| <b>Release Information</b>      | Command introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Add vendor-specific information to the vendor-specific option (17) field of DHCPv6 control messages on server-facing interfaces. The vendor-specific information can be a hostname, a location (such as a unique connection identifier), or both. The hostname can be a string of characters such as <b>Juniper-AB-1</b>. The location should be specified as interface, VLAN ID, and if applicable, stacked VLAN ID. For example, <b>&lt;ifd-name&gt;:&lt;vlan&gt;</b> (ae0:100) or <b>&lt;ifd-name&gt;:&lt;svlan&gt; -&lt;vlan&gt;</b> (ae0:100-10).</p> <p>Junos OS automatically adds the remaining vendor-specific information as per RFC 4243. The enterprise ID is 2636. The hostname is option-data 1, and the location is option-data 2. The DHCPv6 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query a single entity to track and troubleshoot subscriber IP information and network attachment points.</p> |

**Release Information** Statement introduced in Junos OS Release 8.3.  
 Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Enable or disable the insertion of the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server.

To enable insertion of option 82 information in DHCP packets, you must specify at least one of the **circuit-id** or **remote-id** statements.

You can use the **relay-option-82** statement and its subordinate statements at the **[edit forwarding-options dhcp-relay]** hierarchy level to control insertion of option 82 information globally, or at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level to control insertion of option 82 information for a named group of interfaces.

To restore the default behavior (option 82 information is not inserted into DHCP packets), use the **delete relay-option-82** statement.

The remaining statements are explained separately.

| <b>Description</b>              | Relay DHCP client packets to the specified group of DHCP servers when you use the DHCP relay selective processing feature. You can configure the relay operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Configure DHCP relay server to use the configured loopback address as the source address in both the IP header and in DHCP messages relayed to the server.</p> <p>In network configurations where a firewall on the broadband network gateway (BNG) is between the DHCP relay agent and the DHCP server, only the BNG loopback address passes through the BNG firewall. In that case, DHCP unicast packets do not pass through the firewall and are discarded. This configuration statement places the loopback address in IP headers and DHCP messages, which enables DHCP unicast packets to pass through the firewall to the DHCP server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.<br>IPv6 support introduced in Junos OS Release 12.2                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Specify the address for rule matching. Remote address values are matched against a destination or source IP address for the flow depending on the configured value for the <b>demux</b> statement. If you do not specify an address, then any remote address matches this term. If you do not specify a prefix value, then a host mask is the default. |
| <b>Options</b>                  | <p><b>address</b>—IPv4 or IPv6 address or prefix value.</p> <p><b>any-unicast</b>—Match all unicast addresses.</p> <p><b>except</b>—(Optional) Exclude the specified address, prefix, or unicast packets from rule matching.</p>                                                                                                                       |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                     |

| <b>Release Information</b> | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Specify the Agent Remote ID suboption (suboption 2) of the DHCP relay agent information option (option 82) to include in DHCP packets destined for a DHCP server. Optionally specify that the suboption includes a prefix, textual description, or VLAN tag.                                                                                                                                                                                                                                                                                                                                      |

**NOTE:** For Layer 3 interfaces, when you configure `relay-option-82` only, the Agent Remote ID is the default. If no VLAN tags are configured, then the default is the logical interface device (IFL) name. For integrated routing and bridging (IRB) interfaces, the default is the Layer 2 IFL name and bridge domain name.

The interface to bridge domain relationship may be implicit (the interface is mapped to the bridge domain by the system based on VLAN tag) or explicit (the interface is mapped to the bridge domain by configuring it in the bridge domain definition). For the explicit case, tagging might not be relevant for the mapping.

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual LANs (VLANs), stacked VLANs (S-VLANs), or bridge domains is as follows:

```
(fe | ge)-fpc/pic/port.subunit
```

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface.

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that use VLANs is as follows:

*(fe | ge)-fpc/pic/port:vlan-id*

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs is as follows:

*(fe | ge)-fpc/pic/port:svlan-id--vlan-id*

In the case of an IRB interface, the format displays the Layer 2 interface instead of the IRB interface along with the bridge domain name. For IRB interfaces (or other pseudo devices) the default format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

*(fe | ge)-fpc/pic/port.subunit:bridge-domain-name*

- IRB interfaces that use VLANs:

*(fe | ge)-fpc/pic/port.subunit:vlan-name*

To include the IRB interface name with the Layer 2 interface name, configure the **include-irb-and-l2** statement. The format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

*(fe | ge)-fpc/pic/port:bridge-domain-name+irb.subunit*

- IRB interfaces that use VLANs:

*(fe | ge)-fpc/pic/port:vlan-name+irb.subunit*

To include only the IRB interface name without the Layer 2 interface and bridge domain or VLAN, configure the **no-vlan-interface-name** statement. The format is as follows:

*irb.subunit*

The remaining statements are explained separately.

|                                 |                                                                            |

| <b>Description</b>              | Specify that the router match the remote ID string for DHCPv4 and DHCPv6 clients. The router then inspects incoming Renew and Rebind messages and compares the Remote ID in the message against the initial value that DHCP stored when creating the client entry. If there is a mismatch between the initial value and the Renew or Rebind message value, DHCP local server performs the specified action.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | Configure the Policy and Charging Rule Function (PCRF) partition to generate reports for resource allocation failures by default. If you configure this statement, this generates the same result as if you enabled the Resource-Allocation-Notification message trigger with every rule received from the PCRF. |

The following example shows predefined rule installation commands, including the Resource-Allocation-Notification command, for Credit Control Answer (CCA-GX) and Reauthorization Request (RAR-GX) messages between the PCRF and Gx:

```
{ Charging-Rule-Install
{ Charging-Rule-Name:  "fixed-cos" }
{ Charging-Rule-Definition:
{ Charging-Rule-Name:  "firewall" }
{ Service-Identifier:  10 }
{ Rating-Group:       292 }
{ Juniper-Param-V4-Input-Filter: "my_input_filter" }
{ Juniper-Param-V4-Output-Filter: "my_output_filter" }
}
[ Resource-Allocation-Notification: ENABLE_NOTIFICATION(0) ]
}
```

**NOTE:** Some PCRFs may be unable to generate a Resource-Allocation-Notification AVP. As a result, the `report-resource-allocation` statement provides generated reports by default.

For login and update interactions between the PCRF and the Online Charging System (OCS), the OCS sends applicable reports to the PCRF using a CCR-GX-U message. If the service-dynamic-profile instantiation fails, and the Resource-Allocation-Notification (ENABLE\_NOTIFICATION) is set for the charging rule, then the OCS sends a report. The router acknowledges the subscriber activation, allows subscriber traffic to flow, and continues to repeat the process.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Provisioning is already active                      | Remote provisioning by a JSRC server or Gx-plus server is active.           | Disable provisioning.                                                                                  |
| Service activation/deactivation already in progress | Another service activation/deactivation operation is currently in progress. | Wait until the active operation completes and then retry the activation/deactivation operation.        |
| Session identifier is not for a subscriber session  | The session ID is incorrect.                                                | Verify the correct session ID for the subscriber and then retry the activation/deactivation operation. |

## Sample Output

### request network-access aaa subscriber delete session-id service-profile

```
user@host> request network-access aaa subscriber delete session-id 49 service-profile
service-silver
Successful completion
```

### request network-access aaa subscriber delete session-id service-profile (Deactivating a Single Server Instance)

```
user@host> request network-access aaa subscriber delete session-id 6 service-profile
economy-service(up-filter,down-filter)
Successful completion
```

### request network-access aaa subscriber delete session-id service-profile (Deactivating All Server Instances)

```
user@host> request network-access aaa subscriber delete session-id 6 service-profile
economy-service
Successful completion
```

## request network-access aaa subscriber modify session-id

| <b>Description</b>              | Configure the number of requests the router can send per second to all configured RADIUS servers collectively. By limiting the flow of requests from the router to the RADIUS servers, you can prevent the RADIUS servers from being flooded with requests.                                                                                                                                              |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                         |
| <b>Description</b>         | Specify the number of times that the router or switch is allowed to attempt to contact a RADIUS authentication or accounting server. You can override the retry limit for accounting servers with the <a href="#">accounting-retry</a> statement. |

**NOTE:** To successfully set a retry limit for the accounting servers different from the authentication servers, you must configure both the [accounting-retry](#) and [accounting-timeout](#) statements. If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the [retry](#) and [timeout](#) statements.

**NOTE:** The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Specify that the routing instance name be concatenated with the username during the subscriber authentication or DHCP client authentication process. No routing instance name is concatenated if the configuration is in the default routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | Specify that the routing instance name is concatenated with the username during the subscriber authentication or client authentication process. No routing instance name is concatenated if the configuration is in the default routing instance. Use the statement at the [edit ... <a href="#">dhcpv6</a> ] hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that the name of the routing instance is included as part of the username created for all static subscribers or for the static subscribers in the specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Enable configuration of all routing protocols except Internet Group Management Protocol (IGMP) and the Multicast Listener Discovery (MLD) protocol on dynamically created enhanced subscriber management interfaces. IGMP and MLD are natively supported on enhanced subscriber management interfaces, and therefore do not require you to specify the <b>routing-services</b> statement in the dynamic profile.</p> <p>When a dynamic profile containing the <b>routing-services</b> statement is instantiated, the router creates an enhanced subscriber management logical interface, also referred to as a pseudo logical interface, in the form demux0.<i>nnnnnnnnnn</i> (for example, demux0.3221225472). Any associated subscriber routes or routes learned from a routing protocol running on the enhanced subscriber management interface use this pseudo interface as the next-hop interface.</p> |
| <b>Default</b>                  | If you do not include the <b>routing-services</b> statement in the dynamic profile, configuration of all routing protocols except IGMP and MLD on enhanced subscriber management interfaces is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## rule (Configuring)

**Syntax**

```
rule rule-name {
    count-type (application | rule);
    demux (destination-address | source-address);
    forward-rule forward-rule-name;
    match-direction (input | input-output | output);
    term precedence {
        from {
            application-group-any;
            application-groups [ application-group-name ];
            applications [ application-name ];
            local-port-range low low-value high high-value;
            local-ports [ value-list ];
            protocol protocol-number;
            remote-address address <except>;
            remote-address-range low low-value high high-value <except>;
            remote-ports [ value-list ];
            remote-port-range low low-value high high-value;
            remote-prefix-list prefix-list-name <except>;
        }
        then {
            (accept | discard);
            count (application | application-group | application-group-any | rule | none);
            forwarding-class forwarding-class;
            police policer-name;
        }
    }
}
```

**Hierarchy Level** [edit services ptsp]

**Release Information** Statement introduced in Junos OS Release 10.2.

**Description** Specify the rule the router uses when applying this service.

**Options** *rule-name*—Identifier for the collection of terms that constitute this rule.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | Include the Juniper-Network-Family-Indicator AVP into its message requests. To enable the Policy Control and Charging Rules Function (PCRF) to dynamically pass subscription-ID parameters, and support a variety of authentication, authorization, and provisioning configuration, the Juniper attribute-value pairs (AVPs) in <a href="#">Table 80 on page 1337</a> have been allocated from the Juniper Vendor-ID space (2636) vendor-specific attribute (VSA). |

**NOTE:** If no dynamic-subscription ID is received, then neither Online Charging System (OCS) or Offline Charging System (OFCS) communications is initiated.

**Table 80: Allocated Juniper AVPs**

| AVP Name                           | Vendor-ID | AVP Type | Diameter Type | Diameter Flag |
|------------------------------------|-----------|----------|---------------|---------------|
| Juniper-Dyn-Subscription-Indicator | 2636      | 10001    | Enum          | V             |
| Juniper-Dyn-Subscription-Id        | 2636      | 10002    | Grouped       | VM            |
| Juniper-Dyn-Subscription-Id-Type   | 2636      | 10003    | Integer32     | VM            |
| Juniper-Dyn-Subscription-Id-Data   | 2636      | 10004    | UTF8String    | VM            |

The client system (router) sends the Juniper-Dyn-Subscription-Id-Indicator AVP to indicate support of the dynamic assignment of the subscription ID. The Juniper-Dyn-Subscription-Id-Indicator attribute has two values:

- DYN\_SUBSCRIPTION\_NOT\_SUPPORTED (0)
- DYN\_SUBSCRIPTION\_SUPPORTED (1)

The server then sends the Juniper-Dyn-Subscription-Id AVP to the client that indicated support. This is a grouped AVP that contains the values to be sent as Subscription-Id-Type and Subscription-Id-Data.

| Release Information | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                         |
| Description         | Include the Juniper-Network-Family-Indicator AVP into its message requests. In many cases, wireline subscribers support only one IP family, which is required information for both AAA service and Policy Control and Charging Rules Function (PCRF). To indicate this information, the Juniper-Network-Family-Indicator AVP has been allocated from the Juniper Vendor-ID space (2636) VSA in <a href="#">Table 81 on page 1339</a> . |

Table 81: Network Family Indicator AVP

| AVP Name                         | Vendor-ID | AVP Type | Diameter Type | Diameter Flag |
|----------------------------------|-----------|----------|---------------|---------------|
| Juniper-Network-Family-Indicator | 2636      | 10010    | Enum          | V             |

The client system (router) sends the Juniper-Network-Family-Indicator AVP to indicate which network families are associated with the service request and supported by the subscriber. When you configure the Juniper-Network-Family-Indicator AVP to indicate the associated network family, the system sends the information to the PCRF. The Juniper-Network-Family-Indicator attribute has four values:

- UNSPECIFIED (0)
- IPV4\_FAMILY (1)
- IPV6\_FAMILY (2)
- IPV4\_IPV6\_FAMILY (3)

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Include the Origin-State AVP for the Diameter peer, OCS partition, or PCRF partition. The AVP is conveyed in Diameter-level or partition-level messages, respectively. The value of the AVP increases every time it changes, such as when the system reboots. Sending the Origin-State AVP in messages enables Diameter entities that receive the message to infer from a changed AVP value that sessions associated with a lower value are no longer active.</p> <p>If you include the <b>send-origin-state-id</b> statement for the OCS or PCRF partition, a new value is sent for the partition only when a cold boot occurs. The system daemon detects the cold boot and changes the Origin-State-Id when required.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Configure the DHCP Unique Identifier (DUID) type that the DHCPv6 server supports. The server uses the DUID to identify clients for configuration and to group clients into identity associations.</p> <p>Use this statement to explicitly configure the DUID-LL type. DUID-LL uses a link-layer network interface address on the device as part of the unique identifier. Remove this configuration to return to the default type, DUID-EN. DUID-EN has a vendor-assigned value based on the vendor's enterprise number and an IANA-recognized hardware type code. DUID-EN is not explicitly configurable.</p> |
|                                 | <div> <b>NOTE:</b> The DUID-LLT type is not supported.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <b>type</b> —DUID type to support. | <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Add the suboptions <b>link-selection</b> and <b>server-id override</b> to option-82 information for DHCP packets relayed to the server.</p> <p>In network configurations where a firewall on the broadband network gateway (BNG) is between the DHCPv4 relay agent and the DHCP server, only the BNG loopback address passes through the BNG firewall. In that case, DHCP unicast packets do not pass through the firewall and are discarded. To enable DHCP unicast packets to pass through the BNG firewall, use the <a href="#">relay-source</a> configuration statement to configure the DHCP relay agent to use the loopback address as the source address in IP headers and DHCP messages. In this case, this configuration statement adds the <b>link-selection</b> suboption to provide the DHCP server information to locate the correct address pool for the DHCP client and adds the <b>server-id override</b> suboption to set the server ID option.</p>                                                                                                            |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                               |
| <b>Description</b>         | Configure the service-context-id to globally and uniquely identify the Service-Context-Id AVP (cc-service-context) and the Service-Identifier AVP (cc-service-identifier), which is part of the Diameter Credit Control Service charging system. The service provider or operator allocates this identifier. |
| <b>Options</b>             | <b><i>service-context</i></b> —3rd Generation Partnership Project (3GPP)-specific values. <ul style="list-style-type: none"> <li><i>service-context</i>—32251</li> <li><i>customer-domain</i>—3gpp.org</li> </ul>                                                                                            |

**NOTE:** For every service used to support the packet-switching charging infrastructure, you must prepare the necessary documentation and define associated cc-service-context-id values.

For mobile subscribers, the user equipment requests services; whereas for broadband wireline subscribers, the Policy Control and Charging Rules Function (PCRF) requests services. In the wireline environment, PCRF functions as the service requester, and the Policy and Charging Enforcement Function (PCEF) functions as the service receiver and enforcer.

The PCRF controls the PCEF by pushing charging rules. Charging rules are reused as service (policy) rules to push policies. Charging rules may also have an associated rating group, or charging key. As a result, you must configure the PCEF to define a charging rules mapping between credit control services (cc-services) and rating groups.

| <b>Description</b>         | <p>Junos OS uses a shared memory space to store log entries for subscriber service daemons including jpppd, jdhcpd, jl2tpd, autoconfd, bbe-smgd, authd, cosd, and dfwd. Shared memory logging is enabled by default and occurs at the client level. You can view the shmlogs on a per subscriber basis, or use filters to retrieve logs according to a variety of different parameters such as interface name, IP address, session ID, subnet, and VLAN in addition to the Client Identifier or Client DUID. Filtering is disabled by default. To see a complete list of supported filters, use this command:</p> <pre>user@rdevice&gt; show shmlog entries logname all ?</pre> <p>When viewing logs you can limit results on the basis of event flags that include interface events, routing process interaction events, l2tp tunneling events, and ldap authentication events. To see a complete list of supported flags, use this command:</p> <pre>user@rdevice&gt; show shmlog entries logname all flag-name ?</pre> |
| <b>Options</b>             | <p><b>disable</b>—Name of the command to override the default behavior. Use this option to disable shared memory logging; it is always enabled otherwise.</p> <p><b>file</b>— Name of the file containing the shmlogs. Use this option to redirect shmlogs to a file for file-based logging. Specify the file name, define the number of files (from 2 to 1000), and set the maximum file size (from 10240 to 1073741824 bytes). Data will be written to the <code>/var/log/shmlog/</code> directory. Files follow this naming convention: <code>&lt;cfg-file-name&gt;-&lt;daemon&gt;-&lt;severity&gt;.log</code>. The shmlog files are not human-readable, so to access the logs you must first run the following command to generate a file in the <code>/var/log/&lt;file-name&gt;/</code> directory with logs from all daemons:</p> <pre>user@rdevice&gt; show shmlog entries filename /var/log/shmlog/&lt;file-name&gt;*logname all</pre>                                                                            |

If you then want to view logs from a specific daemon, you need to run the following command to generate a file under the `/var/log/<file-name>/` directory with complete logs:

```
user@rdevice> show shmlog entries filename /var/log/shmlog/<filename> logname  
authd*
```

**filtering**— Command to enable filtering. Filtering is subscriber centric and is useful for debugging and troubleshooting. It is disabled by default so you must use this option to enable it.

For example, if you want to quickly view the transmit packet logs for subscribers with interface-name `pp0.100`, you could use the following command to display only the relevant results:

```
user@rdevice> show shmlog entries logname jpppd* interface-name pp0.100 flag  
transmit-packets
```

To debug sessions according to the interface name, use this command:

```
user@rdevice> show shmlog entries logname all interface-name pp0.100
```

To debug sessions that are logging in via VLAN 7 on physical-interface `ge-0/0/0`, use this command:

```
user@rdevice> show shmlog entries logname all vlan 7 physical-interface ge-0/0/0
```

**log-name**—Name of the file containing the log output. Use this option to override all logs or a specified log, and to set the verbosity level (brief, detail, extensive, none, or terse). For example, to configure **bbe-autoconf-info** for detailed file logging, you would use the following command:

```
user@rdevice> [edit system services subscriber-management overrides shmlog]  
user@rdevice> set log-name bbe-autoconf-info detail file-logging
```

**log-type**— Severity level of the collected logs. Use this option to configure the severity level for captured logs (notice, info, or debug).

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.3.                                                                   |
| <b>Description</b>         | Configure the stacked VLAN (S-VLAN) range of subscribers to which the named NAS-Port options definition applies. |

**NOTE:** You can configure a maximum of 16 NAS-Port options definitions per physical interface. Each definition can include a maximum of 32 VLAN ranges or 32 S-VLAN ranges, but cannot include a combination of VLAN ranges and S-VLAN ranges.

**Options** **any**—Entire S-VLAN range representing all S-VLAN IDs. The inner tag (S-VLAN ID) of the S-VLAN range must be configured as **any** to represent all inner VLAN ID tags.

**low-outer-tag**—Outer VLAN ID tag representing the lower limit of the S-VLAN range.

**Range:** 1 through 4094

**high-outer-tag**—Outer VLAN ID tag representing the upper limit of the S-VLAN range.

**Range:** 1 through 4094

**NOTE:** To specify a single outer VLAN ID tag, set **low-outer-tag** and **high-outer-tag** to the same value.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure a partial match criteria used with the DHCP relay agent selective processing feature. DHCP relay agent compares the configured partial match string with the option-specific string received in DHCP client packets. If there is an partial left-to-right match, DHCP performs the action you define for the match criteria.</p> <p>The option-specific string in the DHCP client packets can contain a superset of the specified ASCII or hexadecimal match string, provided that the leftmost characters of the option-specific string entirely match the characters in the configured match string.</p> <p>You can configure an unlimited number of match strings. If you have multiple partial match configurations, the longest match rule applies. For example, DHCP relay agent matches the string “test123” before it matches the string “test”. Match strings do not support wildcard attributes.</p> <p>The <b>local-server-group</b> option is not supported for DHCPv6 relay agent.</p> |
| <b>Options</b>                  | <p><b><i>ascii-string</i></b>—ASCII string of 1 through 255 alphanumeric characters.</p> <p><b><i>hexadecimal-string</i></b>—Hexadecimal string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## statistics (Service Accounting)

---

|                            |                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | statistics (time   volume-time);                                                                                                               |
| <b>Hierarchy Level</b>     | [edit access profile <i>profile-name</i> service accounting]                                                                                   |
| <b>Release Information</b> | Statement introduced in Junos OS Release 14.2R1 for MX Series routers.                                                                         |
| <b>Description</b>         | Configure the router to collect time statistics, or both volume and time statistics, for the service accounting sessions being managed by AAA. |
| <b>Options</b>             | <b>time</b> —Collect uptime statistics only.<br><b>volume-time</b> —Collect both volume and uptime statistics.                                 |

**NOTE:** You must not configure the volume-time option if the local option is configured at the [edit access profile *profile-name* service accounting-order] hierarchy level, because the local configuration automatically determines that both volume and time statistics are collected for the service accounting sessions. If you configure the volume-time option in this case, an error is generated when you commit the configuration.

| <b>Description</b>              | Specify whether the server denies a client to bind when the client does not indicate that it accepts reconfigure messages. This feature is available only for DHCPv6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>                  | Accept solicit messages from clients that do not support reconfiguration and permit them to bind.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

        <world-readable | no-world-readable>;
        flag flag;
    }
}
```

**Hierarchy Level** [edit system services]

**Release Information** Statement introduced in Junos OS Release 11.1.

**Description** Configure global services for subscriber management, such as maintaining subscribers, tracing operations, and enabling enhanced subscriber management.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## subscriber-profile

---

**Syntax**    subscriber-profile *profile-name* {  
              enable *service-name* {  
                  concurrent-data-sessions *max-session-number*;  
              }  
              disable *service-name*;  
              max-data-sessions-per-subscriber {  
                  limit *max-sub-sessions*;  
                  exceed-action {  
                      drop;  
                      syslog;  
                  }  
              }  
          }

**Hierarchy Level**    [edit services service-set *services-set-name*]

**Release Information**    Statement introduced in Junos OS Release 11.4.

**Description**    Specify the subscriber profile name. A subscriber profile specifies which services should be enabled and which services should be disabled for traffic belonging to a subscriber bound to a particular subscriber profile. A subscriber is bound to a minimum of one subscriber profile at any given time.

**Options**    *profile-name*—Name of the profile.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | Configure the subscriber data to use in a Policy and Charging Rules Function (PCRF).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>base-interface-name</b>—Use the specified physical or underlying interface name. If both the underlying interface and the client application perform authentication, authorization, and provisioning, the identification attributes in the server requests enable the AAA or PCRF server to make an association between the two entities.</p> <p><b>delimiter <i>delimiter-character</i></b>—Use the specified character used as the delimiter between the concatenated components of the subscription-id-data-include. You cannot use the semicolon (;) as a delimiter.</p> <p><b>Default:</b> @</p> <p><b>domain-name <i>name</i></b>—Use the specified domain name that is concatenated with the subscription-id-data-include during the subscriber identification process.</p> <p><b>interface-name</b>—Use the specified interface name that is concatenated with the subscription-id-data-include during the subscriber identification process; for example, demux0.</p> <p><b>mac-address</b>—Use the specified client hardware address (chaddr) from the incoming packet that is concatenated with the subscription-id-data-include during the subscriber identification process.</p> <p><b>nas-port-id</b>—Use the specified NAS-Port-ID (RADIUS attribute 87), which identifies the physical interface that subscriber management uses to identify subscribers that is concatenated with the subscription-id-data-include during the subscriber identification process. By default, the NAS-Port-ID includes the interface-description value that describes the physical interface.</p> <p><b>origin-host</b>—Use the specified name of the host that originates the Diameter message that is concatenated with the subscription-id-data-include during the subscriber</p> |

identification process. Supplied as the value of Origin-Host AVP for all messages sent by the Diameter master instance.

**origin-realm**—Use the specified realm of the host that originates the Diameter message that is concatenated with the subscription-id-data-include during the subscriber identification process. Supplied as the value of Origin-Realm AVP for all messages sent by the Diameter master instance.

**user-name**—Use the specified subscriber username that is concatenated with the subscription-id-data-include during the subscriber identification process.

**user-prefix *prefix***—Use the specified user prefix that is concatenated with the subscription-id-data-include during the subscriber identification process.

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                            |
| <b>Description</b>         | Identify the subscriber. You can identify the subscriber using several IANA predefined values, or define your own. The Policy and Charging Rule Function (PCRF) uses the subscription-id-type during a subscriber login session using for CCR-GX-I and CCA-GX-I messages. |

**BEST PRACTICE:** For wireline service, we recommend that you define your own customer-specific value.

If you do not define or include any data in the [subscription-id-data-include](#) statement, then the value defaults to reserved. For some applications, the PCRF may be configured to identify subscribers using another method, and instead use the subscription-id-type for protocol compliance. If the dynamic-subscription-id is provided by the AAA server, then the PCRF uses the dynamic-subscription-id as the identifier regardless of what you defined for the local configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 11.4.<br><b>vlan</b> option added in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>         | <p>Customize the mapping between a termination cause (the internal termination identifier) and a numerical code value for the cause that is reported in the RADIUS Acct-Terminate-Cause attribute (49).</p> <p>When a RADIUS Acct-Stop message is issued as a result of the termination of a subscriber or service session, the RADIUS Acct-Terminate-Cause attribute (49) reports the cause or reason for the termination. This attribute is included only in RADIUS Acct-Stop messages. The termination cause is conveyed as a code value in the attribute. <i>RFC 2866, RADIUS Accounting</i>, defines the standard mapping between 18 code values and termination causes.</p> <p>Junos OS defines a set of internal termination cause codes for AAA, DHCP, L2TP, PPP, and VLAN subscriber and service session failures. By default, these internal cause codes are mapped to the RFC-defined code values. When a subscriber or service session is terminated, the router logs a message for the internal termination cause and logs another message for the RADIUS Acct-Terminate-Cause attribute. You can use the logged information to help monitor and troubleshoot the events.</p> <p>Because there are many different Junos OS internal identifiers for termination causes and only 18 supported, RFC-defined standard code values, by default a given code value can map to multiple identifiers. Instead of using the default code values, you can use the <b>terminate-code</b> statement to map any of the internally defined termination causes to any 32-bit number (1 through 4,294,967,295). The flexibility of customized mapping greatly increases the possibilities for fine-grained analytics and failure tracking.</p> |
| <b>Options</b>             | <p><b>aaa</b>—Map internal identifiers for AAA-specific termination causes to a numerical value.</p> <p><b>deny</b>—Limit selection of termination causes to those associated with denial of subscriber access.</p> <p><b>dhcp</b>—Map internal identifiers for DHCP-specific termination causes to a numerical value.</p> <p><b>l2tp</b>—Map internal identifiers for L2TP-specific termination causes to a numerical value.</p> <p><b>ppp</b>—Map internal identifiers for PPP-specific termination causes to a numerical value.</p> <p><b>radius <i>value</i></b>—Number that represents the termination cause in the RADIUS Acct-Terminate-Cause attribute (49).<br/><b>Range:</b> 1 through 4,294,967,295</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**service-shutdown**—Limit selection of termination causes to those associated with established service sessions independent of the parent subscriber session.

**shutdown**—Limit selection of termination causes to those associated with established subscriber sessions.

**vlan**—Map internal identifiers for VLAN-specific termination causes to a numerical value.

**term-reason**—Internal identifier for the termination causes defined for the specified protocol type.

For protocol-specific termination causes, see the following topics:

- [AAA Termination Causes and Code Values on page 186](#)
- [DHCP Termination Causes and Code Values on page 188](#)
- [L2TP Termination Causes and Code Values on page 189](#)
- [PPP Termination Causes and Code Values on page 209](#)
- [VLAN Termination Causes and Code Values on page 217](#)

| <b>Description</b>              | Define the term actions. You can configure the router to accept or discard the targeted traffic. The action modifiers (count and forwarding-class) are optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p>You can configure one of the following actions:</p> <ul style="list-style-type: none"> <li>• <b>accept</b>—Accept the packets and all subsequent packets in flows that match the rules.</li> <li>• <b>discard</b>—Discard the packet and all subsequent packets in flows that match the rules.</li> </ul> <p>When you select <b>accept</b> as the action, you can optionally configure one or both of the following action modifiers. No action modifiers are allowed with the <b>discard</b> action.</p> <ul style="list-style-type: none"> <li>• <b>count (application   application-group   application-group-any   rule   none)</b>—For all accepted packets that match the rules, record a packet count using PTSP statistics practices. You can specify one of the following options; there is no default setting: <ul style="list-style-type: none"> <li>• <b>application</b>—Count the application that matched in the <b>from</b> clause.</li> <li>• <b>application-group</b>—Count the application group that matched in the <b>from</b> clause.</li> <li>• <b>application-group-any</b>—Count all application groups that match <b>from</b> <b>application-group-any</b> under the <b>any</b> group name.</li> <li>• <b>rule</b>—Count the rule that matched in the <b>from</b> clause.</li> <li>• <b>none</b>—Same as not specifying <b>count</b> as an action.</li> </ul> </li> <li>• <b>forwarding-class <i>forwarding-class</i></b>—Specify the forwarding class name for outgoing packets.</li> </ul> <p>When you include a policer, the only allowed action is <b>discard</b>. For more information on policers, see the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide</i>.</p> <ul style="list-style-type: none"> <li>• <b>police <i>policer-name</i></b>—Apply rate-limiting properties to the traffic as configured at the [edit firewall policer <i>policer-name</i>] hierarchy level. This configuration allows bit-rate and burst-size attributes to be applied to the traffic that are not supported by PTSP rules.</li> </ul> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                    |
| <b>Description</b>         | Configure the amount of time that the local router or switch waits to receive a response from RADIUS authentication and accounting servers. You can override the timeout value for accounting servers with the <a href="#">accounting-timeout</a> statement. |

**NOTE:** To successfully set a timeout value for the accounting servers different from the authentication servers, you must configure both the [accounting-retry](#) and [accounting-timeout](#) statements. If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the [retry](#) and [timeout](#) statements.

**NOTE:** The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Specify the number of seconds that a connection on the TCP socket is idle before the DHCP local server closes the connection. Closing inactive connections enables the DHCP local server to more efficiently apply resources in support of active TCP connections.                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Configure a plain-text token for all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled. A group configuration takes precedence over a DHCP local server configuration. For more information about tokens, see RFC 3118, <i>Authentication for DHCP Messages</i>, section 4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | Define tracing operations for ANCP agent processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>file <i>filename</i></b>— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. Include the <b>disable</b> option after a flag to disable tracing for that flag. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>config</b>—Trace configuration events.</li> <li>• <b>cos</b>—Trace class-of-service events.</li> <li>• <b>general</b>—Trace general flow.</li> <li>• <b>packet</b>—Trace ANCP packet transmit and receive operations.</li> <li>• <b>process</b>—Trace process internals.</li> <li>• <b>protocol</b>—Trace protocol events.</li> <li>• <b>restart</b>—Trace process restart flow</li> <li>• <b>routing-socket</b>—Trace routing socket events.</li> <li>• <b>session</b>—Trace connection events and flow.</li> <li>• <b>startup</b>—Trace ANCP startup events and flow.</li> <li>• <b>subscriber</b>—Trace subscriber events.</li> <li>• <b>timer</b>—Trace timer processing.</li> </ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> |

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Syntax</b>              | <pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i> &gt; &lt;size <i>maximum-file-size</i>&gt;         &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i>;     level (all   error   info   notice   verbose   warning);     no-remote-trace; } </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Hierarchy Level</b>     | [edit system processes dhcp-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | <p>Define global tracing operations for extended DHCP local server and extended DHCP relay agent processes.</p> <p>This statement replaces the deprecated <b>traceoptions</b> statements at the <b>[edit forwarding-options dhcp-relay]</b> and <b>[edit system services dhcp-local-server]</b> hierarchy levels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events.</li> <li>• <b>auth</b>—Trace authentication events.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>fwd</b>—Trace firewall process events.</li> <li>• <b>general</b>—Trace miscellaneous events.</li> <li>• <b>ha</b>—Trace high availability-related events.</li> <li>• <b>interface</b>—Trace interface operations.</li> <li>• <b>io</b>—Trace I/O operations.</li> <li>• <b>liveness-detection</b>—Trace liveness detection operations.</li> <li>• <b>packet</b>—Trace packet and option decoding operations.</li> <li>• <b>performance</b>—Trace performance measurement operations.</li> </ul> |

- **profile**—Trace profile operations.
- **rpd**—Trace routing protocol process events.
- **rtsock**—Trace routing socket operations.
- **security-persistence**—Trace security persistence events.
- **session-db**—Trace session database events.
- **state**—Trace changes in state.
- **statistics**—Trace baseline statistics.
- **ui**—Trace user interface operations.

**level**—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access, allowing only the user **root** and users who have the Junos OS **maintenance** permission to access the trace files.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (***maximum-file-sizek***), megabytes (***maximum-file-sizem***), or gigabytes (***maximum-file-sizeg***). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Range:** 10,240 through 1,073,741,824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Description</b>         | Define tracing options for Diameter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations</li><li>• <b>application</b>—Trace Diameter application interface events</li><li>• <b>configuration</b>—Trace configuration events</li><li>• <b>daemon</b>—Trace Diameter daemon level events</li><li>• <b>diameter-instance</b>—Trace Diameter instance events</li><li>• <b>dne</b>—Trace Diameter network element events</li><li>• <b>framework</b>—Trace Diameter framework events</li><li>• <b>memory-management</b>—Trace memory management events</li><li>• <b>messages</b>—Trace Diameter messages</li><li>• <b>node</b>—Trace Diameter node events</li><li>• <b>peer</b>—Trace Diameter peer events</li></ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Match all levels.</li><li>• <b>error</b>—Match error conditions.</li></ul> |

- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level**

| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>         | Define tracing operations for the main enhanced subscriber management session management process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>file <i>filename</i></b>— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All trace logs are stored in the directory <code>/var/log/bbesmgd</code>.</p> <p><b>files <i>number</i></b>— (Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 5 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. Include the <b>disable</b> option after a flag to disable tracing for that flag. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>auth</b>—Trace general authentication events.</li> <li>• <b>autoconf</b>—Trace autoconfiguration events.</li> <li>• <b>config</b>—Trace configuration events.</li> <li>• <b>demux</b>—Trace demultiplexing (demux) events.</li> <li>• <b>dhcp</b>—Trace DHCP Server events.</li> <li>• <b>dprof</b>—Trace dynamic profile events.</li> <li>• <b>interface</b>—Trace interface events.</li> <li>• <b>io</b>—Trace packet socket events.</li> <li>• <b>l2tp</b>—Trace L2TP events.</li> <li>• <b>main</b>—Trace main operations.</li> <li>• <b>net</b>—Trace network processing events.</li> </ul> |

- **ppp**—Trace PPP events.
- **pppoe**—Trace PPPoE events.
- **rpd**—Trace routing protocol process events.
- **rtsock**—Trace routing socket events.
- **service**—Trace service events.
- **session**—Trace connection events and flow.
- **stats**—Trace statistics events.
- **ucac**—Trace universal call admission control events.
- **ui**—Trace user interface events.
- **vbf**—Trace variable-based forwarding events.

**level** *level*—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match** *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size** *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *size***k** to specify KB, *size***m** to specify MB, or *size***g** to specify GB

**Range:** 10,240 through 1,073,741,824 bytes

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Hierarchy Level</b>     | [edit system processes general-authentication-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | Configure tracing options for the general authentication service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>filter</b>—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifier simplifies troubleshooting in a scaled environment.</p> <ul style="list-style-type: none"> <li><b>user <i>user@domain</i></b>—Username of a subscriber. Optionally use an asterisk (*) as a wildcard to substitute for characters at the beginning or end of either term or both terms.</li> </ul> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li><b>address-assignment</b>—Trace address-assignment pool events</li> <li><b>all</b>—Trace all tracing operations</li> <li><b>configuration</b>—Trace configuration events</li> <li><b>framework</b>—Trace authentication framework events</li> <li><b>gx-plus</b>—Trace Gx-Plus events</li> <li><b>jsrc</b>—Trace JSRC events</li> <li><b>ldap</b>—Trace LDAP authentication events</li> <li><b>local-authentication</b>—Trace local authentication events</li> </ul> |

- **radius**—Trace RADIUS authentication events
- **user-access**—Trace user access events, such as login, logout, and authenticate.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b> | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>         | Define tracing operations for PTSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>configuration</b>—Trace configuration events.</li> <li>• <b>general</b>—Trace general flow.</li> <li>• <b>peer</b>—Trace SRC peer events.</li> <li>• <b>pic</b>—Trace PIC events.</li> <li>• <b>rtsock</b>—Trace routing socket events.</li> <li>• <b>session</b>—Trace session events.</li> </ul> <p><b>disable</b>—Disable this trace flag.</p> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</p> |

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Define tracing operations for static subscriber processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>authentication</b>—Trace authentication events.</li> <li>• <b>configuration</b>—Trace configuration events.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general events.</li> <li>• <b>gres</b>—Trace GRES events.</li> <li>• <b>profile</b>—Trace dynamic profile events.</li> <li>• <b>rtsock</b>—Trace routing socket events.</li> <li>• <b>statistics</b>—Trace statistics events.</li> <li>• <b>subscriber</b>—Trace subscriber events.</li> </ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Match all levels.</li> </ul> |

- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—(Optional) Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                           |                                                           |
|---------------------------|-----------------------------------------------------------|
| <b>Required Privilege</b> | trace—To view this statement in the configuration.        |
| <b>Level</b>              | trace-control—To add this statement to the configuration. |

|                              |                                                                                                                    |

| <b>Description</b>         | Define tracing operations for subscriber management interface processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general events.</li> <li>• <b>issu</b>—Trace unified ISSU events.</li> <li>• <b>server</b>—Trace server events.</li> <li>• <b>session-db</b>—Trace session database interactions.</li> <li>• <b>ui</b>—Trace user interface events.</li> </ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</p> <p><b>Syntax:</b> <b>sizek</b> to specify KB, <b>sizem</b> to specify MB, or <b>sizeg</b> to specify GB</p> <p><b>Range:</b> 10240 through 1073741824</p> <p><b>Default:</b> 128 KB</p> |

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege** trace—To view this statement in the configuration.  
**Level** trace-control—To add this statement to the configuration.

| <b>Description</b>         | Define tracing operations for subscriber management session database replication processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general flow.</li> <li>• <b>mirror</b>—Trace mirroring events.</li> <li>• <b>replication</b>—Trace database replication events.</li> <li>• <b>server</b>—Trace server events.</li> <li>• <b>session-db</b>—Trace session database interactions.</li> <li>• <b>ui</b>—Trace user interface events.</li> </ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to</p> |

indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level** trace—To view this statement in the configuration.  
trace-control—To add this statement to the configuration.

## transport (Diameter Base Protocol)

---

**Syntax**

