| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the IP address for which the TCC router is proxying. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only. Ethernet TCC is not supported on the T640 routing node. |
| <b>Options</b>                  | <code>inet-address <i>address</i></code> —IP address for which the TCC router is acting as a proxy.                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                  |

## service-groups

**Syntax**

```

service-groups {
 service-group-name {
 pbb-service-options {
 default-isid isid-number;
 isid isid-number vlan-id-list [vlan-ids];
 mac-address mac-address;
 }
 service-type (elan | eline);
 source-bmac <mac-address> <length>
 }
}

```

**Hierarchy Level** [edit routing-instances (Multiple Routing Entities) *routing-instance-name*]

**Release Information** Statement introduced in JUNOS Release 10.0.

**Description** For IEEE 802.1ah provider backbone bridge (PBB) configurations, configure the service groups to be supported in the customer routing instance (I-component).

**NOTE:** The `mac-address` statement under `pbb-service-options` is not supported for PBB-EVPN.

**NOTE:** The `eline` option for the `service-type` statement is not supported for PBB-EVPN.

The remaining statements are explained separately. See [CLI Explorer](#).

**Options** *service-group-name*—Name of a service group.

**Required Privilege Level**

|                                                             |
|-------------------------------------------------------------|
| routing—To view this statement in the configuration.        |
| routing-control—To add this statement to the configuration. |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Specify an upper limit on the maximum site identifier that can be accepted to allow a pseudowire to be brought up. Pseudowires cannot be established to sites with site identifiers greater than the configured site range. If you issue the <b>show vpls connections</b> command, such sites are displayed as OR (out of range). |
| <b>Options</b>                  | <b><i>number</i></b> —Maximum number of site identifiers. We recommend using the default value.<br><b>Range:</b> 1 through 65,534<br><b>Default:</b> 65,534                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>For FEC 129, specify the VPWS source attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.</p> <p>Auto-discovery routes are used by BGP to allow auto-discovery of remote source access individual identifiers (SAIIs) (the sources of the point-to-point pseudowires). One auto-discovery route is advertised for each source attachment identifier (SAI) in the instance or mesh group.</p> <p>The SAII is specified with the <b>source-attachment-identifier</b> statement within the FEC 129 VPWS routing instance. You configure the source attachment identifier and the interfaces to associate with that source attachment identifier. Under each interface, you can configure the TAII with the <b>target-attachment-identifier</b> statement. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established.</p> |

| <b>Description</b>              | <p>Set a shared source Provider Backbone Bridging (PBB) MAC (B-MAC) address for all service identifiers (ISIDs) under a specified routing instance. If a source B-MAC address is derived automatically from the aggregated Ethernet system ID, you must specify the <b>auto</b> keyword.</p> <p>For PBB-Ethernet VPN (EVPN) functionality, one service group (a group of ISIDs) can correspond to a single-homed, single-Active, or Active-Active scenario. You cannot mix and match service groups. For a shared B-MAC model, you configure one source B-MAC per service group using the <b>routing-instances <i>routing-instance-name</i> pbb-options <i>service-groups</i> <i>service-group-name</i></b> hierarchy.</p> <p>To specify a source B-MAC per ISID, use the <b>routing-instances <i>routing-instance-name</i> pbb-options <i>service-groups</i> <i>service-group-name</i> isid <i>isid-name</i></b> hierarchy. If you do not specify the source B-MAC per ISID, then the B-MAC inherits from the B-MAC configuration located under the <b>pbb-options</b> setting.</p> |
| <b>Options</b>                  | <b>Length</b> —Length of the B-MAC address.<br><b>Default:</b> 48B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Configure the pseudowire to the specified backup neighbor as the standby. When you configure this statement, traffic flows over both the active and standby pseudowires to the backup device (either a CE device or PE router). The backup device drops the traffic from the standby pseudowire, unless the active pseudowire fails. If the active pseudowire fails, the backup device automatically switches to the standby pseudowire.</p> <p>The <b>standby</b> statement is quite similar to the <a href="#">hot-standby</a> statement introduced in Junos OS Release 12.3. The <b>hot-standby</b> statement allows for a faster forwarding-path switchover during transition periods, as compared to what is allowed by the <b>standby</b> statement.</p>                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | Specifies a static pseudowire for a VPLS domain. By configuring static pseudowires for the VPLS domain, you do not need to configure the LDP or BGP protocols that would normally be used for signaling. Static pseudowires require that you configure a set of in and out labels for each pseudowire configured for the VPLS domain. You can configure both static and dynamic neighbors within the same VPLS routing instance. You can also configure a static pseudowire for a backup neighbor (if you configure the neighbor as static the backup must also be static) and for a mesh group.                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>For FEC 129, specify the VPWS target attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.</p> <p>Auto-discovery routes are used by BGP to allow auto-discovery of SAIIs (the sources of the point-to-point pseudowires). One auto-discovery route is advertised for each source attachment identifier (SAI) in the instance or mesh group.</p> <p>The SAII is specified with the <b>source-attachment-identifier</b> statement within the FEC 129 VPWS routing instance. You configure the source attachment identifier and the interfaces to associate with that source attachment identifier. Under each interface, you can configure the TAII with the <b>target-attachment-identifier</b> statement. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established.</p> |

**Release Information** Statement introduced in Junos OS Release 8.2.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for BFD authentication introduced in Junos OS Release 9.6.  
 Statement introduced in Junos OS Release 12.1 for the QFX Series.  
 Statement introduced in Junos OS Release 13.2 for Layer 2 VPNs and VPLS.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify the threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**NOTE:** The threshold value must be equal to or greater than the transmit interval.

The threshold time must be equal to or greater than the value specified in the `minimum-interval` or the `minimum-receive-interval` statement.

**Options** *milliseconds*—Value for the detection time adaptation threshold.  
**Range:** 1 through 255,000

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 8.2.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 12.1 for QFX Series.  
 Statement introduced in Junos OS Release 13.2 for Layer 2 VPN and VPLS.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.

**Options** *milliseconds*—Value for the transmit interval adaptation threshold.  
**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**NOTE:** The threshold value specified in the *threshold* statement must be greater than the value specified in the *minimum-interval* statement for the *transmit-interval* statement.

| <b>Description</b>              | Configure tracing operations for egress protection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b><i>filename</i></b> —Name of the file to receive the output of the tracing operation.</p> <p><b><i>files number</i></b>—(Optional) Maximum number of trace files. If you specify a maximum number of files, you must also include the <b><i>size</i></b> statement to specify the maximum file size. When a trace file named <i>trace-file</i> reaches its maximum size, it is renamed <i>trace-file.0</i>, then <i>trace-file.1</i>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p><b><i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b><i>flag</i></b> statements.</p> <ul style="list-style-type: none"> <li>• <b><i>all</i></b>—Trace all operations</li> <li>• <b><i>error</i></b>—Trace error conditions</li> <li>• <b><i>route</i></b>—Trace route transitions</li> <li>• <b><i>state</i></b>—Trace state transitions</li> </ul> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b> | Statement introduced in Junos OS Release 13.2 for MX 3D Series routers.<br>Statement introduced in Junos OS Release 14.2 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Trace traffic flowing through an EVPN routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches the maximum size as specified by the <b>size</b> option, it is renamed <b><i>trace-file.0</i></b>. When <b><i>trace-file</i></b> again reaches the maximum size, <b><i>trace-file.0</i></b> is renamed <b><i>trace-file.1</i></b> and <b><i>trace-file</i></b> is renamed <b><i>trace-file.0</i></b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can specify the following tracing flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All EVPN tracing options</li><li>• <b>error</b>—Error conditions</li><li>• <b>general</b>—General events</li><li>• <b>mac-database</b>—MAC route database in the EVPN routing instance</li><li>• <b>nlri</b>—EVPN advertisements received or sent by means of BGP</li><li>• <b>normal</b>—Normal events</li><li>• <b>oam</b>—OAM messages</li><li>• <b>policy</b>—Policy processing</li><li>• <b>route</b>—Routing information</li><li>• <b>state</b>—State transitions</li><li>• <b>task</b>—Routing protocol task processing</li></ul> |

- **timer**—Routing protocol timer processing
- **topology**—EVPN topology changes caused by reconfiguration or advertisements received from other provider edge (PE) routers using BGP

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify the following modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable this trace flag.
- **receive**—Trace received packets.
- **send**—Trace sent packets.

**no-world-readable**—Do not allow any user to read the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches the maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files (as specified by the **files** option) is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—Allow any user to read the log file.

| <b>Description</b>         | Trace traffic flowing through a Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>connections</b>—Layer 2 circuit connections (events and state changes)</li><li>• <b>error</b>—Error conditions</li><li>• <b>fec</b>—Layer 2 circuit advertisements received or sent by means of LDP</li><li>• <b>topology</b>—Layer 2 circuit topology changes caused by reconfiguration or advertisements received from other PE routers</li></ul> <p><b>flag-modifier</b>—(Optional) Modifier for the tracing flag. You can specify the <b>detail</b> modifier if you want to provide detailed trace information.</p> <p><b>no-world-readable</b>—(Optional) Do not allow any user to read the log file.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b><i>trace-file</i></b> reaches this size, it is renamed</p> |

*trace-file.0*. When the *trace-file* again reaches its maximum size, *trace-file.0* is renamed *trace-file.1* and *trace-file* is renamed *trace-file.0*. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>         | Trace traffic flowing through a Layer 2 VPN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <i>trace-file</i> reaches its maximum size, it is renamed <i>trace-file.0</i>, then <i>trace-file.1</i>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>all</b>—All Layer 2 VPN tracing options</li><li>• <b>connections</b>—Layer 2 connections (events and state changes)</li><li>• <b>error</b>—Error conditions</li><li>• <b>general</b>—General events</li><li>• <b>nlri</b>—Layer 2 advertisements received or sent by means of the BGP</li><li>• <b>normal</b>—Normal events</li><li>• <b>policy</b>—Policy processing</li><li>• <b>route</b>—Routing information</li><li>• <b>state</b>—State transitions</li></ul> |

- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing
- **topology**—Layer 2 VPN topology changes caused by reconfiguration or advertisements received from other PE routers using BGP

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify the following modifier:

- **detail**—Provide detailed trace information
- **receive**—Trace received packets
- **send**—Trace transmitted packets

**no-world-readable**—(Optional) Prevents any user from reading the trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file.0*. When *trace-file* again reaches its maximum size, *trace-file.0* is renamed *trace-file.1* and *trace-file* is renamed *trace-file.0*. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *xk* to specify kilobytes, *xm* to specify megabytes, or *xg* to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the trace file.

**Default:** The default is **no-world-readable**.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | Trace traffic flowing through a VPLS routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" ").</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches this size, it is renamed <b><i>trace-file.0</i></b>. When <b><i>trace-file</i></b> again reaches its maximum size, <b><i>trace-file.0</i></b> is renamed <b><i>trace-file.1</i></b> and <b><i>trace-file</i></b> is renamed <b><i>trace-file.0</i></b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can specify the following tracing flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All VPLS tracing options</li><li>• <b>connections</b>—VPLS connections (events and state changes)</li><li>• <b>error</b>—Error conditions</li><li>• <b>nlri</b>—VPLS advertisements received or sent by means of the BGP</li><li>• <b>route</b>—Routing information</li><li>• <b>topology</b>—VPLS topology changes caused by reconfiguration or advertisements received from other provider edge (PE) routers using BGP</li></ul> <p><b>flag-modifier</b>—(Optional) Modifier for the tracing flag. You can specify the following modifiers:</p> |

- **detail**—Provide detailed trace information.
- **disable**—Disable the tracing flag.
- **receive**—Trace received packets.
- **send**—Trace sent packets.

**no-world-readable**—Do not allow any user to read the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—Allow any user to read the log file.

| <b>Description</b>         | <p>Specify the transmit interval for the <b>bfd-liveness-detection</b> statement. The negotiated transmit interval for a peer is the interval between the sending of BFD packets to peers. The receive interval for a peer is the minimum time that it requires between packets sent from its peer; the receive interval is not negotiated between peers. To determine the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.

