain definition). For the explicit case, tagging might not be relevant for the mapping.

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual LANs (VLANs), stacked VLANs (S-VLANs), or bridge domains is as follows:

*(fe | ge)-fpc/pic/port.subunit*

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface for remote systems.

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use VLANs is as follows:

*(fe | ge)-fpc/pic/port:vlan-id*

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs is as follows:

*(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

In the case of an IRB interface, the format displays the Layer 2 interface instead of the IRB interface along with the bridge domain name. For IRB interfaces (or other pseudo devices) the default format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

*(fe | ge)-fpc/pic/port.subunit:bridge-domain-name*

- IRB interfaces that use VLANs:

*(fe | ge)-fpc/pic/port.subunit:vlan-name*

To include the IRB interface name with the Layer 2 interface name, configure the **include-irb-and-l2** statement. The format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

*(fe | ge)-fpc/pic/port:bridge-domain-name+irb.subunit*

- IRB interfaces that use VLANs:

*(fe | ge)-fpc/pic/port:vlan-name+irb.subunit*

To include only the IRB interface name without the Layer 2 interface and bridge domain or VLAN, configure the **no-vlan-interface-name** statement. The format is as follows:

*irb.subunit*

The remaining statements are explained separately.

| <b>Description</b>              | Delete all DHCP clients or only the DHCP clients serviced by the specified group of interfaces when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | Restores the original client configuration when reconfiguration fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Configure the method that the authenticator uses to access RADIUS authentication servers when there are multiple servers configured. Initially, a RADIUS client sends a request to a RADIUS authentication or accounting server. The router or switch, acting as the authenticator, waits for a response from the server before sending another request.</p> <p>When there are multiple RADIUS server connections configured for a client, the authenticator attempts to reach the different servers in the order that they are configured. If there is no response from the first RADIUS server, the authenticator attempts to reach the next RADIUS server. This process repeats until the client is either granted access or there are no more configured servers.</p> <p>If the <b>direct</b> method is configured, the authenticator always treats the first server in the list as the primary server. The authenticator moves on to the second server only if the attempt to reach the first server fails. If the <b>round-robin</b> method is configured, the server chosen first will be rotated based on which server was used last. The first server in the list is treated as a primary for the first authentication request, but for the second request, the second server configured is treated as primary, and so on. With this method, all of the configured servers receive roughly the same number of requests on average so that no single server has to handle all of the requests.</p> |
|                                 | <p> <b>NOTE:</b> The round-robin access method is not recommended for use with EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>                  | The <b>direct</b> option is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>direct</b>—Use the direct access method. The authenticator contacts the first RADIUS server on the list for each request, the second server if the first one fails, and so on.</p> <p><b>round-robin</b>—Use the round-robin method. The authenticator contacts the first RADIUS server for the first request, the second server for the second request, and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Specify the grace period that begins after an authenticated user terminates all sessions and connections. Authentication is not required if a new connection is initiated during the grace period by the same user.</p> <p>During this period, the router determines whether the subscriber is inactive by monitoring data traffic, both upstream from the user (ingress) and downstream to the user (egress). Control traffic is ignored. The subscriber is not considered idle as long as data traffic is detected in either direction. When no traffic is detected for the duration of the idle time out, non-DHCP subscribers (such as L2TP or PPP) are gracefully logged out, similarly to a RADIUS-initiated disconnect or a CLI-initiated logout; DHCP subscribers are disconnected.</p> <p>When you additionally configure the related <a href="#">client-idle-timeout-ingress-only</a> statement (MX Series only), the router monitors only ingress traffic to determine whether the subscriber is inactive; it does not monitor any egress traffic. The related <a href="#">client-session-timeout</a> statement terminates the subscriber session when the session timeout expires regardless of user activity.</p> <p>Client idle timeouts are most often used for residential services rather than business services. The most practical use case for this timeout is in a PPP access model. It is not practical for DHCP or DHCPv6 subscribers.</p> <p>Although you can use the <b>client-idle-timeout</b> statement for dynamically configured subscriber VLANs, this configuration is useful only in limited circumstances (such as IP over Ethernet without DHCP and with fixed addresses) and is not typically used. If you do use the idle timeout for VLANs, the timeout period starts when the VLAN is instantiated. It resets when a client session is created or an existing session is reactivated. When no traffic is detected on an authenticated VLAN for the duration of the timeout, the VLAN is considered inactive and is deleted. If no client sessions are ever created on the VLAN, then the VLAN is removed when the timeout expires.</p> |
| <b>Default</b>                  | The timeout is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Specify that only ingress traffic is monitored for subscriber idle timeout processing for the duration of the idle timeout period that you specify with the <a href="#">client-idle-timeout</a> statement. If no ingress traffic is received for the duration of the timeout, then the subscriber is gracefully logged out (non-DHCP subscribers) or disconnected (DHCP subscribers).</p> <p>If you configure <a href="#">client-idle-timeout</a> alone, then both ingress and egress traffic are monitored during the idle timeout. Monitoring only ingress traffic is useful in cases where the LNS sends traffic to the remote peer even when the peer is not up, such as when the LNS does not have PPP keepalives enabled and therefore does not detect that the peer is not up. Because the LAC monitors both ingress and egress traffic by default, in this situation it receives the egress traffic from the LNS and either does not log out the subscriber or delays detection of inactivity until the egress traffic ceases. When you specify that only ingress traffic is monitored in this case, the LAC can detect that the peer is inactive and then initiate logout.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Specify the amount of time after which user sessions are terminated, regardless of user activity (also known as a forced or hard authentication timeout).</p> <p>Alternatively, when you want subscribers to be identified as inactive before they are terminated, use the related statements, <a href="#">client-idle-timeout</a> and <a href="#">client-idle-timeout-ingress-only</a>. Use <a href="#">client-idle-timeout</a> alone to specify a period of time during which both ingress and egress subscriber data traffic is monitored; if no traffic is detected for the duration of the period, the subscriber is considered inactive and is terminated. Add the <a href="#">client-idle-timeout-ingress-only</a> statement to monitor only ingress traffic for the duration of the timeout set with the <a href="#">client-idle-timeout</a> statement.</p> |
|                                 | <div>  <p><b>BEST PRACTICE:</b> We recommend that you do not configure a session timeout for subscribers receiving voice services. Because the session timeout is a simple time-based timeout, it is likely to interrupt subscribers actively using a voice service and terminate their calls unexpectedly (from the subscriber viewpoint). This result is a particular concern for emergency services calls.</p> </div>                                                                                                                                                                                                                                                                                                                                                             |
|                                 | <p>Client session timeouts are most often used for residential services rather than business services. The most practical use case for this timeout is in a PPP access model when no voice services are offered. For DHCP or DHCPv6 subscribers, the session timeout is used as the DHCP lease timer if no other lease time configuration is present.</p> <p>Although you can use the <b>client-session-timeout</b> statement for dynamically configured subscriber VLANs, this configuration is useful only in limited circumstances (such as IP over Ethernet without DHCP and with fixed addresses) and is not typically used. If you do use the session timeout for VLANs, the timeout period starts when the VLAN is instantiated.</p>                                                                                                                            |
| <b>Default</b>                  | The timeout is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Specify the interval at which Extensible Subscriber Services Manager issues requests for committing op script configurations. Requests that are received and processed within the interval are committed in a batch at the end of the interval. Requests that are processed after the interval are committed at the end of the next commit interval. When no operation script is to be committed, no request for committing operation script configurations is issued. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Configure the router to override the default behavior when the router receives a DHCPv4 Discover or DHCPv6 Solicit message while in a bound state. By default, DHCP maintains the existing client entry when DHCP receives a new Discover or Solicit message that has a client ID that matches the existing client. DHCP then processes the new message using the existing client entry.</p> <p>You use the <b>delete-binding-on-renegotiation</b> statement to override the default action, and to specify that DHCP tear down the existing matching client entry and to process the message as a new client entry.</p>                                                                                                                                                                                                                                                                                                              |
|                                 | <div>  <p><b>NOTE:</b> In Junos OS releases prior to 15.1, the DHCPv6 local server and relay agent use the opposite default behavior, and tear down the existing client entry when receiving a Solicit message while in a bound state. Starting in Junos OS release 15.1, the DHCPv6 local server and DHCPv6 relay agent default behavior is the same as DHCPv4 local server and relay agent—in all models, the default behavior is to maintain the existing client entry.</p> </div>                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | Specify the character used as the delimiter between the concatenated components of the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b><i>delimiter-character</i></b>—Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.</p> <p><b>Default:</b> . (period)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**NOTE:** When you include the [interface-description](#) in the username, the delimiter must not be a character that is part of the interface description. For example, if the text description is configured as “Backbone connection/PHL01”, you cannot use the forward slash (/) as the delimiter.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Description</b>         | Specify the character used as the delimiter between the concatenated components of the username. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <p><b><i>delimiter-character</i></b>—Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.</p> <p><b>Default:</b> . (period)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**NOTE:** When you include the [interface-description](#) in the username, the delimiter must not be a character that is part of the interface description. For example, if the text description is configured as “Backbone connection/PHL01”, you cannot use the forward slash (/) as the delimiter.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Specify the IP address used to establish the subscriber context. Subscriber instantiation is always triggered for ingress packets, so this value indicates which IP address in the ingress packets for the flow is used. If the IP address does not correspond to a known subscriber, then a new subscriber context is created. All service rules attached to a given service set must have the same setting. |
| <b>Options</b>                  | <b>destination-address</b> —Use the destination IP address field of the ingress packet header for the flow.<br><br><b>source-address</b> —Use the source IP address field of the ingress packet header for the flow.                                                                                                                                                                                          |
| <b>Required Privilege Level</b> | <b>interface</b> —To view this statement in the configuration.<br><b>interface-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                       |

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 13.2X51 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router or switch to enable the router or switch to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.