```
transport transport-name {  
    address;  
    logical-system logical-system-name <routing-instance routing-instance-name >;  
    routing-instance routing-instance-name  
}
```

**Hierarchy Level** [edit [diameter](#)]

**Release Information** Statement introduced in Junos OS Release 11.2.

**Description** Configure the Diameter instance and the local IP address for the Diameter local transport connection.

**Options** *transport-name*—Name of the transport.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Specify the event that triggers DHCPv6 relay agent to send bulk leasequery messages to the DHCPv6 servers in the logical system/routing instance. The trigger initiates the bulk leasequery configuration parameters you specify in the DHCPv6 relay agent configuration. The optional event support is in addition to the default CLI command support. |
| <b>Options</b>                  | <b>automatic</b> —Specify that the DHCPv6 relay agent always sends a bulk leasequery message whenever the jdhcp daemon is started or restarted and there are no bound subscribers in the session database. The automatic trigger updates the DHCP relay agent's binding information for clients associated with the requesting DHCPv6 relay agent.      |

| <b>Description</b>              | Enable processing of DHCP client packets that have a gateway IP address (giaddr) of 0 (zero) and contain option 82 information. By default, the DHCP relay agent treats such packets as if they originated at an untrusted source, and drops them without further processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Configure the router to provide a unique value for the NAS-Port attribute (RADIUS attribute 5) of each subscriber. You can configure a NAS-Port value that is unique within the router only, or unique across the different MX routers in the network.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>chassis-id</b>—Value for the <b>chassis-id</b> part of NAS-Port attribute. To ensure that NAS-Port values are unique across all MX series routers in the network, you must specify a unique <b>chassis-id</b> for each MX router.</p> <p><b>Range:</b> 0-127 bits</p> <p><b>chassis-id-width</b>—Number of bits used to uniquely identify the chassis across the MX series routers in the network. All routers must use the same <b>chassis-id-width</b>. If you do not configure a <b>chassis-id-width</b>, the resulting NAS-Port attribute is unique within the router only.</p> <p><b>Range:</b> 1-7 bits</p> |

| <b>Description</b>              | <p>Enable interim accounting updates and configure the amount of time that the router or switch waits before sending a new accounting update.</p> <p>Interim accounting updates are included in the exchange of messages between the client and the accounting server. In RADIUS accounting, the client is the network access server (NAS), which can be the router or switch. The NAS sends Accounting-Request messages to the server, which acknowledges receipt of the requests with Accounting-Response messages. Interim accounting updates are sent in Accounting-Request packets with the Acct-Status-Type attribute set to Interim-Update.</p> <p>When a user is authenticated, the authentication server issues an Access-Accept message in response to a successful Access-Request message. The interval between interim updates can be configured directly on the server using the Acct-Interim-Interval attribute of the Access-Accept message. However, if the update interval is configured on the NAS using <b>update-interval</b>, then the locally configured value overrides the value found in an Access-Accept message from the server.</p> |
|                                 | <p> <b>NOTE:</b> All information in an interim update message is cumulative from the beginning of the session, not from the last interim update message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>                  | No interim updates are sent from the client to the accounting server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## update-interval (Service Accounting)

---

|                            |                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | update-interval <i>minutes</i> ;                                                                                                                 |
| <b>Hierarchy Level</b>     | [edit access profile <i>profile-name</i> <b>service accounting</b> ]                                                                             |
| <b>Release Information</b> | Statement introduced in Junos OS Release 14.2R1 for MX Series routers.                                                                           |
| <b>Description</b>         | Enable service interim accounting updates and configure the amount of time that the router waits before sending a new service accounting update. |

**NOTE:** An update interval value configured in the RADIUS attribute, Service-Interim-Acct-Interval (VSA 26–140), takes precedence over the value configured with this statement. In turn, the value configured with this statement takes precedence over the *interval* value configured at the [edit accounting-options flat-file-profile *profile-name*] hierarchy level.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Configure the amount of time in seconds before a Policy and Charging Rule Function (PCRF) partition stops attempting to send an updated rule report response using a CCR-GX-U message. Use this statement if you added or deleted rules in either the subscriber login using a CCA-GX-I message, or the reauthorization request using a RAR-GX-U message, and configured rule reporting.</p> <p>The last rule report may be preempted by the subscriber logging out too soon. Use this statement to control the amount of time to allow the system to send the last rule report.</p> |
| <b>Options</b>                  | <p><b>seconds</b>—Number of seconds to wait before a PCRF partition stops attempting to send an updated rule report response using a CCR-GX-U message.</p> <p><b>Default:</b> 300</p> <p><b>Range:</b> 0 through 86,400 seconds (24 hours)</p>                                                                                                                                                                                                                                                                                                                                          |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Specify a recommended shaping rate to be applied to upstream traffic on an interface.</p> <p>For ANCP interfaces, this configured rate is used as the default value for the Juniper VSA Upstream-Calculated-Qos-Rate (26-142) when the router has not received and processed the attributes from the access node.</p> <p>For L2TP, the rate is configured on an underlying PPPoE logical interface for a subscriber on an MX Series router acting as a LAC. When the subscriber is tunneled, this rate, referred to as speed for L2TP, is sent to the LNS in the ICCN message as AVP 38.</p> |
| <b>Options</b>                  | <b>rate</b> —Traffic rate in bits per second.<br><b>Range:</b> 1000 through 4,294,967,295 bits per second                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | Use the textual interface description instead of the interface identifier in the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or in the DHCPv6 option 18 (Relay Agent Interface ID) or option 37 (Relay Agent Remote ID) information in DHCP packets that the DHCP relay agent sends to a DHCP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**NOTE:** For integrated routing and bridging (IRB) interfaces, the option 82 field must be able to uniquely identify the incoming interface based on either the Agent Circuit ID or Agent Remote ID. You can modify the information in the textual interface description to match the raw IFD (physical interface without a subunit) name and configure the option 82 field to use the interface description.

The textual description is configured using the **description** statement at the [edit **interfaces interface-name**] hierarchy level. If you specify that the textual description be used and no description is configured for the interface, DHCP relay defaults to using the Layer 2 interface name. When you use the interface description rather than the interface name,

the interface description has to be specified under interface unit ("set interfaces ge-0/0/0 unit 0 description "client"). If you do not do this, then the interface name is used.

In the case of integrated routing and bridging (IRB) interfaces, the textual description of the Layer 2 interface is used instead of the IRB interface. If there is no description configured, the Layer 2 logical interface name is used. To include the IRB interface description instead of the Layer 2 interface description, configure the **use-interface-description** and the **no-vlan-interface-name** statements. If no description is configured for the IRB interface, DHCP relay defaults to using the IRB interface name.

**NOTE:** The **use-interface-description** statement is mutually exclusive with the **use-vlan-id** statement.

---

If you specify the textual interface description, rather than accepting the default syntax, the identification is for packets returned from the server, and only for instances where that identification would be required by the DHCP relay, such as a stateless pass-through.

**NOTE:** By default, DHCP relay accepts a maximum of 253 ASCII characters. If the textual interface description exceeds 253 characters, DHCP relay drops the packet, which results in the DHCP client failing to bind.

---

**Options**    **logical**—Use the textual description that is configured for the logical interface.  
**device**—Use the textual description that is configured for the device interface.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

## user-name-include (OCS Partition)

**Syntax**

```

user-name-include{
    base-interface-name;
    delimiter delimiter-character;
    domain-name my-domain;
    interface-name;
    mac-address;
    nas-port-id;
    origin-host;
    origin-realm;
    user-name;
    user-prefix pref;
}

```

**Hierarchy Level** [edit access [ocs partition](#) *partition-name*]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Configure the username identification to be used in an Online Charging Function (OCS) partition. You can configure a data string to include the following options.

**Options** **base-interface-name**—Use the physical or underlying interface name. If both the underlying interface and the client application perform authentication, authorization, and provisioning, the identification attributes in the server requests enable the AAA or PCRF server to make an association between the two entities.

**delimiter** *delimiter-character*—Use the specified character as the delimiter between the concatenated components of the **user-name-include** statement. You cannot use the semicolon (;) as a delimiter.

**Default:** @

**domain-name** *my-domain*—Use the specified domain name that is concatenated with the **user-name-include** statement during the subscriber identification process.

**interface-name**—Use the interface name that is concatenated with the **user-name-include** statement during the subscriber identification process; for example, demux0.

**mac-address**—Use the client hardware address (chaddr) from the incoming packet that is concatenated with the **user-name-include** statement during the subscriber identification process.

**nas-port-id**—Use the NAS-Port-ID (RADIUS attribute 87), which identifies the physical interface that subscriber management uses to identify users that is concatenated with the **user-name-include** statement during the subscriber identification process. By default, the NAS-Port-ID includes the interface-description value that describes the physical interface.

**origin-host**—Use the name of the host that originates the Diameter message that is concatenated with the **user-name-include** statement during the subscriber

identification process. Supplied as the value of Origin-Host AVP for all messages sent by the Diameter master instance.

**origin-realm**—Use the realm of the host that originates the Diameter message that is concatenated with the **user-name-include** statement during the subscriber identification process. Supplied as the value of Origin-Realm AVP for all messages sent by the Diameter master instance.

**user-name**—(Included in the **user-name-include** statement by default) Use the username that is concatenated with the **user-name-include** statement during the subscriber identification process.

**user-prefix *prefix***—Use the specified user prefix that is concatenated with the **user-name-include** statement during the subscriber identification process.

| <b>Description</b>              | <p>For the <b>relay-agent-interface-id</b> statement, specify that in dual-stack environments, the DHCPv6 relay agent uses an Interface-ID option (option 18) that is based on the DHCPv4 relay agent information option (option 82). When you include this statement, the DHCPv6 relay agent checks for the option 82 Agent Circuit-ID suboption (suboption 1) and inserts it into the outgoing RELAY-FORW message.</p> <p>For the <b>relay-agent-remote-id</b> statement, specify that in dual-stack environments, the DHCPv6 relay agent uses a Remote-ID option (option 37) that is based on the DHCPv4 relay agent information option (option 82). When you include this statement, the DHCPv6 relay agent checks for the option 82 Remote-ID suboption (suboption 2) and inserts it into the outgoing RELAY-FORW message.</p>                                |
| <b>Options</b>                  | <p><b>strict</b>—(Optional) (<b>relay-agent-remote-id</b> only) The router drops Solicit messages that do not include a DHCPv4 Remote-ID (option 82 suboption 2). If you do not specify the <b>strict</b> keyword, the router sends the RELAY-FORW message without adding option 37.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>         | <p>Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.</p> <p>Use the statement at the [edit ... <b>dhcpv6</b>] hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that a string is included as the beginning of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <i>user-prefix-string</i> —String that begins the username. The string can include the following characters: a through z, A through Z, 0 through 9, “-”, or “.”.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

                              services [dhcp-local-server ...](#)],  
                          [edit logical-systems *logical-system-name* system services [dhcp-local-server ...](#)],  
                          [edit routing-instances *routing-instance-name* system services [dhcp-local-server ...](#)]

**Release Information**    Statement introduced in Junos OS Release 9.1.  
                              Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**    Configure the username that the router or switch passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router (or switch) accesses the local authentication service only and does not use external authentication services, such as RADIUS.

The following statements are not supported in the DHCPv6 hierarchy levels:

- **mac-address**
- **option-60**
- **option-82**

The following statements are supported in the DHCPv6 hierarchy levels only:

- **client-id**
- **relay-agent-interface-id**
- **relay-agent-remote-id**
- **relay-agent-subscriber-id**

The remaining statements are explained separately.

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Add vendor-specific information to the option-82, suboption 9 field of DHCPv4 control messages on server-facing interfaces. The vendor-specific information can be a hostname, a location (such as a unique connection identifier), or both. The hostname can be a string of characters such as <b>Juniper-AB-1</b>. The location should be specified as interface, VLAN ID, and if applicable, stacked VLAN ID. For example, <b>&lt;ifd-name&gt;:&lt;vlan&gt;</b> (ae0:100) or <b>&lt;ifd-name&gt;:&lt;svlan&gt; -&lt;vlan&gt;</b> (ae0:100-10).</p> <p>Junos OS automatically adds the remaining vendor-specific information as per RFC 4243. The enterprise ID is 2636. The hostname is option-data 1, and the location is option-data 2. The DHCPv4 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query a single entity to track and troubleshoot subscriber IP information and network attachment points.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure the action that the router performs when a DHCP lease-time violation occurs. The violation occurs when a third-party DHCP server or address-assignment pool offers a DHCP lease time that is less than the threshold specified by the <a href="#">lease-time-threshold</a> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <b><i>action</i></b> —Action taken by the router when a lease-time violation occurs. <ul style="list-style-type: none"><li>• <b>drop</b>—(Optional) For DHCPv4 and DHCPv6 relay agent, the third-party lease is dropped and the client binding fails.</li><li>• <b>override-lease</b>—(Optional) For DHCPv4 and DHCPv6 local server, the third-party lease is overridden with the value specified by the <a href="#">lease-time-threshold</a> statement and binds the client using the new value.</li><li>• <b>strict</b>—(Optional) For DHCPv4 and DHCPv6 local server, DHCP ignores the third-party lease and the client binding fails.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | Configure the router's authd process to wait for an Acct-On-Ack response message from RADIUS before sending new authentication and accounting updates to the RADIUS server. This configuration ensures that when a new subscriber session starts, the authentication and accounting information for the new session does not get deleted when RADIUS clears previously existing session state information. |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Command introduced in Junos OS Release 9.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Clear the ANCP agent connection with all ANCP neighbors or with the specified ANCP neighbor. This command deletes information for subscribers associated with the neighbor, causing the adjusted traffic rates to revert to the configured rate for the subscriber interfaces. The neighbor remains configured (its administrative state is <i>enabled</i>) and can reestablish adjacencies.</p> <p>This command initiates logout of ANCP-triggered dynamic VLAN sessions on the physical interface associated with the specified neighbor; conventionally autosensed dynamic VLAN sessions and their associated logical interfaces are not affected.</p> |
| <b>Options</b>                  | <p><b>none</b>—Clear all ANCP neighbors.</p> <p><b>ip-address <i>ip-address</i></b>—(Optional) Clear the ANCP neighbor specified by the IP address.</p> <p><b>system-name <i>mac-address</i></b>—(Optional) Clear the ANCP neighbor specified by the MAC address.</p>                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Output Fields</b>            | When you enter this command, you are provided no feedback on the status of your request. You can enter the <b>show ancp neighbor</b> command before and after clearing the ANCP neighbors to verify the clear operation.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Sample Output

### clear ancp neighbor

```
user@host> clear ancp neighbor
```

### show ancp neighbor

The following sample output displays the connections with ANCP neighbors before and after the **clear ancp neighbor** command was issued.

```
user@host> show ancp neighbor
```

| IP Address | MAC Address | State | Subscriber | Capabilities |
|------------|-------------|-------|------------|--------------|
|------------|-------------|-------|------------|--------------|

|               |                   |             | Count |      |
|---------------|-------------------|-------------|-------|------|
| 203.0.113.102 | 00:00:5e:00:53:10 | Established | 5     | Topo |
| 203.0.113.122 | 00:00:5e:00:53:12 | Established | 5     | Topo |
| 203.0.113.132 | 00:00:5e:00:53:13 | Established | 5     | Topo |
| 203.0.113.142 | 00:00:5e:00:53:14 | Established | 5     | Topo |

```
user@host> clear ancp neighbor ip-address 203.0.113.102
```

```
user@host> show ancp neighbor
```

| IP Address    | MAC Address       | State       | Subscriber<br>Count | Capabilities |
|---------------|-------------------|-------------|---------------------|--------------|
| 203.0.113.122 | 00:00:5e:00:53:12 | Established | 5                   | Topo         |
| 203.0.113.132 | 00:00:5e:00:53:13 | Established | 5                   | Topo         |
| 203.0.113.142 | 00:00:5e:00:53:14 | Established | 5                   | Topo         |

## Sample Output

### clear dhcp relay binding

The following sample output displays the address bindings in the DHCP client table before and after the **clear dhcp relay binding** command is issued.

```
user@host> show dhcp relay binding
IP address      Hardware address  Type    Lease expires at
198.51.100.32   00:00:5e:00:53:01 active    2007-02-08 16:41:17 EST
192.168.14.8    00:00:5e:00:53:02 active    2007-02-10 10:01:06 EST
```

```
user@host> clear dhcp relay binding 198.51.100.32
```

```
user@host> show dhcp relay binding
IP address      Hardware address  Type    Lease expires at
192.168.14.8    00:00:5e:00:53:02 active    2007-02-10 10:01:06 EST
```

### clear dhcp relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcp relay binding all
```

### clear dhcp relay binding dual-stack all

The following command clears all DHCP relay agent bindings for all DHCPv4 clients and the associated DHCPv6 bindings in the single-session DHCP dual stack. DHCPv6 clients created in a DHCPv6-only stack are not affected.

```
user@host> clear dhcp relay binding dual-stack all
```

### clear dhcp relay binding interface

The following command clears DHCP relay agent bindings on a specific interface:

```
user@host> clear dhcp relay binding interface fe-0/0/3
```

**clear dhcp relay binding <interfaces-vlan>**

The following command uses the *interfaces-vlan* option to clear all DHCP relay agent bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp relay binding interface ae0
```

**clear dhcp relay binding <interfaces-wildcard>**

The following command uses the *interfaces-wildcard* option to clear all DHCP relay agent bindings over a specific interface:

```
user@host> clear dhcp relay binding ge-1/0/0.*
```

## Sample Output

### clear dhcp relay statistics

The following sample output displays the DHCP relay statistics before and after the **clear dhcp relay statistics** command is issued.

```
user@host> show dhcp relay statistics
```

```
Packets dropped:
  Total          1
  Lease Time Violated 1

Messages received:
  BOOTREQUEST    116
  DHCPDECLINE    0
  DHCPDISCOVER   11
  DHCPINFORM     0
  DHCPRELEASE    0
  DHCPREQUEST    105

Messages sent:
  BOOTREPLY      44
  DHCPOFFER      11
  DHCPACK        11
  DHCPNAK        11
```

```
user@host> clear dhcp relay statistics
```

```
user@host> show dhcp relay statistics
```

```
Packets dropped:
  Total          0

Messages received:

```

## clear dhcp server binding

**Syntax**    `clear dhcp server binding`  
               `<address>`  
               `<all>`  
               `<interface interface-name>`  
               `<interfaces-vlan>`  
               `<interfaces-wildcard>`  
               `<logical-system logical-system-name>`  
               `<routing-instance routing-instance-name>`

**Release Information**    Command introduced in Junos OS Release 9.0.  
                                  Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.

**Description**    Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table on the extended DHCP local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Options**    **address**—(Optional) Clear the binding state for the DHCP client, using one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

**all**—(Optional) Clear the binding state for all DHCP clients.

**interface interface-name**—(Optional) Clear the binding state for DHCP clients on the specified interface.

**NOTE:** This option clears all bindings whose initial login requests were received over the specified interface. Dynamic demux login requests are not received over the dynamic demux interface, but rather the underlying interface of the dynamic demux interface. To clear a specific dynamic demux interface, use the *ip-address* or *mac-address* options.

**interfaces-vlan**—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (\*).

**logical-system** *logical-system-name*—(Optional) Clear the binding state for DHCP clients on the specified logical system.

**routing-instance** *routing-instance-name*—(Optional) Clear the binding state for DHCP clients on the specified routing instance.

## Sample Output

### clear dhcp server binding <ip-address>

The following sample output displays the address bindings in the DHCP client table on the extended DHCP local server before and after the **clear dhcp server binding** command is issued.

```
user@host> show dhcp server binding
```

```
2 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

| IP address   | Hardware address  | Type   | Lease expires at        |
|--------------|-------------------|--------|-------------------------|
| 198.51.100.1 | 00:00:5e:00:53:01 | active | 2007-01-17 11:38:47 PST |
| 198.51.100.3 | 00:00:5e:00:53:02 | active | 2007-01-17 11:38:41 PST |

```
user@host> clear dhcp server binding 198.51.100.1
```

```
user@host> show dhcp server binding
```

```
1 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

| IP address   | Hardware address  | Type   | Lease expires at        |
|--------------|-------------------|--------|-------------------------|
| 198.51.100.3 | 00:00:5e:00:53:02 | active | 2007-01-17 11:38:41 PST |

### clear dhcp server binding all

The following command clears all DHCP local server bindings:

```
user@host> clear dhcp server binding all
```

### clear dhcp server binding interface

The following command clears DHCP local server bindings on a specific interface:

```
user@host> clear dhcp server binding interface fe-0/0/2
```

### clear dhcp server binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCP local server bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp server binding ae0
```

### clear dhcp server binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCP local server bindings over a specific interface:

```
user@host> clear dhcp server binding ge-1/0/0.*
```

## clear dhcp server statistics

## Sample Output

### clear dhcpv6 relay binding

The following sample output displays the DHCPv6 bindings before and after the **clear dhcpv6 relay binding** command is issued.

```
user@host> show dhcpv6 relay binding
```

| Prefix                                  | Session Id | Expires | State | Interface  | Client DUID |

### clear dhcpv6 relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcpv6 relay binding all
```

### clear dhcpv6 relay binding dual-stack all

The following command clears all DHCPv6 relay agent bindings for all DHCPv6 clients and the associated DHCPv4 bindings in the single-session DHCP dual stack. DHCPv4 clients created in a DHCPv4-only stack are not affected.

```
user@host> clear dhcpv6 relay binding dual-stack all
```

### clear dhcpv6 relay binding interface

The following command clears DHCPv6 relay agent bindings on a specific interface:

```
user@host> clear dhcpv6 relay binding interface fe-0/0/2
```

### clear dhcpv6 relay binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCPv6 relay agent bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 relay binding interface ae0
```

### clear dhcpv6 relay binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 relay agent bindings over a specific interface:

```
user@host> clear dhcpv6 relay binding ge-1/0/0.*
```

## Sample Output

### clear dhcpv6 relay statistics

The following sample output displays the DHCPv6 relay statistics before and after the **clear dhcpv6 relay statistics** command is issued.

```
user@host> show dhcpv6 relay statistics
DHCPv6 Packets dropped:
  Total                0
  Lease Time Violated  1

Messages received:
  DHCPV6_DECLINE        0
  DHCPV6_SOLICIT        10
  DHCPV6_INFORMATION_REQUEST  0
  DHCPV6_RELEASE        0
  DHCPV6_REQUEST        10
  DHCPV6_CONFIRM        0
  DHCPV6_RENEW          0
  DHCPV6_REBIND         0
  DHCPV6_RELAY_REPL     0
```

```
Messages sent:

[clear dhcpv6 server binding interface on page 1478](#)

[clear dhcpv6 server binding <interfaces-vlan> on page 1478](#)

[clear dhcpv6 server binding <interfaces-wildcard> on page 1478](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### `clear dhcpv6 server binding all`

The following command clears all DHCPv6 local server bindings:

```
user@host> clear dhcpv6 server binding all
```

### `clear dhcpv6 server binding <ipv6-prefix>`

The following command clears DHCPv6 local server bindings for a specific IPv6 prefix:

```
user@host> clear dhcpv6 server binding 14/0x00010001/0x02b3be8f/0x00109400/0x0005
```

### `clear dhcpv6 server binding interface`

The following command clears DHCPv6 local server bindings on a specific interface:

```
user@host> clear dhcpv6 server binding interface fe-0/0/2
```

### `clear dhcpv6 server binding <interfaces-vlan>`

The following command uses the *interfaces-vlan* option to clear all DHCPv6 local server bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 server binding interface ae0
```

### `clear dhcpv6 server binding <interfaces-wildcard>`

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 local server bindings over a specific interface:

```
user@host> clear dhcpv6 server binding ge-1/0/0.*
```