The remaining statements are explained separately. See [CLI Explorer](#).

| <b>Description</b>         | Specify the BFD version for detection. You can explicitly configure BFD version 0, version 1, or the routing device can automatically detect the BFD version. By default, the routing device automatically detects the BFD version, which is either 0 or 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p>Configure the BFD version to detect: <b>0</b> (BFD version 0), <b>1</b> (BFD version 1), or <b>automatic</b> (autodetect the BFD version)</p> <p><b>Default:</b> automatic</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## virtual-circuit-id

---

**Syntax** virtual-circuit-id *identifier*;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols l2circuit local-switching interface *interface-name* backup-neighbor *address*],  
[edit logical-systems *logical-system-name* protocols l2circuit neighbor *address* interface *interface-name*],  
[edit logical-systems *logical-system-name* protocols l2circuit neighbor *address* interface *interface-name* backup-neighbor *address*],  
[edit protocols l2circuit local-switching interface *interface-name* backup-neighbor *address*],  
[edit protocols l2circuit neighbor *address* interface *interface-name*],  
[edit protocols l2circuit neighbor *address* interface *interface-name* backup-neighbor *address*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Hierarchy levels for **backup-neighbor** (pseudowire redundancy) added in Junos OS Release 9.2.  
Statement introduced in Junos OS Release 11.1 for EX Series switches.  
Statement introduced in Junos OS Release 12.3 at the [edit protocols l2circuit local-switching interface *interface-name* backup-neighbor *address*] hierarchy level.

**Description** Uniquely identify a Layer 2 circuit for either a standard pseudowire or a redundant pseudowire.

**Options** *identifier*—1 through 4,294,967,295

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>                                                                                                                                                                                      | Set the default IPv4 or IPv6 address for the gateway for end hosts. Because you must configure the virtual gateway address using the same IP address as on all of the provider edge (PE) devices (which internally generates the same Virtual Router Redundancy Protocol (VRRP) MAC), the need to proxy for remote gateway IP addresses is eliminated. Every logical integrated routing and bridging (IRB) interface can have a corresponding virtual gateway address. The maximum number of PEs that can have the same virtual gateway address is 64. |
| <div>  <b>NOTE:</b> Ping is not supported from the customer edge (CE) device to the virtual-gateway-address IP. </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                                                                                                                                                                                          | <b><i>address</i></b> —virtual gateway address. | <b>Release Information</b>      | Statement introduced in Junos OS Release 17.1 on MX Series routers with MPCs.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | Enables having the same MAC frames across multiple VXLAN segments without traffic crossover. Multicast in VXLAN is implemented as Layer 3 multicast, in which endpoints subscribe to groups. VNID is a 24-bit virtual network identifier that uniquely identifies the VXLAN segment.                                                                                                                                                     |

## vlan-tags (Stacked VLAN Tags)

|                            |                                                                                                                                                                                                                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>vlan-tags inner <i>tpid.vlan-id</i> inner-list <i>value</i> inner-range <i>vid1—vid2</i> outer <i>tpid.vlan-id</i>;</code>                                                                                                                                                                               |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ]                                                                                                               |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.                                                                                                                                                                 |
| <b>Description</b>         | For Gigabit Ethernet IQ and IQE interfaces only, bind TPIDs and 802.1Q VLAN tag IDs to a logical interface.                                                                                                                                                                                                    |
| <b>Options</b>             | <b>inner <i>tpid.vlan-id</i></b> —A TPID and a valid VLAN identifier.<br><b>Range:</b> (most routers) For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.<br><b>inner-list <i>value</i></b> —List or a set of VLAN identifiers. |

**NOTE:** This is supported on MX Series routers with Trio-based FPCs.

**inner-range *tpid. vid1—vid2***—Specify a TPID and a range of VLAN IDs where *vid1* is the start of the range and *vid2* is the end of the range.

**NOTE:** On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the inner-range *tpid. vid1—vid2* option with the `vlan-tags` statement for ISP-facing interfaces.

**Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

**outer *tpid.vlan-id***—A TPID and a valid VLAN identifier.

**Range:** (most routers) For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

**NOTE:** Configuring inner-range with the entire `vlan-id` range consumes system resources and is not a best practice. The inner-range must be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through 4094), it

has the same result as not specifying a range; however, it consumes Packet Forwarding Engine resources such as VLAN lookup table entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
stacked-vlan-tagging;
unit number {
 vlan-tags outer vid inner-range 1-4094;
}

[edit interfaces interface-name]
vlan-tagging;
unit number {
 vlan-id vid;
}
```

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## vpls (Interfaces)

**Syntax** vpls;

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family],  
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the VPLS protocol family information for the logical interface.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Identify the virtual circuit identifier used for the VPLS routing instance or mesh group. This statement is a part of the configuration to enable LDP signaling for VPLS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>The <b>vpls-id-list</b> option allows you to configure multiple pseudowires under LDP-VPLS neighbor by creating one pseudowire per virtual circuit id. This combination of neighbor and virtual circuit ID must be unique across the l2circuit and all local LDP-VPLS instances. The pseudowire will terminate in the specified mesh-group.</p> <p>As with other pseudowires, the pseudowires created here will signal the remote PE via LDP label mapping message. For each pseudowire created under a neighbor, VPLS will create a VT/LSI interface and add both it and the and label route to the mpls.0 table. Note that you can create multiple pseudowires between the same pair of PEs in LDP-VPLS for a single routing instances only.</p> <p>Enable <b>local-switching</b> along with <b>vpls-id-list</b> to allow local switching of traffic (including BUM traffic) between multiple pseudo wires. This can also eliminate the need to have a dedicated mesh-group for each LDP spoke pseudo wire (which has a limit of 14), and provide support for H-VPLS in EVP-LAN and EP-LAN topologies.</p> |
| <b>Options</b>                  | <b>vc-id-numbers</b> —The virtual circuit ID for the PE pair. This ID can be any number in the range of 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify the local and remote Ethernet VPN (EVPN)-Virtual Private Wire Service (VPWS) service identifiers. These service identifiers are unique to an EVPN and are used to identify the endpoints of the EVPN-VPWS network. These endpoints are autodiscovered by BGP and are used to exchange the service labels (learned from the respective provider edge (PE) routers) that are used by autodiscovered routes per EVI route type. Depending on the mode of operation of the PE routers in the EVPN-VPWS network, these two endpoints of the can be colocated on the same PE router or on different PE routers. |
| <b>Options</b>                  | <p><b>local</b>—Unique local VPWS service identifier of the EVPN-VPWS network. This identifies the logical interface of the PE router forwarding traffic to the PE router with a remote VPWS service identifier in the EVPN-VPWS network.</p> <p><b>Range:</b> 1 through 16,777,215</p> <p><b>remote</b>—Unique remote VPWS service identifier of the EVPN-VPWS network. This identifies the logical interface of the PE router receiving the traffic from the PE router with a local VPWS service identifier in the EVPN-VPWS network.</p> <p><b>Range:</b> 1 through 16,777,215</p>                             |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### clear pim snooping join

The following sample output displays information about PIM snooping joins before and after the **clear pim snooping join** command is entered:

```
user@host> show pim snooping join extensive
Instance: vpls1
Learning-Domain: vlan-id 10
Learning-Domain: vlan-id 20

Group: 198.51.100.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 192.0.2.5, port: ge-1/3/7.20
Downstream port: ge-1/3/1.20
```

```
Downstream neighbors:
192.0.2.2 State: Join Flags: SRW Timeout: 185

Group: 198.51.100.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 192.0.2.4, port: ge-1/3/5.20
Downstream port: ge-1/3/3.20
Downstream neighbors:
192.0.2.3 State: Join Flags: SRW Timeout: 175

user@host> clear pim snooping join
Clearing the Join/Prune state for 203.0.113.0/24
Clearing the Join/Prune state for 203.0.113.0/24

user@host> show pim snooping join extensive
Instance: vpls1
Learning-Domain: vlan-id 10
Learning-Domain: vlan-id 20
```

## Sample Output

### clear pim snooping statistics

The following sample output displays PIM snooping statistics before and after the **clear pim snooping statistics** command is entered:

```
user@host> show pim snooping statistics
Instance: vpls1
Learning-Domain: vlan-id 10

Tx J/P messages 0
RX J/P messages 660
Rx J/P messages -- seen 0
```

```
Rx J/P messages -- received 660
Rx Hello messages 1396
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
```

```
Learning-Domain: vlan-id 20
```

```
user@host> clear pim snooping statistics
user@host> show pim snooping statistics
Instance: vpls1
Learning-Domain: vlan-id 10
```

```
Tx J/P messages 0
RX J/P messages 0
Rx J/P messages -- seen 0
Rx J/P messages -- received 0
Rx Hello messages 0
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
```

```
Learning-Domain: vlan-id 20
```

| <b>Description</b>         | Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a <b>ping mpls l2circuit</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | <p><b>count</b> <i>count</i>—(Optional) Number of ping requests to send. If <b>count</b> is not specified, five ping requests are sent. The range of values is 1 through <b>1,000,000</b>. The default value is <b>5</b>.</p> <p><b>destination</b> <i>address</i>—(Optional) Specify an address other than the default (<b>127.0.0.1/32</b>) for the ping echo requests. The address can be anything within the <b>127/8</b> subnet.</p> <p><b>detail</b>—(Optional) Display detailed information about the echo requests sent and received.</p> <p><b>exp</b> <i>forwarding-class</i>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p><b>interface</b> <i>interface-name</i>—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.</p> <p><b>logical-system</b> (all   <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p><b>reply-mode</b>—(Optional) Reply mode for the ping request. This option has the following suboptions:</p> <ul style="list-style-type: none"><li><b>application-level-control-channel</b>—Reply using an application level control channel.</li><li><b>ip-udp</b>—Reply using an IPv4 or IPv6 UDP packet.</li><li><b>no-reply</b>—Do not reply to the ping request.</li></ul> |

**NOTE:** The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

**size bytes**—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**vt**—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

**virtual-circuit virtual-circuit-id neighbor address**—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

**Additional Information** You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

**List of Sample Output** [ping mpls l2circuit interface on page 1954](#)  
[ping mpls l2circuit virtual-circuit detail on page 1954](#)  
[ping mpls l2circuit interface <interface-name> reply-mode on page 1954](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls l2circuit interface

```
user@host> ping mpls l2circuit interface so-1/0/0.1
Request for seq 1, to interface 69, labels <100000, 100208>, packet size 100
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

### ping mpls l2circuit virtual-circuit detail

```
user@host> ping mpls l2circuit virtual-circuit 200 neighbor 10.255.245.122/32 detail
Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms
```

### ping mpls l2circuit interface <interface-name> reply-mode

```

| <b>Description</b>         | <p>Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a <b>ping mpls l2vpn</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>bottom-label-ttl</b>—(Optional) Display the time-to-live value for the bottom label in the label stack.</p> <p><b>count <i>count</i></b>—(Optional) Number of ping requests to send. If <b>count</b> is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p><b>destination <i>address</i></b>—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p><b>detail</b>—(Optional) Display detailed information about the echo requests sent and received.</p> <p><b>exp <i>forwarding-class</i></b>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p><b>instance <i>instance-name</i> local-site-id <i>local-site-id-number</i> remote-site-id <i>remote-site-id-number</i></b>—Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.</p> <p><b>interface <i>interface-name</i></b>—Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p><b>reply-mode</b>—(Optional) Reply mode for the ping request. This option has the following suboptions:</p> |

**application-level-control-channel**—Reply using an application level control channel.

**ip-udp**—Reply using an IPv4 or IPv6 UDP packet.

**no-reply**—Do not reply to the ping request.

The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

**size bytes**—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level**

network

**List of Sample Output**

[ping mpls l2vpn instance on page 1956](#)  
[ping mpls l2vpn instance detail on page 1957](#)  
[ping mpls l2vpn interface <interface-name> reply-mode on page 1957](#)

**Output Fields**

When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code these packets are not counted in the received packets count. They are accounted for separately.

## Sample Output

**ping mpls l2vpn instance**

```

## ping vpls instance

---

**Syntax** ping vpls instance *instance-name* destination-mac *address* source-ip *address*  
<bd-name *name*>  
<control-plane-response>  
<count *number*>  
<detail>  
<learning-vlan-id *number*>  
<logical-system *logical-system-name*>

**Release Information** Command introduced in Junos OS Release 9.1.

**Description** Check the operability of virtual private LAN service (VPLS) connections. Type Ctrl+c to interrupt a **ping vpls instance** command.