The extended DHCP local server is incompatible with the DHCP server on J Series routers and, therefore, is not supported on J Series routers. Also, the DHCP local server and the DHCP/BOOTP relay server, which are configured under the **[edit forwarding-options helpers]** hierarchy level, cannot both be enabled on the router or switch at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.

The **dhcpv6** stanza configures the router or switch to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.

**NOTE:** When you configure the **dhcp-local-server** statement at the routing instance hierarchy level, you must use a routing instance type of **virtual-router**.

---

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the router or switch to enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.</p> <p>DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.</p> <p>The extended DHCP and DHCPv6 relay agent options configured with the <b>dhcp-relay</b> and <b>dhcpv6</b> statements are incompatible with the DHCP/BOOTP relay agent options configured with the <b>bootp</b> statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router (or switch) at the same time.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Enable DHCP services on the device. DHCP services automate network-parameter assignment to network devices. The DHCP service process is enabled by default. However, by default, IP-MAC bindings in the DHCP snooping database do not persist through device reboots. You can improve performance after rebooting by configuring the IP-MAC bindings to persist, by configuring a storage location for the DHCP database file. When specifying the location for the DHCP database, you must also specify how frequently the switch writes the database entries into the DHCP snooping database file.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                          |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Configure DHCPv6 local server options on the router or switch to enable the router or switch to function as a server for the DHCP protocol for IPv6. The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. The local server works together with the AAA service framework to control subscriber access (or DHCP client access) and accounting.</p> <p>The DHCPv6 local server is fully compatible with the extended DHCP local server and DHCP relay agent.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Description              | <p>Configure DHCPv6 relay options on the router or switch to enable the router or switch to function as a DHCPv6 relay agent. A DHCPv6 relay agent forwards DHCPv6 request and reply packets between a DHCPv6 client and a DHCPv6 server.</p> <p>The DHCPv6 relay agent server is fully compatible with the extended DHCP local server and DHCP relay agent. However, the options configured with the <b>dhcpv6</b> statement are incompatible with the DHCP/BOOTP relay agent options configured with the <b>bootp</b> statement. As a result, the DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot be enabled on the router or switch at the same time.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## diameter

**Syntax**

```
diameter {
  network-element element-name {
    dne-origin realm realm-name <host hostname>;
    forwarding {
      route dne-route-name {
        destination realm realm-name <host hostname>;
        function function-name <partition partition-name>;
        metric route-metric;
      }
    }
    function function-name;
    peer peer-name {
      priority priority-number;
    }
  }
  origin realm realm-name host hostname;
  peer peer-name {
    address ip-address;
    connect-actively {
      port port-number;
      transport transport-name;
    }
    logical-system logical-system-name <routing-instance routing-instance-name>;
    peer-origin realm realm-name host hostname;
    routing-instance routing-instance-name;
  }
  transport transport-name {
    address;
    logical-system logical-system-name <routing-instance routing-instance-name>;
    routing-instance routing-instance-name;
  }
}
```

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure the Diameter base protocol for subscriber management.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Specify the address of the DNS server that is used to resolve IPv6 DNS names. You can use RADIUS to provide the address dynamically in the \$junos-ipv6-dns-server variable within Access-Accept messages, or you can statically configure up to three IPv6 addresses.</p> <p>You can also specify the maximum time in seconds for which the DNS server address remains valid. The device can use the recursive DNS server address for DNS name resolution until the time specified expires.</p>                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>\$junos-ipv6-dns-server-address</b>—Dynamically receive the address of the DNS server from RADIUS in Access-Accept messages.</p> <p><b><i>dns-server-address</i></b>—IPv6 address of the DNS server. You can configure up to three DNS server addresses.</p> <p><b>lifetime <i>seconds</i></b>—Maximum time for which the recursive DNS server address remains valid.</p> <p><b>Range:</b> 0 through 4,294,967,295 seconds</p> <p><b>Default:</b> 1800 seconds</p> <p><b>Values:</b> 0 indicates that the advertised recursive DNS server address is no longer valid and that this recursive DNS server address entry can be deleted. A value of 4,294,967,295 seconds indicates an infinite lifetime and a persistent entry in the device for this recursive DNS server address.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## domain (Domain Map)

**Syntax**

```

domain {
  delimiter [delimiter-character];
  map domain-map-name {
    aaa-logical-system logical-system-name {
      aaa-routing-instance routing-instance-name;
    }
    aaa-routing-instance routing-instance-name;
    access-profile profile-name;
    address-pool pool-name;
    dynamic-profile profile-name;
    padn destination-address {
      mask destination-mask;
      metric route-metric;
    }
    strip-domain;
    target-logical-system logical-system-name {
      target-routing-instance routing-instance-name;
    }
    target-routing-instance routing-instance-name;
    tunnel-profile profile-name;
  }
  parse-direction (left-to-right | right-to-left);
  parse-order (domain-first | realm-first);
  realm-delimiter [delimiter-character];
  realm-parse-direction (left-to-right | right-to-left);
}

```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Configure a domain map, which is used to map access options and session parameters for subscriber sessions.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.3.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.                                                                                                                                                                                                                             |
| <b>Description</b>         | Configure an IPv4 address for a DNS name server. You can configure an address globally for a routing instance at the <code>[edit access]</code> hierarchy level or for an access profile at the <code>[edit access profile <i>profile-name</i>]</code> hierarchy level. You can configure more than one address by including the statement multiple times. |

**NOTE:** A DNS name server address configured with this statement is less preferred than one configured with the `domain-name-server inet` statement. That is, the server with the address configured with the `domain-name-server inet` takes precedence over a server configured with this statement.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure an IPv6 address for a DNS name server. You can configure an address globally for a routing instance at the <b>[edit access]</b> hierarchy level or for an access profile at the <b>[edit access profile <i>profile-name</i>]</b> hierarchy level. You can configure more than one address by including the statement multiple times. |
| <b>Options</b>                  | <i>dns-address</i> —IPv6 address of the DNS name server.                                                                                                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Specify a recommended shaping rate to be applied to downstream traffic on an interface.</p> <p>For ANCP interfaces, this configured rate is used as the default value for the Juniper VSA Downstream-Calculated-Qos-Rate (26–141) when the router has not received and processed the attributes from the access node.</p> <p>For L2TP, the rate is configured on an underlying PPPoE logical interface for a subscriber on an MX Series router acting as a LAC. When the subscriber is tunneled, this rate, referred to as speed for L2TP, is sent to the LNS in the ICCN message as AVP 24.</p> |
| <b>Options</b>                  | <p><b>rate</b>—Traffic rate in bits per second.</p> <p><b>Range:</b> 1000 through 4,294,967,295 bits per second</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Configure the Policy and Charging Rule Function (PCRF) or Online Charging System (OCS) partition to the draining state to make substantial configuration changes quickly. To log out all subscribers quickly and immediately, issue the <b>clear network-access pcrf subscribers</b> command.</p> <p>After you set draining for either of the PCRF or OCS partitions, any new subscriber logins are denied, and the time limit you set in the <a href="#">draining-response-timeout</a> statement is used instead of the <a href="#">logout-response-timeout</a> time limit.</p> <p>After the partition has drained, you must issue the <a href="#">clear network-access pcrf</a> or <a href="#">clear network-access ocs statistics</a> command to clear out the respective partition's subscribers and wait for all of the subscribers to log out before you can make configuration changes and resume normal operations.</p> |

| <b>Description</b>              | Drop (discard) specified DHCP client packets when you use DHCP relay agent selective processing. You can configure the drop operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | Assigns the specified dual-stack group to both legs (DHCP and DHCPv6) of the DHCP dual stack. The dual-stack group defines the common configuration settings for DHCP and DHCPv6 subscribers on both legs. These settings take precedence over all other configurations, such as those specified in global, group, or interface settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <i>dual-stack-group-name</i> —Name of the globally configured dual-stack group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.                                                                                                                                                                                                                                          |
| <b>Description</b>              | Enable the Junos OS enhanced subscriber management software architecture to support configuration of dynamic interfaces and services for subscriber management. To use dynamic profiles and authentication to create and manage dynamic subscriber interfaces and services, you must enable enhanced subscriber management and reboot the router. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Configure the exact match criteria used with the DHCP relay agent selective processing feature. DHCP relay agent compares the configured match string with the option-specific string received in DHCP client packets. If there is an exact left-to-right match, DHCP performs the action you define for the match criteria.</p> <p>You can configure an unlimited number of match strings. Match strings do not support wildcard attributes.</p> <p>The <b>local-server-group</b> option is not supported for DHCPv6 relay agent.</p>                                                                |
| <b>Options</b>                  | <p><b><i>ascii-string</i></b>—ASCII string of 1 through 255 alphanumeric characters.</p> <p><b><i>hexadecimal-string</i></b>—Hexadecimal string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                           |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.  
Options **downstream-calculated-qos-rate**, **dsl-forum-attributes**, and **upstream-calculated-qos-rate** added in Junos OS Release 11.4.  
Options **cos-shaping-rate** and **filter-id** added in Junos OS Release 13.2.  
Option **pppoe-description** added in Junos OS Release 14.2.  
Option **virtual-router** added in Junos OS Release 15.1.  
Options **first-relay-ipv4-address** and **first-relay-ipv6-address** added in Junos OS Release 16.1.