## clear dhcpv6 server statistics

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Clear pending Gx-Plus login and logout requests (replays). Sends JSER message to PCRF that includes the Juniper-Event-Type AVP (AVP code 2103) with a value of 3 indicating a discovery request. The PCRF returns a JDER message to initiate discovery of all subscribers. When this discovery completes, all pending subscriber requests are cleared. |

| <b>Description</b>              | Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify both the access node and the subscriber. The access node responds to the NAS with the results of the test.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>ip-address</b> <i>ip-address</i>—IP address that specifies the access node on whose local loop the loopback test is run.</p> <p><b>system-name</b> <i>neighbor-name</i>—System name that specifies the access node on whose local loop the loopback test is run.</p> <p><b>subscriber</b> <i>identifier-string</i>—Access identifier that specifies the subscriber on whose local loop the loopback test is run.</p> <p><b>count</b> <i>count</i>—(Optional) Number of times a loopback message is sent on the local loop. Range: 1 through 32. Default: 1.</p> <p><b>timeout</b> <i>duration</i>—(Optional) Period of time in seconds that the NAS waits for a response to the OAM request. Range: 0 through 255. Default: 5.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Initiate the bulk leasequery operation that updates binding information for subscribers by requesting that DHCP relay agent send the bulk leasequery message to the configured DHCP servers. The DHCP bulk leasequery feature must be configured in the DHCP relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p> <b>NOTE:</b> You must configure at least one of <i>client-id</i>, <i>ipv4-address</i>, or <i>mac-address</i>.</p> <p><b><i>address</i></b>—Specify the IP address of the DHCP local server to query.</p> <p><b><i>client-id</i></b>—Use the DHCP client identifier option (option 61) to identify the client whose binding information is requested.</p> <p><b><i>group-name</i></b>—Specify the name of a group of DHCP local servers to query.</p> <p><b><i>mac-address</i></b>—Use the MAC address to identify the client whose binding information is requested.</p> <p><b><i>logical-system</i></b>—Specify an optional logical system for the DHCP server being queried. The default logical system is used by default.</p> <p><b><i>routing-instance</i></b>—Specify an optional routing instance for the DHCP server being queried. The default routing instance is used by default.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Initiate the leasequery operation that updates binding information for a specific subscriber by requesting that DHCP relay agent send the leasequery message to the configured DHCP servers. The DHCP leasequery feature must be configured in the DHCP relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <div>  <p><b>NOTE:</b> You must configure at least one of <i>client-id</i>, <i>ipv4-address</i>, or <i>mac-address</i>.</p> </div> <p><b>address</b>—Specify the IP address of the DHCP local server to query.</p> <p><b>client-id</b>—Use the DHCP client identifier option (option 61) to identify the client whose binding information is requested.</p> <p><b>group-name</b>—Specify the name of a group of DHCP local servers to query.</p> <p><b>ipv4-address</b>—Use the IPv4 address to identify the client whose binding information is requested.</p> <p><b>logical-system</b>—Specify an optional logical system for the DHCP servers being queried. The default logical system is used by default.</p> <p><b>mac-address</b>—Use the MAC address to identify the client whose binding information is requested.</p> <p><b>routing-instance</b>—Specify an optional routing instance for the DHCP servers being queried. The default routing instance is used by default.</p> |

| <b>Description</b>              | Initiate the bulk leasequery operation that updates binding information for subscribers by requesting that DHCP relay agent send the bulk leasequery message to the configured DHCP servers. The DHCP bulk leasequery feature must be configured in the DHCP relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p> <b>NOTE:</b> You must configure at least one of <i>client-id</i>, <i>ipv4-address</i>, or <i>mac-address</i>.</p> <p><b><i>address</i></b>—Specify the IP address of the DHCP local server to query.</p> <p><b><i>client-id</i></b>—Use the DHCP client identifier option (option 61) to identify the client whose binding information is requested.</p> <p><b><i>group-name</i></b>—Specify the name of a group of DHCP local servers to query.</p> <p><b><i>mac-address</i></b>—Use the MAC address to identify the client whose binding information is requested.</p> <p><b><i>logical-system</i></b>—Specify an optional logical system for the DHCP server being queried. The default logical system is used by default.</p> <p><b><i>routing-instance</i></b>—Specify an optional routing instance for the DHCP server being queried. The default routing instance is used by default.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Initiate the leasequery operation that updates binding information for a specific subscriber by requesting that DHCP relay agent send the leasequery message to the configured DHCP servers. The DHCP leasequery feature must be configured in the DHCP relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <div>  <p><b>NOTE:</b> You must configure at least one of <i>client-id</i>, <i>ipv4-address</i>, or <i>mac-address</i>.</p> </div> <p><b>address</b>—Specify the IP address of the DHCP local server to query.</p> <p><b>client-id</b>—Use the DHCP client identifier option (option 61) to identify the client whose binding information is requested.</p> <p><b>group-name</b>—Specify the name of a group of DHCP local servers to query.</p> <p><b>ipv4-address</b>—Use the IPv4 address to identify the client whose binding information is requested.</p> <p><b>logical-system</b>—Specify an optional logical system for the DHCP servers being queried. The default logical system is used by default.</p> <p><b>mac-address</b>—Use the MAC address to identify the client whose binding information is requested.</p> <p><b>routing-instance</b>—Specify an optional routing instance for the DHCP servers being queried. The default routing instance is used by default.</p> |

| <b>Syntax</b>                   | <code>request dhcp server reconfigure (all   <i>address</i>   interface <i>interface-name</i>   logical-system <i>logical-system-name</i>   routing-instance <i>routing-instance-name</i>)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.0.<br>Command introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Initiate reconfiguration processing for the specified DHCP clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the <b>clear dhcp server binding</b> command.</p> <p>When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a forcerenew message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the forcerenew message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the <b>clear-on-abort</b> statement to configure the client to be cleared when reconfiguration fails.</p> |
| <b>Options</b>                  | <p><b>all</b>—Initiate reconfiguration for all DHCP clients.</p> <p><b><i>address</i></b>—Initiate reconfiguration for DHCP client with the specified IP address or MAC address.</p> <p><b>interface <i>interface-name</i></b>—Initiate reconfiguration for all DHCP clients on this logical interface (clients whose initial login requests were received over the specified interface).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                 | <p> <b>NOTE:</b> You cannot use the <b>interface <i>interface-name</i></b> option with the <b>request dhcp server reconfigure</b> command for DHCP passive clients (clients that are added as a result of DHCP snooped packets). For passive clients, the interface is not guaranteed to be the next-hop interface to the client, as is the case for active clients.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                 | <p><b>logical-system <i>logical-system-name</i></b>—Initiate reconfiguration for all DHCP clients on the specified logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—Initiate reconfiguration reconfigured for all DHCP clients in the specified routing instance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Command introduced in Junos OS Release 10.4.<br>Command introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Initiate reconfiguration processing for the specified DHCPv6 clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the <b>clear dhcpv6 server binding</b> command.</p> <p>When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfigure state and the local server sends a reconfigure message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the reconfigure message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the <b>clear-on-abort</b> statement to configure the client to be cleared when reconfiguration fails.</p> |
| <b>Options</b>                  | <p><b>all</b>—Initiate reconfiguration for all DHCPv6 clients.</p> <p><b>address</b>—Initiate reconfiguration for DHCPv6 client with the specified IPv6 address.</p> <p><b>client-id</b>—Initiate reconfiguration for DHCPv6 client with the specified client ID.</p> <p><b>interface</b> <i>interface-name</i>—Initiate reconfiguration for all DHCPv6 clients on this logical interface (clients whose initial login requests were received over the specified interface).</p> <p><b>logical-system</b> <i>logical-system-name</i>—Initiate reconfiguration for all DHCPv6 clients on the specified logical system.</p> <p><b>routing-instance</b> <i>routing-instance-name</i>—Initiate reconfiguration reconfigured for all DHCPv6 clients in the specified routing instance.</p> <p><b>session-id</b>—Initiate reconfiguration for DHCPv6 client with the specified session ID.</p>                                                                                                                                                                                         |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Initiate the bulk leasequery operation that updates the DHCPv6 relay agent's binding information for a group of subscribers. The DHCPv6 bulk leasequery feature must be configured in the DHCPv6 relay agent.</p> <p>By default, this bulk leasequery command is initiated with relay ID of the DHCPv6 relay agent if you do not explicitly specify one of the <i>client-id</i>, <i>ipv6-prefix</i>, <i>relay-id</i>, <i>ipv6-link-address</i>, or <i>remote-id</i> options.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b><i>address</i></b>—Specify the IPv6 address of the DHCP local server to query.</p> <p><b><i>client-id</i></b>—Update binding information for clients identified by the specified DHCPv6 Client ID option (option 1).</p> <p><b><i>group-name</i></b>—Specify the name of a group of DHCP local servers to query.</p> <p><b><i>ipv6-link-address</i></b>—Update binding information for clients associated with the specified IPv6 network segment.</p> <p><b><i>ipv6-prefix</i></b>—Update binding information for clients identified by the specified IPv6 prefix.</p> <p><b><i>logical-system</i></b>—Specify an optional logical system for the clients. The default logical system is used by default.</p> <p><b><i>relay-id</i></b>—Update binding information for clients associated with the DHCPv6 relay identified by the DHCP Unique Identifier (DUID) in the specified Relay-ID option.</p> <p><b><i>remote-id</i></b>—Update binding information for clients associated with the specified Relay Agent Remote-ID option (option 37).</p> <p><b><i>routing-instance</i></b>—Specify an optional routing instance for the clients. The default routing instance is used by default.</p> |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Initiate the leasequery operation that updates binding information for a specific subscriber by requesting that DHCPv6 relay agent send the leasequery message to the configured DHCP servers. The DHCP leasequery feature must be configured in the DHCPv6 relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p> <b>NOTE:</b> You must configure at least one of <i>client-id</i> or <i>ipv6-prefix</i>.</p> <p><b>address</b>—Specify the IPv6 address of the DHCP local server to query.</p> <p><b>client-id</b>—Use the DHCPv6 Client ID option (option 1) to identify the client whose binding information is requested.</p> <p><b>group-name</b>—Specify the name of a group of DHCP local servers to query.</p> <p><b>ipv6-prefix</b>—Use the IPv6 prefix to identify the client whose binding information is requested.</p> <p><b>logical-system</b>—Specify an optional logical system for the DHCPv6 servers being queried. The default logical system is used by default.</p> <p><b>routing-instance</b>—Specify an optional routing instance for the DHCPv6 servers being queried. The default routing instance is used by default.</p> |

<other-routing-engine>
```

**Release Information** Command introduced before Junos OS Release 7.4.  
 Option **other-routing-engine** introduced in Junos OS Release 8.0.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Option **sfc** introduced for the TX Matrix Plus router in Junos OS Release 9.6.  
 Option **both-routing-engines** introduced in Junos OS Release 12.1.

**Description** Reboot the software.

**NOTE:** Starting with Junos OS Release 15.1F3, the statement **request system reboot** reboots only the guest operating system on the PTX5000 with RE-DUO-C2600-16G and , MX240, MX480, and MX960 with RE-S-1800X4-32G-S.

Starting with Junos OS Release 15.1F5, the statement **request system reboot** reboots only the guest operating system on the MX2010, and MX2020 with REMX2K-1800-32G-S.

**Options** **none**—Reboot the software immediately.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.

**at *time***—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **now**—Stop or reboot the software immediately. This is the default.
- **+*minutes***—Number of minutes from now to reboot the software.
- ***yymmddhhmm***—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to stop the software, specified in 24-hour time.

**both-routing-engines**—(Optional) Reboot both Routing Engines at the same time.

**in *minutes***—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +*minutes*** option.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

**media (compact-flash | disk)**—(Optional) Boot medium for next boot.

**media (external | internal)**—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.
- **internal**—Reboot the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping or rebooting the software.

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**partition**—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

**scc**—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from `re0`, `re0` is rebooted. If you issue the command from `re1`, `re1` is rebooted.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from `re0`, `re0` is rebooted. If you issue the command from `re1`, `re1` is rebooted. Replace *number* with 0.

**slice *slice***—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- 1—Power off partition 1.
- 2—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** Reboot requests are recorded in the system log files, which you can view with the **show log** command (see *show log*). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see *show system processes*).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the **request system reboot** command on a TX Matrix Plus router with no options or the **all-chassis**, **all-lcc**, **lcc *number***, or **sfc** options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the **request system reboot** command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**List of Sample Output**   [request system reboot on page 1520](#)  
[request system reboot \(at 2300\) on page 1520](#)  
[request system reboot \(in 2 Hours\) on page 1520](#)  
[request system reboot \(Immediately\) on page 1520](#)  
[request system reboot \(at 1:20 AM\) on page 1520](#)

**Output Fields**   When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request system reboot](#)

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### [request system reboot \(at 2300\)](#)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
*** System shutdown message from root@test.example.net ***
System going down at 23:00
```

### [request system reboot \(in 2 Hours\)](#)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

### [request system reboot \(Immediately\)](#)

```
user@host> request system reboot at now
```

### [request system reboot \(at 1:20 AM\)](#)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

| <b>Output Fields</b>            | Table 85 on page 1527 lists the output fields for the <b>show ancp cos</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                     |

**Table 85: show ancp cos Output Fields**

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Per-DSL CoS adjustment</b> | Adjustment values applied by the ANCP agent to the actual downstream rates and frame overhead for frame-mode DSL types. The agent then reports the adjusted rates to CoS to establish a shaping rate for the CoS node that corresponds to the subscriber access line.                                         |
| <b>QoS Adjust Flag</b>        | State of QoS adjust: <ul style="list-style-type: none"> <li>• <b>TRUE</b>—The ANCP agent is enabled to adjust the actual downstream data rates and frame overhead and report the adjusted values to CoS.</li> <li>• <b>FALSE</b>—The ANCP agent is not enabled to adjust and report values to CoS.</li> </ul> |
| <b>SDSL overhead adjusted</b> | Percentage by which the actual SDSL downstream rate is adjusted before reporting it to CoS.                                                                                                                                                                                                                   |

Table 85: show ancp cos Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                      |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SDSL bytes</b>                       | Number of bytes by which the actual SDSL downstream frame overhead is adjusted before reporting it to CoS.                                                                             |
| <b>OTHER overhead adjusted</b>          | Percentage by which the actual OTHER downstream rate is adjusted before reporting it to CoS.                                                                                           |
| <b>OTHER bytes</b>                      | Number of bytes by which the actual OTHER downstream frame overhead is adjusted before reporting it to CoS.                                                                            |
| <b>VDSL overhead adjusted</b>           | Percentage by which the actual VDSL downstream rate is adjusted before reporting it to CoS.                                                                                            |
| <b>VDSL bytes</b>                       | Number of bytes by which the actual VDSL downstream frame overhead is adjusted before reporting it to CoS.                                                                             |
| <b>VDSL2 overhead adjusted</b>          | Percentage by which the actual VDSL2 downstream rate is adjusted before reporting it to CoS.                                                                                           |
| <b>VDSL2 bytes</b>                      | Number of bytes by which the actual VDSL2 downstream frame overhead is adjusted before reporting it to CoS.                                                                            |
| <b>Per-DSL adjustment for reporting</b> | Adjustment values applied by the ANCP agent to the actual downstream rates for individual DSL types to account for traffic overhead. The agent then reports the adjusted rates to AAA. |
| <b>ADSL adjustment factor</b>           | Percentage by which the actual ADSL downstream rate is adjusted before reporting it to AAA.                                                                                            |
| <b>ADSL2 adjustment factor</b>          | Percentage by which the actual ADSL2 downstream rate is adjusted before reporting it to AAA.                                                                                           |
| <b>ADSL2+ adjustment factor</b>         | Percentage by which the actual ADSL2+ downstream rate is adjusted before reporting it to AAA.                                                                                          |
| <b>VDSL adjustment factor</b>           | Percentage by which the actual VDSL downstream rate is adjusted before reporting it to AAA.                                                                                            |
| <b>VDSL2 adjustment factor</b>          | Percentage by which the actual VDSL2 downstream rate is adjusted before reporting it to AAA.                                                                                           |
| <b>SDSL adjustment factor</b>           | Percentage by which the actual SDSL downstream rate is adjusted before reporting it to AAA.                                                                                            |
| <b>OTHER adjustment factor</b>          | Percentage by which the actual OTHER downstream rate is adjusted before reporting it to AAA.                                                                                           |
| <b>Keepalive Timer</b>                  | Interval between the keepalive messages that the ANCP agent sends to CoS.                                                                                                              |

Table 85: show ancp cos Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cos State</b>             | State of the interaction between the ANCP agent and CoS: <ul style="list-style-type: none"> <li>• ANCPD_COS_CONNECT_NEEDED</li> <li>• ANCPD_COS_CONNECT_PENDING</li> <li>• ANCPD_COS_CONNECT_DONE</li> <li>• ANCPD_COS_SESSION_SENT</li> <li>• ANCPD_COS_WRITE_READY</li> </ul> |
| <b>Connect Time</b>          | Time at which the ANCP agent connected to CoS; useful for debugging.                                                                                                                                                                                                            |
| <b>Session Time</b>          | Time at which the ANCP agent sent a session connect message to CoS; useful for debugging.                                                                                                                                                                                       |
| <b>Routing Instance Time</b> | Time at which the ANCP agent sent the routing instance to CoS; useful for debugging.                                                                                                                                                                                            |
| <b>Keepalive Time</b>        | Time at which the last keepalive message was sent.                                                                                                                                                                                                                              |
| <b>Update Time</b>           | Time at which the shaping rate was last updated.                                                                                                                                                                                                                                |
| <b>Type</b>                  | Subscriber access type: <b>ifl</b> indicates that a single VLAN carries subscriber traffic and <b>iflset</b> indicates that a set of VLANs carries subscriber traffic.                                                                                                          |
| <b>Name</b>                  | System-wide name of the particular subscriber access.                                                                                                                                                                                                                           |
| <b>Index</b>                 | Access identifier.                                                                                                                                                                                                                                                              |
| <b>Pending Update</b>        | Actual downstream data rate to be applied next to this local loop, in Kbps.                                                                                                                                                                                                     |
| <b>Last Update</b>           | Adjusted downstream data rate last reported to CoS by the ANCP agent for this local loop, in Kbps.                                                                                                                                                                              |

## Sample Output

### show ancp cos

```
user@host> show ancp cos
```

```
Per-DSL CoS adjustment:
  Qos Adjust Flag:      TRUE
  VDSL overhead adjusted: 90
  VDSL bytes:          20
  VDSL2 overhead adjusted: 95
  VDSL2 bytes:         -20
  SDSL overhead adjusted: 85
  SDSL bytes:          30
  OTHER overhead adjusted: 85
  OTHER bytes:         30
```

```
Per-DSL adjustment for reporting:
```

```

ADSL adjustment factor: 100
ADSL2 adjustment factor: 100
ADSL2+ adjustment factor:100
VDSL adjustment factor: 100
VDSL2 adjustment factor: 100
SDSL adjustment factor: 100
OTHER adjustment factor: 100

```

| <b>Partition Flag</b>   | Number that specifies the type of partition requested: 1 (new adjacency) or 2 (recovered adjacency).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail</b>               |

Table 86: show ancp neighbor Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                 | Level of Output |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Partition Identifier</b>            | Number that associates the ANCP message with a specific partition.                                                                                                                                                                                                                                                | <b>detail</b>   |
| <b>Partition Adjacencies</b>           | Number of adjacencies that share the partition.                                                                                                                                                                                                                                                                   | <b>detail</b>   |
| <b>Dead Timer</b>                      | Remaining period that the edge device waits for adjacency packets from a neighbor before declaring the neighbor to be down. The maximum dead time value is three times the configured adjacency timer value. This field displays the current value based on the time that the last adjacency packet was received. | <b>detail</b>   |
| <b>Received Syn Count</b>              | Number of synchronization messages received from neighbors to maintain adjacencies.                                                                                                                                                                                                                               | <b>detail</b>   |
| <b>Received Synack Count</b>           | Number of synchronization acknowledgment messages received from neighbors in response to the node's synchronization messages.                                                                                                                                                                                     | <b>detail</b>   |
| <b>Received Rstack Count</b>           | Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.                                                                                                                                                                                                            | <b>detail</b>   |
| <b>Received Ack Count</b>              | Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.                                                                                                                                                                                                   | <b>detail</b>   |
| <b>Received Port Up Count</b>          | Number of status messages received from neighbors indicating that a port has transitioned to the up state.                                                                                                                                                                                                        | <b>detail</b>   |
| <b>Received Port Down Count</b>        | Number of status messages received from neighbors indicating that a port has transitioned to the down state.                                                                                                                                                                                                      | <b>detail</b>   |
| <b>Received Generic Resp Count</b>     | Number of generic response messages received from neighbors.                                                                                                                                                                                                                                                      | <b>detail</b>   |
| <b>Received Adjacency Update Count</b> | Number of adjacency update messages received from neighbors.                                                                                                                                                                                                                                                      | <b>detail</b>   |
| <b>Received OAM Count</b>              | Number of OAM responses received from neighbors in reply to <b>request</b> commands.                                                                                                                                                                                                                              | <b>detail</b>   |
| <b>Received Other Count</b>            | Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.                                                                                                                                                                                                | <b>detail</b>   |
| <b>Sent Syn Count</b>                  | Number of synchronization messages sent to neighbors to maintain adjacencies.                                                                                                                                                                                                                                     | <b>detail</b>   |
| <b>Sent Synack Count</b>               | Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.                                                                                                                                                                                            | <b>detail</b>   |
| <b>Sent Rstack Count</b>               | Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.                                                                                                                                                                                                                  | <b>detail</b>   |
| <b>Sent Ack Count</b>                  | Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.                                                                                                                                                                                                         | <b>detail</b>   |

Table 86: show ancp neighbor Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output |

| <b>Output Fields</b>            | Table 87 on page 1540 lists the output fields for the <b>show ancp statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                          |

**Table 87: show ancp statistics Output Fields**

| Field Name            | Field Description                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of neighbors   | Total count of ANCP neighbors.                                                                                                                                                                                            |
| Number of subscribers | Total count of ANCP subscribers.                                                                                                                                                                                          |
| Accept Count          | Number of neighbor TCP/IP sessions accepted on listener socket.                                                                                                                                                           |
| Accept Fail Count     | Number of neighbor TCP/IP sessions that failed due to one of the following causes: session already exists, maximum number of ANCP connections exceeded, creation of session or neighbor failed, or protocol start failed. |

Table 87: show ancp statistics Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| No Config Accept Deny Count     | Number of neighbor TCP/IP sessions that failed because the neighbor was not configured.                                       |
| Received Syn Count              | Number of synchronization messages received from neighbors to maintain adjacencies.                                           |
| Received Synack Count           | Number of synchronization acknowledgment messages received from neighbors in response to the node's synchronization messages. |
| Received Rstack Count           | Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.                        |
| Received Ack Count              | Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.               |
| Received Port Up Count          | Number of status messages received from neighbors indicating that a port has transitioned to the up state.                    |
| Received Port Down Count        | Number of status messages received from neighbors indicating that a port has transitioned to the down state.                  |
| Received Generic Resp Count     | Number of generic response messages received from neighbors.                                                                  |
| Received Adjacency Update Count | Number of adjacency update messages received from neighbors.                                                                  |
| Received OAM Count              | Number of OAM responses received from neighbors in reply to <b>request</b> commands.                                          |
| Received Other Count            | Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.            |
| Sent Syn Count                  | Number of synchronization messages sent to neighbors to maintain adjacencies.                                                 |
| Sent Synack Count               | Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.        |
| Sent Rstack Count               | Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.                              |
| Sent Ack Count                  | Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.                     |
| Sent Generic Resp Count         | Number of generic response messages sent to neighbors.                                                                        |
| Sent OAM Count                  | Number of OAM <b>request</b> commands sent to neighbors.                                                                      |

Table 87: show ancp statistics Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Result Codes</b> | <p>Number of generic response messages sent to neighbors that include each of the following result codes:</p> <ul style="list-style-type: none"> <li>• <b>Invalid Request Message Count</b>—A properly formed request messages violated the protocol because of timing (such as a race condition) or direction of transmission.</li> <li>• <b>Specified Port(s) Down Count</b>—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application.</li> <li>• <b>Out of Resources Count</b>—the ANCP agent is out of resources, probably not related to the access lines. This result code is sent only by an access node.</li> <li>• <b>Request Msg Not Implemented Count</b>—</li> <li>• <b>Malformed Msg Count</b>—Message is malformed because it was corrupted in transit or there was an implementation error at either end of the connection.</li> <li>• <b>TLV Missing Count</b>—One or more mandatory TLVs was missing from a request.</li> <li>• <b>Invalid TLV Contents Count</b>—The contents of one or more TLVs in the request do not match its required specification.</li> <li>• <b>Non-Existent Port(s) Count</b>—One or more of the ports specified in a request do not exist, possibly because of a configuration mismatch between the access node and the router or AAA.</li> </ul> |

## Sample Output

### show ancp statistics

```

user@host> show ancp statistics

| <b>Description</b>              | <p>Display information about active subscribers regardless of the subscriber's operational state, for all subscribers (local access loops), the subscriber associated with the access line specified by an ACI, or the subscriber associated with the specified ANCP neighbor (access node).</p> <p>After an ancpd restart, this command displays orphaned entries (marked with an <b>o</b>) for subscriber sessions that were established before the restart but which have not yet been reestablished. As sessions are reestablished, the number of orphaned entries displayed by the command decreases. The number reaches zero when all sessions are reestablished or when the orphaned-interface timer expires.</p> |
| <b>Options</b>                  | <p><b>none</b>—Display information about all subscribers.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of detail.</p> <p><b>identifier <i>identifier</i></b>—(Optional) Display information about the subscriber associated with the access line (ACI) specified by the access identifier.</p> <p><b>ip-address <i>ip-address</i></b>—(Optional) Display information about the subscribers connected to the access node specified by the IP address.</p> <p><b>system-name <i>mac-address</i></b>—(Optional) Display information about the subscribers connected to the access node specified by the MAC address.</p>                                                                             |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Output Fields** [Table 88 on page 1546](#) lists the output fields for the **show ancp subscriber** command. Output fields are listed in the approximate order in which they appear.

**Table 88: show ancp subscriber Output Fields**

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output          |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>Loop Identifier</b>                | <p>Access loop identifier as sent by the access node and configured to map the subscriber to an interface.</p> <p>An asterisk (*) indicates that the information might be stale due to receiving a Port Down message with a DSL Line State of Idle.</p> <p>Two asterisks (**) indicate that the neighbor associated with the subscriber has lost its adjacency. In this case, the DSL Line State might be Established.</p> <p>An <b>o</b> indicates that the entry is for an orphaned interface and represents a previously established subscriber session that has not been reestablished after an ancpd restart.</p> <p>The number of orphaned entries decreases as the ANCP neighbors reestablish adjacencies and the protocol subscriber sessions are reestablished. The command output indicates this by removing the <b>o</b> marker.</p> <p>Eventually the number of orphaned entries reaches zero, because either all the adjacencies and subscriber sessions have been reestablished or any remaining orphaned entries are removed when the orphaned-interface timer expires.</p> | <b>brief none</b>        |
| <b>DSL Line State</b>                 | State of the DSL line: <b>Idle</b> , <b>Showtime</b> , or <b>Silent</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>brief detail</b>      |

**List of Sample Output** [show ancp summary on page 1552](#)

**Output Fields** [Table 89 on page 1551](#) lists the output fields for the **show ancp summary** command. Output fields are listed in the approximate order in which they appear.

**Table 89: show ancp summary Output Fields**

| Field Name          | Field Description                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Configured</b>   | Number of ANCP neighbors in the <b>Configured</b> state; that is, that have been configured but never established.                                         |
| <b>Establishing</b> | Number of ANCP neighbors in the <b>Establishing</b> state; that is, where negotiations are in progress.                                                    |
| <b>Established</b>  | Number of ANCP neighbors in the <b>Established</b> state; that is, where negotiations have succeeded and the ANCP session has been established.            |
| <b>Not Estblshd</b> | Number of ANCP neighbors in the <b>Not Estblshd</b> state; that is, that have lost a previously established adjacency and are ready to begin negotiations. |
| <b>Total</b>        | Total number of ANCP neighbors; sum of neighbors in the <b>Configured</b> , <b>Establishing</b> , <b>Established</b> , and <b>Not Estblshd</b> states.     |
| <b>Showtime</b>     | Number of DSL lines in <b>Showtime</b> state.                                                                                                              |
| <b>Idle</b>         | Number of DSL lines in <b>Idle</b> state.                                                                                                                  |
| <b>Silent</b>       | Number of DSL lines in <b>Silent</b> state.                                                                                                                |
| <b>Unknown</b>      | Number of DSL lines where the state is not <b>Showtime</b> , <b>Idle</b> , or <b>Silent</b> .                                                              |

Table 89: show ancp summary Output Fields (*continued*)

| Field Name   | Field Description                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Total</b> | Total number of DSL lines (ANCP subscribers); sum of DSL lines in the <b>Showtime</b> , <b>Idle</b> , <b>Silent</b> , and <b>Unknown</b> states. |

## Sample Output

### show ancp summary

```
user@host> show ancp summary
```

#### Neighbors Summary:

| Configured | Establishing | Established | Not Established | Total |
|------------|--------------|-------------|-----------------|-------|
| 22         | 0            | 2           | 0               | 24    |

#### Subscribers Summary:

| Showtime | Idle | Silent | Unknown | Total |
|----------|------|--------|---------|-------|
| 4        | 0    | 0      | 0       | 4     |

## show class-of-service interface

---

**Syntax**    `show class-of-service interface`  
              `<comprehensive | detail> <interface-name>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Forwarding class map information added in Junos OS Release 9.4.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers.  
                              Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access routers.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
                              Options **detail** and **comprehensive** introduced in Junos OS Release 11.4.  
                              Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description**    Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.

**NOTE:** On routing platforms with dual Routing Engines, running this command on the backup Routing Engine, with or without any of the available options, is not supported and produces the following error message:

**error: the class-of-service subsystem is not running**

---

**Options**    **none**—Display CoS associations for all physical and logical interfaces.

**comprehensive**—(M Series, MX Series, and T Series routers) (Optional) Display comprehensive quality-of-service (QoS) information about all physical and logical interfaces.

**detail**—(M Series, MX Series, and T Series routers) (Optional) Display QoS and CoS information based on the interface.

If the **interface** *interface-name* is a physical interface, the output includes:

- Brief QoS information about the physical interface
- Brief QoS information about the logical interface
- CoS information about the physical interface
- Brief information about filters or policers of the logical interface
- Brief CoS information about the logical interface

If the **interface** *interface-name* is a logical interface, the output includes:

- Brief QoS information about the logical interface

- Information about filters or policers for the logical interface
- CoS information about the logical interface

**interface-name**—(Optional) Display class-of-service (CoS) associations for the specified interface.

**none**—Display CoS associations for all physical and logical interfaces.

**Output Fields** [Table 92 on page 1557](#) describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

**Table 92: show class-of-service interface Output Fields**

| Field Name            | Field Description                                                                                                                                                                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface    | Name of a physical interface.                                                                                                                                                                                                                                                                              |
| Index                 | Index of this interface or the internal index of this object.<br><br>(Enhanced subscriber management for MX Series routers) Index values for dynamic CoS traffic control profiles and dynamic scheduler maps are larger for enhanced subscriber management than they are for legacy subscriber management. |
| Dedicated Queues      | Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.<br><br>(Enhanced subscriber management for MX-Series routers) This field is not displayed for enhanced subscriber management.                                                       |
| Maximum usable queues | Number of queues you can configure on the interface.                                                                                                                                                                                                                                                       |
| Maximum usable queues | Maximum number of queues you can use.                                                                                                                                                                                                                                                                      |

Table 92: show class-of-service interface Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Total non-default queues created</b>    | Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.<br><br>(Enhanced subscriber management for MX Series routers) This field is not displayed for enhanced subscriber management.                                             |
| <b>Rewrite Input IEEE Code-point</b>       | (QFX3500 switches only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.   |
| <b>Shaping rate</b>                        | Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the <b>Shaping rate</b> field is displayed for either the physical interface or the logical interface.                    |
| <b>Scheduler map</b>                       | Name of the output scheduler map associated with this interface.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.          |
| <b>Scheduler map forwarding class sets</b> | (QFX Series only) Name of the output fabric scheduler map associated with a QFabric system Interconnect device interface.                                                                                                                                                                             |
| <b>Input shaping rate</b>                  | For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.                                                                                                                                                                                                                      |
| <b>Input scheduler map</b>                 | For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.                                                                                                                                                                                                        |
| <b>Chassis scheduler map</b>               | Name of the scheduler map associated with the packet forwarding component queues.                                                                                                                                                                                                                     |
| <b>Rewrite</b>                             | Name and type of the rewrite rules associated with this interface.                                                                                                                                                                                                                                    |
| <b>Traffic-control-profile</b>             | Name of the associated traffic control profile.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic traffic control profile object is associated with a generated UID (for example, <b>TC_PROF_100_199_SERIES_UID1006</b> ) instead of with a subscriber interface. |
| <b>Classifier</b>                          | Name and type of classifiers associated with this interface.                                                                                                                                                                                                                                          |
| <b>Forwarding-class-map</b>                | Name of the forwarding map associated with this interface.                                                                                                                                                                                                                                            |
| <b>Congestion-notification</b>             | (QFX Series and EX4600 switches only) Congestion notification state, <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                              |
| <b>Logical interface</b>                   | Name of a logical interface.                                                                                                                                                                                                                                                                          |
| <b>Object</b>                              | Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , <b>Translation Table</b> (for IQE PICs only), or <b>traffic-class-map</b> (for T4000 routers with Type 5 FPCs).                                                |
| <b>Name</b>                                | Name of an object.                                                                                                                                                                                                                                                                                    |

Table 92: show class-of-service interface Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Speed            | Speed at which the interface is running.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Loopback         | Whether loopback is enabled and the type of loopback.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Source filtering | Whether source filtering is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Flow control     | Whether flow control is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Auto-negotiation | (Gigabit Ethernet interfaces) Whether autonegotiation is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Remote-fault     | (Gigabit Ethernet interfaces) Remote fault status. <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Device flags     | <p>The <b>Device flags</b> field provides information about the physical device and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Down</b>—Device has been administratively disabled.</li> <li>• <b>Hear-Own-Xmit</b>—Device receives its own transmissions.</li> <li>• <b>Link-Layer-Down</b>—The link-layer protocol has failed to connect with the remote endpoint.</li> <li>• <b>Loopback</b>—Device is in physical loopback.</li> <li>• <b>Loop-Detected</b>—The link layer has received frames that it sent, thereby detecting a physical loopback.</li> <li>• <b>No-Carrier</b>—On media that support carrier recognition, no carrier is currently detected.</li> <li>• <b>No-Multicast</b>—Device does not support multicast traffic.</li> <li>• <b>Present</b>—Device is physically present and recognized.</li> <li>• <b>Promiscuous</b>—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media.</li> <li>• <b>Quench</b>—Transmission on the device is quenched because the output buffer is overflowing.</li> <li>• <b>Recv-All-Multicasts</b>—Device is in multicast promiscuous mode and therefore provides no multicast filtering.</li> <li>• <b>Running</b>—Device is active and enabled.</li> </ul> |

Table 92: show class-of-service interface Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface flags</b> | <p>The <b>Interface flags</b> field provides information about the physical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Admin-Test</b>—Interface is in test mode and some sanity checking, such as loop detection, is disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Hardware-Down</b>—Interface is nonfunctional or incorrectly connected.</li> <li>• <b>Link-Layer-Down</b>—Interface keepalives have indicated that the link is incomplete.</li> <li>• <b>No-Multicast</b>—Interface does not support multicast traffic.</li> <li>• <b>No-receive No-transmit</b>—Passive monitor mode is configured on the interface.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>Pop all MPLS labels from packets of depth</b>—MPLS labels are removed as packets arrive on an interface that has the <b>pop-all-labels</b> statement configured. The depth value can be one of the following: <ul style="list-style-type: none"> <li>• <b>1</b>—Takes effect for incoming packets with one label only.</li> <li>• <b>2</b>—Takes effect for incoming packets with two labels only.</li> <li>• <b>[ 1 2 ]</b>—Takes effect for incoming packets with either one or two labels.</li> </ul> </li> <li>• <b>Promiscuous</b>—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.</li> <li>• <b>Recv-All-Multicasts</b>—Interface is in multicast promiscuous mode and provides no multicast filtering.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul> |
| <b>Flags</b>           | <p>The <b>Logical interface flags</b> field provides information about the logical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>ACFC Encapsulation</b>—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer).</li> <li>• <b>Device-down</b>—Device has been administratively disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Clear-DF-Bit</b>—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit.</li> <li>• <b>Hardware-Down</b>—Interface protocol initialization failed to complete successfully.</li> <li>• <b>PFC</b>—Protocol field compression is enabled for the PPP session.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Encapsulation</b>   | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Admin</b>           | Administrative state of the interface ( <b>Up</b> or <b>Down</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Input Filter</b>            | Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Output Filter</b>           | Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Link flags</b>              | Provides information about the physical link and displays one or more of the following values: <ul style="list-style-type: none"> <li>• <b>ACFC</b>—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option.</li> <li>• <b>Give-Up</b>—Link protocol does not continue connection attempts after repeated failures.</li> <li>• <b>Loose-LCP</b>—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-LMI</b>—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-NCP</b>—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational.</li> <li>• <b>Keepalives</b>—Link protocol keepalives are enabled.</li> <li>• <b>No-Keepalives</b>—Link protocol keepalives are disabled.</li> <li>• <b>PFC</b>—Protocol field compression is configured. The PPP session negotiates the PFC option.</li> </ul> |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>CoS queues</b>              | Number of CoS queues configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Statistics last cleared</b> | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 92: show class-of-service interface Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input errors</b>  | <p>Input errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Bucket Drops</b>—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>HS link FIFO overflows</b>—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> </ul> |
| <b>Output errors</b> | <p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>HS link FIFO underflows</b>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeds the MTU of the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                |
| <b>Egress queues</b> | Total number of egress Maximum usable queues on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 92: show class-of-service interface Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue counters</b>                       | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>                                                                                                                                                                                                                                   |
| <b>SONET alarms</b><br><b>SONET defects</b> | <p>(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: <b>SONET PHY</b>, <b>SONET section</b>, <b>SONET line</b>, and <b>SONET path</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                         |

| Received SONET overhead                | Values of the received and transmitted SONET overhead: <ul style="list-style-type: none"> <li>• <b>C2</b>—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P.</li> <li>• <b>F1</b>—Section user channel byte. This byte is set aside for the purposes of users.</li> <li>• <b>K1 and K2</b>—These bytes are allocated for APS signaling for the protection of the multiplex section.</li> <li>• <b>J0</b>—Section trace. This byte is defined for STS-1 number 1 of an STS-N signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter.</li> <li>• <b>S1</b>—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-N signal.</li> <li>• <b>Z3 and Z4</b>—Allocated for future use.</li> </ul>                                                                                                                                                                                  |
| Transmitted SONET overhead             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Received path trace                    | SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Transmitted path trace                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP bytes dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP bytes dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP bytes dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP bytes dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |
| Transmit rate     | Configured transmit rate of the scheduler. The rate is a percentage of the total interface bandwidth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Rate Limit        | <p>Rate limiting configuration of the queue. Possible values are :</p> <ul style="list-style-type: none"> <li><b>None</b>—No rate limit.</li> <li><b>exact</b>—Queue transmits at the configured rate.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Buffer size       | Delay buffer size in the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Priority          | Scheduling priority configured as <b>low</b> or <b>high</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Excess Priority   | Priority of the excess bandwidth traffic on a scheduler: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Adjustment information</b> | <p>Display the assignment of shaping-rate adjustments on a scheduler node or queue.</p> <ul style="list-style-type: none"> <li>• <b>Adjusting application</b>—Application that is performing the shaping-rate adjustment. <ul style="list-style-type: none"> <li>• The adjusting application can appear as <b>ancp LS-0</b>, which is the Junos OS Access Node Control Profile process (<b>ancpd</b>) that performs shaping-rate adjustments on schedule nodes.</li> <li>• The adjusting application can appear as <b>DHCP</b>, which adjusts the shaping-rate and overhead-accounting class-of-service attributes based on DHCP option 82, suboption 9 (Vendor Specific Information). The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</li> <li>• The adjusting application can also appear as <b>pppoe</b>, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</li> </ul> </li> <li>• <b>Adjustment type</b>—Type of adjustment: <b>absolute</b> or <b>delta</b>.</li> <li>• <b>Configured shaping rate</b>—Shaping rate configured for the scheduler node or queue.</li> <li>• <b>Adjustment value</b>—Value of adjusted shaping rate.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment overhead-accounting mode</b>—Configured shaping mode: <b>frame</b> or <b>cell</b>.</li> <li>• <b>Adjustment overhead bytes</b>—Number of bytes that the ANCP agent adds to or subtracts from the actual downstream frame overhead before reporting the adjusted values to CoS.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment multicast index</b>—</li> </ul> |

## Sample Output

### show class-of-service interface (Physical)