When you issue a **ping vpls instance** command, a chassis MAC address is drawn from the ingress PE router's pool of MAC addresses and used to create the VPLS ping packet. The ping packet is then forwarded to the egress PE router. When the egress PE router receives the ping packet, it learns the MAC address from the VPLS ping packet. The MAC address is added to the egress PE router's MAC table.

The **ping vpls instance** command relies on the LSP ping and trace infrastructure defined in RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures* and further enhancements defined in Internet draft draft-stokes-vkompella-ppvpn-hvpls-oam-02, *Testing Hierarchical Virtual Private LAN Services*.

**Options** **instance** *instance-name*—Specify the name of the VPLS routing instance.

**destination-mac** *address*—Specify a destination MAC address for the ping echo requests.

**source ip** *address*—IP address of the outgoing interface.

**bd-name** *name*—(Optional) Name of the bridge domain.

**control-plane-response**—(Optional) Request VPLS OAM responses using the control plane.

**count** *number*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**learning-vlan-id** *number*—(Optional) Specify a learning VLAN identifier for the ping echo requests. The range of values is 0 through 4094.

**logical-system** *logical-system-name*—(Optional) Specify a logical system name for the ping echo requests.

**Additional Information** This statement is only supported on the MX Series routers, the M120 and M320 routers, and the T1600 router.

**Required Privilege Level** network

**List of Sample Output** [ping vpls instance on page 1959](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

| <b>Release Information</b>      | Command introduced in Junos OS Release 9.2.<br>Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Manually trigger a switch from the active pseudowire to the redundant pseudowire. This command can be useful when performing network maintenance.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.<br><br><b>neighbor <i>address</i></b> —(Optional) Trigger a switch of all of the active pseudowire connections with the specified neighbor to their respective redundant pseudowires.<br><br><b>virtual-circuit-id <i>identifier</i></b> —(Optional) Trigger a switch from the active pseudowire connection of the specified Layer 2 circuit to its redundant pseudowire. |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 35: show evpn database Output Fields

| Field Name           | Field Description                                       | Level of Output  |
|----------------------|---------------------------------------------------------|------------------|
| <b>Instance</b>      | Name of the routing instances.                          | All Levels       |
| <b>VNI</b>           | VXLAN network identifier.                               | All Levels       |
| <b>MAC address</b>   | MAC address of the routing instance.                    | All Levels       |
| <b>Origin</b>        | Specific origin of the MAC address.                     | All Levels       |
| <b>Timestamp</b>     | Month, day and time of generated command output.        | All Levels       |
| <b>IP address</b>    | IP address.                                             | All Levels       |
| <b>Prefix</b>        | Prefix address of the VXLAN network identifier.         | <b>extensive</b> |
| <b>Source</b>        | Source address of the VXLAN network identifier.         | <b>extensive</b> |
| <b>Rank</b>          | Level number of the VXLAN network identifier.           | <b>extensive</b> |
| <b>Status</b>        | Status of the of the VXLAN network identifier.          | <b>extensive</b> |
| <b>Remote origin</b> | Specific remote origin of the VXLAN network identifier. | <b>extensive</b> |

## Sample Output

### show evpn database

```

user@host> show evpn database
Instance: bd_red
VNI MAC address Origin Timestamp IP address
50 1a:1b:1b:1b:1b:1b 192.0.2.3 Jun 12 21:57:17
50 1a:1c:1c:1c:1c:1c ge-2/3/0.0 Jun 12 22:05:37
50 b0:c6:9a:e9:cd:d8 192.0.2.3 Jun 12 21:57:17
50 b0:c6:9a:ea:87:42 ge-2/3/0.0 Jun 12 22:05:38

Instance: evpn-0
VNI MAC address Origin Timestamp IP address
4000 1a:1a:1a:1a:01:01 ge-2/3/0.10 Jun 12 21:53:01
4000 1a:1a:1a:1a:01:02 ge-2/3/0.10 Jun 12 21:53:01

```

### show evpn database extensive

```

user@host> show evpn database extensive
Instance: ALPHA

| <b>Output Fields</b>            | <a href="#">Table 36 on page 1965</a> lists the output fields for the <b>show evpn instance</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 36: show evpn instance Output Fields

| Field Name                                | Field Description                                                                                                                                                                                                                                                                  | Level of Output  |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Instance</b>                           | Names of the routing instances.                                                                                                                                                                                                                                                    | All Levels       |
| <b>Intfs</b>                              | Total number of interfaces participating in each routing instance, and number of interfaces that are up.                                                                                                                                                                           | <b>brief</b>     |
| <b>IRB intfs</b>                          | Statistics on number of IRB interfaces for each routing instance: <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of IRB interfaces.</li> <li>• <b>Up</b>—Number of active IRB interfaces.</li> <li>• <b>Nbrs</b>—Number of neighbor IRB interfaces.</li> </ul> | <b>brief</b>     |
| <b>MH ESIs</b>                            | Number of Ethernet segments per routing instance that connect to a multihomed customer site.                                                                                                                                                                                       | <b>brief</b>     |
| <b>MAC addresses</b>                      | Number of local and remote MAC addresses for each routing instance.                                                                                                                                                                                                                | <b>brief</b>     |
| <b>Route Distinguisher</b>                | Unique route distinguisher associated with this routing instance.                                                                                                                                                                                                                  | <b>none</b>      |
| <b>VLAN ID</b>                            | VLAN identifier.                                                                                                                                                                                                                                                                   | <b>none</b>      |
| <b>Label allocation mode</b>              | Label allocation policy for the routing instance.                                                                                                                                                                                                                                  | <b>none</b>      |
| <b>Encapsulation type</b>                 | Encapsulation type for VXLAN EVPN instances (EVIs).                                                                                                                                                                                                                                | <b>extensive</b> |
| <b>Per-instance MAC route label</b>       | Label of MAC route for each routing instance.                                                                                                                                                                                                                                      | <b>none</b>      |
| <b>Per-instance multicast route label</b> | Label of multicast route for each routing instance.                                                                                                                                                                                                                                | <b>none</b>      |
| <b>Total MAC addresses</b>                | Total number of local and remote MAC addresses received for each routing instance.                                                                                                                                                                                                 | <b>extensive</b> |
| <b>Default gateway MAC addresses</b>      | Number of local and remote MAC addresses serving as a default gateway in the routing instance.                                                                                                                                                                                     | <b>extensive</b> |
| <b>Number of local interfaces</b>         | Number of local interfaces belonging to this routing instance.                                                                                                                                                                                                                     | <b>extensive</b> |
| <b>Number of local interfaces up</b>      | Number of active local interfaces belonging to this routing instance.                                                                                                                                                                                                              | <b>extensive</b> |
| <b>Interface name</b>                     | Name of interfaces that belong to this routing instance.                                                                                                                                                                                                                           | <b>extensive</b> |
| <b>ESI</b>                                | Ethernet segment identifier (ESI) value of the interfaces belonging to this routing instance.                                                                                                                                                                                      | <b>extensive</b> |

Table 36: show evpn instance Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output  |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Mode</b>                         | Mode of operation for each routing instance: <ul style="list-style-type: none"> <li>• <b>single-homed</b>—Default mode and does not require Ethernet segment values to be configured.</li> <li>• <b>single-active</b>—EVPN active-standby multihoming mode of operation.</li> </ul>                                                                                                                                                                  | <b>extensive</b> |
| <b>SH label</b>                     | Split horizon label used for the active-standby multihoming mode of operation.                                                                                                                                                                                                                                                                                                                                                                       | <b>extensive</b> |
| <b>Number of IRB interfaces</b>     | Number of IRB interfaces that belong to this routing instance.                                                                                                                                                                                                                                                                                                                                                                                       | <b>extensive</b> |
| <b>L3 context</b>                   | Names of routing instances that have the Layer 3 routes installed for an EVPN IRB interface, typically a VRF routing instance.                                                                                                                                                                                                                                                                                                                       | <b>extensive</b> |
| <b>Number of neighbors</b>          | Number of neighbors connected to this routing instance and their IP addresses.                                                                                                                                                                                                                                                                                                                                                                       | <b>extensive</b> |
| <b>MAC address advertisement</b>    | Number of MAC address advertisements received from the neighbor.                                                                                                                                                                                                                                                                                                                                                                                     | <b>extensive</b> |
| <b>MAC+IP address advertisement</b> | Number of MAC and IP address advertisements received from the neighbor.                                                                                                                                                                                                                                                                                                                                                                              | <b>extensive</b> |
| <b>Inclusive multicast</b>          | Number of inclusive multicast routes received from the neighbor.                                                                                                                                                                                                                                                                                                                                                                                     | <b>extensive</b> |
| <b>Ethernet auto-discovery</b>      | Number of autodiscovery routes per Ethernet segment received from the neighbor.                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b> |
| <b>Number of ethernet segments</b>  | Total number of Ethernet segments for the routing instance.                                                                                                                                                                                                                                                                                                                                                                                          | <b>extensive</b> |
| <b>Designated forwarder</b>         | IP address of the designated forwarder (DF) for the Ethernet segment.                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b> |
| <b>Backup forwarder</b>             | IP address of all the backup designated forwarders or routers that are not designated forwarders for the Ethernet segment.<br><br><b>NOTE:</b> Immediately after an EVPN interface Ethernet segment identifier value is changed and the new configuration is committed, the <b>Designated forwarder</b> information changes to <b>DF not elected yet</b> and the Backup forwarder information is not displayed until after the election is complete. | <b>extensive</b> |

ESI: 00:11:22:33:44:55:66:77:88:99
Designated forwarder: 10.255.0.1
```

## show evpn prefix

**Syntax** `show evpn prefix`

**Release Information** Command introduced in Junos OS Release 17.1 on MX Series routers with MPCs.

**Description** Display Ethernet VPN (EVPN) information for imported and exported prefixes.

**Required Privilege Level** view

**List of Sample Output** [show evpn prefixes on page 1971](#)

**Output Fields** The table 2 lists the output fields for the `show evpn ip-prefix-database` command. Output fields are listed in the approximate order in which they appear.

**Table 37: show evpn prefix Output Fields**

| Field Name    | Field Description                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------|
| VLAN          | VLAN identifier of the Layer 2 circuit.                                                                          |
| VNI           | VXLAN network identifier for the Layer 3 virtual and routing forwarding (VRF) for the customer or tenant domain. |
| Prefix        | MAC address associated with the IP prefix.                                                                       |
| Active Source | The IP address or the ESI value or the IRB interface name of the source.                                         |
| Timestamp     | Month, day and time of generated command output.                                                                 |

## Sample Output

### show evpn prefixes

```

user@host > show evpn prefixes
Instance: ALPHA
VLAN VNI Prefix Active source Timestamp

 9100 10.0.0.0/24 10.255.0.2 May 22
17:16:12
 9100 20.0.0.0/24 00:11:22:33:44:55:66:77:88:99 May 22
22:33:35
 9100 30.0.0.0/24 irb.0 May 22
17:13:31
 9100 40.0.0.0/24 10.255.0.3 May 22
17:14:20

```

## show evpn vpws-instance

|                                 |                                                                                                                                                                                                 |

**Table 38: show evpn vpws-instance Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance                   | Name of the routing instance.                                                                                                                                                                                                                                                                                                                                                            |
| Route Distinguisher        | Route distinguisher as configured for the routing instance on the node.                                                                                                                                                                                                                                                                                                                  |
| Number of local interfaces | Number of interfaces configured to be part of the routing instance.                                                                                                                                                                                                                                                                                                                      |
| Interface name             | Name of the interface.                                                                                                                                                                                                                                                                                                                                                                   |
| ESI                        | Ethernet segment identifier (ESI) configured for the interface.                                                                                                                                                                                                                                                                                                                          |
| Mode                       | Single-homed, single-active, or all-active form of multihoming.                                                                                                                                                                                                                                                                                                                          |
| Role                       | Primary or backup, depending on the role. The role, depending on the mode, is as follows: <ul style="list-style-type: none"> <li>Single-active multihoming—Role is primary if the interface is the designated forwarder (DF) and backup if the interface is the non-DF.</li> <li>All-active multihoming—Role is always primary.</li> <li>Single-homed—Role is always primary.</li> </ul> |
| Status                     | Status of the interface is either Up or Down. Interface is available if the status is Up and interface is not available if the interface is Down.                                                                                                                                                                                                                                        |
| Local SID                  | Local service identifier configured on the interface.                                                                                                                                                                                                                                                                                                                                    |

Table 38: show evpn vpws-instance Output Fields (*continued*)

| Field Name                                                                      | Field Description                                                                                                                                                                                                                                                                                                                                                                   |

## show interfaces lsi (Label-Switched Interface)

**Syntax** `show interfaces interface-type`  
`<brief | detail | extensive | terse>`  
`<descriptions>`  
`<media>`  
`<routing-instance instance-name>`  
`<snmp-index snmp-index>`  
`<statistics>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display status information about the specified label-switched interface (LSI).