**Description** Configure the router or switch to exclude the specified attributes from the specified type of RADIUS message.

Not all attributes are available in all types of RADIUS messages. By default, the router or switch includes the specified attributes in RADIUS Access-Request, Acct-On, Acct-Off, Acct-Start, and Acct-Stop messages.

**NOTE:** If you exclude an attribute from Acct-Off messages, the attributes are then excluded from Interim-Acct messages.

**Options** RADIUS attribute type—RADIUS attribute, Juniper Networks (vendor ID 4874) VSA number and name, or DSL Forum (vendor ID 3561) VSA number and name:

- **acc-aggr-cir-id-asc**—Juniper Networks VSA 26-112, Acc-Aggr-Cir-Id-Asc.
- **acc-aggr-cir-id-bin**—Juniper Networks VSA 26-111, Acc-Aggr-Cir-Id-Bin.
- **acc-loop-cir-id**—Juniper Networks VSA 26-110, Acc-Loop-Cir-Id.
- **acc-loop-encap**—Juniper Networks VSA 26-183, Acc-Loop-Encap.
- **acc-loop-remote-id**—Juniper Networks VSA 26-182, Acc-Loop-Remote-Id.
- **accounting-authentic**—RADIUS attribute 45, Acct-Authentic.
- **accounting-delay-time**—RADIUS attribute 41, Acct-Delay-Time.
- **accounting-session-id**—RADIUS attribute 44, Acct-Session-Id.
- **accounting-terminate-cause**—RADIUS attribute 49, Acct-Terminate-Cause.
- **acct-tunnel-connection**—RADIUS attribute 68, Acct-Tunnel-Connection.
- **act-data-rate-dn**—Juniper Networks VSA 26-114, Act-Data-Rate-Dn
- **act-data-rate-up**—Juniper Networks VSA 26-113, Act-Data-Rate-Up
- **act-interlv-delay-dn**—Juniper Networks VSA 26-126, Act-Interlv-Delay-Dn
- **act-interlv-delay-up**—Juniper Networks VSA 26-124, Act-Interlv-Delay-Up
- **att-data-rate-dn**—Juniper Networks VSA 26-118, Att-Data-Rate-Dn
- **att-data-rate-up**—Juniper Networks VSA 26-117, Att-Data-Rate-Up
- **called-station-id**—RADIUS attribute 30, Called-Station-Id.
- **calling-station-id**—RADIUS attribute 31, Calling-Station-Id.
- **chargeable-user-identity**—RADIUS attribute 89, Chargeable-User-Identity.
- **class**—RADIUS attribute 25, Class.
- **cos-shaping-rate**—Juniper Networks VSA 26-177, Cos-Shaping-Rate.
- **dhcp-gi-address**—Juniper Networks VSA 26-57, DHCP-GI-Address.
- **dhcp-mac-address**—Juniper Networks VSA 26-56, DHCP-MAC-Address.
- **dhcp-options**—Juniper Networks VSA 26-55, DHCP-Options.
- **downstream-calculated-qos-rate**—Juniper Networks VSA 26-141
- **dsl-forum-attributes**—DSL Forum VSA (vendor ID 3561) as described in RFC 4679, *DSL Forum Vendor-Specific RADIUS Attributes*
- **dsl-line-state**—Juniper Networks VSA 26-127, DSL-Line-State
- **dsl-type**—Juniper Networks VSA 26-128, DSL-Type
- **event-timestamp**—RADIUS attribute 55, Event-Timestamp.
- **filter-id**—RADIUS attribute 11, Filter-Id.

- **first-relay-ipv4-address**—Juniper Networks VSA 26-187, DHCP-First-Relay-IPv4-Address.
- **first-relay-ipv6-address**—Juniper Networks VSA 26-188, DHCP-First-Relay-IPv6-Address.
- **framed-ip-address**—RADIUS attribute 8, Framed-IP-Address.
- **framed-ip-netmask**—RADIUS attribute 9, Framed-IP-Netmask.
- **input-filter**—Juniper Networks VSA 26-10, Ingress-Policy-Name.
- **input-gigapackets**—Juniper Networks VSA 26-42, Acct-Input-Gigapackets.
- **input-gigawords**—RADIUS attribute 52, Acct-Input-Gigawords.
- **interface-description**—Juniper Networks VSA 26-53, Interface-Desc.
- **l2tp-rx-connect-speed**—Juniper Networks VSA 26-163, Rx-Connect-Speed
- **l2tp-tx-connect-speed**—Juniper Networks VSA 26-162, Tx-Connect-Speed
- **max-data-rate-dn**—Juniper Networks VSA 26-120, Max-Data-Rate-Dn
- **max-data-rate-up**—Juniper Networks VSA 26-119, Max-Data-Rate-Up
- **max-interlv-delay-dn**—Juniper Networks VSA 26-125, Max-Interlv-Delay-Dn
- **max-interlv-delay-up**—Juniper Networks VSA 26-123, Max-Interlv-Delay-Up
- **min-data-rate-dn**—Juniper Networks VSA 26-116, Min-Data-Rate-Dn
- **min-data-rate-up**—Juniper Networks VSA 26-115, Min-Data-Rate-Up
- **min-lp-data-rate-dn**—Juniper Networks VSA 26-122, Min-Lp-Data-Rate-Dn
- **min-lp-data-rate-up**—Juniper Networks VSA 26-121, Min-Lp-Data-Rate-Up
- **nas-identifier**—RADIUS attribute 32, NAS-Identifier.
- **nas-port**—RADIUS attribute 5, NAS-Port.
- **nas-port-id**—RADIUS attribute 87, NAS-Port-Id.
- **nas-port-type**—RADIUS attribute 61, NAS-Port-Type.
- **output-filter**—Juniper Networks VSA 26-11, Egress-Policy-Name.
- **output-gigapackets**—Juniper Networks VSA 26-43, Acct-Output-Gigapackets.
- **output-gigawords**—RADIUS attribute 53, Acct-Output-Gigawords.
- **pppoe-description**—Juniper Networks VSA 26-24, PPPoE-Description.
- **tunnel-assignment-id**—RADIUS attribute 82, Tunnel-Assignment-ID.
- **tunnel-client-auth-id**—RADIUS attribute 90, Tunnel-Client-Auth-ID.
- **tunnel-client-endpoint**—RADIUS attribute 66, Tunnel-Client-Endpoint.
- **tunnel-medium-type**—RADIUS attribute 65, Tunnel-Medium-Type.
- **tunnel-server-auth-id**—RADIUS attribute 91, Tunnel-Server-Auth-ID.
- **tunnel-server-endpoint**—RADIUS attribute 67, Tunnel-Server-Endpoint.

- **tunnel-type**—RADIUS attribute 64, Tunnel-Type.
- **upstream-calculated-qos-rate**—Juniper Networks VSA 26-142
- **virtual-router**—Juniper Networks VSA 26-1

RADIUS message type:

- **access-request**—RADIUS Access-Request messages.
- **accounting-off**—RADIUS Accounting-Off messages.
- **accounting-on**—RADIUS Accounting-On messages.
- **accounting-start**—RADIUS Accounting-Start messages.
- **accounting-stop**—RADIUS Accounting-Stop messages.

## family (Address-Assignment Pools)

**Syntax**

```
family family {
    dhcp-attributes {
        [protocol-specific attributes]
    }
    host hostname {
        hardware-address mac-address;
        ip-address ip-address;
    }
    network ip-prefix /<prefix-length>;
    prefix ipv6-prefix;
    range range-name {
        high upper-limit;
        low lower-limit;
        prefix-length prefix-length;
    }
}
```

**Hierarchy Level** [edit access address-assignment **pool** *pool-name*]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Configure the protocol family for the address-assignment pool.