```

user@host> show class-of-service interface so-0/2/3
Physical interface: so-0/2/3, Index: 135
Maximum usable queues: 8, Queues in use: 4
Total non-default queues created: 4
Scheduler map: <default>, Index: 2032638653

Logical interface: fe-0/0/1.0, Index: 68, Dedicated Queues: no
Shaping rate: 32000

```

| Object               | Name                 | Type | Index |
|----------------------|----------------------|------|-------|
| Scheduler-map        | <default>            |      | 27    |
| Rewrite              | exp-default          | exp  | 21    |
| Classifier           | exp-default          | exp  | 5     |

| Forwarding-class-map | exp-default          | exp  | 5     |

#### show class-of-service interface (Logical)

```

user@host> show class-of-service interface so-0/2/3.0
Logical interface: so-0/2/3.0, Index: 68, Dedicated Queues: no
Shaping rate: 32000
Object      Name      Type      Index
Scheduler-map <default>
Rewrite     exp-default exp        21
Classifier   exp-default exp        5
Classifier   ipprec-compatibility ip        8
Forwarding-class-map exp-default exp        5

```

#### show class-of-service interface (Gigabit Ethernet)

```

user@host> show class-of-service interface ge-6/2/0
Physical interface: ge-6/2/0, Index: 175
Maximum usable queues: 4, Queues in use: 4
Scheduler map: <default>, Index: 2
Input scheduler map: <default>, Index: 3
Chassis scheduler map: <default-chassis>, Index: 4

```

#### show class-of-service interface (ANCP)

```

user@host> show class-of-service interface pp0.1073741842
Logical interface: pp0.1073741842, Index: 341
Object      Name      Type      Index
Traffic-control-profile TCP-CVLAN Output    12408
Classifier   dscp-ipv6-compatibility dscp-ipv6 9
Classifier   ipprec-compatibility ip        13

Adjusting application: ancp LS-0
Adjustment type: absolute
Configured shaping rate: 4000000
Adjustment value: 11228000
Adjustment overhead-accounting mode: Frame Mode
Adjustment overhead bytes: 50
Adjustment target: node

```

#### show class-of-service interface (PPPoE Interface)

```

user@host> show class-of-service interface pp0.1
Logical interface: pp0.1, Index: 85
Object      Name      Type      Index
Traffic-control-profile tcp-pppoe.o.pp0.1 Output    2726446535
Classifier   ipprec-compatibility ip        13

Adjusting application: PPPoE
Adjustment type: absolute
Adjustment value: 5000000
Adjustment overhead-accounting mode: cell
Adjustment target: node

```

#### show class-of-service interface (DHCP Interface)

```

user@host> show class-of-service interface demux0.1

```

```

Logical interface: pp0.1, Index: 85
  Object      Name      Type      Index
  Traffic-control-profile tcp-dhcp.o.demux0.1  Output    2726446535
  Classifier      ipprec-compatibility ip         13

Adjusting application: DHCP
Adjustment type: absolute
Adjustment value: 5000000
Adjustment overhead-accounting mode: cell
Adjustment target: node

```

#### show class-of-service interface (T4000 Routers with Type 5 FPCs)

```

user@host> show class-of-service interface xe-4/0/0
Physical interface: xe-4/0/0, Index: 153
  Maximum usable queues: 8, Queues in use: 4
  Shaping rate: 5000000000 bps
  Scheduler map: <default>, Index: 2
  Congestion-notification: Disabled

  Logical interface: xe-4/0/0.0, Index: 77
    Object      Name      Type
  Index
    Classifier      ipprec-compatibility ip
    13

```

#### show class-of-service interface detail

```

user@host> show class-of-service interface ge-0/3/0 detail

Physical interface: ge-0/3/0, Enabled, Physical link is Up
  Link-level type: Ethernet, MTU: 1518, Speed: 1000mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000

Physical interface: ge-0/3/0, Index: 138
  Maximum usable queues: 4, Queues in use: 5
  Shaping rate: 50000 bps
  Scheduler map: interface-scheduler-map, Index: 58414
  Input shaping rate: 10000 bps
  Input scheduler map: scheduler-map, Index: 15103
  Chassis scheduler map: <default-chassis>, Index: 4
  Congestion-notification: Disabled

```

user@host> show class-of-service interface ge-0/3/0 comprehensive
Physical interface: ge-0/3/0, Enabled, Physical link is Up
  Interface index: 138, SNMP ifIndex: 601, Generation: 141
  Link-level type: Ethernet, MTU: 1518, Speed: 1000mbps, BPDU Error: None,
  MAC-REWRITE Error: None, Loopback: Disabled, Source filtering: Disabled, Flow
  control: Enabled,
  Auto-negotiation: Enabled, Remote fault: Online
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  CoS queues     : 4 supported, 4 maximum usable queues
  Schedulers     : 256
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:14:f6:f4:b4:5d, Hardware address: 00:14:f6:f4:b4:5d
  Last flapped   : 2010-09-07 06:35:22 PDT (15:14:42 ago)
  Statistics last cleared: Never
Traffic statistics:
  Input bytes   : 0          0 bps
  Output bytes  : 0          0 bps
  Input packets : 0          0 pps
  Output packets: 0          0 pps
IPv6 total statistics:
  Input bytes   : 0
  Output bytes  : 0
  Input packets : 0
  Output packets: 0
Ingress traffic statistics at Packet Forwarding Engine:
  Input bytes   : 0          0 bps
  Input packets : 0          0 pps
  Drop bytes    : 0          0 bps
  Drop packets  : 0          0 pps
Label-switched interface (LSI) traffic statistics:
  Input bytes   : 0          0 bps
  Input packets : 0          0 pps
Input errors:
  Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Policed discards: 0, L3
  incompletes: 0, L2 channel errors: 0, L2 mismatch timeouts: 0, FIFO errors: 0,
  Resource errors: 0
Output errors:
  Carrier transitions: 5, Errors: 0, Drops: 0, Collisions: 0, Aged packets: 0,
  FIFO errors: 0, HS link CRC errors: 0, MTU errors: 0, Resource errors: 0
Ingress queues: 4 supported, 5 in use
Queue counters:      Queued packets  Transmitted packets      Dropped packets

| <b>Output Fields</b>            | <a href="#">Table 93 on page 1585</a> describes the output fields for the <b>show class-of-service interface-set</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 93: show class-of-service interface-set Output Fields**

| Field Name                                      | Field Description                                                                                                                                                                                 |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface-set</b>                            | Name of a logical interface set composed of one or more logical interfaces for which hierarchical scheduling is enabled.                                                                          |
| <b>Index</b>                                    | Index number of this interface set or the internal index number of this object.                                                                                                                   |
| <b>Physical interface</b>                       | Name of a physical interface.                                                                                                                                                                     |
| <b>Queues supported</b>                         | Number of queues you can configure on the interface.                                                                                                                                              |
| <b>Queues in use</b>                            | Number of queues currently configured.                                                                                                                                                            |
| <b>Output traffic control profile</b>           | Name of the output traffic control profile attached to the logical interface set.                                                                                                                 |
| <b>Output traffic control profile remaining</b> | (Enhanced subscriber management for MX Series routers) For dynamic subscriber management, name of the output traffic control profile for remaining traffic attached to the logical interface set. |

Table 93: show class-of-service interface-set Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Adjusting application</b>               | <p>Name of the application that communicates shaping-rate adjustment information to the Junos OS class-of-service process (<b>cosd</b>) on the broadband services router (BSR). The BSR uses the information from this application to perform shaping-rate adjustments on the scheduler node that manages the interface set. The adjusting application appears as <b>ancp LS-0</b> which is the Junos OS Access Node Control Profile process (<b>ancpd</b>) that performs shaping-rate adjustments on schedule nodes. The nodes are logical interface sets configured to represent subscriber local loops. When the synchronization speed of the DSL line changes, <b>ancpd</b> communicates the local loop speed to <b>cosd</b> over the default logical system, <b>LS-0</b>, and then the BSR throttles the shaping rate on the scheduler node to the loop speed.</p> <p>The adjusting application can also appear as <b>PPPoE</b>, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual data rate downstream attribute. The overhead accounting value is based on the access loop encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</p> |
| <b>Adjustment type</b>                     | Type of shaping-rate adjustment performed by the BSR on the scheduler node. The type of adjustment appears as <b>Adjustment type</b> , meaning that the configured shaping rate is adjusted by an absolute value as opposed to by a percentage of the configured rate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Configured shaping rate</b>             | The maximum transmission rate on the physical interface as configured by the output traffic-control profile attached to the scheduler node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Adjustment value</b>                    | Value of the shaping-rate adjustment information sent by the adjusting application to <b>cosd</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Adjustment overhead-accounting mode</b> | Configured shaping mode: <b>frame</b> or <b>cell</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Sample Output

### show class-of-service interface-set

```

user@host> show class-of-service interface-set example-ifset-ge-4/0/0-7
Interface-set: example-ifset-ge-4/0/0-7, Index: 8
Physical interface: ge-4/0/0, Index: 270
Queues supported: 8, Queues in use: 8
Output traffic control profile: example-tcp-basic-rate, Index: 11395
Adjusting application: ancp LS-0
Adjustment type: absolute
Configured shaping rate: 50000000
Adjustment value: 888000
Adjustment overhead-accounting mode: cell

```

### show class-of-service interface-set (Enhanced Subscriber Management)

```

user@host> show class of service interface-set
Interface-set: ge-1/0/0-201-201, Index: 1
Physical interface: ge-1/0/0, Index: 142
Queues supported: 8, Queues in use: 4
Output traffic control profile: LEVEL_2_UID1001, Index: 4294967307
Output traffic control profile remaining: TCP_REMAIN_UID1003, Index: 4294967308

```

## show class-of-service scheduler-map

|                                 |                                                                                                                                                                                                                              |

Table 94: show class-of-service scheduler-map Output Fields

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Scheduler map</b>    | Name of the scheduler map.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.                                                                                        |
| <b>Index</b>            | Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.<br><br>(Enhanced subscriber management for MX Series routers) Index values for dynamic CoS traffic control profiles are larger for enhanced subscriber management than they are for legacy subscriber management. |
| <b>Scheduler</b>        | Name of the scheduler.                                                                                                                                                                                                                                                                                                                        |
| <b>Forwarding class</b> | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.                                                                                                                                                                                                              |

Table 94: show class-of-service scheduler-map Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Transmit rate</b>                    | Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.                                                                     |
| <b>Rate Limit</b>                       | Rate limiting configuration of the queue. Possible values are <b>none</b> , meaning no rate limiting, and <b>exact</b> , meaning the queue only transmits at the configured rate.                                                                                                                          |
| <b>Maximum buffer delay</b>             | Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword <b>remainder</b> to indicate that the buffer is sized according to what remains after other scheduler buffer allocations. |
| <b>Priority</b>                         | Scheduling priority: <b>low</b> or <b>high</b> .                                                                                                                                                                                                                                                           |
| <b>Excess priority</b>                  | Priority of excess bandwidth: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .                                                                                                                                                                                         |
| <b>Explicit Congestion Notification</b> | (QFX Series, OCX Series, and EX4600 switches only) Explicit congestion notification (ECN) state: <ul style="list-style-type: none"> <li>• Disable—ECN is disabled on the specified scheduler</li> <li>• Enable—ECN is enabled on the specified scheduler</li> </ul> ECN is disabled by default.            |
| <b>Adjust minimum</b>                   | Minimum shaping rate for an adjusted queue, in bps.                                                                                                                                                                                                                                                        |
| <b>Adjust percent</b>                   | Bandwidth adjustment applied to a queue, in percent.                                                                                                                                                                                                                                                       |
| <b>Drop profiles</b>                    | Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.                                                                                                                                                                                             |
| <b>Loss priority</b>                    | Packet loss priority for drop profile assignment.                                                                                                                                                                                                                                                          |
| <b>Protocol</b>                         | Transport protocol for drop profile assignment.                                                                                                                                                                                                                                                            |
| <b>Name</b>                             | Name of the drop profile.                                                                                                                                                                                                                                                                                  |

## Sample Output

### show class-of-service scheduler-map

```
user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84
```

```
Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP       9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP       8484   dd-drop-profile
```

```
Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class
Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP      9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP      8484   dd-drop-profile
```

#### show class-of-service scheduler-map (QFX Series)

```
user@switch# show class-of-service scheduler-map
Scheduler map: be-map, Index: 12240
```

```
Scheduler:be-sched, Forwarding class: best-effort, Index: 115
Transmit rate: 30 percent, Rate Limit: none, Buffer size: remainder,
Buffer Limit: none, Priority: low
Excess Priority: unspecified, Explicit Congestion Notification: disable
```

```
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           any      3312   lan-dp
  Medium-high   any      2714   be-dp1
  High          any      3178   be-dp2
```

## show class-of-service scheduler-map

|                                 |                                                                                                                                                                                                                              |

Table 95: show class-of-service scheduler-map Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Transmit rate</b>                    | Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.                                                                     |
| <b>Rate Limit</b>                       | Rate limiting configuration of the queue. Possible values are <b>none</b> , meaning no rate limiting, and <b>exact</b> , meaning the queue only transmits at the configured rate.                                                                                                                          |
| <b>Maximum buffer delay</b>             | Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword <b>remainder</b> to indicate that the buffer is sized according to what remains after other scheduler buffer allocations. |
| <b>Priority</b>                         | Scheduling priority: <b>low</b> or <b>high</b> .                                                                                                                                                                                                                                                           |
| <b>Excess priority</b>                  | Priority of excess bandwidth: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .                                                                                                                                                                                         |
| <b>Explicit Congestion Notification</b> | (QFX Series, OCX Series, and EX4600 switches only) Explicit congestion notification (ECN) state: <ul style="list-style-type: none"> <li>• Disable—ECN is disabled on the specified scheduler</li> <li>• Enable—ECN is enabled on the specified scheduler</li> </ul> ECN is disabled by default.            |
| <b>Adjust minimum</b>                   | Minimum shaping rate for an adjusted queue, in bps.                                                                                                                                                                                                                                                        |
| <b>Adjust percent</b>                   | Bandwidth adjustment applied to a queue, in percent.                                                                                                                                                                                                                                                       |
| <b>Drop profiles</b>                    | Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.                                                                                                                                                                                             |
| <b>Loss priority</b>                    | Packet loss priority for drop profile assignment.                                                                                                                                                                                                                                                          |
| <b>Protocol</b>                         | Transport protocol for drop profile assignment.                                                                                                                                                                                                                                                            |
| <b>Name</b>                             | Name of the drop profile.                                                                                                                                                                                                                                                                                  |

## Sample Output

### show class-of-service scheduler-map

```
user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84
```

```
Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP       9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP       8484   dd-drop-profile
```

```
Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class
Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP      9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP      8484   dd-drop-profile
```

#### show class-of-service scheduler-map (QFX Series)

```
user@switch# show class-of-service scheduler-map
Scheduler map: be-map, Index: 12240
```

```
Scheduler:be-sched, Forwarding class: best-effort, Index: 115
Transmit rate: 30 percent, Rate Limit: none, Buffer size: remainder,
Buffer Limit: none, Priority: low
Excess Priority: unspecified, Explicit Congestion Notification: disable
```

```
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           any      3312   lan-dp
  Medium-high   any      2714   be-dp1
  High          any      3178   be-dp2
```

## show class-of-service traffic-control-profile

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Maximum Burst Size</b>           | Configured maximum burst size, in cells.                                                                                                                                                                                                                                                                     |
| <b>Peak rate</b>                    | Configured peak rate, in cps.                                                                                                                                                                                                                                                                                |
| <b>Sustained rate</b>               | Configured sustained rate, in cps.                                                                                                                                                                                                                                                                           |
| <b>Shaping rate</b>                 | Configured shaping rate, in bps.<br><br><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) Configured peak rate, in cps.                                                                                                                                                                            |
| <b>Shaping rate burst</b>           | Configured burst size for the shaping rate, in bytes.<br><br><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) Configured maximum burst rate, in cells.                                                                                                                                            |
| <b>Shaping rate priority high</b>   | Configured shaping rate for high-priority traffic, in bps.                                                                                                                                                                                                                                                   |
| <b>Shaping rate priority medium</b> | Configured shaping rate for medium-priority traffic, in bps.                                                                                                                                                                                                                                                 |
| <b>Shaping rate priority low</b>    | Configured shaping rate for low-priority traffic, in bps.                                                                                                                                                                                                                                                    |
| <b>Shaping rate excess high</b>     | Configured shaping rate for high-priority excess traffic, in bps.                                                                                                                                                                                                                                            |
| <b>Shaping rate excess low</b>      | Configured shaping rate for low-priority excess traffic, in bps.                                                                                                                                                                                                                                             |
| <b>Scheduler map</b>                | Name of the associated scheduler map.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.                                            |
| <b>Delay Buffer rate</b>            | Configured delay buffer rate, in bps.                                                                                                                                                                                                                                                                        |

Table 96: show class-of-service traffic-control-profile Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Excess rate</b>              | Configured excess rate, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Excess rate high</b>         | Configured excess rate for high priority traffic, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Excess rate low</b>          | Configured excess rate for low priority traffic, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Guaranteed rate</b>          | <p>Configured guaranteed rate, in bps or cps.</p> <p><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values:</p> <ul style="list-style-type: none"> <li>• <b>cbr</b>—Guaranteed rate is equal to the configured peak rate in cps.</li> <li>• <b>rtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> <li>• <b>nrtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> </ul> |
| <b>Guaranteed rate burst</b>    | Configured burst size for the guaranteed rate, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>adjust-minimum</b>           | Configured minimum shaping rate for an adjusted queue, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>overhead accounting mode</b> | Configured shaping mode: <b>Frame Mode</b> or <b>Cell Mode</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Overhead bytes</b>           | Configured byte adjustment value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Adjust parent</b>            | <p>Configured shaping-rate adjustment for parent scheduler nodes. If enabled, this field appears.</p> <p><b>flow-aware</b> indicates that the parent scheduler node is adjusted only once per multicast channel.</p>                                                                                                                                                                                                                                                                                          |

## Sample Output

### show class-of-service traffic-control-profile

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: Profile1, Index: 57625
  Scheduler map: m1
  Delay Buffer rate: 500000
  Guaranteed rate: 1000000

Traffic control profile: Profile2, Index: 57624
  Scheduler map: m2
  Delay Buffer rate: 600000
  Guaranteed rate: 2000000

Traffic control profile: Profile3, Index: 57627
  Scheduler map: m3

```

```

Delay Buffer rate: 800000
Guaranteed rate: 3000000
.Excess rate high: proportion 4

Traffic control profile: Profile4, Index: 57626
Scheduler map: m4
Delay Buffer rate: 750000
Guaranteed rate: 4000000
..adjust-minimum 20000000

Traffic control profile: foo, Index: 57626
Shaping rate: 100000000
Scheduler map: <default>
Overhead accounting mode: Frame Mode
Frame mode overhead accounting bytes: -12
Adjust parent: flow-aware

```

#### show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: at-vbr1, Index: 11395
ATM Service: RTVBR
Scheduler map: m3
overhead accounting mode: Frame Mode
Shaping rate: 1000 cps
Shaping rate burst: 500 cells
Delay Buffer rate: 2000 cps
Guaranteed rate: 1000 cps

Traffic control profile: foo, Index: 38286
ATM Service: UBR
Scheduler map: m3
overhead accounting mode: Frame Mode

```

#### show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: foo, Index: 38286
ATM Service: RTVBR
Shaping rate: 2000 cps
Shaping rate burst: 200 cells
Scheduler map: <default>
Delay Buffer rate: 1000 cps
Guaranteed rate: 1700 cps

```

#### show class-of-service traffic-control-profile (Enhanced Subscriber Management)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: TC_PROF_100_199_SERIES_UID1000, Index: 4294967313
Shaping rate: 11000000

**Table 97: show database-replication statistics Output Fields**

| Field Name       | Field Description                                                                             |
|------------------|-----------------------------------------------------------------------------------------------|
| General          | Number of dropped connections and the maximum buffer count.                                   |
| Message Received | Total size of messages received and the number of received messages that have been processed. |
| Message Sent     | Total size of messages sent and the number of sent messages that have been processed.         |
| Message Queue    | Number of messages in the queue and the maximum size of the queue.                            |

## Sample Output

### show database-replication statistics

```
user@host> show database-replication statistics
```

```
General:
  Dropped connections      0
  Max buffer count        0
Message received:
  Size (bytes)            0
  Processed               0
Message sent:
  Size (bytes)            0
  Processed               0
Message queue:
```

|                |   |
|----------------|---|
| Queue full     | 0 |
| Max queue size | 0 |

**Table 99: show network-access aaa accounting Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile</b>          | Name of the profile associated with the RADIUS server. A RADIUS server can be associated with more than one profile.                                                                                                                                                                                                                                               |
| <b>Logical System</b>   | Logical system associated with the access profile.                                                                                                                                                                                                                                                                                                                 |
| <b>Routing Instance</b> | Routing instance associated with the access profile.                                                                                                                                                                                                                                                                                                               |
| <b>Acct-On-Response</b> | Status of the RADIUS Acct-On response. <ul style="list-style-type: none"> <li>ACK—ACK response for the Acct-On message is received from the RADIUS server.</li> <li>ERROR—An error condition has occurred.</li> <li>NONE— No Acct-On message is sent.</li> <li>PENDING—Acct-On message is sent to RADIUS server, but no response has been received yet.</li> </ul> |

## Sample Output

### show network-access aaa accounting

```

user@host> show network-access aaa accounting
Profile      Logical System  Routing Instance  Acct-On-Response
ppp-profile  default        default          ACK
l2tp-profile default        l2tp_RI          PENDING

```

## show dhcp relay binding

**Syntax** `show dhcp relay binding`  
`<address>`  
`<brief>`  
`<detail>`  
`<interface interface-name>`  
`<interfaces-vlan>`  
`<interfaces-wildcard>`  
`<ip-address | mac-address>`  
`<logical-system logical-system-name>`  
`<routing-instance routing-instance-name>`  
`<summary>`

**Release Information** Command introduced in Junos OS Release 8.3.  
Options **interface** and **mac-address** added in Junos OS Release 8.4.  
Options **interfaces-vlan** and **interfaces-wildcard** added in Junos OS Release 12.1.  
Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.

**Description** Display the address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.

**Options** **address**—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:

- **ip-address**—The specified IP address.
- **mac-address**—The specified MAC address.
- **session-id**—The specified session ID.

**brief**—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as **show dhcp relay binding**.

**detail**—(Optional) Display detailed client binding information.

**interface interface-name**—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

**interfaces-vlan**—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) The set of interfaces on which to show binding state information. This option supports the use of the wildcard character (\*).

**logical-system logical-system-name**—(Optional) Perform this operation on the specified logical system.

**routing-instance routing-instance-name**—(Optional) Perform this operation on the specified routing instance.

**summary**—(Optional) Display a summary of DHCP client information.

**Required Privilege Level** view

**Output Fields** Table 100 on page 1604 lists the output fields for the **show dhcp relay binding** command. Output fields are listed in the approximate order in which they appear.

**Table 100: show dhcp relay binding Output Fields**

| Field Name                                                                                                                                                                                     | Field Description                                                                                | Level of Output     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|---------------------|
| <i>number</i> clients, ( <i>number</i> init, <i>number</i> bound, <i>number</i> selecting, <i>number</i> requesting, <i>number</i> renewing, <i>number</i> rebinding, <i>number</i> releasing) | Summary counts of the total number of DHCP clients and the number of DHCP clients in each state. | <b>summary</b>      |
| <b>IP address</b>                                                                                                                                                                              | IP address of the DHCP client.                                                                   | <b>brief detail</b> |
| <b>Session Id</b>                                                                                                                                                                              | Session ID of the subscriber session.                                                            | <b>brief detail</b> |
| <b>Generated Remote ID</b>                                                                                                                                                                     | Remote ID generated by the Option 82 Agent Remote ID (suboption 1)                               | <b>detail</b>       |
| <b>Hardware address</b>                                                                                                                                                                        | Hardware address of the DHCP client.                                                             | <b>brief detail</b> |
| <b>Expires</b>                                                                                                                                                                                 | Number of seconds in which the lease expires.                                                    | <b>brief detail</b> |

Table 100: show dhcp relay binding Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output     |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>State</b>                     | State of the DHCP relay address binding table on the DHCP client: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has an active IP address lease.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>REBINDING</b>—Client is broadcasting a request to renew the IP address lease.</li> <li>• <b>RELEASE</b>—Client is releasing the IP address lease.</li> <li>• <b>RENEWING</b>—Client is sending a request to renew the IP address lease.</li> <li>• <b>REQUESTING</b>—Client is requesting a DHCP server.</li> <li>• <b>SELECTING</b>—Client is receiving offers from DHCP servers.</li> </ul> | <b>brief detail</b> |
| <b>Interface</b>                 | Incoming client interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | brief               |
| <b>Lease Expires</b>             | Date and time at which the client's IP address lease expires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail              |
| <b>Lease Expires in</b>          | Number of seconds in which the lease expires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail              |
| <b>Lease Start</b>               | Date and time at which the client's IP address lease started.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail              |
| <b>Lease time violated</b>       | Lease time violation has occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | detail              |
| <b>Incoming Client Interface</b> | Client's incoming interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | detail              |
| <b>Server IP Address</b>         | IP address of the DHCP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | detail              |
| <b>Server Interface</b>          | Interface of the DHCP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail              |
| <b>Bootp Relay Address</b>       | IP address of BOOTP relay.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail              |

Table 101: show dhcp relay statistics Output Fields (*continued*)

| Field Name                           | Field Description                                                                                                                                                                                                                               |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| External Server Response             | State of the external DHCP server responsiveness.                                                                                                                                                                                               |
| Packets forwarded                    | Number of packets forwarded. <ul style="list-style-type: none"> <li><b>BOOTREQUEST</b>—Number of BOOTREQUEST protocol data units (PDUs) forwarded</li> <li><b>BOOTREPLY</b>—Number of BOOTREPLY protocol data units (PDUs) forwarded</li> </ul> |
| External Server Response             | State of the external DHCP server responsiveness.                                                                                                                                                                                               |
| Total Requested Servers              | Total number of servers with which the DHCP relay agent has requested a bulk leasequery connection.                                                                                                                                             |
| Total Attempted Servers              | Total number of servers with which the DHCP relay agent has attempted to create a bulk leasequery connection.                                                                                                                                   |
| Total Connected                      | Total number of servers that have formed a bulk leasequery connection with the DHCP relay agent.                                                                                                                                                |
| Total Terminated by Server           | Total number of servers that have terminated a bulk leasequery connection with the DHCP relay agent.                                                                                                                                            |
| Total Max Attempted                  | Total number of servers where the DHCP relay agent reached the maximum retry limit when it attempted to create a bulk leasequery connection.                                                                                                    |
| Total Closed due to Errors           | Total number of bulk leasequery connections that closed due to an internal error on the DHCP relay agent.                                                                                                                                       |
| In-Flight Connected                  | Number of current bulk leasequery connections on the DHCP relay agent.                                                                                                                                                                          |
| Bulk Leasequery Reply Packet Retries | Number of bulk leasequery reply packets that the DHCP relay agent has retried.                                                                                                                                                                  |

## Sample Output

### show dhcp relay statistics

```

user@host> show dhcp relay statistics
Packets dropped:
  Total                34
  Bad hardware address  1
  Bad opcode           1
  Bad options          3
  Invalid server address 5
  Lease Time Violation  1
  No available addresses 1
  No interface match    2
  No routing instance match 9
  No valid local address 4
  Packet too short      2
  Read error            1

```

```
Send error          1
Option 60           1
Option 82           2

#### show dhcp relay statistics bulk-leasequery-connections

```
user@host> show dhcp relay statistics bulk-leasequery-connections

Total Requested Servers: 0
Total Attempted Servers: 0
Total Connected: 0
Total Terminated by Server: 0
Total Max Attempted: 0
Total Closed due to Errors: 0
In-Flight Connected: 0
Bulk Leasequery Reply Packet Retries: 0
```

## show dhcp server binding

**Syntax**    `show dhcp server binding`  
               `<address>`  
               `<interfaces-vlan><brief | detail | summary>`  
               `<interface interface-name>`  
               `<interfaces-vlan>`  
               `<interfaces-wildcard>`  
               `<logical-system logical-system-name>`  
               `<routing-instance routing-instance-name>`

**Release Information**    Command introduced in Junos OS Release 9.0.  
                               Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.

**Description**    Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol (DHCP) local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Options**    **address**—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

**brief | detail | summary**—(Optional) Display the specified level of output about active client bindings. The default is **brief**, which produces the same output as `show dhcp server binding`.

**interface interface-name**—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

**interfaces-vlan**—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) The set of interfaces on which to show the binding state information. This option supports the use of the wildcard character (\*).

**logical-system logical-system-name**—(Optional) Display information about active client bindings for DHCP clients on the specified logical system.

**routing-instance routing-instance-name**—(Optional) Display information about active client bindings for DHCP clients on the specified routing instance.

| Liveness Detection State     | <p>State of the liveness detection status for a subscriber's Bidirectional Forwarding Detection (BFD) protocol session:</p> <p><b>NOTE:</b> This output field displays status only when liveness detection has been explicitly configured for a subscriber and the liveness detection protocol is actively functioning for that subscriber.</p> <ul style="list-style-type: none"> <li><b>DOWN</b>—Liveness detection has been enabled for a subscriber but the broadband network gateway (BNG) detects that the liveness detection session for the BFD protocol is in the <b>DOWN</b> state.<br/>A liveness detection session that was previously in an <b>UP</b> state has transitioned to a <b>DOWN</b> state, beginning with a liveness detection failure, and ending with the deletion of the client binding. The <b>DOWN</b> state is reported only during this transition period of time.</li> <li><b>UNKNOWN</b>—Liveness detection has been enabled for a subscriber but the actual liveness detection state has not yet been determined.<br/>The <b>UNKNOWN</b> state is reported after a DHCP subscriber initially logs in while the underlying liveness detection protocol handshake, such as BFD, is still processing and the BFD session has not yet reached the <b>UP</b> state.</li> <li><b>UP</b>—Liveness detection has been enabled for a subscriber, and the BNG and the subscriber or client have <i>both</i> determined that the liveness detection session for the BFD protocol is in the <b>UP</b> state.</li> <li><b>WENT_DOWN</b>—State is functionally equivalent to the <b>DOWN</b> state. A liveness detection session that was previously in an <b>UP</b> state has transitioned to a <b>DOWN</b> state implying a liveness detection failure.<br/>The <b>WENT_DOWN</b> state applies to the internal distribution of the liveness detection mechanism between the Junos DHCP Daemon for Subscriber Services (JDHCPd), the BFD plug-in within the Broadband Edge Subscriber Management Daemon (BBE-SMGD), and the Packet Forwarding Engine.</li> </ul> | detail          |
| ACI Interface Set Name       | Internally generated name of the dynamic agent circuit identifier (ACI) interface set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | detail          |

Table 103: show dhcp server statistics Output Fields (*continued*)

| Field Name                                         | Field Description                                                                                                     |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Total Accepted Connections</b>                  | Total number of bulk leasequery connections accepted by the server.                                                   |
| <b>Total Not-Accepted Connections</b>              | Total number of bulk leasequery connections not accepted by the server.                                               |
| <b>Connections Closed due to Errors</b>            | Number of bulk leasequery connections that the server closed due to an internal error.                                |
| <b>Connections Closed due to max-empty-replies</b> | Number of bulk leasequery connections that the server closed because the maximum number of empty replies was reached. |
| <b>In-flight Connections</b>                       | Number of bulk leasequery connections on the server.                                                                  |

## Sample Output

### show dhcp server statistics

```

user@host> show dhcp server statistics
Packets dropped:
    Total                  1
    Lease Time Violation   1

Messages received:
    BOOTREQUEST            25
    DHCPDECLINE             0
    DHCPDISCOVER           10
    DHCPINFORM              0
    DHCPRELEASE             4
    DHCPREQUEST            10