**Options** *interface-type*—On most routers, the interface type is *lt-fpc/pic/port*.

*brief | detail | extensive | terse*—(Optional) Display the specified level of output.

*descriptions*—(Optional) Display interface description strings.

*media*—(Optional) Display media-specific information about network interfaces.

*routing-instance instance-name*—(Optional) Display information for the specified routing instance.

*snmp-index snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

*statistics*—(Optional) Display static interface statistics.

**Required Privilege Level** view

| Logical interface  | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels                   |
| Index              | Logical interface index number, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> none |
| SNMP ifIndex       | SNMP interface index number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> none |
| Generation         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b>      |
| Flags              | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels                   |
| Encapsulation      | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels                   |
| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Rate of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Rate of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Rate of packets received on the interface.</li> <li>• <b>Output packets</b>—Rate of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>      |
| Local statistics   | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b>      |
| Transit statistics | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b>      |
| Protocol           | Protocol family configured on the logical interface, such as <b>iso</b> , <b>inet6</b> , <b>mpls</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> none |
| MTU                | MTU size on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> none |
| Generation         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b>      |
| Flags              | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b> none |

## Sample Output

### show interfaces lsi extensive

```

[show l2circuit connections extensive \(Pseudowire Redundancy with Hot Standby\)](#) on page 1986

**Output Fields** [Table 40 on page 1981](#) lists the output fields for the **show l2circuit connections** command. Output fields are listed in the approximate order in which they appear.

**Table 40: show l2circuit connections Output Fields**

| Field Name                         | Field Description                                                      |
|------------------------------------|------------------------------------------------------------------------|
| <b>Layer-2 Circuit Connections</b> | Displays the legends for connection and interface status.              |
| <b>Neighbor</b>                    | Remote PE neighbor.                                                    |
| <b>Interface</b>                   | Logical PE-to-CE interface on which the virtual circuit is configured. |
| <b>Type</b>                        | VC type: <b>rmt</b> (remote) or <b>loc</b> (local).                    |

Table 40: show l2circuit connections Output Fields (*continued*)

| Field Name                               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Encapsulation</b>            | Encapsulation of the local interface.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Flow Label Transmit</b>      | Flow label transmit status.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Flow Label Receive</b>       | Flow label receive status.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Remote PE</b>                | Prefix of the remote PE router.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Negotiated control-word</b>  | Whether the use of the control word has been negotiated for this virtual circuit: <b>Yes (Null)</b> or <b>No</b> .                                                                                                                                                                                                                                                                                                  |
| <b>Incoming label</b>           | Label used by the remote side of the virtual circuit to send packets destined to the local side. This label is routed to the local virtual circuit interface.                                                                                                                                                                                                                                                       |
| <b>Outgoing label</b>           | Label used by the local side of the virtual circuit to send packets to the remote side of the virtual circuit. Packets originated on the local virtual circuit interface are encapsulated with this label before being placed on the tunnel LSP to the neighbor for this virtual circuit. This label is allocated by the neighbor and is used in demultiplexing incoming packets destined for this virtual circuit. |
| <b>Negotiated PW status TLV</b> | Displays the pseudowire status type, length, and value (TLV). TLVs are a method of encoding variable-length or optional information. If the pseudowire status TLV is used, the corresponding local or neighbor PE router status code is also displayed.                                                                                                                                                             |
| <b>local PW status code</b>     | If the pseudowire status TLV is used, displays the local PE router status code.                                                                                                                                                                                                                                                                                                                                     |
| <b>Neighbor PW status code</b>  | If the pseudowire status TLV is used, displays the neighbor PE router status code.                                                                                                                                                                                                                                                                                                                                  |
| <b>Local interface</b>          | Name of the local interface used for the Layer 2 circuit connection.                                                                                                                                                                                                                                                                                                                                                |
| <b>Status</b>                   | Status of the local interface ( <b>Up</b> or <b>Down</b> ).                                                                                                                                                                                                                                                                                                                                                         |
| <b>Encapsulation</b>            | Encapsulation configured for the local interface.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>APS-active</b>               | Indicates that the interface belongs to the working circuit.                                                                                                                                                                                                                                                                                                                                                        |

**Output Fields** Table 41 on page 1989 lists the output fields for the **show l2vpn connections** command. Output fields are listed in the approximate order in which they appear.

**Table 41: show l2vpn connections Output Fields**

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>                   | Name of Layer 2 VPN instance.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>L2vpn-id</b>                   | For BGP autodiscovery, a globally unique Layer 2 VPN community identifier for the instance.                                                                                                                                                                                                                                                                                                    |
| <b>Local-ID</b>                   | BGP <b>local-address</b> assigned to the local routing device.                                                                                                                                                                                                                                                                                                                                 |
| <b>Local site</b>                 | Name of local site.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Local source-attachment-id</b> | For FEC 129, the VPWS source attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.                                                                                                     |
| <b>Target-attachment-id</b>       | For FEC 129, the VPWS target attachment identifier. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established. |
| <b>Interface name</b>             | Name of interface.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Remote Site ID</b>             | Remote site ID.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Label Offset</b>               | Numbers within the label block that are skipped to find the next label base.                                                                                                                                                                                                                                                                                                                   |
| <b>Label-base</b>                 | Advertises the first label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                               |
| <b>Range</b>                      | Advertises the label block size.                                                                                                                                                                                                                                                                                                                                                               |
| <b>status-vector</b>              | Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of 0 indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of 1 indicates either one or both are down.                                                                                                                                                    |
| <b>connection-site</b>            | Name of the connection site.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Type</b>                       | Type of connection: <b>loc</b> (local) or <b>rmt</b> (remote).                                                                                                                                                                                                                                                                                                                                 |
| <b>St</b>                         | Status of the connection. (For a list of possible values, see the <b>Legend for connection status (St)</b> field.)                                                                                                                                                                                                                                                                             |
| <b>Time last up</b>               | Time that the connection was last in the <b>Up</b> condition.                                                                                                                                                                                                                                                                                                                                  |

Table 41: show l2vpn connections Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| St             | <p>Status of the Layer 2 VPN connection (corresponds with Legend for Connection Status):</p> <ul style="list-style-type: none"> <li>• <b>EI</b>—The local Layer 2 VPN interface is configured with an encapsulation that is not supported.</li> <li>• <b>EM</b>—The encapsulation type received on this Layer 2 VPN connection from the neighbor does not match the local Layer 2 VPN connection interface encapsulation type.</li> <li>• <b>VC-Dn</b>—The virtual circuit is currently down.</li> <li>• <b>CM</b>—The two routers do not agree on a control word, which causes a control word mismatch.</li> <li>• <b>CN</b>—The virtual circuit is not provisioned properly.</li> <li>• <b>OR</b>—The label associated with the virtual circuit is out of range.</li> <li>• <b>OL</b>—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.</li> <li>• <b>LD</b>—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>RD</b>—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>LN</b>—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site.</li> <li>• <b>RN</b>—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site.</li> <li>• <b>XX</b>—The Layer 2 VPN connection is down for an unknown reason. This is a programming error.</li> <li>• <b>NC</b>—The interface encapsulation is not configured as an appropriate CCC, TCC, or Layer 2 VPN encapsulation.</li> <li>• <b>WE</b>—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the Layer 2 VPN routing instance.</li> <li>• <b>NP</b>—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance.</li> <li>• <b>-&gt;</b>—Only the outbound connection is up.</li> <li>• <b>&lt;-</b>—Only the inbound connection is up.</li> <li>• <b>Up</b>—The Layer 2 VPN connection is operational.</li> <li>• <b>Dn</b>—The Layer 2 VPN connection is down.</li> <li>• <b>CF</b>—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 VPN connection bandwidth requirement.</li> </ul> |

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            | <ul style="list-style-type: none"> <li>• <b>SC</b>—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers.</li> <li>• <b>LM</b>—The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site, and the associated local site identifier is not being used to distribute Layer 2 VPN label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state.</li> <li>• <b>RM</b>—The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot establish a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state.</li> <li>• <b>IL</b>—The incoming packets for the Layer 2 VPN connection have no MPLS label.</li> </ul> |
| <b>Remote PE</b>           | Address of the remote provider edge router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Incoming label</b>      | Name of the incoming label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Outgoing label</b>      | Name of the outgoing label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Egress Protection</b>   | Whether the given PVC is protected by connection protection logic using egress protection for BGP signaled layer 2 services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Flow Label Receive</b>  | Capability to pop the flow label in the receive direction to the remote provider edge (PE) router                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Flow Label Transmit</b> | Capability to push the flow label in the transmit direction to the provider edge (PE) router                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Output Fields</b>            | Table 42 on page 1995 lists the output fields for the <b>show pim snooping interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 42: show pim snooping interface Output Fields

| Field Name | Field Description                  | Level of Output |
|------------|------------------------------------|-----------------|
| Instance   | Routing instance for PIM snooping. | All levels      |

Table 42: show pim snooping interface Output Fields (*continued*)

| Field Name             | Field Description                                                        | Level of Output |
|------------------------|--------------------------------------------------------------------------|-----------------|
| <b>Learning-Domain</b> | Learning domain for snooping.                                            | All levels      |
| <b>Name</b>            | Router interfaces that are part of this learning domain.                 | All levels      |
| <b>State</b>           | State of the interface: <b>Up</b> , or <b>Down</b> .                     | All levels      |
| <b>IP-Version</b>      | Version of IP used: <b>4</b> for IPv4, or <b>6</b> for IPv6.             | All levels      |
| <b>NbrCnt</b>          | Number of neighboring routers connected through the specified interface. | All levels      |
| <b>DR address</b>      | IP address of the designated router.                                     | All levels      |

## Sample Output

### show pim snooping interfaces

```

user@host> show pim snooping interfaces
Instance: vpls1
Learning-Domain: vlan-id 10
Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
ge-1/3/3.10 Up 4 1
ge-1/3/5.10 Up 4 1
ge-1/3/7.10 Up 4 1
DR address: 192.0.2.5
DR flooding is ON

Learning-Domain: vlan-id 20
Name State IP-Version NbrCnt
ge-1/3/1.20 Up 4 1
ge-1/3/3.20 Up 4 1
ge-1/3/5.20 Up 4 1
ge-1/3/7.20 Up 4 1
DR address: 192.0.2.6
DR flooding is ON

```

### show pim snooping interfaces instance vpls1

```

user@host> show pim snooping interfaces instance vpls1
Instance: vpls1

Learning-Domain: vlan-id 10
Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
ge-1/3/3.10 Up 4 1
ge-1/3/5.10 Up 4 1
ge-1/3/7.10 Up 4 1
DR address: 192.0.2.5
DR flooding is ON