**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

**Options** *family*—Protocol family:

- **inet**—Internet Protocol version 4 suite
- **inet6**—Internet Protocol version 6 suite

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3R3 for MX 240, MX 480, MX 960, MX 2010, and MX 2020 routers with MPC5E, MPC5EQ, and MPC6E MPCs. Support for the <b>next-header</b> firewall match condition is available in Junos OS Release 13.3R6 and later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>The <b>fast-lookup-filter</b> is available for the inet and inet6 protocol families for both static and dynamic profiles. Junos installs firewall filters created under this hierarchy to the accelerated filter block available in the MPC5E, MPC5EQ, and MPC6E MPCs, which provides enhanced performance.</p> <p>Juniper recommends that you use the <b>payload-protocol</b> term rather than the <b>next-header</b> term when configuring a firewall filter with match conditions for IPv6 traffic. Although either can be used, <b>payload-protocol</b> provides the more reliable match condition because it uses the actual payload protocol to find a match, whereas <b>next-header</b> simply takes whatever appears in the first header following the IPv6 header, which may or may not be the actual protocol. In addition, if <b>next-header</b> is used with IPv6, the accelerated filter block lookup process is bypassed and the standard filter used instead.</p> <p>See <i>Firewall Filter Match Conditions for IPv6 Traffic</i> for more information about firewall filters and terms.</p> <p>The filter block hardware supports up to 4095 firewall filters, each of which can support up to 255 terms, to a system maximum of 8000 terms. Firewall instances from the same firewall block can also be attached to multiple interfaces.</p> |
|                                 | <p> <b>NOTE:</b> If both <b>fast-filter-optimization</b> and <b>fast-lookup-filter</b> are configured at the same time, <b>fast-lookup-filter</b> will take precedence (that is, any terms under <b>fast-filter-optimization</b> will be ignored).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>                                                                                                                                                                                                                            | Configure the amount of time in seconds before an Online Charging System (OCS) partition stops attempting to send the final interrogation during the subscriber logout process. When a subscriber starts to logs out, the OCS sends a final interrogation. If there is no response within 24 hours, then the system continues and starts sending a logout message to the Policy and Charging Rule Function (PCRF). If there is no response within the next 24 hours, then the subscriber logout proceeds.                                                                      |

| <b>Description</b>              | <p>Enable subscriber traffic to flow before the first interrogation with the Online Charging System (OCS) occurs.</p> <p>Wireline customers often control user services solely through the Policy Control and Charging Rules Function (PCRF) and use the OCS as a convenient real-time usage monitoring mechanism rather than as an enforcement unit. To decrease the number of possible erroneous OCS configurations, include the <b>force-continue</b> statement to force the broadband Policy and Charging Enforcement Function (BPCEF) to limit the impact of negative responses from the OCS and quota expirations, and to prevent sending OCS notifications for affected rating groups. Whenever the PCEF receives a negative response to any reported group, it stops reporting this group to the OCS.</p> |
|                                 | <div> <b>NOTE:</b> The <b>force-continue</b> state is required; you must configure it in the OCS partition.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## from (Rule)

**Syntax**    from {  
               application-group-any;  
               application-groups [ *application-group-name* ];  
               applications [ *application-name* ];  
               local-port-range low *low-value* high *high-value*;  
               local-ports [ *value-list* ];  
               protocol *protocol-number*;  
               remote-address *address* <except >;  
               remote-address-range low *low-value* high *high-value* <except >;  
               remote-port-range low *low-value* high *high-value*;  
               remote-ports [ *value-list* ];  
               remote-prefix-list *prefix-list-name* <except >;  
           }

**Hierarchy Level**    [edit services ptsp rule *rule-name* **term** *precedence*]

**Release Information**    Statement introduced in Junos OS Release 10.2.

**Description**    Specify match conditions for the PTSP term.

**Options**    For information on match conditions, see the description of firewall filter match conditions in the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                   interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Configure global attributes and data elements of the 3rd Generation Partnership Project (3GPP) Diameter credit control service charging system for the Online Charging System (OCS), which interacts with the Policy and Charging Enforcement Function (PCEF). The PCEF optionally reports usage and receives additional authorizations from the OCS using the 3GPP Gy protocol. Broadband PCEF (BPCEF) interactions with the OCS use online session charging with centralized unit determination and centralized rating.</p> <p>The remaining statement is explained separately.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Configure the maximum period that the ANCP agent waits before sending a SYN message to an ANCP neighbor to negotiate the adjacency. If the neighbor sends a SYN message during this period, the ANCP agent uses the partition information in the neighbor's message when generating its own initial SYN message to the neighbor. The agent does not wait for the period to expire if it receives a SYN message from the neighbor. |
| <b>Options</b>                  | <b><i>seconds</i></b> —Number of seconds the ANCP agent waits.<br><b>Range:</b> 1 through 60 seconds<br><b>Default:</b> 60 seconds                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Enable the ANCP agent to learn partition ID information from neighbors, in support of nonzero ANCP partition IDs. This statement forces the ANCP agent to delay sending a SYN message during adjacency negotiation for a configurable period. When the neighbor sends a SYN message to the ANCP agent during that period, the agent learns the partition ID information from the neighbor and uses that information when it sends its own SYN message. If the agent does not receive the message during the period, then it sends a SYN message to the neighbor when the period times out. |
| <b>Default</b>                  | This statement is disabled. The ANCP agent does not wait before sending the initial SYN message and does not support nonzero partition IDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Supports the addition of vendor-specific hostname in the option-82, suboption 9 field of DHCPv4 control messages on server-facing interfaces. The hostname can be a string of characters such as <b>Juniper-AB-1</b>.</p> <p>Junos OS automatically adds the remaining vendor-specific information as per RFC 4243. The enterprise ID is 2636. The hostname is option-data 1 (the location is option-data 2). The DHCPv4 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query the hostname to track and troubleshoot subscriber IP information and network attachment points.</p> |

| <b>Description</b>              | <p>Supports the addition of vendor-specific hostname in the vendor-specific option (17) of DHCPv6 control messages on server-facing interfaces. The hostname can be a string of characters such as <b>Juniper-AB-1</b>.</p> <p>Junos automatically adds the remaining vendor-specific information as per RFC 4243. The Enterprise ID is 2636. The hostname is option-data 1 (the location is option-data 2). The DHCPv6 relay strips the sub-option data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query the hostname to track and troubleshoot subscriber IP information and network attachment points.</p> |

| <b>Release Information</b> | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**NOTE:** The EX Series switches that support the include-irb-and-l2 statement are the EX4300, EX4600, and EX9200 switches.

**Description** Include both the integrated routing and bridging (IRB) interface name and Layer 2 interface name in the **circuit-id** or **remote-id** value in the DHCP option 82 information. VLAN tags are global.

When you configure the **include-irb-and-l2** statement without including the **no-vlan-interface** statement, the format is as follows:

- Bridge domain:

(fe | ge)-fpc/pic/port.subunit:bridge-domain-name+irb.subunit

- VLAN:

(fe | ge)-fpc/pic/port.subunit:vlan-name+irb.subunit

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface.

When you configure both the **include-irb-and-l2** statement and the **use-vlan-id** statement, the format is as follows:

*(fe | ge)-fpc/pic/port.subunit:svlan-id-vlan-id+irb.subunit*

**NOTE:** The *svlan-id-vlan-id* represents the VLANs associated with the bridge domain.

When you configure both the **include-irb-and-l2** and **no-vlan-interface-name** statements, the format is as follows:

*(fe | ge)-fpc/pic/port.subunit+irb.subunit*

When you configure both the **include-irb-and-l2** and **use-interface-description** statements, the format displays the description for the Layer 2 interface:

*l2\_descr:vlan-name+irb.subunit*

If you configure both the **include-irb-and-l2** and **use-interface-description** statements, and no description for the Layer 2 interface is found, the format displays the Layer 2 logical interface name:

*(fe | ge)-fpc/pic/port.subunit:vlan-name+irb.subunit*

When you configure the **include-irb-and-l2** statement with both the **no-vlan-interface-name** and **use-interface-description** statements, the format displays as follows:

*l2\_descr+irb.subunit*

If you configure the **include-irb-and-l2** statement with both the **no-vlan-interface-name** and **use-interface-description** statements, and no description is found for the Layer 2 interface, the format displays as follows:

*(fe | ge)-fpc/pic/port.subunit+irb.subunit*

|                                 |                                                             |
|---------------------------------|-------------------------------------------------------------|

| <b>Description</b>              | For leasequery and bulk leasequery operations that involve integrated routing and bridging (IRB) interfaces, you must configure DHCP relay agent to include the layer 2 interface name along with IRB name in the circuit ID of option 82. DHCP relay agent uses the layer 2 interface name when using leasequery or bulk leasequery to restore the lease database.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Releases 13.3R3, 14.1R2, and 14.2R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Specify that the DHCP server include option 82 information in NAK and forcerenew messages when you configure secure communications between the DHCP server and DHCP clients that are in different VRFs. You can configure support globally, for a group of interfaces, or for a specific interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>forcerenew</b>—Include option 82 in DHCP forcerenew messages.</p> <p><b>nak</b>—Include option 82 in DHCP NAK messages.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

                           [edit routing-instances *routing-instance-name* system services *dhcp-local-server ...*]

**Release Information**    Statement introduced in Junos OS Release 9.0.  
                               Statement introduced in Junos OS Release 12.3R2 for EX Series switches.  
                               Options **upto** and **exclude** introduced in Junos OS Release 9.1.

**Description**    Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP local server is enabled. You can repeat the **interface *interface-name*** statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP relay agent.

**NOTE:** DHCP values are supported in integrated routing and bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently supports only static DHCP configurations.

**Options**    **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

***interface-name***—Name of the interface. You can repeat this option multiple times.

***upto-interface-name***—Upper end of the range of interfaces; the lower end of the range is the ***interface-name*** entry. The interface device name of the ***upto-interface-name*** must be the same as the device name of the ***interface-name***.

The remaining statements are explained separately.

| <b>Description</b>         | <p>Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP or DHCPv6 relay agent is enabled. You can repeat the <b>interface <i>interface-name</i></b> statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP local server. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>                                                                                                                                                                                                                                                             |

**NOTE:** DHCP values are supported in integrated routing and bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. .

**Options** **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

**interface-name**—Name of the interface. You can repeat this option multiple times.

**overrides**—Override the specified default configuration settings for the interface. The **overrides** statement is described separately.

**upto-interface-name**—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the **upto-interface-name** must be the same as the device name of the **interface-name**.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that a modified version of the interface name is included as part of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message. The interface name is modified by replacing the “/” character with the “-” character. For example, ge-0/1/2.50 is converted to ge-0-1-2.50.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | Set the maximum number of DHCP subscribers or DHCP clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Set the maximum number of DHCP (or DHCPv6) subscribers or clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>M120 and M320 routers do not support DHCPv6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## interface-mib (Enhanced Subscriber Management)

|                            |                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | interface-mib;                                                                                           |
| <b>Hierarchy Level</b>     | [edit dynamic-profiles <i>profile-name</i> interfaces <i>interface-name</i> ]                            |
| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management. |
| <b>Description</b>         | Enable representation of the Interfaces MIB for the specified dynamic interface.                         |

**BEST PRACTICE:** To achieve maximum performance with enhanced subscriber management, we recommend that you *not* enable representation of the Interfaces MIB on all dynamic subscriber interfaces.

|                                 |                                                                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | If you do not include the <b>interface-mib</b> statement, representation of the Interfaces MIB on dynamic subscriber interfaces is disabled by default.                                                                     |

| <b>Description</b>         | <p>Configure extended DHCP tracing operations that can be enabled on a specific interface or group of interfaces.</p> <p>Replaces deprecated <b>interface-traceoptions</b> statements at the [edit forwarding-options dhcp-relay] and [edit system services dhcp-local-server] hierarchy levels.</p> <p>To enable the tracing operation on the specific interfaces, you use the <b>interface <i>interface-name</i> trace</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events</li> <li>• <b>packet</b>—Trace packet and option decoding operations</li> <li>• <b>state</b>—Trace changes in state</li> </ul> <p><b>level</b>—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Match messages of all levels.</li> <li>• <b>error</b>—Match error messages.</li> <li>• <b>info</b>—Match informational messages.</li> <li>• <b>notice</b>—Match notice messages about conditions requiring special handling.</li> </ul> |

- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Description</b>              | Configure the extended DHCP local server to use the IP address method to determine which address-assignment pool to use. The local server uses the IP address in the gateway IP address if one is present in the DHCP client PDU. If no gateway IP address is present, the local server uses the IP address of the receiving interface to find the address-assignment pool. The DHCP local server uses this method by default when no method is explicitly specified.                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Configure an IP connectivity access network (IP-CAN) value according to what best fits your operating environment and access network. The Policy and Charging Rules Function (PCRF) partition requires that you configure this statement. The Policy Control and Charging (PCC) enables a centralized control to ensure that the service sessions (IP-CAN sessions) are provided with appropriate bandwidth and QoS.</p> <p>An IP-CAN bearer is the IP transmission path of defined capacity, delay, and bit error rate. An IP-CAN session incorporates one or more IP-CAN bearers. Support for multiple IP-CAN bearers per IP-CAN session is IP-CAN specific. An IP-CAN session exists as long as the related IPv4 address or IPv6 prefix is assigned and announced to the IP network.</p> <p>If an IP-CAN session is modified, the Policy and Charging Enforcement Function (PCEF) first uses the event trigger to determine whether to request the PCC rules for the modified IP-CAN session from the PCRF. Then upon reception of updated PCC rules from the PCRF, the PCEF activates, modifies, or removes the PCC rules as indicated by the PCRF.</p> |
| <b>Options</b>                  | <p><i>number</i>—Identifier of the IP-CAN value used for your operating environment and access network.</p> <p><b>Default:</b> 77</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Configure AAA to add Juniper Networks DSL VSAs to the RADIUS authentication and accounting request messages for subscribers. If the router has not received and processed the corresponding ANCP attributes from the access node, then AAA provides only the following in these RADIUS messages:</p> <ul style="list-style-type: none"><li>• Downstream-Calculated-QoS-Rate (IANA 4874, 26-141)—Default configured advisory transmit speed.</li><li>• Upstream-Calculated-QoS-Rate (IANA 4874, 26-142)—Default configured advisory receive speed.</li></ul> |
| <b>Default</b>                  | The Juniper Networks DSL VSAs are not added to the RADIUS authentication and accounting request messages. However, the DSL Forum VSA—if available—is added to RADIUS messages by default.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | Override the setting of the broadcast bit in DHCP request packets and instead use the Layer 2 unicast transmission method to transmit DHCP Offer reply packets and DHCP ACK reply packets from the DHCP server to DHCP clients during the discovery process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure the minimum DHCP lease time allowed in your subscriber access network. If a third-party DHCP server or address pool provides a client lease that is less than the configured threshold, the router performs the action specified by the <b>violation-action</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Configure local reporting of service accounting statistics according to the specified flat-file profile, which determines the accounting statistics and nonstatistical parameters that are collected and reported in the local flat file. This configuration collects the running total service statistics per interface family. Because the statistics are maintained in the Routing Engine in a statistics database, they are not affected by a line-card restart, a graceful Routing Engine switchover, or a unified in-service software upgrade (ISSU). The statistics counters are reset when the router reboots.</p> <p>Collecting service statistics into a local flat file is useful when you do not need to send the information to RADIUS, such as when you are using the information for internal monitoring and need an accurate record for analytics.</p> |
| <b>Options</b>                  | <i>profile-name</i> —Name of the flat-file profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | <p>Supports the addition of a vendor-specific location in the option-82, suboption 9 field of DHCPv4 control messages on server-facing interfaces. The location should be specified as interface, vlan ID, and if applicable, svlan ID. For example, <b>&lt;ifd-name&gt;:&lt;vlan&gt;</b> (ae0:100) or <b>&lt;ifd-name&gt;:&lt;svlan&gt; -&lt;vlan&gt;</b> (ae0:100-10).</p> <p>Junos OS automatically adds the remaining vendor-specific information as per RFC 4243. The enterprise ID is 2636. The the location is option-data 2 (the hostname is option-data 1). The DHCPv4 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query the hostname to track and troubleshoot subscriber IP information and network attachment points.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## location (dhcpv6)

| <b>Description</b>              | <p>Supports the addition of a vendor-specific location in the vendor-specific option (17) of DHCPv6 control messages on server-facing interfaces. The location should be specified as interface, vlan ID, and if applicable, svlan ID. For example, <b>&lt;ifd-name&gt;:&lt;vlan&gt;</b> (ae0:100) or <b>&lt;ifd-name&gt;:&lt;svlan&gt; -&lt;vlan&gt;</b> (ae0:100-10).</p> <p>Junos automatically adds the remaining vendor-specific information as per RFC 4243. The Enterprise ID is 2636. The the location is option-data 2 (the hostname is option-data 1). The DHCPv6 relay strips the sub-option data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query the hostname to track and troubleshoot subscriber IP information and network attachment points.</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1R3 for enhanced subscriber management on MX Series routers.                                                                                                                                                                              |
| <b>Description</b>              | Specify the logical system that is used to send mirrored packets to a mediation device for subscriber secure policy traffic mirroring. When you specify a logical system, you must also specify a routing instance.                                                                   |
| <b>Options</b>                  | <b><i>logical-system-name</i></b> —Name of the logical system.<br><b>Default:</b> Logical system <b>default</b>                                                                                                                                                                       |

| <b>Description</b>              | Specify that the logical system name be concatenated with the username during the subscriber authentication or DHCP client process. No logical system name is concatenated if the configuration is in the default logical system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | Specify that the logical system name is concatenated with the username during the subscriber authentication or client authentication process. No logical system name is concatenated if the configuration is in the default logical system. Use the statement at the [edit ... <a href="#">dhcpv6</a> ] hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>              | <p>Configure the router to maintain, rather than log out, DHCP relay and DHCP local server based subscribers when the specified type of event occurs.</p> <p>For example, by default, the router logs out DHCP subscribers when an interface delete event occurs, such as a line card reboot or failure. You would specify the <b>interface-delete</b> option to ensure that the router maintains subscribers during line card reboots or failures. However, this option does not maintain subscribers during router reboots or failures.</p> <p>This statement provides a global configuration for the router, which applies to all DHCP local server and DHCP relay clients in all routing instances.</p> |
|                                 | <div>  <p><b>NOTE:</b> The <b>maintain-subscriber</b> statement and <b>remove-when-no-subscribers</b> statement are mutually exclusive. You cannot specify that dynamically configured VLAN interfaces are removed when no subscribers exist when the router is also configured to maintain subscribers.</p> </div>                                                                                                                                                                                                                                                                                                       |

## map (Domain Map)

```
Syntax  map domain-map-name {
        aaa-logical-system logical-system-name {
            aaa-routing-instance routing-instance-name;
        }
        aaa-routing-instance routing-instance-name;
        access-profile profile-name;
        address-pool pool-name;
        dynamic-profile profile-name;
        padn destination-address {
            mask destination-mask;
            metric route-metric;
        }
        strip-domain;
        strip-username (left-to-right | right-to-left);
        override-password password;
        target-logical-system logical-system-name {
            target-routing-instance routing-instance-name;
        }
        target-routing-instance routing-instance-name;
        tunnel-profile profile-name;
        tunnel-switch-profile profile-name;
    }
```

Hierarchy Level [edit access **domain**]

**Release Information** Statement introduced in Junos OS Release 10.4.  
**override-password** and **strip-username** options introduced in Junos OS Release 15.1.  
 wildcard character introduced in Junos OS Release 16.1.

**Description** Specify the domain map to use to map options and parameters to subscriber sessions based on the subscriber domain.

**Options** **domain-map-name**—Name of the domain map. The name is the same as the subscriber domain to which it will apply. For example, for the username **user1@example.com**, the domain map name is **example.com**.

- **\***—Use the asterisk wildcard character in the **domain-map-name** to specify a wildcard domain map, which enables mapping based on a partial match (for example, **xyz\*northern.example.com**). The router performs the wildcard lookup when there is no exact match for the subscriber domain name. The wildcard can appear anywhere within the domain name string, and can match zero or more characters. The asterisk is the only wildcard character, and only one wildcard is supported in a domain map name. If you include multiple asterisks, the first asterisk is treated as the wildcard character and the others are treated as non-wildcard characters.
- **default**—Use a domain map name of **default** to specify the domain map that the router uses when there is no exact or wildcard match for the domain or realm name in the subscriber username.

- **none**—Use a domain map name of **none** to specify the domain map the router uses when a subscriber username does not have a domain or realm name.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

---

## mask (Domain Map)

---

**Syntax** `mask destination-mask;`

**Hierarchy Level** [edit access domain **map** *domain-map-name* **padn** *destination-address*]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Configure the IP mask of the destination used in the PADN parameters for a domain map.

**Options** **destination-mask**—Subnet mask of the destination.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

---

## match-direction (Services PTSP)

---

**Syntax** `match-direction (input | input-output | output);`

**Hierarchy Level** [edit services ptsp **rule** *rule-name*]

**Release Information** Statement introduced in Junos OS Release 10.2.

**Description** Specify the direction in which the rule match is applied.

**Options** **input**—Apply the rule match on the input side of the interface.

**input-output**—Apply the rule match bidirectionally.

**output**—Apply the rule match on the output side of the interface.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Specify the maximum number of concurrent TCP connections allowed in the logical system/routing instance. This setting helps you manage the resources that the <b>jdhcp</b> daemon uses for bulk leasequery operations in the logical system/routing instance. The number of connections you specify for a logical system/routing instances must be less than the number of connections you specify for the global <a href="#">accept-max-tcp-connections</a> statement.                                                                                           |
| <b>Options</b>                  | <b><i>number-of-connections</i></b> —Maximum number of concurrent TCP connections.<br><b>Range:</b> 1 through 10<br><b>Default:</b> 3                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1R3 for MX Series routers with MPCs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Enhanced subscriber management leverages system shared memory to improve performance and scaling. Since this memory is used by both the Junos configuration and enhanced subscriber management, you must set a <b>max-db-size</b> for the Junos configuration to allow for an allocation of the memory for enhanced subscriber management.</p> <p>Juniper recommends that you set <b>max-db-size</b> to 300 MB or less for MX240, MX480, and MX960 routers, and 100 MB or less for MX5, MX10, MX40, MX80 and MX104 routers. Because you must reboot the device before the new setting takes effect, doing it as a part of the initial configuration can prevent multiple reboots.</p> |
| <b>Options</b>                  | <p><b>size</b>— Specifies the portion of system shared memory, in megabytes (MB), that is allocated for the Junos configuration database.</p> <p><b>Syntax:</b> <i>size M</i> to specify MB</p> <p><b>Default:</b> 300 MB for MX240, MX480, and MX960 routers, and 100 MB for MX5, MX10, MX40, MX80 and MX104 routers</p>                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Specify the maximum number of empty replies that the DHCP local server sends to a specific requestor. When the maximum number is reached, the DHCP server closes the connection.</p> <p>An empty reply is a response sent from the DHCP local server that contains no bindings or has an option status code error. Empty replies are often the response to an unauthorized requestor that has sent an invalid or incorrect query that produces no binding information. By limiting the number of empty replies that the DHCP local server can send, you prevent the connection from being consumed by an unauthorized or malicious requester, and free up the DHCP local server to support legitimate requestors.</p> |
| <b>Options</b>                  | <p><b><i>number-of-replies</i></b>—Number of empty replies the DHCP local server sends before the connection is terminated.</p> <p><b>Range:</b> 1 through 100</p> <p><b>Default:</b> 5</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## nas-port-extended-format

**Syntax**

```
nas-port-extended-format {
  adapter-width width;
  ae-width width;
  port-width width;
  pw-width width;
  slot-width width;
  stacked-vlan-width width;
  vlan-width width;
  atm {
    adapter-width width;
    port-width width;
    slot-width width;
    vci-width width;
    vpi-width width;
  }
}
```

**Hierarchy Level** [edit access profile *profile-name* radius [options](#)]

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.  
**ae-width** option added in Junos OS Release 12.1.  
**atm** option added in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
**atm** option supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)  
**pw-width** option added in Junos OS Release 15.1.

**Description** Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width of the fields in the NAS-Port attribute.

**Options**

- adapter-width *width***—Number of bits in the adapter field.
- ae-width *width***—Number of bits in the aggregated Ethernet identifier field.
- port-width *width***—Number of bits in the port field.
- pw-width *width***—Number of bits in the pseudowire field. Appears in the Cisco NAS-Port-Info AVP (100).
- slot-width *width***—Number of bits in the slot field.
- stacked-vlan-width *width***—Number of bits in the SVLAN ID field.
- vlan-width *width***—Number of bits in the VLAN ID field.

**NOTE:** The total of the widths must not exceed 32 bits, or the configuration will fail.

|                              |                                                                                                                                                                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege</b>    | admin—To view this statement in the configuration.                                                                                                                                                                                     |
| <b>Level</b>                 | admin-control—To add this statement to the configuration.                                                                                                                                                                              |
| <b>Related Documentation</b> | <ul style="list-style-type: none"><li>• <a href="#">Configuring RADIUS Server Options for Subscriber Access on page 119</a></li><li>• <a href="#">Configuring RADIUS Server Parameters for Subscriber Access on page 118</a></li></ul> |

## nas-port-extended-format (Interfaces)

**Syntax** `nas-port-extended-format {  
 adapter-width width;  
 ae-width width;  
 port-width width;  
 slot-width width;  
 stacked;  
 stacked-vlan-width width;  
 vci-width width;  
 vlan-width width;  
 vpi-width width;  
}`

**Hierarchy Level** [edit interfaces *interface-name* radius-options **nas-port-options** *nas-port-options-name*]

**Release Information** Statement introduced in Junos OS Release 12.3.  
 Options **vci-width** and **vpi-width** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
 Options **vci-width** and **vpi-width** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

**Description** Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width of the fields in the NAS-Port attribute.

**Options** **adapter-width *width***—Number of bits in the adapter field.  
**ae-width *width***—Number of bits in the aggregated Ethernet identifier field.  
**port-width *width***—Number of bits in the port field.  
**slot-width *width***—Number of bits in the slot field.  
**stacked**—Include stacked VLAN IDs, in addition to VLAN IDs, in the NAS-Port extended format.  
**stacked-vlan-width *width***—Number of bits in the SVLAN ID field.  
**vci-width *width***—Number of bits in the ATM virtual circuit identifier (VCI) field.  
**vlan-width *width***—Number of bits in the VLAN ID field.  
**vpi-width *width***—Number of bits in the ATM virtual path identifier (VPI) field.

**NOTE:** Each field can be 0 through 32 bits wide; however, the total of the widths of all fields must not exceed 32 bits, or the configuration fails.

The router may truncate the values of individual fields depending on the bit width you specify.

## nas-port-id-format (Subscriber Management)

**Syntax**

```
nas-port-id-format {
  agent-circuit-id;
  agent-remote-id;
  interface-description;
  interface-text-description;
  nas-identifier;
  order {
    agent-circuit-id;
    agent-remote-id;
    interface-description;
    interface-text-description;
    nas-identifier;
    postpend-vlan-tags;
  }
  postpend-vlan-tags;
}
```

**Hierarchy Level** [edit access profile *profile-name* radius [options](#)]

**Release Information** Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.  
Options **interface-text-description**, **order**, and **postpend-vlan-tags** introduced in Junos OS Release 15.1.

**Description** Specify the optional information that the router includes in the NAS-Port-ID (RADIUS attribute 87) that is passed to the RADIUS server during authentication and accounting. You can include any combination of the optional values.

When you specify the values for the NAS-Port-ID, you can configure the values to appear in either the default order or a custom order of your choice.

**NOTE:** The default and custom order methods are mutually exclusive. The configuration fails if you attempt to configure a NAS-Port-ID that includes values in both types of orders.

To specify that the optional values appear in the default order in the NAS-Port-ID, configure the values directly under the **nas-port-id-format** statement. The default order is as follows, in which the **#** character is the delimiter:

**nas-identifier # interface-description # interface-text-description # agent-circuit-id # agent-remote-id # postpend-vlan-tags**

To specify a custom order for the NAS-Port-ID string, you use the **order** option. Include the **order** option before each optional value you want to include in the string, in the order in which you want the options to appear. For example, the configuration, **order interface-text-description order nas-identifier order agent-remote-id** produces the following NAS-Port-ID, in which the **#** character is the delimiter:

**interface-text-description # nas-identifier # agent-remote-id**

**Default** The router includes the interface description in the NAS-Port-ID when no optional values are specified.

**Options** **agent-circuit-id**—Include the agent circuit ID from either DHCP option 82 or the DSL forum VSAs.

**agent-remote-id**—Include the agent remote ID from either DHCP option 82 or the DSL forum VSAs.

**interface-description**—Include the interface description (interface identifier).

**interface-text-description**—Include the textual interface description (the text description that is statically configured in the CLI).