Messages sent:
    BOOTREPLY              20

| Release Information      | Command introduced in Junos OS Release 11.4.<br><i>interfaces-vlan</i> and <i>interfaces-wildcard</i> options introduced in Junos OS Release 12.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | Display the DHCPv6 address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Options                  | <p><b>address</b>—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:</p> <ul style="list-style-type: none"><li>• <i>CID</i>—The specified Client ID (CID).</li><li>• <i>ipv6-prefix</i>—The specified IPv6 prefix.</li><li>• <i>session-id</i>—The specified session ID.</li></ul> <p><b>brief</b>—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as <b>show dhcpv6 relay binding</b>.</p> <p><b>detail</b>—(Optional) Display detailed client binding information.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and S-VLAN ID.</p> <p><b>interfaces-vlan</b>—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.</p> <p><b>interfaces-wildcard</b>—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on the specified logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Perform this operation on the specified routing instance.</p> <p><b>summary</b>—(Optional) Display a summary of DHCPv6 client information.</p> |
| Required Privilege Level | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| External Server Response | State of the external DHCP server responsiveness.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Total Requested Servers  | Total number of servers with which the DHCP relay agent has requested a bulk leasequery connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 105: show dhcpv6 relay statistics Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                            |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Total Attempted Servers</b>              | Total number of servers with which the DHCP relay agent has attempted to create a bulk leasequery connection.                                |
| <b>Total Connected</b>                      | Total number of servers that have formed a bulk leasequery connection with the DHCP relay agent.                                             |
| <b>Total Terminated by Server</b>           | Total number of servers that have terminated a bulk leasequery connection with the DHCP relay agent.                                         |
| <b>Total Max Attempted</b>                  | Total number of servers where the DHCP relay agent reached the maximum retry limit when it attempted to create a bulk leasequery connection. |
| <b>Total Closed due to Errors</b>           | Total number of bulk leasequery connections that closed due to an internal error on the DHCP relay agent.                                    |
| <b>In-Flight Connected</b>                  | Number of current bulk leasequery connections on the DHCP relay agent.                                                                       |
| <b>Bulk Leasequery Reply Packet Retries</b> | Number of bulk leasequery reply packets that the DHCP relay agent has retried.                                                               |

## Sample Output

### show dhcpv6 relay statistics

```

| Release Information      | Command introduced in Junos OS Release 9.6.<br>Options <i>interfaces-vlan</i> and <i>interfaces-wildcard</i> added in Junos OS Release 12.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description              | Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options                  | <p><b>address</b>—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:</p> <ul style="list-style-type: none"><li>• <i>CID</i>—The specified Client ID (CID).</li><li>• <i>ipv6-prefix</i>—The specified IPv6 prefix.</li><li>• <i>session-id</i>—The specified session ID.</li></ul> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output about active client bindings. The default is <b>brief</b>, which produces the same output as <b>show dhcpv6 server binding</b>.</p> <p><b>interface interface-name</b>—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.</p> <p><b>interfaces-vlan</b>—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.</p> <p><b>interfaces-wildcard</b>—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p><b>logical-system logical-system-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified logical system.</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified routing instance.</p> |

| <b>Output Fields</b>            | Table 108 on page 1643 lists the output fields for the <b>show diameter</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                               |

**Table 108: show diameter Output Fields**

| Field Name          | Field Description                                     | Level of Output |
|---------------------|-------------------------------------------------------|-----------------|
| Diameter process id | ID number of the Diameter process.                    | All levels      |
| Functions           | Number of functions associated with Diameter.         | All levels      |
| Connected functions | Number of functions with active Diameter connections. | All levels      |
| Instances           | Number of configured Diameter instances.              | All levels      |

Table 108: show diameter Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                             | Level of Output     |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Network elements (NEs)</b>                  | Number of configured Diameter network elements.                                                               | All levels          |
| <b>Connected NEs</b>                           | Number of Diameter network elements with active connections.                                                  | All levels          |
| <b>Peers</b>                                   | Number of Diameter peer nodes.                                                                                | All levels          |
| <b>Activated peers</b>                         | Number of Diameter peers with active connections.                                                             | All levels          |
| <b>Open peers</b>                              | Number of peers in the open state, without active network element connections but available for a connection. | All levels          |
| <b>Transports</b>                              | Number of transports configured.                                                                              | All levels          |
| <b>Requests queued for network transmit</b>    | Number of requests waiting to be sent to the Diameter peers.                                                  | All levels          |
| <b>Answers queued for network transmit</b>     | Number of replies waiting to be sent to the Diameter peers.                                                   | All levels          |
| <b>Expected answers from network</b>           | Number of replies expected to be received from the Diameter peers.                                            | All levels          |
| <b>Requests queued for function transmit</b>   | Number of requests waiting to be sent to the functions associated with Diameter.                              | All levels          |
| <b>Answers queued for function transmit</b>    | Number of replies waiting to be sent to the functions associated with Diameter.                               | All levels          |
| <b>Expected answers from functions</b>         | Number of replies expected to be received from the functions associated with Diameter.                        | All levels          |
| <b>Memory used by network transmit queues</b>  | Amount of memory consumed by network transmit queues.                                                         | All levels          |
| <b>Memory used by function transmit queues</b> | Amount of memory consumed by function transmit queues.                                                        | All levels          |
| <b>Origin-state-id</b>                         | Value of the Origin-State-ID AVP.                                                                             | All levels          |
| <b>Function</b>                                | Name of the function for which information is displayed.                                                      | <b>brief detail</b> |
| <b>State</b>                                   | State of the Diameter connection with the function: <b>Connected</b> or <b>Disconnec</b> (disconnected).      | <b>brief detail</b> |

Table 108: show diameter Output Fields (*continued*)

| Field Name                                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output     |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Upstream Transaction Utilization</b>   | Percent of upstream traffic used for this function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>brief detail</b> |
| <b>Downstream Transaction Utilization</b> | Percent of downstream traffic used for this function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>brief detail</b> |

| <b>Instance</b>                           | Name of the Diameter instance in which the network element is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>brief detail</b> |
| <b>State</b>                              | State of the network element: <ul style="list-style-type: none"> <li>Connecting—None of the network element peers are in the open state and available for connection.</li> <li>Selecting—One network element peer is connected and the network element is waiting for another peer to reach the open state so that it can be connected.</li> <li>Partially-Connected—One network element peer is in the open state and connected.</li> <li>Post-selection-delay—Three or more peers are in the open state and the network element is waiting to deactivate the peers in excess of two.</li> <li>Fully-connected—Two network element peers are in the open state and connected.</li> </ul> | <b>brief detail</b> |
| <b>Primary Peer</b>                       | Primary peer for the network element, based on the configured peer priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>brief detail</b> |
| <b>Secondary Peer</b>                     | Secondary peer for the network element, based on the configured peer priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>brief detail</b> |
| <b>Peer</b>                               | Name of the peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>brief detail</b> |

Table 108: show diameter Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output     |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Instance</b>        | Name of the Diameter instance in which the peer is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>brief detail</b> |
| <b>State</b>           | State of the peer: <ul style="list-style-type: none"> <li>• Bad-Config—Misconfiguration.</li> <li>• Bad-Remote—Remote side does not conform to one of the decisions or is sending malformed messages.</li> <li>• Closed—Normal disconnect due to a request from the remote site or due to excessive watchdog timeouts.</li> <li>• Destructing—Peer to be deleted on the next timer tick. Until then, it performs no actions.</li> <li>• Disabled—Peer is administratively disabled.</li> <li>• Internal-error—Internal error has been detected and the peer is in the process of restarting.</li> <li>• No-Activation—Peer is not used by any Diameter network element.</li> <li>• Rejected—Connection was rejected by remote side of the connection.</li> <li>• Suspended—All other reasons to be suspended.</li> </ul> | <b>brief detail</b> |
| <b>NE-Count</b>        | Number of network elements associated with the peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>brief detail</b> |
| <b>Activated Count</b> | Activation status of the peer: <ul style="list-style-type: none"> <li>• 1—Peer is activated.</li> <li>• 0—Peer is not activated.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>brief detail</b> |
| <b>Primary Count</b>   | Status of the peer: primary (1) or secondary (0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>brief detail</b> |
| <b>Secondary Count</b> | Status of the peer: secondary (0) or primary (1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>brief detail</b> |

| <b>Output Fields</b>            | <a href="#">Table 109 on page 1649</a> lists the output fields for the <b>show diameter function</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                     |

Table 109: show diameter function Output Fields

| Field Name                              | Field Description                                        | Level of Output |
|-----------------------------------------|----------------------------------------------------------|-----------------|
| <b>Function name</b>                    | Name of the function for which information is displayed. | All levels      |
| <b>State</b>                            | State of the Diameter connection with the function.      | All levels      |
| <b>Upstream transaction utilization</b> | Percent of upstream traffic used for this function.      | All levels      |

Table 109: show diameter function Output Fields (*continued*)

| Field Name                                   | Field Description                                                              | Level of Output |
|----------------------------------------------|--------------------------------------------------------------------------------|-----------------|
| <b>Downstream transaction utilization</b>    | Percent of downstream traffic used for this function.                          | All levels      |
| <b>Network transmit buffer utilization</b>   | Percent of network transmission buffer used for this function.                 | All levels      |
| <b>Function transmit buffer utilization</b>  | Percent of function transmission buffer used for this function.                | All levels      |
| <b>Routed destinations</b>                   | Number of destinations that have this function associated with their routes.   | All levels      |
| <b>Requests queued for network tx</b>        | Number of requests waiting to be sent to the Diameter peers for this function. | <b>detail</b>   |
| <b>Pending answers from network</b>          | Number of replies expected from the Diameter peers for this function.          | <b>detail</b>   |
| <b>Answers queued for function tx</b>        | Number of replies waiting to be sent to this function.                         | <b>detail</b>   |
| <b>Total upstream transactions pending</b>   | Total number of messages queued for this function.                             | <b>detail</b>   |
| <b>Upstream transactions limit</b>           | Total number of messages queued for this function.                             | <b>detail</b>   |
| <b>Requests queued for function tx</b>       | Number of requests waiting to be sent to this function.                        | <b>detail</b>   |
| <b>Pending answers from function</b>         | Number of replies expected to be received from this function.                  | <b>detail</b>   |
| <b>Answers queued for network tx</b>         | Number of replies waiting to be sent to this function.                         | <b>detail</b>   |
| <b>Total downstream transactions pending</b> | Total number of messages queued for the Diameter peers.                        | <b>detail</b>   |
| <b>Downstream transactions limit</b>         | Maximum number of messages that can be queued for the Diameter peers.          | <b>detail</b>   |
| <b>Buffers used by network tx queue</b>      | Number of buffers used by messages queued for the Diameter peers.              | <b>detail</b>   |
| <b>Limit on network tx queue buffers</b>     | Maximum buffer capacity available for messages queued for the Diameter peers.  | <b>detail</b>   |

Table 109: show diameter function Output Fields (*continued*)

| Field Name                         | Field Description                                                        | Level of Output |
|------------------------------------|--------------------------------------------------------------------------|-----------------|
| Buffers used by function tx queue  | Number of buffers used by messages queued for this function.             | detail          |
| Limit on function tx queue buffers | Maximum buffer capacity available for messages queued for this function. | detail          |
| Origin-state-id                    | Value of the Origin-State-ID AVP.                                        | detail          |

## Sample Output

### show diameter function

```
user@host> show diameter function
```

```
Diameter function list:
```

| Function | State      | Upstream Transaction Utilization % | Downstream Transaction Utilization % | Net Queue Buffer Utilization % | Func Queue Buffer Utilization % | Routed Dests |
|----------|------------|------------------------------------|--------------------------------------|--------------------------------|---------------------------------|--------------|
| jsrc     | Disconnect | 0                                  | 0                                    | 0                              | 0                               | 0            |

### show diameter function brief

```
user@host> show diameter function brief
```

```
Diameter function:
```

```
Function name           : gx-plus
State                   : Connected
Upstream transaction utilization : 0 %
Downstream transaction utilization : 0 %
Network transmit buffer utilization : 0 %
Function transmit buffer utilization : 0 %
Routed destinations     : 1

Function name           : jsrc
State                   : Disconnected
Upstream transaction utilization : 0 %
Downstream transaction utilization : 0 %
Network transmit buffer utilization : 0 %
Function transmit buffer utilization : 0 %
Routed destinations     : 0
```

### show diameter function detail (JSRC)

```
user@host> show diameter function detail
```

```
Diameter function:
```

```
Function name           : jsrc
State                   : Disconnected
Upstream transaction utilization : 0 %
Downstream transaction utilization : 0 %
Network transmit buffer utilization : 0 %
```

```
Function transmit buffer utilization : 0 %
Routed destinations                 : 0
Requests queued for network tx      : 0
Pending answers from network       : 0
Answers queued for function tx      : 0
Total upstream transactions pending : 0
Upstream transactions limit         : 1024
Requests queued for function tx     : 0
Pending answers from function       : 0
Answers queued for network tx       : 0
Total downstream transactions pending : 0
Downstream transactions limit       : 1024
Buffers used by network tx queue    : 0
Limit on network tx queue buffers   : 10485760
Buffers used by function tx queue   : 0
Limit on function tx queue buffers  : 10485760
```

#### show diameter function detail (Gx-Plus)

```
user@host> show diameter function gx-plus detail
```

```
Diameter function:
Function name           : gx-plus
State                   : Connected
Upstream transaction utilization : 0 %
Downstream transaction utilization : 0 %
Network transmit buffer utilization : 0 %
Function transmit buffer utilization : 0 %
Routed destinations     : 1
Requests queued for network tx : 0
Pending answers from network : 0
Answers queued for function tx : 0
Total upstream transactions pending : 0
Upstream transactions limit : 1024
Requests queued for function tx : 0
Pending answers from function : 0
Answers queued for network tx : 0
Total downstream transactions pending : 0
Downstream transactions limit : 1024
Buffers used by network tx queue : 0
Limit on network tx queue buffers : 10485760
Buffers used by function tx queue : 0
Limit on function tx queue buffers : 10485760
Origin-state-id         : 0
```

## show diameter function statistics

| <b>Description</b>              | Display statistics about all functions associated with Diameter instances or only the specified function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output. The <b>summary</b> output is displayed by default and includes basic function statistics. The <b>brief</b> output displays the summary information in a different format and adds numbers accumulated since the Diameter node was started. The <b>detail</b> output adds information to the <b>brief</b> output.</p> <p><b>function-name</b>—(Optional) Display information for only the specified function. Currently, Gx-Plus, JSRC, and packet-triggered-subscribers are supported functions. When you specify a function, the <b>brief</b> output is displayed by default, even when you explicitly specify <b>summary</b>.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Over-limit function answers</b>  | Number of answers sent to Diameter peers that exceeded the limit on the function transmit queue.        | <b>detail</b>   |
| <b>Over-limit function messages</b> | Total number of messages sent to Diameter peers that exceeded the limit on the function transmit queue. | <b>detail</b>   |
| <b>Failed to forward requests</b>   | Number of requests that were not successfully sent by Diameter to the network.                          | <b>detail</b>   |
| <b>Failed to forward answers</b>    | Number of answers that were not successfully sent by Diameter to the network.                           | <b>detail</b>   |
| <b>Failed to forward messages</b>   | Total number of messages that were not successfully sent by Diameter to the network.                    | <b>detail</b>   |

## Sample Output

### show diameter function statistics

```
user@host> show diameter function statistics
Diameter function statistics:
      Delivered Delivered Delivered Forwarded Forwarded Forwarded
Function Requests  Answers  Messages Requests  Answers  Messages
jsrc           0          0          0          0          0          0
```

### show diameter function statistics brief

```
user@host> show diameter function statistics brief
Diameter function statistics:
Function name           : jsrc

Delivered requests      :          0          0
Delivered answers       :          0          0
Delivered messages      :          0          0
Forwarded requests      :          0          0
Forwarded answers       :          0          0
Forwarded messages      :          0          0
```

### show diameter function statistics detail

```
user@host> show diameter function statistics detail
Diameter function statistics:
Function name           : jsrc

Delivered requests      :          0          0
Delivered answers       :          0          0
Delivered messages      :          0          0
Forwarded requests      :          0          0
Forwarded answers       :          0          0
Forwarded messages      :          0          0
Over-limit network requests :          0          0
Over-limit network answers :          0          0
Over-limit network messages :          0          0
Failed to deliver requests :          0          0
Failed to deliver answers  :          0          0
Failed to deliver messages :          0          0
Over-limit function requests :          0          0
Over-limit function answers :          0          0
Over-limit function messages :          0          0
Failed to forward requests :          0          0
Failed to forward answers  :          0          0
Failed to forward messages :          0          0
```

## show diameter instance

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 111: show diameter instance Output Fields

| Field Name    | Field Description                                              | Level of Output |
|---------------|----------------------------------------------------------------|-----------------|
| name          | Name of the Diameter instance.                                 | summary         |
| Origin-realm  | Value of Origin-Realm AVP.                                     | summary         |
| Origin-host   | Value of Origin-Host AVP.                                      | summary         |
| NE-total      | Total number of network elements configured for this instance. | summary         |
| NE-connected  | Number of network elements with active Diameter connections.   | summary         |
| Instance name | Name of the Diameter instance.                                 | brief detail    |
| Origin realm  | Value of Origin-Realm AVP.                                     | brief detail    |
| Origin host   | Value of Origin-Host AVP.                                      | brief detail    |
| NEs           | Total number of network elements configured for this instance. | brief detail    |

Table 111: show diameter instance Output Fields (*continued*)

| Field Name    | Field Description                                            | Level of Output |
|---------------|--------------------------------------------------------------|-----------------|
| Connected NEs | Number of network elements with active Diameter connections. | brief detail    |

## Sample Output

### show diameter instance

```
user@host> show diameter instance
```

```
Diameter instances:
  Name      Origin-Realm  Origin-Host  NE-Total  NE-Connected
  master    rrrr         hhhh        1         1
```

### show diameter instance detail

```
user@host> show diameter instance detail
```

```
Diameter instance:
  Instance name : master

  Origin realm  : rrrr

  Origin host   : hhhh

  NEs           : 1
  Connected NEs : 1
```

## show diameter network-element

|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>State</b>                 | State of the network element: <ul style="list-style-type: none"> <li>Connecting—None of the network element peers are in the open state and available for connection.</li> <li>Selecting—One network element peer is connected and the network element is waiting for another peer to reach the open state so that it can be connected.</li> <li>Partially-Connected—One network element peer is in the open state and connected.</li> <li>Post-selection-delay—Three or more peers are in the open state and the network element is waiting to deactivate the peers in excess of two.</li> <li>Fully-connected—Two network element peers are in the open state and connected.</li> </ul> | All levels          |
| <b>Primary peer</b>          | Primary peer for the network element, based on the configured peer priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels          |
| <b>Secondary peer</b>        | Secondary peer for the network element, based on the configured peer priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels          |
| <b>NE name</b>               | Name of the Diameter network element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>brief detail</b> |
| <b>Instance name</b>         | Name of the Diameter instance in which the network element is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>brief detail</b> |
| <b>Peers</b>                 | Number of configured peers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>brief detail</b> |
| <b>Activated peers</b>       | Number of peers that have been activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>brief detail</b> |
| <b>Open peers</b>            | Number of peers in the open state, without active network element connections but available for a connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>brief detail</b> |
| <b>Routes</b>                | Number of routes configured for the network element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>brief detail</b> |
| <b>Invalid routes</b>        | Number of routes that are invalid because they lack one or more of the following: application and partition, Diameter instance, or destination realm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>brief detail</b> |
| <b>Activation delay</b>      | Period in milliseconds between peer activations by the network element.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>brief detail</b> |
| <b>First selection delay</b> | Period in milliseconds that the network element waited after connecting to the first peer to allow other peers to reach the open state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>brief detail</b> |
| <b>Postselection delay</b>   | Period in milliseconds that the network element waited after having two peers in the open state before deactivating all lower-priority peers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>brief detail</b> |

## Sample Output

### show diameter network-element

```
user@host> show diameter network-element
```

```
Diameter network-elements:

```
Primary      Secondary
```

| Name | Instance | State           | Peer | Peer |
|------|----------|-----------------|------|------|
| ne0  | master   | Fully-connected | p0   | p1   |

#### show diameter network-element detail

```
user@host> show diameter network-element detail
```

Diameter network-element:

NE name : ne0

Instance name : master

State : Fully-connected

Primary peer : p0

Secondary peer : p1

Peers : 5

Activated peers : 4

Open peers : 2

Routes : 1

Invalid routes : 0

Activation delay : 10000 ms

First selection delay : 0 ms

Post selection delay : 30000 ms

## show diameter network-element map

| <b>Remote end origin realm</b> | Name of the realm of the Diameter node that originates messages to the peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail</b>        |
| <b>Remote end origin host</b>  | Name of the host of the Diameter node that originates messages to the peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail</b>        |
| <b>Local address</b>           | Local IP address on the Diameter origin node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail</b>        |
| <b>Local port</b>              | Local port on the Diameter origin node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail</b>        |

Table 114: show diameter peer Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                  | Level of Output |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Local transport         | Number of transports configured.                                                                                                                                                                   | detail          |
| Time since last enable  | Period since peer was enabled in <i>hh:mm:ss</i> format.                                                                                                                                           | detail          |
| In state time           | Period that peer has been in present state in <i>hh:mm:ss</i> format.                                                                                                                              | detail          |
| Remaining in state time | Period that peer will remain in present state in <i>hh:mm:ss</i> format.                                                                                                                           | detail          |
| Missing wd events       | Number of missed watchdog events.                                                                                                                                                                  | detail          |
| Tx queue length         | Number of messages in the transmit queue.                                                                                                                                                          | detail          |
| Answer waiting count    | Number of answers on which the peer is waiting.                                                                                                                                                    | detail          |
| Time since last rx      | Number of milliseconds since the last message was received by the peer.                                                                                                                            | detail          |
| Time until wd timeout   | Time remaining until next watchdog event.                                                                                                                                                          | detail          |
| Operation timeout       | Watchdog timeout period.                                                                                                                                                                           | detail          |
| Suspended timeout base  | Base timeout period in suspended states (suspended, rejected, bad-remonte, bad-config). This timeout doubles after each consecutive suspension, until the maximum value of 600 seconds is reached. | detail          |
| Closed timeout          | Timeout period in normal closed state, such as when an external peer requested a disconnect.                                                                                                       | detail          |
| Connection timeout      | Timeout period for establishing a connection.                                                                                                                                                      | detail          |
| Waiting origin state id | Whether the peer is waiting for the Origin-State-Id AVP, <b>yes</b> or <b>no</b> .                                                                                                                 | detail          |

## Sample Output

### show diameter peer

```
user@host> show diameter peer
```

```
Diameter peer list:
```

| Peer | Instance | State         | NE-Count | Activated Count | Primary Count | Secondary Count |
|------|----------|---------------|----------|-----------------|---------------|-----------------|
| p0   | master   | I-Open        | 1        | 1               | 1             | 0               |
| p1   | master   | I-Open        | 1        | 1               | 0             | 1               |
| p288 | master   | Suspended     | 1        | 1               | 0             | 0               |
| pA   | master   | Suspended     | 1        | 1               | 0             | 0               |
| pB   | master   | No-Activation | 1        | 0               | 0             | 0               |

|    |        |               |   |   |   |   |
|----|--------|---------------|---|---|---|---|
| pc | master | No-Activation | 0 | 0 | 0 | 0 |
| pd | master | No-Activation | 0 | 0 | 0 | 0 |

### show diameter peer detail

| <b>Description</b>              | Display peer-to-network-element mapping information for all peers associated with Diameter instances or with the specified peer.                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output. The <b>summary</b> output is displayed by default and includes basic peer information. The <b>brief</b> output displays the summary information in a different format. The <b>detail</b> output adds information to the <b>brief</b> output.</p> <p><b>peer-name</b>—(Optional) Display mapping information for only the specified peer.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Output Fields</b>            | <a href="#">Table 115 on page 1669</a> lists the output fields for the <b>show diameter peer map</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                             |

**Table 115: show diameter peer map Output Fields**

| Field Name      | Field Description                                                             | Level of Output |
|-----------------|-------------------------------------------------------------------------------|-----------------|
| <b>Peer</b>     | Name of the peer.                                                             | All levels      |
| <b>Instance</b> | Name of the Diameter instance in which the network element is configured.     | All levels      |
| <b>NE</b>       | Name of the Diameter network element.                                         | All levels      |
| <b>Priority</b> | Priority configured for the peer. A lower number indicates a higher priority. | All levels      |

Table 115: show diameter peer map Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output     |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>State</b>         | State of the peer: <ul style="list-style-type: none"> <li>Activated—Peer has been activated (selected) by the network element.</li> <li>Not-Activated—Peer has not been selected by the network element.</li> <li>Primary—Peer that is connected to the network element and has the higher priority of the two connected peers.</li> <li>Secondary—Peer that is connected to the network element and has the lower priority of the two connected peers.</li> </ul> | All levels          |
| <b>Instance name</b> | Name of the Diameter instance in which the network element is configured.                                                                                                                                                                                                                                                                                                                                                                                          | <b>brief detail</b> |
| <b>NE name</b>       | Name of the Diameter network element.                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>brief detail</b> |
| <b>Usage</b>         | Role of the peer for the network element, <b>Primary</b> or <b>Secondary</b> .                                                                                                                                                                                                                                                                                                                                                                                     | <b>brief detail</b> |

## Sample Output

### show diameter peer map

```
user@host> show diameter peer map
```

```
Diameter peer usage by network elements:
```

| Peer | Instance | NE  | Priority | State         |
|------|----------|-----|----------|---------------|
| p0   | master   | ne0 | 20       | Primary       |
| p1   | master   | ne0 | 10       | Secondary     |
| p288 | master   | ne0 | 30       | Activated     |
| pA   | master   | ne0 | 15       | Activated     |
| pB   | master   | ne0 | 5        | Not-Activated |

### show diameter peer map detail

```
user@host> show diameter peer map detail
```

```
Diameter network-element peers:
```

```
Peer                : p0

Instance name       : master

NE name             : ne0

Priority             :      20
Usage               : Primary

Peer                : p1

Instance name       : master

NE name             : ne0

Priority             :      10
Usage               : Secondary

Peer                : p288
```

```
Instance name      : master
NE name            : ne0
Priority            :      30
Usage              : Activated
Peer               : pA
Instance name      : master
NE name            : ne0
Priority            :      15
Usage              : Activated
Peer               : pB
Instance name      : master
NE name            : ne0
Priority            :        5
Usage              : Not-Activated
```

## show diameter peer statistics

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Command introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Display statistics about all peers associated with Diameter instances or only the specified peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output. The <b>summary</b> output is displayed by default and includes basic function statistics. The <b>brief</b> output displays the summary information in a different format and adds numbers accumulated since the peer was connected. The <b>detail</b> output adds information to the <b>brief</b> output.</p> <p><b>peer-name</b>—(Optional) Display information for only the specified peer. When you specify a peer, the <b>brief</b> output is displayed by default, even when you explicitly specify <b>summary</b>.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Output Fields</b>            | Table 116 on page 1672 lists the output fields for the <b>show diameter peer statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 116: show diameter peer statistics Output Fields**

| Field Name | Field Description                                                         | Level of Output |
|------------|---------------------------------------------------------------------------|-----------------|
| Peer       | Name of the peer.                                                         | summary brief   |
| Instance   | Name of the Diameter instance in which the network element is configured. | summary brief   |
| Rx         | Total number of messages received.                                        | summary brief   |
| Rx-Peer    | Number of messages received by the peer.                                  | summary brief   |
| Rx-node    | Number of messages received by the Diameter node.                         | summary brief   |

Table 116: show diameter peer statistics Output Fields (*continued*)

| Field Name           | Field Description                                                         | Level of Output      |
|----------------------|---------------------------------------------------------------------------|----------------------|
| <b>Forw</b>          | Total number of forwarded messages.                                       | <b>summary brief</b> |
| <b>Tx-Peer</b>       | Number of messages transmitted by the peer.                               | <b>summary brief</b> |
| <b>Tx</b>            | Total number of transmitted messages.                                     | <b>summary brief</b> |
| <b>Peer name</b>     | Name of the peer.                                                         | <b>detail</b>        |
| <b>Instance name</b> | Name of the Diameter instance in which the network element is configured. | <b>detail</b>        |

## Sample Output

### show diameter peer statistics

```
user@host> show diameter peer statistics
```

```
Diameter peer statistics:
```

| Peer | Instance | Rx  | Rx-Peer | Rx-Node | Forw | Tx-Peer | Tx |
|------|----------|-----|---------|---------|------|---------|----|
| p0   | master   | 113 | 113     | 0       | 0    | 113     |    |
| 113  |          |     |         |         |      |         |    |
| p1   | master   | 110 | 110     | 0       | 0    | 110     |    |
| 110  |          |     |         |         |      |         |    |
| p288 | master   | 0   | 0       | 0       | 0    | 0       |    |
| 0    |          |     |         |         |      |         |    |
| pA   | master   | 0   | 0       | 0       | 0    | 0       |    |
| 0    |          |     |         |         |      |         |    |

| Field Name    | Field Description                                                   | Level of Output |
|---------------|---------------------------------------------------------------------|-----------------|
| Route         | Name of the route.                                                  | summary brief   |
| NE            | Name of the network element associated with the route.              | summary brief   |
| Instance      | Name of the Diameter instance in which the route is configured.     | summary brief   |
| NE name       | Name of the network element associated with the route.              | brief detail    |
| Instance name | Name of the Diameter instance in which the route is configured.     | brief detail    |
| Valid         | Determination whether the route is valid, <b>yes</b> or <b>no</b> . | All levels      |
| Up            | State of the route, <b>yes</b> (up) or <b>no</b> (down).            | All levels      |
| Function      | Name of the function associated with the route.                     | brief detail    |

Table 117: show diameter route Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                     | Level of Output     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Partition</b>  | Partition associated with the function.                                                                                                                                                                                                                                                                                                                               | <b>brief detail</b> |
| <b>Dest-realm</b> | Destination realm configured for the route.                                                                                                                                                                                                                                                                                                                           | <b>brief detail</b> |
| <b>Dest-host</b>  | Destination hostname configured for the route.                                                                                                                                                                                                                                                                                                                        | <b>brief detail</b> |
| <b>Metric</b>     | Metric associated with the destination and function to create the route.                                                                                                                                                                                                                                                                                              | <b>brief detail</b> |
| <b>Score</b>      | <p>Value that represents how a route is configured. The basic score is 0. Points are added according to the following scheme:</p> <ul style="list-style-type: none"> <li>• Function is specified—Add 3.</li> <li>• Function partition is specified—Add 1.</li> <li>• Destination realm is specified—Add 1.</li> <li>• Destination host is specified—Add 1.</li> </ul> | <b>brief detail</b> |

## Sample Output

### show diameter route

```
user@host> show diameter route
```

```
Diameter routes:
Route      NE          Instance   Valid Up
rA         ne0         master     yes  yes
```

### show diameter route detail

```
user@host> show diameter route detail
```

```
Diameter route:
Route name      : rA
NE name         : ne0
Instance name   : master
Valid           : yes
Up              : yes
Function        : jsrc
Partition       : jsrc-a
Dest-realm      : outer-realm
Dest-host       : outer-host
Metric          :      50
Score           :      6
```

## show dynamic-profile session

---

**Syntax**    show dynamic-profile session  
              <client-id *client-id*>  
              <profile-name *profile-name*>  
              <service-id *service-id*>

**Release Information**    Command introduced in Junos OS Release 13.3.

**Description**    Display dynamic profile (client or service) information for all subscribers or for subscribers specified by client ID or service session ID. You can filter the output by also specifying a dynamic profile.

### NOTE:

- The output does not display the variable stanzas defined in the dynamic profile configuration.
  - The variables in the profile configuration are replaced with subscriber specific values.
  - If the conditional variable in the dynamic profile is evaluated as NULL, the subscriber value for the variable is displayed as **NONE** in the command output.
  - The variable is also displayed as **NONE** when the variable (any variable and not necessarily conditional) in the dynamic profile has no value associated with it.
  - The format in which the configuration is displayed looks similar, but not exactly the same as the format of the **show configuration dynamic-profiles** command.
- 

**Options**    **client-id** *client-id*—Display dynamic profile information for subscribers associated with the specified client.

**profile-name** *profile-name*—(Optional) Display dynamic profile information for the specified subscriber or service profile.

**service-id** *service-id*—Display dynamic profile information for subscribers associated with the specified service session.