Learning-Domain: vlan-id 20
Name State IP-Version NbrCnt

```

```

ge-1/3/1.20 Up 4 1
ge-1/3/3.20 Up 4 1
ge-1/3/5.20 Up 4 1
ge-1/3/7.20 Up 4 1
DR address: 192.0.2.6
DR flooding is ON

```

#### show pim snooping interfaces interface <interface-name>

```

user@host> show pim snooping interfaces interface ge-1/3/1.10
Instance: vpls1
Learning-Domain: vlan-id 10

Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
DR address: 192.0.2.5
DR flooding is ON

Learning-Domain: vlan-id 20
DR address: 192.0.2.6
DR flooding is ON

```

#### show pim snooping interfaces vlan-id <vlan-id>

```

user@host> show pim snooping interfaces vlan-id 10
Instance: vpls1
Learning-Domain: vlan-id 10

Name State IP-Version NbrCnt
ge-1/3/1.10 Up 4 1
ge-1/3/3.10 Up 4 1
ge-1/3/5.10 Up 4 1
ge-1/3/7.10 Up 4 1
DR address: 192.0.2.5
DR flooding is ON

```

Table 44: show pim snooping neighbors Output Fields

| Field Name                          | Field Description                                                                                                                                                                                                                                                                             | Level of Output |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Instance</b>                     | Routing instance for PIM snooping.                                                                                                                                                                                                                                                            | All levels      |
| <b>Learning-Domain</b>              | Learning domain for PIM snooping.                                                                                                                                                                                                                                                             | All levels      |
| <b>Interface</b>                    | Router interface for which PIM snooping neighbor details are displayed.                                                                                                                                                                                                                       | All levels      |
| <b>Option</b>                       | PIM snooping options available on the specified interface: <ul style="list-style-type: none"> <li>• H = Hello Option Holdtime</li> <li>• P = Hello Option DR Priority</li> <li>• L = Hello Option LAN Prune Delay</li> <li>• G = Generation Identifier</li> <li>• T = Tracking Bit</li> </ul> | All levels      |
| <b>Uptime</b>                       | Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.                                                                                               | All levels      |
| <b>Neighbor addr</b>                | IP address of the PIM snooping neighbor connected through the specified interface.                                                                                                                                                                                                            | All levels      |
| <b>Address</b>                      | IP address of the specified router interface.                                                                                                                                                                                                                                                 | All levels      |
| <b>Hello Option Holdtime</b>        | Time for which the neighbor is available, in seconds. The range of values is <b>0</b> through <b>65,535</b> .                                                                                                                                                                                 | <b>detail</b>   |
| <b>Hello Option DR Priority</b>     | Designated router election priority. The range of values is <b>0</b> through <b>4294967295</b> .<br><br><b>NOTE:</b> By default, every PIM interface has an equal probability (priority 1) of being selected as the DR.                                                                       | <b>detail</b>   |
| <b>Hello Option Generation ID</b>   | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                        | <b>detail</b>   |
| <b>Hello Option LAN Prune Delay</b> | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                                | <b>detail</b>   |

## Sample Output

### show pim snooping neighbors

```

user@host> show pim snooping neighbors
B = Bidirectional Capable, G = Generation Identifier,

**Table 45: show pim snooping statistics Output Fields**

| Field Name      | Field Description                  | Level of Output |
|-----------------|------------------------------------|-----------------|
| Instance        | Routing instance for PIM snooping. | All levels      |
| Learning-Domain | Learning domain for PIM snooping.  | All levels      |

Table 45: show pim snooping statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                 | Level of Output |
|-------------------------------------|-----------------------------------------------------------------------------------|-----------------|
| <b>Tx J/P messages</b>              | Total number of transmitted join/prune packets.                                   | All levels      |
| <b>Rx J/P messages</b>              | Total number of received join/prune packets.                                      | All levels      |
| <b>Rx J/P messages -- seen</b>      | Number of join/prune packets seen but not received on the upstream interface.     | All levels      |
| <b>Rx J/P messages -- received</b>  | Number of join/prune packets received on the downstream interface.                | All levels      |
| <b>Rx Hello messages</b>            | Total number of received hello packets.                                           | All levels      |
| <b>Rx Version Unknown</b>           | Number of packets received with an unknown version number.                        | All levels      |
| <b>Rx Neighbor Unknown</b>          | Number of packets received from an unknown neighbor.                              | All levels      |
| <b>Rx Upstream Neighbor Unknown</b> | Number of packets received with unknown upstream neighbor information.            | All levels      |
| <b>Rx Bad Length</b>                | Number of packets received containing incorrect length information.               | All levels      |
| <b>Rx J/P Busy Drop</b>             | Number of join/prune packets dropped while the router is busy.                    | All levels      |
| <b>Rx J/P Group Aggregate 0</b>     | Number of join/prune packets received containing the aggregate group information. | All levels      |
| <b>Rx Malformed Packet</b>          | Number of malformed packets received.                                             | All levels      |
| <b>Rx No PIM Interface</b>          | Number of packets received without the interface information.                     | All levels      |
| <b>Rx No Upstream Neighbor</b>      | Number of packets received without upstream neighbor information.                 | All levels      |
| <b>Rx Unknown Hello Option</b>      | Number of hello packets received with unknown options.                            | All levels      |

## Sample Output

### show pim snooping statistics

```

user@host> show pim snooping statistics
Instance: vpls1
Learning-Domain: vlan-id 10

Tx J/P messages 0
Rx J/P messages 8

```

```

Rx J/P messages -- seen 0
Rx J/P messages -- received 8
Rx Hello messages 37
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
Rx No PIM Interface 0
Rx No Upstream Neighbor 0
Rx Bad Length 0
Rx Neighbor Unknown 0
Rx Unknown Hello Option 0
Rx Malformed Packet 0

Rx J/P Group Aggregate 0
Rx Malformed Packet 0
Rx No PIM Interface 0
Rx No Upstream Neighbor 0
Rx Bad Length 0
Rx Neighbor Unknown 0
```

## show route

---

**List of Syntax**    [Syntax on page 2012](#)  
                         [Syntax \(EX Series Switches\) on page 2012](#)

**Syntax**    show route  
              <all>  
              <destination-prefix>  
              <logical-system (all | *logical-system-name*)>  
              <private>  
              <te-ipv4-prefix-ip *te-ipv4-prefix-ip*>  
              <te-ipv4-prefix-node-ip *te-ipv4-prefix-node-ip*>  
              <te-ipv4-prefix-node-iso *te-ipv4-prefix-node-iso*>

**Syntax (EX Series Switches)**    show route  
                                          <all>  
                                          <destination-prefix>  
                                          <private>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Option **private** introduced in Junos OS Release 9.5.  
                              Option **private** introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.  
                              Option **display-client-data** introduced in Junos OS Release 16.2R1 on MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series routers.  
                              Options **te-ipv4-prefix-ip**, **te-ipv4-prefix-node-ip**, and **te-ipv4-prefix-node-iso** introduced in Junos OS Release 17.2R1 on MX Series and PTX Series.

**Description**    Display the active entries in the routing tables.

**Options**    **none**—Display brief information about all active entries in the routing tables.

**all**—(Optional) Display information about all routing tables, including private, or internal, routing tables.

**destination-prefix**—(Optional) Display active entries for the specified address or range of addresses.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**private**—(Optional) Display information only about all private, or internal, routing tables.

**display-client-data** —(Optional) Display client id and cookie information for routes installed by rpd client applications.

**te-ipv4-prefix-ip *te-ipv4-prefix-ip***—(Optional) Display IPv4 address of the traffic-engineering prefix, without the mask length if present in the routing table.

**te-ipv4-prefix-node-ip** *te-ipv4-prefix-node-ip*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 node addresses from the traffic-engineered routes in the **lsdist.0** table.

**te-ipv4-prefix-node-iso** *te-ipv4-prefix-node-iso*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 routes with the specified ISO circuit ID from the **lsdist.0** table.

**Output Fields** [Table 46 on page 2013](#) describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

**Table 46: show route Output Fields**

| Field Name                 | Field Description                                                       |
|----------------------------|-------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                        |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |

Table 46: show route Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number routes</i>                        | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>                   | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>                                                                                                                                                                      |
| [ <i>protocol, preference</i> ]             | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                               |
| <i>weeks:days<br/>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>metric</i>                               | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 46: show route Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>localpref</b>        | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>from</b>             | Interface from which the route was received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>AS path</b>          | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>Route Labels</b>     | Stack of labels carried in the BGP route update.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>to</b>               | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 46: show route Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| via             | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul> |
| Private unicast | (Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes <i>not</i> managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| balance         | Distribution of the load based on the underlying operational interface bandwidth for equal-cost multipaths (ECMP) across the nexthop gateways in percentages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### show route (VPN)

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```
user@host> show route 192.0.2.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)
+ = Active Route, - = Last Active, * = Both

192.0.2.0/24 [BGP/170] 00:28:32, localpref 100, from 10.9.9.160
 AS path: 13980 ?, validation-state: unverified
 > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
 [BGP/170] 00:28:28, localpref 100, from 10.9.9.169
 AS path: 13980 ?, validation-state: unverified
 > to 10.100.0.42 via ae2.0, Push 126016, Push 300368(top)
 #[Multipath/255] 00:28:28, metric2 102
 > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
 to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
```

### show route (with Destination Prefix)

```
user@host> show route 172.16.0.0/12

| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> <li>• <b>inclusive multicast Ethernet tag route</b>—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> <li>• <b>route distinguisher</b>—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</li> <li>• <b>Ethernet tag ID</b>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</li> <li>• <b>IP address length</b>—(1 octet) Length of IP address in bits.</li> <li>• <b>originating router's IP address</b>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</li> </ul> </li> </ul> |
| label stacking                                 | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 47: show route table Output Fields (*continued*)

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ <i>protocol, preference</i> ]               | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> |
| Level                                         | (IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Route Distinguisher                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PMSI                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Next-hop type                                 | Type of next hop. For a description of possible values for this field, see <a href="#">Table 48 on page 2036</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Next-hop reference count                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Flood nexthop branches exceed maximum message | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Source                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Next hop                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| via                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>                                                                                                          |
| Label-switched-path <i>lsp-path-name</i>      | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 47: show route table Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Label operation   | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                          |
| Interface         | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Protocol next hop | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Indirect next hop | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| State             | State of the route (a route can be in more than one state). See <a href="#">Table 49 on page 2037</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Local AS          | AS number of the local routing devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Age               | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AIGP              | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Metric            | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                   |
| MED-plus-IGP      | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TTL-Action        | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Task              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Announcement bits | <p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, <b><i>n-Resolve inet</i></b> indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <li><b><i>n</i></b>—An index used by Juniper Networks customer support only.</li> </ul> |

Table 47: show route table Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AS path             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| validation-state    | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FECs bound to route | Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Primary Upstream    | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| RPF Nexthops        | When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Label               | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 47: show route table Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| weight                              | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                    |
| VC Label                            | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                                 | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLAN ID                             | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Prefixes bound to route             | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                    |
| Communities                         | Community path attribute for the route. See <a href="#">Table 50 on page 2039</a> for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                             |
| Layer2-info: encaps                 | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| control flags                       | Control flags: <b>none</b> or <b>Site Down</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| mtu                                 | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Label-Base, range                   | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                                |
| status vector                       | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Accepted Multipath                  | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Accepted LongLivedStale             | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                                  |
| Accepted LongLivedStaleImport       | <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p> |
| ImportAccepted LongLivedStaleImport | <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>                                                                                                                                                                       |
| Accepted MultipathContrib           | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Localpref                           | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Router ID                           | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 47: show route table Output Fields (*continued*)

| Field Name            | Field Description                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------|
| Primary Routing Table | In a routing table group, the name of the primary routing table in which the route resides.    |
| Secondary Tables      | In a routing table group, the name of one or more secondary tables in which the route resides. |

Table 48 on page 2036 describes all possible values for the Next-hop Types output field.