**nas-identifier**—Include the NAS identifier value (RADIUS attribute 32).

**order**—Specify the optional values you want to include in the NAS-Port-ID and the customized order in which you want the values to appear. You must include the **order** option before each optional value (for example, **order agent-circuit-id order interface-description**).

**postpend-vlan-tags**—Include the VLAN tags. The router includes the tags in the format **:<outer-tag>-<inner-tag>** for a double-tagged VLAN, or **:<outer-tag>** for a single-tagged VLAN.

**Required Privilege Level** **admin**—To view this statement in the configuration.  
**admin-control**—To add this statement to the configuration.

## nas-port-options (RADIUS Options)

**Syntax** `nas-port-options nas-port-options-name {  
     nas-port-extended-format {  
         adapter-width width;  
         ae-width width;  
         port-width width;  
         slot-width width;  
         stacked;  
         stacked-vlan-width width;  
         vci-width width;  
         vlan-width width;  
         vpi-width width;  
     }  
     nas-port-type port-type;  
     stacked-vlan-ranges (any | low-outer-tag–high-outer-tag),any;  
     vlan-ranges (any | low-tag–high-tag);  
 }`

**Hierarchy Level** [edit interfaces *interface-name* *radius-options*]

**Release Information** Statement introduced in Junos OS Release 12.3.

**Description** Create a NAS-Port options definition to configure the NAS-Port-Type (61) RADIUS IETF attribute, and an extended format for the NAS-Port (5) RADIUS IETF attribute, on a per-physical interface, per-VLAN, or per-stacked VLAN (S-VLAN) basis. Each NAS-Port options definition includes the NAS-Port extended format, the NAS-Port-Type, and either the VLAN range of subscribers or the S-VLAN range of subscribers to which the definition applies.

**NOTE:** You can configure a maximum of 16 NAS-Port options definitions per physical interface. Each definition can include a maximum of 32 VLAN ranges or 32 S-VLAN ranges, but cannot include a combination of VLAN ranges and S-VLAN ranges.

**Options** *nas-port-options-name*—Name of the NAS-Port options definition.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

              **max-outstanding-requests** *number*;  
              **partition** *partition-name* {  
                  destination-host *hostname*;  
                  destination-realm *realm-name*;  
                  diameter-instance master;  
              }  
              **request-retry** *retries*;  
              **timeout** *seconds*;  
              }

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced in Junos OS Release 16.1.

**Description**    Specify the destination and transmission parameters for the Diameter Network Access Server Requirements (NASREQ) protocol.

NASREQ is a Diameter-based authentication and authorization protocol. The NASREQ client has two queues, the transmit queue and response queue. The transmit queue stores outbound packets until sent to Diameter, and includes requests and responses. The response queue stores request packets until Diameter responds to the request, and includes only requests waiting for a response.

The following configuration options control transmission flow and use of the queues:

- **max-outstanding-requests** option specifies the maximum number of requests (includes AAR and STR) that the NASREQ client sends to Diameter for wireline transmissions. Effectively, this is the maximum count of requests on the response-queue (the maximum number of in-flight requests for which there has not been a response or timeout); it does not include sent responses.
- The **request-retry** option specifies how many times the NASREQ client retries transmitting a packet to the Diameter server when a timeout is received from the Diameter server for the request.
- The **timeout** option specifies the number of seconds that an outbound packet remains in the transmit queue before it is declared to have timed out. The NASREQ client does not transmit packets that have timed out. The timeout value applies to all packets in the transmit queue, including both requests and responses to be sent. Diameter manages packets that time out after transmission.

**Options**    **number**—Maximum number of requests that the NASREQ client sends to Diameter.  
              **Range:** 20 through 100

**retries**—Number of times to re-send a timeout request to Diameter after the initial request.  
                  This value applies only to requests in the response queue. A value of 0 indicates to try transmission once and then do not retry.  
              **Range:** 0 through 3

**seconds**—Number of seconds that an outbound packet remains in the transmit queue before it is declared to have timed out.

**Range:** 5 through 30

The remaining statements are explained separately.

## neighbor (Define ANCP)

**Syntax**

```
neighbor ip-address {
  adjacency-loss-hold-time seconds;
  adjacency-timer;
  auto-configure-trigger interface interface-name;
  ietf-mode;
  maximum-discovery-table-entries entry-number;
  pre-ietf-mode;
}
```

**Hierarchy Level** [edit protocols [anccp](#)]

**Release Information** Statement introduced in Junos OS Release 9.4.

**Description** Configure an ANCP neighbor with which the ANCP agent on the router forms an adjacency for reporting and shaping traffic.

**Options** *ip-address*—IP address of the ANCP neighbor.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 8.5.<br><b>enhanced-ethernet</b> and <b>enhanced-ip</b> options introduced in Junos OS Release 11.4.<br><b>limited-ifl-scaling</b> option introduced in Junos OS Release 15.1R3 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Set the router's network services to a specific mode of operation. On MX240, MX480, and MX960 routers, MPC5E and MPC7E power on only if the network services mode configured is <b>enhanced-ip</b> or <b>enhanced-ethernet</b> . All the other MPCs work with any of the network services modes.<br><br>MX2010 and MX2020 support only <b>enhanced-ip</b> and <b>enhanced-ethernet</b> network services modes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Disable the default transmission and periodic refresh of unsolicited Router Advertisement messages by the router when the subscriber interface is created, and at configured periodic intervals thereafter. When you include the <b>no-unsolicited-ra</b> statement, the router sends Router Advertisement messages and associated periodic refresh messages only when it receives a Router Solicitation message from the subscriber. |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                     |

 [edit vlans *vlan-name* forwarding-options dhcp-security dhcpv6-options option-18],  
 [edit vlans *vlan-name* forwarding-options dhcp-security dhcpv6-options option-37]

**Release Information** Statement introduced in Junos OS Release 14.1.

**NOTE:** The EX Series switches that support the **no-vlan-interface-name** statement are the EX4300, EX4600, and EX9200 switches.

**Description** When you do not want bridge domain or VLAN tag information, do not include the VLAN ID nor the VLAN interface name (the default) in the circuit or remote ID value in the DHCP option 82 information.

**NOTE:** The **no-vlan-interface-name** statement is mutually exclusive with the **use-interface-description** and **use-vlan-id** statements.

When you configure the **no-vlan-interface-name** statement only, the format displays only the Layer 3 interface:

```
irb.subunit
```

**NOTE:** The *subunit* is required and used to differentiate the interface for remote systems.

When you configure the **no-vlan-interface-name** and **use-interface-description** statements, the format displays the IRB interface description:

*irb\_descr*

If you configure the **no-vlan-interface-name** and **use-interface-description** statements, and no description for the IRB interface is found, the format displays the IRB interface name:

*irb.subunit*

When you configure the **no-vlan-interface-name** and **include-irb-and-l2** statements, the format displays the Layer 2 logical interface name and the IRB interface name:

*(fe | ge)-fpc/pic/port.subunit+irb.subunit*

When you configure the **no-vlan-interface-name**, **include-irb-and-l2** and **use-interface-name** statements, the format displays the Layer 2 interface description and the IRB interface name:

*l2\_descr+irb.subunit*

If you configure the **no-vlan-interface-name**, **include-irb-and-l2** and **use-interface-name** statements, and no description for the Layer 2 interface is found, the format displays the Layer 2 logical interface name and the IRB interface name:

*(fe | ge)-fpc/pic/port.subunit+irb.subunit*

|                                 |                                                                                                                                                                                                                                                                                                   |

            }
        }
    }
```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Configure the Online Charging System (OCS) global attributes and partition. The OCS interacts with the Policy and Charging Enforcement Function (PCEF). The PCEF optionally reports usage and receives additional authorizations from the OCS using the 3rd Generation Partnership Project (3GPP) Gy protocol. Broadband PCEF (BPCEF) interactions with the OCS use online session charging with centralized unit determination and centralized rating.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>                                                                                                                                                                                                                                    | Specify the option 82 that is concatenated with the username during the subscriber authentication or client authentication process. You can specify either, both, or neither the Agent Circuit ID and the Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If neither suboption is supplied, the raw payload of option 82 is concatenated to the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | <p>Specify the type of Option 82 information from the client PDU that is concatenated with the username during the subscriber authentication or DHCP client authentication process. You can specify either, both, or neither of the Agent Circuit ID and Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the <b>ip-address-first</b> statement before configuring the <b>option-82</b> statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Prevent ANCP from performing an adjustment on the actual downstream data rate that ANCP receives from the DSLAM for the difference between the customer premise equipment (CPE) protocol overhead and the B-RAS protocol overhead. You include this statement when you want CoS to perform the adjustment on the data rate from the DSLAM according to the overhead accounting configuration in a CoS traffic control profile.</p> <p>When this statement is not configured (the default condition), ANCP makes the traffic rate adjustment according to the configuration of the <b>qos-adjust-line-type</b> statements and reports that rate to CoS. CoS then applies (if configured) the adjustment set by the <b>overhead-accounting</b> statement in the CoS traffic profile.</p> |
|                                 | <div> <b>NOTE:</b> ANCP reports a traffic rate to CoS only if the qos-adjust statement at the [edit protocols ancp] hierarchy level has been configured.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.3X48-D10 for SRX Series devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | <p>Override the default configuration settings for the extended DHCP local server. Specifying the <b>overrides</b> statement with no subordinate statements removes all DHCP local server overrides at that hierarchy level.</p> <ul style="list-style-type: none"> <li>To override global DHCP local server configuration options, include the <b>overrides</b> statement and its subordinate statements at the <b>[edit system services dhcp-local-server]</b> hierarchy level.</li> <li>To override configuration options for a named group of interfaces, include the statements at the <b>[edit system services dhcp-local-server group <i>group-name</i>]</b> hierarchy level.</li> <li>To override configuration options for a specific interface within a named group of interfaces, include the statements at the <b>[edit system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i>]</b> hierarchy level.</li> <li>Use the <b>[edit system services dhcp-local-server dhcpv6]</b> hierarchy level to override DHCPv6 configuration options.</li> </ul> |

**NOTE:** By default, `jdhcp` does not process DHCPINFORM message. Only after you enable the `overrides` command using the `set system services dhcp-local-server overrides process-inform` statement, `jdhcp` starts processing the DHCPINFORM message.

The remaining statements are explained separately.

The `interface-client-limit` statement is not supported in the `[edit system services dhcp-local-server dhcpv6]` hierarchy level.

The `asymmetric-prefix-lease-time`, `delegated-pool`, `multi-address-embedded-option-response`, and `rapid-commit` statements are supported in the `[edit system services dhcp-local-server dhcpv6 ...]` hierarchy level only.

## partition (OCS)

**Syntax**

```
partition partition-name {
    called-station-id station-name;
    charging-id number;
    destination-host ocs-hostname;
    destination-realm ocs-realm-name;
    diameter-instance;
    draining;
    draining-response-timeout seconds;
    final-response-timeout seconds;
    force-continue;
    ggsn-address address;
    ggsn-mcc-mnc ggsn-mcc-mnc;
    max-outstanding-requests number;
    send-origin-state-id number;
    user-name-include {
        base-interface-name;
        delimiter delimiter-character;
        domain-name domain-name;
        interface-name;
        mac-address;
        nas-port-id;
        origin-host;
        origin-realm;
        user-name;
        user-prefix prefix;
    }
}
```

**Hierarchy Level** [edit access [ocs](#)]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Configure an Online Charging System (OCS) partition (a specific logical system: routing instance context) and its parameters to define user ID information, destination host and realm names, and number of outstanding requests to the OCS, and control subscriber traffic flow before the first interrogation with the OCS. The OCS that interacts with the Policy and Charging Enforcement Function (PCEF). Broadband PCEF (BPCEF) interactions with the OCS use online session charging with centralized unit determination and centralized rating.

**Options** *partition-name*—Name of the OCS partition. You can define only one partition for the OCS.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Release Information**    Statement introduced in Junos OS Release 16.2.

**Description**    Configure a Policy and Charging Rules Function (PCRF) partition (a specific logical system:routing instance context) and its parameters to define subscription ID information, destination host and realm names, and reporting for rules and resources. The PCRF is a centralized policy decision point that deploys business policy rules to allocate broadband network resources and manages flow-based charges for subscribers and services.

**Options**    *partition-name*—Name of the PCRF partition. You can define only one partition for the PCRF.

The remaining statements are explained separately.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                          admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Specify the password that is sent to AAA for user login for all static subscribers on interfaces configured at the <b>[edit system services static-subscribers interface]</b> hierarchy level, or for the subscribers in a specified group. The group version of the statement takes precedence over the global version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>password-string</b>—String that defines the password.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Configure the Policy and Charging Rules Function (PCRF) global attributes, rules, parameters, and partition to authorize and provision subscribers. PCRF is a centralized policy decision point that deploys business policy and charging rules to allocate broadband network resources and manages flow-based charges for subscribers and services. PCRF pushes the rules down to the Policy and Charging Enforcement Function (PCEF) using the 3GPP Gx protocol and online policy interface.

The remaining statements are explained separately.

## pool (Address-Assignment Pools)

```
Syntax  pool pool-name {
        family family {
            dhcp-attributes {
                [ protocol-specific attributes ]
            }
            host hostname {
                hardware-address mac-address;
                ip-address ip-address;
            }
            network ip-prefix/<prefix-length>;
            prefix ipv6-prefix;
            range range-name {
                high upper-limit;
                low lower-limit;
                prefix-length prefix-length;
            }
        }
        hold-down;
        link pool-name;
    }
```

**Hierarchy Level** [edit access [address-assignment](#)]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Configure the name of an address-assignment pool.

**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

**Options** *pool-name*—Name assigned to the address-assignment pool.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Add a prefix to the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or to the DHCPv6 option 18 (Relay Agent Interface-ID) or option 37 (Relay Agent Remote-ID) information in DHCP packets that DHCP relay agent sends to a DHCP server. The prefix can consist of any combination of the hostname, logical system name, and routing instance name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Hierarchy Level** [edit access]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure PPP CHAP, or a profile and its subscriber access, L2TP, or PPP properties.

**Options** *profile-name*—Name of the profile.

For CHAP, the name serves as the mapping between peer identifiers and CHAP secret keys. This entity is queried for the secret key whenever a CHAP challenge or response is received.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Hierarchy Level** [edit dynamic-profiles *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.  
Support at the [edit dynamic-profiles *profile-name* protocols mld] and [edit dynamic-profiles *profile-name* protocols router-advertisement] hierarchy levels introduced in Junos OS Release 10.1.

**Description** Enable IGMP on the router. IGMP must be enabled for the router to receive multicast packets.

**Default** IGMP is disabled on the router. IGMP is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP).

The statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure AAA to use the specified application for subscriber service provisioning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>gx-plus</b>—Specify Gx-Plus as the application used to communicate with a PCRF server for subscriber service provisioning.</p> <p><b>jsrc</b>—Specify JSRC as the application used to communicate with the SAE for subscriber service provisioning. JSRC is used in an SRC environment to request services from the SAE for an authenticated subscriber. JSRC attempts to activate these services. If successful, JSRC returns an ACK message. If unsuccessful, the subscriber is denied access.</p> <p><b>pcrf</b>—Specify Policy Control and Charging Rules Function (PCRF) as the application used to request provisioning from the PCRF server over the Gx protocol. If you change this configuration, any existing subscriber sessions are unaffected.</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | Configure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces to be reconfigured when a RADIUS-initiated disconnect is received by the DHCP client or group of clients. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>                  | The client is deleted when a RADIUS-initiated disconnect is received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Hierarchy Level** [edit services]

**Release Information** Statement introduced in Junos OS Release 9.4.

**Description** Assign parameters that are used with subscriber secure policy mirroring.

The remaining statements are explained separately.

**Required Privilege Level** flow-tap—To view this statement in the configuration.  
flow-tap-control—To add this statement to the configuration.

## radius-options (Interfaces)

**Syntax**

```
radius-options {
  nas-port-options nas-port-options-name {
    nas-port-extended-format {
      adapter-width width;
      ae-width width;
      port-width width;
      slot-width width;
      stacked;
      stacked-vlan-width width;
      vci-width width;
      vlan-width width;
      vpi-width width;
    }
    nas-port-type port-type;
    stacked-vlan-ranges (any | low-outer-tag-high-outer-tag),any;
    vlan-ranges (any | low-tag-high-tag);
  }
}
```

**Hierarchy Level** [edit interfaces *interface-name*]

**Release Information** Statement introduced in Junos OS Release 12.3.

**Description** Configure RADIUS options to set the NAS-Port-Type (61) RADIUS IETF attribute, and an extended format for the NAS-Port (5) RADIUS IETF attribute, on a per-physical interface, per-VLAN, or per-stacked VLAN (S-VLAN) basis.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | Configure DHCPv6 local server to recognize the Rapid Commit option (DHCPv6 option 14) in DHCPv6 solicit messages sent from the DHCPv6 client. When rapid commit is enabled for both DHCPv6 local server and the DHCPv6 client, a two-message handshake is used instead of the standard four-message handshake. You can enable rapid commit support on DHCPv6 local server globally, for a named group, or for a specific interface.                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | Rapid commit support is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Specify that the DHCPv6 Relay Agent Remote-ID option (option 37) in the client PDU name is concatenated with the username during the subscriber authentication or DHCP client authentication process. In order to generate an ASCII version of the username, the router concatenates only the remote-id portion of option 37 to the username, and ignores the enterprise number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Specify that the DHCPv6 relay agent include Relay Agent Remote-ID (option 37) in DHCPv6 packets destined for a DHCPv6 server. Optionally specify that the option includes a prefix, the interface textual description, or both. In dual-stack environments, you can also specify that the DHCPv6 relay agent use the DHCPv4 option 82 value for DHCPv6 option 37.</p> <p>The remaining statements are explained separately.</p>                                                                                               |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Specify that the DHCPv6 Relay Agent Remote-ID option (option 37) in the client PDU name is concatenated with the username during the subscriber authentication or client authentication process. In order to generate an ASCII version of the username, the router concatenates only the remote-id portion of option 37 to the username, and ignores the enterprise number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | <p>Configure the extended DHCP relay agent selective processing that is based on DHCP options in DHCP client packets and specify the action to perform on client traffic. You can configure support globally or for a named group of interfaces, and for either DHCP or DHCPv6 relay agent.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                            |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