**Required Privilege Level**    view

**List of Sample Output**    [show dynamic-profile session client-id \(Client ID\) on page 1679](#)  
                                  [show dynamic-profile session client-id profile-name \(Client ID and Dynamic Profile\) on page 1681](#)  
                                  [show dynamic-profile session service-id \(Service Session\) on page 1681](#)

**Output Fields** This command displays the dynamic client or service profile configuration for each subscriber.

## Sample Output

### show dynamic-profile session client-id (Client ID)

```
user@host>show dynamic-profile session client-id 20

## show extensible-subscriber-services counters

<b>Syntax</b>	show extensible-subscriber-services counters
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display number of times various events were processed by Extensible Subscriber Services Manager.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear extensible-subscriber-services counters on page 1482</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 119 on page 1686</a> describes the output fields for the <b>show extensible-subscriber-services counters</b> command. Output fields are listed in the approximate order in which they appear.

**Table 119: show extensible-subscriber-services counters Output Fields**

Field Name	Field Description
Total Sessions	Number of extensible-subscriber-service control sessions that are currently in the system
Total Services	Number of extensible-subscriber-services that are currently in the system
Active Services	Number of extensible-subscriber-services that are currently in active state
Op-script execution	Total number of operational scripts executed: <ul style="list-style-type: none"> <li>Successful—Operational scripts that are executed without error</li> <li>Unsuccessful—Operational scripts that encountered errors</li> </ul>
Commit execution	Total number of commit scripts executed: <ul style="list-style-type: none"> <li>Successful—Commit scripts that are executed without error</li> <li>Unsuccessful—Commit scripts that encountered errors</li> </ul>
Application execution	Number of applications executed: <ul style="list-style-type: none"> <li>Successful—Applications that are executed without error</li> <li>Unsuccessful—Applications that encountered errors</li> </ul>
Service requests	Number of service requests received by the daemon. It has counters for total number of requests received, acknowledged (Acked), and negatively acknowledged (Nacked).

## Sample Output

```
# show extensible-subscriber-services counters
```

```
Total Sessions:      7
Total Services:      14
```

Active Services:	14
Op-script execution:	
Successful	30
Unsuccessful	0
Commit execution:	
Successful	4
Unsuccessful	0
Application execution:	
Successful	0
Unsuccessful	0
Service requests:	
Received	30
Aked	30
Nacked	0

## show extensible-subscriber-services debug-information

---

<b>Syntax</b>	show extensible-subscriber-services debug-information
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Write service session information to a file.
<b>Required Privilege Level</b>	view
<b>Output Fields</b>	<a href="#">Table 120 on page 1688</a> lists the output fields for the <b>show extensible-subscriber-services debug-information</b> command.

Table 120: show extensible-subscriber-services debug-information Output Fields

Field Name	Field Description
File Name	Name of the file that contains the service session information

---

### Sample Output

```
#show extensible-subscriber-services debug-information
File Name: /var/tmp/dump_session_record
```

## show extensible-subscriber-services dictionary

<b>Syntax</b>	show extensible-subscriber-services dictionary
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display contents of the dictionary including attributes and services.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">dictionary on page 1028</a></li> <li>• <a href="#">request services extensible-subscriber-services reload-dictionary on page 1511</a></li> <li>• <a href="#">show extensible-subscriber-services dictionary attributes on page 1693</a></li> <li>• <a href="#">show extensible-subscriber-services dictionary services on page 1696</a></li> <li>• <a href="#">Understanding the Dictionary File on page 222</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 121 on page 1689</a> lists the output fields for the <b>show extensible-subscriber-services dictionary</b> command. Output fields are listed in the approximate order in which they appear.

**Table 121: show extensible-subscriber-services dictionary Output Fields**

Field Name	Field Description
Acct-Session-Id	<p>Unique accounting identifier that makes it easy to match start and stop records in a log file. The identifier can be in one of the following formats:</p> <ul style="list-style-type: none"> <li>• <b>decimal</b>—For example, 435264</li> <li>• <b>description</b>—In the generic format, <b>jnpr interface-specifier:subscriber-session-id</b>; For example, <b>jnpr fastEthernet 3/2.6:1010101010101</b></li> </ul>
ERX-Service-Activate	Service to be activated for the subscriber.
Service-Type	Type of service the user has requested or the type of service to be provided.
ADSL-Agent-Remote-Id	Identifier for the subscriber on the digital subscriber line access multiplexer (DSLAM) interface that initiated the service request.
ERX-Med-Port-Number	UDP port in the mediation device to which mirrored traffic is forwarded
NAS-Port-Id	Text string that identifies the physical interface of the NAS that is authenticating the user.
ERX-Med-Dev-Handle	Identifier that associates mirrored traffic with a specific subscriber
ERX-Service-Deactivate	Service to be deactivated for the subscriber.
NAS-IP-Address	IP address of the network access server (NAS) that is requesting authentication of the user.

Table 121: show extensible-subscriber-services dictionary Output Fields (*continued*)

Field Name	Field Description
NAS-Identifier	Name of the NAS that originated the authentication or accounting request.
ERX-Service-Acct-Interval	Amount of time between accounting updates for the service type
ADSL-Agent-Circuit-Id	Identifier for subscriber's access node and the digital subscriber line (DSL) on the access node.
ERX-LI-Action	<p>Traffic mirroring action.</p> <p>For dynamic CoA, VSA 26-58 changes the action on the mirrored traffic identified by VSA 26-59.</p> <p>CoA-Request messages that include any of the RADIUS-based mirroring attributes (VSAs 26-58, 26-59, 26-60, or 26-61) must always include all four VSAs.</p> <p>If the CoA action is to stop mirroring (VSA 26-58 value is 0), then the values of the other three attributes in the CoA message must match the existing attribute values, or the action fails.</p>
ERX-Med-Ip-Address	IP address of content destination device to which mirrored traffic is forwarded.

### Sample Output

```
root@ce-bras-mx240-g> show extensible-subscriber-services dictionary
```

## show extensible-subscriber-services sessions

<b>Syntax</b>	<code>show extensible-subscriber-services sessions <i>accounting-session-id</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display session information. It displays a list of the services applied and their current state. Specify the accounting session ID to view information about a specific session. If an accounting session ID is not specified in the command, the command displays details of all the sessions.
<b>Options</b>	<i>accounting-session-id</i> —Identifier of the session you want information about.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear extensible-subscriber-services sessions on page 1483</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 124 on page 1699</a> describes the output fields for the <b>show extensible-subscriber-services sessions</b> command. Output fields are listed in the approximate order in which they appear.

**Table 124: show extensible-subscriber-services sessions Output Fields**

Field Name	Field Description
Session ID	Session ID. Accounting session ID must be enclosed in quotation marks.
Timestamp	Time when the session was started
Service Name	Name of the service
Commit State	Commit state: <b>Init</b> , <b>Queued</b> , or <b>Success</b> .
Service ID	Service ID

## Sample Output

```
#show extensible-subscriber-services sessions
Session ID: jnpr demux0.1073762028:46422
  Timestamp: Fri Mar  8 04:58:27 2013
  Service Name: ngcoco

## show extensible-subscriber-services service

<b>Syntax</b>	show extensible-subscriber-services service
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display service information. It displays the service name specified in the dictionary, scripts used for provisioning and deprovisioning, and the number of services. A service can have more than one version. Each version is grouped using an action set. The number of action sets is equal to the number of versions for the service. Number of services in all the versions is displayed in <b>Total Services</b> .
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding the Dictionary File on page 222</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 125 on page 1701</a> lists the output fields for the <b>show extensible-subscriber-services service</b> command. Output fields are listed in the approximate order in which they appear.

**Table 125: show extensible-subscriber-services service Output Fields**

Field Name	Field Description
Service Name	Name of the service
Action	Name and number of services provisioned or deprovisioned.
Total Services	Total number of services provisioned or deprovisioned.

## Sample Output

```
#show extensible-subscriber-services services
Service Name: ngcoco
  Action:
    Provision:      iceaaa_ngcoco_add_1
    Deprovision:    iceaaa_del_1
    Services:       1301

    Total Services:      1301

Service Name: dhcprelay
  Action:
    Provision:      iceaaa_dhcprelay_add_1
    Deprovision:    iceaaa_del_1
    Services:       1301

    Total Services:      1301
```

## show ipv6 router-advertisement

<b>Syntax</b>	<pre>show ipv6 router-advertisement &lt;conflicts&gt; &lt;interface <i>interface</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;prefix <i>prefix/prefix length</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.2 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers.
<b>Options</b>	<p><b>none</b>—Display all IPv6 router advertisement information for all interfaces.</p> <p><b>conflicts</b>—(Optional) Display only the IPv6 router advertisement information that is conflicting.</p> <p><b>interface <i>interface</i></b>—(Optional) Display IPv6 router advertisement information for the specified interface.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>prefix <i>prefix/prefix length</i></b>—(Optional) Display IPv6 router advertisement information for the specified prefix.</p>
<b>Additional Information</b>	The display identifies conflicting information by enclosing the value the router is advertising in brackets.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear ipv6 router-advertisement on page 1484</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show ipv6 router-advertisement on page 1703</a></p> <p><a href="#">show ipv6 router-advertisement conflicts on page 1704</a></p> <p><a href="#">show ipv6 router-advertisement prefix on page 1704</a></p>
<b>Output Fields</b>	<a href="#">Table 126 on page 1702</a> describes the output fields for the <b>show ipv6 router-advertisement</b> command. Output fields are listed in the approximate order in which they appear.

Table 126: show ipv6 router-advertisement Output Fields

Field Name	Field Description
Interface	Name of the interface.

Table 126: show ipv6 router-advertisement Output Fields (*continued*)

Field Name	Field Description
Advertisements sent	Number of router advertisements sent and the elapsed time since they were sent.
Solicits received	Number of solicitation messages received.
Advertisements received	Number of router advertisements received.
Advertisements from	Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received.
Managed	Managed address configuration flag: 0 (stateless) or 1 (stateful).
Other configuration	Other stateful configuration flag: 0 (stateless) or 1 (stateful).
Reachable time	Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.
Default lifetime	Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router.
Retransmit timer	Time between retransmitted Neighbor Solicitation messages, in milliseconds.
Current hop limit	Configured current hop limit.
Prefix	Name and length of the prefix.
Valid lifetime	How long the prefix remains valid for onlink determination.
Preferred lifetime	How long the prefix generated by stateless autoconfiguration remains preferred.
On link	Onlink flag: 0 (not onlink) or 1 (onlink).
Autonomous	Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous).

## Sample Output

### show ipv6 router-advertisement

```

user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 0
Interface: fxp0.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 1
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
  Managed: 0

```

```
Other configuration: 0 [1]
Reachable time: 0 ms
Default lifetime: 1800 sec
Retransmit timer: 0 ms
Current hop limit: 64
```

#### show ipv6 router-advertisement conflicts

```
user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
Other configuration: 0 [1]
```

#### show ipv6 router-advertisement prefix

```
user@host> show ipv6 router-advertisement prefix 2001:db8:8040::/16
Interface: fe-0/1/3.0
Advertisements sent: 3, last sent 00:04:11 ago
Solicits received: 0
Advertisements received: 3
Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
Managed: 0
Other configuration: 0
Reachable time: 0 ms
Default lifetime: 180 sec [1800 sec]
Retransmit timer: 0 ms
Current hop limit: 64
Prefix: 2001:db8:8040:1::/64
Valid lifetime: 2592000 sec
Preferred lifetime: 604800 sec
On link: 1
Autonomous: 1
```

## show network-access aaa accounting

<b>Syntax</b>	<b>show network-access aaa accounting</b>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3.
<b>Description</b>	Display the state of the RADIUS Acct-On response sent from the RADIUS server.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">RADIUS Acct-On and Acct-Off Messages on page 103</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa accounting on page 1705</a>
<b>Output Fields</b>	<a href="#">Table 99 on page 1602</a> lists the output fields for the <b>show network-access aaa accounting</b> command. Output fields are listed in the approximate order in which they appear.

**Table 127: show network-access aaa accounting Output Fields**

Field Name	Field Description
<b>Profile</b>	Name of the profile associated with the RADIUS server. A RADIUS server can be associated with more than one profile.
<b>Logical System</b>	Logical system associated with the access profile.
<b>Routing Instance</b>	Routing instance associated with the access profile.
<b>Acct-On-Response</b>	Status of the RADIUS Acct-On response. <ul style="list-style-type: none"> <li>ACK—ACK response for the Acct-On message is received from the RADIUS server.</li> <li>ERROR—An error condition has occurred.</li> <li>NONE— No Acct-On message is sent.</li> <li>PENDING—Acct-On message is sent to RADIUS server, but no response has been received yet.</li> </ul>

## Sample Output

### show network-access aaa accounting

```

user@host> show network-access aaa accounting
Profile      Logical System  Routing Instance  Acct-On-Response
ppp-profile  default        default          ACK
l2tp-profile default        l2tp_RI          PENDING

```

## show network-access aaa radius-servers

<b>Syntax</b>	<b>show network-access aaa radius-servers</b> <b>&lt;detail&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 12.1.
<b>Description</b>	Display RADIUS server status and information.
<b>Options</b>	<b>detail</b> —(Optional) Display detailed level of information.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying and Managing Subscriber AAA Information on page 223</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa radius-servers on page 1710</a> <a href="#">show network-access aaa radius-servers on page 1711</a> <a href="#">show network-access aaa radius-servers detail on page 1711</a>
<b>Output Fields</b>	Table 128 on page 1706 lists the output fields for the <b>show network-access aaa radius-servers</b> command. Output fields are listed in the approximate order in which they appear.

**Table 128: show network-access aaa radius-servers Output Fields**

Field Name	Field Description	Level of Output
<b>Profile</b>	Name of the profile associated with the RADIUS server. A RADIUS server can be associated with more than one profile.	All levels
<b>Server address</b>	IPv4 or IPv6 address of the RADIUS server.	All levels
<b>Authentication port</b>	RADIUS server authentication port number.	All levels
<b>Preauthentication port</b>	RADIUS server preauthentication port number.	All levels
<b>Accounting port</b>	RADIUS server accounting port number.	All levels
<b>Accounting retry</b>	Number of times the router retransmits RADIUS accounting messages when no response is received from the server.	Detail
<b>Accounting timeout</b>	Period the local router waits to receive a response from a RADIUS accounting server before retransmitting the message.	Detail

**Table 128: show network-access aaa radius-servers Output Fields (continued)**

Field Name	Field Description	Level of Output
Status	<p>RADIUS server status, <b>UP</b> (Alive), <b>UNREACHABLE</b>, or <b>DOWN</b> (DEAD).</p> <p>If status is <b>DOWN</b>, the Status field includes the number of seconds configured by the <b>revert-interval</b> statement. The router does not send requests to servers in the <b>DOWN</b> state, but does send requests to servers with a status of either <b>UP</b> or <b>UNREACHABLE</b>.</p> <p><b>NOTE:</b></p> <p>After requests to a server or set of servers time out after 10 seconds, the status of the servers changes. The following guidelines apply to server status:</p> <ul style="list-style-type: none"> <li>For the purpose of marking a server as <b>Down</b> (DEAD), the request includes the original request and any retries that are configured. The 10-second timeout period starts after the initial request and all retries have expired without receiving a response from the server.</li> </ul> <p>The amount of the timeout period that elapses before the server is marked <b>Down</b> is not always exactly 10 seconds, and can vary depending on how frequently subscribers are logging in. When subscribers are continually and rapidly logging in, the server is marked as <b>Down</b> at 10 seconds. However, if subscribers are logging in less frequently and at a slower pace, then the server is not marked <b>Down</b> until a subsequent subscriber attempts to log in. For example, if the subsequent subscriber logs in a minute after the request and all retries lapse, and the 10-second timeout starts, the actual time until the server is marked <b>Down</b> is 50 seconds after the timeout starts (the one minute between subscriber login minus the 10-second timeout).</p> <ul style="list-style-type: none"> <li>All servers cannot be marked as <b>DOWN</b>; instead, the unresponsive servers are marked as <b>UNREACHABLE</b>.</li> </ul> <p>For example, if only one RADIUS server is configured and that server is unresponsive, the server status is marked as <b>UNREACHABLE</b> rather than <b>DOWN</b>.</p> <ul style="list-style-type: none"> <li>If at least one server has a status of <b>UP</b>, the status of all unresponsive servers is set to <b>DOWN</b> for the remainder of the configured revert-interval setting.</li> <li>If no server has a status of <b>UP</b>, then the status of the unresponsive servers is set to <b>UNREACHABLE</b> for the remainder of the revert-interval setting or for 30 seconds, whichever is less.</li> <li>The status of unresponsive servers is returned to <b>UP</b> from <b>DOWN</b> or <b>UNREACHABLE</b> at the end of the revert-interval setting (or the 30-second interval).</li> <li>If no requests are sent to a server, the server's status is always <b>UP</b>.</li> </ul>	All levels

Table 128: show network-access aaa radius-servers Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>RADIUS servers</b>	Details for specific RADIUS server, identified by IP address.	Detail
<b>Authentication requests</b>	Number of authentication requests received by the authentication server.	Detail
<b>Authentication rollover requests</b>	Number of requests coming into the server as a result of the previous server timing out.	Detail
<b>Authentication retransmissions</b>	Number of retransmissions.	Detail
<b>Accepts</b>	Number of authentication requests accepted by the authentication server.	Detail
<b>Rejects</b>	Number of authentication requests rejected by the authentication server.	Detail
<b>Challenges</b>	Number of authentication requests challenged by the authentication server.	Detail
<b>Authentication malformed responses</b>	Number of responses with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).	Detail
<b>Authentication bad authenticators</b>	Number of responses in which the authenticator is incorrect for the authentication request. This can occur if the RADIUS secrets for the client and server do not match.	Detail
<b>Authentication requests pending</b>	Number of authentication requests waiting for a response.	Detail
<b>Authentication request timeouts</b>	Number of times an authentication request to the server timed out.	Detail
<b>Authentication unknown responses</b>	Number of unknown responses. The RADIUS response type in the header is invalid or unsupported.	Detail
<b>Authentication packets dropped</b>	Number of packets dropped because they are too short or because the router receives a response for which there is no corresponding request.	Detail
<b>Preauthentication requests</b>	Number of preauthentication requests received by the preauthentication server.	Detail
<b>Preauthentication rollover requests</b>	Number of preauthentication requests coming into the server as a result of the previous server timing out.	Detail

**Table 128: show network-access aaa radius-servers Output Fields (continued)**

Field Name	Field Description	Level of Output
<b>Preauthentication retransmissions</b>	Number of retransmissions of preauthentication requests.	Detail
<b>Preauthentication Accepts</b>	Number of preauthentication requests accepted by the preauthentication server.	Detail
<b>Preauthentication Rejects</b>	Number of preauthentication requests rejected by the preauthentication server.	Detail
<b>Preauthentication Challenges</b>	Number of preauthentication requests challenged by the preauthentication server.	Detail
<b>Preauthentication malformed responses</b>	Number of responses to preauthentication requests with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).	Detail
<b>Preauthentication bad authenticators</b>	Number of responses in which the authenticator is incorrect for the preauthentication request. This can occur if the RADIUS secrets for the client and server do not match.	Detail
<b>Preauthentication requests pending</b>	Number of preauthentication requests waiting for a response.	Detail
<b>Preauthentication request timeouts</b>	Number of times a preauthentication request to the server timed out.	Detail
<b>Preauthentication unknown responses</b>	Number of unknown responses during the preauthentication phase. The RADIUS response type in the header is invalid or unsupported.	Detail
<b>Preauthentication packets dropped</b>	Number of preauthentication packets dropped because they are too short or because the router receives a response for which there is no corresponding request.	Detail
<b>Accounting start requests</b>	Number of accounting start requests received.	Detail
<b>Accounting interim requests</b>	Number of accounting interim requests received.	Detail
<b>Accounting stop requests</b>	Number of accounting stop requests received.	Detail
<b>Accounting rollover requests</b>	Number of requests coming into the server as a result of the previous server timing out.	Detail

Table 128: show network-access aaa radius-servers Output Fields (*continued*)

Field Name	Field Description	Level of Output
Accounting retransmissions	Number of retransmissions.	Detail
Accounting start responses	Number of accounting start responses sent by the server.	Detail
Accounting interim responses	Number of accounting interim responses sent by the server.	Detail
Accounting stop responses	Number of accounting stop responses sent by the server.	Detail
Accounting malformed responses	Number of responses with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).	Detail
Accounting bad authenticators	Number of responses in which the authenticator is incorrect for the accounting request. This can occur if the RADIUS secrets for the client and server do not match.	Detail
Accounting requests pending	Number of accounting requests waiting for a response.	Detail
Accounting request timeouts	Number of accounting requests to the accounting server that timed out.	Detail
Accounting unknown responses	Number of unknown responses. The RADIUS response type in the header is invalid or unsupported.	Detail
Accounting packets dropped	Number of packets dropped because they are too short or because the router receives a response for which there is no corresponding request.	Detail

## Sample Output

### show network-access aaa radius-servers

```

user@host> show network-access aaa radius-servers

<b>Output Fields</b>	<p><a href="#">Table 129 on page 1714</a> lists the output fields for the <b>show network-access aaa statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 129: show network-access aaa statistics Output Fields

Field Name	Field Description	Level of Output
<b>Requests received</b>	<ul style="list-style-type: none"> <li>Number of accounting requests generated by the AAA framework.</li> <li>Number of dynamic requests received from the external server.</li> </ul> <p>Does not include requests sent from backup accounting.</p>	All levels
<b>Accounting request failures</b>	<p>Number of accounting requests that failed to be sent or queued from a client to a RADIUS accounting server.</p> <p>Does not include requests sent from backup accounting.</p>	detail
<b>Accounting request success</b>	<p>Number of accounting requests successfully sent or queued from a client to a RADIUS accounting server.</p> <p>Does not include requests sent from backup accounting.</p>	detail
<b>Account on requests</b>	<p>Number of accounting on requests sent from a client to a RADIUS accounting server.</p>	detail
<b>Accounting start requests</b>	<p>Number of accounting start requests sent from a client to a RADIUS accounting server.</p>	detail
<b>Accounting interim requests</b>	<p>Number of accounting interim requests sent from a client to a RADIUS accounting server.</p>	detail
<b>Accounting stop requests</b>	<p>Number of accounting stop requests sent from a client to a RADIUS accounting server.</p> <p>Does not include requests sent from backup accounting.</p>	detail
<b>Accounting request timeouts</b>	<p>Number of accounting requests to the accounting server that timed out. This field was named <b>Timed out requests</b> in releases before Junos OS Release 16.1.</p> <p>Does not include requests sent from backup accounting.</p>	All levels
<b>Accounting Response failures</b>	<p>Number of accounting requests not acknowledged (NAK) by the accounting server.</p> <p>Does not include requests sent from backup accounting.</p>	All levels

Table 129: show network-access aaa statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Accounting response success</b>	Number of accounting requests acknowledged by the accounting server.  Does not include requests sent from backup accounting.	All levels
<b>Account on responses</b>	Number of accounting on requests acknowledged by the RADIUS accounting server.	<b>detail</b>
<b>Accounting start responses</b>	Number of accounting start requests acknowledged by the RADIUS accounting server.	<b>detail</b>
<b>Accounting interim responses</b>	Number of accounting interim requests acknowledged by the RADIUS accounting server.	<b>detail</b>
<b>Accounting stop responses</b>	Number of accounting stop requests acknowledged by the RADIUS accounting server.  Does not include requests sent from backup accounting.	<b>detail</b>
<b>Accounting rollover requests</b>	Number of accounting requests coming to a RADIUS accounting server after a previous server timing out.	<b>detail</b>
<b>Accounting unknown requests</b>	Number of unknown accounting requests sent from a client to a RADIUS accounting server (for example, when the header has invalid or unsupported information).	<b>detail</b>
<b>Accounting radius pending requests</b>	Number of accounting requests sent from a client to a RADIUS accounting server that are waiting for a response from the server.	<b>detail</b>
<b>Accounting malformed responses</b>	Number of accounting responses from a RADIUS accounting server that have invalid or unexpected attributes.	<b>detail</b>
<b>Accounting retransmissions</b>	Number of accounting requests made by a client to the RADIUS sever that were retransmitted.  Does not include requests sent from backup accounting.	<b>detail</b>
<b>Accounting bad authenticators</b>	Number of accounting responses from a RADIUS accounting server that have an incorrect authenticator (for example, the client and server RADIUS secret do not match).	<b>detail</b>

Table 129: show network-access aaa statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Accounting packets dropped</b>	Number of accounting responses from a RADIUS accounting server that are dropped by a client.	<b>detail</b>
<b>Accounting backup record creation requests</b>	Number of accounting stop requests from a client to a RADIUS accounting server that were forwarded to be backed up.	<b>detail</b>
<b>Accounting backup replay request success</b>	Number of backup accounting stop requests successfully created by clients after each timeout for replay to a RADIUS accounting server.	<b>detail</b>
<b>Accounting backup request failures</b>	Number of backup accounting requests that failed to be sent or queued from a client to a RADIUS accounting server.	<b>detail</b>
<b>Accounting backup request success</b>	Number of backup accounting requests successfully sent or queued from a client to a RADIUS accounting server.	<b>detail</b>
<b>Accounting backup timeouts</b>	Number of backup accounting requests that timed out after being sent to a RADIUS accounting server.	<b>detail</b>
<b>Accounting backup in-flight requests</b>	<p>Number of backup accounting requests that were successfully sent or queued to a RADIUS accounting server for which no response or error has been received yet.</p> <p>Backup requests are replayed only in the following circumstances:</p> <ul style="list-style-type: none"> <li>When the request being replayed receives a positive response, the next request can be replayed.</li> <li>When the request being replayed receives a timeout response, it can be replayed again.</li> </ul> <p>Consequently this intermediate timer displays 1 or 0. The value eventually drops to 0 as requests are responded to positively or fail due to error.</p>	<b>detail</b>
<b>Accounting backup responses success</b>	Number of backup records that were successfully acknowledged with a positive response from a RADIUS accounting server.	<b>detail</b>

Table 129: show network-access aaa statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Accounting backup radius requests</b>	<p>Number of backup requests sent to UDP level.</p> <p>This is a RADIUS-level counter and increments rapidly based on the configured retries and timeouts and the RADIUS-level retransmissions. An observation that the value is increasing is more significant than the exact value of the counter.</p>	<b>detail</b>
<b>Accounting backup radius responses</b>	<p>Number of responses received at the UDP level for backup requests.</p> <p>This is a RADIUS-level counter and increments rapidly based on the configured retries and timeouts and the RADIUS-level retransmissions. Observation that the value is increasing is more significant than the exact value of the counter.</p>	<b>detail</b>
<b>Accounting backup radius timeouts</b>	<p>Number of backup requests that timed out after being sent to UDP.</p> <p>This is a RADIUS-level counter and increments rapidly based on the configured retries and timeouts and the RADIUS-level retransmissions. Observation that the value is increasing is more significant than the exact value of the counter.</p>	<b>detail</b>
<b>Accounting backup radius pending requests</b>	<p>Number of backup requests sent to a RADIUS accounting server that are waiting for a response from the server.</p> <p>This is an intermediate state counter that eventually drops to zero as requests are responded to or failed due to error.</p>	<b>detail</b>
<b>Accounting backup radius retransmissions</b>	<p>Sum of backup request retransmissions for each RADIUS accounting server.</p> <p>This is a RADIUS-level counter and increments rapidly based on the configured retries and timeouts and the RADIUS-level retransmissions. Observation that the value is increasing is more significant than the exact value of the counter.</p>	<b>detail</b>
<b>Accounting backup malformed responses</b>	<p>Sum of malformed responses received for backup requests sent to each RADIUS accounting server at the UDP level.</p>	<b>detail</b>
<b>Accounting backup bad authenticators</b>	<p>Sum of responses received for backup accounting requests for each RADIUS accounting server where authenticators were mismatched.</p>	<b>detail</b>

Table 129: show network-access aaa statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Accounting backup responses dropped</b>	Sum of responses for backup accounting requests for each RADIUS accounting server that were dropped due to various sanity checks.	<b>detail</b>
<b>Accounting backup rollover requests</b>	Sum of backup accounting requests rolled over for each RADIUS accounting server.	<b>detail</b>
<b>Accounting backup unknown responses</b>	Sum of unknown responses for backup accounting requests for each RADIUS accounting server.	<b>detail</b>
<b>Client</b>	Client type; for example, DHCP, Mobile IP, PPP.	none specified
<b>Out of Memory</b>	Number of times an address was not given to the client due to memory issues.	none specified
<b>No Matches</b>	Number of times there were no network matches for the pool.	none specified
<b>Pool Name</b>	Name of the address-assignment pool for this client.	none specified
<b>Out of Addresses</b>	Number of times there were no available addresses in the pool.	none specified
<b>Address total</b>	Number of addresses in the pool.	none specified
<b>Addresses in use</b>	Number of addresses in use.	none specified
<b>Address Usage (percent)</b>	Percentage of total addresses in use.	none specified
<b>Pool Usage</b>	Percentage of allocated addresses in the specified address pool.	none specified
<b>processed successfully</b>	Number of dynamic requests processed successfully by the AAA framework.	All levels
<b>errors during processing</b>	Number of dynamic requests that resulted in processing errors by the AAA framework.	All levels
<b>Link Name</b>	Name of the secondary address-assignment pool to which the primary pool is linked.	

Table 129: show network-access aaa statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>silently dropped</b>	Number of dynamic requests dropped by the AAA framework due to multiple back-to-back or duplicate requests.	All levels
<b>RADIUS Server</b>	IPv4 or IPv6 address of the RADIUS server to which the router is sending requests.	All levels
<b>Profile</b>	Name of the RADIUS profile associated with the RADIUS server. A RADIUS server can be associated with more than one RADIUS profile.	All levels
<b>Configured</b>	Configured maximum number of outstanding requests from the router to the RADIUS server for a specific profile. An outstanding request is a request to which the RADIUS server has not yet responded. The range of values is 0 through 2000 outstanding requests. The default value is 1000.	All levels
<b>Current</b>	Current number of outstanding requests from the router to the RADIUS server for a specific profile. An outstanding request is a request to which the RADIUS server has not yet responded.	All levels
<b>Peak</b>	Highest number of outstanding requests from the router to the RADIUS server for a specific profile at any point in time since the router was started or since the counter was last cleared.  <b>NOTE:</b> If the value of this field is equal to the value of the <b>Configured</b> field, you may want to increase the value of the <b>Configured</b> field.	All levels
<b>Exceeded</b>	Number of times that the router attempted to send requests to the RADIUS server in excess of the configured maximum value for a specific profile.  <b>NOTE:</b> If the value of this field is nonzero, you may want to increase the value of the <b>Configured</b> field.	All levels

## Sample Output

### show network-access aaa statistics accounting

```

user@host> show network-access aaa statistics accounting
Accounting module statistics
Accounting module statistics
Requests received: 5000
Accounting request timeouts: 2000
Accounting response failures: 0
Accounting response success: 3000

```

### show network-access aaa statistics accounting detail

```
user@host> show network-access aaa statistics accounting detail
Accounting module statistics
Accounting module statistics
  Requests received: 5000
  Accounting request failures: 0
  Accounting request success: 5000
    Account on requests: 0
    Accounting start requests: 3000
    Accounting interim requests: 0
    Accounting stop requests: 2000
  Accounting request timeouts: 2000

## show network-access aaa statistics authentication

<b>Syntax</b>	<b>show network-access aaa statistics authentication</b> <b>&lt;detail&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1. Option <b>detail</b> introduced in Junos OS Release 12.1.
<b>Description</b>	Display AAA authentication statistics.
<b>Options</b>	<b>detail</b> —(Optional) Displays detailed information about authentication.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying and Managing Subscriber AAA Information on page 223</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa statistics authentication on page 1724</a> <a href="#">show network-access aaa statistics authentication detail on page 1724</a>
<b>Output Fields</b>	Table 130 on page 1722 lists the output fields for the <b>show network-access aaa statistics authentication</b> command. Output fields are listed in the approximate order in which they appear.

Table 130: show network-access aaa statistics authentication Output Fields

Field Name	Field Description	Level of Output
Requests received	Number of authentication requests received from clients.	All levels
Accepts	Number of authentication requests accepted by the authentication server.	All levels
Rejects	Number of authentication requests rejected by the authentication server.	All levels
Challenges	Number of authentication requests challenged by the authentication server.	All levels
Timed out requests	Number of authentication requests that timed out.	All levels
RADIUS authentication failures	Number of RADIUS authentication requests that have failed.	Detail
Queue request deleted	Number of queue requests that have been deleted.	Detail
Malformed reply	Number of malformed replies received from the RADIUS authentication server.	Detail

**Table 130: show network-access aaa statistics authentication Output Fields (*continued*)**

Field Name	Field Description	Level of Output
<b>No server configured</b>	Number of authentication requests that failed because no authentication server is configured.	Detail
<b>Access Profile configuration not found</b>	Number of authentication requests that failed because no access profile is configured.	Detail
<b>Unable to create client record</b>	Number of times that the router is unable to create the client record for the authentication request.	Detail
<b>Unable to create client request</b>	Number of times that the router is unable to create the client request for the authentication request.	Detail
<b>Unable to build authentication request</b>	Number of times that the router is unable to build the authentication request.	Detail
<b>No server found</b>	Number of requests to the authentication server that have timed out; the server is then considered to be down.	Detail
<b>Unable to create handle</b>	Number of authentication requests that have failed because of an internal allocation failure.	Detail
<b>Unable to queue request</b>	Number of times the router was unable to queue the request to the authentication server.	Detail
<b>Invalid credentials</b>	Number of times the router did not have proper authorization to access the authentication server.	Detail
<b>Malformed request</b>	Number of times the router request to the authentication server is malformed.	Detail
<b>License unavailable</b>	Number of times the router did not have a license to access the authentication server.	Detail
<b>Redirect requested</b>	Number of authentication requests that have been redirected based on routing instance.	Detail
<b>Internal failure</b>	Number of internal failures.	Detail
<b>Local authentication failures</b>	Number of times local authentication failed.	Detail
<b>LDAP lookup failures</b>	Number of times the LDAP lookup operation failed.	Detail

## Sample Output

### show network-access aaa statistics authentication

```
user@host> show network-access aaa statistics authentication
Authentication module statistics
  Requests received: 2118
    Accepts: 261
    Rejects: 975
  Challenges: 0
  Timed out requests: 882
```

### show network-access aaa statistics authentication detail

```
user@host> show network-access aaa statistics authentication detail
Authentication module statistics
  Requests received: 2118
    Accepts: 261
    Rejects: 975
      RADIUS authentication failures: 975
        Queue request deleted: 0
        Malformed reply: 0
        No server configured: 0
        Access Profile configuration not found: 0
        Unable to create client record: 0
        Unable to create client request: 0
        Unable to build authentication request: 0
        No server found: 975
        Unable to create handle: 0
        Unable to queue request: 0
        Invalid credentials: 0
        Malformed request: 0
        License unavailable: 0
        Redirect requested: 0
        Internal failure: 0
      Local authentication failures: 0
      LDAP lookup failures: 0
  Challenges: 0
  Timed out requests: 882
```

## show network-access aaa statistics pending-accounting-stops

---

<b>Syntax</b>	show network-access aaa statistics pending-accounting-stops
<b>Release Information</b>	Command introduced in Junos OS Release 13.1.
<b>Description</b>	Display the number of pending accounting stop requests.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request network-access aaa replay pending-accounting-stops on page 1312</a></li><li>• <a href="#">show accounting pending-accounting-stops on page 1523</a></li></ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa statistics pending-accounting-stops on page 1725</a>
<b>Output Fields</b>	<a href="#">Table 131 on page 1725</a> lists the output field for the <b>show network-access aaa statistics pending-accounting-stops</b> command.

**Table 131: show network-access aaa statistics pending-accounting-stops Output Fields**

Field Name	Field Description
Pending accounting stops	Total number of accounting stop messages queued.

---

### Sample Output

#### show network-access aaa statistics pending-accounting-stops

```
user@host> show network-access aaa statistics pending-accounting-stops
Pending accounting stops: 10,000
```

## show network-access aaa statistics preauthentication

<b>Syntax</b>	<b>show network-access aaa statistics preauthentication</b>
<b>Release Information</b>	Command introduced in Junos OS Release 13.3.
<b>Description</b>	Display AAA preauthentication statistics.
<b>Options</b>	<b>detail</b> —(Optional) Displays detailed information about authentication.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RADIUS Logical Line Identifier (LLID) Overview on page 147</a></li> <li>• <a href="#">Configuring Logical Line Identification (LLID) Preauthentication on page 150</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa statistics preauthentication on page 1726</a>
<b>Output Fields</b>	<a href="#">Table 132 on page 1726</a> lists the output fields for the <b>show network-access aaa statistics preauthentication</b> command. Output fields are listed in the approximate order in which they appear.