Table 48: Next-hop Types Output Field Values

| Next-Hop Type            | Description                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Broadcast (bcast)        | Broadcast next hop.                                                                                                                                                                                                                                                            |
| Deny                     | Deny next hop.                                                                                                                                                                                                                                                                 |
| Discard                  | Discard next hop.                                                                                                                                                                                                                                                              |
| Flood                    | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| Hold                     | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                           |
| Indexed (idxd)           | Indexed next hop.                                                                                                                                                                                                                                                              |
| Indirect (indr)          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                   |
| Interface                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                   |
| Local (locl)             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                         |
| Multicast (mcst)         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                  |
| Multicast discard (mdsc) | Multicast discard.                                                                                                                                                                                                                                                             |
| Multicast group (mgrp)   | Multicast group member.                                                                                                                                                                                                                                                        |
| Receive (recv)           | Receive.                                                                                                                                                                                                                                                                       |
| Reject (rjct)            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                 |

Table 48: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type            | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resolve (rslv)           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                          |
| Routed multicast (mcrtr) | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                  |
| Router                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as a next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| Table                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                      |
| Unicast (ucst)           | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Unilist (ulst)           | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                  |

Table 49 on page 2037 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 49: State Output Field Values

| Value                                 | Description                                                                      |
|---------------------------------------|----------------------------------------------------------------------------------|
| Accounting                            | Route needs accounting.                                                          |
| Active                                | Route is active.                                                                 |
| Always Compare MED                    | Path with a lower multiple exit discriminator (MED) is available.                |
| AS path                               | Shorter AS path is available.                                                    |
| Cisco Non-deterministic MED selection | Cisco nondeterministic MED is enabled, and a path with a lower MED is available. |
| Clone                                 | Route is a clone.                                                                |
| Cluster list length                   | Length of cluster list sent by the route reflector.                              |
| Delete                                | Route has been deleted.                                                          |
| Ex                                    | Exterior route.                                                                  |

Table 49: State Output Field Values (*continued*)

| Value                                       | Description                                                                                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ext                                         | BGP route received from an external BGP neighbor.                                                                                                                                    |
| FlashAll                                    | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden                                      | Route not used because of routing policy.                                                                                                                                            |
| IfCheck                                     | Route needs forwarding RPF check.                                                                                                                                                    |
| IGP metric                                  | Path through next hop with lower IGP metric is available.                                                                                                                            |
| Inactive reason                             | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| Initial                                     | Route being added.                                                                                                                                                                   |
| Int                                         | Interior route.                                                                                                                                                                      |
| Int Ext                                     | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| Interior > Exterior > Exterior via Interior | Direct, static, IGP, or EBGp path is available.                                                                                                                                      |
| Local Preference                            | Path with a higher local preference value is available.                                                                                                                              |
| Martian                                     | Route is a martian (ignored because it is obviously invalid).                                                                                                                        |
| MartianOK                                   | Route exempt from martian filtering.                                                                                                                                                 |
| Next hop address                            | Path with lower metric next hop is available.                                                                                                                                        |
| No difference                               | Path from neighbor with lower IP address is available.                                                                                                                               |
| NoReadvrt                                   | Route not to be advertised.                                                                                                                                                          |
| NotBest                                     | Route not chosen because it does not have the lowest MED.                                                                                                                            |
| Not Best in its group                       | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                            |
| NotInstall                                  | Route not to be installed in the forwarding table.                                                                                                                                   |
| Number of gateways                          | Path with a greater number of next hops is available.                                                                                                                                |
| Origin                                      | Path with a lower origin code is available.                                                                                                                                          |

Table 49: State Output Field Values (*continued*)

| Value                          | Description                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pending                        | Route pending because of a hold-down configured on another route.                                                                                                                                                                 |
| Release                        | Route scheduled for release.                                                                                                                                                                                                      |
| RIB preference                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| Route Distinguisher            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| Route Metric or MED comparison | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| Route Preference               | Route with lower preference value is available.                                                                                                                                                                                   |
| Router ID                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| Secondary                      | Route not a primary route.                                                                                                                                                                                                        |
| Unusable path                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| Update source                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

[Table 50 on page 2039](#) describes the possible values for the Communities output field.

Table 50: Communities Output Field Values

| Value                                                             | Description                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                                | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                        |
| <b>bandwidth: local AS</b><br><b>number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| <b>domain-id</b>                                                  | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                           |
| <b>domain-id-vendor</b>                                           | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                   |
| <i>link-bandwidth-number</i>                                      | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).                                                                                                                                                                                                               |
| <i>local AS number</i>                                            | Local AS number: from 1 through 65,535.                                                                                                                                                                                                                                               |

Table 50: Communities Output Field Values (*continued*)

| Value                                | Description                                                                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>options</i>                       | 1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                        |
| <i>origin</i>                        | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                                  |
| <i>ospf-route-type</i>               | 1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses. |
| <i>route-type-vendor</i>             | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <i>area-number:ospf-route-type:options</i> .                                                                                            |
| <i>rte-type</i>                      | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <i>area-number:ospf-route-type:options</i> .                                                                                            |
| <i>target</i>                        | Defines which VPN the route participates in; <b>target</b> has the format <i>32-bit IP address:16-bit number</i> . For example, 10.19.0.0:100.                                                                                                                                                          |
| <i>unknown IANA</i>                  | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                        |
| <i>unknown OSPF vendor community</i> | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                                         |

## Sample Output

### show route table bgp.l2vpn

```

user@host> show route table bgp.l2vpn
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.24.1:1:4:1/96
 *[BGP/170] 01:08:58, localpref 100, from 192.168.24.1
 AS path: I
 > to 10.0.16.2 via fe-0/0/1.0, label-switched-path am

```

### show route table bgp.l3vpn.0

```

user@host> show route table bgp.l3vpn.0
bgp.l3vpn.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.71.15:100:10.255.71.17/32

## show route table (EVPN)

**Syntax** `show route table routing-table-name`

**Release Information** Command introduced in Junos OS Release 17.1 on MX Series routers with MPCs.

**Description** Display the route entries in a particular routing table.

**Required Privilege Level** view

**List of Sample Output** [show route table ALPHA.evpn.0 on page 2067](#)

### Sample Output

#### show route table ALPHA.evpn.0

```
user@host> show route table ALPHA.evpn.0
ALPHA.evpn.0: 20 destinations, 20 routes (20 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

5:10.255.0.1:100::9100::10.0.0.0::24/304
 *[EVPN/170] 01:51:55

                 <multicast>  
                 <table *routing-instance-name*>  
                 <vpn *vpn*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Option **bridge-domain** introduced in Junos OS Release 7.5

Option **learning-vlan-id** introduced in Junos OS Release 8.4

Options **all** and **vlan** introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **bridge** (**ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn**), **ethernet-switching**, **evpn**, **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mcsnoop-inet**, **mcsnoop-inet6**, **mpls**, **satellite-inet**, **satellite-inet6**, **satellite-vpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers,

display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id *learning-vlan-id***—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching *matching***—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** —(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the **show route instance** command.

**vlan (all | *vlan-name*)**—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn *vpn***—(Optional) Display routing table entries for a specified VPN.

**Required Privilege  
Level**

view

**Output Fields** [Table 51 on page 2071](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

**Table 51: show route forwarding-table Output Fields**

| Field Name     | Field Description                                                                                                                                                                                            | Level of Output |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Logical system | Name of the logical system. This field is displayed if you specify the <b>table</b> <i>logical-system-name/routing-instance-name</i> option on a device that is configured for and supports logical systems. | All levels      |
| Routing table  | Name of the routing table (for example, inet, inet6, mpls).                                                                                                                                                  | All levels      |

Table 51: show route forwarding-table Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output         |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Enabled protocols | <p>The features and protocols that have been enabled for a given routing table. This field can contain the following values:</p> <ul style="list-style-type: none"> <li>• BUM hashing—BUM hashing is enabled.</li> <li>• MAC Stats—Mac Statistics is enabled.</li> <li>• Bridging—Routing instance is a normal layer 2 bridge.</li> <li>• No VLAN—No VLANs are associated with the bridge domain.</li> <li>• All VLANs—The <b>vlan-id all</b> statement has been enabled for this bridge domain.</li> <li>• Single VLAN—Single VLAN ID is associated with the bridge domain.</li> <li>• MAC action drop—New MACs will be dropped when the MAC address limit is reached.</li> <li>• Dual VLAN—Dual VLAN tags are associated with the bridge domain</li> <li>• No local switching—No local switching is enabled for this routing instance..</li> <li>• Learning disabled—Layer 2 learning is disabled for this routing instance.</li> <li>• MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached.</li> <li>• VPLS—The VPLS protocol is enabled.</li> <li>• No IRB I2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance.</li> <li>• ACKed by all peers—All peers have acknowledged this routing instance.</li> <li>• BUM Pruning—BUM pruning is enabled on the VPLS instance.</li> <li>• Def BD VXLAN—VXLAN is enabled for the default bridge domain.</li> <li>• EVPN—EVPN protocol is enabled for this routing instance.</li> <li>• Def BD OVSDb—Open vSwitch Database (OVSDb) is enabled on the default bridge domain.</li> <li>• Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain.</li> <li>• L2 backhaul—Layer 2 backhaul is enabled.</li> <li>• FRR optimize—Fast reroute optimization</li> <li>• MAC pinning—MAC pinning is enabled for this bridge domain.</li> <li>• MAC Aging Timer—The MAC table aging time is set per routing instance.</li> <li>• EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation.</li> <li>• PBBN—This routing instance is configured as a provider backbone bridged network.</li> <li>• PBN—This routing instance is configured as a provider bridge network.</li> <li>• ETREE—The ETREE protocol is enabled on this EVPN routing instance.</li> <li>• ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance.</li> <li>• Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain.</li> <li>• MPLS control word—Control word is enabled for this MPLS routing instance.</li> </ul> | All levels              |
| Address family    | Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels              |
| Destination       | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |

Table 51: show route forwarding-table Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Route Type (Type)       | <p>How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li>• <b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li>• <b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li>• <b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li>• <b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li>• <b>ignore (ignr)</b>—Ignore this route.</li> <li>• <b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li>• <b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li>• <b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul> | All levels              |
| Route Reference (RtRef) | Number of routes to reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

| Next hop Type (Type)       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b> —Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrst)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| Reference (NhRef)          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| Next-hop interface (Netif) | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive none</b> |
| Weight                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| Balance                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| RPF interface              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>             |

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```

so-1/1/0 {
 unit 0 {
 family inet {
 rpf-check;
 address 192.0.2.2/30;
 }
 }
}

user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
Destination: 192.0.2.3/32

```

```

Route type: destination
Route reference: 0
Flags: sent to PFE
Nexthop: 192.0.2.3
Next-hop type: broadcast
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0

Route interface-index: 67
Index: 328 Reference: 1

```

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 52: show security group-vpn member ike security-associations Output Fields**

| Field Name   | Field Description                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Index</b> | Index number of an SA. This number is an internally generated number you can use to display information about a single SA.                                                                                   |
| <b>State</b> | State of the IKE security associations: <ul style="list-style-type: none"> <li>• <b>DOWN</b>—SA has not been negotiated with the peer.</li> <li>• <b>UP</b>—SA has been negotiated with the peer.</li> </ul> |

Table 52: show security group-vpn member ike security-associations Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Initiator cookie</b>      | Random number, called a cookie, which is sent to the remote node when the IKE negotiation is triggered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Responder cookie</b>      | <p>Random number generated by the remote node and sent back to the initiator as a verification that the packets were received.</p> <p>A cookie is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Mode</b>                  | <p>Negotiation method agreed on by the two IPsec endpoints, or peers, used to exchange information between themselves. Each exchange type determines the number of messages and the payload types that are contained in each message. The modes, or exchange types, are</p> <ul style="list-style-type: none"> <li>• <b>main</b>—The exchange is done with six messages. This mode or exchange type encrypts the payload, protecting the identity of the neighbor. The authentication method used is displayed: preshared keys or certificate.</li> <li>• <b>aggressive</b>—The exchange is done with three messages. This mode or exchange type does not encrypt the payload, leaving the identity of the neighbor unprotected.</li> </ul> |
| <b>Remote Address</b>        | IP address of the destination peer with which the local peer communicates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>IKE Peer</b>              | IP address of the destination peer with which the local peer communicates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Exchange type</b>         | <p>Negotiation method agreed on by the two IPsec endpoints, or peers, used to exchange information between themselves. Each exchange type determines the number of messages and the payload types that are contained in each message. The modes, or exchange types, are</p> <ul style="list-style-type: none"> <li>• <b>main</b>—The exchange is done with six messages. This mode or exchange type encrypts the payload, protecting the identity of the neighbor. The authentication method used is displayed: preshared keys or certificate.</li> <li>• <b>aggressive</b>—The exchange is done with three messages. This mode or exchange type does not encrypt the payload, leaving the identity of the neighbor unprotected.</li> </ul> |
| <b>Authentication method</b> | <p>Method the server uses to authenticate the source of IKE messages:</p> <ul style="list-style-type: none"> <li>• <b>pre-shared-keys</b>—Preshared key for encryption and decryption that both participants must have before beginning tunnel negotiations.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Local</b>                 | Address of the local peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Lifetime</b>              | Number of seconds remaining until the IKE SA expires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## show security pki ca-certificate (View)

**Syntax** show security pki ca-certificate  
<brief | detail>  
<ca-profile *ca-profile-name* >

**Release Information** Command modified in Junos OS Release 8.5. Subject string output field added in Junos OS Release 12.1X44-D10. Policy identifier output field added in Junos OS Release 12.3X48-D10.

**Description** Display information about the certificate authority (CA) public key infrastructure (PKI) digital certificates configured on the device.

**NOTE:** The FIPS image does not permit the use of MD5 fingerprints. Therefore, MD5 fingerprints are not included when a certificate is displayed using this command. The SHA-1 fingerprint that is currently displayed is retained in the FIPS image. The Simple Certificate Enrollment Protocol (SCEP) is disabled in the FIPS image.

- Options**
- none—Display basic information about all configured CA certificates.
  - brief | detail—(Optional) Display the specified level of output.
  - ca-profile *ca-profile-name*- (Optional) Display information about only the specified CA certificate.

**Required Privilege Level** view

- Related Documentation**
- [ca-profile \(Security PKI\)](#)
  - [request security pki ca-certificate verify \(Security\)](#)

**List of Sample Output** [show security pki ca-certificate ca-profile RootCA brief on page 2091](#)  
[show security pki ca-certificate ca-profile RootCA detail on page 2091](#)  
[show security pki ca-certificate ca-profile ca-tmp detail on page 2091](#)

**Output Fields** [Table 53 on page 2089](#) lists the output fields for the **show security pki ca-certificate** command. Output fields are listed in the approximate order in which they appear.

**Table 53: show security pki ca-certificate Output Fields**

| Field Name             | Field Description                |
|------------------------|----------------------------------|
| Certificate identifier | Name of the digital certificate. |

Table 53: show security pki ca-certificate Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Certificate version  | Revision number of the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Serial number        | Unique serial number of the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Issuer               | <p>Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>Country</b>—Country of origin.</li> <li>• <b>Locality</b>—Locality of origin.</li> <li>• <b>Common name</b>—Name of the authority.</li> </ul>                                                  |
| Subject              | <p>Details of the digital certificate holder organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>Country</b>—Country of origin.</li> <li>• <b>Locality</b>—Locality of origin.</li> <li>• <b>Common name</b>—Name of the authority.</li> </ul> <p>If the certificate contains multiple subfield entries, all entries are displayed.</p> |
| Subject string       | Subject field as it appears in the certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Validity             | <p>Time period when the digital certificate is valid. Values are:</p> <ul style="list-style-type: none"> <li>• <b>Not before</b>—Start time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul>                                                                                                                                                                                                                                                      |
| Public key algorithm | Encryption algorithm used with the private key, such as <b>rsaEncryption(1024 bits)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Signature algorithm  | Encryption algorithm that the CA used to sign the digital certificate, such as <b>sha1WithRSAEncryption</b> .                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Certificate Policy   | <b>Policy Identifier</b> —One or more policy object identifiers (OIDs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Use for key          | Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Data encipherment</b> .                                                                                                                                                                                                                                                                                                                                                                                                  |
| Fingerprint          | Secure Hash Algorithm ( <b>SHA1</b> ) and Message Digest 5 ( <b>MD5</b> ) hashes used to identify the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Distribution CRL     | Distinguished name information and the URL for the certificate revocation list (CRL) server.                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Instance</b>                      | Name of the VPLS instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Local site</b>                    | Name of the local site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>VPLS-id</b>                       | Identifier for the VPLS site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Number of local interfaces</b>    | Number of interfaces configured for the local site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Number of local interfaces up</b> | Number of interfaces configured for the local site that are currently up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>IRB interface present</b>         | Indicates whether or not an integrated routing and bridging (IRB) interface is present ( <b>yes</b> or <b>no</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Intf</b>                          | <p>List of all of the interfaces configured for the local site. The types of interfaces can include VPLS virtual loopback tunnel interfaces and label-switched interfaces. Any interface that supports VPLS could be listed here.</p> <p>Virtual loopback tunnel interfaces are displayed using the <b>vt-fpc/pic/port.nnnnn</b> format. Label-switched interfaces are displayed using the <b>lsi.nnnnn</b> format. In both cases, <b>nnnnn</b> is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain.</p> <p>Each interface might include the following information:</p> <ul style="list-style-type: none"> <li>• Identification as a VPLS interface</li> <li>• Name of the associated VPLS routing instance</li> <li>• Local site number</li> <li>• Remote site number</li> <li>• VPLS neighbor address</li> <li>• VPLS identifier</li> </ul> |
| <b>Interface flags</b>               | <p>Flag associated with the interface. Can include the following:</p> <ul style="list-style-type: none"> <li>• <b>VC-Down</b>—The virtual circuit associated with this interface is down.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Label-base</b>                    | First label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 54: show vpls connections Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Offset</b>          | Displays the VPLS Edge (VE) block offset in the Layer 2 VPN NLRI. The VE block offset is used to identify a label block from which a particular label value is selected to setup a pseudowire for a remote site. The block offset value itself indicates the starting VE ID that maps to the label base contained in the VPLS NLRI advertisement.                                                                                           |
| <b>Size</b>            | Label block size. A configurable value that represents the number of label blocks required to cover all the pseudowires for the remote peer. Acceptable configuration values are: <b>2</b> , <b>4</b> , <b>8</b> and <b>16</b> . The default value is <b>2</b> . A value of <b>0</b> will be displayed when using the <b>remote-site</b> option.                                                                                            |
| <b>Range</b>           | Label block range. A value that keeps track of the numbers of remote sites discovered within each label block.                                                                                                                                                                                                                                                                                                                              |
| <b>Preference</b>      | Preference value advertised for a VPLS site. When multiple PE routers are assigned the same VE ID for multihoming, you might need to specify that a particular PE router acts as the designated forwarder by configuring the site preference value. The site preference indicates the degree of preference for a particular customer site. The site preference is one of the tie-breaking criteria used in a designated forwarder election. |
| <b>status-vector</b>   | Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of <b>0</b> indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of <b>1</b> indicates either one or both are down.                                                                                                                                                                                   |
| <b>connection-site</b> | Name of the connection site.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Neighbor</b>        | IP address and VPLS identifier for the VPLS neighbor. If multiple pseudowires have been configured, the IP address will also show the PW-specific <a href="#">vpls-id-list</a> , for example, 203.0.113.144 (vpls-id 200).                                                                                                                                                                                                                  |
| <b>Type</b>            | Type of connection: <b>loc</b> (local) or <b>rmt</b> (remote).                                                                                                                                                                                                                                                                                                                                                                              |

Table 54: show vpls connections Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>St</b>  | <p>Status of the VPLS connection (corresponds with Legend for Connection Status):</p> <ul style="list-style-type: none"> <li>• <b>EI</b>—The local VPLS interface is configured with an encapsulation that is not supported.</li> <li>• <b>EM</b>—The encapsulation type received on this VPLS connection from the neighbor does not match the local VPLS connection interface encapsulation type.</li> <li>• <b>VC-Dn</b>—The virtual circuit is currently down.</li> <li>• <b>CM</b>—The two routers do not agree on a control word, which causes a control word mismatch.</li> <li>• <b>CN</b>—The virtual circuit is not provisioned properly.</li> <li>• <b>OR</b>—The label associated with the virtual circuit is out of range.</li> <li>• <b>OL</b>—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.</li> <li>• <b>LD</b>—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>RD</b>—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>LN</b>—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site.</li> <li>• <b>RN</b>—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site.</li> </ul> <p>In a multihoming configuration, one multihomed PE site displays the state <b>LN</b>, and the other multihomed PE site displays the state <b>RN</b> in the following circumstances:</p> <ul style="list-style-type: none"> <li>• The multihomed links are both configured to be the backup site.</li> <li>• The two multihomed PE routers have the same site ID, but have a peering relationship with a route reflector (RR) that has a different site ID.</li> </ul> <ul style="list-style-type: none"> <li>• <b>XX</b>—The VPLS connection is down for an unknown reason. This is a programming error.</li> <li>• <b>MM</b>—The MTU for the local site and the remote site do not match.</li> <li>• <b>BK</b>—The router is using a backup connection.</li> <li>• <b>PF</b>—Profile parse failure.</li> <li>• <b>RS</b>—The remote site is in a standby state.</li> <li>• <b>NC</b>—The interface encapsulation is not configured as an appropriate CCC, TCC, or VPLS encapsulation.</li> <li>• <b>WE</b>—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the VPLS routing instance.</li> </ul> |

Table 54: show vpls connections Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | <ul style="list-style-type: none"> <li>• <b>NP</b>—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance.</li> <li>• <b>--&gt;</b>—Only the outbound connection is up.</li> <li>• <b>&lt;--</b>—Only the inbound connection is up.</li> <li>• <b>Up</b>—The VPLS connection is operational.</li> <li>• <b>Dn</b>—The VPLS connection is down.</li> <li>• <b>CF</b>—The router cannot find enough bandwidth to the remote router to satisfy the VPLS connection bandwidth requirement.</li> <li>• <b>SC</b>—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers.</li> <li>• <b>LM</b>—The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site, and the associated local site identifier is not being used to distribute VPLS label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state.</li> <li>• <b>RM</b>—The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot establish a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state.</li> <li>• <b>IL</b>—The incoming packets for the VPLS connection have no MPLS label.</li> <li>• <b>MI</b>—The configured mesh group identifier is in use by another system in the network.</li> <li>• <b>ST</b>—The router has switched to a standby connection.</li> <li>• <b>PB</b>—Profile busy.</li> <li>• <b>SN</b>—The VPLS neighbor is static.</li> </ul> |
| <b>Time last up</b>  | Time connection was last in the <b>Up</b> condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b># Up trans</b>    | Number of transitions from <b>Down</b> to <b>Up</b> condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Outgoing label</b>           | Name of the outgoing label.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Negotiated PW status TLV</b> | Indicates whether or not the pseudowire status TLV has been negotiated for the VPLS connection.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Local interface</b>          | Provides the following information about the local interface configured for the VPLS neighbor: <ul style="list-style-type: none"> <li>• Name of the local interface</li> <li>• <b>Status</b>—Interface status (<b>Up</b> or <b>Down</b>)</li> <li>• <b>Encapsulation</b>—Interface encapsulation (for example, <b>ETHERNET</b>)</li> <li>• <b>Description</b>—Includes the VPLS instance name, the VPLS neighbor address, and the VPLS identifier</li> </ul> |
| <b>Time</b>                     | Date and time of VPLS connection event.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Event</b>                    | Type of event.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Interface/Lbl/PE</b>         | Interface, label, or PE router.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Connection History</b>       | Each entry can include the date, time, year, and the connection event. Connection events include any of a variety of events related to VPLS connections, such as route changes, label updates, and interfaces going down or coming up.                                                                                                                                                                                                                       |

## Sample Output

### show vpls connections