**Table 132: show network-access aaa statistics preauthentication Output Fields**

Field Name	Field Description	Level of Output
<b>Requests received</b>	Number of preauthentication requests received from clients.	All levels
<b>Multistack requests</b>	Number of preauthentication requests for dual-stack subscribers.	All levels
<b>Accepts</b>	Number of preauthentication requests accepted by the preauthentication server.	All levels
<b>Rejects</b>	Number of preauthentication requests rejected by the preauthentication server.	All levels
<b>Challenges</b>	Number of preauthentication requests challenged by the preauthentication server.	All levels
<b>Timed out requests</b>	Number of preauthentication requests that timed out.	All levels

## Sample Output

### show network-access aaa statistics preauthentication

```

user@host> show network-access aaa statistics preauthentication
Preauthentication module statistics
Requests received: 2118

```

Multistack requests: 0  
Accepts: 261  
Rejects: 975  
Challenges: 0  
Timed out requests: 882

## show network-access aaa subscribers

<b>Syntax</b>	<b>show network-access aaa subscribers</b> <b>&lt;logical-system <i>logical-system-name</i>&gt;</b> <b>&lt;routing-instance <i>routing-instance-name</i>&gt;</b> <b>&lt;statistics&gt;</b> <b>&lt;username&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1.
<b>Description</b>	Display subscriber-specific AAA statistics.
<b>Options</b>	<p><b>logical-system <i>logical-system-name</i></b>—(Optional) List subscribers in the specific logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) List subscribers for the specific routing instance. If you do not specify a routing instance name, the default routing instance is assumed.</p> <p><b>statistics</b>—(Optional) Display statistics for the subscriber events.</p> <p><b>username</b>—(Optional) Display information for the specified subscriber.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying and Managing Subscriber AAA Information on page 223</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa subscribers logical-system on page 1729</a> <a href="#">show network-access aaa subscribers logical-system routing-instance on page 1729</a> <a href="#">show network-access aaa subscribers statistics username on page 1730</a> <a href="#">show network-access aaa subscribers username on page 1730</a>
<b>Output Fields</b>	<a href="#">Table 133 on page 1728</a> lists the output fields for the <b>show network-access aaa subscribers</b> command. Output fields are listed in the approximate order in which they appear.

**Table 133: show network-access aaa subscribers Output Fields**

Field Name	Field Description
Challenge requests	Number of authentication requests challenged by the authentication server for this subscriber.
Challenge responses	Number of challenge responses sent by the subscriber to the authentication server.
START sent successfully	Number of accounting start requests generated by the AAA framework for this subscriber.
START send failures	Number of accounting start requests that failed to make it to the accounting server for this subscriber.
START ack received	Number of accounting start requests acknowledged by the accounting server for this subscriber.

Table 133: show network-access aaa subscribers Output Fields (*continued*)

Field Name	Field Description
<b>INTERIM sent successfully</b>	Number of accounting interim requests generated by the AAA framework for this subscriber.
<b>INTERIM send failures</b>	Number of accounting interim requests that failed to make it to the accounting server for this subscriber.
<b>INTERIM ack received</b>	Number of accounting interim requests acknowledged by the accounting server for this subscriber.
<b>Requests received</b>	Number of reauthentication requests received by the authentication server.
<b>Successful responses</b>	Number of successful reauthentication requests granted by the authentication server.
<b>Aborts handled</b>	Number of reauthentication requests aborted by the authentication server.
<b>Service name</b>	Name of the subscriber service.
<b>Creation requests</b>	Number of requests to create the service.
<b>Deletion requests</b>	Number of requests to delete the service.
<b>Request timeouts</b>	Number of times the service request was timed out.
<b>Client type</b>	Type of client; for example, DHCP, Mobile IP, PPP.
<b>Session-ID</b>	ID of the subscriber session.
<b>Session uptime</b>	How long the session has been up, in <i>HH:MM:SS</i> .
<b>Accounting</b>	Status of accounting, and type of accounting if accounting is on.

## Sample Output

### show network-access aaa subscribers logical-system

```

user@host> show network-access aaa subscribers logical-system
Username           Client type      Logical system/Routing instance

**Table 134: show network-access aaa subscribers session-id Output Fields**

Field Name	Field Description	Level of Output
Type and Client type	Type of client.	All levels

Table 134: show network-access aaa subscribers session-id Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Accounting</b>	Status of the accounting configuration for the service, <b>on</b> or <b>off</b> , and the type of accounting, <b>time</b> , <b>volume+time</b> , or <b>flat-file</b> .  The <b>time</b> and <b>volume+time</b> types are configured in RADIUS Service-Statistics VSA [26-69].	brief none
<b>Service type</b>	Type of accounting: <b>volume</b> , <b>time</b> , <b>volume+time</b> , or <b>na</b> .	brief
<b>Quota</b>	Quota for service: volume (in Mbps) or time (seconds).	brief
<b>Username</b>	Name of the user logged in to the session.	detail
<b>Stripped username</b>	Username after the domain has been removed.	detail
<b>Logical system/Routing instance and AAA Logical system/Routing instance</b>	Name of the routing instance, logical system name, or both used for the session.	All levels
<b>Target Logical system/Routing instance</b>	Logical system/routing instance to which the session is mapped.	detail
<b>Access-profile</b>	Access profile used for AAA services for the session.	detail
<b>Session ID</b>	ID of the subscriber session.  The session ID value displayed under <b>Service name</b> is the service session ID.	detail
<b>Accounting Session ID</b>	ID of the accounting session (RADIUS attribute 44). The ID appears in decimal or description format, as specified by the <b>accounting-session-id-format</b> statement.	detail
<b>Multi Accounting Session ID</b>	Bundle ID for MLPPP sessions. Acct-Multi-Session-Id (RADIUS attribute 50) uses the value of the session database bundle session ID to enable RADIUS to link together multiple related sessions. The value of this field is zero when no MLPPP sessions exist.	detail
<b>IP Address</b>	IP address of the subscriber. For a single-session dual stack, addresses of both IPv4 and IPv6 clients are displayed.	detail

**Table 134: show network-access aaa subscribers session-id Output Fields (continued)**

Field Name	Field Description	Level of Output
<b>IPv6 Address</b>	IPv6 address of the subscriber. For a single-session dual stack, addresses of both IPv4 and IPv6 clients are displayed.	detail
<b>IPv6 Prefix</b>	IPv6 prefix of the subscriber. For a single-session dual stack, addresses of both IPv4 and IPv6 clients are displayed.	detail
<b>Authentication State</b>	State of the subscriber authentication session: <b>AuthInit</b> , <b>AuthStart</b> , <b>AuthChallenge</b> , <b>AuthRedirect</b> , <b>AuthClntRespWait</b> , <b>AuthAcctVolStatsAckWait</b> , <b>AuthAcctStopAckWait</b> , <b>AuthServCreateRespWait</b> , <b>AuthLogoutStart</b> , <b>AuthStateActive</b> , <b>AuthClntLogoutRespWait</b> , <b>AuthProfileUpdateWait</b> , <b>AuthProvisionRespWait</b> , <b>AuthProvisionServiceCreationWait</b>	detail
<b>Gx-Plus Provisioning State</b>	State of Gx-Plus provisioning: <ul style="list-style-type: none"> <li>ignored—Subscriber has no IPv4 address or NAS-Port-ID.</li> <li>in-progress—Provisioning is in progress.</li> <li>logout—Subscriber logout is in progress.</li> <li>logout-done—Logout response has been received.</li> <li>response-received—Provisioning response has been received.</li> </ul>	detail
<b>Pcrf Provisioning State</b>	State of PCRF provisioning: <ul style="list-style-type: none"> <li><b>active</b>—PCRF provisioning is active.</li> <li><b>ignored</b>—Subscriber has no IPv4 address or NAS-Port-ID.</li> <li><b>in-progress</b>—Provisioning is in progress.</li> <li><b>logout</b>—Subscriber logout is in progress.</li> <li><b>logout-done</b>—Logout response has been received.</li> <li><b>response-received</b>—Provisioning response has been received.</li> </ul>	detail
<b>Pcrf Subscription-Id-Type</b>	Type of subscriber for a PCRF partition. You can define your own or use a predefined value: <b>0 (END_USER_E164)</b> , <b>1 (END_USER_IMSI)</b> , <b>2 (END_USER_SIP_URI)</b> , <b>3 (END_USER_NAI)</b> , <b>4 (END_USER_PRIVATE)</b> .	detail
<b>Pcrf Subscription-Id-Data</b>	Subscriber data string concatenated from a list of user-selected data options used to identify the subscriber type for a PCRF partition; for example, demux0	detail

Table 134: show network-access aaa subscribers session-id Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Ocs Subscription-Id-Type</b>	Type of subscriber for an OCS partition. You can define your own or use a predefined value: <b>0 (END_USER_E164)</b> , <b>1 (END_USER_IMSI)</b> , <b>2 (END_USER_SIP_URI)</b> , <b>3 (END_USER_NAI)</b> , <b>4 (END_USER_PRIVATE)</b> .	detail
<b>Ocs Subscription-Id-Data</b>	Subscriber data string concatenated from a list of user-selected data options used to identify the subscriber type for an OCS partition; for example: test-sid	detail
<b>Ocs Interrogation State</b>	State of the OCS interrogation: <b>first</b> , <b>intermediate</b> , <b>final</b> .	detail
<b>Ocs Data State</b>	State of the OCS data: <b>none</b>	detail
<b>Accounting State</b>	State of the subscriber accounting session: <b>Acc-Init</b> , <b>Acc-Start-Sent</b> , <b>Imm-Update-Stats-Pending</b> , <b>Acc-Interim-Sent</b> , <b>Acc-Stop-Stats-Pending</b> , <b>Acc-Stop-Sent</b> , <b>Acc-Stop-On-Fail-Deny-Sent</b> , <b>Acc-Stop-Ackd</b>	detail
<b>Provisioning-type</b>	Provisioning type for this session: <ul style="list-style-type: none"> <li>gx-plus—Subscriber service uses Gx-Plus provisioning.</li> <li>jsrc—Subscriber service uses JSRC provisioning.</li> <li>none—Provisioning is not enabled.</li> </ul>	detail
<b>Service name</b>	Name of the attached service or policy. <ul style="list-style-type: none"> <li>For RADIUS-activated and CLI-activated services, displays the full activation string for the service. If the activation string includes service parameters, then both the service name and service parameters are displayed.</li> <li>For JSRC-activated policies—displays the policy name.</li> </ul>	All levels
<b>Service State</b>	State of the service provided in the subscriber session.	detail
<b>Service Family</b>	Network family of the service provided in the subscriber session.	detail
<b>Service Activation Source</b>	Source used to activate the service.	detail
<b>Session uptime</b>	How long the session has been up, in <i>HH:MM:SS</i> .	All levels
<b>Service CC-Service-Identifier</b>	Data identification element of the 3GPP Diameter credit control service charging system that uniquely defines the <b>CC-Service-Context</b> .	detail

Table 134: show network-access aaa subscribers session-id Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Service Rating-Group</b>	Value associated with a charging rule and part of the accounting data stream for the PCRF.	detail
<b>Ocs Control</b>	Whether OCS controls the service: <b>yes</b> or <b>no</b> .	detail
<b>Accounting status</b>	Status of the accounting configuration for the service, <b>on</b> or <b>off</b> , and the type of accounting, <b>time</b> , <b>volume+time</b> , or <b>flat-file</b> .  The <b>time</b> and <b>volume+time</b> types are configured in RADIUS Service-Statistics VSA [26-69].	detail
<b>Service accounting session ID</b>	ID of the service accounting session; RADIUS Acct-Session-Id attribute (44). The ID appears in decimal or description format, as specified by the <b>accounting-session-id-format</b> statement.	detail
<b>Service accounting state</b>	State of the service accounting session: <b>Acc-Init</b> , <b>Acc-Start-Sent</b> , <b>Imm-Update-Stats-Pending</b> , <b>Acc-Interim-Sent</b> , <b>Acc-Stop-Stats-Pending</b> , <b>Acc-Stop-Sent</b> , <b>Acc-Stop-On-Fail-Deny-Sent</b> , <b>Acc-Stop-Ackd</b>	detail
<b>Accounting interim interval</b>	Amount of time between interim accounting updates for this service, in seconds; RADIUS Service-Interim-Acct-Interval VSA [26-140] or Diameter Acct-Interim-Interval AVP (85).	detail

## Sample Output

### show network-access aaa subscribers session-id brief

```

user@host> show network-access aaa subscribers session-id 6 brief
Logical system/Routing instance  Client type  Session uptime  Accounting
default:default                 dhcp      00:01:29       on/time
Service name                    Service type  Quota          Accounting

## show network-access aaa terminate-code

---

<b>Syntax</b>	<b>show network-access aaa terminate-code</b> <b>&lt;brief   detail   summary&gt;</b> <b>&lt;reverse&gt;</b> <b>&lt;(aaa   dhcp   l2tp   ppp)&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.4. <b>vlan</b> option introduced in Junos OS Release 16.1.
<b>Description</b>	Display the count for termination cause types and the current mapping between session termination cause types and code values.
<b>Options</b>	<b>none</b> —Display all mappings.  <b>brief   detail   summary</b> —(Optional) Display the specified level of output. The <b>summary</b> output is displayed by default and includes base count information about mappings. The <b>brief</b> output displays mappings with non-zero usage count and custom mappings. The <b>detail</b> output displays all mappings.  <b>aaa</b> —(Optional) Limit display to AAA mappings only.  <b>dhcp</b> —(Optional) Limit display to DHCP mappings only.  <b>l2tp</b> —(Optional) Limit display to L2TP mappings only.  <b>ppp</b> —(Optional) Limit display to PPP mappings only.  <b>reverse</b> —(Optional) Display mapping of the code value conveyed in the RADIUS Acct-Terminate-Cause attribute (49) to the termination cause type.  <b>vlan</b> —(Optional) Limit display to VLAN mappings only.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Session Termination Causes and RADIUS Termination Cause Codes on page 183</a></li><li>• <a href="#">Mapping Session Termination Causes to Custom Termination Cause Codes on page 185</a></li><li>• <a href="#">AAA Termination Causes and Code Values on page 186</a></li><li>• <a href="#">DHCP Termination Causes and Code Values on page 188</a></li><li>• <a href="#">L2TP Termination Causes and Code Values on page 189</a></li><li>• <a href="#">PPP Termination Causes and Code Values on page 209</a></li><li>• <a href="#">VLAN Termination Causes and Code Values on page 217</a></li></ul>

**Output Fields** Table 130 on page 1722 lists the output fields for the **show network-access aaa terminate-code** command. Output fields are listed in the approximate order in which they appear.

**Table 135: show network-access aaa terminate-code Output Fields**

Field Name	Field Description	Level of Output
RADIUS	RFC-defined code value conveyed in the RADIUS Acct-Terminate-Cause attribute (49) or a nonstandard, customized value that you configure with the <b>terminate-code aaa</b> statement at the <b>[edit access]</b> hierarchy level.	<b>brief detail</b>  None (with <b>reverse</b> option)
Custom	Whether or not the termination cause is a customized mapping or the default mapping.	All levels
Mapping-Count	Number of mappings that occurred for a specific terminate cause type or category (standard or summary output) or per termination cause (reverse output).	<b>summary</b> None
Usage-Count	Number of times the terminate code mapping was used.	All levels
Type	Termination cause type—null, aaa, dhcp, l2tp, ppp, or vlan.  <b>NOTE:</b> The null termination cause type indicates that no termination reason was provided by the subscriber and the RADIUS Acct-Terminate-Cause attribute (49) was not included in the Acct-Stop request	All levels
Code	Specific termination cause.	<b>brief detail</b>

## Sample Output

### show network-access aaa terminate-code

```

user@host> show network-access aaa terminate-code
Terminate-code:
  Custom Mapping-Count Usage-Count Type
no      1              0          null
no      12             0          aaa

## show network-access address-assignment pool

<b>Syntax</b>	<code>show network-access address-assignment pool <i>pool-name</i></code> <code>&lt;logical-system <i>logical-system-name</i>&gt;</code> <code>&lt;routing-instance <i>routing-instance-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0.
<b>Description</b>	Display state information for each address-assignment pool.
<b>Options</b>	<p><b>none</b>—Display information about clients that have obtained addresses from the address-assignment pool.</p> <p><b>pool <i>pool-name</i></b>—Display information about the specified address-assignment pool.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on the specified logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Perform this operation on the specified routing instance.</p>
<b>Required Privilege Level</b>	view and system
<b>List of Sample Output</b>	<a href="#">show network-access address-assignment pool on page 1743</a>
<b>Output Fields</b>	<a href="#">Table 136 on page 1743</a> lists the output fields for the <b>show network-access address-assignment pool</b> command. Output fields are listed in the approximate order in which they appear.

**Table 136: show network-access address-assignment pool Output Fields**

Field Name	Field Description
IP address	IP address of the client.
Hardware address	MAC address of the client.
Type	Type of client.

## Sample Output

### show network-access address-assignment pool

```

user@host> show network-access address-assignment pool sunnywest logical-system ls1
routing-instance routinst2
IP address      Hardware address  Type
192.168.2.1     00:00:5e:00:53:01 DHCP
192.168.2.2     00:00:5e:00:53:02 DHCP
192.168.2.3     00:00:5e:00:53:03 DHCP
192.168.2.4     00:00:5e:00:53:04 DHCP

```

## show network-access domain-map

<b>Syntax</b>	<b>show network-access domain-map</b> <b>&lt;statistics&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4.
<b>Description</b>	Display domain map information.
<b>Options</b>	<b>statistics</b> —(Optional) Display domain map statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying and Managing Domain Map Configuration on page 225</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access domain-map statistics on page 1744</a>
<b>Output Fields</b>	<a href="#">Table 137 on page 1744</a> lists the output fields for the <b>show network-access domain-map statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 137: show network-access domain-map Output Fields**

Field Name	Field Description
<b>Matched domains</b>	Number of usernames with domain names that are matched.
<b>Unmatched domains</b>	Number of usernames with domain names that are not matched.
<b>Missing domain names</b>	Number of usernames without a domain name.
<b>Stripped username</b>	Number of usernames from which the domain name has been stripped.
<b>Default used</b>	Number of times the default domain map is used.

## Sample Output

### show network-access domain-map statistics

```

user@host> show network-access domain-map statistics
General domain mapping statistics
  Matched domains: 7
  Unmatched domains: 1
  Missing domain names: 0
  Stripped username: 7
Domain statistics for domain-name: default
  Default used: 1

```

## show network-access gx-plus

<b>Syntax</b>	<b>show network-access gx-plus</b> <b>&lt;state   statistics   sync-state&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Display Gx-Plus provisioning state, synchronization state, and statistics information.
<b>Options</b>	<b>state</b> —(Optional) Display Gx-Plus provisioning state. <b>statistics</b> —(Optional) Display Gx-Plus statistics. <b>sync-state</b> —(Optional) Display Gx-Plus synchronization state.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear network-access gx-plus replay on page 1488</a></li> <li>• <a href="#">clear network-access gx-plus statistics on page 1489</a></li> </ul>

```

## show network-access nasreq statistics

<b>Syntax</b>	show network-access nasreq statistics
<b>Release Information</b>	Command introduced in Junos OS Release 16.1.
<b>Description</b>	Display information about the NASREQ protocol exchanges that are used to authenticate and authorize subscribers when they log in.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Diameter Network Access Server Application (NASREQ) on page 755</a></li> <li>• <a href="#">Configuring the Diameter Network Access Server Application (NASREQ) on page 757</a></li> <li>• <a href="#">Messages Used by Diameter Applications on page 686</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 139 on page 1747</a> lists the output fields for the <b>show network-access nasreq statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 139: show network-access nasreq statistics Output Fields**

Field Name	Field Description
Authentication request attempts	Number of authentication requests forwarded to the NASREQ engine. Note that authentication includes authorization in one message exchange.
Authentication request failures	Number of authentication request failures at the NASREQ engine. This includes timeout failures of the request waiting in the transmit queue.
Authentication request messages sent	Number of authentication requests forwarded to the Diameter engine.
Authentication request message failures	Number of authentication requests failures at the Diameter engine.
Authentication request messages timeouts	Number of authentication requests that timed out waiting for a response from the NASREQ server.
Authentication denies failures	Number of authentication responses with an unsuccessful result-code.
Authentication grants received	Number of authentication responses with a successful result-code.
Authorization request attempts	Number of authorization requests to the NASREQ engine.
Authorization request failures	Number of authorization request failures at the NASREQ engine. This includes timeout failures of the request waiting in the transmit queue.
Authorization request messages sent	Number of authorization requests forwarded to the Diameter engine.
Authorization request message failures	Number of authorization requests failures at the Diameter engine.

Table 139: show network-access nasreq statistics Output Fields (*continued*)

Field Name	Field Description
Authorization request messages timeouts	Number of authorization requests that timed out waiting for a response from the NASREQ server.
Authorization denies failures	Number of authorization responses with an unsuccessful result-code.
Authorization grants received	Number of authorization responses with a successful result-code.
Session-terminate request attempts	Number of session-terminate requests forwarded to the NASREQ engine.
Session-terminate request failures	Number of session-terminate requests failures at the NASREQ engine. This includes timeout failures of the request waiting in the transmit queue.
Session-terminate request messages sent	Number of session-terminate requests forwarded to the Diameter engine.
Session-terminate request messages failures	Number of session-terminate requests failures at the Diameter engine.
Session-terminate request messages timeouts	Number of session-terminate requests that timed out waiting for a response from the NASREQ server.
Session-terminate response message failures	Number of session-terminate responses with an unsuccessful result-code.
Session-terminate response messages received	Number of session-terminate responses with a successful result-code.
Abort-session requests received	Number of abort-session requests received by the NASREQ engine.
Abort-session response-ack messages sent	Number of abort-session requests receiving an ACK response.
Abort-session response-nack messages sent	Number of abort-session requests receiving a NACK response.
Abort-session response message failures	Number of abort-session responses that failed transmission, either due to timeout in the transmit queue, or failed by the Diameter engine.
Number of NASREQ subscribers	Number of active subscribers that received NASREQ authorization.
Number of result-code-1xxx	Number of response messages with an informational result-code.
Number of result-code-2xxx	Number of response messages with a success result-code.
Number of result-code-3xxx	Number of response messages with a protocol-error result-code.
Number of result-code-4xxx	Number of response messages with an transient-error result-code.
Number of result-code-5xxx	Number of response messages with a permanent-error result-code.

Table 139: show network-access nasreq statistics Output Fields (*continued*)

Field Name	Field Description
Number of result-code-other	Number of response messages with an unregistered result-code.
Transmit queue time-outs	Number of request/responses that timed out waiting for Diameter engine resources.
Transmit message drops	Number of request/responses dropped.
Transmit message failures	Number of request/response failures at the Diameter engine.
Number of requests on the Tx queue	Number of requests/responses currently on the transmit queue.
Number of requests waiting for a response	Number of requests currently in the response queue waiting for a response.
Number of outstanding requests	Number of outstanding requests, including AAR and STR.
Total number of allocated messages	Number of currently allocated request/response messages.

## Sample Output

```

user@host> show network-access nasreq statistics
Authentication request attempts:4000
Authentication request failures:0

## show ppp address-pool

<b>Syntax</b>	<code>show ppp address-pool <i>pool-name</i> &lt;detail&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 7.5.
<b>Description</b>	Display PPP address pool information.
<b>Options</b>	<p><i>pool-name</i>—Address pool name.</p> <p><b>detail</b>—(Optional) Display detailed address pool information.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Verifying and Managing PPP Configuration for Subscriber Management</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show ppp address-pool on page 1757</a></p> <p><a href="#">show ppp address-pool detail on page 1757</a></p>
<b>Output Fields</b>	<p><a href="#">Table 142 on page 1756</a> lists the output fields for the <b>show ppp address-pool</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 142: show ppp address-pool Output Fields**

Field Name	Field Description	Level of Output
<b>Address pool</b>	Trace address pool code.	All levels
<b>Address range</b>	Range of sequentially ordered IP addresses contained in the address pool.	<b>detail</b>
<b>Number of assigned addresses</b>	Fixed IP address that is to be given to remote users when they dial in. This is a host-only IP address (subnet mask is 255.255.255.255) and is only for single connection receiver profiles.	All levels
<b>Number of addresses configured</b>	Number of IP addresses that are available for allocation and used by PPP sessions.	All levels
<b>Assigned addresses</b>	Addresses assigned to PPP sessions from the address pool.	<b>detail</b>

## Sample Output

### show ppp address-pool

```
user@host> show ppp address-pool
Address pool ppp1
  Address range: 203.0.113.221 - 203.0.113.230
  Number of assigned addresses: 0
  Number of addresses configured: 10
```

### show ppp address-pool detail

```
user@host> show ppp address-pool ppp1 detail
Address pool ppp1
  Address range: 203.0.113.221 - 203.0.113.230
  Number of assigned addresses: 2
  Number of addresses configured: 10
  Assigned addresses:
    203.0.113.221
    203.0.113.222
```

## show route

---

**List of Syntax**    [Syntax on page 1758](#)  
                         [Syntax \(EX Series Switches\) on page 1758](#)

**Syntax**    show route  
              <all>  
              <*destination-prefix*>  
              <logical-system (all | *logical-system-name*)>  
              <private>

**Syntax (EX Series Switches)**    show route  
                                         <all>  
                                         <*destination-prefix*>  
                                         <private>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Option **private** introduced in Junos OS Release 9.5.  
                              Option **private** introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.  
                              Option **display-client-data** introduced in Junos OS Release 16.2R1 on MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series routers.

**Description**    Display the active entries in the routing tables.

**Options**    **none**—Display brief information about all active entries in the routing tables.

**all**—(Optional) Display information about all routing tables, including private, or internal, routing tables.

***destination-prefix***—(Optional) Display active entries for the specified address or range of addresses.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**private**—(Optional) Display information only about all private, or internal, routing tables.

**display-client-data**—(Optional) Display client id and cookie information for routes installed by rpd client applications.

**Required Privilege Level**    view

**Output Fields** [Table 143 on page 1759](#) describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

**Table 143: show route Output Fields**

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>

Table 143: show route Output Fields (*continued*)

Field Name	Field Description
<i>destination-prefix</i>	<p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>
[ <i>protocol, preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>
<i>weeks:days hours:minutes:seconds</i>	How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).
<b>metric</b>	Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
<b>localpref</b>	Local preference value included in the route.
<b>from</b>	Interface from which the route was received.

Table 143: show route Output Fields (*continued*)

Field Name	Field Description
<b>AS path</b>	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
<b>Route Labels</b>	Stack of labels carried in the BGP route update.
<b>validation-state</b>	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
<b>to</b>	<p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>

Table 143: show route Output Fields (*continued*)

Field Name	Field Description
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul>
Private unicast	(Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes <i>not</i> managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.
balance	Distribution of the load based on the underlying operational interface bandwidth for equal-cost multipaths (ECMP) across the nexthop gateways in percentages.

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    * [MVPN/70] 19:53:41, metric2 1
    Indirect
1:65500:1:10.0.0.40/240
    * [BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
    [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240

## show route extensive

<b>List of Syntax</b>	<a href="#">Syntax on page 1766</a> <a href="#">Syntax (EX Series Switches) on page 1766</a>
<b>Syntax</b>	show route extensive <destination-prefix> <logical-system (all   logical-system-name)>
<b>Syntax (EX Series Switches)</b>	show route extensive <destination-prefix>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display extensive information about the active entries in the routing tables.
<b>Options</b>	<p><b>none</b>—Display all active entries in the routing table.</p> <p><b>destination-prefix</b>—(Optional) Display active entries for the specified address or range of addresses.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show route extensive on page 1773</a> <a href="#">show route extensive (Access Route) on page 1780</a> <a href="#">show route extensive (BGP PIC Edge) on page 1780</a> <a href="#">show route extensive (FRR and LFA) on page 1781</a> <a href="#">show route extensive (IS-IS) on page 1782</a> <a href="#">show route extensive (Route Reflector) on page 1782</a> <a href="#">show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 1782</a> <a href="#">show route label detail (Multipoint LDP with Multicast-Only Fast Reroute) on page 1783</a>
<b>Output Fields</b>	<a href="#">Table 144 on page 1766</a> describes the output fields for the <b>show route extensive</b> command. Output fields are listed in the approximate order in which they appear.

Table 144: show route extensive Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 144: show route extensive Output Fields (*continued*)

Field Name	Field Description
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>
<i>route-destination</i> (entry, announced)	<p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>
<b>TSI</b>	Protocol header information.
<b>label stacking</b>	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>
<b>[protocol, preference]</b>	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>

Table 144: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b>Level</b>	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
<b>Route Distinguisher</b>	IP subnet augmented with a 64-bit prefix.
<b>PMSI</b>	Provider multicast service interface (MVPN routing table).
<b>Next-hop type</b>	Type of next hop. For a description of possible values for this field, see the Output Field table in the <i>show route detail</i> command.
<b>Next-hop reference count</b>	Number of references made to the next hop.
<b>Flood nexthop branches exceed maximum message</b>	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
<b>Source</b>	IP address of the route source.
<b>Next hop</b>	Network layer address of the directly reachable neighboring system.
<b>via</b>	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
<b>Label-switched-path lsp-path-name</b>	Name of the LSP used to reach the next hop.
<b>Label operation</b>	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
<b>Offset</b>	Whether the metric has been increased or decreased by an offset value.
<b>Interface</b>	(Local only) Local interface name.
<b>Protocol next hop</b>	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.

Table 144: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b><i>label-operation</i></b>	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
<b>Indirect next hops</b>	<p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul>
<b>State</b>	State of the route (a route can be in more than one state). See the Output Field table in the <i>show route detail</i> command.
<b>Session ID</b>	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).
<b>Weight</b>	<p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <b>show route table</b>.</p>

Table 144: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b>Inactive reason</b>	<p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGp path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul>
<b>Local AS</b>	Autonomous system (AS) number of the local routing device.
<b>Age</b>	How long the route has been known.
<b>AIGP</b>	Accumulated interior gateway protocol (AIGP) BGP attribute.
<b>Metric</b>	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
<b>MED-plus-IGP</b>	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
<b>TTL-Action</b>	<p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <b>show route table</b>.</p>

Table 144: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b>Task</b>	Name of the protocol that has added the route.
<b>Announcement bits</b>	<p>List of protocols that are consumers of the route. Using the following output as an example, <b>Announcement bits (3): 0-KRT 5-Resolve tree 2 8-BGP RT Background</b> there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP).</p> <p>The notation <b><i>n</i>-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.</p>
<b>AS path</b>	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
<b>validation-state</b>	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
<b>FECs bound to route</b>	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
<b>AS path: I &lt;Originator&gt;</b>	(For route reflected output only) Originator ID attribute set by the route reflector.

Table 144: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b>route status</b>	<p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> <li>• <b>Accepted</b>—The specified BGP route is imported by the default BGP policy.</li> <li>• <b>Import</b>—The route is imported into a Layer 3 VPN routing instance.</li> <li>• <b>Import-Protect</b>—A remote instance egress that is protected.</li> <li>• <b>Multipath</b>—A BGP multipath active route.</li> <li>• <b>MultipathContrib</b>—The route is not active but contributes to the BGP multipath.</li> <li>• <b>Protect</b>—An egress route that is protected.</li> <li>• <b>Stale</b>—A route that is marked stale due to graceful restart.</li> </ul>
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See the Output Field table in the <i>show route detail</i> command for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: <b>none</b> or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.

Table 144: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b>status vector</b>	Layer 2 VPN and VPLS network layer reachability information (NLRI).
<b>Localpref</b>	Local preference value included in the route.
<b>Router ID</b>	BGP router ID as advertised by the neighbor in the open message.
<b>Primary Routing Table</b>	In a routing table group, the name of the primary routing table in which the route resides.
<b>Secondary Tables</b>	In a routing table group, the name of one or more secondary tables in which the route resides.
<b>Originating RIB</b>	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix.
<b>Node path count</b>	Number of nodes in the path.
<b>Forwarding nexthops</b>	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

## Sample Output

## show services subscriber bandwidth

<b>Syntax</b>	<pre>show services subscriber bandwidth &lt;client-id <i>client-id</i>&gt; &lt;interface <i>interface-name</i>&gt; &lt;top-talkers <i>top-talkers</i>&gt; &lt;ip-address <i>ip-address</i>&gt; &lt;service-interface <i>interface-name</i>&gt; &lt;top-talkers <i>top-talkers</i>&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2.
<b>Description</b>	Display bandwidth information about subscribers with the specified criteria. The bandwidth is computed at fixed intervals on the MS-DPC and only the last interval is used for comparison.
<b>Options</b>	<p><b>client-id <i>client-id</i></b>—(Optional) Displays bandwidth information for the subscriber with this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Displays bandwidth information for the subscriber with this underlying interface name.</p> <p><b>ip-address <i>ip-address</i></b>—(Optional) Displays bandwidth information for the subscriber with this IPv4 address.</p> <p><b>service-interface <i>interface-name</i></b>—(Optional) Displays bandwidth information for the subscriber with this service interface name.</p> <p><b>top-talkers <i>number-top-talkers</i></b>—(Optional) Displays bandwidth information for the specified number of subscribers using the most bandwidth based on the input-bps or output-bps values for the interface or service interface.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show services subscriber bandwidth client-id on page 1785</a>
<b>Output Fields</b>	<a href="#">Table 145 on page 1784</a> lists the output fields for the <b>show services subscriber bandwidth</b> command. Output fields are listed in the approximate order in which they appear.

**Table 145: show services subscriber bandwidth Output Fields**

Field Name	Field Description
client-id	Client identifier.
input-bps	Ingress bandwidth in bytes per second.
output-bps	Egress bandwidth in bytes per second.
input-pps	Ingress bandwidth in packets per second.
output-pps	Egress bandwidth in packets per second.

## Sample Output

show services

subscriber bandwidth client-id

```
user@host> show services subscriber bandwidth client-id 1
client-id  input-bps  output-bps  input-pps  output-pps
1           20          20          1000       1000
```

## show services subscriber dynamic-policies

<b>Syntax</b>	<b>show services subscriber dynamic-policies client-id <i>client-id</i></b>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2.
<b>Description</b>	Display information about the active dynamic policies applied to the specified subscriber.
<b>Options</b>	<b>client-id <i>client-id</i></b> —Displays information about the active dynamic policies applied to the subscriber with this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show services subscriber dynamic-policies client-id on page 1787</a>
<b>Output Fields</b>	<a href="#">Table 146 on page 1786</a> lists the output fields for the <b>show services subscriber dynamic-policies</b> command. Output fields are listed in the approximate order in which they appear.

**Table 146: show services subscriber dynamic-policies Output Fields**

Field Name	Field Description
<b>Subscriber session</b>	Client identifier.
<b>Policy name</b>	Dynamic policy identifier.
<b>rpr</b>	Rule precedence for the dynamic policy.
<b>d</b>	Direction of the dynamic policy.
<b>Template</b>	Service rule associated with the dynamic policy.
<b>tpr</b>	Term precedence.
<b>ra</b>	Remote address.
<b>rm</b>	Remote address mask.
<b>lpl</b>	Lower boundary for the local port range.
<b>lph</b>	Upper boundary for the local port range.
<b>rpl</b>	Lower boundary for the remote port range.
<b>rph</b>	Upper boundary for the remote port range.
<b>p</b>	Protocol.

Table 146: show services subscriber dynamic-policies Output Fields (*continued*)

Field Name	Field Description
<b>a-f</b>	Action.
<b>a-s</b>	Type of statistics collection and aggregation.
<b>a-fc</b>	Forwarding class.
<b>a-p-l</b>	Policer instance.
<b>a-p-bw</b>	Policer bandwidth.
<b>a-p-mbs</b>	Policer maximum burst size.
<b>a-fu</b>	Unit number for forwarding instance.
<b>anl</b>	Application names.
<b>agl</b>	Application group name.

## Sample Output

show services

subscriber dynamic-policies client-id

## show services subscriber flows

<b>Syntax</b>	<b>show services subscriber flows client-id <i>client-id</i></b>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2. Offload status for flows using Juniper Forwarding Mechanism (JFM) added in Junos OS Release 12.1.
<b>Description</b>	Display information about the data flows associated with the specified subscriber. Offloading using JFM is supported only on MX Series routers with Modular Port Concentrators (MPCs) for the packet-triggered subscribers and policy control (PTSP) plug-in.
<b>Options</b>	<b>client-id <i>client-id</i></b> —Displays information about the data flows associated with the subscriber identified by this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show services subscriber flows client-id on page 1790</a> <a href="#">show services subscriber flows client-id for offloading using JFM on page 1790</a>
<b>Output Fields</b>	<a href="#">Table 147 on page 1789</a> lists the output fields for the <b>show services subscriber flows</b> command. Output fields are listed in the approximate order in which they appear.

**Table 147: show services subscriber flows Output Fields**

Field Name	Field Description
<b>Subscriber session</b>	Client identifier.
<b>Number of data flows</b>	Number of data sessions associated with this subscriber.
<b>Data flow high-water-mark</b>	High water mark number of concurrent data sessions for this subscriber. This value is never reset during the login session.
<b>5-tuple</b>	5 tuple information for each flow.
<b>Application-ID</b>	Application ID for each flow.
<b>Policy-name</b>	Service rule name for each flow.
<b>Dir</b>	Direction of each flow.
<b>Packets</b>	Information about counter statistics for each flow.
<b>Bytes</b>	Information about counter statistics for each flow.

Table 147: show services subscriber flows Output Fields (*continued*)

Field Name	Field Description
Off	The status of offload to Packet Forwarding Engine using JFM. The various options are: <ul style="list-style-type: none"> <li>• Not Offloaded (-)</li> <li>• Offload requested but not completed (R)</li> <li>• Offload requested and completed (O)</li> </ul>
Action	Action of the service rule for each flow.

## Sample Output

show services  
subscriber flows client-id

```
user@host> show services subscriber flows client-id 1
Subscriber session 1
Number of data flows: 1
Data flows high-water-mark: 8180
5-tuple

## show services subscriber statistics

<b>Syntax</b>	<b>show services subscriber statistics client-id</b> <i>client-id</i>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2.
<b>Description</b>	Display information about the data traffic statistics for the specified packet-triggered subscriber and for each service rule attached to that subscriber.
<b>Options</b>	<b>client-id</b> <i>client-id</i> —Displays information about the data traffic statistics associated with the subscriber identified by this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show services subscriber statistics client-id by rule on page 1794</a> <a href="#">show services subscriber statistics client-id by application on page 1794</a>
<b>Output Fields</b>	<a href="#">Table 149 on page 1794</a> lists the output fields for the <b>show services subscriber statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 149: show services subscriber statistics Output Fields**

Field Name	Field Description
<b>Aggregation-level</b>	Type of statistics collected — subscriber and service rule or application.
<b>Name/Id</b>	Identifier for Aggregation-level field.
<b>Packets-in</b>	Number of ingress packets.
<b>Packets-out</b>	Number of egress packets.
<b>Bytes-in</b>	Number of ingress bytes.
<b>Bytes-out</b>	Number of egress bytes.

### Sample Output

show services  
subscriber statistics client-id by rule

```

user@host> show services subscriber statistics client-id 1
Aggregation-level Name/Id   Packets-in Packets-out Bytes-in Bytes-out
subscriber        1             5           5        1000    1000

**Release Information**    Command introduced in Junos OS Release 9.3.  
                              Command introduced in Junos OS Release 9.3 for EX Series switches.  
                              **client-type**, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.  
                              **count** option usage with other options introduced in Junos OS Release 10.2.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.  
                              The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.  
                              Options **vci** and **vpi** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
                              Options **vci** and **vpi** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
                              Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description**    Display information for active subscribers.

**Options**    **detail | extensive | terse**—(Optional) Display the specified level of output.

**aci-interface-set-name**—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as aci-1003-ge-1/0/0.4001, and not the actual ACI value found in the DHCP or PPPoE control packets.

**address**—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example,

192.0.2.0). If you specify the IP address as a prefix with a netmask (for example, 192.0.2.0/32), the router displays a message that the IP address is invalid, and rejects the command.

***agent-circuit-identifier-substring***—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

***client-type***—(Optional) Display subscribers whose client type matches one of the following client types:

- ***dhcp***—DHCP clients only.
- ***dot1x***—Dot1x clients only.
- ***essm***—ESSM clients only.
- ***fwauth***—FwAuth (authenticated across a firewall) clients only.
- ***l2tp***—L2TP clients only.
- ***mlppp***—MLPPP clients only.
- ***ppp***—PPP clients only.
- ***pppoe***—PPPoE clients only.
- ***static***—Static clients only.
- ***vlan***—VLAN clients only.
- ***vlan-oob***—VLAN out-of-band (ANCP-triggered) clients only.
- ***vpls-pw***—VPLS pseudowire clients only.
- ***xauth***—Xauth clients only.

***count***—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the ***count*** option alone or with the ***address***, ***client-type***, ***interface***, ***logical-system***, ***mac-address***, ***profile-name***, ***routing-instance***, ***stacked-vlan-id***, ***subscriber-state***, or ***vlan-id*** options.

***id***—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the ***show subscribers extensive*** or the ***show subscribers interface extensive*** commands.

***interface***—(Optional) Display subscribers whose interface matches the specified interface.

***logical-system***—(Optional) Display subscribers whose logical system matches the specified logical system.

***mac-address***—(Optional) Display subscribers whose MAC address matches the specified MAC address.

***physical-interface-name***—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

***profile-name***—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

**routing-instance**—(Optional) Display subscribers whose routing instance matches the specified routing instance.

**stacked-vlan-id**—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

**subscriber-state**—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

**user-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

**vci-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is 0 through 255.

**vpi-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is 0 through 65,535.

**vlan-id**—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID, regardless of whether the subscriber uses a single-tagged or double-tagged VLAN. For subscribers using a double-tagged VLAN, this option displays subscribers where the inner VLAN tag matches the specified VLAN ID. To display only subscribers where the specified value matches only double-tagged VLANs, use the **stacked-vlan-id** option to match the outer VLAN tag.

**NOTE:** Because of display limitations, logical system and routing instance output values are truncated when necessary.

**Output Fields** [Table 151 on page 1801](#) lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

**Table 151: show subscribers Output Fields**

Field Name	Field Description
<b>Interface</b>	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.  The * character indicates a continuation of addresses for the same session.

Table 151: show subscribers Output Fields (*continued*)

Field Name	Field Description
IP Address/VLAN ID	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i>  No IP address or VLAN ID is assigned to an L2TP tunnel-switched session. For these subscriber sessions the value is <b>Tunnel-switched</b> .
User Name	Name of subscriber.
LS:RI	Logical system and routing instance associated with the subscriber.
Type	Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
IP Address	Subscriber IPv4 address.
IP Netmask	Subscriber IP netmask.  (MX Series) This field displays 255.255.255.255 by default. For tunneled or terminated PPP subscribers only, this field displays the actual value of Framed-IP-Netmask when the SDB_FRAMED_PROTOCOL attribute in the session database is equal to AUTHD_FRAMED_PROTOCOL_PPP. This occurs in the use case where the LNS generates access-internal routes when it receives Framed-IP-Netmask from RADIUS during authorization. When it receives Framed-Pool from RADIUS, the pool mask is ignored and the default /32 mask is used.
Primary DNS Address	IP address of primary DNS server.
Secondary DNS Address	IP address of secondary DNS server.
Primary WINS Address	IP address of primary WINS server.
Secondary WINS Address	IP address of secondary WINS server.
IPv6 Address	Subscriber IPv6 address, or multiple addresses.
IPv6 Prefix	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
IPv6 User Prefix	IPv6 prefix obtained through ND/RA.
IPv6 Address Pool	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
IPv6 Network Prefix Length	Length of the network portion of the IPv6 address.
IPv6 Prefix Length	Length of the subscriber IPv6 prefix.
Logical System	Logical system associated with the subscriber.
Routing Instance	Routing instance associated with the subscriber.

Table 151: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>Interface</b>	(Enhanced subscriber management for MX Series routers) Name of the enhanced subscriber management logical interface, in the form <b>demux0.nnnn</b> (for example, <b>demux0.3221225472</b> ), to which access-internal and framed subscriber routes are mapped.
<b>Interface Type</b>	Whether the subscriber interface is <b>Static</b> or <b>Dynamic</b> .
<b>Interface Set</b>	<p>Internally generated name of the dynamic ACI or ALI interface set used by the subscriber session. The prefix of the name indicates the string received in DHCP or PPPoE control packets on which the interface set is based. For ALI interface sets, the prefix indicates that the value is configured as a trusted option to identify the subscriber line.</p> <p>The name of the interface set uses one of the following prefixes:</p> <ul style="list-style-type: none"> <li>• <b>aci</b>—ACI; for example, aci-1033-demux0.3221225524. This is the only prefix allowed for ACI interface sets.</li> <li>• <b>ari</b>—ARI; for example, ari-1033-demux0.3221225524.</li> <li>• <b>aci+ari</b>—Both the ACI and ARI; for example, aci+ari-1033-demux0.3221225524.</li> <li>• <b>noids</b>—Neither the ACI nor the ARI were received; for example, noids-1033-demux0.3221225524.</li> </ul> <p><b>NOTE:</b> ACI interface sets are configured with the <b>agent-circuit-identifier</b> autoconfiguration stanza. ALI interface sets are configured with the <b>line-identity</b> autoconfiguration stanza.</p>
<b>Interface Set Type</b>	Interface type of the ACI interface set: <b>Dynamic</b> . This is the only ACI interface set type currently supported.
<b>Interface Set Session ID</b>	Identifier of the dynamic ACI interface set entry in the session database.
<b>Underlying Interface</b>	Name of the underlying interface for the subscriber session.
<b>Dynamic Profile Name</b>	Dynamic profile used for the subscriber.
<b>Dynamic Profile Version</b>	Version number of the dynamic profile used for the subscriber.
<b>MAC Address</b>	MAC address associated with the subscriber.
<b>State</b>	Current state of the subscriber session ( <b>Init</b> , <b>Configured</b> , <b>Active</b> , <b>Terminating</b> , <b>Tunneled</b> ).
<b>L2TP State</b>	Current state of the L2TP session, <b>Tunneled</b> or <b>Tunnel-switched</b> . When the value is <b>Tunnel-switched</b> , two entries are displayed for the subscriber; the first entry is at the LNS interface on the LTS and the second entry is at the LAC interface on the LTS.
<b>Tunnel switch Profile Name</b>	Name of the L2TP tunnel switch profile that initiates tunnel switching.
<b>Local IP Address</b>	IP address of the local gateway (LAC).
<b>Remote IP Address</b>	IP address of the remote peer (LNS).
<b>VLAN Id</b>	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .

Table 151: show subscribers Output Fields (*continued*)

Field Name	Field Description
Stacked VLAN Id	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
RADIUS Accounting ID	RADIUS accounting ID associated with the subscriber.
Agent Circuit ID	<p>For the <b>dhcp</b> client type, option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.</p> <p>For the <b>vlan-oob</b> client type, the agent circuit ID or access-loop circuit identifier that identifies the subscriber line based on the subscriber-facing DSLAM interface on which the subscriber request originates.</p>
Agent Remote ID	<p>For the <b>dhcp</b> client type, option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.</p> <p>For the <b>vlan-oob</b> client type, the agent remote ID or access-loop remote identifier that identifies the subscriber line based on the NAS-facing DSLAM interface on which the subscriber request originates.</p>
DHCP Relay IP Address	IP address used by the DHCP relay agent.
ATM VPI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual path identifier (VPI) on the subscriber's physical interface.
ATM VCI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual circuit identifier (VCI) for each VPI configured on the subscriber interface.
Login Time	Date and time at which the subscriber logged in.
Effective shaping-rate	Actual downstream traffic shaping rate for the subscriber, in kilobits per second.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	<b>len</b> = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber service session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session Name	Service session profile name.

Table 151: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>Session Timeout (seconds)</b>	Number of seconds of access provided to the subscriber before the session is automatically terminated.
<b>Idle Timeout (seconds)</b>	Number of seconds subscriber can be idle before the session is automatically terminated.
<b>IPv6 Delegated Address Pool</b>	Name of the pool used for DHCPv6 prefix delegation.
<b>IPv6 Delegated Network Prefix Length</b>	Length of the prefix configured for the IPv6 delegated address pool.
<b>IPv6 Interface Address</b>	Address assigned by the Framed-Ipv6-Prefix AAA attribute.
<b>IPv6 Framed Interface Id</b>	Interface ID assigned by the Framed-Interface-Id AAA attribute.
<b>ADF IPv4 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv4 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>IPv4 Input Filter Name</b>	Name assigned to the IPv4 input filter (client or service session).
<b>IPv4 Output Filter Name</b>	Name assigned to the IPv4 output filter (client or service session).
<b>IPv6 Input Filter Name</b>	Name assigned to the IPv6 input filter (client or service session).
<b>IPv6 Output Filter Name</b>	Name assigned to the IPv6 output filter (client or service session).
<b>IFL Input Filter Name</b>	Name assigned to the logical interface input filter (client or service session).
<b>IFL Output Filter Name</b>	Name assigned to the logical interface output filter (client or service session).

## Sample Output

### show subscribers (IPv4)

```
user@host> show subscribers
```

Interface	IP Address/VLAN ID	User Name	LS:RI

## show subscribers summary

<b>Syntax</b>	<pre>show subscribers summary &lt;all&gt; &lt;detail   extensive   terse&gt; &lt;count&gt; &lt;physical-interface <i>physical-interface-name</i>&gt; &lt;logical-system <i>logical-system</i> pic   port   routing-instance <i>routing-instance</i>   slot&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2.
<b>Description</b>	Display summary information for subscribers.
<b>Options</b>	<p><b>none</b>—Display summary information by state and client type for all subscribers.</p> <p><b>all</b>—(Optional) Display summary information by state, client type, and LS:RI.</p> <p><b>detail   extensive   terse</b>—(Not supported on MX Series routers) (Optional) Display the specified level of output.</p> <p><b>count</b>—(Not supported on MX Series routers) (Optional) Display the count of total subscribers and active subscribers for any specified option.</p> <p><b>logical-system <i>logical-system</i></b>—(Optional) Display subscribers whose logical system matches the specified logical system.</p> <p><b>physical-interface <i>physical-interface-name</i></b>—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers whose physical interface matches the specified physical interface, by subscriber state, client type, and LS:RI.</p> <p><b>pic</b>—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by PIC number and the total number of subscribers.</p> <p><b>port</b>—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by port number and the total number of subscribers.</p> <p><b>routing-instance <i>routing-instance</i></b>—(Optional) Display subscribers whose routing instance matches the specified routing instance.</p> <p><b>slot</b>—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by FPC slot number and the total number of subscribers.</p>
	<p> <b>NOTE:</b> Due to display limitations, logical system and routing instance output values are truncated when necessary.</p>

**Output Fields** [Table 152 on page 1820](#) lists the output fields for the **show subscribers summary** command. Output fields are listed in the approximate order in which they appear.

**Table 152: show subscribers summary Output Fields**

Field Name	Field Description	Level of Output
<b>Subscribers by State</b>	Number of subscribers summarized by state. The summary information includes the following: <ul style="list-style-type: none"> <li>Init—Number of subscriber currently in the initialization state.</li> <li>Configured—Number of configured subscribers.</li> <li>Active—Number of active subscribers.</li> <li>Terminating—Number of subscribers currently terminating.</li> <li>Terminated—Number of terminated subscribers.</li> <li>Total—Total number of subscribers for all states.</li> </ul>	<b>detail none</b>
<b>Subscribers by Client Type</b>	Number of subscribers summarized by client type. Client types can include DHCP, L2TP, PPP, PPPOE, STATIC-INTERFACE, VLAN, and VLAN-OOB. Also displays the total number of subscribers for all client types (Total).	<b>detail extensive none</b>
<b>Subscribers by LS:RI</b>	Number of subscribers summarized by logical system:routing instance (LS:RI) combination. Also displays the total number of subscribers for all LS:RI combinations (Total).	<b>detail none</b>
<b>Subscribers by Connection Type</b>	Number of subscribers summarized by connection type, <b>Cross-connected</b> or <b>Terminated</b> .	<b>extensive</b>
<b>Interface</b>	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.  The * character indicates a continuation of addresses for the same session.  For aggregated Ethernet interfaces, the output of the <b>summary (pic   port   slot)</b> options prefixes the interface name with ae0:.	All levels

Table 152: show subscribers summary Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Count</b>	Count of subscribers displayed for each PIC, port, or slot when those options are specified with the <b>summary</b> option. For an aggregated Ethernet configuration, the total subscriber count does not equal the sum of the individual PIC, port, or slot counts, because each subscriber can be in more than one aggregated Ethernet link.	<b>detail extensive none</b>
<b>Total Subscribers</b>	Total number of subscribers for all physical interfaces, all PICS, all ports, or all LS:RI slots.	<b>detail extensive none</b>
<b>IP Address/VLAN ID</b>	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i>	<b>terse</b>
<b>User Name</b>	Name of subscriber.	<b>terse</b>
<b>LS:RI</b>	Logical system and routing instance associated with the subscriber.	<b>terse</b>

## show system subscriber-management route

<b>Syntax</b>	<pre>show system subscriber-management route &lt;family <i>family</i>&gt; &lt;incomplete&gt; &lt;level (brief   detail)&gt; &lt;next-hop&gt; &lt;route-type <i>type</i>&gt; &lt;rrt-index <i>index</i>&gt; &lt;summary&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.
<b>Description</b>	Display information about how routes are mapped to specific enhanced subscriber management interfaces. You can customize the output by including one or more optional filters in the command. With the exception of the <b>summary</b> option, all filter options can be combined in a single command.
<b>Options</b>	<p><b>family <i>family</i></b>—(Optional) Display route mapping information for the specified protocol family: <b>inet</b> (IPv4) or <b>inet6</b> (IPv6).</p> <p><b>incomplete</b>—(Optional) Display route mapping information for incomplete routes that are missing elements required to add the routes to the routing table.</p> <p><b>level (brief   detail)</b>—(Optional) Display the specified level of output: <b>brief</b> or <b>detail</b>.</p> <p><b>next-hop</b>—(Optional) Display the next hop associated with the route entry.</p> <p><b>route-type <i>type</i></b>—(Optional) Display route mapping information for the specified route type: <b>access</b>, <b>access-internal</b>, <b>kernel</b>, or <b>local</b>.</p> <p><b>rrt-index <i>index</i></b>—(Optional) Display mapping information for the specified routing table index, in the range 0 through 65535. An <b>rrt-index</b> value of 0 (zero) denotes routes in the default routing table managed by enhanced subscriber management.</p> <p><b>summary</b>—(Optional) Display summary information about the routes managed by enhanced subscriber management.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying and Managing Junos OS Enhanced Subscriber Management on page 562</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show system subscriber-management route family route-type rrt-index level brief on page 1826</a></p> <p><a href="#">show system subscriber-management route family route-type rrt-index level detail on page 1827</a></p> <p><a href="#">show system subscriber-management route family route-type rrt-index level brief on page 1828</a></p>

**Output Fields** Table 153 on page 1826 lists the output fields for the **show system subscriber-management route** command. Output fields are listed in the approximate order in which they appear.

**Table 153: show system subscriber-management route Output Fields**

Field Name	Field Description	Level of Output
<i>address</i>	IPv4 or IPv6 address associated with the route entry.	All levels
<b>Route Type</b>	One of the following route types: <ul style="list-style-type: none"> <li>• Access</li> <li>• Access-internal</li> <li>• Kernel</li> <li>• Local</li> </ul>	All levels
<b>Interface</b>	Name of the enhanced subscriber management interface associated with the route entry.	All levels
<b>Next-hop</b>	Next-hop associated with the route entry.	All levels
<b>Rtt-index</b>	Value of the routing table index. A value of <b>0</b> (zero) denotes a route in the default routing table managed by enhanced subscriber management.	<b>detail</b>
<b>Bbe index</b>	Value of the interface index for the control plane.	<b>detail</b>
<b>Flow id</b>	Value of the route object index.	<b>detail</b>
<b>Reference Count</b>	Used for internal accounting.	<b>detail</b>
<b>Dirty Flags</b>	Used for internal accounting.	<b>detail</b>
<b>Flags</b>	Used for internal accounting.	<b>detail</b>
<b>Family</b>	One of the following protocol families: <ul style="list-style-type: none"> <li>• AF_INET—IPv4</li> <li>• AF_INET6—IPv6</li> </ul>	<b>detail</b>

## Sample Output

### show system subscriber-management route family route-type rtt-index level brief

The following example displays abbreviated information about IPv6 access routes in the default routing table (**rtt-index 0**) managed by enhanced subscriber management.

```

user@host> show system subscriber-management route family inet6 route-type access rtt-index 0
level brief
2001:db8::/64
    Route Type: Access
    Interface: pp0.3221225479, Next-hop:721
2001:db8:0:0:1::/64
    Route Type: Access

```

```

        Interface: pp0.3221225477, Next-hop:721

## show system subscriber-management statistics

<b>Syntax</b>	show system subscriber-management statistics <all> <dhcp> <pppoe>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management. Enhanced I/O Statistics introduced as part of Extensive output in Junos OS Release 15.1R4 on MX Series routers for enhanced subscriber management.
<b>Description</b>	Display statistics for the specified option. You can customize the output by including one or more optional filters in the command. With the exception of the <b>extensive</b> option, all filter options can be combined in a single command.
<b>Options</b>	<b>all</b> —(Optional) Display packet statistics for all protocol.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Understanding Dropped Packets and Untransmitted Traffic Using show Commands</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system subscriber-management statistics all on page 1830</a> <a href="#">show system subscriber-management statistics pppoe on page 1831</a> <a href="#">show system subscriber-management statistics dhcp on page 1831</a> <a href="#">show system subscriber-management statistics dhcp extensive on page 1832</a> <a href="#">show system subscriber-management statistics extensive on page 1833</a>
<b>Output Fields</b>	<a href="#">Table 153 on page 1826</a> lists the output fields for the <b>show system subscriber-management statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 154: show system subscriber-management statistics Output Fields

Field Name	Field Description
<b>Rx Statistics</b>	Statistics for packets received.
<b>Tx Statistics</b>	Statistics for packets sent.
<b>Enhanced I/O Statistics</b>	Statistics for visibility into packet drops from the queue.
<b>Error Statistics</b>	Includes connection packets, flow control, and messages and packets sent to and received from the daemon.
<b>ERA discards</b>	Event Rate Analyzer discards. For DHCP and PPPoE in advanced subscriber management, ERA packet discard counts are included for Discover, Solicit, and PADI packets .

Table 154: show system subscriber-management statistics Output Fields (*continued*)

Field Name	Field Description
<b>padis</b>	PPPoE Active Discovery Initiation (PADI) packets.  PADI is the first step in the PPPoE establishment protocol.
<b>padrs</b>	PPPoE Active Discovery Request packets.
<b>ppp</b>	Point-to-Point Protocol packets.
<b>router solicitations</b>	Number of router solicitations sent or received.  Router solicitations are sent to prompt all on-link routers to send it router advertisements.
<b>router advertisements</b>	Number of router advertisements sent or received.
<b>route solicit response packet</b>	Number of router solicitation responses sent or received.

## Sample Output

The following examples displays packet statistics accumulated for DHCP and PPPoE since the last time the session manager was cleared.

## show system subscriber-management summary

<b>Syntax</b>	show system subscriber-management summary
<b>Release Information</b>	Command introduced in Junos OS Release 11.1. Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.
<b>Description</b>	Display complete subscriber management database summary information.
<b>Options</b>	none—This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show database-replication statistics on page 1598</a></li> <li>• <a href="#">show database-replication summary on page 1600</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system subscriber-management summary on page 1836</a> <a href="#">show system subscriber-management summary (Enhanced Subscriber Management) on page 1837</a>
<b>Output Fields</b>	Table 155 on page 1835 lists the output fields for the <b>show system subscriber-management summary</b> command. Output fields are listed in the approximate order in which they appear.

**Table 155: show system subscriber-management summary Output Fields**

Field Name	Field Description
Graceful Restart	State of graceful Routing Engine switchover (GRES): <ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul> (Enhanced subscriber management for MX Series routers) The name of this field is <b>Graceful Switchover</b> .
Mastership	State of the Routing Engine: <ul style="list-style-type: none"> <li>• Master</li> <li>• Standby</li> </ul>
Database	State of the subscriber management database: <ul style="list-style-type: none"> <li>• Available</li> <li>• Init</li> <li>• Not-available</li> </ul>

Table 155: show system subscriber-management summary Output Fields (*continued*)

Field Name	Field Description
<b>Standby</b>	<p>(Enhanced subscriber management for MX Series routers) State of the standby Routing Engine:</p> <ul style="list-style-type: none"> <li>• <b>Connected</b>—Connected but not synchronized</li> <li>• <b>Disconnected</b>—Not connected</li> <li>• <b>Resync (<i>nn</i>%)</b>—Connected and <i>nn</i> percent synchronized with the master Routing Engine</li> <li>• <b>Synchronized</b>—Synchronized with the master Routing Engine</li> </ul>
Chassisd ISSU State	<p>State of unified ISSU chassis daemon:</p> <ul style="list-style-type: none"> <li>• ABORT</li> <li>• DAEMON_ISSU_PREPARE</li> <li>• DAEMON_ISSU_PREPARE_DONE</li> <li>• DAEMON_SWITCHOVER_PREPARE</li> <li>• DAEMON_SWITCHOVER_PREPARE_DONE</li> <li>• FRU_ISSU</li> <li>• FRU_ISSU_DONE</li> <li>• IDLE</li> <li>• UNKNOWN</li> </ul>
ISSU State	<p>State of unified ISSU aggregate daemon:</p> <ul style="list-style-type: none"> <li>• ABORT</li> <li>• IDLE</li> <li>• PREPARE</li> <li>• READY</li> <li>• SWITCHOVER_PREPARE</li> <li>• SWITCHOVER_READY</li> <li>• UNKNOWN</li> </ul>
ISSU Wait	<p>Amount of time, in seconds, requested by a daemon to perform cleanup. If multiple daemons request time, the displayed value is the highest wait time requested by a daemon.</p>

## Sample Output

### show system subscriber-management summary

```

user@host> show system subscriber-management summary
General:
Graceful Restart      Enabled
Mastership            Master
Database              Available
Chassisd ISSU State   DAEMON_ISSU_PREPARE
ISSU State            PREPARE
ISSU Wait             198

```

**show system subscriber-management summary (Enhanced Subscriber Management)**

```
user@host> show system subscriber-management summary
```

```
General:
```

Graceful Switchover	Enabled
Mastership	Master
Database	Available
Standby	Resync (75%)
Chassisd ISSU State	IDLE
ISSU State	IDLE
ISSU Wait	0

## test aaa authd-lite user

---

<b>Syntax</b>	<code>test aaa authd-lite user <i>username</i> password <i>password</i> profile <i>access-profile-name</i> &lt;port <i>nas-port</i>&gt; &lt;zero-stats&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Verify authd-lite subscriber access authentication, accounting, and address allocation configuration.
<b>Options</b>	<p><b><i>username</i></b>—Specify the subscriber username to test.</p> <p><b><i>password password</i></b>—Specify the password associated with the username.</p> <p><b><i>profile access-profile-name</i></b>—Specify the access profile associated with the subscriber.</p> <p><b><i>port nas-port</i></b>—(Optional) Specify the NAS port used for the test.</p> <p><b><i>zero-stats</i></b>—(Optional) Specify that no accounting statistics are set for this test.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Testing a Subscriber AAA Configuration on page 819</a></li></ul>
<b>List of Sample Output</b>	<a href="#">test aaa authd-lite user on page 1838</a>
<b>Output Fields</b>	<p>When you enter this command, you are provided feedback on the status of your request. For information about output fields related to authentication, accounting, and subscriber-specific information, see the <a href="#">show network-access aaa statistics</a>, <a href="#">show network-access aaa statistics authentication</a>, <a href="#">show network-access aaa subscribers</a>, and <a href="#">show subscribers</a> commands.</p> <p>The <b>test</b> command does not support volume-time accounting. If volume-time accounting is configured for the test subscriber, the <b>test</b> command replaces the statistics with time-only accounting statistics.</p> <p>This command displays only attributes that are supported by Junos OS; these attributes appear even when their values are not set. The Virtual Router Name (LS:RI) field matches the Juniper Networks Virtual-Router VSA (26-1), if present; otherwise the field displays default:default. The displayed value for all other attributes that are not received is <b>&lt;not set&gt;</b>.</p>

## Sample Output

### test aaa authd-lite user

The following example tests the configuration for authd-lite subscriber user1bt with a password of \$ABC123 and an access profile of employee12, and displays the resulting output:

```
user@host> test aaa authd-lite user user1bt password $ABC123 profile employee12
Authentication Grant
```

```

## test aaa dhcp user

**Syntax** test aaa dhcp user *username*  
 <agent-remote-id *ari*>  
 <logical-system *logical-system-name*>  
 <mac-address *mac-address*>  
 <no-address-request>  
 <option-82 *option-82*>  
 <password *password*>  
 <profile *access-profile-name*>  
 <routing-instance *routing-instance-name*>  
 <service-type *service-type*>  
 <source-address *source-address*>  
 <terminate-code *code-value*>

**Release Information** Command introduced in Junos OS Release 11.2.  
 Option **terminate-code** added in Junos OS Release 11.4.  
 Option **agent-remote-id** added in Junos OS Release 14.1.  
 Options **no-address-request** and **service-type** added in Junos OS Release 16.1.

**Description** Verify Dynamic Host Configuration Protocol (DHCP) subscriber access authentication, accounting, and address allocation configuration by creating a test pseudo session.

**Options** *username*—Subscriber username to test.

**agent-remote-id** *ari*—(Optional) Value of the DSL Forum Agent-Remote-Id (VSA 26–2).

**logical-system** *logical-system-name*—(Optional) Logical system in which the subscriber is authenticated. This is the logical system in the AAA LS:RI context for the subscriber. This context differs from the subscriber context, which is the LS:RI in which the subscriber is placed, by either the Virtual-Router VSA (26-1) or the Redirect-VRouter-Name VSA (26–25).

**mac-address** *mac-address*—(Optional) MAC address of the DHCP client.

**no-address-request**—(Optional) Prevents the test from failing when no user IP address is allocated. For example, for Layer 2 VLAN-OOB subscribers, the subscriber address is provided by means the RADIUS Client-Profile-Name VSA (26-174) rather than a direct allocation.

**option-82** *option-82*—(Optional) DHCP relay agent information option (option-82) value.

**password** *password*—(Optional) Password associated with the username.

**profile** *access-profile-name*—(Optional) Access profile associated with the subscriber.

**routing-instance** *routing-instance-name*—(Optional) Routing instance in which the subscriber is authenticated. This is the routing instance in the AAA LS:RI context for the subscriber. This context differs from the subscriber context, which is the LS:RI in which the subscriber is placed, by either the Virtual-Router VSA (26-1) or the Redirect-VRouter-Name VSA (26–25). In the case of VSA 26–25, the subscriber is re-authenticated in the subscriber context.

**service-type** *service-type*—(Optional) Value of the Service Type RADIUS attribute [6] that is associated with the test user; either a number in the range 1 through 255 or one of the following strings that corresponds to an RFC-defined service type; the numbers are the values that are carried in the RADIUS attribute to specify the service:

administrative (6)	callback-nas-prompt (9)
authenticate-only (8)	framed (2)
call-check (10)	login (1)
callback-admin (11)	nas-prompt (7)
callback-framed (4)	outbound (5)
callback-login (3)	—

**source-address** *source-address*—(Optional) IP address of the outgoing interface.

**terminate-code** *code-value*—(Optional) Code associated with the subscriber termination.

**Required Privilege Level**

view

**Related Documentation**

- [Testing a Subscriber AAA Configuration on page 819](#)

**List of Sample Output**

[test aaa dhcp user on page 1842](#)

**Output Fields**

When you enter this command, you are provided feedback on the status of your request. For information about output fields related to authentication, accounting, and subscriber-specific information, see the [show network-access aaa statistics](#), [show network-access aaa statistics authentication](#), [show network-access aaa subscribers](#), and [show subscribers](#) commands.

The **test** command does not support volume-time accounting. If volume-time accounting is configured for the test subscriber, the **test** command replaces the statistics with time-only accounting statistics.

This command displays only attributes that are supported by Junos OS; these attributes appear even when their values are not set. The Virtual Router Name (LS:RI) field matches the Juniper Networks Virtual-Router VSA (26-1), if present; otherwise the field displays default:default. The displayed value for all other attributes that are not received is **<not set>**.

## Sample Output

### test aaa ppp user (tunneled user)

The following example tests the configuration for PPP tunneled subscriber accounting14, with password \$ABC123 and access profile finance-b, and displays the resulting output:

```

user@host> test aaa ppp user accounting14 password $ABC123 14 profile finance-b
Authentication Grant with Tunnel Attributes