```
user@host> show vpls connections
```

```
Layer-2 VPN connections:
```

```
Legend for connection status (St)
```

```

EI -- encapsulation invalid NC -- interface encapsulation not CCC/TCC/VPLS
EM -- encapsulation mismatch WE -- interface and instance encaps not same
VC-Dn -- Virtual circuit down NP -- interface hardware not present
CM -- control-word mismatch -< -- only outbound connection is up
CN -- circuit not provisioned >- -- only inbound connection is up
OR -- out of range Up -- operational
OL -- no outgoing label Dn -- down
LD -- local site signaled down CF -- call admission control failure
RD -- remote site signaled down SC -- local and remote site ID collision
LN -- local site not designated LM -- local site ID not minimum designated
RN -- remote site not designated RM -- remote site ID not minimum designated
XX -- unn connection status IL -- no incoming label
MM -- MTU mismatch MI -- Mesh-Group ID not available
BK -- Backup connection ST -- Standby connection

```

PF -- Profile parse failure      PB -- Profile busy

## show vpls flood event-queue

**Syntax**    show vpls flood event-queue

**Release Information**    Command introduced in Junos OS Release 8.0.

**Description**    Display the pending events in the VPLS flood queue.

**Options**    This command has no options.

**Required Privilege Level**    view

**List of Sample Output**    [show vpls flood event-queue on page 2104](#)

**Output Fields**    [Table 55 on page 2104](#) lists the output fields for the **show vpls flood event-queue** command. Output fields are listed in the approximate order in which they appear.

**Table 55: show vpls flood event-queue Output Fields**

| Field Name                   | Field Description                                                        |
|------------------------------|--------------------------------------------------------------------------|
| <b>Current Pending Event</b> | Provides information on the current event in the VPLS flood event queue. |
| <b>Name</b>                  | Name of the event.                                                       |
| <b>Owner Name</b>            | Name of the interface associated with the flood event.                   |
| <b>Pending Op</b>            | Pending operation for the event.                                         |
| <b>Last Error</b>            | Name of the last error encountered.                                      |
| <b>Number of Retries</b>     | Number of attempts made to update the event queue.                       |
| <b>Pending Event List</b>    | List of the events awaiting processing.                                  |
| <b>Event Name</b>            | Name of the event.                                                       |
| <b>Pending Op</b>            | Pending operation for the event.                                         |
| <b>Event Identifier</b>      | Name of the interface associated with the flood event.                   |

## Sample Output

### show vpls flood event-queue

```
user@host> show vpls flood event-queue
```

## Current Pending Event

## show vpls flood route

**Syntax** show vpls flood route  
 (all-ce-flood instance-name *instance-name* <logical-system-name *logical-system-name*>  
 |  
 ce-flood interface *interface-name*)

**Release Information** Command introduced in Junos OS Release 8.0.

**Description** Display VPLS route information related to the flood process for either the specified routing instance or the specified interface.

**Options** **all-ce-flood**—Display the flood next-hop route for all customer edge routers for traffic coming from the core of the network.

**ce-flood interface *interface-name***—Display the flood next-hop route for traffic coming from the specified customer edge interface.

**instance-name *instance-name***—Display the flood routes for the specified instance.

**logical-system-name *logical-system-name***—(Optional) Specify the logical system whose flood routes you want to display. You can only specify the default logical system name for VPLS. The default logical system name is **\_\_example\_ls1\_\_** (the name must be entered in the command with the underscore characters).

**Required Privilege Level** view

**List of Sample Output** [show vpls flood route all-ce-flood on page 2109](#)  
[show vpls flood route ce-flood on page 2109](#)

**Output Fields** [Table 57 on page 2108](#) lists the output for the **show vpls flood route** command. Output fields are listed in the approximate order in which they appear.

**Table 57: show vpls flood route Output Fields**

| Field Name             | Field Description                                                     |
|------------------------|-----------------------------------------------------------------------|
| Flood route prefix     | Prefix for the flood route.                                           |
| Flood route type       | Type of flood route (either <b>CE_FLOOD</b> or <b>ALL_CE_FLOOD</b> ). |
| Flood route owner      | VPLS routing instance or interface associated with the flood route.   |
| Nexthop type           | Next-hop type. For example, <b>flood</b> for a flood route.           |
| Nexthop index          | Next-hop index number for the route.                                  |
| Interfaces flooding to | Interfaces to which VPLS routes are being flooded.                    |

Table 57: show vpls flood route Output Fields (*continued*)

| Field Name | Field Description                 |
|------------|-----------------------------------|
| Name       | Name of the interface.            |
| Type       | Type of VPLS router (CE or VE).   |
| Nh type    | Next-hop type.                    |
| Index      | Index number for the flood route. |

## Sample Output

### show vpls flood route all-ce-flood

```
user@host: __example_lsi__> show vpls flood route all-ce-flood logical-system-name
__example_lsi__instance-name green
```

```
Flood route prefix: default
Flood route type: ALL_CE_FLOOD
Flood route owner: green
Nexthop type: flood
Nexthop index: 383
 Interfaces Flooding to:
 Name Type NhType Index
 fe-1/2/1.0 CE
```

### show vpls flood route ce-flood

```
user@host: __example_lsi__> show vpls flood route ce-flood interface fe-1/2/1.0
```

```
Flood route prefix: 0x47/16
Flood route type: CE_FLOOD
Flood route owner: fe-1/2/1.0
Nexthop type: flood
Nexthop index: 388
 Interfaces Flooding to:
 Name Type NhType Index
 lsi.49152 VE indr 262142
```

## show vpls mac-move-action

|                                 |                                                                                                                                                                                             |

**Output Fields** [Table 59 on page 2113](#) describes the output fields for the **show vpls mac-table** command. Output fields are listed in the approximate order in which they appear.

**Table 59: show vpls mac-table Output fields**

| Field Name              | Field Description                                                                                                                                                                                                                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Age                     | Age of a single mac-address.                                                                                                                                                                                                                                                                       |
| Routing instance        | Name of the routing instance.                                                                                                                                                                                                                                                                      |
| Bridging domain         | Name of the bridging domain.                                                                                                                                                                                                                                                                       |
| MAC address             | MAC address or addresses learned on a logical interface.                                                                                                                                                                                                                                           |
| MAC flags               | Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>S</b>—Static MAC address configured.</li> <li>• <b>D</b>—Dynamic MAC address learned.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>NM</b>—Nonconfigured MAC.</li> </ul> |
| Logical interface       | Name of the logical interface.                                                                                                                                                                                                                                                                     |
| MAC count               | Number of MAC addresses learned on a specific routing instance or interface.                                                                                                                                                                                                                       |
| Learning interface      | Logical interface or logical Label Switched Interface (LSI) the address is learned on.                                                                                                                                                                                                             |
| Base learning interface | Base learning interface of the MAC address. This field is introduced in Junos OS Release 14.2.                                                                                                                                                                                                     |
| Learn VLAN ID/VLAN      | VLAN ID of the routing instance or bridge domain in which the MAC address was learned.                                                                                                                                                                                                             |
| VXLAN ID/VXLAN          | VXLAN Network Identifier (VNI)                                                                                                                                                                                                                                                                     |
| Layer 2 flags           | Debugging flags signifying that the MAC address is present in various lists.                                                                                                                                                                                                                       |
| Epoch                   | Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.                                                                                                                                                                                              |
| Sequence number         | Sequence number assigned to this MAC address. Used for debugging.                                                                                                                                                                                                                                  |
| Learning mask           | Mask of Packet Forwarding Engines where this MAC address was learned. Used for debugging.                                                                                                                                                                                                          |
| IPC generation          | Creation time of the logical interface when this MAC address was learned. Used for debugging.                                                                                                                                                                                                      |

## Sample Output

### show vpls mac-table

```

user@host> show vpls mac-table
MAC flags (S -static MAC, D -dynamic MAC,
 SE -Statistics enabled, NM -Non configured MAC)

Routing instance : vpls_ldp1
VLAN : 223
 MAC MAC Logical
 address flags interface
 00:00:5e:00:53:5d D ge-0/2/5.400

MAC flags (S -static MAC, D -dynamic MAC,
 SE -Statistics enabled, NM -Non configured MAC)

Routing instance : vpls_red
VLAN : 401
 MAC MAC Logical
 address flags interface
 00:00:5e:00:53:12 D lsi.1051138
 00:00:5e:00:53:f0 D lsi.1051138

```

### show vpls mac-table (with Layer 2 Services over GRE Interfaces)

```

user@host> show vpls mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned
 SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

```

### show vpls mac-table age (for GE interface)

```
user@host> show vpls mac-table age 00:00:5e:00:53:1a instance vpls_instance_1
MAC Entry Age information
Current Age: 4 seconds
```

### show vpls mac-table age (for AE interface)

```
user@host> show vpls mac-table age 000:00:5e:00:53:1a instance vpls_instance_1
MAC Entry Age information
Current Age on FPC1: 102 seconds
Current Age on FPC2: 94 seconds
```

### show vpls mac-table count

```
user@host> show vpls mac-table count
0 MAC address learned in routing instance __example_private1__
```

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| lc-0/0/0.32769    | 0         |
| lc-0/1/0.32769    | 0         |
| lc-0/2/0.32769    | 0         |
| lc-2/0/0.32769    | 0         |
| lc-0/3/0.32769    | 0         |
| lc-2/1/0.32769    | 0         |
| lc-9/0/0.32769    | 0         |
| lc-11/0/0.32769   | 0         |
| lc-2/2/0.32769    | 0         |
| lc-9/1/0.32769    | 0         |
| lc-11/1/0.32769   | 0         |
| lc-2/3/0.32769    | 0         |
| lc-9/2/0.32769    | 0         |
| lc-11/2/0.32769   | 0         |
| lc-11/3/0.32769   | 0         |
| lc-9/3/0.32769    | 0         |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 0         |

1 MAC address learned in routing instance vpls\_ldp1

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| lsi.1051137       | 0         |
| ge-0/2/5.400      | 1         |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 1         |

1 MAC address learned in routing instance vpls\_red

MAC address count per interface within routing instance:

| Logical interface | MAC count |
|-------------------|-----------|
| ge-0/2/5.300      | 1         |

MAC address count per learn VLAN within routing instance:

| Learn VLAN ID | MAC count |
|---------------|-----------|
| 0             | 1         |

### show vpls mac-table detail

```

user@host> show vpls mac-table detail
MAC address: 00:00:5e:00:53:5d
Routing instance: vpls_ldp1
Learning interface: ge-0/2/5.400
Layer 2 flags: in_ifd, in_ifl, in_vlan, kernel
Epoch: 0 Sequence number: 1
Learning mask: 0x1 IPC generation: 0

MAC address: 00:00:5e:00:53:5d
Routing instance: vpls_red
Learning interface: ge-0/2/5.300
Layer 2 flags: in_ifd, in_ifl, in_vlan, kernel

| <b>Output Fields</b>            | <a href="#">Table 60 on page 2117</a> lists the output fields for the <b>show vpls statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                          |

**Table 60: show vpls statistics Output Fields**

| Field Name                  | Field Description                                                                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance                    | Name of the VPLS instance.                                                                                                                                                                                                                          |
| Local interface             | Name of the local VPLS virtual loopback tunnel interface, <b>vt-fpc/pic/port.nnnnn</b> , where <b>nnnnn</b> is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain. |
| Index                       | Number associated with the next hop.                                                                                                                                                                                                                |
| Remote provider edge router | Address of the remote provider edge router.                                                                                                                                                                                                         |
| Multicast packets           | Number of multicast packets received.                                                                                                                                                                                                               |
| Multicast bytes             | Number of multicast bytes received.                                                                                                                                                                                                                 |
| Flood packets               | Number of VPLS flood packets received.                                                                                                                                                                                                              |

Table 60: show vpls statistics Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                     |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Flood bytes       | Number of VPLS flood bytes received.                                                                                                  |
| Current MAC count | Number of MAC addresses learned by the interface and the configured maximum limit on the number of MAC addresses that can be learned. |

## Sample Output

### show vpls statistics

```
user@host> show vpls statistics
```

```
VPLS statistics:
