**Table 88: show amt summary Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                         | Level of Output |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>AMT anycast prefix</b>  | Prefix advertised by unicast routing protocols to route AMT discovery messages to the router from nearby AMT gateways.                                                                                    | All levels      |
| <b>AMT anycast address</b> | Anycast address configured from which the anycast prefix is derived.                                                                                                                                      | All levels      |
| <b>AMT local address</b>   | Local unique AMT relay IP address configured. Used to send AMT relay advertisement messages, it is the IP source address of AMT control messages and the source address of the data tunnel encapsulation. | All levels      |
| <b>AMT tunnel limit</b>    | Maximum number of AMT tunnels that can be created.                                                                                                                                                        | All levels      |
| <b>active tunnels</b>      | Number of active AMT tunnel interfaces.                                                                                                                                                                   | All levels      |

## Sample Output

### show amt summary

```
user@host> show amt summary
AMT anycast prefix : 20.0.0.4/32
AMT anycast address : 20.0.0.4
AMT local address : 20.0.0.4
AMT tunnel limit : 1000, active tunnels : 2
```

## show amt tunnel

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>AMT gateway address</b>           | Address of the AMT gateway that is being connected by the AMT tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |
| <b>port</b>                          | Client port used by the AMT tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |
| <b>AMT tunnel interface</b>          | Dynamically created AMT logical interfaces used by the AMT tunnel in the format <b>ud-FPC/PIC/Port.unit</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>AMT tunnel state</b>              | State of the AMT tunnel. The state is normally <b>Active</b> . <ul style="list-style-type: none"> <li>• <b>Active</b>—The tunnel is active.</li> <li>• <b>Pending</b>—The tunnel creation is pending. This is a transient state.</li> <li>• <b>Down</b>—The tunnel is in the down state.</li> <li>• <b>Graceful restart pending</b>—Graceful restart is in progress.</li> <li>• <b>Reviving</b>—The routing protocol daemon or Routing Engine was restarted (not gracefully). The tunnel remains in the reviving state until the AMT gateway sends a control message. When the message is received the tunnel is moved to the <b>Active</b> state. If no message is received before the AMT tunnel inactivity timer expires, the tunnel is deleted.</li> </ul> | All levels      |
| <b>AMT tunnel inactivity timeout</b> | Number of seconds since the most recent control message was received from an AMT gateway. If no message is received before the AMT tunnel inactivity timer expires, the tunnel is deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Number of groups</b>              | Number of multicast groups using the tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Group</b>                         | Multicast group address or addresses using the tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail</b>   |
| <b>Include Source</b>                | Multicast source address for each IGMPv3 group using the tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail</b>   |
| <b>AMT message count</b>             | Statistics for AMT messages: <ul style="list-style-type: none"> <li>• <b>AMT Request</b>—Number of AMT relay tunnel request messages received.</li> <li>• <b>AMT membership update</b>—Number of AMT membership update messages received.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels      |

## Sample Output

### show amt tunnel

```

user@host> show amt tunnel
AMT gateway address : 11.11.11.2, port : 2268
AMT tunnel interface : ud-5/1/10.1120256
AMT tunnel state : Active
AMT tunnel inactivity timeout : 15
Number of groups : 1

AMT message count:
AMT Request      AMT membership update
2                2

```

### show amt tunnel detail

```

user@host> show amt tunnel detail
AMT gateway address : 11.11.11.2, port : 2268
AMT tunnel interface : ud-5/3/10.1120512
AMT tunnel state : Active
AMT tunnel inactivity timeout : 62
Number of groups : 1
Group: 226.2.3.2

AMT message count:
AMT Request      AMT membership update
2                2

AMT gateway address : 11.11.11.3, port : 2268
AMT tunnel interface : ud-5/2/10.1120513
AMT tunnel state : Active
AMT tunnel inactivity timeout : 214
Number of groups : 1
Group: 226.2.3.3

AMT message count:
AMT Request      AMT membership update
2                2

```

### show amt tunnel tunnel-interface

```

user@host> show amt tunnel tunnel-interface ud-5/3/10.1120512
AMT gateway address : 11.11.11.2, port : 2268
AMT tunnel interface : ud-5/3/10.1120512
AMT tunnel state : Active
AMT tunnel inactivity timeout : 145
Number of groups : 1

AMT message count:
AMT Request      AMT membership update
2                2

```

### show amt tunnel gateway-address

```

user@host> show amt tunnel gateway-address 11.11.11.3 port 2268
AMT gateway address : 11.11.11.3, port : 2268
AMT tunnel interface : ud-5/2/10.1120513
AMT tunnel state : Active
AMT tunnel inactivity timeout : 214
Number of groups : 1
Group: 226.2.3.3

AMT message count:
AMT Request      AMT membership update
2                2

```

### show amt tunnel gateway-address detail

```

user@host> show amt tunnel gateway-address 11.11.11.2 detail
AMT gateway address : 11.11.11.2, port : 2268
AMT tunnel interface : ud-5/3/10.1120512
AMT tunnel state : Active
AMT tunnel inactivity timeout : 234
Number of groups : 1

```

Group: 226.2.3.2

AMT message count:

|             |                       |
|-------------|-----------------------|
| AMT Request | AMT membership update |
| 2           | 2                     |

## show dvmrp interfaces

**Syntax** show dvmrp interfaces  
<logical-system (all | *logical-system-name*)>

### Release Information

**NOTE:** Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

**Description** Display information about Distance Vector Multicast Routing Protocol (DVMRP)–enabled interfaces.

**Options** **none**—(Same as **logical-system all**) Display information about DVMRP-enabled interfaces.  
**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show dvmrp interfaces on page 1585](#)

**Output Fields** [Table 90 on page 1583](#) describes the output fields for the **show dvmrp interfaces** command. Output fields are listed in the approximate order in which they appear.

**Table 90: show dvmrp interfaces Output Fields**

| Field Name       | Field Description                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------|
| <b>Interface</b> | Name of the interface.                                                                              |
| <b>State</b>     | State of the interface: <b>up</b> or <b>down</b> .                                                  |
| <b>Leaf</b>      | Whether the interface is a leaf (that is, whether it has no neighbors) or whether it has neighbors. |
| <b>Metric</b>    | Interface metric: a value from 1 through 31.                                                        |
| <b>Announce</b>  | Number of routes the interface is announcing.                                                       |

Table 90: show dvmrp interfaces Output Fields (*continued*)

| Field Name  | Field Description                                                                                                                                                                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b> | DVMRP mode: <ul style="list-style-type: none"><li>• <b>Forwarding</b>—DVMRP does both the routing and the multicast data forwarding.</li><li>• <b>Unicast-routing</b>—DVMRP does only the routing. Forwarding of the multicast data packets can be done by enabling PIM on the interface.</li></ul> |

## Sample Output

### show dvmrp interfaces

```
user@host> show dvmrp interfaces
Interface State Leaf Metric Announce Mode
fxp0.0    Up    N    1    4 Forwarding
fxp1.0    Up    N    1    4 Forwarding
fxp2.0    Up    N    1    3 Forwarding
lo0.0     Up    Y    1    0 Unicast-routing
```

## show dvmrp neighbors

**Syntax** `show dvmrp neighbors`  
`<logical-system (all | logical-system-name)>`

**NOTE:** Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

**Description** Display information about Distance Vector Multicast Routing Protocol (DVMRP) neighbors.

**Options** **none**—(Same as **logical-system all**) Display information about DVMRP neighbors.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show dvmrp neighbors on page 1587](#)

**Output Fields** [Table 91 on page 1586](#) describes the output fields for the **show dvmrp neighbors** command. Output fields are listed in the approximate order in which they appear.

**Table 91: show dvmrp neighbors Output Fields**

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor</b>  | Address of the neighboring DVMRP router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Interface</b> | Interface through which the neighbor is reachable.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Version</b>   | Version of DVMRP that the neighbor is running, in the format <i>major</i> <b>minor</b> .                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Flags</b>     | Information about the neighbor: <ul style="list-style-type: none"> <li><b>1</b>—One way. The local router has seen the neighbor, but the neighbor has not seen the local router.</li> <li><b>G</b>—Neighbor supports generation ID.</li> <li><b>L</b>—Neighbor is a leaf router.</li> <li><b>M</b>—Neighbor supports mtrace.</li> <li><b>N</b>—Neighbor supports netmask in prune messages and graft messages.</li> <li><b>P</b>—Neighbor supports pruning.</li> <li><b>S</b>—Neighbor supports SNMP.</li> </ul> |

Table 91: show dvmrp neighbors Output Fields (*continued*)

| Field Name         | Field Description                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------|
| <b>Routes</b>      | Number of routes learned from the neighbor.                                                           |
| <b>Timeout</b>     | How long until the DVMRP neighbor information times out, in seconds.                                  |
| <b>Transitions</b> | Number of generation ID changes that have occurred since the local router learned about the neighbor. |

## Sample Output

### show dvmrp neighbors

```
user@host> show dvmrp neighbors
Neighbor      Interface    Version  Flags    Routes  Timeout  Transitions
192.168.1.1   ipip.0       3.255    PGM      3       28       1
```

## show dvmrp prefix

**Syntax** show dvmrp prefix  
 <brief | detail>  
 <logical-system (all | *logical-system-name*)>  
 <prefix>

### Release Information

**NOTE:** Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

**Description** Display information about Distance Vector Multicast Routing Protocol (DVMRP) prefixes.

**Options** **none**—Display standard information about all DVMRP prefixes.

**brief | detail**—(Optional) Display the specified level of output.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**prefix**—(Optional) Display information about specific prefixes.

**Required Privilege Level** view

**List of Sample Output** [show dvmrp prefix on page 1590](#)  
[show dvmrp prefix brief on page 1590](#)  
[show dvmrp prefix detail on page 1590](#)

**Output Fields** [Table 92 on page 1588](#) describes the output fields for the **show dvmrp prefix** command. Output fields are listed in the approximate order in which they appear.

**Table 92: show dvmrp prefix Output Fields**

| Field Name             | Field Description                          | Level of Output |
|------------------------|--------------------------------------------|-----------------|
| Prefix                 | DVMRP route.                               | All levels      |
| Next hop               | Next hop from which the route was learned. | All levels      |
| Age                    | Last time that the route was refreshed.    | All levels      |
| <i>multicast-group</i> | Multicast group address.                   | <b>detail</b>   |

Table 92: show dvmrp prefix Output Fields (*continued*)

| Field Name            | Field Description                                                    | Level of Output |
|-----------------------|----------------------------------------------------------------------|-----------------|
| <b>Prunes sent</b>    | Number of prune messages sent to the multicast group.                | <b>detail</b>   |
| <b>Grafts sent</b>    | Number of grafts sent to the multicast group.                        | <b>detail</b>   |
| <b>Cache lifetime</b> | Lifetime of the group in the multicast cache, in seconds.            | <b>detail</b>   |
| <b>Prune lifetime</b> | Lifetime remaining and total lifetime of prune messages, in seconds. | <b>detail</b>   |

## Sample Output

### show dvmrp prefix

```
user@host> show dvmrp prefix
Prefix          Next hop      Age
10.38.0.0       /30 10.38.0.1 00:06:17
10.38.0.4       /30 10.38.0.5 00:06:13
10.38.0.8       /30 10.38.0.2 00:00:04
10.38.0.12      /30 10.38.0.6 00:00:04
10.255.14.114   /32 10.255.14.114 00:06:17
10.255.14.142   /32 10.38.0.2 00:00:04
10.255.14.144   /32 10.38.0.2 00:00:04
10.255.70.15    /32 10.38.0.6 00:00:04
192.168.14.0    /24 192.168.14.114 00:06:17
192.168.195.40 /30 192.168.195.41 00:06:17
192.168.195.92 /30 10.38.0.2 00:00:04
```

### show dvmrp prefix brief

The output for the **show dvmrp prefix brief** command is identical to that for the **show dvmrp prefix** command.

### show dvmrp prefix detail

```
user@host> show dvmrp prefix detail
Prefix          Next hop      Age
10.38.0.0       /30 10.38.0.1 00:06:28
10.38.0.4       /30 10.38.0.5 00:06:24
10.38.0.8       /30 10.38.0.2 00:00:15
10.38.0.12      /30 10.38.0.6 00:00:15
10.255.14.114   /32 10.255.14.114 00:06:28
10.255.14.142   /32 10.38.0.2 00:00:15
10.255.14.144   /32 10.38.0.2 00:00:15

```

## show dvmrp prunes

**Syntax** `show dvmrp prunes`  
`<all | rx | tx>`  
`<logical-system (all | logical-system-name)>`

### Release Information

**NOTE:** Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

**Description** Display information about active Distance Vector Multicast Routing Protocol (DVMRP) prune messages.

**Options** **none**—Display received and transmitted DVMRP prune information.

**all**—(Optional) Display information about all received and transmitted prune messages.

**rx**—(Optional) Display information about received prune messages.

**tx**—(Optional) Display information about transmitted prune messages.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show dvmrp prunes on page 1592](#)

**Output Fields** [Table 93 on page 1591](#) describes the output fields for the **show dvmrp prunes** command. Output fields are listed in the approximate order in which they appear.

**Table 93: show dvmrp prunes Output Fields**

| Field Name    | Field Description                                                          |
|---------------|----------------------------------------------------------------------------|
| Group         | Group address.                                                             |
| Source prefix | Prefix for the prune.                                                      |
| Timeout       | How long until the prune message expires, in seconds.                      |
| Neighbor      | Neighbor to which the prune was sent or from which the prune was received. |

## Sample Output

### show dvmrp prunes

```
user@host> show dvmrp prunes
Group          Source prefix      Timeout Neighbor
224.0.1.1      128.112.0.0        /12    7077 192.168.1.1
224.0.1.32     160.0.0.0          /3     7087 192.168.1.1

Table 94: show igmp group Output Fields

| Field Name              | Field Description                                                                                                                                                                                                         | Level of Output   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Interface</b>        | Name of the interface that received the IGMP membership report. A name of <b>local</b> indicates that the local routing device joined the group itself.                                                                   | All levels        |
| <b>Group</b>            | Group address.                                                                                                                                                                                                            | All levels        |
| <b>Group Mode</b>       | Mode the SSM group is operating in: <b>Include</b> or <b>Exclude</b> .                                                                                                                                                    | All levels        |
| <b>Source</b>           | Source address.                                                                                                                                                                                                           | All levels        |
| <b>Source timeout</b>   | Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.      | <b>detail</b>     |
| <b>Last reported by</b> | Address of the host that last reported membership in this group.                                                                                                                                                          | All levels        |
| <b>Timeout</b>          | Time remaining until the group membership is removed.                                                                                                                                                                     | <b>brief none</b> |
| <b>Group timeout</b>    | Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer. | <b>detail</b>     |
| <b>Type</b>             | Type of group membership: <ul style="list-style-type: none"> <li>• <b>Dynamic</b>—Host reported the membership.</li> <li>• <b>Static</b>—Membership is configured.</li> </ul>                                             | All levels        |

## Sample Output

### show igmp group (Include Mode)

```

user@host> show igmp group
Interface: t1-0/1/0.0
  Group: 198.51.100.1
    Group mode: Include
    Source: 203.0.113.2
    Last reported by: 203.0.113.52
    Timeout:      24 Type: Dynamic
  Group: 198.51.100.1
    Group mode: Include
    Source: 203.0.113.3
    Last reported by: 203.0.113.52
    Timeout:      24 Type: Dynamic
  Group: 198.51.100.1
    Group mode: Include
    Source: 203.0.113.4
    Last reported by: 203.0.113.52
    Timeout:      24 Type: Dynamic
  Group: 198.51.100.2
    Group mode: Include
    Source: 203.0.113.4
    Last reported by: 203.0.113.52

```

```

        Timeout:      24 Type: Dynamic
Interface: t1-0/1/1.0
Interface: ge-0/2/2.0
Interface: ge-0/2/0.0
Interface: local
  Group: 198.51.100.12
    Source: 0.0.0.0
    Last reported by: Local
    Timeout:      0 Type: Dynamic
  Group: 198.51.100.22
    Source: 0.0.0.0
    Last reported by: Local
    Timeout:      0 Type: Dynamic

```

### show igmp group (Exclude Mode)

```

user@host> show igmp group
Interface: t1-0/1/0.0
Interface: t1-0/1/1.0
Interface: ge-0/2/2.0
Interface: ge-0/2/0.0
Interface: local
  Group: 198.51.100.2
    Source: 0.0.0.0
    Last reported by: Local
    Timeout:      0 Type: Dynamic
  Group: 198.51.100.22
    Source: 0.0.0.0
    Last reported by: Local
    Timeout:      0 Type: Dynamic

```

### show igmp group brief

The output for the **show igmp group brief** command is identical to that for the **show igmp group** command.

### show igmp group detail

```

user@host> show igmp group detail
Interface: t1-0/1/0.0
  Group: 198.51.100.1
    Group mode: Include
    Source: 203.0.113.2
    Source timeout: 12
    Last reported by: 203.0.113.52
    Group timeout:      0 Type: Dynamic
  Group: 198.51.100.1
    Group mode: Include

Table 95: show igmp interface Output Fields

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>          | Name of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>Querier</b>            | Address of the routing device that has been elected to send membership queries.                                                                                                                                                                                                                                                                                                                                                                                                             | All levels      |
| <b>State</b>              | State of the interface: <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |
| <b>SSM Map Policy</b>     | Name of the source-specific multicast (SSM) map policy that has been applied to the IGMP interface.                                                                                                                                                                                                                                                                                                                                                                                         | All levels      |
| <b>Timeout</b>            | How long until the IGMP querier is declared to be unreachable, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>Version</b>            | IGMP version being used on the interface: 1 , 2 , or 3.                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Groups</b>             | Number of groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |
| <b>Group limit</b>        | Maximum number of groups allowed on the interface. Any joins requested after the limit is reached are rejected.                                                                                                                                                                                                                                                                                                                                                                             | All levels      |
| <b>Group threshold</b>    | Configured threshold at which a warning message is generated.<br><br>This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.                                                                                                                                                                                                                                | All levels      |
| <b>Group log-interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels      |
| <b>Immediate Leave</b>    | State of the immediate leave option: <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface.</li> <li>• <b>Off</b>—Indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</li> </ul> | All levels      |
| <b>Promiscuous Mode</b>   | State of the promiscuous mode option: <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router can accept IGMP reports from subnetworks that are not associated with its interfaces.</li> <li>• <b>Off</b>—Indicates that the router can accept IGMP reports only from subnetworks that are associated with its interfaces.</li> </ul>                                                                                                                                  | All levels      |

Table 95: show igmp interface Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Passive</b>               | <p>State of the passive mode option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router can run IGMP on the interface but not send or receive control traffic such as IGMP reports, queries, and leaves.</li> <li>• <b>Off</b>—Indicates that the router can run IGMP on the interface and send or receive control traffic such as IGMP reports, queries, and leaves.</li> </ul> <p>The <b>passive</b> statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the <b>on</b> state declaration:</p> <ul style="list-style-type: none"> <li>• <b>send-general-query</b>—The interface sends general queries.</li> <li>• <b>send-group-query</b>—The interface sends group-specific and group-source-specific queries.</li> <li>• <b>allow-receive</b>—The interface receives control traffic.</li> </ul> | All levels      |
| <b>OIF map</b>               | Name of the OIF map (if configured) associated with the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels      |
| <b>SSM map</b>               | Name of the source-specific multicast (SSM) map (if configured) used on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Configured Parameters</b> | <p>Information configured by the user:</p> <ul style="list-style-type: none"> <li>• <b>IGMP Query Interval</b>—Interval (in seconds) at which this router sends membership queries when it is the querier.</li> <li>• <b>IGMP Query Response Interval</b>—Time (in seconds) that the router waits for a report in response to a general query.</li> <li>• <b>IGMP Last Member Query Interval</b>—Time (in seconds) that the router waits for a report in response to a group-specific query.</li> <li>• <b>IGMP Robustness Count</b>—Number of times the router retries a query.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                | All levels      |
| <b>Derived Parameters</b>    | <p>Derived information:</p> <ul style="list-style-type: none"> <li>• <b>IGMP Membership Timeout</b>—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.</li> <li>• <b>IGMP Other Querier Present Timeout</b>—Time (in seconds) that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |

## Sample Output

### show igmp interface

```

user@host> show igmp interface
Interface: at-0/3/1.0
  Querier: 203.0.3.113.31
  State:      Up Timeout:   None Version:  2 Groups:    4
  SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0
  Querier: 203.0.113.11
  State:      Up Timeout:   None Version:  2 Groups:    2
  SSM Map Policy: ssm-policy-B
Interface: so-1/0/1.0

```

```
Querier: 203.0.113.21
State:      Up Timeout:    None Version:  2 Groups:    4
SSM Map Policy: ssm-policy-C
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0
```

### **show igmp interface brief**

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 1599](#).

### **show igmp interface detail**

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 1599](#).

### **show igmp interface <interface-name>**

```
user@host# show igmp interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 203.0.113.111
State: Up Timeout:    None Version:  3 Groups:    1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

## show igmp snooping interface

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |

| <b>Output Fields</b>            | Table 96 on page 1601 lists the output fields for the <b>show igmp snooping interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |

Table 96: show igmp snooping interface Output Fields

| Field Name       | Field Description                   | Level of Output |
|------------------|-------------------------------------|-----------------|
| Routing-instance | Routing instance for IGMP snooping. | All levels      |

Table 96: show igmp snooping interface Output Fields (*continued*)

| Field Name                                | Field Description                                                                                                                    | Level of Output |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Learning Domain</b>                    | Learning domain for snooping.                                                                                                        | All levels      |
| <b>IGMP Query Interval</b>                | Frequency (in seconds) with which this router sends membership queries when it is the querier.                                       | All levels      |
| <b>IGMP Query Response Interval</b>       | Time (in seconds) that the router waits for a response to a general query.                                                           | All levels      |
| <b>IGMP Last Member Query Interval</b>    | Time (in seconds) that the router waits for a report in response to a group-specific query.                                          | All levels      |
| <b>IGMP Robustness Count</b>              | Number of times the router retries a query.                                                                                          | All levels      |
| <b>immediate-leave</b>                    | State of immediate leave: <b>On</b> or <b>Off</b> .                                                                                  | All levels      |
| <b>router-interface</b>                   | Router interfaces that are part of this learning domain.                                                                             | All levels      |
| <b>Group limit</b>                        | Maximum number of (source,group) pairs allowed per interface. When a group limit is not configured, this field is not shown.         | All levels      |
| <b>interface</b>                          | Interfaces that are being snooped in this learning domain.                                                                           | All levels      |
| <b>Groups</b>                             | Number of groups on the interface.                                                                                                   | All levels      |
| <b>State</b>                              | State of the interface: <b>Up</b> or <b>Down</b> .                                                                                   | All levels      |
| <b>Up Groups</b>                          | Number of active multicast groups attached to the logical interface.                                                                 | All levels      |
| <b>IGMP Membeship Timeout</b>             | Timeout for group membership. If no report is received for these groups before the timeout expires, the group membership is removed. | All levels      |
| <b>IGMP Other Querier Present Timeout</b> | Time that the router waits for the IGMP querier to send a query.                                                                     | All levels      |

## Sample Output

### show igmp snooping interface

```

user@host> show igmp snooping interface ge-0/1/4
Instance: default-switch

Bridge-Domain: sample

Learning-Domain: default
Interface: ge-0/1/4.0
State: Up Groups: 0
Immediate leave: Off
Router interface: no

```

```

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

### show igmp snooping interface (logical systems)

```

user@host> show igmp snooping interface logical-system all
logical-system: default
Instance: VPLS-6
Learning-Domain: default
Interface: ge-0/2/2.601
    State:          Up Groups:      10
    Immediate leave: Off
    Router interface: no

```

```

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

```

```

Instance: VS-4
Bridge-Domain: VS-4-BD-1
Learning-Domain: vlan-id 1041
Interface: ae2.3
    State:          Up Groups:      0
    Immediate leave: Off
    Router interface: no
Interface: ge-0/2/2.1041
    State:          Up Groups:      20
    Immediate leave: Off
    Router interface: no

```

```

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

```

```

Instance: default-switch
Bridge-Domain: bd-200
Learning-Domain: default
Interface: ge-0/2/2.100
    State:          Up Groups:      20
    Immediate leave: Off
    Router interface: no

```

```

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

```

```

Bridge-Domain: bd0

```

```
Learning-Domain: default
Interface: ae0.0
  State:          Up Groups:      0
  Immediate leave: Off
  Router interface: yes
Interface: ae1.0
  State:          Up Groups:      0
  Immediate leave: Off
  Router interface: no
Interface: ge-0/2/2.0
  State:          Up Groups:     32
  Immediate leave: Off
  Router interface: no
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

```
Instance: VPLS-1
Learning-Domain: default
Interface: ge-0/2/2.502
  State:          Up Groups:     11
  Immediate leave: Off
  Router interface: no
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

```
Instance: VS-1
Bridge-Domain: VS-BD-1
Learning-Domain: default
Interface: ae2.0
  State:          Up Groups:      0
  Immediate leave: Off
  Router interface: no
Interface: ge-0/2/2.1010
  State:          Up Groups:     20
  Immediate leave: Off
  Router interface: no
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

```
Bridge-Domain: VS-BD-2
Learning-Domain: default
Interface: ae2.0
  State:          Up Groups:      0
  Immediate leave: Off
  Router interface: no
Interface: ge-0/2/2.1011
  State:          Up Groups:     20
  Immediate leave: Off
  Router interface: no
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

```
Instance: VPLS-p2mp
Learning-Domain: default
Interface: ge-0/2/2.3001
    State:          Up Groups:      0
    Immediate leave: Off
    Router interface: no
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

### show igmp snooping interface (Group Limit Configured)

```
user@host> show igmp snooping interface instance vpls1
Instance: vpls1
```

```
Learning-Domain: default
Interface: ge-1/3/9.0
    State:          Up Groups:      0
    Immediate leave: Off
    Router interface: yes
Interface: ge-1/3/8.0
    State:          Up Groups:      0
    Immediate leave: Off
    Router interface: yes
    Group limit:    1000
```

```
Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2
```

## show igmp snooping membership

| <b>Output Fields</b>            | <a href="#">Table 97 on page 1607</a> lists the output fields for the <b>show igmp snooping membership</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 97: show igmp snooping membership Output Fields

| Field Name              | Field Description                                                                                                                                                                                                                                    | Level of Output |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Instance</b>         | Routing instance for IGMP snooping.                                                                                                                                                                                                                  | All levels      |
| <b>Learning Domain</b>  | Learning domain for snooping.                                                                                                                                                                                                                        | All levels      |
| <b>Interface</b>        | Interface on which this router is a proxy.                                                                                                                                                                                                           | <b>detail</b>   |
| <b>Up Groups</b>        | Number of active multicast groups attached to the logical interface.                                                                                                                                                                                 | All levels      |
| <b>Group</b>            | Multicast group address in the membership database.                                                                                                                                                                                                  | All levels      |
| <b>Group Mode</b>       | Mode the SSM group is operating in: <b>Include</b> or <b>Exclude</b> .                                                                                                                                                                               | All levels      |
| <b>Source</b>           | Source address used on queries.                                                                                                                                                                                                                      | <b>detail</b>   |
| <b>Last reported by</b> | Address of source last replying to the query.                                                                                                                                                                                                        | <b>detail</b>   |
| <b>Group Timeout</b>    | Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.                            | All levels      |
| <b>Timeout</b>          | Length of time (in seconds) left until the entry is purged.                                                                                                                                                                                          | <b>detail</b>   |
| <b>Type</b>             | Way that the group membership information was learned: <ul style="list-style-type: none"> <li>• <b>Dynamic</b>—Group membership was learned by the IGMP protocol.</li> <li>• <b>Static</b>—Group membership was learned by configuration.</li> </ul> | <b>detail</b>   |
| <b>Include receiver</b> | Source address of receiver included in membership with timeout (in seconds).                                                                                                                                                                         | <b>detail</b>   |

## Sample Output

### show igmp snooping membership

```

user@host> show igmp snooping membership
Instance: vpls2

Learning-Domain: vlan-id 2
Interface: ge-3/0/0.2
Up Groups:      0
Interface: ge-3/1/0.2
Up Groups:      0
Interface: ge-3/1/5.2
Up Groups:      0

Instance: vpls1

Learning-Domain: vlan-id 1
Interface: ge-3/0/0.1
Up Groups:      0
Interface: ge-3/1/0.1

```

```

Up Groups:      0
Interface: ge-3/1/5.1
Up Groups:      1
  Group: 225.10.10.1
    Group mode: Exclude
    Source: 0.0.0.0
    Last reported by: 100.6.85.2
    Group timeout: 173 Type: Dynamic

```

#### show igmp snooping membership (Exclude Mode)

```

user@host> show igmp snooping membership
Instance: vpls2

Learning-Domain: vlan-id 2
Interface: ge-3/0/0.2
Up Groups:      0
Interface: ge-3/1/0.2
Up Groups:      0
Interface: ge-3/1/5.2

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                            |

**Table 101: show mld interface Output Fields**

| Field Name            | Field Description                                                                              | Level of Output |
|-----------------------|------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>      | Name of the interface.                                                                         | All levels      |
| <b>Querier</b>        | Address of the router that has been elected to send membership queries.                        | All levels      |
| <b>State</b>          | State of the interface: <b>Up</b> or <b>Down</b> .                                             | All levels      |
| <b>SSM Map Policy</b> | Name of the source-specific multicast (SSM) map policy that has been applied to the interface. | All levels      |
| <b>SSM Map Policy</b> | Name of the source-specific multicast (SSM) map policy at the MLD interface.                   | All levels      |

Table 101: show mld interface Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Timeout</b>            | How long until the MLD querier is declared to be unreachable, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | All levels      |
| <b>Version</b>            | MLD version being used on the interface: 1 or 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>Groups</b>             | Number of groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| <b>Passive</b>            | <p>State of the passive mode option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router can run IGMP or MLD on the interface but not send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</li> <li>• <b>Off</b>—Indicates that the router can run IGMP or MLD on the interface and send or receive control traffic such as IGMP or MLD reports, queries, and leaves.</li> </ul> <p>The <b>passive</b> statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the <b>on</b> state declaration:</p> <ul style="list-style-type: none"> <li>• <b>send-general-query</b>—The interface sends general queries.</li> <li>• <b>send-group-query</b>—The interface sends group-specific and group-source-specific queries.</li> <li>• <b>allow-receive</b>—The interface receives control traffic</li> </ul> | All levels      |
| <b>OIF map</b>            | Name of the OIF map associated to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>SSM map</b>            | Name of the source-specific multicast (SSM) map used on the interface, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Group limit</b>        | Maximum number of groups allowed on the interface. Any memberships requested after the limit is reached are rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Group threshold</b>    | <p>Configured threshold at which a warning message is generated.</p> <p>This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Group log-interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Immediate Leave</b>    | <p>State of the immediate leave option:</p> <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router removes a host from the multicast group as soon as the router receives a multicast listener done message from a host associated with the interface.</li> <li>• <b>Off</b>—Indicates that after receiving a multicast listener done message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |

Table 101: show mld interface Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Configured Parameters</b> | Information configured by the user. <ul style="list-style-type: none"> <li>• <b>MLD Query Interval (.1 secs)</b>—Interval at which this router sends membership queries when it is the querier.</li> <li>• <b>MLD Query Response Interval (.1 secs)</b>—Time that the router waits for a report in response to a general query.</li> <li>• <b>MLD Last Member Query Interval (.1 secs)</b>—Time that the router waits for a report in response to a group-specific query.</li> <li>• <b>MLD Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |
| <b>Derived Parameters</b>    | Derived information. <ul style="list-style-type: none"> <li>• <b>MLD Membership Timeout (.1 secs)</b>—Timeout period for group membership. If no report is received for these groups before the timeout expires, the group membership will be removed.</li> <li>• <b>MLD Other Querier Present Timeout (.1 secs)</b>—Time that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                        | All levels      |

## Sample Output

### show mld interface

```

user@host> show mld interface
Interface: fe-0/0/0
  Querier: None
  State: Up      Timeout:      0    Version:  1    Groups:      0
  SSM Map Policy: ssm-policy-A
Interface: at-0/3/1.0
  Querier: 8038::c0a8:c345
  State: Up      Timeout:    None    Version:  1    Groups:      0
  SSM Map Policy: ssm-policy-B
Interface: fe-1/0/1.0
  Querier: ::192.168.195.73
  State: Up      Timeout:    None    Version:  1    Groups:      3
  SSM Map Policy: ssm-policy-C
  SSM map: ipv6map1
Immediate Leave: On

Configured Parameters:
MLD Query Interval (.1 secs): 1250
MLD Query Response Interval (.1 secs): 100
MLD Last Member Query Interval (.1 secs): 10
MLD Robustness Count: 2

Derived Parameters:
MLD Membership Timeout (.1secs): 2600
MLD Other Querier Present Timeout (.1 secs): 2550

```

### show mld interface brief

The output for the **show mld interface brief** command is identical to that for the **show mld interface** command. For sample output, see [show mld interface on page 1624](#).

### show mld interface detail

The output for the **show mld interface detail** command is identical to that for the **show mld interface** command. For sample output, see [show mld interface on page 1624](#).

### show mld interface <interface-name>

```
user@host# show mld interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 203.0.113.111
State: Up Timeout:   None Version: 3 Groups:    1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

## show mld statistics

---

|                                 |                                                                                                                                                                                                                                                                                                                                  |

No further classification was performed.</li> <li>• <b>Bad Receive If</b>—Number of messages received on an interface not enabled for MLD.</li> <li>• <b>Rx non-local</b>—Number of messages received from nonlocal senders.</li> <li>• <b>Timed out</b>—Number of groups that timed out as a result of not receiving an explicit leave message.</li> <li>• <b>Rejected Report</b>—Number of reports dropped because of the MLD group policy.</li> <li>• <b>Total Interfaces</b>—Number of interfaces configured to support IGMP.</li> </ul> |

## Sample Output

### show mld statistics

```

user@host> show mld statistics
MLD packet statistics for all interfaces
MLD Message type      Received      Sent  Rx errors
Listener Query (v1/v2)    0            2      0
Listener Report (v1)      0            0      0
Listener Done (v1/v2)     0            0      0
Listener Report (v2)      0            0      0
Other Unknown types              0      0
MLD v2 source required for SSM    2
MLD v2 mode not applicable for SSM 0

MLD Global Statistics
Bad Length                0
Bad Checksum              0
Bad Receive If            0
Rx non-local              0

```

|                  |   |
|------------------|---|
| Timed out        | 0 |
| Rejected Report  | 0 |
| Total Interfaces | 2 |

#### show mld statistics interface

```
user@host> show mld statistics interface fe-1/0/1.0
MLD interface packet statistics for fe-1/0/1.0
MLD Message type      Received      Sent  Rx errors
Listener Query (v1/v2)      0           2       0
Listener Report (v1)        0           0       0
Listener Done (v1/v2)       0           0       0
Listener Report (v2)        0           0       0
Other Unknown types                0       0
MLD v2 source required for SSM      2
MLD v2 mode not applicable for SSM 0

MLD Global Statistics
Bad Length                  0
Bad Checksum                0
Bad Receive If              0
Rx non-local                0
Timed out                   0
Rejected Report              0
Total Interfaces            2

**Output Fields** Table 104 on page 1633 describes the output fields for the **show msdp source** command. Output fields are listed in the approximate order in which they appear.

**Table 104: show msdp source Output Fields**

| Field Name     | Field Description                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source address | IP address of the source.                                                                                                                                                                                                                                               |
| /Len           | Length of the prefix for this IP address.                                                                                                                                                                                                                               |
| Type           | Discovery method for this multicast source: <ul style="list-style-type: none"> <li>• <b>Configured</b>—Source-active limit explicitly configured for this source.</li> <li>• <b>Dynamic</b>—Source-active limit established when this source was discovered.</li> </ul> |
| Maximum        | Source-active limit applied to this source.                                                                                                                                                                                                                             |
| Threshold      | Source-active threshold applied to this source.                                                                                                                                                                                                                         |
| Exceeded       | Number of source-active messages received from this source exceeding the established maximum.                                                                                                                                                                           |

## Sample Output

**show msdp source**

```

user@host> show msdp source
Source address /Len  Type      Maximum  Threshold  Exceeded
0.0.0.0       /0    Configured    5        none       0
10.1.0.0      /16   Configured    500      none       0
10.1.1.1      /32   Configured    10000    none       0
10.1.1.2      /32   Dynamic       6936     none       0
10.1.5.5      /32   Dynamic       500      none      123
10.2.1.1      /32   Dynamic        2        none       0

```

## show msdp source-active

[show msdp source-active source on page 1636](#)

**Output Fields** [Table 105 on page 1635](#) describes the output fields for the **show msdp source-active** command. Output fields are listed in the approximate order in which they appear.

**Table 105: show msdp source-active Output Fields**

| Field Name                              | Field Description                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                                                   |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                                                        |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.                                         |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                                                        |
| Group address                           | Multicast address of the group.                                                                                                                            |
| Source address                          | IP address of the source.                                                                                                                                  |
| Peer address                            | IP address of the peer.                                                                                                                                    |
| Originator                              | Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured. |
| Flags                                   | Flags: <b>Accept</b> , <b>Reject</b> , or <b>Filtered</b> .                                                                                                |

## Sample Output

### show msdp source-active

```

user@host> show msdp source-active
Group address  Source address  Peer address  Originator  Flags
230.0.0.0      192.168.195.46  local        10.255.14.30  Accept
230.0.0.1      192.168.195.46  local        10.255.14.30  Accept
230.0.0.2      192.168.195.46  local        10.255.14.30  Accept
230.0.0.3      192.168.195.46  local        10.255.14.30  Accept
230.0.0.4      192.168.195.46  local        10.255.14.30  Accept

```

### show msdp source-active brief

The output for the **show msdp source-active brief** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 1635](#).

### show msdp source-active detail

The output for the **show msdp source-active detail** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 1635](#).

### show msdp source-active source

```
user@host> show msdp source-active source 192.168.215.246
```

```
Global active source limit exceeded: 0
```

```
Global active source limit maximum: 25000
```

```
Global active source limit threshold: 24000
```

```
Global active source limit log-warning: 100
```

```
Global active source limit log interval: 0
```

| Group address | Source address  | Peer address   | Originator     | Flags  |
|---------------|-----------------|----------------|----------------|--------|
| 226.2.2.1     | 192.168.215.246 | 10.255.182.140 | 10.255.182.140 | Accept |
| 226.2.2.3     | 192.168.215.246 | 10.255.182.140 | 10.255.182.140 | Accept |

| <b>Output Fields</b>            | <a href="#">Table 106 on page 1637</a> describes the output fields for the <b>show msdp statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                     |

**Table 106: show msdp statistics Output Fields**

| Field Name                             | Field Description                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded    | Number of times all peers have exceeded configured active source limits.                                                    |
| Global active source limit maximum     | Configured number of active source messages accepted by the device.                                                         |
| Global active source limit threshold   | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.          |
| Global active source limit log-warning | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device). |

Table 106: show msdp statistics Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                                                                                                                     |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Global active source limit log interval</b>    | Time (in seconds) between consecutive log messages.                                                                                                                                                   |
| <b>Peer</b>                                       | Address of peer.                                                                                                                                                                                      |
| <b>Last State Change</b>                          | How long ago the peer state changed.                                                                                                                                                                  |
| <b>Last message received from the peer</b>        | How long ago the last message was received from the peer.                                                                                                                                             |
| <b>RPF Failures</b>                               | Number of reverse path forwarding (RPF) failures.                                                                                                                                                     |
| <b>Remote Closes</b>                              | Number of times the remote peer closed.                                                                                                                                                               |
| <b>Peer Timeouts</b>                              | Number of peer timeouts.                                                                                                                                                                              |
| <b>SA messages sent</b>                           | Number of source-active messages sent.                                                                                                                                                                |
| <b>SA messages received</b>                       | Number of source-active messages received.                                                                                                                                                            |
| <b>SA request messages sent</b>                   | Number of source-active request messages sent.                                                                                                                                                        |
| <b>SA request messages received</b>               | Number of source-active request messages received.                                                                                                                                                    |
| <b>SA response messages sent</b>                  | Number of source-active response messages sent.                                                                                                                                                       |
| <b>SA response messages received</b>              | Number of source-active response messages received.                                                                                                                                                   |
| <b>SA messages with zero Entry Count received</b> | Entry Count is a field within SA message that defines how many source/group tuples are present in the SA message. The counter is incremented each time an SA with an Entry Count of zero is received. |
| <b>Active source exceeded</b>                     | Number of times this peer has exceeded configured source-active limits.                                                                                                                               |
| <b>Active source Maximum</b>                      | Configured number of active source messages accepted by this peer.                                                                                                                                    |
| <b>Active source threshold</b>                    | Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.                                                                       |
| <b>Active source log-warning</b>                  | Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                                   |
| <b>Active source log-interval</b>                 | Time (in seconds) between consecutive log messages on this peer.                                                                                                                                      |

Table 106: show msdp statistics Output Fields (*continued*)

| Field Name                  | Field Description                      |
|-----------------------------|----------------------------------------|
| Keepalive messages sent     | Number of keepalive messages sent.     |
| Keepalive messages received | Number of keepalive messages received. |
| Unknown messages received   | Number of unknown messages received.   |
| Error messages received     | Number of error messages received.     |

## Sample Output

### show msdp statistics

```

user@host> show msdp statistics
Global active source limit exceeded: 0
Global active source limit maximum: 10
Global active source limit threshold: 8
Global active source limit log-warning: 60
Global active source limit log interval: 60

## show multicast backup-pe-groups

**Syntax** show multicast backup-pe-groups  
 <address *pe-address*>  
 <group *group-name*>  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Release Information** Command introduced in Junos OS Release 9.0.

**Description** Display backup PE router group information when ingress PE redundancy is configured. Ingress PE redundancy provides a backup resource when point-to-multipoint LSPs are configured for multicast distribution.

**Options** none—Display standard information about all backup PE groups.

**address *pe-address***—(Optional) Display the groups that a PE address is associated with.

**group *group***—(Optional) Display the backup PE group information for a particular group.

**instance *instance-name***—(Optional) Display backup PE group information for a specific multicast instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show multicast backup-pe-groups on page 1642](#)

**Output Fields** [Table 107 on page 1641](#) describes the output fields for the **show multicast backup-pe-groups** command. Output fields are listed in the approximate order in which they appear.

**Table 107: show multicast backup-pe-groups Output Fields**

| Field Name      | Field Description                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup PE Group | Group name.                                                                                                                                                          |
| Designated PE   | Primary PE router. Address of the PE router that is currently forwarding traffic on the static route.                                                                |
| Transitions     | Number of times that the designated PE router has transitioned from the most eligible PE router to a backup PE router and back again to the most eligible PE router. |
| Last Transition | Time of the most recent transition.                                                                                                                                  |
| Local Address   | Address of the local PE router.                                                                                                                                      |
| Backup PE List  | List of PE routers that are configured to be backups for the group.                                                                                                  |

## Sample Output

### show multicast backup-pe-groups

```
user@host> show multicast backup-pe-groups
Instance: master

Backup PE group: b1
  Designated PE: 10.255.165.7
  Transitions: 1
  Last Transition: 03:15:01
  Local Address: 10.255.165.7
  Backup PE List:
    10.255.165.8

Backup PE group: b2
  Designated PE: 10.255.165.7
  Transitions: 2
  Last Transition: 02:58:20
  Local Address: 10.255.165.7
  Backup PE List:
    10.255.165.9
    10.255.165.8
```

## show multicast flow-map

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                         |

Table 109: show multicast forwarding-cache statistics Output Fields

| Field Name | Field Description                                                                                                           |
|------------|-----------------------------------------------------------------------------------------------------------------------------|
| Instance   | Name of the routing instance for which multicast forwarding cache statistics are displayed.                                 |
| Family     | Protocol family for which multicast forwarding cache statistics are displayed: <b>ALL</b> , <b>INET</b> , or <b>INET6</b> . |

Table 109: show multicast forwarding-cache statistics Output Fields (*continued*)

| Field Name                               | Field Description                                                                                                                                                                                                                                                                           |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General (or MVPN RPT) Suppression Active | Indicates whether suppression is configured.                                                                                                                                                                                                                                                |
| General (or MVPN RPT) Entries Used       | Number of currently used multicast forwarding cache entries.                                                                                                                                                                                                                                |
| General (or MVPN RPT) Suppress Threshold | Maximum number of multicast forwarding cache entries that can be added to the cache. When the number of entries reaches the configured threshold, the device suspends adding new multicast forwarding cache entries.                                                                        |
| General (or MVPN RPT) Reuse Value        | Number of multicast forwarding cache entries that must be reached before the device creates new multicast forwarding cache entries. When the total number of multicast forwarding cache entries is below the reuse value, the device resumes adding new multicast forwarding cache entries. |

## Sample Output

### show multicast forwarding cache statistics instance

```

user@host> show multicast forwarding-cache statistic instance mvpn1 inet6
  Instance: mvpn1 Family: INET6
  General Suppression Active           Yes
  General Entries Used                 0
  General Suppress Threshold          200
  General Reuse Value                 200
  MVPN RPT Suppression Active         Yes
  MVPN RPT Entries Used               0
  MVPN RPT Suppress Threshold         200
  MVPN RPT Reuse Value                200

```

### show multicast forwarding cache statistics instance (Forwarding-cache suppression is disabled)

```

user@host> show multicast forwarding-cache statistic instance mvpn1
  Instance: mvpn1 Family: ALL
  Forwarding-cache suppression disabled Not enabled by configuration

```

## show multicast interface

**List of Syntax** [Syntax on page 1647](#)  
[Syntax \(EX Series Switch and the QFX Series\) on page 1647](#)

**Syntax** show multicast interface  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switch and the QFX Series)** show multicast interface

**Release Information** Command introduced in Junos OS Release 8.3.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display bandwidth information about IP multicast interfaces.

**Options** **none**—Display all interfaces that have multicast configured.  
**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show multicast interface on page 1648](#)

**Output Fields** [Table 110 on page 1647](#) describes the output fields for the **show multicast interface** command. Output fields are listed in the approximate order in which they appear.

**Table 110: show multicast interface Output Fields**

| Field Name                       | Field Description                                                    |
|----------------------------------|----------------------------------------------------------------------|
| <b>Interface</b>                 | Name of the multicast interface.                                     |
| <b>Maximum bandwidth (bps)</b>   | Maximum bandwidth setting, in bits per second, for this interface.   |
| <b>Remaining bandwidth (bps)</b> | Amount of bandwidth, in bits per second, remaining on the interface. |

Table 110: show multicast interface Output Fields (*continued*)

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mapped bandwidth deduction (bps)</b>      | <p>Amount of bandwidth, in bits per second, used by any flows that are mapped to the interface.</p> <p><b>NOTE:</b> Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface.</p> <p>This field does not appear in the output when the no QoS adjustment feature is disabled.</p>         |
| <b>Local bandwidth deduction (bps)</b>       | <p>Amount of bandwidth, in bits per second, used by any mapped flows that are traversing the interface.</p> <p><b>NOTE:</b> Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface.</p> <p>This field does not appear in the output when the no QoS adjustment feature is disabled.</p> |
| <b>Reverse OIF mapping</b>                   | <p>State of the reverse OIF mapping feature (<b>on</b> or <b>off</b>).</p> <p><b>NOTE:</b> This field does not appear in the output when the no QoS adjustment feature is disabled.</p>                                                                                                                                                                                    |
| <b>Reverse OIF mapping no QoS adjustment</b> | <p>State of the no QoS adjustment feature (<b>on</b> or <b>off</b>) for interfaces that are using reverse OIF mapping.</p> <p><b>NOTE:</b> This field does not appear in the output when the no QoS adjustment feature is disabled.</p>                                                                                                                                    |
| <b>Leave timer</b>                           | <p>Amount of time a mapped interface remains active after the last mapping ends.</p> <p><b>NOTE:</b> This field does not appear in the output when the no QoS adjustment feature is disabled.</p>                                                                                                                                                                          |
| <b>No QoS adjustment</b>                     | <p>State (<b>on</b>) of the no QoS adjustment feature when this feature is enabled.</p> <p><b>NOTE:</b> This field does not appear in the output when the no QoS adjustment feature is disabled.</p>                                                                                                                                                                       |

## Sample Output

### show multicast interface

```

user@host> show multicast interface
Interface          Maximum bandwidth (bps) Remaining bandwidth (bps)
fe-0/0/3           100000000                0
fe-0/0/3.210       100000000                -2000000
fe-0/0/3.220       100000000                100000000
fe-0/0/3.230       200000000                180000000
fe-0/0/2.200       100000000                100000000

```

## show multicast mrinfo

Table 111: show multicast mrinfo Output Fields

| Field Name                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>source-address</i>                | Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>ip-address-1—&gt;ip-address-2</i> | Queried router interface address and directly attached neighbor interface address, respectively.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>(name or ip-address)</i>          | Name or IP address of neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>[metric/threshold/type/flags]</i> | Neighbor's multicast profile: <ul style="list-style-type: none"> <li><b>metric</b>—Always has a value of 1, because <b>mrinfo</b> queries the directly connected interfaces of a device.</li> <li><b>threshold</b>—Multicast threshold time-to-live (TTL). The range of values is 0 through 255.</li> <li><b>type</b>—Multicast connection type: <b>pim</b> or <b>tunnel</b>.</li> <li><b>flags</b>—Flags for this route: <ul style="list-style-type: none"> <li><b>querier</b>—Queried router is the designated router for the neighboring session.</li> <li><b>leaf</b>—Link is a leaf in the multicast network.</li> <li><b>down</b>—Link status indicator.</li> </ul> </li> </ul> |

## Sample Output

### show multicast mrinfo

```
user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
  192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
  0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```

        <identifier-number>
        <inet | inet6>
        <logical-system (all | logical-system-name)>
```

**Syntax (EX Series Switch and the QFX Series)** show multicast next-hops <brief | detail> <identifier-number> <inet | inet6>

| Release Information | Command introduced before Junos OS Release 7.4.                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                               |
|                     | <b>inet6</b> option introduced in Junos OS Release 10.0 for EX Series switches.                                                                  |
|                     | <b>detail</b> option display of next-hop ID number introduced in Junos OS Release 11.1 for M Series and T Series routers and EX Series switches. |
|                     | Command introduced in Junos OS Release 11.3 for the QFX Series.                                                                                  |
|                     | Support for bidirectional PIM added in Junos OS Release 12.1.                                                                                    |
|                     | Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                           |
|                     | <b>terse</b> option introduced in Junos OS Release 16.1 for the MX Series.                                                                       |

**Description** Display the entries in the IP multicast next-hop table.

**Options** **none**—Display standard information about all entries in the multicast next-hop table for all supported address families.

**brief** | **detail** | **terse**—(Optional) Display the specified level of output. Use **terse** to display the total number of outgoing interfaces (as opposed to listing them) When you include the **detail** option on M Series and T Series routers and EX Series switches, the downstream interface name includes the next-hop ID number in parentheses, in the form **fe-0/1/2.0-(1048574)**, where **1048574** is the next-hop ID number.

Starting in Junos OS release 16.1, the **show multicast next-hops** statement shows the hierarchical next hops contained in the top-level next hop.

**identifier-number**—(Optional) Show a particular next hop by ID number. The range of values is 1 through 65,535.

**inet | inet6**—(Optional) Display entries for IPv4 or IPv6 family addresses, respectively.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**Output Fields** [Table 112 on page 1653](#) describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

**Table 112: show multicast next-hops Output Fields**

| Field Name                     | Field Description                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Family</b>                  | Protocol family (such as <b>INET</b> ).                                                                                                                |
| <b>ID</b>                      | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.                                        |
| <b>RefCount</b>                | Number of cache entries that are using this next hop.                                                                                                  |
| <b>KRefCount</b>               | Kernel reference count for the next hop.                                                                                                               |
| <b>Downstream interface</b>    | Interface names associated with each multicast next-hop ID.                                                                                            |
| <b>Incoming interface list</b> | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM. |

## Sample Output

### show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefCount  Downstream interface
262142      4          2  so-1/0/0.0
262143      2          1  mt-1/1/0.49152
262148      2          1  mt-1/1/0.32769
```

### show multicast next-hops (Bidirectional PIM)

```
user@host> show multicast next-hops

Output fields are listed in the order in which they appear.</p>                                                                                                                                                                                                                                                      |

Table 113: show multicast pim-to-igmp-proxy Output Fields

| Field Name                   | Field Description                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>              | Routing instance. Default instance is <b>master</b> (inet.0 routing table).                                                                           |
| <b>Proxy state</b>           | State of PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |
| <b><i>interface-name</i></b> | Name of upstream interface (no more than two allowed) on which PIM-to-IGMP message translation is configured.                                         |

## Sample Output

### show multicast pim-to-igmp-proxy

```
user@host> show multicast pim-to-igmp-proxy
Instance: master Proxy state: enabled
ge-0/1/0.1
ge-0/1/0.2
```

### show multicast pim-to-igmp-proxy instance

```
user@host> show multicast pim-to-igmp-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/1/0.1
```

## show multicast pim-to-mld-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Output fields are listed in the order in which they appear.</p>                                                                                                                                                                                                                                                     |

**Table 114: show multicast pim-to-mld-proxy Output Fields**

| Field Name  | Field Description                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Proxy state | State of PIM-to-MLD message translation, also known as PIM-to-MLD proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |

Table 114: show multicast pim-to-mld-proxy Output Fields (*continued*)

| Field Name            | Field Description                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------|
| <i>interface-name</i> | Name of upstream interface (no more than two allowed) on which PIM-to-MLD message translation is configured. |

## Sample Output

### show multicast pim-to-mld-proxy

```
user@host> show multicast pim-to-mld-proxy
Instance: master Proxy state: enabled
ge-0/5/0.1
ge-0/5/0.2
```

### show multicast pim-to-mld-proxy instance

```
user@host> show multicast pim-to-mld-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/5/0.1
```

## show multicast route

**List of Syntax**    [Syntax on page 1659](#)  
                          [Syntax \(EX Series Switch and the QFX Series\) on page 1659](#)

**Syntax**    show multicast route  
                  <brief | detail | extensive | summary>  
                  <active | all | inactive>  
                  <group *group*>  
                  <inet | inet6>  
                  <instance *instance name*>  
                  <logical-system (all | *logical-system-name*)>  
                  <oif-count>  
                  <*regular-expression*>  
                  <source-prefix *source-prefix*>

**Syntax (EX Series Switch and the QFX Series)**    show multicast route  
                  <brief | detail | extensive | summary>  
                  <active | all | inactive>  
                  <group *group*>  
                  <inet | inet6>  
                  <instance *instance name*>  
                  <*regular-expression*>  
                  <source-prefix *source-prefix*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                  Support for bidirectional PIM added in Junos OS Release 12.1.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
                                  **oif-count** option introduced in Junos OS Release 16.1 for the MX Series.  
                                  xxxSupport for PIM NSR support for VXLAN added in Junos OS Release 16.2.

**Description**    Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

**NOTE:** On all SRX Series devices, when a multicast route is not available, pending sessions are not torn down, and subsequent packets are queued. If no multicast route resolve comes back, then the traffic flow has to wait for the pending session to timed out. Then packets can trigger new pending session create and route resolve.

**Options**    **none**—Display standard information about all entries in the multicast forwarding table for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**active | all | inactive**—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

**group *group***—(Optional) Display the cache entries for a particular group.

**inet | inet6**—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**oif-count** —(Optional) Display a count of outgoing interfaces rather than listing them.

**regular-expression**—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.

**source-prefix *source-prefix***—(Optional) Display the cache entries for a particular source prefix.

**Output Fields** [Table 115 on page 1660](#) describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

**Table 115: show multicast route Output Fields**

| Field Name | Field Description                                                            | Level of Output |
|------------|------------------------------------------------------------------------------|-----------------|
| family     | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ). | All levels      |

Table 115: show multicast route Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Group                         | Group address.<br><br>For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.                                                                                                                                                                                                                                                                                                                       | All levels       |
| Source                        | Prefix and length of the source as it is in the multicast forwarding table.                                                                                                                                                                                                                                                                                                                                                                                   | All levels       |
| Incoming interface list       | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                                                                                                                                                                                                                                                                                        | All levels       |
| Upstream interface            | Name of the interface on which the packet with this source prefix is expected to arrive.                                                                                                                                                                                                                                                                                                                                                                      | All levels       |
| Upstream rpf interface list   | When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request.                                                                                                                                                                                                                                                               | All levels       |
| Downstream interface list     | List of interface names to which the packet with this source prefix is forwarded.                                                                                                                                                                                                                                                                                                                                                                             | All levels       |
| Number of outgoing interfaces | Total number of outgoing interfaces for each (S,G) entry.                                                                                                                                                                                                                                                                                                                                                                                                     | extensive        |
| Session description           | Name of the multicast session.                                                                                                                                                                                                                                                                                                                                                                                                                                | detail extensive |
| Statistics                    | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays <b>Forwarding statistics are not available</b> .<br><br><b>NOTE:</b> On QFX Series switches and OCX Series switches, this field does not report valid statistics. | detail extensive |
| Next-hop ID                   | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command.                                                                                                                                                                                                                                                             | detail extensive |
| Incoming interface list ID    | For bidirectional PIM, incoming interface list identifier.<br><br>Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                                                                                                                                                                                                              | detail extensive |
| Upstream protocol             | The protocol that maintains the active multicast forwarding route for this group or source.<br><br>When the <b>show multicast route extensive</b> command is used with the <b>display-origin-protocol</b> option, the field name is only <b>Protocol</b> and not <b>Upstream Protocol</b> . However, this field also displays the protocol that installed the active route.                                                                                   | detail extensive |
| Route type                    | Type of multicast route. Values can be (S,G) or (*G).                                                                                                                                                                                                                                                                                                                                                                                                         | summary          |

| Field Name                             | Field Description                                                                                                                                                                                                               | Level of Output          |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Route state                            | Whether the group is <b>Active</b> or <b>Inactive</b> .                                                                                                                                                                         | <b>summary extensive</b> |
| Route count                            | Number of multicast routes.                                                                                                                                                                                                     | <b>summary</b>           |
| Forwarding state                       | Whether the prefix is pruned or forwarding.                                                                                                                                                                                     | <b>extensive</b>         |
| Cache lifetime/timeout                 | Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry. A value of <b>forever</b> indicates routes that do not have keepalive times. | <b>extensive</b>         |
| Wrong incoming interface notifications | Number of times that the upstream interface was not available.                                                                                                                                                                  | <b>extensive</b>         |
| Uptime                                 | Time since the creation of a multicast route.                                                                                                                                                                                   | <b>extensive</b>         |

## Sample Output

Starting in Junos OS Release 16.1, **show multicast route** displays the top-level hierarchical next hop.

### show multicast route

```

user@host> show multicast route
Family: INET

Group: 233.252.0.0
  Source: 10.255.14.144/32
  Upstream interface: local
  Downstream interface list:
    so-1/0/0.0

Group: 233.252.0.1
  Source: 10.255.14.144/32
  Upstream interface: local
  Downstream interface list:
    so-1/0/0.0

Group: 233.252.0.1
  Source: 10.255.70.15/32
  Upstream interface: so-1/0/0.0
  Downstream interface list:
    mt-1/1/0.1081344

Family: INET6

```

### show multicast route (Bidirectional PIM)

```

user@host> show multicast route
Family: INET

Group: 233.252.0.1/24

```

```

Source: *
Incoming interface list:
  lo0.0 ge-0/0/1.0
Downstream interface list:
  ge-0/0/1.0

Group: 233.252.0.3/24
Source: *
Incoming interface list:
  lo0.0 ge-0/0/1.0 xe-4/1/0.0
Downstream interface list:
  ge-0/0/1.0

Group: 233.252.0.11/24
Source: *
Incoming interface list:
  lo0.0 ge-0/0/1.0
Downstream interface list:
  ge-0/0/1.0

Group: 233.252.0.13/24

Incoming interface list:
  lo0.0 ge-0/0/1.0 xe-4/1/0.0
Downstream interface list:
  ge-0/0/1.0
Family: INET6

```

### show multicast route brief

The output for the **show multicast route brief** command is identical to that for the **show multicast route** command. For sample output, see [show multicast route on page 1662](#) or [show multicast route \(Bidirectional PIM\) on page 1662](#).

### show multicast route detail

```

user@host> show multicast route detail
Family: INET

Group: 233.252.0.0

## show multicast scope

**List of Syntax** [Syntax on page 1672](#)  
[Syntax \(EX Series Switch and the QFX Series\) on page 1672](#)

**Syntax** show multicast scope  
 <inet | inet6>  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switch and the QFX Series)** show multicast scope  
 <inet | inet6>  
 <instance *instance-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display administratively scoped IP multicast information.

**Options** **none**—Display standard information about administratively scoped multicast information for all supported address families in all routing instances.

**inet | inet6**—(Optional) Display scoped multicast information for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display administratively scoped information for a specific multicast instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show multicast scope on page 1673](#)  
[show multicast scope inet on page 1673](#)  
[show multicast scope inet6 on page 1673](#)

**Output Fields** [Table 117 on page 1672](#) describes the output fields for the **show multicast scope** command. Output fields are listed in the approximate order in which they appear.

**Table 117: show multicast scope Output Fields**

| Field Name | Field Description            |
|------------|------------------------------|
| Scope name | Name of the multicast scope. |

Table 117: show multicast scope Output Fields (*continued*)

| Field Name      | Field Description                                           |
|-----------------|-------------------------------------------------------------|
| Group Prefix    | Range of multicast groups that are scoped.                  |
| Interface       | Interface that is the boundary of the administrative scope. |
| Resolve Rejects | Number of kernel resolve rejects.                           |

## Sample Output

### show multicast scope

```
user@host> show multicast scope
```

| Scope name | Group Prefix       | Interface  | Resolve Rejects |
|------------|--------------------|------------|-----------------|
| 233-net    | 233.252.0.0/16     | fe-0/0/0.1 | 0               |
| local      | 233.252.0.1/16     | fe-0/0/0.1 | 0               |
| local      | 2001:db8::/16      | fe-0/0/0.1 | 0               |
| larry      | 2001:db8::1234/128 | fe-0/0/0.1 | 0               |

### show multicast scope inet

```
user@host> show multicast scope inet
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 233-net    | 233.252.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 233.252.0.0/16 | fe-0/0/0.1 | 0               |

### show multicast scope inet6

```
user@host> show multicast scope inet6
```

| Scope name | Group Prefix       | Interface  | Resolve Rejects |
|------------|--------------------|------------|-----------------|
| local      | 2001:db8::/16      | fe-0/0/0.1 | 0               |
| larry      | 2001:db8::1234/128 | fe-0/0/0.1 | 0               |

## show multicast snooping next-hops

**Syntax**    `show multicast snooping next-hops`  
               `<brief | detail>`  
               `<identifier next-hop-ID>`  
               `<inet>`  
               `<inet6>`  
               `<logical-system logical-system-name>`

**Release Information**    Command introduced in Junos OS Release 11.2.

**Description**    Display information about the IP multicast snooping next-hops.

**Options**    **brief | detail**—(Optional) Display the specified level of output.

**inet**—(Optional) Display information for IPv4 multicast next hops only. If a family is not specified, both IPv4 and IPv6 results will be shown.

**inet6**—(Optional) Display information for IPv6 multicast next hops only. If a family is not specified, both IPv4 and IPv6 results will be shown.

**logical-system *logical-system-name***—(Optional) Display information about a particular logical system, or type 'all'.

**Required Privilege Level**    view

**List of Sample Output**    [show multicast snooping next-hops on page 1676](#)  
                                   [show multicast snooping next-hops \(IGMP snooping enabled on a VPLS\) on page 1676](#)

**Output Fields**    [Table 118 on page 1674](#) describes the output fields for the **show multicast snooping next-hops** command. Output fields are listed in the approximate order in which they appear.

**Table 118: show multicast snooping next-hops Output Fields**

| Field Name           | Field Description                                                                                   |
|----------------------|-----------------------------------------------------------------------------------------------------|
| Family               | Protocol family for which multicast snooping next hops are displayed: <b>INET</b> or <b>INET6</b> . |
| RefCount             | Number of cache entries that are using this next hop.                                               |
| KRefCount            | Kernel reference count for the next hop.                                                            |
| Downstream interface | Interface names associated with each multicast next-hop ID.                                         |

Table 118: show multicast snooping next-hops Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Nexthop Id</b> | Identifier for the next-hop.<br><br><b>NOTE:</b> To see the next-hop ID for a given PE mesh group, <b>igmp-snooping</b> must be enabled for the relevant VPLS routing instance. (Junos OS creates a default CE and VE mesh groups for each VPLS routing instance. The next hop of the VE mesh group is the set of VE mesh-group interfaces of the remaining PEs in the same VPLS routing instance.) |

## Sample Output

### show multicast snooping next-hops

```

user@host> show multicast snooping next-hops
Family: INET
ID          Refcount KRefCount Downstream interface Nexthop Id
1048574      4          1 ge-0/1/0.1000
               ge-0/1/2.1000
               ge-0/1/3.1000

               lsi.1048579-(2004)

```

### show multicast snooping next-hops (IGMP snooping enabled on a VPLS)

In this example, ID 1048585 is the VE next-hop ID created for the VE next hop that is holding VE interfaces for the routing instance. It only appears if igmp snooping is enabled on the VPLS.

```

user@host> show multicast snooping next-hops
Family: INET
ID          Refcount KRefCount Downstream interface Addr
1048588      2          1 1048585
1048589      2          1 1048585
               ge-0/0/5.100
0            2          0 ge-0/0/0.100
               ge-0/0/1.100

## show multicast sessions

**List of Syntax**    [Syntax on page 1677](#)  
                          [Syntax \(EX Series Switch and the QFX Series\) on page 1677](#)

**Syntax**    show multicast sessions  
                  <brief | detail | extensive>  
                  <logical-system (all | *logical-system-name*)>  
                  <*regular-expression*>

**Syntax (EX Series Switch and the QFX Series)**    show multicast sessions  
                  <brief | detail | extensive>  
                  <*regular-expression*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display information about announced IP multicast sessions.

**NOTE:** On all SRX Series devices, only 100 packets can be queued during pending (S, G) route. However, when multiple multicast sessions enter the route resolve process at the same time, buffer resources are not sufficient to queue 100 packets for each session.

**Options**    **none**— Display standard information about all multicast sessions for all routing instances.  
                  **brief | detail | extensive**—(Optional) Display the specified level of output.  
                  **logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.  
                  ***regular-expression***—(Optional) Display information about announced sessions that match a UNIX-style regular expression.

**Required Privilege Level**    view

**List of Sample Output**    [show multicast sessions on page 1679](#)  
                                  [show multicast sessions regular-expression detail on page 1679](#)

**Output Fields**    [Table 119 on page 1678](#) describes the output fields for the **show multicast sessions** command. Output fields are listed in the approximate order in which they appear.

Table 119: show multicast sessions Output Fields

| Field Name          | Field Description                               |
|---------------------|-------------------------------------------------|
| <i>session-name</i> | Name of the known announced multicast sessions. |

---

## show multicast snooping route

**Syntax** show multicast snooping route  
 <regexp>  
 <active>  
 <all>  
 <bridge-domain *bridge-domain-name*>  
 <brief >  
 <control>  
 <data>  
 <detail >  
 <extensive>  
 <group *group*>  
 <inactive>  
 <inet>  
 <inet6>  
 <instance *instance-name*>  
 <logical-system *logical-system-name*>  
 <mesh-group *mesh-group-name*>  
 <qualified-vlan *vlan-id*>  
 <source-prefix *source-prefix*>  
 <vlan *vlan-id*>

**Release Information** Command introduced in Junos OS Release 8.5.  
 Support for **control**, **data**, **qualified-vlan** and **vlan** options introduced in Junos OS Release 13.3 for EX Series switches.

**Description** Display the entries in the IP multicast snooping forwarding table. You can display some of this information with the **show route table inet.1** command.

**Options** **none**—Display standard information about all entries in the multicast snooping table for all virtual switches and all bridge domains.

**active | all | inactive** —(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast snooping table.

**bridge-domain *bridge-domain***—(Optional) Display the entries for a particular bridge domain.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**control**—(Optional) Display control route entries.

**data**—(Optional) Display data route entries.

**group *group***—(Optional) Display the entries for a particular group.

**inet**—(Optional) Display IPv4 information.

**inet6**—(Optional) Display IPv6 information.

**instance *instance-name***—(Optional) Display the entries for a multicast instance.

**logical-system** *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

**mesh-group** *mesh-group-name*—(Optional) Display the entries for a particular mesh group.

**qualified-vlan** *vlan-id*—(Optional) Display the entries for a particular qualified VLAN.

**regex**—(Optional) Display information about the multicast forwarding table entries that match a UNIX-style regular expression.

**source-prefix** *source-prefix*—(Optional) Display the entries for a particular source prefix.

**vlan** *vlan-id*—(Optional) Display the entries for a particular VLAN.

**Required Privilege Level** view

**List of Sample Output** [show multicast snooping route bridge-domain on page 1683](#)  
[show multicast snooping route instance vs on page 1683](#)

**Output Fields** [Table 120 on page 1682](#) describes the output fields for the **show multicast snooping route** command. Output fields are listed in the approximate order in which they appear.

**Table 120: show multicast snooping route Output Fields**

| Field Name              | Field Description                                                                                                                                                                         | Level of Output         |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Nexthop Bulking</b>  | Displays whether next-hop bulk updating is <b>ON</b> or <b>OFF</b> (only for routing-instance type of <b>virtual switch</b> or <b>vpls</b> ).                                             | All levels              |
| <b>Family</b>           | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).                                                                                                              | All levels              |
| <b>Group</b>            | Group address.                                                                                                                                                                            | All levels              |
| <b>Source</b>           | Prefix and length of the source as it is in the multicast forwarding table. For (*,G) entries, this field is set to "*".                                                                  | All levels              |
| <b>Routing-instance</b> | Name of the routing instance to which this routing information applies. (Displayed when multicast is configured within a routing instance.)                                               | All levels              |
| <b>Learning Domain</b>  | Name of the learning domain to which this routing information applies.                                                                                                                    | <b>detail extensive</b> |
| <b>Statistics</b>       | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix.                               | <b>detail extensive</b> |
| <b>Next-hop ID</b>      | Next-hop identifier of the prefix. The identifier is returned by the router's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command. | <b>detail extensive</b> |
| <b>Route state</b>      | Whether the group is <b>Active</b> or <b>Inactive</b> .                                                                                                                                   | <b>extensive</b>        |

Table 120: show multicast snooping route Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                  | Level of Output  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Forwarding state       | Whether the prefix is <b>Pruned</b> or <b>Forwarding</b> .                                                                                         | <b>extensive</b> |
| Cache lifetime/timeout | Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry. | <b>extensive</b> |

| <b>Release Information</b>      | <p>Command introduced before Junos OS Release 7.4.</p> <p><b>interface</b> option introduced in Junos OS Release 16.1 for the MX Series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Display IP multicast statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>none</b>—Display multicast statistics for all supported address families for all routing instances.</p> <p><b>inet   inet6</b>—(Optional) Display multicast statistics for IPv4 or IPv6 family addresses, respectively.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display statistics for a specific routing instance.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display statistics for a specific interface.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| <b>Additional Information</b>   | The input and output interface multicast statistics are consistent, but not timely. They are constructed from the forwarding statistics, which are gathered at 30-second intervals. Therefore, the output from this command always lags the true count by up to 30 seconds.                                                                                                                                                                                                                                                                                                                                    |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Field Name                                                                    | Field Description                                                                                                                                                      |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>                                                              | Name of the interface for which statistics are being reported.                                                                                                         |
| <b>Routing Protocol</b>                                                       | Primary multicast protocol on the interface: <b>PIM</b> , <b>DVMRP</b> for <b>INET</b> , or <b>PIM</b> for <b>INET6</b> .                                              |
| <b>Mismatch</b>                                                               | Number of multicast packets that did not arrive on the correct upstream interface.                                                                                     |
| <b>Kernel Resolve</b>                                                         | Number of resolve requests processed by the primary multicast protocol on the interface.                                                                               |
| <b>Resolve No Route</b>                                                       | Number of resolve requests that were ignored because there was no route to the source.                                                                                 |
| <b>In Kbytes</b>                                                              | Total accumulated incoming packets (in KB) since the last time the <b>clear multicast statistics</b> command was issued.                                               |
| <b>Out Kbytes</b>                                                             | Total accumulated outgoing packets (in KB) since the last time the <b>clear multicast statistics</b> command was issued.                                               |
| <b>Mismatch error</b>                                                         | Number of mismatches that were ignored because of internal errors.                                                                                                     |
| <b>Mismatch No Route</b>                                                      | Number of mismatches that were ignored because there was no route to the source.                                                                                       |
| <b>Routing Notify</b>                                                         | Number of times that the multicast routing system has been notified of a new multicast source by a multicast routing protocol .                                        |
| <b>Resolve Error</b>                                                          | Number of resolve requests that were ignored because of internal errors.                                                                                               |
| <b>In Packets</b>                                                             | Total number of incoming packets since the last time the <b>clear multicast statistics</b> command was issued.                                                         |
| <b>Out Packets</b>                                                            | Total number of outgoing packets since the last time the <b>clear multicast statistics</b> command was issued.                                                         |
| <b>Resolve requests on interfaces not enabled for multicast <i>n</i></b>      | Number of resolve requests on interfaces that are not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued. |
| <b>Resolve requests with no route to source <i>n</i></b>                      | Number of resolve requests with no route to the source that have accumulated since the <b>clear multicast statistics</b> command was last issued.                      |
| <b>Routing notifications on interfaces not enabled for multicast <i>n</i></b> | Number of routing notifications on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued.     |
| <b>Routing notifications with no route to source <i>n</i></b>                 | Number of routing notifications with no route to the source that have accumulated since the <b>clear multicast statistics</b> command was last issued.                 |
| <b>Interface Mismatches on interfaces not enabled for multicast <i>n</i></b>  | Number of interface mismatches on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued.      |

Table 121: show multicast statistics Output Fields (*continued*)

| Field Name                                                               | Field Description                                                                                                                                              |
|--------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group Membership on interfaces not enabled for multicast</b> <i>n</i> | Number of group memberships on interfaces not enabled for multicast that have accumulated since the <b>clear multicast statistics</b> command was last issued. |

## Sample Output

### show multicast statistics

```

user@host> show multicast statistics
Address family: INET
Interface: fe-0/0/0
  Routing Protocol:      PIM  Mismatch error:      0
  Mismatch:              0   Mismatch No Route:    0

| <b>Output Fields</b>                                | <a href="#">Table 122 on page 1691</a> describes the output fields for the <b>show multicast usage</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 122: show multicast usage Output Fields

| Field Name      | Field Description                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                        |
| <b>Group</b>    | Group address.                                                                                                                                                                           |
| <b>Sources</b>  | Number of sources.                                                                                                                                                                       |
| <b>Packets</b>  | Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays <b>unavailable</b> . |
| <b>Bytes</b>    | Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays <b>unavailable</b> .     |
| <b>Prefix</b>   | IP address.                                                                                                                                                                              |
| <b>/len</b>     | Prefix length.                                                                                                                                                                           |
| <b>Groups</b>   | Number of multicast groups.                                                                                                                                                              |

## Sample Output

### show multicast usage

```

user@host> show multicast usage
Group          Sources  Packets      Bytes
233.252.0.0    1        52847      4439148
233.252.0.1    2        13450      1125530

Prefix         /len  Groups  Packets      Bytes
10.255.14.144  /32   2       66254      5561304
10.255.70.15   /32   1        43        3374...
```

### show multicast usage brief

The output for the **show multicast usage brief** command is identical to that for the **show multicast usage** command. For sample output, see [show multicast usage on page 1691](#).

### show multicast usage instance

```

user@host> show multicast usage instance VPN-A
Group          Sources  Packets      Bytes
233.252.0.254  1        5538      509496
233.252.0.39   1         13         624
233.252.0.40   1         13         624

Prefix         /len  Groups  Packets      Bytes
192.168.195.34 /32   1       5538      509496
```

```
10.255.14.30    /32  1      13          624
10.255.245.91  /32  1      13          624
...
```

#### show multicast usage detail

```
user@host> show multicast usage detail

Group          Sources Packets          Bytes

## show pim bootstrap

**List of Syntax** [Syntax on page 1693](#)  
[Syntax \(EX Series Switch and the QFX Series\) on page 1693](#)

**Syntax** show pim bootstrap  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switch and the QFX Series)** show pim bootstrap  
 <instance *instance-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**instance** option introduced in Junos OS Release 10.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** For sparse mode only, display information about Protocol Independent Multicast (PIM) bootstrap routers.

**Options** **none**—Display PIM bootstrap router information for all routing instances.

**instance *instance-name***—(Optional) Display information about bootstrap routers for a specific PIM-enabled routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show pim bootstrap on page 1694](#)  
[show pim bootstrap instance on page 1694](#)

**Output Fields** [Table 123 on page 1693](#) describes the output fields for the **show pim bootstrap** command. Output fields are listed in the approximate order in which they appear.

**Table 123: show pim bootstrap Output Fields**

| Field Name | Field Description                                                     |
|------------|-----------------------------------------------------------------------|
| Instance   | Name of the routing instance.                                         |
| BSR        | Bootstrap router.                                                     |
| Pri        | Priority of the routing device as elected to be the bootstrap router. |

Table 123: show pim bootstrap Output Fields (*continued*)

| Field Name    | Field Description                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------|
| Local address | Local routing device address.                                                                        |
| Pri           | Local routing device address priority to be elected as the bootstrap router.                         |
| State         | Local routing device election state: <b>Candidate</b> , <b>Elected</b> , or <b>Ineligible</b> .      |
| Timeout       | How long until the local routing device declares the bootstrap router to be unreachable, in seconds. |

## Sample Output

### show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master
```

| BSR                       | Pri | Local address             | Pri | State      | Timeout |
|---------------------------|-----|---------------------------|-----|------------|---------|
| None                      | 0   | 10.255.71.46              | 0   | InEligible | 0       |
| 2001:db8:1:1:1:0:aff:785c | 34  | 2001:db8:1:1:1:0:aff:7c12 | 0   | InEligible | 0       |

### show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
Instance: PIM.VPN-A
```

| BSR  | Pri | Local address   | Pri | State      | Timeout |
|------|-----|-----------------|-----|------------|---------|
| None | 0   | 192.168.196.105 | 0   | InEligible | 0       |

## show pim interfaces

| <b>Name</b>         | Interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>State</b>        | State of the interface. The state also is displayed in the <b>show interfaces</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Mode</b>         | <p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> <li>• <b>B</b>—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</li> <li>• <b>S</b>—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</li> <li>• <b>Dense</b>—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</li> <li>• <b>Sparse-Dense</b>—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as <b>dense</b> is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as <b>sparse</b> is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules.</li> </ul> <p>When sparse-dense mode is configured, the output includes both <b>S</b> and <b>D</b>. When bidirectional-sparse mode is configured, the output includes <b>S</b> and <b>B</b>. When bidirectional-sparse-dense mode is configured, the output includes <b>B</b>, <b>S</b>, and <b>D</b>.</p> |
| <b>IP</b>           | Version number of the address family on the interface: <b>4</b> (IPv4) or <b>6</b> (IPv6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

                              **inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                              Support for bidirectional PIM added in Junos OS Release 12.1.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.  
                              Multiple new filter options introduced in Junos OS Release 13.2.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
                              **downstream-count** option introduced in Junos OS Release 16.1.  
                              Support for PIM NSR support for VXLAN added in Junos OS Release 16.2

**Description**    Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.

For bidirectional PIM, display information about PIM group ranges (\*G-range) for each active bidirectional RP group range, in addition to each of the joined (\*G) routes.

**Options**    **none**—Display the standard information about PIM groups for all supported family addresses for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**bidirectional | dense | sparse**—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

**downstream-count**—(Optional) Display the downstream count instead of a list.

**exact**—(Optional) Display information about only the group that exactly matches the specified group address.

**inet | inet6**—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**range**—(Optional) Address range of the group, specified as *prefix/prefix-length*.

**rp *ip-address/prefix* | source *ip-address/prefix***—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Display information about PIM (S,G) or (\*,G) entries.

**Required Privilege Level**

**Output Fields** [Table 125 on page 1700](#) describes the output fields for the **show pim join** command. Output fields are listed in the approximate order in which they appear.

**Table 125: show pim join Output Fields**

| Field Name                               | Field Description                                                      | Level of Output                            |
|------------------------------------------|------------------------------------------------------------------------|--------------------------------------------|
| <b>Instance</b>                          | Name of the routing instance.                                          | <b>brief detail extensive summary none</b> |
| <b>Family</b>                            | Name of the address family: <b>inet</b> (IPv4) or <b>inet6</b> (IPv6). | <b>brief detail extensive summary none</b> |
| <b>Route type</b>                        | Type of multicast route: (S,G) or (*G).                                | <b>summary</b>                             |
| <b>Route count</b>                       | Number of (S,G) routes and number of (*G) routes.                      | <b>summary</b>                             |
| <b>R</b>                                 | Rendezvous Point Tree.                                                 | <b>brief detail extensive none</b>         |
| <b>S</b>                                 | Sparse.                                                                | <b>brief detail extensive none</b>         |
| <b>W</b>                                 | Wildcard.                                                              | <b>brief detail extensive none</b>         |
| <b>Group</b>                             | Group address.                                                         | <b>brief detail extensive none</b>         |
| <b>Bidirectional group prefix length</b> | For bidirectional PIM, length of the IP prefix for RP group ranges.    | All levels                                 |

Table 125: show pim join Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output             |

| Source                    | Multicast source: <ul style="list-style-type: none"> <li>• * (wildcard value)</li> <li>• <i>ipv4-address</i></li> <li>• <i>ipv6-address</i></li> </ul>                                                                                                                                                                                                                                                                                                                                   | brief detail extensive none |
| RP                        | Rendezvous point for the PIM group.                                                                                                                                                                                                                                                                                                                                                                                                                                                      | brief detail extensive none |
| Flags                     | PIM flags: <ul style="list-style-type: none"> <li>• <b>bidirectional</b>—Bidirectional mode entry.</li> <li>• <b>dense</b>—Dense mode entry.</li> <li>• <b>rptree</b>—Entry is on the rendezvous point tree.</li> <li>• <b>sparse</b>—Sparse mode entry.</li> <li>• <b>spt</b>—Entry is on the shortest-path tree for the source.</li> <li>• <b>wildcard</b>—Entry is on the shared tree.</li> </ul>                                                                                     | brief detail extensive none |
| Upstream interface        | RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*G).<br><br>For bidirectional PIM, <b>RP Link</b> means that the interface is directly connected to a subnet that contains a phantom RP address.<br><br>A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.                                            | brief detail extensive none |
| Upstream neighbor         | Information about the upstream neighbor: <b>Direct</b> , <b>Local</b> , <b>Unknown</b> , or a specific IP address.<br><br>For bidirectional PIM, <b>Direct</b> means that the interface is directly connected to a subnet that contains a phantom RP address.<br><br>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.                                                                                                    | extensive                   |
| Active upstream interface | When multicast-only fast reroute (MoFRR) is configured in a PIM domain, the upstream interface for the active path. A PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. Preference is given to two paths that do not converge to the same immediate upstream router. PIM installs appropriate multicast routes with upstream neighbors as RPF next hops with two (primary and backup) interfaces. | extensive                   |
| Active upstream neighbor  | On the MoFRR primary path, the IP address of the neighbor that is directly connected to the active upstream interface.                                                                                                                                                                                                                                                                                                                                                                   | extensive                   |

| Number of downstream interfaces | Total number of outgoing interfaces for each (S,G) entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | extensive       |
| Assert Timeout                  | Length of time between assert cycles on the downstream interface. Not displayed if the assert timer is null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | extensive       |
| Keepalive timeout               | Time remaining until the downstream join state is updated (in seconds). If the downstream join state is not updated before this keepalive timer reaches zero, the entry is deleted. If there is a directly connected host, <b>Keepalive timeout</b> is <b>Infinity</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | extensive       |

Table 125: show pim join Output Fields (*continued*)

| Field Name                                | Field Description                                                                                                                                                                                                                                                                                                                     | Level of Output  |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Uptime</b>                             | Time since the creation of (S,G) or (*,G) state. The uptime is not refreshed every time a PIM join message is received for an existing (S,G) or (*,G) state.                                                                                                                                                                          | <b>extensive</b> |
| <b>Bidirectional accepting interfaces</b> | <p>Interfaces on the routing device that forward bidirectional PIM traffic.</p> <p>The reasons for forwarding bidirectional PIM traffic are that the interface is the winner of the designated forwarder election (<b>DF Winner</b>), or the interface is the reverse path forwarding (RPF) interface toward the RP (<b>RPF</b>).</p> | <b>extensive</b> |

## Sample Output

### show pim join summary

```

user@host> show pim join summary
Instance: PIM.master Family: INET

Route type      Route count
(s,g)           2
(*,g)           1

Instance: PIM.master Family: INET6

```

## show pim mdt

**Syntax** `show pim mdt instance instance-name`  
`<brief | detail | extensive>`  
`<incoming | outgoing>`  
`<logical-system (all | logical-system-name)>`  
`<range>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display information about Protocol Independent Multicast (PIM) default multicast distribution tree (MDT) and the data MDTs in a Layer 3 VPN environment for a routing instance.

**Options** `instance instance-name`—Display information about data-MDTs for a specific PIM-enabled routing instance.

`brief | detail | extensive`—(Optional) Display the specified level of output.

`incoming | outgoing`—(Optional) Display incoming or outgoing multicast data tunnels, respectively.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

`range`—(Optional) Display information about an IP address with optional prefix length representing a particular multicast group.

**Required Privilege Level** view

**List of Sample Output** [show pim mdt instance on page 1721](#)  
[show pim mdt instance detail on page 1722](#)  
[show pim mdt instance extensive on page 1722](#)  
[show pim mdt instance incoming on page 1722](#)  
[show pim mdt instance outgoing on page 1722](#)  
[show pim mdt instance \(SSM Mode\) on page 1723](#)

**Output Fields** [Table 126 on page 1720](#) describes the output fields for the **show pim mdt** command. Output fields are listed in the approximate order in which they appear.

**Table 126: show pim mdt Output Fields**

| Field Name       | Field Description                                                                               | Level of Output |
|------------------|-------------------------------------------------------------------------------------------------|-----------------|
| Instance         | Name of the routing instance.                                                                   | All levels      |
| Tunnel direction | Direction the tunnel faces, from the router's perspective: <b>Outgoing</b> or <b>Incoming</b> . | All levels      |

Table 126: show pim mdt Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                    | Level of Output |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Tunnel mode</b>                | Mode the tunnel is operating in: <b>PIM-SSM</b> or <b>PIM-ASM</b> .                                                                                                                  | All levels      |
| <b>Default group address</b>      | Default multicast group address using this tunnel.                                                                                                                                   | All levels      |
| <b>Default source address</b>     | Default multicast source address using this tunnel.                                                                                                                                  | All levels      |
| <b>Default tunnel interface</b>   | Default multicast tunnel interface.                                                                                                                                                  | All levels      |
| <b>Default tunnel source</b>      | Address used as the source address for outgoing PIM control messages.                                                                                                                | All levels      |
| <b>C-Group</b>                    | Customer-facing multicast group address using this tunnel. If you enable dynamic reuse of data MDT group addresses, more than one group address can use the same data MDT.           | <b>detail</b>   |
| <b>C-Source</b>                   | IP address of the multicast source in the customer's address space. If you enable dynamic reuse of data MDT group addresses, more than one source address can use the same data MDT. | <b>detail</b>   |
| <b>P-Group</b>                    | Service provider-facing multicast group address using this tunnel.                                                                                                                   | <b>detail</b>   |
| <b>Data tunnel interface</b>      | Multicast data tunnel interface that set up the data-MDT tunnel.                                                                                                                     | <b>detail</b>   |
| <b>Last known forwarding rate</b> | Last known rate, in kilobits per second, at which the tunnel was forwarding traffic.                                                                                                 | <b>detail</b>   |
| <b>Configured threshold rate</b>  | Rate, in kilobits per second, above which a data-MDT tunnel is created and below which it is deleted.                                                                                | <b>detail</b>   |
| <b>Tunnel uptime</b>              | Time that this data-MDT tunnel has existed. The format is <i>hours:minutes:seconds</i> .                                                                                             | <b>detail</b>   |

## Sample Output

### show pim mdt instance

```

user@host> show pim mdt instance VPN-A
Instance: PIM.VPN-A
Tunnel direction: Outgoing
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.32768
Default tunnel source: 192.168.7.1

C-group address   C-source address   P-group address   Data tunnel interface
235.1.1.2         192.168.195.74     228.0.0.0         mt-1/1/0.32769

Instance: PIM.VPN-A

```

```
Tunnel direction: Incoming
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.1081344
```

#### show pim mdt instance detail

```
user@host> show pim mdt instance VPN-A detail
Instance: PIM.VPN-A
Tunnel direction: Outgoing
Default group address: 239.1.1.1
Default tunnel interface: mt-1/1/0.32768
Default tunnel source: 192.168.7.1

Default group address: 232.1.1.1
Default source address: 10.255.14.218
Default tunnel interface: mt-1/3/0.1081345

```

## show pim mdt data-mdt-joins

**Syntax** `show pim mdt data-mdt-joins`  
`<logical-system (all | logical-system-name)> instance instance-name`

**Release Information** Command introduced in Junos OS Release 11.2.

**Description** In a draft-rosen Layer 3 multicast virtual private network (MVPN) configured with service provider tunnels, display the advertisements of new multicast distribution tree (MDT) group addresses cached by the provider edge (PE) routers in the specified VPN routing and forwarding (VRF) instance that is configured to use the Protocol Independent Multicast (PIM) protocol.

**Options** `instance instance-name`—Display data MDT join packets cached by PE routers in a specific PIM instance.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**NOTE:** Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

**Required Privilege Level** view

**List of Sample Output** [show pim mdt data-mdt-joins on page 1725](#)

**Output Fields** [Table 127 on page 1724](#) describes the output fields for the `show pim mdt data-mdt-joins` command. Output fields are listed in the approximate order in which they appear.

**Table 127: show pim mdt data-mdt-joins Output Fields**

| Field Name | Field Description                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C-Group    | IPv4 group address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic destination. This 32-bit value is carried in the C-group field of the MDT join TLV packet. |

Table 127: show pim mdt data-mdt-joins Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>C-Source</b> | IPv4 address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic source. This 32-bit value is carried in the C-source field of the MDT join TLV packet.                                               |
| <b>P-Group</b>  | IPv4 group address in the service provider's address space of the new data MDT that the PE router will use to encapsulate the VPN multicast traffic flow (C-Source, C-Group). This 32-bit value is carried in the P-group field of the MDT join TLV packet. |
| <b>P-Source</b> | IPv4 address of the PE router.                                                                                                                                                                                                                              |
| <b>Timeout</b>  | Timeout, in seconds, remaining for this cache entry. When the cache entry is created, this field is set to 180 seconds. After an entry times out, the PE router deletes the entry from its cache and prunes itself off the data MDT.                        |

## Sample Output

### show pim mdt data-mdt-joins

```

user@host show pim mdt data-mdt-joins instance VPN-A
C-Source      C-Group      P-Source      P-Group      Timeout
20.2.15.9     225.1.1.2    20.0.0.5      239.10.10.0  172
20.2.15.9     225.1.1.3    20.0.0.5      239.10.10.1  172

```

## show pim mdt data-mdt-limit

**Syntax** `show pim mdt data-mdt-limit instance instance-name`  
`<logical-system (all | logical-system-name)>`

**Release Information** Command introduced in Junos OS Release 12.2.

**Description** Display the maximum number configured and the currently active data multicast distribution trees (MDTs) for a specific VPN routing and forwarding (VRF) instance.

**Options** `instance instance-name`—Display data MDT information for the specified VRF instance.

`logical-system (all | logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

**NOTE:** Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

**List of Sample Output** [show pim mdt data-mdt-limit on page 1727](#)

**Output Fields** [Table 128 on page 1726](#) describes the output fields for the `show pim mdt data-mdt-limit` command. Output fields are listed in the approximate order in which they appear.

**Table 128: show pim mdt data-mdt-limit Output Fields**

| Field Name           | Field Description                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Maximum Data Tunnels | Maximum number of data MDTs created in this VRF instance. If the number is 0, no data MDTs are created for this VRF instance. |
| Active Data Tunnels  | Active number of data MDTs in this VRF instance.                                                                              |

## Sample Output

`show pim mdt data-mdt-limit`

```
user@host show pim mdt data-mdt-limit instance VPN-A
Maximum Data Tunnels           10
Active Data Tunnels             2
```

## show pim neighbors

**Output Fields** Table 129 on page 1729 describes the output fields for the **show pim neighbors** command. Output fields are listed in the approximate order in which they appear.

**Table 129: show pim neighbors Output Fields**

| Field Name                                       | Field Description                                                                                                                                                                                                                                                                                                                                | Level of Output   |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Instance</b>                                  | Name of the routing instance.                                                                                                                                                                                                                                                                                                                    | All levels        |
| <b>Interface</b>                                 | Interface through which the neighbor is reachable.                                                                                                                                                                                                                                                                                               | All levels        |
| <b>Neighbor addr</b>                             | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                                                   | All levels        |
| <b>IP</b>                                        | IP version: 4 or 6.                                                                                                                                                                                                                                                                                                                              | All levels        |
| <b>V</b>                                         | PIM version running on the neighbor: 1 or 2.                                                                                                                                                                                                                                                                                                     | All levels        |
| <b>Mode</b>                                      | PIM mode of the neighbor: <b>Sparse</b> , <b>Dense</b> , <b>SparseDense</b> , or <b>Unknown</b> . When the neighbor is running PIM version 2, this mode is always <b>Unknown</b> .                                                                                                                                                               | All levels        |
| <b>Option</b>                                    | Can be one or more of the following: <ul style="list-style-type: none"> <li>• <b>B</b>—Bidirectional Capable.</li> <li>• <b>G</b>—Generation Identifier.</li> <li>• <b>H</b>—Hello Option Holdtime.</li> <li>• <b>L</b>—Hello Option LAN Prune Delay.</li> <li>• <b>P</b>—Hello Option DR Priority.</li> <li>• <b>T</b>—Tracking bit.</li> </ul> | <b>brief</b> none |
| <b>Uptime</b>                                    | Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.                                                                                                                                                  | All levels        |
| <b>Address</b>                                   | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                                                   | <b>detail</b>     |
| <b>BFD</b>                                       | Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: <b>Enabled</b> , <b>Operational state is up</b> , or <b>Disabled</b> .                                                                                                                                                                   | <b>detail</b>     |
| <b>Hello Option Holdtime</b>                     | Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.                                                                                                                                                                                                                                                   | <b>detail</b>     |
| <b>Hello Default Holdtime</b>                    | Default holdtime and the time remaining if the <b>holdtime</b> option is not in the received hello message.                                                                                                                                                                                                                                      | <b>detail</b>     |
| <b>Hello Option DR Priority</b>                  | Designated router election priority. The range of values is 0 through 255.                                                                                                                                                                                                                                                                       | <b>detail</b>     |
| <b>Hello Option Generation ID</b>                | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                                                                           | <b>detail</b>     |
| <b>Hello Option Bi-Directional PIM supported</b> | Neighbor can process bidirectional PIM messages.                                                                                                                                                                                                                                                                                                 | <b>detail</b>     |

Table 129: show pim neighbors Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                   | Level of Output |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Hello Option LAN Prune Delay | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                      | detail          |
| Join Suppression supported   | Neighbor is capable of join suppression.                                                                                                                                                                                                                                            | detail          |
| Rx Join                      | Information about joins received from the neighbor. <ul style="list-style-type: none"> <li><b>Group</b>—Group addresses in the join message.</li> <li><b>Source</b>—Address of the source in the join message.</li> <li><b>Timeout</b>—Time for which the join is valid.</li> </ul> | detail          |

## Sample Output

### show pim neighbors

```

user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority, T = Tracking bit

Interface      IP V Mode   Option    Uptime Neighbor addr
so-1/0/0.0      4 2        HPLG      00:07:10 10.111.10.2

```

### show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command. For sample output, see [show pim neighbors on page 1730](#).

### show pim neighbors instance

```

user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority, T = Tracking bit

Interface      IP V Mode   Option    Uptime Neighbor addr
at-0/3/1.0      4 2        HPLG      00:07:54 10.111.30.2
mt-1/1/0.32768  4 2        HPLG      00:07:22 10.10.47.101
so-1/0/1.0      4 2        HPLG      00:07:50 10.111.20.2

```

### show pim neighbors detail

```

user@host> show pim neighbors detail
Instance: PIM.master
Interface: ge-0/0/1.0

Address: 10.10.1.1, IPv4, PIM v2, Mode: SparseDense, sg Join Count: 0, tsf
Join Count: 2
Hello Option Holdtime: 65535 seconds

```

```

Hello Option DR Priority: 1
Hello Option Generation ID: 2053759302
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

Address: 10.10.1.2, IPv4, PIM v2, sg Join Count: 0, tsg Join Count: 2
BFD: Disabled
Hello Option Holdtime: 105 seconds 93 remaining
Hello Option DR Priority: 1
Hello Option Generation ID: 1734018161
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

Interface: lo0.0

Address: 10.255.179.246, IPv4, PIM v2, Mode: SparseDense, sg Join Count:
0, tsg Join Count: 0
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 1997462267
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

```

#### show pim neighbors detail (With BFD)

```

user@host> show pim neighbors detail
Instance: PIM.master
Interface: fe-1/0/0.0
Address: 192.168.11.1, IPv4, PIM v2, Mode: Sparse
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 836607909
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

Address: 192.168.11.2, IPv4, PIM v2
BFD: Enabled, Operational state is up
Hello Default Holdtime: 105 seconds 104 remaining
Hello Option DR Priority: 1

**Output Fields** [Table 130 on page 1733](#) describes the output fields for the **show pim rps** command. Output fields are listed in the approximate order in which they appear.

**Table 130: show pim rps Output Fields**

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                          | Level of Output         |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Instance</b>                 | Name of the routing instance.                                                                                                                                                                                                                                                                                                                                                              | All levels              |
| <b>Family or Address family</b> | Name of the address family: <b>inet</b> (IPv4) or <b>inet6</b> (IPv6).                                                                                                                                                                                                                                                                                                                     | All levels              |
| <b>RP address</b>               | Address of the rendezvous point.                                                                                                                                                                                                                                                                                                                                                           | All levels              |
| <b>Type</b>                     | Type of RP: <ul style="list-style-type: none"> <li><b>auto-rp</b>—Address of the RP known through the Auto-RP protocol.</li> <li><b>bootstrap</b>—Address of the RP known through the bootstrap router protocol (BSR).</li> <li><b>embedded</b>—Address of the RP known through an embedded RP (IPv6).</li> <li><b>static</b>—Address of RP known through static configuration.</li> </ul> | <b>brief none</b>       |
| <b>Holdtime</b>                 | How long to keep the RP active, with time remaining, in seconds.                                                                                                                                                                                                                                                                                                                           | All levels              |
| <b>Timeout</b>                  | How long until the local routing device determines the RP to be unreachable, in seconds.                                                                                                                                                                                                                                                                                                   | All levels              |
| <b>Groups</b>                   | Number of groups currently using this RP.                                                                                                                                                                                                                                                                                                                                                  | All levels              |
| <b>Group prefixes</b>           | Addresses of groups that this RP can span.                                                                                                                                                                                                                                                                                                                                                 | <b>brief none</b>       |
| <b>Learned via</b>              | Address and method by which the RP was learned.                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |

Table 130: show pim rps Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                  | Level of Output                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| <b>Mode</b>                   | The PIM mode of the RP: bidirectional or sparse.<br><br>If a sparse and bidirectional RPs are configured with the same RP address, they appear as separate entries in both formats.                                                                                                                                                                                | All levels                               |
| <b>Time Active</b>            | How long the RP has been active, in the format <i>hh:mm:ss</i> .                                                                                                                                                                                                                                                                                                   | detail extensive                         |
| <b>Device Index</b>           | Index value of the order in which Junos OS finds and initializes the interface.<br><br>For bidirectional RPs, the <b>Device Index</b> output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.                                                                                                              | detail extensive                         |
| <b>Subunit</b>                | Logical unit number of the interface.<br><br>For bidirectional RPs, the <b>Subunit</b> output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.                                                                                                                                                             | detail extensive                         |
| <b>Interface</b>              | Either the encapsulation or the de-encapsulation logical interface, depending on whether this routing device is a designated router (DR) facing an RP router, or is the local RP, respectively.<br><br>For bidirectional RPs, the <b>Interface</b> output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces. | detail extensive                         |
| <b>Group Ranges</b>           | Addresses of groups that this RP spans.                                                                                                                                                                                                                                                                                                                            | detail extensive<br><i>group-address</i> |
| <b>Active groups using RP</b> | Number of groups currently using this RP.                                                                                                                                                                                                                                                                                                                          | detail extensive                         |

## Sample Output

### show pim rps

```

user@host> show pim rps
Instance: PIM.master

Address-family INET
RP address      Type      Mode    Holdtime Timeout Groups Group prefixes

```

```
10.100.100.100 auto-rp      sparse      150      146      0 233.252.0.0/8
                               233.252.0.1/24
10.200.200.200 auto-rp      sparse      150      146      0 233.252.0.2/4

address-family INET6
```

### show pim rps brief

The output for the **show pim rps brief** command is identical to that for the **show pim rps** command. For sample output, see [show pim rps on page 1735](#).

### show pim rps <group-address>

```
user@host> show pim rps 233.252.0.0
Instance: PIM.master
Instance: PIM.master

RP selected: 10.100.100.100
```

### show pim rps <group-address>

```
user@host> show pim rps 233.252.0.0
Instance: PIM.master
Instance: PIM.master

RP selected: 10.100.100.100
```

### show pim rps <group-address> (Bidirectional PIM)

```
user@host> show pim rps 233.252.0.1
Instance: PIM.master

233.252.0.0/16
    10.4.12.75 (Bidirectional)

RP selected: 10.4.12.75
```

### show pim rps <group-address> (PIM Dense Mode)

```
user@host> show pim rps 233.252.0.1
Instance: PIM.master

Dense Mode active for group 233.252.0.1
```

### show pim rps <group-address> (SSM Range Without asm-override-ssm Configured)

```
user@host> show pim rps 233.252.0.1
Instance: PIM.master

Source-specific Mode (SSM) active for group 233.252.0.1
```

### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Sparse-Mode RP)

```
user@host> show pim rps 233.252.0.1
Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group
233.252.0.1
```

```

233.252.0.0/16
    10.4.12.75

RP selected: 10.4.12.75

```

### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Bidirectional RP)

```

user@host> show pim rps 233.252.0.1
Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group
233.252.0.1

233.252.0.0/16
    10.4.12.75 (Bidirectional)

RP selected: (null)

```

### show pim rps instance

| Upstream state       | Information about the upstream interface: <ul style="list-style-type: none"> <li>• <b>Join to RP</b>—Sending a join to the rendezvous point.</li> <li>• <b>Join to Source</b>—Sending a join to the source.</li> <li>• <b>Local RP</b>—Sending neither join messages nor prune messages toward the RP, because this router is the rendezvous point.</li> <li>• <b>Local Source</b>—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device.</li> <li>• <b>Prune to RP</b>—Sending a prune to the rendezvous point.</li> <li>• <b>Prune to Source</b>—Sending a prune to the source.</li> </ul> <p><b>NOTE:</b> RP group range entries have <b>None</b> in the <b>Upstream state</b> field because RP group ranges do not trigger actual PIM join messages between routers.</p> | All levels       |
| Upstream neighbor    | Information about the upstream neighbor: <b>Direct</b> , <b>Local</b> , <b>Unknown</b> , or a specific IP address. <p>For bidirectional PIM, <b>Direct</b> means that the interface is directly connected to a subnet that contains a phantom RP address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels       |
| Upstream port        | RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*G). <p>For bidirectional PIM, <b>RP Link</b> means that the interface is directly connected to a subnet that contains a phantom RP address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels       |
| Downstream port      | Information about downstream interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>extensive</b> |
| Downstream neighbors | Address of the downstream neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b> |
| Timeout              | Time remaining until the downstream join state is updated (in seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>extensive</b> |

## Sample Output

### show pim snooping join

```

user@host> show pim snooping join
Instance: vpls1

Learning-Domain: vlan-id 10
Group: 198.51.100.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 192.0.2.4, port: ge-1/3/5.10

Learning-Domain: vlan-id 20
Group: 198.51.100.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 203.0.113.4, port: ge-1/3/5.20

```

### show pim snooping join extensive

```

user@host> show pim snooping join extensive
Instance: vpls1
Learning-Domain: vlan-id 10

Group: 198.51.100.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 192.0.2.4, port: ge-1/3/5.10
Downstream port: ge-1/3/1.10
Downstream neighbors:
192.0.2.2 State: Join Flags: SRW Timeout: 166

Learning-Domain: vlan-id 20
Group: 198.51.100.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 203.0.113.4, port: ge-1/3/5.20
Downstream port: ge-1/3/3.20
Downstream neighbors:
203.0.113.3 State: Join Flags: SRW Timeout: 168

```

### show pim snooping join instance

```

user@host> show pim snooping join instance vpls1
Instance: vpls1

Learning-Domain: vlan-id 10
Group: 198.51.100.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 192.0.2.4, port: ge-1/3/5.10

```

```
Learning-Domain: vlan-id 20
Group: 198.51.100.3
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 203.0.113.4, port: ge-1/3/5.20
```

#### show pim snooping join vlan-id

```
user@host> show pim snooping join vlan-id 10
Instance: vpls1
Learning-Domain: vlan-id 10
Group: 198.51.100.2
Source: *
Flags: sparse,rptree,wildcard
Upstream state: None
Upstream neighbor: 192.0.2.4, port: ge-1/3/5.10
```

**Table 134: show pim snooping statistics Output Fields**

| Field Name      | Field Description                  | Level of Output |
|-----------------|------------------------------------|-----------------|
| Instance        | Routing instance for PIM snooping. | All levels      |
| Learning-Domain | Learning domain for PIM snooping.  | All levels      |

Table 134: show pim snooping statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                 | Level of Output |
|-------------------------------------|-----------------------------------------------------------------------------------|-----------------|
| <b>Tx J/P messages</b>              | Total number of transmitted join/prune packets.                                   | All levels      |
| <b>Rx J/P messages</b>              | Total number of received join/prune packets.                                      | All levels      |
| <b>Rx J/P messages -- seen</b>      | Number of join/prune packets seen but not received on the upstream interface.     | All levels      |
| <b>Rx J/P messages -- received</b>  | Number of join/prune packets received on the downstream interface.                | All levels      |
| <b>Rx Hello messages</b>            | Total number of received hello packets.                                           | All levels      |
| <b>Rx Version Unknown</b>           | Number of packets received with an unknown version number.                        | All levels      |
| <b>Rx Neighbor Unknown</b>          | Number of packets received from an unknown neighbor.                              | All levels      |
| <b>Rx Upstream Neighbor Unknown</b> | Number of packets received with unknown upstream neighbor information.            | All levels      |
| <b>Rx Bad Length</b>                | Number of packets received containing incorrect length information.               | All levels      |
| <b>Rx J/P Busy Drop</b>             | Number of join/prune packets dropped while the router is busy.                    | All levels      |
| <b>Rx J/P Group Aggregate 0</b>     | Number of join/prune packets received containing the aggregate group information. | All levels      |
| <b>Rx Malformed Packet</b>          | Number of malformed packets received.                                             | All levels      |
| <b>Rx No PIM Interface</b>          | Number of packets received without the interface information.                     | All levels      |
| <b>Rx No Upstream Neighbor</b>      | Number of packets received without upstream neighbor information.                 | All levels      |
| <b>Rx Unknown Hello Option</b>      | Number of hello packets received with unknown options.                            | All levels      |

## Sample Output

### show pim snooping statistics

```

user@host> show pim snooping statistics
Instance: vpls1
Learning-Domain: vlan-id 10

Tx J/P messages 0
RX J/P messages 8

```

```

Rx J/P messages -- seen 0
Rx J/P messages -- received 8
Rx Hello messages 37
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
Rx No PIM Interface 0
Rx No Upstream Neighbor 0
Rx Bad Length 0
Rx Neighbor Unknown 0
Rx Unknown Hello Option 0
Rx Malformed Packet 0

```

Learning-Domain: vlan-id 20

```

Tx J/P messages 0
RX J/P messages 2
Rx J/P messages -- seen 0
Rx J/P messages -- received 2
Rx Hello messages 39
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0
Rx Malformed Packet 0
Rx No PIM Interface 0
Rx No Upstream Neighbor 0
Rx Bad Length 0
Rx Neighbor Unknown 0
Rx Unknown Hello Option 0
Rx Malformed Packet 0

```

### show pim snooping statistics instance

```

user@host> show pim snooping statistics instance vpls1
Instance: vpls1
Learning-Domain: vlan-id 10

```

```

Tx J/P messages 0
RX J/P messages 9
Rx J/P messages -- seen 0
Rx J/P messages -- received 9
Rx Hello messages 45
Rx Version Unknown 0
Rx Neighbor Unknown 0
Rx Upstream Neighbor Unknown 0
Rx Bad Length 0
Rx J/P Busy Drop 0
Rx J/P Group Aggregate 0

[show pim source \(Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs\) on page 1759](#)

**Output Fields** [Table 135 on page 1758](#) describes the output fields for the **show pim source** command. Output fields are listed in the approximate order in which they appear.

**Table 135: show pim source Output Fields**

| Field Name         | Field Description                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance           | Name of the routing instance.                                                                                                                                                         |
| Source             | Address of the source or reverse path.                                                                                                                                                |
| Prefix/length      | Prefix and prefix length for the route used to reach the RPF address.                                                                                                                 |
| Upstream Protocol  | Protocol toward the source address.                                                                                                                                                   |
| Upstream interface | RPF interface toward the source address.<br><br>A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.            |
| Upstream Neighbor  | Address of the RPF neighbor used to reach the source address.<br><br>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling. |

## Sample Output

### show pim source

```
user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local

Source 10.255.70.15
  Prefix 10.255.70.15/32
  Upstream interface so-1/0/0.0
  Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6
```

### show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 1758](#).

**show pim source detail**

```

user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local
  Active groups:233.252.0.0
    233.252.0.1
    233.252.0.1

Source 10.255.70.15
  Prefix 10.255.70.15/32
  Upstream interface so-1/0/0.0
  Upstream neighbor 10.111.10.2
  Active groups:233.252.0.1

Instance: PIM.master Family: INET6

```

**show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs)**

```

user@host> show pim source
Instance: PIM.master Family: INET

Source 10.1.1.1
  Prefix 10.1.1.1/32
  Upstream interface Local
  Upstream neighbor Local

Source 10.2.7.7
  Prefix 10.2.7.0/24
  Upstream protocol MLDP
  Upstream interface Pseudo MLDP
  Upstream neighbor MLDP LSP root <10.1.1.2>

Source 192.168.219.11
  Prefix 192.168.219.0/28
  Upstream protocol MLDP
  Upstream interface Pseudo MLDP
  Upstream neighbor MLDP LSP root <10.1.1.2>

Instance: PIM.master Family: INET6

Source 2001:db8::1:2:7:7
  Prefix 2001:db8::1:2:7:0/120
  Upstream protocol MLDP
  Upstream interface Pseudo MLDP
  Upstream neighbor MLDP LSP root <10.1.1.2>

```

**Output Fields** Table 136 on page 1761 describes the output fields for the **show pim statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 136: show pim statistics Output Fields**

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance         | <p>Name of the routing instance.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul>                                                                                                 |
| Family           | <p>Output is for IPv4 or IPv6 PIM statistics. <b>INET</b> indicates IPv4 statistics, and <b>INET6</b> indicates IPv6 statistics.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul> |
| PIM statistics   | PIM statistics for all interfaces or for the specified interface.                                                                                                                                                                                                                                                                                                                                                       |
| PIM message type | Message type for which statistics are displayed.                                                                                                                                                                                                                                                                                                                                                                        |
| Received         | Number of received statistics.                                                                                                                                                                                                                                                                                                                                                                                          |
| Sent             | Number of messages sent of a certain type.                                                                                                                                                                                                                                                                                                                                                                              |
| Rx errors        | Number of received packets that contained errors.                                                                                                                                                                                                                                                                                                                                                                       |
| V2 Hello         | PIM version 2 hello packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| V2 Register      | PIM version 2 register packets.                                                                                                                                                                                                                                                                                                                                                                                         |
| V2 Register Stop | PIM version 2 register stop packets.                                                                                                                                                                                                                                                                                                                                                                                    |
| V2 Join Prune    | PIM version 2 join and prune packets.                                                                                                                                                                                                                                                                                                                                                                                   |
| V2 Bootstrap     | PIM version 2 bootstrap packets.                                                                                                                                                                                                                                                                                                                                                                                        |
| V2 Assert        | PIM version 2 assert packets.                                                                                                                                                                                                                                                                                                                                                                                           |
| V2 Graft         | PIM version 2 graft packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| V2 Graft Ack     | PIM version 2 graft acknowledgment packets.                                                                                                                                                                                                                                                                                                                                                                             |
| V2 Candidate RP  | PIM version 2 candidate RP packets.                                                                                                                                                                                                                                                                                                                                                                                     |

Table 136: show pim statistics Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V2 State Refresh                 | PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh.<br><br>State refresh is an extension to PIM-DM. It not supported in Junos OS. |
| V2 DF Election                   | PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.                                                       |
| V1 Query                         | PIM version 1 query packets.                                                                                                                                   |
| V1 Register                      | PIM version 1 register packets.                                                                                                                                |
| V1 Register Stop                 | PIM version 1 register stop packets.                                                                                                                           |
| V1 Join Prune                    | PIM version 1 join and prune packets.                                                                                                                          |
| V1 RP Reachability               | PIM version 1 RP reachability packets.                                                                                                                         |
| V1 Assert                        | PIM version 1 assert packets.                                                                                                                                  |
| V1 Graft                         | PIM version 1 graft packets.                                                                                                                                   |
| V1 Graft Ack                     | PIM version 1 graft acknowledgment packets.                                                                                                                    |
| AutoRP Announce                  | Auto-RP announce packets.                                                                                                                                      |
| AutoRP Mapping                   | Auto-RP mapping packets.                                                                                                                                       |
| AutoRP Unknown type              | Auto-RP packets with an unknown type.                                                                                                                          |
| Anycast Register                 | Auto-RP announce packets.                                                                                                                                      |
| Anycast Register Stop            | Auto-RP announce packets.                                                                                                                                      |
| Global Statistics                | Summary of PIM statistics for all interfaces.                                                                                                                  |
| Hello dropped on neighbor policy | Number of hello packets dropped because of a configured neighbor policy.                                                                                       |
| Unknown type                     | Number of PIM control packets received with an unknown type.                                                                                                   |
| V1 Unknown type                  | Number of PIM version 1 control packets received with an unknown type.                                                                                         |
| Unknown Version                  | Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.                                                     |

Table 136: show pim statistics Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Neighbor unknown                | Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.                    |
| Bad Length                      | Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.       |
| Bad Checksum                    | Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet. |
| Bad Receive If                  | Number of PIM control packets received on an interface that does not have PIM configured.                                 |
| Rx Bad Data                     | Number of PIM control packets received that contain data for TCP Bad register packets.                                    |
| Rx Intf disabled                | Number of PIM control packets received on an interface that has PIM disabled.                                             |
| Rx V1 Require V2                | Number of PIM version 1 control packets received on an interface configured for PIM version 2.                            |
| Rx V2 Require V1                | Number of PIM version 2 control packets received on an interface configured for PIM version 1.                            |
| Rx Register not RP              | Number of PIM register packets received when the routing device is not the RP for the group.                              |
| Rx Register no route            | Number of PIM register packets received when the RP does not have a unicast route back to the source.                     |
| Rx Register no decap if         | Number of PIM register packets received when the RP does not have a de-encapsulation interface.                           |
| Null Register Timeout           | Number of NULL register timeout packets.                                                                                  |
| RP Filtered Source              | Number of PIM packets received when the routing device has a source address filter configured for the RP.                 |
| Rx Unknown Reg Stop             | Number of register stop messages received with an unknown type.                                                           |
| Rx Join/Prune no state          | Number of join and prune messages received for which the routing device has no state.                                     |
| Rx Join/Prune on upstream if    | Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.     |
| Rx Join/Prune for invalid group | Number of join or prune messages received for invalid multicast group addresses.                                          |

| Field Name                     | Field Description                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx Join/Prune messages dropped | Number of join and prune messages received and dropped.                                                                                                                     |
| Rx sparse join for dense group | Number of PIM sparse mode join messages received for a group that is configured for dense mode.                                                                             |
| Rx Graft/Graft Ack no state    | Number of graft and graft acknowledgment messages received for which the router or switch has no state.                                                                     |
| Rx Graft on upstream if        | Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.                                                                |
| Rx CRP not BSR                 | Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.                                                                 |
| Rx BSR when BSR                | Number of BSR messages received in which the PIM message type is Bootstrap.                                                                                                 |
| Rx BSR not RPF if              | Number of BSR messages received on an interface that is not the RPF interface.                                                                                              |
| Rx unknown hello opt           | Number of PIM hello packets received with options that Junos OS does not support.                                                                                           |
| Rx data no state               | Number of PIM control packets received for which the routing device has no state for the data type.                                                                         |
| Rx RP no state                 | Number of PIM control packets received for which the routing device has no state for the RP.                                                                                |
| Rx aggregate                   | Number of PIM aggregate MDT packets received.                                                                                                                               |
| Rx malformed packet            | Number of PIM control packets received with a malformed IP unicast or multicast address family.                                                                             |
| No RP                          | Number of PIM control packets received with no RP address.                                                                                                                  |
| No register encaps if          | Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.                                                         |
| No route upstream              | Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP. |
| Nexthop Unusable               | Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.                                                  |
| RP mismatch                    | Number of PIM control packets received for which the routing device has an RP mismatch.                                                                                     |

Table 136: show pim statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RP mode mismatch                    | RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| RPF neighbor unknown                | Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Rx Joins/Prunes filtered            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Tx Joins/Prunes filtered            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Embedded-RP invalid addr            | Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Embedded-RP limit exceed            | Number of times the limit configured with the <b>maximum-rps</b> statement is exceeded. The <b>maximum-rps</b> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Embedded-RP added                   | <p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the routing device:</p> <ul style="list-style-type: none"> <li>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</li> <li>• PIM join message with an embedded RP multicast group address</li> <li>• Static embedded RP multicast group address associated with an interface</li> <li>• Packets sent to an embedded RP multicast group address received on the DR</li> </ul> <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p> |
| Embedded-RP removed                 | Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Rx Register msgs filtering drop     | Number of received register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tx Register msgs filtering drop     | Number of register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Rx Bidir Join/Prune on non-Bidir if | Error counter for join and prune messages received on non-bidirectional PIM interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 136: show pim statistics Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx Bidir Join/Prune on non-DF if | Error counter for join and prune messages received on non-designated forwarder interfaces.                                                                                          |
| V4 (S,G) Maximum                 | Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted. |
| V4 (S,G) Accepted                | Number of accepted (S,G) IPv4 multicast routes.                                                                                                                                     |
| V4 (S,G) Threshold               | Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv4 multicast routes accepted by the device).                                            |
| V4 (S,G) Log Interval            | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V6 (S,G) Maximum                 | Maximum number of (S,G) IPv6 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted. |
| V6 (S,G) Accepted                | Number of accepted (S,G) IPv6 multicast routes.                                                                                                                                     |
| V6 (S,G) Threshold               | Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv6 multicast routes accepted by the device).                                            |
| V6 (S,G) Log Interval            | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V4 (grp-prefix, RP) Maximum      | Maximum number of group-to-rendezvous point (RP) IPv4 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.        |
| V4 (grp-prefix, RP) Accepted     | Number of accepted group-to-RP IPv4 multicast mappings.                                                                                                                             |
| V4 (grp-prefix, RP) Threshold    | Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv4 multicast mappings accepted by the device).                                    |
| V4 (grp-prefix, RP) Log Interval | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V6 (grp-prefix, RP) Maximum      | Maximum number of group-to RP IPv6 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.                           |
| V6 (grp-prefix, RP) Accepted     | Number of accepted group-to-RP IPv6 multicast mappings.                                                                                                                             |

| <b>Output Fields</b>            | <a href="#">Table 137 on page 1773</a> describes the output fields for the <b>show sap listen</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                      |

**Table 137: show sap listen Output Fields**

| Field Name           | Field Description                                                            |
|----------------------|------------------------------------------------------------------------------|
| <b>Group address</b> | Address of the group that the local router is listening to for SAP messages. |
| <b>Port</b>          | UDP port number used for SAP.                                                |

## Sample Output

### show sap listen

```
user@host> show sap listen
Group address  Port
224.2.127.254  9875
239.255.255.255 9875
```

#### `show sap listen brief`

The output for the **show sap listen brief** command is identical to that for the **show sap listen** command. For sample output, see [show sap listen on page 1773](#).

#### `show sap listen detail`

The output for the **show sap listen detail** command is identical to that for the **show sap listen** command. For sample output, see [show sap listen on page 1773](#).

## test msdp

## Sample Output

### clear ipv6 router-advertisement

```
user@host> clear ipv6 router-advertisement
```

## show ipv6 neighbors

**Syntax** show ipv6 neighbors

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.3 for EX Series switches.  
 Command introduced in Junos OS Release 12.2 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display information about the IPv6 neighbor cache.

**NOTE:** Starting with Junos OS Release 16.1, **show ipv6 neighbors** command does not display the underlying ifl information if enhanced-convergence statement at [edit irb unit *unit-number*] hierarchy level and enhanced-ip statement at [edit chassis network-services] hierarchy level is configured for the destination interface IRB.

**Options** This command has no options.

**Required Privilege Level** view

[show ipv6 neighbors on page 1781](#)

**Output Fields** [Table 138 on page 1780](#) describes the output fields for the **show ipv6 neighbors** command. Output fields are listed in the approximate order in which they appear.

**Table 138: show ipv6 neighbors Output Fields**

| Field Name        | Field Description                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------------------------|
| IPv6 Address      | Name of the IPv6 interface.                                                                                                |
| Linklayer Address | Link-layer address.                                                                                                        |
| State             | State of the link: <b>up</b> , <b>down</b> , <b>incomplete</b> , <b>reachable</b> , <b>stale</b> , or <b>unreachable</b> . |
| Exp               | Number of seconds until the entry expires.                                                                                 |
| Rtr               | Whether the neighbor is a routing device: <b>yes</b> or <b>no</b> .                                                        |

Table 138: show ipv6 neighbors Output Fields (*continued*)

| Field Name       | Field Description                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Secure</b>    | Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: <b>yes</b> or <b>no</b> . |
| <b>Interface</b> | Name of the interface.                                                                                        |

## Sample Output

### show ipv6 neighbors

```

user@host> show ipv6 neighbors
IPv6 Address      Linklayer Address  State      Exp Rtr Secure
Interface
2001:db8:0:1:2a0:a514:0:24c  00:05:85:8f:c8:bd  stale      546 yes no
fe-1/2/0.1
fe80::2a0:a514:0:24c      00:05:85:8f:c8:bd  stale      258 yes no
fe-1/2/0.1
fe80::2a0:a514:0:64c      00:05:85:8f:c8:bd  stale      111 yes no
fe-1/2/1.5
fe80::2a0:a514:0:a4c      00:05:85:8f:c8:bd  stale      327 yes no
fe-1/2/2.9

```

### show ipv6 neighbors

The command displaying the underlying l2 ifl information when **enhanced-convergence** statement and **enhanced-ip** statement is not configured.

```

IPv6 Address      Linklayer Address  State      Exp Rtr Secure
Interface
23::23:0:0:2      00:00:23:00:00:02  reachable  0   no  no      irb.0
[xe-2/2/0.0]

```

The command not displaying the underlying l2 ifl information when **enhanced-convergence** statement and **enhanced-ip** statement is configured.

```

IPv6 Address      Linklayer Address  State      Exp Rtr Secure
Interface
23::23:0:0:2      00:00:23:00:00:02  reachable  0   no  no      irb.0

```

## show ipv6 router-advertisement

| <b>Output Fields</b>            | <a href="#">Table 139 on page 1783</a> describes the output fields for the <b>show ipv6 router-advertisement</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 139: show ipv6 router-advertisement Output Fields

| Field Name                     | Field Description                                                                                                             |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>               | Name of the interface.                                                                                                        |
| <b>Advertisements sent</b>     | Number of router advertisements sent and the elapsed time since they were sent.                                               |
| <b>Solicits received</b>       | Number of solicitation messages received.                                                                                     |
| <b>Advertisements received</b> | Number of router advertisements received.                                                                                     |
| <b>Advertisements from</b>     | Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received. |
| <b>Managed</b>                 | Managed address configuration flag: 0 (stateless) or 1 (stateful).                                                            |
| <b>Other configuration</b>     | Other stateful configuration flag: 0 (stateless) or 1 (stateful).                                                             |
| <b>Reachable time</b>          | Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.             |
| <b>Default lifetime</b>        | Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router. |
| <b>Retransmit timer</b>        | Time between retransmitted Neighbor Solicitation messages, in milliseconds.                                                   |
| <b>Current hop limit</b>       | Configured current hop limit.                                                                                                 |
| <b>Prefix</b>                  | Name and length of the prefix.                                                                                                |
| <b>Valid lifetime</b>          | How long the prefix remains valid for onlink determination.                                                                   |
| <b>Preferred lifetime</b>      | How long the prefix generated by stateless autoconfiguration remains preferred.                                               |
| <b>On link</b>                 | Onlink flag: 0 (not onlink) or 1 (onlink).                                                                                    |
| <b>Autonomous</b>              | Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous).                                                  |

## Sample Output

### show ipv6 router-advertisement

```

user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 0
Interface: fxp0.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 1

```

```

Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
Managed: 0
Other configuration: 0 [1]
  Reachable time: 0 ms
  Default lifetime: 1800 sec
  Retransmit timer: 0 ms
  Current hop limit: 64

```

#### show ipv6 router-advertisement conflicts

```

user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
  Other configuration: 0 [1]

```

#### show ipv6 router-advertisement prefix

```

user@host> show ipv6 router-advertisement prefix 2001:db8:8040::/16
Interface: fe-0/1/3.0
  Advertisements sent: 3, last sent 00:04:11 ago
  Solicits received: 0
  Advertisements received: 3
  Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
  Managed: 0
  Other configuration: 0
  Reachable time: 0 ms
  Default lifetime: 180 sec [1800 sec]
  Retransmit timer: 0 ms
  Current hop limit: 64
  Prefix: 2001:db8:8040:1::/64
    Valid lifetime: 2592000 sec
    Preferred lifetime: 604800 sec
    On link: 1
    Autonomous: 1

```

## CHAPTER 21

# IS-IS Operational Commands

- clear isis adjacency
- clear isis database
- clear isis overload
- clear isis statistics
- show isis adjacency
- show isis authentication
- show isis backup coverage
- show isis backup label-switched-path
- show isis backup spf results
- show isis context-identifier
- show isis database
- show isis hostname
- show isis interface
- show isis overview
- show isis route
- show isis spf
- show isis statistics

## clear isis adjacency

## Sample Output

### clear isis adjacency

The following sample output displays IS-IS adjacency database information before and after the **clear isis adjacency** command is entered:

```
user@host> show isis adjacency
IS-IS adjacency database:
Interface      System          L State      Hold (secs) SNPA
so-1/0/0.0     karaku1         3 Up         26
so-1/1/3.0     1921.6800.5080 3 Up         23
so-5/0/0.0     1921.6800.5080 3 Up         19
```

user@host> clear isis adjacency karaku1

```
user@host> show isis adjacency
IS-IS adjacency database:
Interface      System          L State      Hold (secs) SNPA
so-1/0/0.0     karaku1         3 Initializing 26
so-1/1/3.0     1921.6800.5080 3 Up         24
so-5/0/0.0     1921.6800.5080 3 Up         21
```

### clear isis adjacency all

```
user@host> clear isis adjacency all
IS-IS adjacency database:
Interface      System          L State      Hold (secs) SNPA
so-1/0/0.0     karaku1         3 Initializing 26
so-1/1/3.0     1921.6800.5080 3 Initializing 24
so-5/0/0.0     1921.6800.5080 3 Initializing 21
```

## clear isis database

## Sample Output

### clear isis database

The following sample output displays IS-IS link-state database information before and after the **clear isis database all** command is entered:

```
user@host> show isis database
IS-IS level 1 link-state database:
LSP ID                Sequence Checksum Lifetime (secs)
crater.00-00          0x12   0x84dd             1139
1 LSPs
IS-IS level 2 link-state database:
LSP ID                Sequence Checksum Lifetime (secs)
crater.00-00          0x19   0xe92c             1134
badlands.00-00        0x16   0x1454             985

## Sample Output

### clear isis overload

The following sample output displays IS-IS database information before and after the **clear isis overload** command is entered:

```
user@host> show isis database
IS-IS level 1 link-state database:
LSP ID                Sequence Checksum Lifetime Attributes
pro3-c.00-00          0x4    0x10db    1185 L1 L2 Overload

  1 LSPs
IS-IS level 2 link-state database:
LSP ID                Sequence Checksum Lifetime Attributes
pro3-c.00-00          0x5    0x429f    1185 L1 L2 Overload

pro2-a.00-00          0x91e   0x2589     874 L1 L2
pro2-a.02-00          0x1     0xcbc     874 L1 L2
  3 LSPs

user@host> clear isis overload

user@host> show isis database
IS-IS level 1 link-state database:
LSP ID                Sequence Checksum Lifetime Attributes
pro3-c.00-00          0xa    0x429e    1183 L1 L2
  1 LSPs

IS-IS level 2 link-state database:
LSP ID                Sequence Checksum Lifetime Attributes
pro3-c.00-00          0xc    0x9c39    1183 L1 L2
pro2-a.00-00          0x91e   0x2589     783 L1 L2
pro2-a.02-00          0x1     0xcbc     783 L1 L2
  3 LSPs
```

## Sample Output

### clear isis statistics

The following sample output displays IS-IS statistics before and after the **clear isis statistics** command is entered:

```
user@host> show isis statistics
IS-IS statistics for merino:
```

**Output Fields** Table 140 on page 1795 describes the output fields for the **show isis adjacency** command. Output fields are listed in the approximate order in which they appear.

**Table 140: show isis adjacency Output Fields**

| Field Name                                | Field Description                                                                                                                                                                                                                               | Level of Output         |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Interface</b>                          | Interface through which the neighbor is reachable.                                                                                                                                                                                              | All levels              |
| <b>System</b>                             | System identifier ( <b>sysid</b> ), displayed as a name, if possible.                                                                                                                                                                           | <b>brief</b>            |
| <b>L or Level</b>                         | Level: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul> An exclamation point (!) preceding the level number indicates that the adjacency is missing an IP address. | All levels              |
| <b>State</b>                              | State of the adjacency: <b>Up</b> , <b>Down</b> , <b>New</b> , <b>One-way</b> , <b>Initializing</b> , or <b>Rejected</b> .                                                                                                                      | All levels              |
| <b>Hold (secs)</b>                        | Remaining hold time of the adjacency.                                                                                                                                                                                                           | <b>brief</b>            |
| <b>SNPA</b>                               | Subnetwork point of attachment (MAC address of the next hop).                                                                                                                                                                                   | <b>brief</b>            |
| <b>Expires in</b>                         | How long until the adjacency expires, in seconds.                                                                                                                                                                                               | <b>detail</b>           |
| <b>Priority</b>                           | Priority to become the designated intermediate system.                                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Up/Down transitions</b>                | Count of adjacency status changes from <b>Up</b> to <b>Down</b> or from <b>Down</b> to <b>Up</b> .                                                                                                                                              | <b>detail</b>           |
| <b>Last transition</b>                    | Time of the last <b>Up/Down</b> transition.                                                                                                                                                                                                     | <b>detail</b>           |
| <b>Circuit type</b>                       | Bit mask of levels on this interface: 1=Level 1 router; 2=Level 2 router; 3=both Level 1 and Level 2 router.                                                                                                                                    | <b>detail</b>           |
| <b>Speaks</b>                             | Protocols supported by this neighbor.                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>MAC address</b>                        | MAC address of the interface.                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Topologies</b>                         | Supported topologies.                                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Restart capable</b>                    | Whether a neighbor is capable of graceful restart: <b>Yes</b> or <b>No</b> .                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Adjacency advertisement: Advertise</b> | This routing device has signaled to advertise this interface to its neighbors in their link-state PDUs.                                                                                                                                         | <b>detail extensive</b> |
| <b>Adjacency advertisement: Suppress</b>  | This neighbor has signaled not to advertise the interface in the routing device's outbound link-state PDUs.                                                                                                                                     | <b>detail extensive</b> |

Table 140: show isis adjacency Output Fields (*continued*)

| Field Name           | Field Description                               | Level of Output  |
|----------------------|-------------------------------------------------|------------------|
| IP addresses         | IP address of this neighbor.                    | detail extensive |
| IPv6 Address         | IPv6 address of the neighbor.                   | detail extensive |
| Level 1 IPv4 Adj-SID | Level 1 IPv4 node-SID of the adjacent neighbor. | detail extensive |
| Level 1 IPv6 Adj-SID | Level 1 IPv6 node-SID of the adjacent neighbor. |                  |
| Level 2 IPv4 Adj-SID | Level 2 IPv4 node-SID of the adjacent neighbor. | detail extensive |
| Level 2 IPv6 Adj-SID | Level 2 IPv6 node-SID of the adjacent neighbor. | detail extensive |

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Transition log | <p>List of recent transitions, including:</p> <ul style="list-style-type: none"> <li>• <b>When</b>—Time at which an IS-IS adjacency transition occurred.</li> <li>• <b>State</b>—Current state of the IS-IS adjacency (<b>up</b>, <b>down</b>, or <b>rejected</b>). <ul style="list-style-type: none"> <li>• <b>Up</b>—Adjacency is up and operational.</li> <li>• <b>Down</b>—Adjacency is down and not available.</li> <li>• <b>Rejected</b>—Adjacency has been rejected.</li> </ul> </li> <li>• <b>Event</b>—Type of transition that occurred. <ul style="list-style-type: none"> <li>• <b>Seenself</b>—Possible routing loop has been detected.</li> <li>• <b>Interface down</b>—IS-IS interface has gone down and is no longer available.</li> <li>• <b>Error</b>—Adjacency error.</li> </ul> </li> <li>• <b>Down reason</b>—Reason that an IS-IS adjacency is down: <ul style="list-style-type: none"> <li>• <b>3-Way Handshake Failed</b>—Connection establishment failed.</li> <li>• <b>Address Mismatch</b>—Address mismatch caused link failure.</li> <li>• <b>Aged Out</b>—Link expired.</li> <li>• <b>ISO Area Mismatch</b>—IS-IS area mismatch caused link failure.</li> <li>• <b>Bad Hello</b>—Unacceptable hello message caused link failure.</li> <li>• <b>BFD Session Down</b>—Bidirectional failure detection caused link failure.</li> <li>• <b>Interface Disabled</b>—IS-IS interface is disabled.</li> <li>• <b>Interface Down</b>—IS-IS interface is unavailable.</li> <li>• <b>Interface Level Disabled</b>—IS-IS level is disabled.</li> <li>• <b>Level Changed</b>—IS-IS level has changed on the adjacency.</li> <li>• <b>Level Mismatch</b>—Levels on adjacency are not compatible.</li> <li>• <b>MPLS LSP Down</b>—Label-switched path (LSP) is unavailable.</li> <li>• <b>MT Topology Changed</b>—IS-IS topology has changed.</li> <li>• <b>MT Topology Mismatch</b>—IS-IS topology is mismatched.</li> <li>• <b>Remote System ID Changed</b>—Adjacency peer system ID changed.</li> <li>• <b>Protocol Shutdown</b>—IS-IS protocol is disabled.</li> <li>• <b>CLI Command</b>—Adjacency brought down by user.</li> <li>• <b>Unknown</b>—Unknown.</li> </ul> </li> </ul> | extensive       |

## Sample Output

### show isis adjacency

```

user@host> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
at-2/3/0.0         ranier      3 Up          23

```

### show isis adjacency brief

The output for the **show isis adjacency brief** command is identical to that for the **show isis adjacency** command. For sample output, see [show isis adjacency on page 1797](#).

### show isis adjacency detail

```
user@host> show isis adjacency detail
ranier
  Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 21 secs
  Priority: 0, Up/Down transitions: 1, Last transition: 00:01:09 ago
  Circuit type: 3, Speaks: IP, IPv6
  Topologies: Unicast, IPV6-Unicast Restart capable: Yes, Adjacency advertisement:
  Advertise
  LAN id: pro-bng3-c-F.02, IP addresses: 11.1.1.2
  IPv6 addresses: fe80::2a0:a514:0:4745
  Level 1 IPv4 Adj-SID: 299808, IPv6 Adj-SID: 299824
```

### show isis adjacency extensive

```
user@host> show isis adjacency extensive
ranier
  Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 22 secs
  Priority: 0, Up/Down transitions: 1, Last transition: 00:01:16 ago
  Circuit type: 3, Speaks: IP, IPv6

  Topologies: Unicast, IPV6-Unicast
  Restart capable: Yes, Adjacency advertisement: Advertise
  IP addresses: 11.1.1.2
  IPv6 addresses: fe80::2a0:a514:0:3e45
  Level 1 IPv4 Adj-SID: 300112, IPv6 Adj-SID: 300304
  Level 2 IPv4 Adj-SID: 300320, IPv6 Adj-SID: 300336
  Transition log:

## show isis authentication

**List of Syntax** [Syntax on page 1799](#)  
[Syntax \(EX Series Switches and QFX Series\) on page 1799](#)

**Syntax** show isis authentication  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches and QFX Series)** show isis authentication  
 <instance *instance-name*>

**Release Information** Command introduced in Junos OS Release 7.5.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for hitless authentication key rollover introduced in Junos OS Release 11.2.  
 Command introduced in Junos OS Release 12.1 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display information about Intermediate System-to-Intermediate System (IS-IS) authentication.

**Options** **none**—Display information about IS-IS authentication.

**instance** *instance-name*—(Optional) Display IS-IS authentication for the specified routing instance.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

[show isis backup spf results no-coverage on page 1807](#)

**Output Fields** [Table 144 on page 1806](#) lists the output fields for the **show isis backup spf results** command. Output fields are listed in the approximate order in which they appear.

**Table 144: show isis backup spf results Output Fields**

| Field Name              | Field Description                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------|
| <i>node-name</i>        | Name of the destination node.                                                                      |
| <b>Address</b>          | Address of the destination node.                                                                   |
| <b>Primary next-hop</b> | Interface and name of the node of the primary next hop to reach the destination.                   |
| <b>Root</b>             | Name of the next-hop neighbor.                                                                     |
| <b>Metric</b>           | Metric to the node.                                                                                |
| <b>Eligible</b>         | Indicates that the next-hop neighbor has been designated as a backup path to the destination node. |
| <b>Backup next-hop</b>  | Name of the interface of the backup next hop.                                                      |
| <b>SNPA</b>             | Subnetwork point of attachment (MAC address of the next hop).                                      |
| <b>LSP</b>              | Name of the MPLS label-switched path (LSP) designated as a backup path.                            |
| <b>Not eligible</b>     | Indicates that the next-hop neighbor cannot function as a backup path to the destination.          |
| <b>Reason</b>           | Describes why the next-hop neighbor is designated as <b>Not eligible</b> as a backup path.         |

## Sample Output

### show isis backup spf results

```

user@host> show isis backup spf results

IS-IS level 1 SPF results:
  0 nodes

IS-IS level 2 SPF results:
banff.00
  Primary next-hop: so-6/0/0.0, IPV4, olympic
  Primary next-hop: ae0.0, IPV4, camaro, SNPA: 0:90:69:f:67:f0
  Primary next-hop: so-6/0/0.0, IPV6, olympic
  Primary next-hop: ae0.0, IPV6, camaro, SNPA: 0:90:69:f:67:f0
    Root: camaro, Root Metric: 10, Metric: 10
    Not eligible, Reason: Primary next-hop multipath
    Root: olympic, Root Metric: 10, Metric: 10

```

```

    Not eligible, Reason: Primary next-hop multipath
    Root: glacier, Root Metric: 10, Metric: 25
    Not eligible, Reason: Primary next-hop multipath
crater.00
    Primary next-hop: so-6/0/0.0, IPV4, olympic
    Primary next-hop: so-6/0/0.0, IPV6, olympic
    Root: olympic, Root Metric: 10, Metric: 10
    Not eligible, Reason: Primary next-hop link fate sharing
    Root: glacier, Root Metric: 10, Metric: 15
    Eligible, Backup next-hop: as0.0, IPV4, glacier
    Eligible, Backup next-hop: as0.0, IPV6, glacier
    Root: camaro, Root Metric: 10, Metric: 20
    Not eligible, Reason: Interface is already covered
olympic.00
    Primary next-hop: so-6/0/0.0, IPV4, olympic
    Primary next-hop: so-6/0/0.0, IPV6, olympic
    Root: olympic, Root Metric: 10, Metric: 0
    Not eligible, Reason: Primary next-hop link fate sharing
    Root: camaro, Root Metric: 10, Metric: 20
    track-item: olympic.00-00
    track-item: kobuk.00-00
    Not eligible, Reason: Path loops
    Root: glacier, Root Metric: 10, Metric: 20
    track-item: olympic.00-00
    track-item: kobuk.00-00
    Not eligible, Reason: Path loops

| <b>Output Fields</b>            | Table 145 on page 1809 lists the output fields for the <b>show isis context-identifier</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                    |

Table 145: show isis context-identifier Output Fields

| Field Name | Field Description                                                                                                  | Level of Output |
|------------|--------------------------------------------------------------------------------------------------------------------|-----------------|
| Context    | IPv4 address that defines a protection pair. The context is manually configured on both primary and protector PEs. | detail          |
| Owner      | Protocol that requires the context.                                                                                | detail          |
| Role       | Role of the PE, which is either primary or protector.                                                              | detail          |
| Primary    | Name of the primary PE.                                                                                            | detail          |
| Metric     | Advertised interior gateway protocol (IGP) metric.                                                                 | detail          |

## Sample Output

```
user@host> show isis context-identifier detail
```

```
IS-IS context database:
```

```
Context      Owner    Role    Primary    Metric
2.2.4.3      MPLS     Primary pro3-e     1
```

Advertiser pro3-e, Router ID 10.255.245.198, Metric 1, Level 1  
Advertiser pro3-e, Router ID 10.255.245.198, Metric 1, Level 2  
Advertiser pro3-c, Router ID 10.255.245.196, Metric 11, Level 2

## show isis database

**List of Syntax**    [Syntax on page 1811](#)  
                          [Syntax \(EX Series Switches and QFX Series\) on page 1811](#)

**Syntax**    show isis database  
                  <system-id>  
                  <brief | detail | extensive>  
                  <instance *instance-name*>  
                  <level (1 | 2)>  
                  <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches and QFX Series)**    show isis database  
                  <system-id>  
                  <brief | detail | extensive>  
                  <level (1 | 2)>  
                  <instance *instance-name*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Command introduced in Junos OS Release 12.1 for the QFX Series.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
                                  Command introduced in Junos OS Release 15.1X53-D30 for the QFX10002 switch.

**Description**    Display the entries in the Intermediate System-to-Intermediate System (IS-IS) link-state database, which contains data about PDU packets.

**Options**    **none**—Display standard information about IS-IS link-state database entries for all routing instances.

**system id**—(Optional) Display IS-IS link-state database entries for the specified intermediate system.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**instance *instance-name***—(Optional) Display IS-IS link-state database entries for the specified routing instance.

**level (1 | 2)**—(Optional) Display IS-IS link-state database entries for the specified IS-IS level.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**    view

## show isis hostname

**List of Syntax** [Syntax on page 1825](#)  
[Syntax \(EX Series Switches and QFX Series\) on page 1825](#)

**Syntax** show isis hostname  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches and QFX Series)** show isis hostname

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 12.1 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display IS-IS hostname database information.

This command displays the system ID-to-name cache. The output shows if the mapping has been learned by receipt of a Hostname TLV #137 (type dynamic) configured in Junos OS with the **set system host-name** command, or a static mapping defined in Junos OS with the **set system static-host-mapping *hostname* sysid** command (type static). The local router always has its type set to static even if **static-host-mapping** is not configured.

**Options** **none**—Display IS-IS hostname database information.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show isis hostname on page 1826](#)

**Output Fields** [Table 147 on page 1825](#) describes the output fields for the **show isis hostname** command. Output fields are listed in the approximate order in which they appear.

**Table 147: show isis hostname Output Fields**

| Field Name | Field Description                         |
|------------|-------------------------------------------|
| System Id  | System identifier mapped to the hostname. |
| Hostname   | Hostname mapped to the system identifier. |

Table 147: show isis hostname Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type       | Type of mapping between system identifier and hostname. <ul style="list-style-type: none"><li>• <b>Dynamic</b>—Hostname mapping determined as described in RFC 2763, <i>Dynamic Hostname Exchange Mechanism for IS-IS</i>.</li><li>• <b>Static</b>—Hostname mapping configured by user.</li></ul> |

## Sample Output

### show isis hostname

```
user@host> show isis hostname
IS-IS hostname database:
System Id      Hostname      Type
1921.6800.4201 isis1         Dynamic
1921.6800.4202 isis2         Static
1921.6800.4203 isis3         Dynamic
```

## show isis interface

**List of Syntax**    [Syntax on page 1827](#)  
                          [Syntax \(EX Series Switches and QFX Series\) on page 1827](#)

**Syntax**    show isis interface  
                  <brief | detail | extensive>  
                  <interface-name>  
                  <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches and QFX Series)**    show isis interface  
                  <brief | detail | extensive>  
                  <interface-name>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Command introduced in Junos OS Release 12.1 for the QFX Series.

**Description**    Display status information about Intermediate System-to-Intermediate System (IS-IS)-enabled interfaces.

**NOTE:** If the configured metric for an IS-IS level is above 63, and the **wide-metrics-only** statement is not configured, the **show isis interface detail** command and the **show isis interface extensive** command display 63 as the metric value for that level. Configure the **wide-metrics-only** statement to generate metric values greater than 63 on a per IS-IS level basis.

The **show isis interface** command displays the configured metric value for an IS-IS level irrespective of whether is configured or not.

**Options**    **none**—Display standard information about all IS-IS-enabled interfaces.  
                  **brief | detail | extensive**—(Optional) Display the specified level of output.  
                  **interface-name**—(Optional) Display information about the specified interface only.  
                  **logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**    view

| <b>Output Fields</b>                              | <a href="#">Table 149 on page 1832</a> lists the output fields for the <b>show isis overview</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                               |

**Table 149: show isis overview Output Fields**

| Field Name         | Field Description                                                  |
|--------------------|--------------------------------------------------------------------|
| Hostname           | Name of the router.                                                |
| Sysid              | Part of the ISO address of the routing device.                     |
| Areaid             | The area number of the routing device.                             |
| Instance           | IS-IS routing instance.                                            |
| Router ID          | Router ID of the routing device.                                   |
| Adjacency holddown | Adjacency holddown capability: <b>enabled</b> or <b>disabled</b> . |

Table 149: show isis overview Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                            |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Areas                   | Maximum number of IS-IS areas advertised by the routing device.                                                                                                                              |
| LSP life time                   | Lifetime of the link-state PDU, in seconds.                                                                                                                                                  |
| Filter low life time LSPs up to | LSPs with a lifetime lower than this value are filtered out.                                                                                                                                 |
| Attached bit evaluation         | Attached bit capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                                 |
| SPF delay                       | Delay before performing consecutive shortest-path-first (SPF) calculations.                                                                                                                  |
| SPF holddown                    | Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached.                                                                     |
| SPF rapid runs                  | Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.                                                                                     |
| Overload bit at startup is set  | Overload bit capability is enabled.                                                                                                                                                          |
| Overload high metrics           | Overload high metrics capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                        |
| Overload timeout                | Time period after which overload is reset and the time that remains before the timer is set to expire.                                                                                       |
| Traffic engineering             | Traffic engineering capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                          |
| Restart                         | Graceful restart capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                             |
| Restart duration                | Time period for complete reacquisition of IS-IS neighbors.                                                                                                                                   |
| Helper mode                     | Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                      |
| Level                           | IS-IS level: <ul style="list-style-type: none"> <li>• 1—Level 1 information</li> <li>• 2—Level 2 information</li> </ul>                                                                      |
| IPv4 is enabled                 | IP Protocol version 4 capability is enabled.                                                                                                                                                 |
| IPv6 is enabled                 | IP Protocol version 6 capability is enabled.                                                                                                                                                 |
| Micro-loop avoidance            | Micro-loop avoidance is enabled. Generally adjacent nodes converge faster than neighboring nodes causing traffic to loop. A route convergence delay is configured to avoid such micro loops. |
| Internal route preference       | Preference value of internal routes.                                                                                                                                                         |

Table 149: show isis overview Output Fields (*continued*)

| Field Name                    | Field Description                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| External route preference     | Preference value of external routes.                                                                  |
| Prefix export limit           | Number of prefixes allowed to be exported, as configured by the <b>prefix-export-limit</b> statement. |
| Prefix export count           | Number of prefixes exported.                                                                          |
| Wide area metrics are enabled | Wide area metrics capability is enabled.                                                              |
| Narrow metrics are enabled    | Narrow metrics capability is enabled.                                                                 |
| Adjacency holddown is active  | IS-IS adjacencies come up one after another when adjacency holddown is enabled.                       |

## Sample Output

### show isis overview

```

user@host> show isis overview
Instance: master
Router ID: 10.255.107.183
Hostname: pro-bng3-a
Sysid: 0192.0168.0001
Areaid: 49.0002
Adjacency holddown: enabled
Maximum Areas: 3
LSP life time: 1200
Filter low life time LSPs up to: 300
Attached bit evaluation: enabled
SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
IPv4 is enabled, IPv6 is enabled
Micro-loop avoidance: Enabled
  Method: Route Convergence Delay, Route convergence delay: 5000 msec
Traffic engineering: enabled
Restart: Disabled
  Helper mode: Enabled
Level 1
  Internal route preference: 15
  External route preference: 160
  Wide metrics are enabled, Narrow metrics are enabled
  Adjacency holddown is active
Level 2
  Internal route preference: 18
  External route preference: 165
  Prefix export limit: 5, Prefix export count: 5
  Wide metrics are enabled
  Adjacency holddown is active

## show isis route

---

**List of Syntax**    [Syntax on page 1836](#)  
                         [Syntax \(EX Series Switches and QFX Series\) on page 1836](#)

**Syntax**    show isis route  
                 <destination>  
                 <inet | inet6>  
                 <instance *instance-name*>  
                 <logical-system (all | *logical-system-name*)>  
                 <topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

**Syntax (EX Series Switches and QFX Series)**    show isis route  
                 <destination>  
                 <inet | inet6>  
                 <instance *instance-name*>  
                 <topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Command introduced in Junos OS Release 12.1 for the QFX Series.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display the routes in the IS-IS routing table.

**Options**    **none**—Display all routes in the IS-IS routing table for all supported address families for all routing instances.

**destination**—(Optional) Destination address for the route.

**inet | inet6**—(Optional) Display inet (IPv4) or inet6 (IPv6) routes, respectively.

**instance *instance-name***—(Optional) Display routes for the specified routing instance only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)**—(Optional) Display routes for the specified topology only, or use unicast to display information, if available, for both IPv4 and IPv6 unicast topologies.

**Required Privilege Level**    view

**List of Sample Output**    [show isis route logical-system on page 1837](#)  
                                  [show isis route floodgroup on page 1837](#)  
                                  [show isis route \(CLNS\) on page 1838](#)  
                                  [show isis route on page 1838](#)

**Output Fields** Table 150 on page 1837 describes the output fields for the **show isis route** command. Output fields are listed in the approximate order in which they appear.

**Table 150: show isis route Output Fields**

| Field Name             | Field Description                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current version</b> | Number of the current version of the IS-IS routing table.                                                                                  |
| <b>L1</b>              | Version of Level 1 SPF that was run.                                                                                                       |
| <b>L2</b>              | Version of Level 2 SPF that was run.                                                                                                       |
| <b>Prefix or Label</b> | Destination of the route.                                                                                                                  |
| <b>L</b>               | IS-IS level: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul> |
| <b>Version</b>         | Version of SPF that generated the route.                                                                                                   |
| <b>Metric</b>          | Metric value associated with the route.                                                                                                    |
| <b>Type</b>            | Metric type: <b>int</b> (internal) or <b>ext</b> (external).                                                                               |
| <b>Interface</b>       | Interface to the next hop.                                                                                                                 |
| <b>Via</b>             | System identifier of the next hop, displayed as a name if possible.                                                                        |
| <b>ISO Routes</b>      | ISO routing table entries.                                                                                                                 |
| <b>snpa</b>            | MAC address.                                                                                                                               |

## Sample Output

### show isis route logical-system

```

user@host> show isis route logical-system ls1
IS-IS routing table                      Current version: L1: 8 L2: 11

**Output Fields** Table 151 on page 1841 describes the output fields for the **show isis spf** command. Output fields are listed in the approximate order in which they appear.

**Table 151: show isis spf Output Fields**

| Field Name     | Field Description                                                                       |
|----------------|-----------------------------------------------------------------------------------------|
| Node           | System ID of a node.                                                                    |
| Metric         | Metric to the node.                                                                     |
| Interface      | Interface of the next hop.                                                              |
| Via            | System ID of the next hop.                                                              |
| SNPA           | Subnetwork point of attachment (MAC address of the next hop).                           |
| Start time     | (log option only) Time that the SPF computation started.                                |
| Elapsed (secs) | (log option only) Length of time, in seconds, required to complete the SPF computation. |
| Count          | (log option only) Number of times the SPF was triggered.                                |
| Reason         | (log option only) Reason that the SPF computation was completed.                        |

## Sample Output

### show isis spf log

```

user@host> show isis spf log logical-system lsl
IS-IS level 1 SPF log:
Start time      Elapsed (secs) Count Reason
Fri Oct 31 12:41:18 0.000069 1 Reconfig
Fri Oct 31 12:41:18 0.000107 3 Updated LSP fix.00-00
Fri Oct 31 12:41:18 0.000050 3 Address change on so-1/2/2.0
Fri Oct 31 12:41:23 0.000033 1 Updated LSP fix.00-00
Fri Oct 31 12:41:28 0.000178 5 New adjacency scat on ge-1/1/0.0
Fri Oct 31 12:41:59 0.000060 1 Updated LSP fix.00-00
Fri Oct 31 12:42:30 0.000161 2 Multi area attachment change
Fri Oct 31 12:56:58 0.000198 1 Periodic SPF
Fri Oct 31 13:10:29 0.000209 1 Periodic SPF
IS-IS level 2 SPF log:
Start time      Elapsed (secs) Count Reason
Fri Oct 31 12:41:18 0.000035 1 Reconfig
Fri Oct 31 12:41:18 0.000047 2 Updated LSP fix.00-00
Fri Oct 31 12:41:18 0.000043 5 Address change on gr-0/2/0.0
Fri Oct 31 12:41:23 0.000022 1 Updated LSP fix.00-00
Fri Oct 31 12:41:59 0.000144 3 New adjacency h on gr-0/2/0.0
Fri Oct 31 12:42:30 0.000257 3 New LSP skag.00-00
Fri Oct 31 12:54:37 0.000195 1 Periodic SPF
Fri Oct 31 12:55:50 0.000178 1 Updated LSP fix.00-00
Fri Oct 31 12:55:55 0.000174 1 Updated LSP h.00-00
Fri Oct 31 12:55:58 0.000176 1 Updated LSP skag.00-00

| <b>Output Fields</b>                              | <p><a href="#">Table 152 on page 1846</a> describes the output fields for the <b>show isis statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                           |

Table 152: show isis statistics Output Fields

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PDU type                    | <p>PDU type:</p> <ul style="list-style-type: none"> <li>• <b>CSNP</b>—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.</li> <li>• <b>IIH</b>—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.</li> <li>• <b>LSP</b>—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.</li> <li>• <b>PSNP</b>—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.</li> <li>• <b>Unknown</b>—The PDU type is unknown.</li> </ul> |
| Received                    | Number of PDUs received since IS-IS started or since the statistics were set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Processed                   | Number of PDUs received less the number dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Drops                       | Number of PDUs dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

```

## show lldp neighbors

**Syntax** `show lldp neighbors`  
`<interface interface-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display information about LLDP neighbors.

For information about interface names, see [“Interface Naming Overview” on page 27](#). For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

**Options** `interface interface-name`—(Optional) Display the neighbor information about a particular physical interface.

**NOTE:** Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

**Required Privilege Level** view

**Related Documentation**

- [clear lldp neighbors on page 1850](#)

**List of Sample Output**

- [show lldp neighbors on page 1861](#)
- [show lldp neighbors interface ge-0/0/4 \(Management Address is IPv4\) on page 1861](#)
- [show lldp neighbors interface ge-0/0/4 \(Management Address is IPv6\) on page 1862](#)
- [show lldp neighbors \(Management Ethernet Interfaces\) on page 1863](#)

**Output Fields** [Table 155 on page 1858](#) describes the output fields for the `show lldp neighbors` command. Output fields are listed in the approximate order in which they appear.

**Table 155: show lldp neighbors Output Fields**

| Field Name                      | Field Description                                                     |
|---------------------------------|-----------------------------------------------------------------------|
| LLDP Remote Devices Information | Information about remote devices.                                     |
| LocalInterface                  | List of local interfaces for which neighbor information is available. |

Table 155: show lldp neighbors Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>ChassisId</b>                 | List of chassis identifiers for neighbors.                                                                             |
| <b>PortInfo</b>                  | List of port information gathered from neighbors. This could be the port identifier or port description.               |
| <b>SysName</b>                   | List of system names gathered from neighbors.                                                                          |
| <b>LLDP Neighbor Information</b> | Information about both local and neighbor systems on the interface (appears when the <b>interface</b> option is used). |
| <b>Local Information</b>         | Information about local systems on the interface (appears when the <b>interface</b> option is used).                   |
| <b>Neighbor Information</b>      | Information about both local and neighbor system on the interface (appears when the <b>interface</b> option is used).  |
| <b>Index</b>                     | Local interface index (appears when the <b>interface</b> option is used).                                              |
| <b>Time Mark</b>                 | Date and timestamp of information (appears when the <b>interface</b> option is used).                                  |
| <b>Time To Live</b>              | Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).              |
| <b>Local Interface</b>           | Name of the local physical interface (appears when the <b>interface</b> option is used).                               |
| <b>Parent Interface</b>          | Name of the <b>ae</b> interface to which the interface belongs                                                         |
| <b>Local Port ID</b>             | Local port identifier (appears when the <b>interface</b> option is used).                                              |
| <b>Neighbor Information</b>      | Information about neighbor systems on the interface (appears when the <b>interface</b> option is used).                |
| <b>Chassis type</b>              | Type of chassis identifier supplied, such as <b>MAC address</b> (appears when the <b>interface</b> option is used).    |
| <b>Chassis ID</b>                | Chassis identifier of type listed (appears when the <b>interface</b> option is used).                                  |
| <b>Port type</b>                 | Type of port identifier supplied, such as <b>local</b> (appears when the <b>interface</b> option is used).             |
| <b>Port ID</b>                   | Port identifier of type listed (appears when the <b>interface</b> option is used).                                     |
| <b>Port description</b>          | Port description (appears when the <b>interface</b> option is used).                                                   |
| <b>System name</b>               | Name supplied by the system on the interface (appears when the <b>interface</b> option is used).                       |

Table 155: show lldp neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Description</b>  | Description supplied by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                                                                              |
| <b>System Capabilities</b> | Capabilities (such as <b>bridge</b> or <b>router</b> ) that are <b>Supported</b> or <b>Enabled</b> by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                |
| <b>Management address</b>  | Details of the management address: <b>Address Type</b> (such as <b>ipv4</b> and <b>ipv6</b> ), <b>Address</b> (such as <b>10.204.34.35</b> , <b>1fd::1a10</b> ), <b>Interface Number</b> , <b>Interface Subtype</b> , and Organization Identifier ( <b>OID</b> ) (appears when the <b>interface</b> option is used). |
| <b>Organization Info</b>   | One or more entries listing remote information by Organizationally Unique Identifier ( <b>OUI</b> ), <b>Subtype</b> , <b>Index</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).                                                                                                             |

---

## Sample Output

### show lldp neighbors

```
user@host> show lldp neighbors
```

| Local Interface | Parent Interface | Chassis Id        | Port info | System Name |
|-----------------|------------------|-------------------|-----------|-------------|
| ge-2/0/0        | ae0              | ac:4b:c8:92:67:c0 | 528       | apg-hp      |
| ge-2/0/1        | ae0              | ac:4b:c8:92:67:c0 | 529       | apg-hp      |

## Sample Output

### show lldp neighbors interface ge-0/0/4 (Management Address is IPv4)

```
user@host> show lldp neighbors interface ge-0/0/4
```

LLDP Neighbor Information:

Local Information:

Index: 2 Time to live: 120 Time mark: Tue Dec 31 11:47:46 2013 Age: 15 secs

Local Interface : ge-2/0/1

Parent Interface : ae0

Local Port ID : 1476

Ageout Count : 0

Neighbour Information:

Chassis type : Mac address

Chassis ID : ac:4b:c8:92:67:c0

Port type : Locally assigned

Port ID : 529

## show lldp remote-global-statistics

---

**Syntax**    `show lldp remote-global-statistics`

**Release Information**    Command introduced in Junos OS Release 9.6.

**Description**    Display remote Link Layer Discovery Protocol (LLDP) global statistics.

**Options**    This command has no options.

**Required Privilege Level**    view

**List of Sample Output**    [show lldp remote-global-statistics on page 1865](#)

**Output Fields**    [Table 156 on page 1864](#) describes the output fields for the `show lldp remote-global-statistics` command. Output fields are listed in the approximate order in which they appear.

**Table 156: show lldp remote-global-statistics Output Fields**

| Field Name                          | Field Description                                                                                     |
|-------------------------------------|-------------------------------------------------------------------------------------------------------|
| LLDP Remote Database Table Counters | Information about remote database table counters.                                                     |
| LastchangeTime                      | Time elapsed between LLDP agent startup and the last change to the remote database table information. |
| Inserts                             | Number of insertions made in the remote database table.                                               |
| Deletes                             | Number of deletions made in the remote database table.                                                |
| Drops                               | Number of LLDP frames dropped from the remote database table because of errors.                       |
| Ageouts                             | Number of remote database table entries that have aged out of the table.                              |

## Sample Output

### show lldp remote-global-statistics

```
user@host> show lldp remote-global-statistics
user@host> show lldp remote-global-statistics
LLDP Remote Database Table Counters
LastchangeTime      Inserts    Deletes    Drops    Ageouts
00:00:76 (76 sec)   192        0          0        0
```

## show lldp statistics

| <b>Received</b>    | Number of LLDP frames received on this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Transmitted</b> | Number of LLDP frames sent on this interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 157: show lldp statistics Output Fields (*continued*)

| Field Name           | Field Description                                                                         |
|----------------------|-------------------------------------------------------------------------------------------|
| <b>Unknown-TLVs</b>  | Number of LLDP frames with unsupported content received on this interface.                |
| <b>With-Errors</b>   | Number of LLDP frames with errors received on this interface.                             |
| <b>Discarded</b>     | Number of LLDP frames received on this interface that were discarded because of problems. |
| <b>Transmitted</b>   | Total number of LLDP frames that were transmitted on an interface.                        |
| <b>Untransmitted</b> | Total number of LLDP frames that were untransmitted on an interface.                      |

## Sample Output

### show lldp statistics

```
user@host> show lldp statistics
```

| Interface  | Parent Interface | Received | Unknown TLVs | With Errors |
|------------|------------------|----------|--------------|-------------|
| xe-3/0/0.0 | ae31.0           | 1564     | 0            | 0           |
| xe-3/0/1.0 | ae31.0           | 1564     | 0            | 0           |
| xe-3/0/2.0 | ae31.0           | 1565     | 0            | 0           |
| xe-3/0/3.0 | ae31.0           | 1566     | 0            | 0           |
| xe-3/0/4.0 | ae31.0           | 1598     | 0            | 0           |
| xe-3/0/5.0 | ae31.0           | 1598     | 0            | 0           |
| xe-3/0/6.0 | ae31.0           | 1596     | 0            | 0           |

| 0              | 17312       | 0             |

## Sample Output

### show lldp statistics interface ge-0/1/1

```
user@host> show lldp statistics interface ge-0/1/1
```

| Interface | Received | Transmitted | Unknown-TLVs | With-Errors | Discarded |
|-----------|----------|-------------|--------------|-------------|-----------|
| ge-0/1/1  | 544      | 540         | 0            | 0           | 0         |

## CHAPTER 23

# MVRP Operational Commands

- `show mvrp`
- `show mvrp applicant-state`
- `show mvrp dynamic-vlan-memberships`
- `show mvrp interface`
- `show mvrp registration-state`
- `show mvrp statistics`

## show mvrp

**Syntax** `show mvrp`

**Release Information** Command introduced in Junos OS Release 10.1.  
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description** Display Multiple VLAN Registration Protocol (MVRP) configuration information.

**Required Privilege Level** view

**Related Documentation**

- [show mvrp applicant-state on page 1872](#)
- [show mvrp dynamic-vlan-memberships on page 1874](#)
- [show mvrp interface on page 1875](#)
- [show mvrp registration-state on page 1877](#)
- [show mvrp statistics on page 1879](#)

**List of Sample Output** [show mvrp on page 1871](#)

**Output Fields** [Table 158 on page 1870](#) lists the output fields for the **show mvrp** command. Output fields are listed in the approximate order in which they appear.

**Table 158: show mvrp Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MVRP dynamic VLAN creation | Displays whether global MVRP dynamic VLAN creation is <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MVRP BPDU MAC address      | Displays the multicast media access control (MAC) address for MVRP. If configured, the provider MVRP multicast MAC address is used; otherwise, the customer MVRP multicast MAC address is used.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| MVRP timers (ms)           | Displays MVRP timer information: <ul style="list-style-type: none"> <li>• <b>Interface</b>—The interface on which MVRP is configured.</li> <li>• <b>Join</b>—The maximum number of milliseconds the interfaces must wait before sending VLAN advertisements.</li> <li>• <b>Leave</b>—The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message.</li> <li>• <b>LeaveAll</b>—The interval at which LeaveAll messages are sent on interfaces. LeaveAll messages maintain current MVRP VLAN membership information in the network.</li> </ul> |

## Sample Output

### show mvrp

```
user@host> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)
  Interface      Join   Leave  LeaveAll
  ge-11/2/8      200   800    10000
  ge-11/0/9      200   800    10000
  ge-11/3/0      200   800    10000
```

## show mvrp applicant-state

**Syntax** `show mvrp applicant-state`

**Release Information** Command introduced in Junos OS Release 10.1.

**Description** For MX Series routers and EX Series switches, display Multiple VLAN Registration Protocol (MVRP) applicant state information.

**Required Privilege Level** view

**Related Documentation**

- [show mvrp on page 1870](#)
- [show mvrp interface on page 1875](#)
- [show mvrp registration-state on page 1877](#)
- [show mvrp statistics on page 1879](#)

**List of Sample Output** [show mvrp applicant-state on page 1873](#)

**Output Fields** [Table 159 on page 1872](#) lists the output fields for the `show mvrp applicant-state` command. Output fields are listed in the approximate order in which they appear.

**Table 159: show mvrp applicant-state Output Fields**

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN Id    | Displays the VLAN ID number.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Interface  | Displays the interface number associated with the VLAN ID.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| State      | Displays one of the following MVRP registrar states: <ul style="list-style-type: none"> <li>• VO—Very anxious observer.</li> <li>• VP—Very anxious passive.</li> <li>• VA—Very anxious new.</li> <li>• AN—Anxious new.</li> <li>• AA—Anxious active.</li> <li>• QA—Quiet active.</li> <li>• LA—Leaving active.</li> <li>• AO—Anxious observer.</li> <li>• QO—Quiet observer.</li> <li>• LO—Leaving observer.</li> <li>• AP—Anxious passive.</li> <li>• QA—Quiet passive.</li> </ul> |

## Sample Output

### show mvrp applicant-state

```
user@host> show mvrp applicant-state
MVRP applicant state for routing instance 'default-switch'
(V0) Very anxious observer, (VP) Very anxious passive, (VA) Very anxious new,
(AN) Anxious new, (AA) Anxious active, (QA) Quiet active, (LA) Leaving active,
(AO) Anxious observer, (QO) Quiet observer, (LO) Leaving observer,
(AP) Anxious passive, (QP) Quiet passive

VLAN Id      Interface      State
-----
100          ge-11/3/0      Declaring (QA)
200          ge-11/3/0      Declaring (QA)
300          ge-11/3/0      Declaring (QA)
```

## show mvrp dynamic-vlan-memberships

|                                 |                                                                                                                                                                                                                                                                                                                                                            |

**Table 160: show mvrp dynamic-vlan-memberships Output Fields**

| Field Name        | Field Description                                                           |
|-------------------|-----------------------------------------------------------------------------|
| <b>VLAN Id</b>    | The VLAN ID of the dynamically created VLAN.                                |
| <b>Interfaces</b> | The interface or interfaces that are bound to the dynamically created VLAN. |

## Sample Output

### show mvrp dynamic-vlan-memberships

```

user@host> show mvrp dynamic-vlan-memberships
MVRP dynamic vlans for routing instance 'default-switch'
(s) static vlan, (f) fixed registration

VLAN Id      Interfaces
  100 (s)    ge-11/3/0
  200 (s)    ge-11/3/0
  300 (s)

```

## show mvrp interface

**Syntax** `show mvrp interface`

**Release Information** Command introduced in Junos OS Release 10.1.

**Description** For MX Series routers and EX Series switches, display Multiple VLAN Registration Protocol (MVRP) interface-specific information.

**Required Privilege Level** view

**Related Documentation**

- [show mvrp on page 1870](#)
- [show mvrp applicant-state on page 1872](#)
- [show mvrp dynamic-vlan-memberships on page 1874](#)
- [show mvrp registration-state on page 1877](#)
- [show mvrp statistics on page 1879](#)

**List of Sample Output** [show mvrp interface on page 1875](#)

**Output Fields** [Table 161 on page 1875](#) lists the output fields for the `show mvrp interface` command. Output fields are listed in the approximate order in which they appear.

**Table 161: show mvrp interface Output Fields**

| Field Name               | Field Description                                                                    |
|--------------------------|--------------------------------------------------------------------------------------|
| <b>Interface</b>         | Interface on which MVRP is configured.                                               |
| <b>Status</b>            | Status of the MVRP: <b>Enabled</b> or <b>Disabled</b> .                              |
| <b>Registration Mode</b> | Registration for the interface: <b>Fixed</b> , <b>Forbidden</b> , or <b>Normal</b> . |
| <b>Applicant Mode</b>    | Applicant mode.                                                                      |

## Sample Output

### show mvrp interface

```

user@host> show mvrp interface
MVRP interface information for routing instance 'default-switch'

Interface      Status      Registration Mode      Applicant
Mode
ge-11/2/8      Enabled     Normal                 Normal
ge-11/0/9      Enabled     Normal                 Normal
ge-11/3/0      Enabled     Normal                 Normal

```

## show mvrp registration-state

**Syntax** `show mvrp registration-state`

**Release Information** Command introduced in Junos OS Release 10.1.

**Description** For MX Series routers and EX Series switches, display Multiple VLAN Registration Protocol (MVRP) registration state information.

**Required Privilege Level** view

**Output Fields** [Table 162 on page 1877](#) lists the output fields for the `show mvrp registration-state` command. Output fields are listed in the approximate order in which they appear.

**Table 162: show mvrp registration-state Output Fields**

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN Id         | Displays the VLAN ID number.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Interface       | Displays the interface number associated with the VLAN ID.                                                                                                                                                                                                                                                                                                                                                                      |
| Registrar State | Displays whether the registrar state is <b>Registered</b> or <b>Empty</b> .                                                                                                                                                                                                                                                                                                                                                     |
| Forced State    | Displays whether the forced state is <b>Registered</b> or <b>Empty</b> .                                                                                                                                                                                                                                                                                                                                                        |
| Managed State   | Displays one of the following states: <ul style="list-style-type: none"> <li>• <b>Fixed</b>—VLANs always stay in a registered state and are declared as such on all other forwarding ports.</li> <li>• <b>Normal</b>—VLANs participate in the MVRP protocol and honor incoming join requests normally.</li> <li>• <b>Forbidden</b>—VLANs ignore the incoming join requests and always stay in an unregistered state.</li> </ul> |
| STP State       | Displays whether the Spanning Tree Protocol (STP) is <b>Blocking</b> or <b>Forwarding</b> .                                                                                                                                                                                                                                                                                                                                     |

## Sample Output

### show mvrp registration-state

```
user@host> show mvrp registration-state
MVRP registration state for routing instance 'default-switch'
```

| VLAN Id | Interface | Registrar<br>State | Forced<br>State | Managed<br>State | STP<br>State |
|---------|-----------|--------------------|-----------------|------------------|--------------|
| 100     | ge-11/2/8 | Empty              | Registered      | Fixed            | Forwarding   |
|         | ge-11/0/9 | Empty              | Empty           | Normal           | Forwarding   |
|         | ge-11/3/0 | Registered         | Registered      | Normal           | Forwarding   |
| 101     | ge-11/2/8 | Empty              | Registered      | Fixed            | Forwarding   |
|         | ge-11/0/9 | Empty              | Empty           | Normal           | Forwarding   |
|         | ge-11/3/0 | Registered         | Registered      | Normal           | Forwarding   |

## show mvrp statistics

**Syntax**    `show mvrp statistics`

**Release Information**    Command introduced in Junos OS Release 10.1.

**Description**    For MX Series routers and EX Series switches, display Multiple VLAN Registration Protocol (MVRP) statistics in the form of Multiple Registration Protocol data unit (MRPDU) messages.

**Required Privilege Level**    view

**Related Documentation**

- [show mvrp on page 1870](#)
- [show mvrp applicant-state on page 1872](#)
- [show mvrp dynamic-vlan-memberships on page 1874](#)
- [show mvrp interface on page 1875](#)
- [show mvrp registration-state on page 1877](#)

**List of Sample Output**    [show mvrp statistics on page 1879](#)

**Output Fields**    [Table 163 on page 1879](#) lists the output fields for the **show mvrp statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 163: show mvrp statistics Output Fields**

| Field Name                       | Field Description                                        |
|----------------------------------|----------------------------------------------------------|
| interface name                   | Interface for which MVRP statistics are displayed.       |
| VLAN IDs registered              | Number of VLAN IDs registered.                           |
| Sent MVRP PDUs                   | Number of MRPDU messages transmitted from the router.    |
| Received MVRP PDUs without error | Number of MRPDU messages received on the router.         |
| Received MVRP PDUs with error    | Number of invalid MRPDU messages received on the router. |

## Sample Output

**show mvrp statistics**

```
user@host> show mvrp statistics
```

## MVRP statistics for routing instance 'default-switch'

Interface name : ge-11/2/8  
VLAN IDs registered : 0  
Sent MVRP PDUs : 1467  
Received MVRP PDUs without error: 0  
Received MVRP PDUs with error : 0

Interface name : ge-11/0/9  
VLAN IDs registered : 0  
Sent MVRP PDUs : 1418  
Received MVRP PDUs without error: 702  
Received MVRP PDUs with error : 0

Interface name : ge-11/3/0  
VLAN IDs registered : 2  
Sent MVRP PDUs : 1524  
Received MVRP PDUs without error: 1366  
Received MVRP PDUs with error : 0

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| <b>advertising-router</b> <i>router-id</i> , <b>netsummary</b> , <b>network</b> , <b>nssa</b> , <b>opaque-area</b> , and <b>router</b> options added in Junos OS Release 8.3. You must use the <b>purge</b> command with these options. |                                                 |
| <b>area</b> <i>area-id</i> option added in Junos OS Release 8.3.                                                                                                                                                                        |                                                 |
| Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                      |                                                 |
| <b>realm</b> option added in Junos OS Release 9.2.                                                                                                                                                                                      |                                                 |
| <b>advertising-router</b> ( <i>router-id</i>   <b>self</b> ) option added in Junos OS Release 9.5.                                                                                                                                      |                                                 |

**advertising-router** (*router-id* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**purge** option (and all options that are dependent on the **purge** option) hidden in Junos OS Release 13.3.

**Description** With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine.

**CAUTION:** You can also use the **purge** command with any of the options to discard rather than delete the specified LSA entries. This command is useful only for testing. Use it with care, because it causes significant network disruption.

- Options**
- all**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.
  - advertising-router** (*router-id* | **self**)—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.
  - area** *area-id*—(Optional) Discard entries for the LSAs in the specified area.
  - asbrsummary**—(Optional) Discard summary AS boundary router LSA entries.
  - external**—(Optional) Discard external LSAs.
  - instance** *instance-name*—(Optional) Delete or discard entries for the specified routing instance only.
  - inter-area-prefix**—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.
  - inter-area-router**—(OSPFv3 only) (Optional) Discard interarea router LSAs.
  - intra-area-prefix**—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.
  - logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.
  - link-local**—(Optional) Delete link-local LSAs.
  - lsa-id** *lsa-id*—(Optional) Discard the LSA entries with the specified LSA identifier.
  - netsummary**—(Optional) Discard summary network LSAs.
  - network**—(Optional) Discard network LSAs.

**nssa**—(Optional) Discard not-so-stubby area (NSSA) LSAs.

**opaque-area**—(Optional) Discard opaque area-scope LSAs.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Optional) Discard router LSAs.

**purge**—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

**Required Privilege  
Level**

clear

                          [Syntax \(EX Series Switch and QFX Series\) on page 1886](#)

**Syntax**    clear (ospf | ospf3) neighbor  
              <all>  
              <area *area-id*>  
              <instance *instance-name*>  
              <interface *interface-name*>  
              <logical-system (all | *logical-system-name*)>  
              <neighbor>  
              <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

**Syntax (EX Series Switch and QFX Series)**    clear (ospf | ospf3) neighbor  
                                                          <all>  
                                                          <area *area-id*>  
                                                          <instance *instance-name*>  
                                                          <interface *interface-name*>  
                                                          <neighbor>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **realm** option introduced in Junos OS Release 9.2.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Tear down Open Shortest Path First (OSPF) neighbor connections.

**Options**    **all**—Tear down OSPF connections with all neighbors for all routing instances.

**area *area-id***—(Optional) Tear down neighbor connections for the specified area only.

**instance *instance-name***—(Optional) Tear down neighbor connections for the specified routing instance only.

**interface *interface-name***—(Optional) Tear down neighbor connections for the specified interface only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**neighbor**—(Optional) Clear the state of the specified neighbor only.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(Optional) (OSPFv3 only) Clear the state of the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level**    clear

| Output Fields            | <a href="#">Table 164 on page 1893</a> lists the output fields for the <b>show (ospf   ospf3) backup coverage</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 164: show (ospf | ospf3) backup coverage Output Fields

| Field Name             | Field Description                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------|
| <b>Node Coverage</b>   | Information about backup coverage for each OSPF node.                                         |
| <b>Area</b>            | Area number. Area <b>0.0.0.0</b> is the backbone.                                             |
| <b>Covered Nodes</b>   | Number of nodes for which backup coverage is available.                                       |
| <b>Total Nodes</b>     | Total number of OSPF nodes.                                                                   |
| <b>Route Coverage</b>  | Information about backup coverage for each type of OSPF route.                                |
| <b>Path Type</b>       | Type of OSPF path: <b>Intra</b> , <b>Inter</b> , <b>Ext1</b> , <b>Ext2</b> , and <b>All</b> . |
| <b>Covered Routes</b>  | For each path type, the number of routes for which backup coverage is available.              |
| <b>Total Routes</b>    | For each path type, the total number of configured routes.                                    |
| <b>Percent Covered</b> | For all nodes and for each path type, the percentage for which backup coverage is available.  |

## Sample Output

### show ospf backup coverage

```

user@host> show ospf backup coverage
Topology default coverage:

Node Coverage:

Area              Covered  Total  Percent
                  Nodes   Nodes  Covered
0.0.0.0           4        5    80.00%

Route Coverage:

Path Type  Covered  Total  Percent
          Routes Routes  Covered
Intra      8       14    57.14%
Inter      0        0   100.00%
Ext1       0        0   100.00%
Ext2       1        1   100.00%
All        9       15    60.00%

```

### show ospf3 backup coverage

```

user @host > show ospf3 backup coverage
show ospf3 backup coverage
Node Coverage:

Area              Covered  Total  Percent
                  Nodes   Nodes  Covered

```

0.0.0.0                      4            5    80.00%

Route Coverage:

| Path Type | Covered<br>Routes | Total<br>Routes | Percent<br>Covered |
|-----------|-------------------|-----------------|--------------------|
| Intra     | 4                 | 6               | 66.67%             |
| Inter     | 0                 | 0               | 100.00%            |
| Ext1      | 0                 | 0               | 100.00%            |
| Ext2      | 1                 | 1               | 100.00%            |
| All       | 5                 | 7               | 71.43%             |

show (ospf | ospf3) backup lsp

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 166: show (ospf |ospf3) backup neighbor Output Fields

| Field Name                     | Field Description                                 | Level of Output |
|--------------------------------|---------------------------------------------------|-----------------|
| <b>Neighbor to Self Metric</b> | Metric from the backup neighbor to the OSPF node. | All levels      |
| <b>Self to Neighbor Metric</b> | Metric from the OSPF node to the backup neighbor. | All levels      |
| <b>Direct next-hop</b>         | Interface and address of the direct next hop.     | All levels      |

## Sample Output

### show ospf backup neighbor

```
user@host> show ospf backup neighbor
Topology default backup neighbors:

Area 0.0.0.5 backup neighbors:

10.0.0.5
  Neighbor to Self Metric: 5
  Self to Neighbor Metric: 5
  Direct next-hop: ge-4/0/0.111 via 10.0.175.5

10.0.0.6
  Neighbor to Self Metric: 5
  Self to Neighbor Metric: 5
  Direct next-hop: ge-4/1/0.110 via 10.0.176.6
```

## show (ospf | ospf3) backup spf

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## show ospf context-identifier

---

**List of Syntax**    [Syntax on page 1906](#)  
                         [Syntax \(EX Series Switches and QFX Series\) on page 1906](#)

**Syntax**    show ospf context-identifier  
                 <brief | detail>  
                 <area *area-id*>  
                 <context-id>  
                 <instance *instance-name*>  
                 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches and QFX Series)**    show ospf context-identifier  
                 <brief | detail>  
                 <area *area-id*>  
                 <context-id>  
                 <instance *instance-name*>

**Release Information**    Command introduced in Junos OS Release 10.4.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display the context identifier information processed and advertised by Open Shortest Path First (OSPF) for egress protection.

**Options**    **none**—Display information about all context identifiers.

**brief | detail**—(Optional) Display the specified level of output.

**area *area-id***—(Optional) Display information about the context identifier for the specified area.

**context-id**—(Optional) Display information about the specified context identifier.

**instance *instance-name***—(Optional) Display information about the context identifier for the specified routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**    view

### Sample Output

#### show ospf context-identifier

```

user@host> show ospf context-identifier
Context-id: 2.2.4.3
Status: active, Metric: 65534, PE role: protector, Area: 0.0.0.0

```

#### show ospf context-identifier detail

```

user@host> show ospf context-identifier detail
Context-id: 88.24.13.1
Status: inactive, Metric: 0, PE role: protector, Area: 0.0.0.13
Other Advertisements:
Advertising router: 8.8.8.103
Type: stub link
Metric: 65534

```

## show ospf database

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **advertising-router self (*address* | self)** option introduced in Junos OS Release 9.5.  
                              **advertising-router self (*address* | self)** option introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display the entries in the OSPF version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**    **none**—Display standard information about entries in the OSPFv2 link-state database for all routing instances.

- brief | detail | extensive | summary**—(Optional) Display the specified level of output.
- advertising-router (*address* | *self*)**—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.
- area *area-id***—(Optional) Display the LSAs in a particular area.
- asbrsummary**—(Optional) Display summary AS boundary router LSA entries.
- external**—(Optional) Display external LSAs.
- instance *instance-name***—(Optional) Display all OSPF database information under the named routing instance.
- link-local**—(Optional) Display information about link-local LSAs.
- logical-system (*all* | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.
- lsa-id *lsa-id***—(Optional) Display the LSA with the specified LSA identifier.
- netsummary**—(Optional) Display summary network LSAs.
- network**—(Optional) Display information about network LSAs.
- nssa**—(Optional) Display information about not-so-stubby area (NSSA) LSAs.
- opaque-area**—(Optional) Display opaque area-scope LSAs.
- router**—(Optional) Display information about router LSAs.

                  <nssa>  
                  <router>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  **realm** option introduced in Junos OS Release 9.2.  
                                  **advertising-router** (*address* | **self**) option introduced in Junos Release 9.5.  
                                  **advertising-router** (*address* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Display the entries in the OSPF version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**    **none**—Display standard information about all entries in the OSPFv3 link-state database.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**advertising-router (*address* | *self*)**—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

**area *area-id***—(Optional) Display the LSAs in a particular area.

**external**—(Optional) Display external LSAs.

**instance *instance-name***—(Optional) Display all OSPF database information under the named routing instance.

**inter-area-prefix**—(Optional) Display information about interarea-prefix LSAs.

**inter-area-router**—(Optional) Display information about interarea-router LSAs.

**intra-area-prefix**—(Optional) Display information about intra-area-prefix LSAs.

**link**—(Optional) Display information about link LSAs.

**link-local**—(Optional) Display information about link-local LSAs.

**logical-system (*all* | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsa-id *lsa-id***—(Optional) Display the LSA with the specified LSA identifier.

**network**—(Optional) Display information about network LSAs.

**nssa**—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

**realm (*ipv4-multicast* | *ipv4-unicast* | *ipv6-multicast*)**—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

**router**—(Optional) Display information about router LSAs.

**Required Privilege Level**

## show (ospf | ospf3) interface

---

**List of Syntax**    [Syntax on page 1930](#)  
                         [Syntax \(EX Series Switches and QFX Series\) on page 1930](#)

**Syntax**    `show (ospf | ospf3) interface`  
              `<brief | detail | extensive>`  
              `<area area-id>`  
              `<interface-name>`  
              `<instance instance-name>`  
              `<logical-system (all | logical-system-name)>`  
              `<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>`

**Syntax (EX Series Switches and QFX Series)**    `show (ospf | ospf3) interface`  
                                                          `<brief | detail | extensive>`  
                                                          `<area area-id>`  
                                                          `<interface-name>`  
                                                          `<instance instance-name>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **area** option introduced in Junos OS Release 9.2.  
                              **area** option introduced in Junos OS Release 9.2 for EX Series switches.  
                              **realm** option introduced in Junos OS Release 9.2.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display the status of OSPF interfaces.

**Options**    **none**—Display standard information about the status of all OSPF interfaces for all routing instances

**brief | detail | extensive**—(Optional) Display the specified level of output.

**area *area-id***—(Optional) Display information about the interfaces that belong to the specified area.

**interface-name**—(Optional) Display information for the specified interface.

**instance *instance-name***—(Optional) Display all OSPF interfaces under the named routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Display information about the interfaces for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level** view

**List of Sample Output** [show ospf interface brief on page 1933](#)  
[show ospf interface detail on page 1933](#)  
[show ospf3 interface detail on page 1933](#)  
[show ospf interface detail\(When Multiarea Adjacency Is Configured\) on page 1933](#)  
[show ospf interface area area-id on page 1935](#)  
[show ospf interface extensive \(When Flooding Reduction Is Enabled\) on page 1935](#)  
[show ospf interface extensive \(When LDP Synchronization Is Configured\) on page 1935](#)

**Output Fields** [Table 171 on page 1931](#) lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

**Table 171: show (ospf | ospf3) interface Output Fields**

| Field Name              | Field Description                                                                                                                 | Level of Output  |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Interface</b>        | Name of the interface running OSPF version 2 or OSPF version 3.                                                                   | All levels       |
| <b>State</b>            | State of the interface: <b>BDR</b> , <b>Down</b> , <b>DR</b> , <b>DRother</b> , <b>Loop</b> , <b>PtToPt</b> , or <b>Waiting</b> . | All levels       |
| <b>Area</b>             | Number of the area that the interface is in.                                                                                      | All levels       |
| <b>DR ID</b>            | Address of the area's designated router.                                                                                          | All levels       |
| <b>BDR ID</b>           | Backup designated router for a particular subnet.                                                                                 | All levels       |
| <b>Nbrs</b>             | Number of neighbors on this interface.                                                                                            | All levels       |
| <b>Type</b>             | Type of interface: <b>LAN</b> , <b>NBMA</b> , <b>P2MP</b> , <b>P2P</b> , or <b>Virtual</b> .                                      | detail extensive |
| <b>Address</b>          | IP address of the neighbor.                                                                                                       | detail extensive |
| <b>Mask</b>             | Netmask of the neighbor.                                                                                                          | detail extensive |
| <b>Prefix-length</b>    | (OSPFv3) IPv6 prefix length, in bits.                                                                                             | detail extensive |
| <b>OSPF3-Intf-Index</b> | (OSPFv3) OSPF version 3 interface index.                                                                                          | detail extensive |
| <b>MTU</b>              | Interface maximum transmission unit (MTU).                                                                                        | detail extensive |
| <b>Cost</b>             | Interface cost (metric).                                                                                                          | detail extensive |
| <b>DR addr</b>          | Address of the designated router.                                                                                                 | detail extensive |
| <b>BDR addr</b>         | Address of the backup designated router.                                                                                          | detail extensive |
| <b>Adj count</b>        | Number of adjacent neighbors.                                                                                                     | detail extensive |

Table 171: show (ospf | ospf3) interface Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                    | Level of Output         |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Secondary</b>       | Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area.                                                                                                                                                 | <b>detail extensive</b> |
| <b>Flood Reduction</b> | Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the <b>DoNotAge</b> bit set. As a result, LSAs are refreshed only when a change occurs.                                                                                                                    | <b>extensive</b>        |
| <b>Priority</b>        | Router priority used in designated router (DR) election on this interface.                                                                                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Flood list</b>      | List of link-state advertisements (LSAs) that might be about to flood this interface.                                                                                                                                                                                                                                                                | <b>extensive</b>        |
| <b>Ack list</b>        | Acknowledgment list. List of pending acknowledgments on this interface.                                                                                                                                                                                                                                                                              | <b>extensive</b>        |
| <b>Descriptor list</b> | List of packet descriptors.                                                                                                                                                                                                                                                                                                                          | <b>extensive</b>        |
| <b>Hello</b>           | Configured value for the hello timer.                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

**Syntax (EX Series Switch and QFX Series)**    show (ospf | ospf3) io-statistics

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display Open Shortest Path First (OSPF) input and output statistics.

**Options**    none—Display OSPF input and output statistics.  
               **logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**    view

**Related Documentation**    • [clear \(ospf | ospf3\) statistics on page 1889](#)

**List of Sample Output**    [show ospf io-statistics on page 1937](#)

**Output Fields**    [Table 172 on page 1936](#) lists the output fields for the **show ospf io-statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 172: show (ospf | ospf3) io-statistics Output Fields**

| Field Name      | Field Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| Packets read    | Number of OSPF packets read since the last time the routing protocol was started.                         |
| average per run | Total number of packets divided by the total number of times the OSPF read operation is scheduled to run. |
| max run         | Maximum number of packets for a given run among all scheduled runs.                                       |
| Receive errors  | Number of faulty packets received with errors.                                                            |

## Sample Output

### show ospf io-statistics

```
user@host> show ospf io-statistics
```

```
Packets read: 7361, average per run: 1.00, max run: 1  
Receive errors:  
None
```

## show (ospf | ospf3) log

---

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## show (ospf | ospf3) neighbor

**List of Syntax**    [Syntax on page 1941](#)  
                          [Syntax \(EX Series Switches and QFX Series\) on page 1941](#)

**Syntax**    `show (ospf | ospf3) neighbor`  
                  `<brief | detail | extensive>`  
                  `<area area-id>`  
                  `<instance (all | instance-name)>`  
                  `<interface interface-name>`  
                  `<logical-system (all | logical-system-name)>`  
                  `<neighbor>`  
                  `<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>`

**Syntax (EX Series Switches and QFX Series)**    `show (ospf | ospf3) neighbor`  
                  `<brief | detail | extensive>`  
                  `<area area-id>`  
                  `<instance (all | instance-name)>`  
                  `<interface interface-name>`  
                  `<neighbor>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  **instance all** option introduced in Junos OS Release 9.1.  
                                  **instance all** option introduced in Junos OS Release 9.1 for EX Series switches.  
                                  **area**, **interface**, and **realm** options introduced in Junos OS Release 9.2.  
                                  **area** and **interface** options introduced in Junos OS Release 9.2 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display information about OSPF neighbors.

CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the **show (ospf | ospf3) neighbor** command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the **show (ospf | ospf3) neighbor** command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.

**Options**    **none**—Display standard information about all OSPF neighbors for all routing instances.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**area *area-id***—(Optional) Display information about the OSPF neighbors for the specified area.

**instance (all | *instance-name*)**—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

**interface *interface-name***—(Optional) Display information about OSPF neighbors for the specified logical interface.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**neighbor**—(Optional) Display information about the specified OSPF neighbor.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level** view

**Output Fields** [Table 174 on page 1942](#) lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

**Table 174: show (ospf | ospf3) neighbor Output Fields**

| Field Name       | Field Description                                  | Level of Output |
|------------------|----------------------------------------------------|-----------------|
| <b>Address</b>   | Address of the neighbor.                           | All levels      |
| <b>Interface</b> | Interface through which the neighbor is reachable. | All levels      |

Table 174: show (ospf | ospf3) neighbor Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output         |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>State</b>                          | <p>State of the neighbor:</p> <ul style="list-style-type: none"> <li>• <b>Attempt</b>—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor.</li> <li>• <b>Down</b>—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the <b>Down</b> state, although at a reduced frequency.</li> <li>• <b>Exchange</b>—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged.</li> <li>• <b>ExStart</b>—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number.</li> <li>• <b>Full</b>—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements.</li> <li>• <b>Init</b>—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state may occur, for example, because the routing device itself did not appear in the neighbor's hello packet.</li> <li>• <b>Loading</b>—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the <b>Exchange</b> state.</li> <li>• <b>2Way</b>—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state <b>2Way</b> or greater.</li> </ul> | All levels              |
| <b>ID</b>                             | Router ID of the neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <b>Pri</b>                            | Priority of the neighbor to become the designated router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |

| <b>Link state retransmission list</b> | <p>Total number of link-state advertisements retransmitted. For <b>extensive</b> output only, the following information is also displayed:</p> <ul style="list-style-type: none"> <li>• <b>Type</b>—Type of link advertisement: <b>ASBR</b>, <b>Sum</b>, <b>Extern</b>, <b>Network</b>, <b>NSSA</b>, <b>OpaqArea</b>, <b>Router</b>, or <b>Summary</b>.</li> <li>• <b>LSA ID</b>—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.</li> <li>• <b>Adv rtr</b>—Address of the routing device that sent the advertisement.</li> <li>• <b>Seq</b>—Link sequence number of the advertisement.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b> |

Table 174: show (ospf | ospf3) neighbor Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                | Level of Output  |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Neighbor-address</b>        | (OSPFv3 only) If the neighbor uses virtual links, the <b>Neighbor-address</b> is the site-local, local, or global address. If the neighbor uses a physical interface, the <b>Neighbor-address</b> is an IPv6 link-local address. | detail extensive |
| <b>area</b>                    | Area that the neighbor is in.                                                                                                                                                                                                    | detail extensive |
| <b>OSPF3-Intf-Index</b>        | (OSPFv3 only) Displays the OSPFv3 interface index.                                                                                                                                                                               | detail extensive |
| <b>opt</b>                     | Option bits received in the hello packets from the neighbor.                                                                                                                                                                     | detail extensive |
| <b>DR or DR-ID</b>             | Address of the designated router.                                                                                                                                                                                                | detail extensive |
| <b>BDR or BDR-ID</b>           | Address of the backup designated router.                                                                                                                                                                                         | detail extensive |
| <b>Up</b>                      | Length of time since the neighbor came up.                                                                                                                                                                                       | detail extensive |
| <b>adjacent</b>                | Length of time since the adjacency with the neighbor was established.                                                                                                                                                            | detail extensive |
| <b>SPRING Adjacency Labels</b> | Segment routing in networking adjacency labels.<br><br><i>NOTE:</i> Displayed only when segment routing is enabled                                                                                                               | detail extensive |
| <b>Label</b>                   | Segment routing label.                                                                                                                                                                                                           | detail extensive |
| <b>Flags</b>                   | Segment routing flags. Flags VL indicate <i>value</i> and <i>local</i> .                                                                                                                                                         | detail extensive |

**Output Fields** Table 175 on page 1949 lists the output fields for the **show ospf overview** command. Output fields are listed in the approximate order in which they appear.

**Table 175: show ospf overview Output Fields**

| Field name                           | Field Description                                                                                                                                                                        | Level of Output |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Instance</b>                      | OSPF routing instance.                                                                                                                                                                   | All levels      |
| <b>Router ID</b>                     | Router ID of the routing device.                                                                                                                                                         | All levels      |
| <b>Route table index</b>             | Route table index.                                                                                                                                                                       | All levels      |
| <b>Configured overload</b>           | Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires. | All levels      |
| <b>Topology</b>                      | Topology identifier.                                                                                                                                                                     | All levels      |
| <b>Prefix export count</b>           | Number of prefixes exported into OSPF.                                                                                                                                                   | All levels      |
| <b>Full SPF runs</b>                 | Number of complete Shortest Path First calculations.                                                                                                                                     | All levels      |
| <b>SPF delay</b>                     | Delay before performing consecutive Shortest Path First calculations.                                                                                                                    | All levels      |
| <b>SPF holddown</b>                  | Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.                                           | All levels      |
| <b>SPF rapid runs</b>                | Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.                                                                | All levels      |
| <b>LSA refresh time</b>              | Refresh period for link-state advertisement (in minutes).                                                                                                                                | All levels      |
| <b>SPRING</b>                        | Source protocol routing in networking: <b>enable</b> or <b>disable</b> .                                                                                                                 | All levels      |
| <b>Node Segments</b>                 | Nodes of source protocol routing in networking: <b>enable</b> or <b>disable</b> .                                                                                                        | All levels      |

                  <realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>  
                  <router>  
                  <topology (default | ipv4-multicast | *topology-name*)>  
                  <transit>

**Syntax (EX Series Switch and QFX Series)**    show (ospf | ospf3) route  
                  <brief | detail | extensive>  
                  <abr | asbr | extern | inter | intra>  
                  <destination>  
                  <instance *instance-name*>  
                  <network>  
                  <no-backup-coverage>  
                  <router>  
                  <topology (default | ipv4-multicast | *topology-name*)>  
                  <transit>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  **topology** option introduced in Junos OS Release 9.0.  
                                  **realm** option introduced in Junos OS Release 9.2.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display the entries in the Open Shortest Path First (OSPF) routing table.

**Options**    **none**—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.

**destination**—Display routes to the specified IP address (with optional destination prefix length).

**brief | detail | extensive**—(Optional) Display the specified level of output.

**abr**—(Optional) Display routes to area border routers.

**asbr**—(Optional) Display routes to autonomous system border routers.

**extern**—(Optional) Display external routes.

**inter**—(Optional) Display interarea routes.

**intra**—(Optional) Display intra-area routes.

**instance (default | ipv4-multicast | *instance-name*)**—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

**logical-system (default | ipv4-multicast | *logical-system-name*)**—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

**network**—(Optional) Display routes to networks.

**no-backup-coverage**—(Optional) Display routes with no backup coverage.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Optional) Display routes to all routers.

**topology (default | ipv4-multicast | *topology-name*)**—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

**transit**—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

**Required Privilege Level**

**Output Fields** [Table 176 on page 1954](#) list the output fields for the **show (ospf | ospf3) route** command. Output fields are listed in the approximate order in which they appear.

**Table 176: show (ospf | ospf3) route Output Fields**

| Field Name      | Field Description         | Output Level |
|-----------------|---------------------------|--------------|
| <b>Topology</b> | Name of the topology.     | All levels   |
| <b>Prefix</b>   | Destination of the route. | All levels   |

Table 176: show (ospf | ospf3) route Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Output Level |

| <b>NH-addr</b>            | (OSPFv3 only) IPv6 address of the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels   |
| <b>NextHop Interface</b>  | (OSPFv2 only) Interface through which the route's next hop is reachable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels   |
| <b>Nexthop addr/label</b> | (OSPFv2 only) If the <b>NH Type</b> is <b>IP</b> , then it is the address of the next hop. If the <b>NH Type</b> is <b>LSP</b> , then it is the name of the label-switched path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels   |
| <b>Area</b>               | Area ID of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail       |
| <b>Origin</b>             | Router from which the route was learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail       |
| <b>Type 7</b>             | Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail       |
| <b>P-bit</b>              | Route was learned through NSSA LSA and the propagate bit was set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | detail       |
| <b>Fwd NZ</b>             | Forwarding address is nonzero. <b>Fwd NZ</b> is only displayed if the route is learned through an NSSA LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | detail       |

Table 176: show (ospf | ospf3) route Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Output Level     |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>optional-capability</b>   | Optional capabilities propagated in the router LSA. This field is in the output for intra-area router routes only (when <b>Route Type</b> is <b>Area BR</b> , <b>AS BR</b> , <b>Area/AS BR</b> , or <b>Router</b> ), not for interarea router routes or network routes. Three bits in this field are defined as follows: <ul style="list-style-type: none"> <li>• <b>0x4 (V)</b>—Routing device is at the end of a virtual active link.</li> <li>• <b>0x2 (E)</b>—Routing device is an autonomous system boundary router.</li> <li>• <b>0x1 (B)</b>—Routing device is an area border router.</li> </ul> | <b>detail</b>    |
| <b>priority</b>              | The priority assigned to the prefix: <ul style="list-style-type: none"> <li>• <b>high</b></li> <li>• <b>medium</b></li> <li>• <b>low</b></li> </ul> <p><b>NOTE:</b> The <b>priority</b> field applies only to routes of type <b>Network</b>.</p>                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b>    |
| <b>BGP-ORR Generation-ID</b> | Display the BGP-ORR generation identifier of the main OSPF route. This field is shown only for non-zero values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b> |

## CHAPTER 25

# Protocol-Independent Routing Operational Commands

- `show as-path`
- `show as-path domain`
- `show as-path summary`
- `show route`
- `show route active-path`
- `show route advertising-protocol`
- `show route all`
- `show route aspath-regex`
- `show route best`
- `show route brief`
- `show route ccc`
- `show route community`
- `show route community-name`
- `show route damping`
- `show route detail`
- `show route exact`
- `show route export`
- `show route export vrf-target`
- `show route extensive`
- `show route flow validation`
- `show route forwarding-table`
- `show route forwarding-table interface-name`
- `show route hidden`
- `show route inactive-path`
- `show route inactive-prefix`
- `show route instance`

- `show route label`
- `show route label-switched-path`
- `show route localization`
- `show route martians`
- `show route match-prefix`
- `show route next-hop`
- `show route no-community`
- `show route output`
- `show route protocol`
- `show route range`
- `show route receive-protocol`
- `show route resolution`
- `show route snooping`
- `show route source-gateway`
- `show route summary`
- `show route table`
- `show route terse`

## show as-path

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>                 | <p>Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the <b>as-path-prepend</b> action) or through aggregation.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| <b>Options</b>                     | <p><b>none</b>—Display basic information about AS paths that the local routing device is using (same as brief).</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## show as-path domain

---

**List of Syntax**   [Syntax on page 1972](#)  
[Syntax \(EX Series Switches\) on page 1972](#)

**Syntax**   `show as-path domain`  
`<logical-system (all | logical-system-name)>`

**Syntax (EX Series Switches)**   `show as-path domain`

**Release Information**   Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**   Display autonomous system (AS) path domain information.

**Options**   **none**—(Optional) Display AS path domain information for all routing instances.  
**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**   view

**List of Sample Output**   [show as-path domain on page 1974](#)

**Output Fields**   [Table 179 on page 1972](#) lists the output fields for the **show as-path domain** command. Output fields are listed in the approximate order in which they appear

**Table 179: show as-path domain Output Fields**

| Field Name          | Field Description                                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Domain</b>       | Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain. |
| <b>Primary</b>      | Primary AS number.                                                                                                                                                                                 |
| <b>References</b>   | Path reference count.                                                                                                                                                                              |
| <b>Number Paths</b> | Number of known AS paths.                                                                                                                                                                          |

Table 179: show as-path domain Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Flags</b>    | Information about the AS path: <ul style="list-style-type: none"><li>• <b>ASLoop</b>—Path contains an AS loop.</li><li>• <b>Atomic</b>—Path includes the ATOMIC_AGGREGATE path attribute.</li><li>• <b>Local</b>—Path was created by local aggregation.</li><li>• <b>Master</b>—Path was created by the master routing instance.</li></ul> |
| <b>Local AS</b> | AS number of the local routing device.                                                                                                                                                                                                                                                                                                     |
| <b>Loops</b>    | How many times this AS number can appear in an AS path.                                                                                                                                                                                                                                                                                    |

## Sample Output

show as-path domain

```
user@host> show as-path domain
Domain: 1          Primary: 10458
References:        3 Paths:      30383
Flags: Master
Local AS: 10458   Loops: 1
```

| <b>Description</b>                 | <p>Display autonomous system (AS) path summary information.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| <b>Options</b>                     | <p><b>none</b>—(Optional) Display AS path summary information for all routing instances.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                          |

                  <te-ipv4-prefix-node-iso *te-ipv4-prefix-node-iso*>

**Syntax (EX Series Switches)**    show route  
                  <all>  
                  <destination-prefix>  
                  <private>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Option **private** introduced in Junos OS Release 9.5.  
                                  Option **private** introduced in Junos OS Release 9.5 for EX Series switches.  
                                  Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.  
                                  Option **display-client-data** introduced in Junos OS Release 16.2R1 on MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series routers.  
                                  Options **te-ipv4-prefix-ip**, **te-ipv4-prefix-node-ip**, and **te-ipv4-prefix-node-iso** introduced in Junos OS Release 17.2R1 on MX Series and PTX Series.

**Description**    Display the active entries in the routing tables.

**Options**    **none**—Display brief information about all active entries in the routing tables.

**all**—(Optional) Display information about all routing tables, including private, or internal, routing tables.

**destination-prefix**—(Optional) Display active entries for the specified address or range of addresses.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**private**—(Optional) Display information only about all private, or internal, routing tables.

**display-client-data** —(Optional) Display client id and cookie information for routes installed by rpd client applications.

**te-ipv4-prefix-ip *te-ipv4-prefix-ip***—(Optional) Display IPv4 address of the traffic-engineering prefix, without the mask length if present in the routing table.

**te-ipv4-prefix-node-ip** *te-ipv4-prefix-node-ip*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 node addresses from the traffic-engineered routes in the **lsdist.0** table.

**te-ipv4-prefix-node-iso** *te-ipv4-prefix-node-iso*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 routes with the specified ISO circuit ID from the **lsdist.0** table.

**Table 181: show route Output Fields**

| Field Name                 | Field Description                                                       |
|----------------------------|-------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                        |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |

Table 181: show route Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number routes</i>                        | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>                   | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>                                                                                                                                                                      |
| [ <i>protocol, preference</i> ]             | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                               |
| <i>weeks:days<br/>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>metric</i>                               | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 181: show route Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>localpref</b>        | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>from</b>             | Interface from which the route was received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>AS path</b>          | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>Route Labels</b>     | Stack of labels carried in the BGP route update.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>to</b>               | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 181: show route Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| via             | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul> |
| Private unicast | (Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes <i>not</i> managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| balance         | Distribution of the load based on the underlying operational interface bandwidth for equal-cost multipaths (ECMP) across the nexthop gateways in percentages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    * [MVPN/70] 19:53:41, metric2 1
    Indirect
1:65500:1:10.0.0.40/240
    * [BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
    [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
    * [BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
    [BGP/170] 19:53:25, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

### show route (VPN)

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```
user@host> show route 192.0.2.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)
+ = Active Route, - = Last Active, * = Both

192.0.2.0/24          [BGP/170] 00:28:32, localpref 100, from 10.9.9.160
                     AS path: 13980 ?, validation-state: unverified
                     > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
                     [BGP/170] 00:28:28, localpref 100, from 10.9.9.169
                     AS path: 13980 ?, validation-state: unverified
                     > to 10.100.0.42 via ae2.0, Push 126016, Push 300368(top)
                     #[Multipath/255] 00:28:28, metric2 102
                     > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
                     to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
```

### show route (with Destination Prefix)

```
user@host> show route 172.16.0.0/12

inet.0: 10 destinations, 10 routes (9 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.0.0/12        *[Static/5] 2w4d 12:54:27
                     > to 192.168.167.254 via fxp0.0
```

### show route destination-prefix detail

## Sample Output

### show route active-path

```
user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.70.19/32    *[Direct/0] 21:33:52
```

```

> via lo0.0
10.255.71.50/32 * [IS-IS/15] 00:18:13, metric 10
> to 172.16.100.1 via so-2/1/3.0
172.16.100.1/24 * [Direct/0] 00:18:36
> via so-2/1/3.0
172.16.100.1/32 * [Local/0] 00:18:41
Local via so-2/1/3.0
192.168.64.0/21 * [Direct/0] 21:33:52
> via fxp0.0
192.168.70.19/32 * [Local/0] 21:33:52
Local via fxp0.0

```

### show route active-path brief

The output for the **show route active-path brief** command is identical to that for the **show route active-path** command. For sample output, see [show route active-path on page 1994](#).

### show route active-path detail

```

user@host> show route active-path detail

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Display the routing information as it has been prepared for advertisement to a particular neighbor of a particular dynamic routing protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>neighbor-address</i></b>—Address of the neighboring router to which the route entry is being transmitted.</p> <p><b><i>protocol</i></b>—Protocol transmitting the route:</p> <ul style="list-style-type: none"> <li>• <b>bgp</b>—Border Gateway Protocol</li> <li>• <b>dvmrp</b>—Distance Vector Multicast Routing Protocol</li> <li>• <b>msdp</b>—Multicast Source Discovery Protocol</li> <li>• <b>pim</b>—Protocol Independent Multicast</li> <li>• <b>rip</b>—Routing Information Protocol</li> <li>• <b>ripng</b>—Routing Information Protocol next generation</li> </ul> |
| <b>Additional Information</b>   | Routes displayed are routes that the routing table has exported into the routing protocol and that have been filtered by the associated protocol's <b>export</b> routing policy statements. Starting with Junos OS Release 13.3, you can display the routing instance table <b>foo</b> for any address family, on a VPN route reflector, or a VPN AS boundary router that is advertising local VPN routes. However, if you do not specify the <b>table</b> in the command, the output displays each VRF prefix twice.                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Output Fields** [Table 182 on page 2000](#) lists the output fields for the **show route advertising-protocol** command. Output fields are listed in the approximate order in which they appear.

**Table 182: show route advertising-protocol Output Fields**

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>routing-table-name</i>                    | Name of the routing table—for example, inet.0.                                                                                                                                                                                                                                                                                                                                                                                      | All levels              |
| <i>number destinations</i>                   | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                             | All levels              |
| <i>number routes</i>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                               | All levels              |
| <b>Prefix</b>                                | Destination prefix.                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>brief none</b>       |
| <i>destination-prefix (entry, announced)</i> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>BGP group and type</b>                    | BGP group name and type ( <b>Internal</b> or <b>External</b> ).                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Route Distinguisher</b>                   | Unique 64-bit prefix augmenting each IP subnet.                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Advertised Label</b>                      | Incoming label advertised by the Label Distribution Protocol (LDP). When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label. | <b>detail extensive</b> |
| <b>Label-Base, range</b>                     | First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>VPN Label</b>                             | Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Nexthop</b>                               | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.<br><br>If the next-hop advertisement to the peer is <b>Self</b> , and the RIB-out next hop is a specific IP address, the RIB-out IP address is included in the extensive output. See <a href="#">show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address) on page 2003</a> .                     | All levels              |

Table 182: show route advertising-protocol Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| <b>MED</b>                  | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>brief</b>                   |
| <b>Lclpref or Localpref</b> | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels                     |
| <b>Queued</b>               | When BGP route prioritization is enabled and a route is present in a priority queue, this shows which priority queue the route is in.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels except <b>brief</b> |
| <b>AS path</b>              | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if configured on the router, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels                     |
| <b>Route Labels</b>         | Stack of labels carried in the BGP route update.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive</b>        |
| <b>Cluster list</b>         | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b>        |
| <b>Originator ID</b>        | (For route reflected output only) Address of routing device that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b>        |

| List of Sample Output       | <a href="#">show route all on page 2004</a>                                                                                                                                                                                                                                                                                                   |
| Output Fields               | In Junos OS Release 9.5 and later, only the output fields for the <b>show route all</b> command display all routing tables, including private, or hidden, routing tables. The output field table of the <a href="#">show route</a> command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later. |

## Sample Output

### show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0                *[MPLS/0] 2d 02:24:39, metric 1
```

```

1          Receive
          *[MPLS/0] 2d 02:24:39, metric 1
          Receive
2          *[MPLS/0] 2d 02:24:39, metric 1
          Receive
800017     *[VPLS/7] 1d 14:00:16
          > via vt-3/2/0.32769, Pop
800018     *[VPLS/7] 1d 14:00:26
          > via vt-3/2/0.32772, Pop

user@host> show route all
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0          *[MPLS/0] 2d 02:19:12, metric 1
          Receive
1          *[MPLS/0] 2d 02:19:12, metric 1
          Receive
2          *[MPLS/0] 2d 02:19:12, metric 1
          Receive
800017     *[VPLS/7] 1d 13:54:49
          > via vt-3/2/0.32769, Pop
800018     *[VPLS/7] 1d 13:54:59
          > via vt-3/2/0.32772, Pop
vt-3/2/0.32769 [VPLS/7] 1d 13:54:49
              Unusable
vt-3/2/0.32772 [VPLS/7] 1d 13:54:59
              Unusable

```

## show route aspath-regex

| <b>Description</b>                 | Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                     | <b><i>regular-expression</i></b> —Regular expression that matches an entire AS path.<br><br><b><code>logical-system (all   <i>logical-system-name</i>)</code></b> —(Optional) Perform this operation on all logical systems or on a particular logical system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Additional Information</b>      | <p>You can specify a regular expression as:</p> <ul style="list-style-type: none"><li>• An individual AS number</li><li>• A period wildcard used in place of an AS number</li><li>• An AS path regular expression that is enclosed in parentheses</li></ul> <p>You also can include the operators described in the table of AS path regular expression operators in the <i>Junos Policy Framework Configuration Guide</i>. The following list summarizes these operators:</p> <ul style="list-style-type: none"><li>• <b><code>{<i>m,n</i>}</code></b>—At least <i>m</i> and at most <i>n</i> repetitions of the AS path term.</li><li>• <b><code>{<i>m</i>}</code></b>—Exactly <i>m</i> repetitions of the AS path term.</li><li>• <b><code>{<i>m</i>,}</code></b>—<i>m</i> or more repetitions of the AS path term.</li><li>• <b><code>*</code></b>—Zero or more repetitions of an AS path term.</li><li>• <b><code>+</code></b>—One or more repetitions of an AS path term.</li><li>• <b><code>?</code></b>—Zero or one repetition of an AS path term.</li><li>• <b><code>aspath_term   aspath_term</code></b>—Match one of the two AS path terms.</li></ul> <p>When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:</p> |

```
show route aspath-regex ".* 234 .*"
```

| Release Information         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description                 | Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Options                     | <p><b><i>as-number:community-value</i></b>—One or more community identifiers. <b><i>as-number</i></b> is the AS number, and <b><i>community-value</i></b> is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.</p> <p>For example:</p> <pre>user@host&gt; show route table inet.0 protocol bgp community "12083:6015" community "12083:65551"</pre> <p>or</p> <pre>user@host&gt; show route table inet.0 protocol bgp community [12083:6014 12083:65551]</pre> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Additional Information      | Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Required Privilege Level    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <i>routing-table-name</i>                    | Name of the routing table—for example, <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |
| <b>destinations</b>                          | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels              |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>[protocol, preference]</b>                | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> | All levels              |
| <b>Next-hop reference count</b>              | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Source</b>                                | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Next hop</b>                              | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>via</b>                                   | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Protocol next hop</b>                     | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Indirect next hop</b>                     | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>State</b>                                 | Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

Table 183: show route damping Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output  |

| Local AS          | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive |
| Peer AS           | AS number of the peer routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive |
| Age               | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | detail extensive |
| Metric            | Metric for the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive |
| Task              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive |
| Announcement bits | List of protocols that announce this route. <i>n-Resolve inet</i> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive |
| AS path           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| to                | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | brief none       |
| via               | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | brief none       |
| Communities       | Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive |
| Localpref         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels       |
| Router ID         | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | detail extensive |

Table 183: show route damping Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                        | Level of Output         |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Merit (last update/now)</b> | Last updated and current figure-of-merit value.                                                                                                                          | <b>detail extensive</b> |
| <b>damping-parameters</b>      | Name that identifies the damping parameters used, which is defined in the damping statement at the <b>[edit policy-options]</b> hierarchy level.                         | <b>detail extensive</b> |
| <b>Last update</b>             | Time of most recent change in path attributes.                                                                                                                           | <b>detail extensive</b> |
| <b>First update</b>            | Time of first change in path attributes, which started the route damping process.                                                                                        | <b>detail extensive</b> |
| <b>Flaps</b>                   | Number of times the route has gone up or down or its path attributes have changed.                                                                                       | <b>detail extensive</b> |
| <b>Suppressed</b>              | ( <b>suppressed</b> keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it. | All levels              |
| <b>Reusable in</b>             | ( <b>suppressed</b> keyword only) Time when a suppressed route will again be available.                                                                                  | All levels              |
| <b>Preference will be</b>      | ( <b>suppressed</b> keyword only) Preference value that will be applied to the route when it is again active.                                                            | All levels              |

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>[protocol, preference]</code> | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value.</p> <p><b>Preference2</b> values are signed integers, that is, <b>Preference2</b> values can be either positive or negative values. However, Junos OS evaluates <b>Preference2</b> values as unsigned integers that are represented by positive values. Based on the <b>Preference2</b> values, Junos OS evaluates a preferred route differently in the following scenarios:</p> <ul style="list-style-type: none"> <li>• <b>Both Signed Preference2 values</b> <ul style="list-style-type: none"> <li>• Route A = -101</li> <li>• Route B = -156</li> </ul> <p>Where both the <b>Preference2</b> values are signed, Junos OS evaluates only the unsigned value of <b>Preference2</b> and Route A, which has a lower <b>Preference2</b> value is preferred.</p> </li> <li>• <b>Unsigned Preference2 values</b> <p>Now consider both unsigned <b>Preference2</b> values:</p> <ul style="list-style-type: none"> <li>• Route A = 4294967096</li> <li>• Route B = 200</li> </ul> <p>Here, Junos OS considers the lesser <b>Preference2</b> value and Route B with a <b>Preference2</b> value of 200 is preferred because it is less than 4294967096.</p> </li> <li>• <b>Combination of signed and unsigned Preference2 values</b> <p>When <b>Preference2</b> values of two routes are compared, and for one route the <b>Preference2</b> is a signed value, and for the other route it is an unsigned value, Junos OS prefers the route with the positive <b>Preference2</b> value over the negative <b>Preference2</b> value. For example, consider the following signed and unsigned <b>Preference2</b> values:</p> <ul style="list-style-type: none"> <li>• Route A = -200</li> <li>• Route B = 200</li> </ul> <p>In this case, Route B with a <b>Preference2</b> value of 200 is preferred although this value is greater than -200, because Junos OS evaluates only the unsigned value of the <b>Preference2</b> value.</p> </li> </ul> |
| <b>Level</b>                        | (IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/>lsp-path-name</b>         | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Indirect next hop</b>                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>State</b>                                         | State of the route (a route can be in more than one state). See <a href="#">Table 186 on page 2031</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Local AS</b>                                      | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Metric</b>            | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MED-plus-IGP</b>      | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>TTL-Action</b>        | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.<br><br>For sample output, see <a href="#">show route table</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Task</b>              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Announcement bits</b> | The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, <b><i>n-Resolve inet</i></b> indicates that the specified route is used for route resolution for next hops found in the routing table.<br><br><ul style="list-style-type: none"> <li><b><i>n</i></b>—An index used by Juniper Networks customer support only.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>AS path</b>           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li><b>I</b>—IGP.</li> <li><b>E</b>—EGP.</li> <li><b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li><b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li><b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li><b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li><b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li><b>( )</b>—Parentheses enclose a confederation.</li> <li><b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 184: show route detail Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| ORR Generation-ID       | Displays the optimal route reflection (ORR) generation identifier. ISIS and OSPF interior gateway protocol (IGP) updates filed whenever any of the corresponding ORR route has its metric valued changed, or if the ORR route is added or deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| FECs bound to route     | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Label-Base, range</b>                   | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                               |
| <b>status vector</b>                       | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Accepted Multipath</b>                  | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Accepted LongLivedStale</b>             | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                                  |
| <b>Accepted LongLivedStaleImport</b>       | <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p> |
| <b>ImportAccepted LongLivedStaleImport</b> | <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>                                                                                                                                                                      |
| <b>Accepted MultipathContrib</b>           | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Localpref</b>                           | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Router ID</b>                           | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Primary Routing Table</b>               | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Secondary Tables</b>                    | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                       |

[Table 185 on page 2029](#) describes all possible values for the Next-hop Types output field.

Table 185: Next-hop Types Output Field Values

| Next-Hop Type            | Description         |
|--------------------------|---------------------|
| <b>Broadcast (bcast)</b> | Broadcast next hop. |
| <b>Deny</b>              | Deny next hop.      |
| <b>Discard</b>           | Discard next hop.   |

Table 185: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Flood</b>                    | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.                                                                                                                             |
| <b>Hold</b>                     | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                                                                                                                                                       |
| <b>Indexed (idxd)</b>           | Indexed next hop.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                                                                                                                                               |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                                                                                                                                               |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                                                                                                                                                     |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                                                                                                                                              |
| <b>Multicast discard (mdsc)</b> | Multicast discard.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Multicast group (mgrp)</b>   | Multicast group member.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Receive (recv)</b>           | Receive.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Resolve (rslv)</b>           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Routed multicast (mcrt)</b>  | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Router</b>                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |

Table 185: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type  | Description                                                                                 |
|----------------|---------------------------------------------------------------------------------------------|
| Unicast (ucst) | Unicast.                                                                                    |
| Unilist (ulst) | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. |

Table 186 on page 2031 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 186: State Output Field Values

| Value                                 | Description                                                                                                                                                                          |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accounting                            | Route needs accounting.                                                                                                                                                              |
| Active                                | Route is active.                                                                                                                                                                     |
| Always Compare MED                    | Path with a lower multiple exit discriminator (MED) is available.                                                                                                                    |
| AS path                               | Shorter AS path is available.                                                                                                                                                        |
| Cisco Non-deterministic MED selection | Cisco nondeterministic MED is enabled, and a path with a lower MED is available.                                                                                                     |
| Clone                                 | Route is a clone.                                                                                                                                                                    |
| Cluster list length                   | Length of cluster list sent by the route reflector.                                                                                                                                  |
| Delete                                | Route has been deleted.                                                                                                                                                              |
| Ex                                    | Exterior route.                                                                                                                                                                      |
| Ext                                   | BGP route received from an external BGP neighbor.                                                                                                                                    |
| FlashAll                              | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden                                | Route not used because of routing policy.                                                                                                                                            |
| IfCheck                               | Route needs forwarding RPF check.                                                                                                                                                    |
| IGP metric                            | Path through next hop with lower IGP metric is available.                                                                                                                            |
| Inactive reason                       | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| Initial                               | Route being added.                                                                                                                                                                   |

Table 186: State Output Field Values (*continued*)

| Value                                                    | Description                                                                   |
|----------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>Int</b>                                               | Interior route.                                                               |
| <b>Int Ext</b>                                           | BGP route received from an internal BGP peer or a BGP confederation peer.     |
| <b>Interior &gt; Exterior &gt; Exterior via Interior</b> | Direct, static, IGP, or EBGp path is available.                               |
| <b>Local Preference</b>                                  | Path with a higher local preference value is available.                       |
| <b>Martian</b>                                           | Route is a martian (ignored because it is obviously invalid).                 |
| <b>MartianOK</b>                                         | Route exempt from martian filtering.                                          |
| <b>Next hop address</b>                                  | Path with lower metric next hop is available.                                 |
| <b>No difference</b>                                     | Path from neighbor with lower IP address is available.                        |
| <b>NoReadvrt</b>                                         | Route not to be advertised.                                                   |
| <b>NotBest</b>                                           | Route not chosen because it does not have the lowest MED.                     |
| <b>Not Best in its group</b>                             | Incoming BGP AS is not the best of a group (only one AS can be the best).     |
| <b>NotInstall</b>                                        | Route not to be installed in the forwarding table.                            |
| <b>Number of gateways</b>                                | Path with a greater number of next hops is available.                         |
| <b>Origin</b>                                            | Path with a lower origin code is available.                                   |
| <b>Pending</b>                                           | Route pending because of a hold-down configured on another route.             |
| <b>Programmed</b>                                        | Route installed programmatically by on-box or off-box applications using API. |
| <b>Release</b>                                           | Route scheduled for release.                                                  |
| <b>RIB preference</b>                                    | Route from a higher-numbered routing table is available.                      |
| <b>Route Distinguisher</b>                               | 64-bit prefix added to IP subnets to make them unique.                        |
| <b>Route Metric or MED comparison</b>                    | Route with a lower metric or MED is available.                                |
| <b>Route Preference</b>                                  | Route with lower preference value is available                                |
| <b>Router ID</b>                                         | Path through a neighbor with lower ID is available.                           |

Table 186: State Output Field Values (*continued*)

| Value                | Description                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary</b>     | Route not a primary route.                                                                                                                                                                                                        |
| <b>Unusable path</b> | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| <b>Update source</b> | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

Table 187 on page 2033 describes the possible values for the Communities output field.

Table 187: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is <b>0</b> . A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                                  |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.                   |
| <b>domain-id</b>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                                             |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                                     |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from <b>0</b> through <b>4,294,967,295</b> (bytes per second).                                                                                                                                                                                                                   |
| <i>local AS number</i>                                  | Local AS number: from <b>1</b> through <b>65,535</b> .                                                                                                                                                                                                                                                  |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                        |
| <b>origin</b>                                           | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                                  |
| <i>ospf-route-type</i>                                  | 1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses. |
| <b>route-type-vendor</b>                                | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <i>area-number:ospf-route-type:options</i> .                                                                                            |
| <b>rte-type</b>                                         | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <i>area-number:ospf-route-type:options</i> .                                                                                            |

Table 187: Communities Output Field Values (*continued*)

| Value                                | Description                                                                                                                                       |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>target</b>                        | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.    |
| <b>unknown IANA</b>                  | Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized. |
| <b>unknown OSPF vendor community</b> | Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.           |

| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>TSI</b>                                     | Protocol header information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>—</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                             |

Table 190: show route extensive Output Fields (*continued*)

| Field Name                                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Level</b>                                         | (IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Route Distinguisher</b>                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>PMSI</b>                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path lsp-path-name</b>             | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Offset</b>                                        | Whether the metric has been increased or decreased by an offset value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 190: show route extensive Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>label-operation</i></b> | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                 |
| <b>Indirect next hops</b>     | <p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul> |
| <b>State</b>                  | State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Session ID</b>             | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Weight</b>                 | <p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                     |

Table 190: show route extensive Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inactive reason | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGp path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul> |
| Local AS        | Autonomous system (AS) number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Age             | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AIGP            | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric          | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MED-plus-IGP    | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Task</b>                          | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Announcement bits</b>             | <p>List of protocols that are consumers of the route. Using the following output as an example, <b>Announcement bits (3): 0-KRT 5-Resolve tree 2 8-BGP RT Background</b> there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP).</p> <p>The notation <b><i>n</i>-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>AS path</b>                       | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>              | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>FECs bound to route</b>           | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>AS path: I &lt;Originator&gt;</b> | (For route reflected output only) Originator ID attribute set by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 190: show route extensive Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route status</b>     | <p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> <li>• <b>Accepted</b>—The specified BGP route is imported by the default BGP policy.</li> <li>• <b>Import</b>—The route is imported into a Layer 3 VPN routing instance.</li> <li>• <b>Import-Protect</b>—A remote instance egress that is protected.</li> <li>• <b>Multipath</b>—A BGP multipath active route.</li> <li>• <b>MultipathContrib</b>—The route is not active but contributes to the BGP multipath.</li> <li>• <b>Protect</b>—An egress route that is protected.</li> <li>• <b>Stale</b>—A route that is marked stale due to graceful restart.</li> </ul> |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                   |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                               |
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                           |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLAN ID                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Cluster list            | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Originator ID           | (For route reflected output only) Address of router that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Prefixes bound to route | Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Communities             | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Layer2-info: encaps     | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| control flags           | Control flags: <b>none</b> or Site Down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| mtu                     | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 190: show route extensive Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>status vector</b>         | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                              |
| <b>Localpref</b>             | Local preference value included in the route.                                                                                                                                                                                                                                                                    |
| <b>Router ID</b>             | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                 |
| <b>Primary Routing Table</b> | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                      |
| <b>Secondary Tables</b>      | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                   |
| <b>Originating RIB</b>       | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| <b>Node path count</b>       | Number of nodes in the path.                                                                                                                                                                                                                                                                                     |
| <b>Forwarding nexthops</b>   | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                            |

## Sample Output

## show route flow validation

**List of Syntax**   [Syntax on page 2068](#)  
[Syntax \(EX Series Switches\) on page 2068](#)

**Syntax**   `show route flow validation`  
                   `<brief | detail>`  
                   `<ip-prefix>`  
                   `<table table-name>`  
                   `<logical-system (all | logical-system-name)>`

**Syntax (EX Series Switches)**   `show route flow validation`  
                                           `<brief | detail>`  
                                           `<ip-prefix>`  
                                           `<table table-name>`

**Release Information**   Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**   Display flow route information.

**Options**   **none**—Display flow route information.

**brief | detail**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

**ip-prefix**—(Optional) IP address for the flow route.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**table table-name**—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the **show route flow validation inet** command).

**Required Privilege Level**   view

**List of Sample Output**   [show route flow validation on page 2069](#)  
                                   [show route flow validation \(IPv6\) on page 2069](#)

**Output Fields**   [Table 191 on page 2068](#) lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

**Table 191: show route flow validation Output Fields**

| Field Name                | Field Description                                | Level of Output |
|---------------------------|--------------------------------------------------|-----------------|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). | All levels      |

Table 191: show route flow validation Output Fields (*continued*)

| Field Name                  | Field Description                                                       | Level of Output |
|-----------------------------|-------------------------------------------------------------------------|-----------------|
| <i>prefix</i>               | Route address.                                                          | All levels      |
| Active unicast route        | Active route in the routing table.                                      | All levels      |
| Dependent flow destinations | Number of flows for which there are routes in the routing table.        | All levels      |
| Origin                      | Source of the route flow.                                               | All levels      |
| Neighbor AS                 | Autonomous system identifier of the neighbor.                           | All levels      |
| Flow destination            | Number of entries and number of destinations that match the route flow. | All levels      |
| Unicast best match          | Destination that is the best match for the route flow.                  | All levels      |
| Flags                       | Information about the route flow.                                       | All levels      |

## Sample Output

### show route flow validation

```

user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 64501
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent

```

### show route flow validation (IPv6)

```

user@host> show route flow validation
inet6.0:
2001:db8::11:11:11:0/120
    Active unicast route
        Dependent flow destinations: 2
        Origin: 2001:db8::13:14:2:2, Neighbor AS: 2000
2001:db8::11:11:11:10/128
    Flow destination (1 entries, 1 match origin, next-as)
        Unicast best match: 2001:db8::11:11:11:0/120
        Flags: Consistent
2001:db8::11:11:11:30/128
    Flow destination (1 entries, 1 match origin, next-as)
        Unicast best match: 2001:db8::11:11:11:0/120
        Flags: Consistent

```

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Option **bridge-domain** introduced in Junos OS Release 7.5

Option **learning-vlan-id** introduced in Junos OS Release 8.4

Options **all** and **vlan** introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **bridge** (**ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn**), **ethernet-switching**, **evpn**, **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mcsnoop-inet**, **mcsnoop-inet6**, **mpls**, **satellite-inet**, **satellite-inet6**, **satellite-vpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers,

display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** (**default** | *logical-system-name/routing-instance-name* | *routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege Level**

**Output Fields** [Table 192 on page 2073](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

**Table 192: show route forwarding-table Output Fields**

| Field Name     | Field Description                                                                                                                                                                                            | Level of Output |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Logical system | Name of the logical system. This field is displayed if you specify the <b>table</b> <i>logical-system-name/routing-instance-name</i> option on a device that is configured for and supports logical systems. | All levels      |
| Routing table  | Name of the routing table (for example, inet, inet6, mpls).                                                                                                                                                  | All levels      |

Table 192: show route forwarding-table Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output         |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Enabled protocols | <p>The features and protocols that have been enabled for a given routing table. This field can contain the following values:</p> <ul style="list-style-type: none"> <li>• BUM hashing—BUM hashing is enabled.</li> <li>• MAC Stats—Mac Statistics is enabled.</li> <li>• Bridging—Routing instance is a normal layer 2 bridge.</li> <li>• No VLAN—No VLANs are associated with the bridge domain.</li> <li>• All VLANs—The <b>vlan-id all</b> statement has been enabled for this bridge domain.</li> <li>• Single VLAN—Single VLAN ID is associated with the bridge domain.</li> <li>• MAC action drop—New MACs will be dropped when the MAC address limit is reached.</li> <li>• Dual VLAN—Dual VLAN tags are associated with the bridge domain</li> <li>• No local switching—No local switching is enabled for this routing instance..</li> <li>• Learning disabled—Layer 2 learning is disabled for this routing instance.</li> <li>• MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached.</li> <li>• VPLS—The VPLS protocol is enabled.</li> <li>• No IRB I2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance.</li> <li>• ACKed by all peers—All peers have acknowledged this routing instance.</li> <li>• BUM Pruning—BUM pruning is enabled on the VPLS instance.</li> <li>• Def BD VXLAN—VXLAN is enabled for the default bridge domain.</li> <li>• EVPN—EVPN protocol is enabled for this routing instance.</li> <li>• Def BD OVSDb—Open vSwitch Database (OVSDb) is enabled on the default bridge domain.</li> <li>• Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain.</li> <li>• L2 backhaul—Layer 2 backhaul is enabled.</li> <li>• FRR optimize—Fast reroute optimization</li> <li>• MAC pinning—MAC pinning is enabled for this bridge domain.</li> <li>• MAC Aging Timer—The MAC table aging time is set per routing instance.</li> <li>• EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation.</li> <li>• PBBN—This routing instance is configured as a provider backbone bridged network.</li> <li>• PBN—This routing instance is configured as a provider bridge network.</li> <li>• ETREE—The ETREE protocol is enabled on this EVPN routing instance.</li> <li>• ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance.</li> <li>• Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain.</li> <li>• MPLS control word—Control word is enabled for this MPLS routing instance.</li> </ul> | All levels              |
| Address family    | Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels              |
| Destination       | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |

Table 192: show route forwarding-table Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Route Type (Type)       | <p>How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li>• <b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li>• <b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li>• <b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li>• <b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li>• <b>ignore (ignr)</b>—Ignore this route.</li> <li>• <b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li>• <b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li>• <b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul> | All levels              |
| Route Reference (RtRef) | Number of routes to reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

| Next hop Type (Type)       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b> —Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrst)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| Reference (NhRef)          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| Next-hop interface (Netif) | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive none</b> |
| Weight                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| Balance                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| RPF interface              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>             |

## Sample Output

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;
      address 192.0.2.2/30;
    }
  }
}

user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
Destination: 192.0.2.3/32
```

```

Route type: destination
Route reference: 0
Flags: sent to PFE
Nexthop: 192.0.2.3
Next-hop type: broadcast
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0
Route interface-index: 67
Index: 328      Reference: 1

```

## Sample Output

### show route inactive-prefix

```
user@host> show route inactive-prefix

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

127.0.0.1/32          [Direct/0] 00:04:54
> via lo0.0
```

### show route inactive-prefix detail

```
user@host> show route inactive-prefix detail

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
127.0.0.1/32 (1 entry, 0 announced)
  Direct Preference: 0
    Next hop type: Interface
    Next-hop reference count: 1
    Next hop: via lo0.0, selected
    State: <Hidden Martian Int>
    Age: 4:51
    Task: IF
    AS path: I00:04:54
      > via lo0.0
```

### show route inactive-prefix extensive

The output for the **show route inactive-prefix extensive** command is identical to that of the **show route inactive-path detail** command. For sample output, see [show route inactive-prefix detail on page 2098](#).

### show route inactive-prefix terse

```
user@host> show route inactive-prefix terse

inet.0: 18 destinations, 18 routes (17 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

A Destination      P Prf  Metric 1  Metric 2  Next hop      AS path
127.0.0.1/32      D   0                >lo0.0
```

## show route instance

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Output Fields** Table 194 on page 2100 lists the output fields for the **show route instance** command. Output fields are listed in the approximate order in which they appear.

**Table 194: show route instance Output Fields**

| Field Name                       | Field Description                                                                                                                                                                                                                                                  | Level of Output          |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Instance or <i>instance-name</i> | Name of the routing instance.                                                                                                                                                                                                                                      | All levels               |
| Operational Routing Instances    | ( <b>operational</b> keyword only) Names of all operational routing instances.                                                                                                                                                                                     | —                        |
| Type                             | Type of routing instance: <b>forwarding</b> , <b>l2vpn</b> , <b>no-forwarding</b> , <b>vpls</b> , <b>virtual-router</b> , or <b>vrf</b> .                                                                                                                          | All levels               |
| State                            | State of the routing instance: <b>active</b> or <b>inactive</b> .                                                                                                                                                                                                  | <b>brief detail none</b> |
| Interfaces                       | Name of interfaces belonging to this routing instance.                                                                                                                                                                                                             | <b>brief detail none</b> |
| Restart State                    | Status of graceful restart for this instance: <b>Pending</b> or <b>Complete</b> .                                                                                                                                                                                  | <b>detail</b>            |
| Path selection timeout           | Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is <b>300</b> .                                                                                                                                             | <b>detail</b>            |
| Tables                           | Tables (and number of routes) associated with this routing instance.                                                                                                                                                                                               | <b>brief detail none</b> |
| Route-distinguisher              | Unique route distinguisher associated with this routing instance.                                                                                                                                                                                                  | <b>detail</b>            |
| Vrf-import                       | VPN routing and forwarding instance import policy name.                                                                                                                                                                                                            | <b>detail</b>            |
| Vrf-export                       | VPN routing and forwarding instance export policy name.                                                                                                                                                                                                            | <b>detail</b>            |
| Vrf-import-target                | VPN routing and forwarding instance import target community name.                                                                                                                                                                                                  | <b>detail</b>            |
| Vrf-export-target                | VPN routing and forwarding instance export target community name.                                                                                                                                                                                                  | <b>detail</b>            |
| Vrf-edge-protection-id           | Context identifier configured for edge-protection.                                                                                                                                                                                                                 | <b>detail</b>            |
| Fast-reroute-priority            | Fast reroute priority setting for a VPLS routing instance: <b>high</b> , <b>medium</b> , or <b>low</b> . The default is <b>low</b> .                                                                                                                               | <b>detail</b>            |
| Restart State                    | Restart state: <ul style="list-style-type: none"> <li><b>Pending:protocol-name</b>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li><b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> | <b>detail</b>            |

Table 194: show route instance Output Fields (*continued*)

| Field Name             | Field Description                               | Level of Output                  |
|------------------------|-------------------------------------------------|----------------------------------|
| Primary rib            | Primary table for this routing instance.        | <b>brief</b> none <b>summary</b> |
| Active/holddown/hidden | Number of active, hold-down, and hidden routes. | All levels                       |

## Sample Output

### show route instance

```

user@host> show route instance
Instance          Type
Primary RIB
master            forwarding
inet.0            16/0/1
iso.0             1/0/0
mpls.0            0/0/0
inet6.0           2/0/0
l2circuit.0       0/0/0
__juniper_private1__ forwarding
__juniper_private1__.inet.0 12/0/0
__juniper_private1__.inet6.0 1/0/0

```

### show route instance detail (Graceful Restart Complete)

```

user@host> show route instance detail

| <b>Output Fields</b>            | Table 195 on page 2113 lists the output fields for the <b>show route localization</b> command. Output fields are listed in the approximate order in which they appear. |

Table 195: show route localization Output Fields

| Field Name        | Field Description                                                      |
|-------------------|------------------------------------------------------------------------|
| <b>FIB-local</b>  | FPCs configured as FIB-local.                                          |
| <b>FIB-remote</b> | FPCs configured as FIB-remote.                                         |
| <b>Normal</b>     | FPCs neither configured as <b>FIB-local</b> or <b>FIB-remote</b> .     |
| <b>Protocols</b>  | IPv4 (inet) or IPv6 (inet6) traffic configured for route localization. |

## Sample Output

```
user@R0> show route localization
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
  FIB-local: FPC2(4,5)
  FIB-remote: FPC0, FPC1
  Normal:    FPC3, FPC4, FPC5, FPC6, FPC7
```

```
user@R0> show route localization detail
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
  FIB-local: FPC2(4,5)
  FIB-remote: FPC0, FPC1
  Normal:    FPC3, FPC4, FPC5, FPC6, FPC7
FIB localization configuration
  Protocols: inet, inet6
  FIB-local: FPC2
  FIB-remote: FPC0, FPC1
```

Forwarding Engine addresses

FPC0: 1  
FPC1: 2  
FPC2: 4, 5  
FPC3: 6  
FPC4: 8  
FPC5: 11  
FPC6: 13  
FPC7: 15

## show route martians

**List of Syntax** [Syntax on page 2115](#)  
[Syntax \(EX Series Switches\) on page 2115](#)

**Syntax** show route martians  
 <logical-system (all | *logical-system-name*)>  
 <table *routing-table-name*>

**Syntax (EX Series Switches)** show route martians  
 <table *routing-table-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display the martian (invalid and ignored) entries associated with each routing table.

**Options** **none**—Display standard information about route martians for all routing tables.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**table *routing-table-name***—(Optional) Display information about route martians for all routing tables whose name begins with this string (for example, **inet.0** and **inet6.0** are both displayed when you run the **show route martians table inet** command).

**Required Privilege Level** view

| <b>Output Fields</b>               | Table 197 on page 2152 describes the output fields for the <b>show route receive-protocol</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 197: show route receive-protocol Output Fields

| Field Name                                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output         |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>routing-table-name</i>                       | Name of the routing table—for example, inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels              |
| <i>number destinations</i>                      | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                       | All levels              |
| <i>number routes</i>                            | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                      | All levels              |

| MED                                             | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                      | none <b>brief</b>       |
| <i>destination-prefix</i><br>(entry, announced) | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Accepted LongLivedStale</b>                  | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                           | <b>detail extensive</b> |
| <b>Accepted LongLivedStaleImport</b>            | The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.<br><br>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table | <b>detail extensive</b> |
| <b>ImportAccepted LongLivedStaleImport</b>      | Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table<br><br>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Route Distinguisher</b>                      | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Label-Base, range</b>                        | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>VPN Label</b>                                | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |

## show route resolution

---

**List of Syntax**    [Syntax on page 2160](#)  
                          [Syntax \(EX Series Switches\) on page 2160](#)

**Syntax**    show route resolution  
              <brief | detail | extensive | summary>  
              <index *index*>  
              <logical-system (all | *logical-system-name*)>  
              <*prefix*>  
              <table *routing-table-name*>  
              <unresolved>

**Syntax (EX Series Switches)**    show route resolution  
                                          <brief | detail | extensive | summary>  
                                          <index *index*>  
                                          <*prefix*>  
                                          <table *routing-table-name*>  
                                          <unresolved>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**    Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.

**Options**    **none**—Display standard information about all entries in the next-hop resolution database.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**index *index***—(Optional) Show the index of the resolution tree.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***prefix network/destination-prefix***—(Optional) Display database entries for the specified address.

**table *routing-table-name***—(Optional) Display information about a particular routing table (for example, **inet.0**) where policy-based export is currently enabled.

**unresolved**—(Optional) Display routes that could not be resolved.

**Required Privilege Level**    view

**Related Documentation**    • [Example: Configuring Route Resolution on PE Routers](#)

**List of Sample Output**    [show route resolution detail on page 2162](#)  
                                  [show route resolution summary on page 2163](#)  
                                  [show route resolution unresolved on page 2163](#)

**Output Fields** Table 198 on page 2162 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

**Table 198: show route resolution Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>          | Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.                                                                                     |
| <b>Tree index</b>                  | Tree index identifier.                                                                                                                                                                                                                                                                                                                                |
| <b>Nodes</b>                       | Number of nodes in the tree.                                                                                                                                                                                                                                                                                                                          |
| <b>Reference count</b>             | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                            |
| <b>Contributing routing tables</b> | Routing tables used for next-hop resolution.                                                                                                                                                                                                                                                                                                          |
| <b>Originating RIB</b>             | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of <b>inet.0</b> resolving through <b>inet.0</b> and <b>inet.3</b> , this field indicates which routing table, <b>inet.0</b> or <b>inet.3</b> , provided the best path for a particular prefix. |
| <b>Metric</b>                      | Metric associated with the forwarding next hop.                                                                                                                                                                                                                                                                                                       |
| <b>Node path count</b>             | Number of nodes in the path.                                                                                                                                                                                                                                                                                                                          |
| <b>Forwarding next hops</b>        | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                                                                 |

## Sample Output

### show route resolution detail

```

user@host> show route resolution detail
Tree Index: 1, Nodes 0, Reference Count 1

## show route summary

---

<b>List of Syntax</b>	<a href="#">Syntax on page 2173</a> <a href="#">Syntax (EX Series Switches) on page 2173</a>
<b>Syntax</b>	<pre>show route summary &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;table <i>routing-table-name</i>&gt;</pre>
<b>Syntax (EX Series Switches)</b>	show route summary
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Display summary statistics about the entries in the routing table.</p> <p>CPU utilization might increase while the device learns routes. We recommend that you use the <b>show route summary</b> command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the <b>show route summary</b> command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).</p>
<b>Options</b>	<p><b>none</b>—Display summary statistics about the entries in the routing table.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>table <i>routing-table-name</i></b>—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, <b>inet.0</b> and <b>inet6.0</b> are both displayed when you run the <b>show route summary table inet</b> command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show route summary on page 2175</a> <a href="#">show route summary table on page 2175</a> <a href="#">show route summary table (with Route Limits Configured for the Routing Table) on page 2176</a>
<b>Output Fields</b>	<p><a href="#">Table 199 on page 2174</a> lists the output fields for the <b>show route summary</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 199: show route summary Output Fields

Field Name	Field Description
<b>Router ID</b>	Address of the local routing device.
<b><i>routing-table-name</i></b>	Name of the routing table (for example, <b>inet.0</b> ).
<b>destinations</b>	Number of destinations for which there are routes in the routing table.
<b>routes</b>	<p>Number of routes in the routing table:</p> <ul style="list-style-type: none"> <li>• <b>active</b>—Number of routes that are active.</li> <li>• <b>holddown</b>—Number of routes that are in the hold-down state before being declared inactive.</li> <li>• <b>hidden</b>—Number of routes that are not used because of routing policy.</li> </ul>
<b>Restart complete</b>	<p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> <li>• <b>Pending:protocol-name</b>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>• <b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> <p>For example, if the output shows-</p> <ul style="list-style-type: none"> <li>• LDP.inet.0: 5 routes (4 active, 1 holddown, 0 hidden) Restart Pending: OSPF LDP VPN</li> </ul> <p>This indicates that <b>OSPF</b>, <b>LDP</b>, and <b>VPN</b> protocols did not restart for <b>LDP.inet.0</b> routing table.</p> <ul style="list-style-type: none"> <li>• vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden) Restart Complete</li> </ul> <p>This indicates that all protocols have restarted for <b>vpls_1.l2vpn.0</b> routing table.</p>
<b>Limit/Threshold</b>	<p>Displays the configured route limits for the routing table set with the <b>maximum-prefixes</b> and the <b>maximum-paths</b> statements. If you do not configure route limits for the routing table, the show output does not display this information.</p> <ul style="list-style-type: none"> <li>• <b>destinations</b>—The first number represents the maximum number of route prefixes installed in the routing table. The second number represents the number of route prefixes that trigger a warning message.</li> <li>• <b>routes</b>—The first number represents the maximum number of routes. The second number represents the number of routes that trigger a warning message.</li> </ul>
<b>Direct</b>	Routes on the directly connected network.
<b>Local</b>	Local routes.
<b><i>protocol-name</i></b>	Name of the protocol from which the route was learned. For example, <b>OSPF</b> , <b>RSVP</b> , and <b>Static</b> .

**Output Fields** [Table 181 on page 1978](#) describes the output fields for the **show route table** command. Output fields are listed in the approximate order in which they appear.

**Table 200: show route table Output Fields**

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
Restart complete	<p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> <li>• <b>Pending:</b><i>protocol-name</i>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>• <b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> <p>For example, if the output shows-</p> <ul style="list-style-type: none"> <li>• LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden) Restart Pending: OSPF LDP VPN</li> </ul> <p>This indicates that <b>OSPF</b>, <b>LDP</b>, and <b>VPN</b> protocols did not restart for the <b>LDP.inet.0</b> routing table.</p> <ul style="list-style-type: none"> <li>• vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden) Restart Complete</li> </ul> <p>This indicates that all protocols have restarted for the <b>vpls_1.l2vpn.0</b> routing table.</p>
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 200: show route table Output Fields (*continued*)

Field Name	Field Description
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>
<i>route-destination</i> (entry, announced)	<p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> <li>• <b>inclusive multicast Ethernet tag route</b>—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> <li>• <b>route distinguisher</b>—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</li> <li>• <b>Ethernet tag ID</b>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</li> <li>• <b>IP address length</b>—(1 octet) Length of IP address in bits.</li> <li>• <b>originating router's IP address</b>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</li> </ul> </li> </ul>
<i>label stacking</i>	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>

Table 200: show route table Output Fields (*continued*)

Field Name	Field Description
[ <i>protocol, preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop. For a description of possible values for this field, see <a href="#">Table 185 on page 2029</a> .
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
Label-switched-path <i>lsp-path-name</i>	Name of the LSP used to reach the next hop.

Table 200: show route table Output Fields (*continued*)

Field Name	Field Description
Label operation	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See <a href="#">Table 186 on page 2031</a> .
Local AS	AS number of the local routing devices.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.
Task	Name of the protocol that has added the route.
Announcement bits	<p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, <b><i>n-Resolve inet</i></b> indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <li><b><i>n</i></b>—An index used by Juniper Networks customer support only.</li> </ul>

Table 200: show route table Output Fields (*continued*)

Field Name	Field Description
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
FECs bound to route	Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.

Table 200: show route table Output Fields (*continued*)

Field Name	Field Description
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See <a href="#">Table 187 on page 2033</a> for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: <b>none</b> or <b>Site Down</b> .
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.
Accepted LongLivedStaleImport	<p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p>
ImportAccepted LongLivedStaleImport	<p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.

Table 200: show route table Output Fields (*continued*)

Field Name	Field Description
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

[Table 185 on page 2029](#) describes all possible values for the Next-hop Types output field.

Table 201: Next-hop Types Output Field Values

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.
Deny	Deny next hop.
Discard	Discard next hop.
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.
Reject (rjct)	Discard. An ICMP unreachable message was sent.

Table 201: Next-hop Types Output Field Values (*continued*)

Next-Hop Type	Description
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrtr)	Regular multicast next hop.
Router	<p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as a next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul>
Table	Routing table next hop.
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

Table 186 on page 2031 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 202: State Output Field Values

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.

Table 202: State Output Field Values (*continued*)

Value	Description
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGp path is available.
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.

Table 202: State Output Field Values (*continued*)

Value	Description
Pending	Route pending because of a hold-down configured on another route.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available.
Router ID	Path through a neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul>
Update source	Last tiebreaker is the lowest IP address value.

Table 187 on page 2033 describes the possible values for the Communities output field.

Table 203: Communities Output Field Values

Value	Description
<i>area-number</i>	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
<b>bandwidth: local AS</b> <b>number:link-bandwidth-number</b>	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
<b>domain-id</b>	Unique configurable number that identifies the OSPF domain.
<b>domain-id-vendor</b>	Unique configurable number that further identifies the OSPF domain.
<i>link-bandwidth-number</i>	Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).
<i>local AS number</i>	Local AS number: from 1 through 65,535.

Table 203: Communities Output Field Values (*continued*)

Value	Description
<i>options</i>	1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.
<i>origin</i>	(Used with VPNs) Identifies where the route came from.
<i>ospf-route-type</i>	1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses.
<i>route-type-vendor</i>	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <i>area-number:ospf-route-type:options</i> .
<i>rte-type</i>	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <i>area-number:ospf-route-type:options</i> .
<i>target</i>	Defines which VPN the route participates in; <b>target</b> has the format <i>32-bit IP address:16-bit number</i> . For example, 10.19.0.0:100.
<i>unknown IANA</i>	Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.
<i>unknown OSPF vendor community</i>	Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.

## Sample Output

### show route table bgp.l2vpn

```

user@host> show route table bgp.l2vpn
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.24.1:1:4:1/96

## show route terse

**List of Syntax** [Syntax on page 2215](#)  
[Syntax \(EX Series Switches\) on page 2215](#)

**Syntax** show route terse  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route terse

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display a high-level summary of the routes in the routing table.

**NOTE:** For BGP routes, the `show route terse` command displays the local preference attribute and MED instead of the metric1 and metric2 values. This is mostly due to historical reasons.

To display the metric1 and metric2 value of a BGP route, use the [show route extensive](#) command.

**Options** **none**—Display a high-level summary of the routes in the routing table.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show route terse on page 2217](#)

**Output Fields** [Table 204 on page 2215](#) describes the output fields for the `show route terse` command. Output fields are listed in the approximate order in which they appear.

**Table 204: show route terse Output Fields**

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 204: show route terse Output Fields (*continued*)

Field Name	Field Description
<i>number routes</i>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>
<i>route key</i>	Key for the state of the route: <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul>
<b>A</b>	Active route. An asterisk (*) indicates this is the active route.
<b>V</b>	Validation status of the route: <ul style="list-style-type: none"> <li>• <b>?</b>—Not evaluated. Indicates that the route was not learned through BGP.</li> <li>• <b>I</b>—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>N</b>—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>V</b>—Valid. Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
Destination	Destination of the route.
<b>P</b>	Protocol through which the route was learned: <ul style="list-style-type: none"> <li>• <b>A</b>—Aggregate</li> <li>• <b>B</b>—BGP</li> <li>• <b>C</b>—CCC</li> <li>• <b>D</b>—Direct</li> <li>• <b>G</b>—GMPLS</li> <li>• <b>I</b>—IS-IS</li> <li>• <b>L</b>—L2CKT, L2VPN, LDP, Local</li> <li>• <b>K</b>—Kernel</li> <li>• <b>M</b>—MPLS, MSDP</li> <li>• <b>O</b>—OSPF</li> <li>• <b>P</b>—PIM</li> <li>• <b>R</b>—RIP, RIPng</li> <li>• <b>S</b>—Static</li> <li>• <b>T</b>—Tunnel</li> </ul>
<b>Prf</b>	Preference value of the route. In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.

Table 204: show route terse Output Fields (*continued*)

Field Name	Field Description
Metric 1	First metric value in the route. For routes learned from BGP, this is the MED metric.
Metric 2	Second metric value in the route. For routes learned from BGP, this is the IGP metric.
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>I—IGP.</li> <li>E—EGP.</li> <li>?—Incomplete; typically, the AS path was aggregated.</li> </ul>

## CHAPTER 26

# RIP Operational Commands

- `clear rip general-statistics`
- `clear rip statistics`
- `show rip general-statistics`
- `show rip neighbor`
- `show rip statistics`

## clear rip general-statistics

---

<b>List of Syntax</b>	<a href="#">Syntax on page 2220</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 2220</a>
<b>Syntax</b>	clear rip general-statistics <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches and QFX Series)</b>	clear rip general-statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
<b>Description</b>	Clear RIP general statistics.
<b>Options</b>	<b>none</b> —Clear RIP general statistics.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show rip general-statistics on page 2223</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear rip general-statistics on page 2220</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear rip general-statistics

```
user@host> clear rip general-statistics
```

## clear rip statistics

<b>List of Syntax</b>	<a href="#">Syntax on page 2221</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 2221</a>
<b>Syntax</b>	<pre>clear rip statistics &lt;instance (all   <i>instance-name</i>)&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;neighbor&gt; &lt;peer (all   <i>address</i>)&gt;</pre>
<b>Syntax (EX Series Switches and QFX Series)</b>	<pre>clear rip statistics &lt;instance (all   <i>instance-name</i>)&gt; &lt;neighbor&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	Clear RIP statistics.
<b>Options</b>	<p><b>none</b>—Reset RIP counters for all neighbors for all routing instances.</p> <p><b>instance (all   <i>instance-name</i>)</b>—(Optional) Clear RIP statistics for all instances or for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>neighbor</b>—(Optional) Clear RIP statistics for the specified neighbor only.</p> <p><b>peer (all   <i>address</i>)</b>—(Optional) Clear RIP statistics for a single peer or all peers.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show rip statistics on page 2227</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear rip statistics on page 2221</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear rip statistics

```
user@host> clear rip statistics
```

## show rip general-statistics

**List of Syntax**    [Syntax on page 2223](#)  
                          [Syntax \(EX Series Switches and QFX Series\) on page 2223](#)

**Syntax**    show rip general-statistics  
                  <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches and QFX Series)**    show rip general-statistics

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Command introduced in Junos OS Release 12.1 for the QFX Series.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display brief RIP statistics.

**Options**    none—Display brief RIP statistics.  
                  **logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**    view

**Related Documentation**    • [clear rip general-statistics on page 2220](#)

**List of Sample Output**    [show rip general-statistics on page 2224](#)

**Output Fields**    [Table 205 on page 2223](#) lists the output fields for the **show rip general-statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 205: show rip general-statistics Output Fields**

Field Name	Field Description
bad msgs	Number of invalid messages received.
no rcv intf	Number of packets received with no matching interface.
curr memory	Amount of memory currently used by RIP.
max memory	Most memory used by RIP.

## Sample Output

### show rip general-statistics

```
user@host> show rip general-statistics
RIPv2 I/O info:
  bad msgs      :      0
  no recv intf  :      0
  curr memory   :      0
  max memory    :      0
```

## show rip neighbor

---

<b>List of Syntax</b>	<a href="#">Syntax on page 2225</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 2225</a>
<b>Syntax</b>	<pre>show rip neighbor &lt;instance (all   <i>instance-name</i>)&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;name&gt;</pre>
<b>Syntax (EX Series Switches and QFX Series)</b>	<pre>show rip neighbor &lt;instance (all   <i>instance-name</i>)&gt; &lt;name&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	Display information about RIP neighbors.
<b>Options</b>	<p><b>none</b>—Display information about all RIP neighbors for all instances.</p> <p><b>instance (all   <i>instance-name</i>)</b>—(Optional) Display RIP neighbor information for all instances or for only the specified routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>name</b>—(Optional) Display detailed information about only the specified RIP neighbor.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show rip neighbor on page 2226</a> <a href="#">show rip neighbor (With Demand Circuits Configured) on page 2226</a>
<b>Output Fields</b>	<p><a href="#">Table 206 on page 2226</a> lists the output fields for the <b>show rip neighbor</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 206: show rip neighbor Output Fields

Field Name	Field Description
<b>Neighbor</b>	Name of the RIP neighbor.  <b>NOTE:</b> Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits.  If you configure demand circuits at the <b>[edit protocols rip group group-name neighbor neighbor-name]</b> hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the <b>[edit protocols rip group group-name]</b> hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.
<b>State</b>	State of the connection: <b>Up</b> or <b>Dn</b> (Down).
<b>Source Address</b>	Address of the port on the local router.
<b>Destination Address</b>	Address of the port on the remote router.
<b>Send Mode</b>	Send options: <b>broadcast</b> , <b>multicast</b> , <b>none</b> , or <b>version 1</b> .
<b>Receive Mode</b>	Type of packets to accept: <b>both</b> , <b>none</b> , <b>version 1</b> , or <b>version 2</b> .
<b>In Met</b>	Metric added to incoming routes when advertising into RIP routes that were learned from other protocols.

## Sample Output

### show rip neighbor

```

user@host> show rip neighbor
Neighbor      Local  Source  Destination  Send  Receive  In
-----
ge-2/3/0.0    Up    192.168.9.105  192.168.9.107  bcast  both      1
at-5/1/1.42    Dn    (null)      (null)        mcast  v2 only   3
at-5/1/0.42    Dn    (null)      (null)        mcast  both      3
at-5/1/0.0     Up    198.51.100.0  224.0.0.9     mcast  both      3
so-0/0/0.0     Up    192.168.9.97  224.0.0.9     mcast  both      3

```

### show rip neighbor (With Demand Circuits Configured)

```

user@host> show rip neighbor
Neighbor      Local  Source  Destination  Send  Receive  In
-----
so-0/1/0.0(DC) Up    10.10.10.2  224.0.0.9     mcast  both      1
so-0/2/0.0(DC) Up    192.0.2.2   224.0.0.9     mcast  both      1

```

## show rip statistics

<b>List of Syntax</b>	<a href="#">Syntax on page 2227</a> <a href="#">Syntax (EX Series Switches and QFX Series) on page 2227</a>
<b>Syntax</b>	<pre>show rip statistics &lt;instance (all   <i>instance-name</i>)&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;name&gt; &lt;peer (all   <i>address</i>)&gt;</pre>
<b>Syntax (EX Series Switches and QFX Series)</b>	<pre>show rip statistics &lt;instance (all   <i>instance-name</i>)&gt; &lt;name&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	Display RIP statistics about messages sent and received on an interface, as well as information received from advertisements from other routing devices.
<b>Options</b>	<p><b>none</b>—Display RIP statistics for all routing instances.</p> <p><b>instance (all   <i>instance-name</i>)</b>—(Optional) Display RIP statistics for all instances or for only the specified routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>name</i></b>—(Optional) Display detailed information about only the specified RIP neighbor.</p> <p><b>peer (all   <i>address</i>)</b>—(Optional) Display RIP statistics for a single peer or all peers.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear rip statistics on page 2221</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show rip statistics on page 2229</a>
<b>Output Fields</b>	<p><a href="#">Table 207 on page 2228</a> lists the output fields for the <b>show rip statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 207: show rip statistics Output Fields

Field Name	Field Description
<b>RIP info</b>	<p>Information about RIP on the specified interface:</p> <ul style="list-style-type: none"> <li>• <b>port</b>—UDP port number used for RIP.</li> <li>• <b>update interval</b>—Interval between routing table updates, in seconds.</li> <li>• <b>holddown</b>—Hold-down interval, in seconds.</li> <li>• <b>timeout</b>—Timeout interval, in seconds.</li> <li>• <b>restart in progress</b>—Graceful restart status. Displayed when RIP is or has been in the process of graceful restart.</li> <li>• <b>restart time</b>—Estimated time for the graceful restart to finish, in seconds.</li> <li>• <b>restart will complete in</b>—Remaining time for the graceful restart to finish, in seconds.</li> <li>• <b>rts learned</b>—Number of routes learned through RIP.</li> <li>• <b>rts held down</b>—Number of routes held down by RIP.</li> <li>• <b>rqsts dropped</b>—Number of received request packets that were dropped.</li> <li>• <b>resps dropped</b>—Number of received response packets that were dropped.</li> </ul>
<b><i>logical-interface</i></b>	<p>Name of the logical interface and its statistics:</p> <ul style="list-style-type: none"> <li>• <b>routes learned</b>—Number of routes learned on the logical interface.</li> <li>• <b>routes advertised</b>—Number of routes advertised by the logical interface.</li> </ul>
<b>Counter</b>	<p>List of counter types:</p> <ul style="list-style-type: none"> <li>• <b>Updates Sent</b>—Number of update messages sent.</li> <li>• <b>Triggered Updates Sent</b>—Number of triggered update messages sent.</li> <li>• <b>Responses Sent</b>—Number of response messages sent.</li> <li>• <b>Bad Messages</b>—Number of invalid messages received.</li> <li>• <b>RIPv1 Updates Received</b>—Number of RIPv1 update messages received.</li> <li>• <b>RIPv1 Bad Route Entries</b>—Number of RIPv1 invalid route entry messages received.</li> <li>• <b>RIPv1 Updates Ignored</b>—Number of RIPv1 update messages ignored.</li> <li>• <b>RIPv2 Updates Received</b>—Number of RIPv2 update messages received.</li> <li>• <b>RIPv2 Bad Route Entries</b>—Number of RIPv2 invalid route entry messages received.</li> <li>• <b>RIPv2 Updates Ignored</b>—Number of RIPv2 update messages that were ignored.</li> <li>• <b>Authentication Failures</b>—Number of received update messages that failed authentication.</li> <li>• <b>RIP Requests Received</b>—Number of RIP request messages received.</li> <li>• <b>RIP Requests Ignored</b>—Number of RIP request messages ignored.</li> </ul>
<b>Total</b>	Total number of packets for the selected counter.
<b>Last 5 min</b>	Number of packets for the selected counter in the most recent 5-minute period.
<b>Last minute</b>	Number of packets for the selected counter in the most recent 1-minute period.

## Sample Output

### show rip statistics

```

user@host> show rip statistics so-0/0/0.0
RIP info: port 520; update interval: 30s; holddown 180s; timeout 120s
restart in progress: restart time 60s; restart will complete in 55s
    rts learned   rts held down   rqsts dropped   resps dropped
              0              0              0              0
so-0/0/0.0: 0 routes learned; 501 routes advertised
Counter      Total      Last 5 min   Last minute
-----
Updates Sent          0          0          0
Triggered Updates Sent 0          0          0
Responses Sent        0          0          0
Bad Messages          0          0          0
RIPv1 Updates Received 0          0          0
RIPv1 Bad Route Entries 0          0          0
RIPv1 Updates Ignored  0          0          0
RIPv2 Updates Received 0          0          0
RIPv2 Bad Route Entries 0          0          0
RIPv2 Updates Ignored  0          0          0
Authentication Failures 0          0          0
RIP Requests Received  0          0          0
RIP Requests Ignored   0          0          0

## CHAPTER 27

# RIPng Operational Commands

- `clear ripng general-statistics`
- `clear ripng statistics`
- `show ripng general-statistics`
- `show ripng neighbor`
- `show ripng statistics`

## clear ripng general-statistics

---

<b>List of Syntax</b>	<a href="#">Syntax on page 2232</a> <a href="#">Syntax (EX Series Switches) on page 2232</a>
<b>Syntax</b>	clear ripng general-statistics <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	clear ripng general-statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Clear RIP next generation (RIPng) general statistics.
<b>Options</b>	<b>none</b> —Clear RIPng general statistics.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show ripng general-statistics on page 2234</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear ripng general-statistics on page 2232</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ripng general-statistics

```
user@host> clear ripng general-statistics
```

## clear ripng statistics

---

<b>List of Syntax</b>	<a href="#">Syntax on page 2233</a> <a href="#">Syntax (EX Series Switch) on page 2233</a>
<b>Syntax</b>	clear ripng statistics < <i>instance</i>   <i>name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switch)</b>	clear ripng statistics < <i>instance</i>   <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Clear RIP next-generation (RIPng) statistics.
<b>Options</b>	<p><b>none</b>—Reset RIPng counters for all neighbors for all routing instances.</p> <p><b><i>instance</i></b>—(Optional) Reset RIPng counters for the specified instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>name</i></b>—(Optional) Reset RIPng counters for the specified neighbor.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ripng statistics on page 2238</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear ripng statistics on page 2233</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ripng statistics

```
user@host> clear ripng statistics
```

## show ripng general-statistics

---

List of Syntax	<a href="#">Syntax on page 2234</a> <a href="#">Syntax (EX Series Switch) on page 2234</a>
Syntax	show ripng general-statistics <logical-system (all   <i>logical-system-name</i> )>
Syntax (EX Series Switch)	show ripng general-statistics
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display general RIP next-generation (RIPng) statistics.
Options	<b>none</b> —Display general RIPng statistics.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">clear ripng general-statistics on page 2232</a></li></ul>
List of Sample Output	<a href="#">show ripng general-statistics on page 2235</a>
Output Fields	<a href="#">Table 208 on page 2234</a> lists the output fields for the <b>show ripng general-statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 208: show ripng general-statistics Output Fields**

Field Name	Field Description
bad msgs	Number of invalid messages received.
no rcv intf	Number of packets received with no matching interface.
curr memory	Amount of memory currently used by RIPng.
max memory	Most memory used by RIPng.

## Sample Output

### show ripng general-statistics

```
user@host> show ripng general-statistics
RIPng I/O info:
  bad msgs      :      0
  no recv intf  :      0
  curr memory   :      0
  max memory    :      0
```

## show ripng neighbor

**List of Syntax** [Syntax on page 2236](#)  
[Syntax \(EX Series Switch\) on page 2236](#)

**Syntax** show ripng neighbor  
 <logical-system (all | *logical-system-name*)>  
 <*name*>

**Syntax (EX Series Switch)** show ripng neighbor  
 <*name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display information about RIP next-generation (RIPng) neighbors.

**Options** **none**—Display information about all RIPng neighbors.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***name***—(Optional) Display detailed information about a specific RIPng neighbor.

**Required Privilege Level** view

**List of Sample Output** [show ripng neighbor on page 2237](#)

**Output Fields** [Table 209 on page 2236](#) lists the output fields for the **show ripng neighbor** command. Output fields are listed in the approximate order in which they appear.

**Table 209: show ripng neighbor Output Fields**

Field Name	Field Description
<b>Neighbor</b>	Name of RIPng neighbor.
<b>State</b>	State of the connection: <b>Up</b> or <b>Dn</b> (Down).
<b>Source Address</b>	Source address.
<b>Destination Address</b>	Destination address.
<b>Send</b>	Send options: <b>broadcast</b> , <b>multicast</b> , <b>none</b> , <b>version 1</b> , or <b>yes</b> .
<b>Recv</b>	Type of packets to accept: <b>both</b> , <b>none</b> , <b>version 1</b> , or <b>yes</b> .

Table 209: show ripng neighbor Output Fields (*continued*)

Field Name	Field Description
In Met	Metric added to incoming routes when advertising into RIPng routes that were learned from other protocols.

Sample Output

show ripng neighbor

```
user@host> show ripng neighbor
Neighbor      State  Source Address          Dest Address  Send Recv Met
-----
fe-0/0/2.0    Up     fe80::290:69ff:fe68:b002  ff02::9      yes  yes   1
```

## show ripng statistics

---

<b>List of Syntax</b>	<a href="#">Syntax on page 2238</a> <a href="#">Syntax (EX Series Switch) on page 2238</a>
<b>Syntax</b>	show ripng statistics <logical-system (all   <i>logical-system-name</i> )> < <i>name</i> >
<b>Syntax (EX Series Switch)</b>	show ripng statistics < <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display RIP next generation (RIPng) statistics about messages sent and received on an interface, as well as information received from advertisements from other routing devices.
<b>Options</b>	<b>none</b> —Display RIPng statistics for all neighbors.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b><i>name</i></b> —(Optional) Display detailed information about a specific RIPng neighbor.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">clear ripng statistics on page 2233</a></li></ul>
<b>List of Sample Output</b>	<a href="#">show ripng statistics on page 2239</a>
<b>Output Fields</b>	<a href="#">Table 210 on page 2239</a> lists the output fields for the <b>show ripng statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 210: show ripng statistics Output Fields

Field Name	Field Description
<b>RIPng info</b>	Information about RIPng on the specified interface: <ul style="list-style-type: none"> <li><b>port</b>—UDP port number used for RIPng.</li> <li><b>holddown</b>—Hold-down interval, in seconds.</li> <li><b>rts learned</b>—Number of routes learned through RIPng.</li> <li><b>rts held down</b>—Number of routes held down by RIPng.</li> <li><b>rqsts dropped</b>—Number of received request packets that were dropped.</li> <li><b>resps dropped</b>—Number of received response packets that were dropped.</li> <li><b>restart</b>—Graceful restart status. Displayed when RIPng is or has been in the process of graceful restart.</li> </ul>
<b>logical-interface</b>	Name of the logical interface and its statistics: <ul style="list-style-type: none"> <li><b>routes learned</b>—Number of routes learned on the logical interface.</li> <li><b>routes advertised</b>—Number of routes advertised by the logical interface.</li> <li><b>timeout</b>—Timeout interval, in seconds.</li> <li><b>update interval</b>—Interval between routing table updates, in seconds.</li> </ul>
<b>Counter</b>	List of counter types: <ul style="list-style-type: none"> <li><b>Updates Sent</b>—Number of update messages sent.</li> <li><b>Triggered Updates Sent</b>—Number of triggered update messages sent.</li> <li><b>Responses Sent</b>—Number of response messages sent.</li> <li><b>Bad Messages</b>—Number of invalid messages received.</li> <li><b>Updates Received</b>—Number of RIPng update messages received.</li> <li><b>Bad Route Entries</b>—Number of RIPng invalid route entry messages received.</li> <li><b>Updates Ignored</b>—Number of RIPng update messages ignored.</li> <li><b>RIPng Requests Received</b>—Number of RIPng request messages received.</li> <li><b>RIPng Requests Ignored</b>—Number of RIPng request messages ignored.</li> </ul>
<b>Total</b>	Total number of packets for the selected counter.
<b>Last 5 min</b>	Number of packets for the selected counter in the most recent 5-minute period.
<b>Last minute</b>	Number of packets for the selected counter in the most recent 1-minute period.

## Sample Output

### show ripng statistics

```

user@host> show ripng statistics

## CHAPTER 28

# Firewall Filter Operational Commands

- `clear firewall`
- `show firewall`
- `show firewall filter version`
- `show firewall log`
- `show firewall prefix-action-stats`
- `show firewall templates-in-use`
- `show policer`

## clear firewall

---

**List of Syntax**   [Syntax on page 2242](#)  
[Syntax \(EX Series Switches\) on page 2242](#)

**Syntax**   `clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | logical-system logical-system-name)`

**Syntax (EX Series Switches)**   `clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | policer counter (all | counter-id counter-index))`

**Release Information**   Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
**logical-system** option introduced in Junos OS Release 9.3.  
**log** option introduced before Junos OS Release 11.4.

**Description**   Clear statistics about configured firewall filters.

When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.

Subscriber management uses firewall filters to capture and report the volume-based service accounting counters that are used for subscriber billing. The **clear firewall** command also clears the service accounting counters that are reported to the RADIUS accounting server. For this reason, you must be cautious in specifying which firewall statistics you want to clear.

**NOTE:** The **clear firewall** command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).

---

If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the **prefix-action** action on matched packets, wait at least 5 seconds before you enter the **show firewall prefix-action-stats** command. A 5-second pause between issuing the **clear firewall** and **show firewall prefix-action-stats** commands avoids a possible timeout of the **show firewall prefix-action-stats** command.

**Options**   **all**—Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.

**counter *counter-name***—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.

**filter *filter-name***—Clear the packet and byte counts for the specified firewall filter.

**log (all | *logical-system-name*)**—Clear log entries for IPv4 firewall filters that have **then log** as an action. Use **log all** to clear all log entries or **log *logical-system-name*** to clear log entries for the specified logical system.

**logical-system *logical-system-name***—Clear the packet and byte counts for the specified logical system.

**policer counter (all | counter-id *counter-index*)**—(EX8200 switches only) Clear all policer counters using the **policer counter all** command, or clear a specific policer counter using the **policer counter counter-id *counter-index*** command. The value of *counter-index* can be 0, 1, or 2.

**Required Privilege Level** clear

**Related Documentation** • [show firewall on page 2244](#)

**List of Sample Output** [clear firewall all on page 2243](#)  
[clear firewall \(counter counter-name\) on page 2243](#)  
[clear firewall \(filter filter-name\) on page 2243](#)  
[clear firewall \(policer counter all\) \(EX8200 Switch\) on page 2243](#)  
[clear firewall \(policer counter counter-id counter-index\) \(EX8200 Switch\) on page 2243](#)

## Sample Output

clear firewall all

```
user@host> clear firewall all
```

clear firewall (counter counter-name)

```
user@host> clear firewall counter port-filter-counter
```

clear firewall (filter filter-name)

```
user@host> clear firewall filter ingress-port-filter
```

clear firewall (policer counter all) (EX8200 Switch)

```
user@switch> clear firewall policer counter all
```

clear firewall (policer counter counter-id counter-index) (EX8200 Switch)

```
user@switch> clear firewall policer counter counter-id 0
```

## show firewall

---

**List of Syntax**    [Syntax on page 2244](#)  
                          [Syntax \(EX Series Switches\) on page 2244](#)

**Syntax**    show firewall  
              <application (CFM | eswd | RMPS)>>  
              <counter *counter-name*>  
              <detail>  
              <filter *filter-name*>  
              <filter regex *regular-expression*>  
              <logical-system (all | *logical-system-name*)>  
              <terse>

**Syntax (EX Series Switches)**    show firewall  
                                          <application (CFM | eswd | RMPS)>>  
                                          <counter *counter-name*>  
                                          <detail>  
                                          <filter *filter-name*>  
                                          <filter regex *regular-expression*>  
                                          <log <(detail | interface *interface-name*)>>  
                                          <policer counters <(detail | counter-id *counter-index* <detail>)>>  
                                          <terse>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Option **logical-system** introduced in Junos OS Release 9.3.  
                              Option **terse** introduced in Junos OS Release 9.4.  
                              Option **policer counters** introduced in Junos OS Release 12.2 for EX Series switches.  
                              Option **detail** introduced in Junos OS Release 12.3 for EX Series switches.  
                              Option **detail** introduced in Junos OS Release 14.1 for MX Series routers.  
                              Option **regex *regular-expression*** introduced in Junos OS Release 14.2.

**Description**    Display enhanced statistics and counters for all configured firewall filters.

**Options**    **none**—(Optional) Display statistics and counters for all configured firewall filters and counters. For EX Series switches, this command also displays statistics about all configured policers.

**application (CFM | eswd | RMPS)**—(Optional) Show firewall elements owned by the selected software component:

- Connectivity Fault Management (CFM)
- Ethernet switching daemon (eswd)—Shows only on devices that support it.
- Resource Management and Packet Steering (RMPS)

**counter *counter-name***—(Optional) Name of a filter counter.

**detail**—(EX Series switches and MX Series routers only) (Optional) Display firewall filter statistics and enhanced policer statistics and counters.

**filter** *filter-name*—(Optional) Name of a configured filter.

**filter regex** *regular-expression*—(Optional) Regular expression that matches the names of a subset of filters.

**logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**log**—(Optional) Display log entries for firewall filters.

**log** <(**detail** | **interface** *interface-name*)>—(EX Series switches only) (Optional) Display detailed log entries of firewall activity or log information about a specific interface.

**policer counters** <(**detail** | **counter-id** *counter-index* <**detail**>)>—(EX8200 switches only) (Optional) Display enhanced policer counter statistics in brief or in detail.

**terse**—(Optional) Display firewall filter names only.

**Required Privilege Level**

view

**Output Fields** Table 211 on page 2246 lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

**Table 211: show firewall Output Fields**

Field Name	Field Description
<b>Filter</b>	<p>Name of a filter that has been configured with the <b>filter</b> statement at the <b>[edit firewall]</b> hierarchy level.</p> <p>Except on EX Series switches:</p> <ul style="list-style-type: none"> <li>When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either <b>-i</b> for an input filter or <b>-o</b> for an output filter.</li> <li>When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either <b>-in</b> for an input filter or <b>-out</b> for an output filter. When a logical system-specific filter is displayed, the name of the filter is prefixed with two underscore (__) characters and the name of the logical system (for example, <b>__ls1/filter1</b>).</li> <li>When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (:).</li> </ul> <p><b>NOTE:</b> For <b>bridge family filter</b>, the <b>ip-protocol</b> match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset, such as the MX 3D MPC line cards.</p>
<b>Counters</b>	<p>Display filter counter information:</p> <ul style="list-style-type: none"> <li><b>Name</b>—Name of a filter counter that has been configured with the <b>counter</b> firewall filter action.</li> <li><b>Bytes</b>—Number of bytes that match the filter term under which the <b>counter</b> action is specified.</li> <li><b>Packets</b>—Number of packets that matched the filter term under which the <b>counter</b> action is specified.</li> </ul> <p><b>NOTE:</b> On M and T Series routers, firewall filters cannot count <b>ip-options</b> packets on a per option type and per interface basis. A limited work around is to use the <b>show pfe statistics ip options</b> command to see <b>ip-options</b> statistics on a per Packet Forwarding Engine (PFE) basis. See <i>show pfe statistics ip</i> for sample output.</p>
<b>Policers</b>	<p>Display policer information:</p> <ul style="list-style-type: none"> <li><b>Name</b>—Name of policer.</li> <li><b>Bytes</b>—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on interfaces hosted on MICs and MPCs in MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer. For other combinations of policer type, device, and line card type, this field is blank.</li> <li><b>Packets</b>—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.</li> </ul>
<b>Policer Counter Index</b>	(EX8200 switch only) Global management counter ID. The counter ID value ( <i>counter-index</i> ) can be 0, 1, or 2.
<b>Green</b>	(EX8200 switch only) Number of packets within the limits. The number of packets is smaller than the committed information rate (CIR).

Table 211: show firewall Output Fields (*continued*)

Field Name	Field Description
<b>Yellow</b>	(EX8200 switch only) Number of packets partially within the limits. The number of packets is greater than the CIR, but the burst size is within the excess burst size (EBS) limit.
<b>Discard</b>	(EX8200 switch only) Number of discarded packets.
<b>Bytes</b>	(EX8200 switch only) Number of green, yellow, red, or discarded packets in bytes.
<b>Packets</b>	(EX8200 switch only) Number of green, yellow, red, or discarded packets.
<b>Filter name</b>	(EX8200 switch only) Name of the filter with a term associated to a policer.
<b>Term name</b>	(EX8200 switch only) Name of the term associated with a policer.
<b>Policer name</b>	(EX8200 switch only) Name of the policer that is associated with a global management counter.
P1-t1	<ul style="list-style-type: none"> <li>• OOS packet statistics for packets that are marked out-of-specification (out-of-spec) by the policer. Changes to all packets that have out-of-spec actions, such as discard, color marking, or forwarding-class, are included in this counter.</li> <li>• Offered packet statistics for traffic subjected to policing.</li> <li>• Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the in-spec statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.</li> </ul>

## Sample Output

### show firewall filter (MX Series Router and EX Series Switch)

```
user@host> show firewall filter test
Filter: test
Counters:
Name          Bytes      Packets
Counter-1     0          0
Counter-2     0          0
Policers:
Name          Bytes      Packets
Policer-1    2770       70
```

### show firewall filter (non MX Series Router and EX Series Switch)

```
user@host> show firewall filter test
Filter: test
Counters:
Name          Bytes      Packets
Counter-1     0          0
Counter-2     0          0
Policers:
Name          Bytes      Packets
Policer-1    70
```

### show firewall filter (Dynamic Input Filter)

```
user@host> show firewall filter dfwd-ge-5/0/0.1-in
Filter: dfwd-ge-5/0/0.1-in
Counters:
Name          Bytes      Packets
c1-ge-5/0/0.1-in 0          0
```

### show firewall (Logical Systems)

```
user@host> show firewall

Filter: __lr1/test
Counters:
Name          Bytes      Packets
icmp          420        5
Filter: __default_bpdu_filter__
Filter: __lr1/inet_filter1
Counters:
Name          Bytes      Packets
inet_tcp_count 0          0
inet_udp_count 0          0
Filter: __lr1/inet_filter2
Counters:
Name          Bytes      Packets
inet_icmp_count 0          0
inet_pim_count 0          0
Filter: __lr2/inet_filter1
Counters:
Name          Bytes      Packets
inet_tcp_count 0          0
```

inet_udp_count	0	0
----------------	---	---

### show firewall (counter counter-name)

```
user@host> show firewall counter icmp-counter
Filter: ingress-port-voip-class-filter
Counters:
Name                               Bytes      Packets
icmp-counter                        0          0
```

### show firewall log

```
user@host> show firewall log
Log :
```

Time	Filter	Action	Interface	Protocol	Src Addr
08:00:53	pfe 192.168.3.4	R	ge-1/0/1.0	ICMP	192.168.3.5
08:00:52	pfe 192.168.3.4	R	ge-1/0/1.0	ICMP	192.168.3.5

08:00:48	pfe 192.168.3.4	R	ge-1/0/1.0	ICMP	192.168.3.5
08:00:47	pfe 192.168.3.4	R	ge-1/0/1.0	ICMP	192.168.3.5

### show firewall policer counters (EX8200 Switch)

```
user@switch> show firewall policer counters
Policer Counter Index 0:
```

	Bytes	Packets
Green:	73	15914
Yellow:	9	1962
Discard:	119	25942

```
Policer Counter Index 1:
```

	Bytes	Packets
Green:	0	0
Yellow:	0	0
Discard:	0	0

```
Policer Counter Index 2:
```

	Bytes	Packets
Green:	0	0
Yellow:	0	0
Discard:	0	0

### show firewall policer counters (detail) (EX8200 Switch)

```
user@switch> show firewall policer counters detail
Policer Counter Index 0:
```

	Bytes	Packets
--	-------	---------

```

Green:                73                15914
Yellow:               9                 1962
Discard:              119              25942

Filter name           Term name          Policer name
myfilter              polcr-term-1      myfilter-polcr-1
inet-filter-ae        ae-snmp          policer-1
inet-filter-ae        ae-ssh           policer-2

Policer Counter Index 1:
Bytes                Packets
Green:               0                 0
Yellow:              0                 0
Discard:             0                 0

Filter name           Term name          Policer name

Policer Counter Index 2:
Bytes                Packets
Green:               0                 0
Yellow:              0                 0
Discard:             0                 0

Filter name           Term name          Policer name

```

#### show firewall policer counters (counter-id counter-index) (EX8200 Switch)

```

user@switch> show firewall policer counters counter-id 0
Policer Counter Index 0:
Bytes                Packets
Green:               73                15914

Transmitted	0	18446744073709358260

## show firewall filter version

<b>Syntax</b>	show firewall filter version <filter-name>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2R2.
<b>Description</b>	Display the version number of the installed firewall filter in the Routing Engine.
<b>Options</b>	none—(Optional) Display the version number of all installed firewall filters.  filter-name—(Optional) Name of a configured filter. If you specify the name of a filter, only the version number of that filter is displayed.
<b>Additional Information</b>	The initial version number is 1. This number increments by one when you modify the firewall filter settings or an associated prefix action. The maximum version number is 4,294,967,295. When the version number reaches 4,294,967,295, this number is reset to 1.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show firewall filter version on page 2252</a>
<b>Output Fields</b>	<a href="#">Table 212 on page 2252</a> lists the output fields for the <b>show firewall filter version</b> command. Output fields are listed in the approximate order in which they appear.

Table 212: show firewall filter version Output Fields

Field Name	Field Description
Filter	Name of a filter that has been configured with the <b>filter</b> statement at the <b>[edit firewall]</b> hierarchy level.
Version	Display the version number of the firewall filter.

## Sample Output

### show firewall filter version

```
user@host> show firewall filter version
Filter version information :
Filter                                     Version
test                                     10
```

## show firewall log

**List of Syntax** [Syntax on page 2253](#)  
[Syntax \(EX Series Switches\) on page 2253](#)

**Syntax** show firewall log  
 <detail>  
 <extensive>  
 <interface *interface-name*>  
 <logical-system (*logical-system-name* | all)>

**Syntax (EX Series Switches)** show firewall log  
 <detail>  
 <interface *interface-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**extensive** option introduced in Junos OS Release 16.1.  
**logical-system** option introduced in Junos OS Release 9.3.

**Description** Display log information about firewall filters.

**Options** **none**—Display log information about firewall filters.

**detail**—(Optional) Display detailed information.

**extensive**—(Optional) Display hex dump of packet captured by log action.

**interface *interface-name***—(Optional) Display log information about a specific interface.

**logical-system (*logical-system-name* | all)**—(Optional) Perform this operation on all logical systems or on a particular system.

**Required Privilege Level** view

**List of Sample Output** [show firewall log on page 2254](#)  
[show firewall log detail on page 2254](#)  
[show firewall log extensive on page 2255](#)

**Output Fields** [Table 213 on page 2253](#) lists the output fields for the **show firewall log** command. Output fields are listed in the approximate order in which they appear.

**Table 213: show firewall log Output Fields**

Field Name	Field Description
Time of Log	Time that the event occurred.

Table 213: show firewall log Output Fields (*continued*)

Field Name	Field Description
<b>Filter</b>	<ul style="list-style-type: none"> <li>Displays the name of a configured firewall filter or service filter only if the packet hit the filter's <b>log</b> action in a kernel filter (in the control plane). For any traffic that reaches the Routing Engine, the packets hit the <b>log</b> action in the kernel.</li> <li>For all other logged packets (packet hit the filter's <b>log</b> action in the Packet Forwarding Engine), this field displays <b>pfe</b> instead of a configured filter name.</li> </ul>
<b>Filter Action</b>	Filter action: <ul style="list-style-type: none"> <li>A—Accept</li> <li>D—Discard</li> <li>R—Reject</li> </ul>
<b>Name of Interface</b>	<ul style="list-style-type: none"> <li>Displays a physical interface name if the packet arrived at a port on a line card.</li> <li>Displays <b>local</b> if the packet was generated by the device's internal Ethernet interface, <b>em1</b> or <b>fxp1</b>, which connects the Routing Engine with the router's packet-forwarding components.</li> </ul>
<b>Name of protocol</b>	Packet's protocol name: <b>egp</b> , <b>gre</b> , <b>icmp</b> , <b>ipip</b> , <b>ospf</b> , <b>pim</b> , <b>rsvp</b> , <b>tcp</b> , or <b>udp</b> .
<b>Packet length</b>	Length of the packet.
<b>Source address</b>	Packet's source address.
<b>Destination address</b>	Packet's destination address and port.

## Sample Output

### show firewall log

```

user@host>show firewall log
Time      Filter  Action Interface    Protocol  Src Addr   Dest Addr
13:10:12  pfe      D      rlsq0.902     ICMP     192.0.2.2  192.0.2.1
13:10:11  pfe      D      rlsq0.902     ICMP     192.0.2.2  192.0.2.1

## show firewall prefix-action-stats

---

List of Syntax	<a href="#">Syntax (filter-specific mode) on page 2256</a> <a href="#">Syntax (term-specific mode) on page 2256</a>
Syntax (filter-specific mode)	<code>show firewall prefix-action-stats filter <i>filter-name</i> prefix-action <i>prefix-action-name</i></code> <code>&lt;from <i>number</i> to <i>number</i>&gt;</code> <code>&lt;logical-system (<i>logical-system-name</i>   all)&gt;</code>
Syntax (term-specific mode)	<code>show firewall prefix-action-stats filter <i>filter-name</i> prefix-action <i>prefix-action-name-term-name</i></code> <code>&lt;from <i>number</i> to <i>number</i>&gt;</code> <code>&lt;logical-system (<i>logical-system-name</i>   all)&gt;</code>
Release Information	Command introduced before Junos OS Release 7.4. <b>logical-system</b> option introduced in Junos OS Release 9.3.
Description	<p>Display prefix action statistics about configured firewall filters.</p> <p>If you clear statistics for firewall filters that are applied to MPCs and that also use the <b>prefix-action</b> action on matched packets, wait at least 5 seconds before you enter the <b>show firewall prefix-action-stats</b> command. A 5-second pause between issuing the <b>clear firewall</b> and <b>show firewall prefix-action-stats</b> commands avoids a possible timeout of the <b>show firewall prefix-action-stats</b> command.</p> <p>By default, policers operate in <i>term-specific</i> mode.</p> <p>See <i>Filter-Specific Policer Overview</i> for information about how to configure policers in <i>filter-specific</i> mode.</p>
Options	<p><b>filter <i>filter-name</i></b>—Name of a filter.</p> <p><b>prefix-action <i>prefix-action-name</i></b>—Name of a prefix action.</p> <p><b>from <i>number</i> to <i>number</i></b>—(Optional) Starting and ending counter or policer.</p> <p><b>logical-system (<i>logical-system-name</i>   all)</b>—(Optional) Perform this operation on all logical systems or on a particular system.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">clear firewall on page 2242</a></li></ul>
List of Sample Output	<a href="#">show firewall prefix-action-stats on page 2257</a>
Output Fields	<a href="#">Table 214 on page 2257</a> lists the output fields for the <b>show firewall prefix-action-stats</b> command. Output fields are listed in the approximate order in which they appear.

Table 214: show firewall prefix-action-stats Output Fields

Field Name	Field Description
<b>Filter</b>	Filter name.  Filters configured for logical systems include the name of the filter prefixed with the two underscore characters (__) and the name of the logical system (for example, __ls1/filter1).

## Sample Output

The following sample output assumes that the policer *act1* is in term mode and that there is a term named *term1* configured in the firewall filter *test*.

### show firewall prefix-action-stats

```

user@host> show firewall prefix-action-stats filter test prefix-action act1-term1 from 0 to 9
Filter: test
Counters:
Name                Bytes                Packets
act1-0              0                    0
act1-1              0                    0
act1-2              0                    0
act1-3              0                    0
act1-4              0                    0
act1-5              0                    0
act1-6              0                    0
act1-7              0                    0
act1-8              0                    0
act1-9              0                    0
Policers:
Name                Bytes                Packets
act1-0              0                    0
act1-1              0                    0
act1-2              0                    0
act1-3              0                    0

act1-5              0                    0
act1-6              0                    0
act1-7              0                    0
act1-8              0                    0
act1-9              0                    0

```

## show firewall templates-in-use

---

Syntax	show firewall templates-in-use
Release Information	Command introduced in Junos OS Release 12.3.
Description	Display the names of configured filter templates that are currently in use by dynamic subscribers and the number of times each template is referenced.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">clear firewall on page 2242</a></li><li>• <a href="#">show firewall log on page 2253</a></li></ul>
List of Sample Output	<a href="#">show firewall templates-in-use on page 2259</a>
Output Fields	<a href="#">Table 215 on page 2258</a> lists the output fields for the <b>show firewall templates-in-use</b> command. Output fields are listed in the approximate order in which they appear.

Table 215: show firewall templates-in-use Output Fields

Field Name	Field Description
Filter Template	Name of a filter that has been configured using the <b>filter</b> statement at either the <b>[edit firewall]</b> or <b>[edit dynamic-profiles <i>profile-name</i> firewall]</b> hierarchy and is being used as a template for dynamic subscriber filtering.
Reference Count	Number of times the filter has been referenced by subscribers accessing the network.

## Sample Output

### show firewall templates-in-use

```
user@host> show firewall templates-in-use
```

Filter Template	Dynamic	Subscribers	Reference Counts
-----			-----
egressFilter			10
ingressFilter			10
dfilter			5
dfilter-pol			5

## show policer

<b>Syntax</b>	show policer <detail> <policer-name>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Option <b>detail</b> introduced in Junos OS Release 12.3.
<b>Description</b>	Display the number of policed packets for a given policer or an aggregate policer. An aggregate policer is an aggregate of different policers on the same logical interface.
<b>Options</b>	<b>none</b> —Display the number of policed packets for all configured policers.  <b>detail</b> —(Optional) Display enhanced statistics and counters for policers.  <b>policer-name</b> —(Optional) Display the number of policed packets for the specified policer.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show policer (MX Series) on page 2261</a> <a href="#">show policer (non MX Series Router) on page 2261</a> <a href="#">show policer (Aggregate Policer, non MX Series Router) on page 2261</a> <a href="#">show policer detail on page 2262</a>
<b>Output Fields</b>	<a href="#">Table 216 on page 2260</a> lists the output fields for the <b>show policer</b> command. Output fields are listed in the approximate order in which they appear.

**Table 216: show policer Output Fields**

Field Name	Field Description
<b>Name</b>	Name of the policer.
<b>Bytes</b>	<ul style="list-style-type: none"> <li>(For two-color policers on MX Series routers, and for hierarchical policers on MS-DPC, MIC, and MPC interfaces on MX Series routers)—Total number of bytes policed by the specified policer. For other combinations of policer type, device, and line card type, this field is blank.</li> <li>(T Series and M10i)—Not applicable. The Bytes information is not displayed.</li> </ul>
<b>Packets</b>	Total number of packets policed by the specified policer.

Table 216: show policer Output Fields (*continued*)

Field Name	Field Description
Policer detail	<ul style="list-style-type: none"> <li>OOS packet statistics for packets that are marked out-of-specification by the policer. Changes to all packets that have out-of-specification actions, such as discard, color marking, or forwarding-class, are included in this counter.</li> <li>Offered packet statistics for traffic subjected to policing.</li> <li>Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the within-specification statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.</li> </ul>

## Sample Output

### show policer (MX Series)

```

user@host> show policer
Policers:
Name                                     Bytes      Packets

## CHAPTER 29

# Layer 2 Bridging and Switching Operational Commands

- clear bridge mac-table
- clear error bpdu interface
- clear error mac-rewrite
- show bridge domain
- show bridge flood
- show bridge mac-table
- show bridge statistics
- show l2-learning global-information
- show l2-learning global-mac-count
- show l2-learning instance
- show l2-learning interface
- show mac-rewrite interface

## clear bridge mac-table

---

<b>Syntax</b>	<code>clear bridge mac-table</code> <code>&lt;bridge-domain (all   <i>bridge-domain-name</i>)&gt;</code> <code>&lt;instance <i>instance-name</i>&gt;</code> <code>&lt;interface <i>interface-name</i>&gt;</code> <code>&lt;learning-vlan id (all-vlan   <i>learning-vlan-id</i>)&gt;</code> <code>&lt;mac-address&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.4.
<b>Description</b>	(MX Series routers only) Clear learned Layer 2 address information from the media access control (MAC) address table.
<b>Options</b>	<p><b>none</b>—Clear all learned Layer 2 address information from the MAC address table.</p> <p><b>bridge-domain (all   <i>bridge-domain-name</i>)</b>—(Optional) Clear learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Clear learned Layer 2 MAC addresses for the specified routing instance.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Clear learned Layer 2 MAC addresses for the specified interface.</p> <p><b>learning-vlan-id (all-vlan   <i>learning-vlan-id</i>)</b>—(Optional) Clears learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.</p> <p><b>mac-address</b>—(Optional) Clear the specified learned Layer 2 address from the MAC address table.</p>
<b>Required Privilege Level</b>	clear
<b>List of Sample Output</b>	<a href="#">clear bridge mac-table on page 2264</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear bridge mac-table

```
user@host> clear bridge mac-table
```

## clear error bpdu interface

---

<b>Syntax</b>	<code>clear error bpdu interface <i>interface-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.4.
<b>Description</b>	Clear a bridge protocol data unit (BPDU) error condition caused by the detection of a possible bridging loop from Spanning Tree Protocol (STP) operation.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring BPDU Protection for Spanning-Tree Instance Interfaces</i></li><li>• <i>Configuring BPDU Protection on All Edge Ports</i></li><li>• <i>Unblocking an Interface That Receives BPDUs in Error (CLI Procedure)</i></li></ul>
<b>List of Sample Output</b>	<a href="#">clear error bpdu interface on page 2265</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear error bpdu interface

```
user@host> clear error bpdu interface ge-1/1/1
```

## clear error mac-rewrite

---

<b>Syntax</b>	<code>clear error mac-rewrite</code> <code>&lt;interface <i>interface-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1.
<b>Description</b>	(MX Series routers only) Clear a MAC rewrite error condition caused by the reception of tunneled Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) packets on an interface with Layer 2 protocol tunneling enabled.
<b>Options</b>	<code>interface <i>interface-name</i></code> —(Optional) Clear the MAC rewrite error condition for the specified interface.
<b>Required Privilege Level</b>	clear
<b>List of Sample Output</b>	<a href="#">clear error mac-rewrite interface on page 2266</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear error mac-rewrite interface

```
user@host> clear error mac-rewrite interface ge-1/0/1
```

## show bridge domain

**Syntax** `show bridge domain`  
`<brief | detail | extensive>`  
`<bridge-domain (all | domain-name)>`  
`<instance instance-name>`  
`<operational>`

**Release Information** Command introduced in Junos OS Release 8.4.

**Description** (MX Series routers only) Display bridge domain information.

**Options** **none**—Display information for all bridge domains.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**bridge-domain (all | *domain-name*)**— (Optional) Display information about all bridge domains or the specified bridge domain.

**instance *instance-name***—(Optional) Display information for the specified routing instance.

**operational**—(Optional) Display information for the operational routing instances.

**Required Privilege Level** view

**List of Sample Output** [show bridge domain on page 2267](#)  
[show bridge domain brief on page 2267](#)  
[show bridge domain detail on page 2268](#)

## Sample Output

### show bridge domain

```
user@host> show bridge domain
Instance      Primary Table  Bridging Domain  Type      Active
vs1           bridge.0      vlan100          bridge     2
vs1           bridge.0      vlan200          bridge     0
```

### show bridge domain brief

```
user@host> show bridge domain brief
Instance      Primary Table  Bridging Domain  Type      Active
vs1           bridge.0      vlan100          bridge     2
vs1           bridge.0      vlan200          bridge     0
```

## show bridge mac-table

---

<b>Syntax</b>	<pre>show bridge mac-table   &lt;age&gt;   &lt;brief   count   detail   extensive&gt;   &lt;bridge-domain (all   <i>bridge-domain-name</i>)&gt;   &lt;global-count&gt;   &lt;instance <i>instance-name</i>&gt;   &lt;interface <i>interface-name</i>&gt;   &lt;mac-address&gt;   &lt;instance <i>instance-name</i>&gt;   &lt;vlan-id (all-vlan   <i>vlan-id</i>)&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 8.4. Command introduced in Junos OS Release 15.1 Support for PBB-EVPN instance added in Junos OS Release 16.1 MAC Flag P to indicate a MAC Pinned interface introduced in Junos OS 16.2
<b>Description</b>	(MX Series routers only) Display Layer 2 MAC address information.
<b>Options</b>	<p><b>none</b>—Display all learned Layer 2 MAC address information.</p> <p><b>age</b>— (Optional) Display age of a single mac-address.</p> <p><b>brief   count   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>bridge-domain (all   <i>bridge-domain-name</i>)</b>—(Optional) Display learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.</p> <p><b>global-count</b>—(Optional) Display the total number of learned Layer 2 MAC addresses on the system.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display learned Layer 2 MAC addresses for the specified interface.</p> <p><b>mac-address</b>—(Optional) Display the specified learned Layer 2 MAC address information.</p> <p><b>vlan-id (all-vlan   <i>vlan-id</i>)</b>—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.</p>
<b>Additional Information</b>	When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.

**Output Fields** [Table 217 on page 2277](#) describes the output fields for the **show bridge mac-table** command. Output fields are listed in the approximate order in which they appear.

**Table 217: show bridge mac-table Output Fields**

Field Name	Field Description
Age	Age of a single mac-address.
<b>Routing instance</b>	Name of the routing instance.
Bridging domain	Name of the bridging domain.
MAC address	MAC address or addresses learned on a logical interface.
MAC flags	Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>S</b>—Static MAC address is configured.</li> <li>• <b>D</b>—Dynamic MAC address is configured.</li> <li>• <b>L</b>—Locally learned MAC address is configured.</li> <li>• <b>C</b>—Control MAC address is configured.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>NM</b>—Non-configured MAC.</li> <li>• <b>R</b>—Remote PE MAC address is configured.</li> <li>• <b>P</b>—MAC Pinned interface is configured</li> </ul>
Logical interface	Name of the logical interface.
MAC count	Number of MAC addresses learned on the specific routing instance or interface.
Learning interface	Name of the logical interface on which the MAC address was learned.
Learning VLAN	VLAN ID of the routing instance or bridge domain in which the MAC address was learned.
VXLAN ID/VXLAN	VXLAN Network Identifier (VNI).

Table 217: show bridge mac-table Output Fields (*continued*)

Field Name	Field Description
Layer 2 flags	Debugging flags signifying that the MAC address is present in various lists.
Epoch	Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.
Sequence number	Sequence number assigned to this MAC address. Used for debugging.
Learning mask	Mask of the Packet Forwarding Engines where this MAC address was learned. Used for debugging.
IPC generation	Creation time of the logical interface when this MAC address was learned. Used for debugging.

## Sample Output

### show bridge mac-table

```

## show l2-learning global-information

<b>Syntax</b>	<b>show l2-learning global-information</b>
<b>Release Information</b>	Command introduced in Junos OS Release 8.4.
<b>Description</b>	(MX Series routers only) Display Layer 2 learning process-related information for the entire router.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show l2-learning global-information on page 2285</a>
<b>Output Fields</b>	<a href="#">Table 218 on page 2285</a> describes the output fields for the <b>show l2-learning global-information</b> command. Output fields are listed in the approximate order in which they appear.

**Table 218: show l2-learning global-information Output Fields**

Field Name	Field Description
<b>MAC aging interval</b>	Configured timeout interval, in seconds, for all MAC table entries.
<b>MAC learning</b>	Status of MAC learning: <b>Enabled</b> or <b>Disabled</b> .
<b>MAC statistics</b>	Status of MAC accounting: <b>Enabled</b> or <b>Disabled</b> .
<b>MAC limit Count</b>	Configured maximum limit on the number of MAC addresses that can be learned.
<b>MAC limit hit flag</b>	Status of the learned MAC limit hit flag: <b>Enabled</b> (the learned MAC exceeds the global MAC limit) or <b>Disabled</b> (the learned MAC does not exceed the global MAC limit).
<b>MAC packet action drop</b>	Status of action to drop packets after the configured MAC address limit is reached: <b>Enabled</b> (packets are dropped) or <b>Disabled</b> (packets are forwarded).

## Sample Output

### show l2-learning global-information

```

user@host> show l2-learning global-information
Global Configuration:

MAC aging interval      : 300
MAC learning            : Enabled

```

```
MAC statistics      : Disabled
MAC limit Count    : 393215
MAC limit hit flag  : Disabled
MAC packet action drop: Disabled
```

## show l2-learning global-mac-count

---

<b>Syntax</b>	<code>show l2-learning global-mac-count</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.3.
<b>Description</b>	(MX Series routers only) Display the total number of dynamic and static MAC addresses learned for the entire router.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show l2-learning global-mac-count on page 2287</a>
<b>Output Fields</b>	Displays the total number of dynamic and static MAC addresses learned for the entire router.

## Sample Output

### show l2-learning global-mac-count

```
user@host> show l2-learning global-mac-count
100 dynamic and static MAC addresses learned globally
```

## show l2-learning instance

**Syntax** `show l2-learning instance`

**Release Information** (MX Series routers only) Command introduced in Junos OS Release 8.4.

**Description** Display Layer 2 learning properties for all the configured routing instances.

**Options** This command has no options.

**Required Privilege Level** view

**List of Sample Output** [show l2-learning instance on page 2289](#)

**Output Fields** [Table 219 on page 2288](#) describes the output fields for the **show l2-learning instance** command. Output fields are listed in the approximate order in which they appear.

**Table 219: show l2-learning instance Output Fields**

Field Name	Field Description
Routing Instance	Name of routing instance.
Bridging Domain	Name of bridging domain.  On MX Series routers you can use the <b>show l2-learning instance &lt;extensive&gt;</b> command option to display the Bridge Service-id information which includes the Config Service ID and the Active Service ID.
Index	Number associated with the routing instance or bridging domain.
Logical System	Name of logical system or <b>Default</b> if no logical system is configured.
Routing instance flags	Status of Layer 2 learning properties for each routing instance: <ul style="list-style-type: none"> <li>• <b>DL</b>—MAC learning is disabled.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>AD</b>—Packets are dropped after MAC address limit is reached.</li> <li>• <b>LH</b>—The maximum number of MAC addresses has been learned on the routing instance. The routing instance is not able to learn any additional MAC addresses.</li> </ul>
MAC limit	Maximum number of MAC addresses that can be learned from each interface in the routing instance or bridging domain.

## Sample Output

### show l2-learning instance

```
user@host> show l2-learning instance
Information for routing instance:
```

```
Routing Instance flags (DL -disable learning, SE -stats enabled,
                        AD -packet action drop, LH -mac limit hit)
```

Routing Instance	Bridging Domain	Index	Logical System	Routing flags	MAC limit
__juniper_private1__		1	Default		5000
vs1	vlan100	3	Default		5120
vs1	vlan200	4	Default		5120

## show l2-learning interface

---

<b>Syntax</b>	<b>show l2-learning interface</b>
<b>Release Information</b>	Command introduced in Junos OS Release 8.4. Added sample output to indicate an EVPN MAC Pinned interface, introduced in Junos OS 16.2R1.
<b>Description</b>	(MX Series routers only) Display Layer 2 learning information for all the interfaces.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show l2-learning interface on page 2290</a> <a href="#">show l2 learning-interface on page 2291</a>
<b>Output Fields</b>	<a href="#">Table 220 on page 2290</a> describes the output fields for the <b>show l2-learning interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 220: show l2-learning interface**Output Fields

Field Name	Field Description
<b>Logical interface</b>	Name of the logical interface.
<b>Index</b>	Index of the interface.
<b>Routing Instance</b>	Number of the routing instance to which the interface belongs.
<b>Interface device</b>	Value of the order in which the Junos OS finds and initializes the interface.
<b>Logical interface flags</b>	Status of Layer 2 learning properties for each interface: <ul style="list-style-type: none"><li>• <b>DL</b>—MAC learning is disabled.</li><li>• <b>SE</b>—MAC accounting is enabled.</li><li>• <b>AD</b>—Packets are dropped after the MAC interface limit is reached.</li><li>• <b>MAC limit</b>—Maximum number of MAC addresses that can be learned from the interface.</li><li>• <b>MP</b>—MAC Pinning enabled.</li></ul>

## Sample Output

### show l2-learning interface

```
user@host> show l2-learning interface
Information for interface family:
```

Logical Interface flags (DL -disable learning, SE -stats enabled,  
AD -packet action drop, LH -mac limit hit)

Logical interface	Index	Routing instance	Interface device	Logical Interface flags	MAC limit
ge-11/0/3.0	79	3	136		1024
ge-11/1/4.100	84	3	150		1024
ge-11/1/1.100	86	3	147		1024
ge-11/1/0.100	87	3	146		1024

xe-10/2/0.200	94	4	144		1024

### show l2 learning-interface

```
user@host> run show l2-learning interface
Routing Instance Name : default-switch
Logical Interface flags (DL -disable learning, AD -packet action drop,
                        LH - MAC limit hit, DN - Interface Down, MP - MAC Pinning
enabled)
Logical      BD      MAC      STP      Logical
Interface    Name    Limit    State    Interface flags
ae0.0                8192                MP
```

## show mac-rewrite interface

<b>Syntax</b>	<b>show mac-rewrite interface</b> <b>&lt;brief   detail&gt;</b> <b>&lt;interface-name&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1. Command introduced in Junos OS Release 14.1X53-D10 for EX Series switches.
<b>Description</b>	Display Layer 2 protocol tunneling information.
<b>Options</b>	<b>brief   detail</b> —(Optional) Display the specified level of output.  <b>interface interface-name</b> —(Optional) Display Layer 2 protocol tunneling information for the specified interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>layer2-control</i></li> <li>• <i>mac-rewrite</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show mac-rewrite interface on page 2292</a> <a href="#">show mac-rewrite interface (EX Series Switch) on page 2293</a>
<b>Output Fields</b>	<a href="#">Table 221 on page 2292</a> lists the output fields for the <b>show mac-rewrite interface</b> command. Output fields are listed in the approximate order in which they appear.

**Table 221: show mac-rewrite interface Output Fields**

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the interface that has Layer 2 protocol tunneling configured on it.	<b>brief detail</b>
<b>Protocols</b>	Layer 2 protocols being tunneled on this interface: Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), Per-VLAN Spanning Tree Plus (PVSTP+), or VLAN Trunk Protocol (VTP).  On EX Series switches, the following Layer 2 protocols are supported: 802.3A, CDP, LACP, LLDP, MVRP, STP, VTP, GVRP, VSTP.	<b>brief detail</b>

## Sample Output

### show mac-rewrite interface

```

user@host> show mac-rewrite interface
Interface      Protocols

```

```
ge-1/0/5      STP VTP CDP PVSTP+
```

#### show mac-rewrite interface (EX Series Switch)

```
user@switch> show mac-rewrite interface
Interface      Protocols
ge-0/0/1       STP
```

## CHAPTER 30

# VPN Operational Commands

- `clear vpls mac-address`
- `clear vpls mac-table`
- `request l2circuit-switchover`
- `show dynamic-tunnels database`
- `show hfrr profiles`
- `show ingress-replication mvpn`
- `show l2circuit connections`
- `show l2vpn connections`
- `show mvpn c-multicast`
- `show mvpn instance`
- `show mvpn neighbor`
- `show vpls connections`
- `show vpls flood event-queue`
- `show vpls flood instance`
- `show vpls flood route`
- `show vpls mac-table`
- `show vpls statistics`

## clear vpls mac-address

---

<b>Syntax</b>	<code>clear vpls mac-address</code> <code>&lt;instance <i>instance-name</i>&gt;</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code> <code>&lt;mac-address&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	(T Series and M Series routers, except for the M160 router) Clear media access control (MAC) address entries from the virtual private LAN service (VPLS) table.
<b>Options</b>	<b>none</b> —Clear all MAC address entries from the VPLS table for all routing instances.  <b>instance <i>instance-name</i></b> —(Optional) Clear all MAC address entries for a VPLS instance from the VPLS table.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>mac-address</b> —(Optional) Clear a specific MAC address in a VPLS instance from the VPLS table.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">clear vpls mac-address on page 2296</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear vpls mac-address

```
user@host> clear vpls mac-address
```

## clear vpls mac-table

<b>Syntax</b>	clear vpls mac-table <instance <i>instance-name</i> > <interface <i>interface-name</i> > <logical-system (all   <i>logical-system-name</i> )> <mac-address> <vlan-id>
<b>Release Information</b>	Command introduced before Junos OS Release 9.5.
<b>Description</b>	(MX Series routers) Clear media access control (MAC) addresses from the virtual private LAN service (VPLS) MAC table.
<b>Options</b>	<p><b>none</b>—Clear all MAC addresses from the VPLS table for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Clear all MAC addresses for a VPLS instance from the VPLS table.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Clear all MAC addresses for a VPLS interface from the VPLS table.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>mac-address</b>—(Optional) Clear a specific MAC address in a VPLS instance from the VPLS table.</p> <p><b>vlan-id</b>—(Optional) Clear MAC addresses on a specified VLAN (0 through 4095).</p>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">clear vpls mac-table on page 2297</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear vpls mac-table

```
user@host> clear vpls mac-table
```

## request l2circuit-switchover

---

<b>Syntax</b>	<code>request l2circuit-switchover</code> <code>&lt;logical-system (all   logical-system-name)&gt;</code> <code>&lt;neighbor address&gt;</code> <code>&lt;virtual-circuit-id identifier&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
<b>Description</b>	Manually trigger a switch from the active pseudowire to the redundant pseudowire. This command can be useful when performing network maintenance.
<b>Options</b>	<b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>neighbor <i>address</i></b> —(Optional) Trigger a switch of all of the active pseudowire connections with the specified neighbor to their respective redundant pseudowires.  <b>virtual-circuit-id <i>identifier</i></b> —(Optional) Trigger a switch from the active pseudowire connection of the specified Layer 2 circuit to its redundant pseudowire.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>MPLS Feature Support on QFX Series and EX4600 Switches</i></li></ul>
<b>List of Sample Output</b>	<a href="#">request l2circuit-switchover virtual-circuit-id on page 2298</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request l2circuit-switchover virtual-circuit-id

```
user@host>request l2circuit-switchover virtual-circuit-id 12
```

## show dynamic-tunnels database

<b>Syntax</b>	show dynamic-tunnels database <destination> <logical-system (all   <i>logical-system-name</i> )> <table <i>routing-table-name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display dynamic tunnel database information.
<b>Options</b>	<p><b>none</b>—Display dynamic tunnel database information for all destinations and routing tables.</p> <p><b>destination</b>—(Optional) Display database entries for the specified IP address (with optional destination prefix length) only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>table <i>routing-table-name</i></b>—(Optional) Display database entries for the specified table only.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show dynamic-tunnels database (Tunnel Is Up) on page 2300</a> <a href="#">show dynamic-tunnels database (No Tunnel PIC) on page 2300</a> <a href="#">show dynamic-tunnels database (Tunnel Is Expiring) on page 2300</a> <a href="#">show dynamic-tunnels database (Destination Specified) on page 2300</a>
<b>Output Fields</b>	Table 222 on page 2299 lists the output fields for the <b>show dynamic-tunnels database</b> command. Output fields are listed in the approximate order in which they appear.

**Table 222: show dynamic-tunnels database Output Fields**

Field Name	Field Description
<b>Table</b>	Name of the routing table (for example, <b>inet.0</b> ).
<b>Destination-network</b>	Destination IP address and subnet.
<b>Tunnel to</b>	Destination IP address and prefix of the tunnel.
<b>State</b>	State of the tunnel: <b>Up</b> , <b>Up (expires in <i>nn:nn:nn</i>seconds)</b> , or <b>Dn</b> (down).
<b>Reference count</b>	Number of routes across the dynamic tunnel that are currently being resolved.

Table 222: show dynamic-tunnels database Output Fields (*continued*)

Field Name	Field Description
<b>Next-hop type</b>	Type of tunnel: GRE.
<b>Source address</b>	Source IP address of the tunnel.
<b>Next-hop</b>	IP address of the destination interface.
<b>State</b>	State of the destination interface: Up, Dn, or Dn (no tunnel pic).

## Sample Output

### show dynamic-tunnels database (Tunnel Is Up)

```

user@host> show dynamic-tunnels database
Table: inet.3

Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32 State: Up
Reference count: 2
Next-hop type: gre
Source address: 10.255.120.92
Next hop: gr-4/3/0.32769
State: Up

```

### show dynamic-tunnels database (No Tunnel PIC)

```

user@host> show dynamic-tunnels database
Table: inet.3

Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32 State: Dn
Reference count: 2
Next-hop type: gre
Source address: 10.255.120.92
State: Dn (no tunnel pic)

```

### show dynamic-tunnels database (Tunnel Is Expiring)

```

user@host> show dynamic-tunnels database
Table: inet.3

Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32 State: Up (expires in 00:14:56 seconds)
Reference count: 0
Next-hop type: gre
Source address: 10.255.120.92
Next hop: gr-4/3/0.32769
State: Up

```

### show dynamic-tunnels database (Destination Specified)

```

user@host> show dynamic-tunnels database 10.255.120.94

```

Table: inet.3

Destination-network: 10.255.120.94/32  
Tunnel to: 10.255.120.94/32 State: Up  
Reference count: 2  
Next-hop type: gre  
Source address: 10.255.120.92  
Next hop: gr-4/3/0.32769  
State: Up

## show hfrr profiles

<b>Syntax</b>	show hfrr profiles <brief   extensive>
<b>Release Information</b>	Command introduced in Junos OS Release 12.2.
<b>Description</b>	<p>Display host fast reroute (HFRR) profile information.</p> <p>HFRR adds a precomputed protection path into the Packet Forwarding Engine, such that if a link between a provider edge device and a server farm becomes unusable for forwarding, the Packet Forwarding Engine can use another path without having to wait for the router or the protocols to provide updated forwarding information.</p>
<b>Options</b>	<p><b>none</b>—Display information about HFRR profiles.</p> <p><b>brief   extensive</b>—(Optional) Display the specified level of output.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Link Protection with Host Fast Reroute</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show hfrr profiles on page 2303</a>
<b>Output Fields</b>	<p><a href="#">Table 223 on page 2302</a> describes the output fields for the <b>show hfrr profiles</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 223: show hfrr profiles Output Fields**

Field Name	Field Description
HFRR	
HFRR current state	Status of the HFRR profile: HFRR_ACTIVE, HFRR_INACTIVE, HFRR_IFLH-NOT-CONF, and so on.
HFRR Prefix limit blackout timer expiry (in secs)	Time interval between an HFRR profile becoming inactive on exceeding the ARP prefix limit, and the profile starting the SYNC process.
HFRR prefix limit hit count	Number of times that an HFRR profile becomes inactive on exceeding the ARP prefix limit.
HFRR protected IFL name	Interface configured for the HFRR feature.
HFRR protected IFL handle	
HFRR routing instance name	The routing instance in which the HFRR interface is configured.

Table 223: show hfrf profiles Output Fields (*continued*)

Field Name	Field Description
HFRR routing instance handle	
HFRR sync BG scheduled	
HFRR RTS filter on	
HFRR delete BG scheduled	
HFRR ARP prefix limit	Configured ARP prefix limit.
HFRR ARP supplementary blackout timeout (in mins)	Supplementary time-out value configured for profile to be inactive when it hits ARP prefix limit.
HFRR number of ARP routes learned	Number of ARP routes learned on the configured interface.
HFRR number of FRR routes created	Number of ARP routes created on the configured interface.

## Sample Output

### show hfrf profiles

```

user@host> show hfrf profiles
HFRR pointer: 0x9254000
HFRR current state: HFRR_ACTIVE
HFRR Prefix limit blackout timer expiry (in secs): 0
HFRR prefix limit hit count: 0
HFRR protected IFL name: ge-4/1/0.0
HFRR protected IFL handle: 0x9248738
HFRR routing instance name: test
HFRR routing instance handle: 0x9145740
HFRR sync BG scheduled: NO
HFRR RTS filter on: YES
HFRR delete BG scheduled: NO
HFRR ARP prefix limit: 0
HFRR ARP supplementary blackout timeout (in mins): 1
HFRR number of ARP routes learned: 4
HFRR number of FRR routes created: 2

```

## show ingress-replication mvpn

**Syntax** show ingress-replication mvpn

**Release Information** Command introduced in Junos OS Release 10.4.

**Description** Display the state and configuration of the ingress replication tunnels created for the MVPN application when using the **mpls-internet-multicast** routing instance type.

**Required Privilege Level** View

**List of Sample Output** [show ingress-replication mvpn on page 2304](#)

**Output Fields** [Table 224 on page 2304](#) lists the output fields for the **show ingress-replication mvpn** command. Output fields are listed in the approximate order in which they appear.

**Table 224: show ingress-replication mvpn Output Fields**

Field Name	Field Description
Ingress tunnel	Identifies the MVPN ingress replication tunnel.
Application	Identifies the application (MVPN).
Unicast tunnels	List of unicast tunnels in use.
Leaf address	Address of the tunnel.
Tunnel type	Identifies the unicast tunnel type.
Mode	Indicates whether the tunnel was created as a new tunnel for the ingress replication, or if an existing tunnel was used.
State	Indicates whether the tunnel is Up or Down.

## Sample Output

### show ingress-replication mvpn

```

user@host> show ingress-replication mvpn
Ingress Tunnel: mvpn:1
  Application: MVPN
  Unicast tunnels
    Leaf Address      Tunnel-type      Mode      State
    10.255.245.2      P2P LSP         New       Up
    10.255.245.4      P2P LSP         New       Up
Ingress Tunnel: mvpn:2
  Application: MVPN
  Unicast tunnels

```

Leaf Address	Tunnel-type	Mode	State
10.255.245.2	P2P LSP	Existing	Up

## show l2circuit connections

---

<b>Syntax</b>	<code>show l2circuit connections</code> <code>&lt;brief   extensive   summary&gt;</code> <code>&lt;down   up   up-down&gt;</code> <code>&lt;history&gt;</code> <code>&lt;interface <i>interface-name</i>&gt;</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code> <code>&lt;neighbor <i>neighbor</i>&gt;</code> <code>&lt;status&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Display enhancements in Junos OS Release 9.6. Display enhancements in Junos OS Release 10.2. Display enhancements in Junos OS Release 12.1. Display enhancements in Junos OS Release 13.2. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
<b>Description</b>	Display status information about Layer 2 virtual circuits from the local provider edge (PE) router to its neighbors.
<b>Options</b>	<p><b>none</b>—Display standard information about Layer 2 virtual circuits on all interfaces for all neighbors.</p> <p><b>brief   extensive   summary</b>—(Optional) Display the specified level of output. Use <b>history</b> to display information about connection history. Use <b>status</b> to display information about the connection and interface status.</p> <p><b>down   up   up-down</b>—(Optional) Display nonoperational, operational, or both kinds of connections.</p> <p><b>history</b>—(Optional) Display information about connection history.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Show all Layer 2 virtual circuits on an interface.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>neighbor <i>neighbor</i></b>—(Optional) IP address of a specific neighbor.</p> <p><b>status</b>—(Optional) Display information about the connection and interface status.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show l2circuit connections on page 2310</a> <a href="#">show l2circuit connections interface on page 2311</a> <a href="#">show l2circuit connections extensive on page 2311</a>

[show l2circuit connections extensive \(Pseudowire Redundancy with Hot Standby\)](#) on page 2312

**Output Fields** [Table 225 on page 2307](#) lists the output fields for the **show l2circuit connections** command. Output fields are listed in the approximate order in which they appear.

**Table 225: show l2circuit connections Output Fields**

Field Name	Field Description
<b>Layer-2 Circuit Connections</b>	Displays the legends for connection and interface status.
<b>Neighbor</b>	Remote PE neighbor.
<b>Interface</b>	Logical PE-to-CE interface on which the virtual circuit is configured.
<b>Type</b>	VC type: <b>rmt</b> (remote) or <b>loc</b> (local).

Table 225: show l2circuit connections Output Fields (*continued*)

Field Name	Field Description
<b>Legend for connection status (St)</b>	<p>Status of the virtual circuit connection:</p> <ul style="list-style-type: none"> <li><b>EI</b>—The local virtual circuit interface is configured with an encapsulation that is not supported.</li> <li><b>MM</b>—The two routers do not agree on an MTU value, which causes an MTU mismatch.</li> <li><b>EM</b>—The encapsulation type received on this virtual circuit from the neighbor does not match the local virtual circuit interface encapsulation type.</li> <li><b>CM</b>—The two routers do not agree on a control word, which causes a control word mismatch.</li> <li><b>VM</b>—The remote and local VLAN IDs do not match across the Layer 2 circuit.</li> <li><b>OL</b>—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.</li> <li><b>NC</b>—The interface is not configured as a CCC or TCC interface.</li> <li><b>BK</b>—The virtual circuit has switched to a backup connection.</li> <li><b>CB</b>—The remote PE router is advertising a different cell bundle from that configured on the local PE router.</li> <li><b>LD</b>—The connection to the local site is signaled down, because the CE-facing interface to the local site is down.</li> <li><b>RD</b>—The remote neighbor is down. It has signaled a problem using the pseudowire status code.</li> <li><b>NP</b>—The router detects that interface hardware is not present. The hardware may be offline, a PIC may not be of the desired type, or the interface may be configured in a different routing instance.</li> <li><b>Dn</b>—The virtual circuit is down.</li> <li><b>VC-Dn</b>—The virtual circuit is down because there is no tunnel LSP from the local PE router to the neighbor.</li> <li><b>UP</b>—The virtual circuit is operational.</li> <li><b>CF</b>—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 circuit bandwidth requirement.</li> <li><b>IB</b>—The bit rate is incompatible for Time Division Multiplexing (TDM).</li> <li><b>TDM</b>—TDM is not configured correctly.</li> <li><b>ST</b>—The virtual circuit has been switched to a standby connection.</li> <li><b>SP</b>—The virtual circuit connection is using a static pseudowire.</li> <li><b>RS</b>—The remote site is in a standby state.</li> <li><b>XX</b>—The virtual circuit is down for an unknown reason. This is a programming error.</li> </ul>
<b>Time last up</b>	Date and time the virtual circuit was last operational.
<b># Up trans</b>	Number of times the virtual circuit came up.
<b>local-interface-name</b>	Name of the local PE-to-CE interface.
<b>Status</b>	Status of the local interface.
<b>Up</b>	Interface is operational.

Table 225: show l2circuit connections Output Fields (*continued*)

Field Name	Field Description
<b>Dn</b>	Interface is not operational.
<b>NP</b>	Not present. Interface does not exist.
<b>DS</b>	Disabled. Interface has been administratively disabled.
<b>WE</b>	Wrong encapsulation. The interface is not configured as CCC.
<b>UN</b>	Interface status is initialized.
<b>Encapsulation</b>	Encapsulation of the local interface.
<b>Flow Label Transmit</b>	Flow label transmit status.
<b>Flow Label Receive</b>	Flow label receive status.
<b>Remote PE</b>	Prefix of the remote PE router.
<b>Negotiated control-word</b>	Whether the use of the control word has been negotiated for this virtual circuit: <b>Yes (Null)</b> or <b>No</b> .
<b>Incoming label</b>	Label used by the remote side of the virtual circuit to send packets destined to the local side. This label is routed to the local virtual circuit interface.
<b>Outgoing label</b>	Label used by the local side of the virtual circuit to send packets to the remote side of the virtual circuit. Packets originated on the local virtual circuit interface are encapsulated with this label before being placed on the tunnel LSP to the neighbor for this virtual circuit. This label is allocated by the neighbor and is used in demultiplexing incoming packets destined for this virtual circuit.
<b>Negotiated PW status TLV</b>	Displays the pseudowire status type, length, and value (TLV). TLVs are a method of encoding variable-length or optional information. If the pseudowire status TLV is used, the corresponding local or neighbor PE router status code is also displayed.
<b>local PW status code</b>	If the pseudowire status TLV is used, displays the local PE router status code.
<b>Neighbor PW status code</b>	If the pseudowire status TLV is used, displays the neighbor PE router status code.
<b>Local interface</b>	Name of the local interface used for the Layer 2 circuit connection.
<b>Status</b>	Status of the local interface ( <b>Up</b> or <b>Down</b> ).
<b>Encapsulation</b>	Encapsulation configured for the local interface.
<b>APS-active</b>	Indicates that the interface belongs to the working circuit.

Table 225: show l2circuit connections Output Fields (*continued*)

Field Name	Field Description
APS-inactive	Indicates that the interface belongs to the protect circuit.
Connection protection	Whether or not connection protection is configured for the Layer 2 circuit to the neighbor: <b>Yes</b> or <b>No</b> .
VC bandwidth	Bandwidth requirement of the Layer 2 circuit.
Time	Time at which the event occurred.
Connection History	<p>Event types logged in history.</p> <ul style="list-style-type: none"> <li>• <b>loc intf up</b>—Local virtual circuit interface went up.</li> <li>• <b>loc intf down</b>—Local virtual circuit interface went down.</li> <li>• <b>In lbl Update</b>—Incoming label has been updated.</li> <li>• <b>Out lbl Update</b>—Outgoing label has been updated.</li> <li>• <b>PE route changed</b>—Route to PE router has been updated.</li> <li>• <b>PE route down</b>—Route to PE router is down.</li> <li>• <b>rmt side marked</b>—Remote side is marked.</li> <li>• <b>VC Dn</b>—Remote side indicated that its end of the virtual circuit is down (if the tunnel LSP from the remote side to the local side is down).</li> <li>• <b>status update timer</b>—Status update timer processing. It computes the state of the virtual circuit, and determines whether it should be advertised to or withdrawn from the remote side.</li> </ul>

## Sample Output

## show l2vpn connections

---

<b>Syntax</b>	<code>show l2vpn connections</code> <code>&lt;brief   extensive&gt;</code> <code>&lt;down   up   up-down&gt;</code> <code>&lt;history&gt;</code> <code>&lt;instance <i>instance</i>&gt;</code> <code>&lt;instance-history&gt;</code> <code>&lt;local-site <i>local-site</i>&gt;</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code> <code>&lt;remote-site <i>remote-site</i>&gt;</code> <code>&lt;status&gt;</code> <code>&lt;summary&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. <b>instance-history</b> option introduced in Junos OS Release 12.3R2.
<b>Description</b>	Display Layer 2 virtual private network (VPN) connections.
<b>Options</b>	<b>none</b> —Display all Layer 2 VPN connections for all routing instances.  <b>brief   extensive</b> —(Optional) Display the specified level of output.  <b>down   up   up-down</b> —(Optional) Display nonoperational, operational, or both kinds of connections.  <b>history</b> —(Optional) Display information about connection history.  <b>instance <i>instance</i></b> —(Optional) Display connections for the specified routing instance only.  <b>instance-history</b> —(Optional) Display information about connection history for a particular instance.  <b>local-site <i>local-site</i></b> —(Optional) Display connections for the specified Layer 2 VPN local site name or ID only.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>remote-site <i>remote-site</i></b> —(Optional) Display connection for the specified Layer 2 VPN remote site ID only.  <b>status</b> —(Optional) Display information about the connection and interface status.  <b>summary</b> —(Optional) Display summary of all Layer 2 VPN connections information.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show l2vpn connections on page 2317</a> <a href="#">show l2vpn connections on page 2318</a>

[show l2vpn connections extensive on page 2319](#)

[show l2vpn connections extensive \(VPWS\) on page 2319](#)

**Output Fields** Table 226 on page 2315 lists the output fields for the **show l2vpn connections** command. Output fields are listed in the approximate order in which they appear.

**Table 226: show l2vpn connections Output Fields**

Field Name	Field Description
<b>Instance</b>	Name of Layer 2 VPN instance.
<b>L2vpn-id</b>	For BGP autodiscovery, a globally unique Layer 2 VPN community identifier for the instance.
<b>Local-ID</b>	BGP <b>local-address</b> assigned to the local routing device.
<b>Local site</b>	Name of local site.
<b>Local source-attachment-id</b>	For FEC 129, the VPWS source attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.
<b>Target-attachment-id</b>	For FEC 129, the VPWS target attachment identifier. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established.
<b>Interface name</b>	Name of interface.
<b>Remote Site ID</b>	Remote site ID.
<b>Label Offset</b>	Numbers within the label block that are skipped to find the next label base.
<b>Label-base</b>	Advertises the first label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.
<b>Range</b>	Advertises the label block size.
<b>status-vector</b>	Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of 0 indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of 1 indicates either one or both are down.
<b>connection-site</b>	Name of the connection site.
<b>Type</b>	Type of connection: <b>loc</b> (local) or <b>rmt</b> (remote).
<b>St</b>	Status of the connection. (For a list of possible values, see the <b>Legend for connection status (St)</b> field.)
<b>Time last up</b>	Time that the connection was last in the <b>Up</b> condition.

Table 226: show l2vpn connections Output Fields (*continued*)

Field Name	Field Description
# Up trans	Number of transitions from <b>Down</b> to <b>Up</b> condition.
Local circuit	Address and status of local circuit.
Remote circuit	Address and status of remote circuit.
St	<p>Status of the Layer 2 VPN connection (corresponds with Legend for Connection Status):</p> <ul style="list-style-type: none"> <li>• <b>EI</b>—The local Layer 2 VPN interface is configured with an encapsulation that is not supported.</li> <li>• <b>EM</b>—The encapsulation type received on this Layer 2 VPN connection from the neighbor does not match the local Layer 2 VPN connection interface encapsulation type.</li> <li>• <b>VC-Dn</b>—The virtual circuit is currently down.</li> <li>• <b>CM</b>—The two routers do not agree on a control word, which causes a control word mismatch.</li> <li>• <b>CN</b>—The virtual circuit is not provisioned properly.</li> <li>• <b>OR</b>—The label associated with the virtual circuit is out of range.</li> <li>• <b>OL</b>—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.</li> <li>• <b>LD</b>—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>RD</b>—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>LN</b>—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site.</li> <li>• <b>RN</b>—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site.</li> <li>• <b>XX</b>—The Layer 2 VPN connection is down for an unknown reason. This is a programming error.</li> <li>• <b>NC</b>—The interface encapsulation is not configured as an appropriate CCC, TCC, or Layer 2 VPN encapsulation.</li> <li>• <b>WE</b>—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the Layer 2 VPN routing instance.</li> <li>• <b>NP</b>—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance.</li> <li>• <b>-&gt;</b>—Only the outbound connection is up.</li> <li>• <b>&lt;-</b>—Only the inbound connection is up.</li> <li>• <b>Up</b>—The Layer 2 VPN connection is operational.</li> <li>• <b>Dn</b>—The Layer 2 VPN connection is down.</li> <li>• <b>CF</b>—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 VPN connection bandwidth requirement.</li> </ul>

Table 226: show l2vpn connections Output Fields (*continued*)

Field Name	Field Description
	<ul style="list-style-type: none"> <li>• <b>SC</b>—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers.</li> <li>• <b>LM</b>—The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site, and the associated local site identifier is not being used to distribute Layer 2 VPN label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state.</li> <li>• <b>RM</b>—The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot establish a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state.</li> <li>• <b>IL</b>—The incoming packets for the Layer 2 VPN connection have no MPLS label.</li> </ul>
Remote PE	Address of the remote provider edge router.
Incoming label	Name of the incoming label.
Outgoing label	Name of the outgoing label.
Egress Protection	Whether the given PVC is protected by connection protection logic using egress protection for BGP signaled layer 2 services.
Flow Label Receive	Capability to pop the flow label in the receive direction to the remote provider edge (PE) router
Flow Label Transmit	Capability to push the flow label in the transmit direction to the provider edge (PE) router
Time	Date and time of Layer 2 VPN connection event.
Event	Type of event.
Interface/Lbl/PE	Interface, label, or PE router.

## show vpls connections

<b>Syntax</b>	<pre>show vpls connections &lt;brief   extensive&gt; &lt;down   up   up-down&gt; &lt;history&gt; &lt;instance <i>instance-name</i> local-site <i>local-site-name</i> remote-site <i>remote-site-name</i>&gt; &lt;instance-history&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;status&gt; &lt;summary&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>instance-history</b> option introduced in Junos OS Release 12.3R2.</p>
<b>Description</b>	(T Series and M Series routers, except for the M160 router) Display virtual private LAN service (VPLS) connection information.
<b>Options</b>	<p><b>none</b>—Display information about all VPLS connections for all routing instances.</p> <p><b>brief   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>down   up   up-down</b>—(Optional) Display nonoperational, operational, or both types of connections.</p> <p><b>history</b>—(Optional) Display information about connection history.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display the VPLS connections for the specified routing instance only.</p> <p><b>instance-history</b>—(Optional) Display information about connection history for a particular instance.</p> <p><b>local-site <i>local-site-name</i></b>—(Optional) Display the VPLS connections for the specified local site name or ID only.</p> <p><b>remote-site <i>remote-site-name</i></b>—(Optional) Display the VPLS connections for the specified remote site name or ID only. Label block size information is always shown as 0 when using this option.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>status</b>—(Optional) Display information about the connection and interface status.</p> <p><b>summary</b>—(Optional) Display summary of all VPLS connections information.</p>
<b>Required Privilege Level</b>	view

**List of Sample Output** [show vpls connections on page 2338](#)  
[show vpls connections \(with FEC128 and FEC129 in the same routing-instance\) on page 2340](#)  
[show vpls connections \(with multiple pseudowires\) on page 2341](#)  
[show vpls connections extensive \(Static VPLS Neighbors\) on page 2342](#)

**Output Fields** Table 230 on page 2334 lists the output fields for the **show vpls connections** command. Output fields are listed in the approximate order in which they appear.

**Table 230: show vpls connections Output Fields**

Field Name	Field Description
<b>Instance</b>	Name of the VPLS instance.
<b>Local site</b>	Name of the local site.
<b>VPLS-id</b>	Identifier for the VPLS site.
<b>Number of local interfaces</b>	Number of interfaces configured for the local site.
<b>Number of local interfaces up</b>	Number of interfaces configured for the local site that are currently up.
<b>IRB interface present</b>	Indicates whether or not an integrated routing and bridging (IRB) interface is present ( <b>yes</b> or <b>no</b> ).
<b>Intf</b>	<p>List of all of the interfaces configured for the local site. The types of interfaces can include VPLS virtual loopback tunnel interfaces and label-switched interfaces. Any interface that supports VPLS could be listed here.</p> <p>Virtual loopback tunnel interfaces are displayed using the <b>vt-fpc/pic/port.nnnnn</b> format. Label-switched interfaces are displayed using the <b>lsi.nnnnn</b> format. In both cases, <b>nnnnn</b> is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain.</p> <p>Each interface might include the following information:</p> <ul style="list-style-type: none"> <li>• Identification as a VPLS interface</li> <li>• Name of the associated VPLS routing instance</li> <li>• Local site number</li> <li>• Remote site number</li> <li>• VPLS neighbor address</li> <li>• VPLS identifier</li> </ul>
<b>Interface flags</b>	<p>Flag associated with the interface. Can include the following:</p> <ul style="list-style-type: none"> <li>• <b>VC-Down</b>—The virtual circuit associated with this interface is down.</li> </ul>
<b>Label-base</b>	First label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.

Table 230: show vpls connections Output Fields (*continued*)

Field Name	Field Description
<b>Offset</b>	Displays the VPLS Edge (VE) block offset in the Layer 2 VPN NLRI. The VE block offset is used to identify a label block from which a particular label value is selected to setup a pseudowire for a remote site. The block offset value itself indicates the starting VE ID that maps to the label base contained in the VPLS NLRI advertisement.
<b>Size</b>	Label block size. A configurable value that represents the number of label blocks required to cover all the pseudowires for the remote peer. Acceptable configuration values are: <b>2</b> , <b>4</b> , <b>8</b> and <b>16</b> . The default value is <b>2</b> . A value of <b>0</b> will be displayed when using the <b>remote-site</b> option.
<b>Range</b>	Label block range. A value that keeps track of the numbers of remote sites discovered within each label block.
<b>Preference</b>	Preference value advertised for a VPLS site. When multiple PE routers are assigned the same VE ID for multihoming, you might need to specify that a particular PE router acts as the designated forwarder by configuring the site preference value. The site preference indicates the degree of preference for a particular customer site. The site preference is one of the tie-breaking criteria used in a designated forwarder election.
<b>status-vector</b>	Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of <b>0</b> indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of <b>1</b> indicates either one or both are down.
<b>connection-site</b>	Name of the connection site.
<b>Neighbor</b>	IP address and VPLS identifier for the VPLS neighbor. If multiple pseudowires have been configured, the IP address will also show the PW-specific <i>vpls-id-list</i> , for example, 203.0.113.144 (vpls-id 200).
<b>Type</b>	Type of connection: <b>loc</b> (local) or <b>rmt</b> (remote).

Table 230: show vpls connections Output Fields (*continued*)

Field Name	Field Description
<b>St</b>	<p>Status of the VPLS connection (corresponds with Legend for Connection Status):</p> <ul style="list-style-type: none"> <li>• <b>EI</b>—The local VPLS interface is configured with an encapsulation that is not supported.</li> <li>• <b>EM</b>—The encapsulation type received on this VPLS connection from the neighbor does not match the local VPLS connection interface encapsulation type.</li> <li>• <b>VC-Dn</b>—The virtual circuit is currently down.</li> <li>• <b>CM</b>—The two routers do not agree on a control word, which causes a control word mismatch.</li> <li>• <b>CN</b>—The virtual circuit is not provisioned properly.</li> <li>• <b>OR</b>—The label associated with the virtual circuit is out of range.</li> <li>• <b>OL</b>—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.</li> <li>• <b>LD</b>—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>RD</b>—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.</li> <li>• <b>LN</b>—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site.</li> <li>• <b>RN</b>—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site. In a multihoming configuration, one multihomed PE site displays the state <b>LN</b>, and the other multihomed PE site displays the state <b>RN</b> in the following circumstances: <ul style="list-style-type: none"> <li>• The multihomed links are both configured to be the backup site.</li> <li>• The two multihomed PE routers have the same site ID, but have a peering relationship with a route reflector (RR) that has a different site ID.</li> </ul> </li> <li>• <b>XX</b>—The VPLS connection is down for an unknown reason. This is a programming error.</li> <li>• <b>MM</b>—The MTU for the local site and the remote site do not match.</li> <li>• <b>BK</b>—The router is using a backup connection.</li> <li>• <b>PF</b>—Profile parse failure.</li> <li>• <b>RS</b>—The remote site is in a standby state.</li> <li>• <b>NC</b>—The interface encapsulation is not configured as an appropriate CCC, TCC, or VPLS encapsulation.</li> <li>• <b>WE</b>—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the VPLS routing instance.</li> </ul>

Table 230: show vpls connections Output Fields (*continued*)

Field Name	Field Description
	<ul style="list-style-type: none"> <li>• <b>NP</b>—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance.</li> <li>• <b>--&gt;</b>—Only the outbound connection is up.</li> <li>• <b>&lt;--</b>—Only the inbound connection is up.</li> <li>• <b>Up</b>—The VPLS connection is operational.</li> <li>• <b>Dn</b>—The VPLS connection is down.</li> <li>• <b>CF</b>—The router cannot find enough bandwidth to the remote router to satisfy the VPLS connection bandwidth requirement.</li> <li>• <b>SC</b>—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers.</li> <li>• <b>LM</b>—The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site, and the associated local site identifier is not being used to distribute VPLS label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state.</li> <li>• <b>RM</b>—The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot establish a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state.</li> <li>• <b>IL</b>—The incoming packets for the VPLS connection have no MPLS label.</li> <li>• <b>MI</b>—The configured mesh group identifier is in use by another system in the network.</li> <li>• <b>ST</b>—The router has switched to a standby connection.</li> <li>• <b>PB</b>—Profile busy.</li> <li>• <b>SN</b>—The VPLS neighbor is static.</li> </ul>
<b>Time last up</b>	Time connection was last in the <b>Up</b> condition.
<b># Up trans</b>	Number of transitions from <b>Down</b> to <b>Up</b> condition.
<b>Status</b>	Status of the (local or remote circuit) local interface: <ul style="list-style-type: none"> <li>• <b>Up</b>—Operational</li> <li>• <b>Dn</b>—Down</li> <li>• <b>NP</b>—Not present</li> <li>• <b>DS</b>—Disabled</li> <li>• <b>WE</b>—Wrong encapsulation</li> <li>• <b>UN</b>—Uninitialized</li> </ul>
<b>Encapsulation</b>	Type of encapsulation: <b>VPLS</b> .
<b>Remote PE</b>	Address of the remote provider edge router.

Table 230: show vpls connections Output Fields (*continued*)

Field Name	Field Description
<b>Negotiated control-word</b>	Whether a control word has been negotiated: <b>Yes</b> or <b>No</b> .
<b>Incoming label</b>	Name of the incoming label.
<b>Outgoing label</b>	Name of the outgoing label.
<b>Negotiated PW status TLV</b>	Indicates whether or not the pseudowire status TLV has been negotiated for the VPLS connection.
<b>Local interface</b>	Provides the following information about the local interface configured for the VPLS neighbor: <ul style="list-style-type: none"> <li>• Name of the local interface</li> <li>• <b>Status</b>—Interface status (<b>Up</b> or <b>Down</b>)</li> <li>• <b>Encapsulation</b>—Interface encapsulation (for example, <b>ETHERNET</b>)</li> <li>• <b>Description</b>—Includes the VPLS instance name, the VPLS neighbor address, and the VPLS identifier</li> </ul>
<b>Time</b>	Date and time of VPLS connection event.
<b>Event</b>	Type of event.
<b>Interface/Lbl/PE</b>	Interface, label, or PE router.
<b>Connection History</b>	Each entry can include the date, time, year, and the connection event. Connection events include any of a variety of events related to VPLS connections, such as route changes, label updates, and interfaces going down or coming up.

## show vpls flood event-queue

---

**Syntax**    show vpls flood event-queue

**Release Information**    Command introduced in Junos OS Release 8.0.

**Description**    Display the pending events in the VPLS flood queue.

**Options**    This command has no options.

**Required Privilege Level**    view

**List of Sample Output**    [show vpls flood event-queue on page 2344](#)

**Output Fields**    [Table 231 on page 2344](#) lists the output fields for the **show vpls flood event-queue** command. Output fields are listed in the approximate order in which they appear.

**Table 231: show vpls flood event-queue Output Fields**

Field Name	Field Description
<b>Current Pending Event</b>	Provides information on the current event in the VPLS flood event queue.
<b>Name</b>	Name of the event.
<b>Owner Name</b>	Name of the interface associated with the flood event.
<b>Pending Op</b>	Pending operation for the event.
<b>Last Error</b>	Name of the last error encountered.
<b>Number of Retries</b>	Number of attempts made to update the event queue.
<b>Pending Event List</b>	List of the events awaiting processing.
<b>Event Name</b>	Name of the event.
<b>Pending Op</b>	Pending operation for the event.
<b>Event Identifier</b>	Name of the interface associated with the flood event.

## Sample Output

### show vpls flood event-queue

```
user@host> show vpls flood event-queue
```

## Current Pending Event

Name: Flood Nexthop

Owner Name:ge-4/3/0.0

Pending Op: ADD

Last Error:ENOMEM

Number of Retries:3

Pending Event List:

Event Name	Pending Op	Event Identifier
Flood Nexthop	ADD	ge-4/3/0.0
Flood Route	ADD	ge-4/3/0.0

## show vpls flood instance

**Syntax** show vpls flood instance  
 <brief | detail | extensive>  
 <instance-name>  
 <logical-system *logical-system-name*>

**Release Information** Command introduced in Junos OS Release 8.0.

**Description** Display VPLS information related to the flood process.

**Options** **none**—Display VPLS information related to the flood process for all routing instances.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**instance-name**—(Optional) Display VPLS information related to the flood process for the specified routing instance.

**logical-system *logical-system-name***—(Optional) Display VPLS information related to the flood process for the specified logical system.

**Required Privilege Level** view

**List of Sample Output** [show vpls flood instance on page 2347](#)  
[show vpls flood instance logical-system-name on page 2347](#)  
[show vpls flood instance detail on page 2347](#)

**Output Fields** [Table 232 on page 2346](#) lists the output fields for the **show vpls flood instance** command. Output fields are listed in the approximate order in which they appear.

**Table 232: show vpls flood instance Output Fields**

Field Name	Field Description
Logical system	Name of the logical system.
Name	Name of the VPLS routing instance.
CEs	Number of CE routers connected to the VPLS instance.
VEs	Number of VE routers connected to the VPLS instance.
Flood routes	List of all flood routes associated with the VPLS instance.
Prefix	Prefix for the route.
Type	Type of route.

Table 232: show vpls flood instance Output Fields (*continued*)

Field Name	Field Description
Owner	VPLS routing instance or interface associated with the route.
NhType	Next-hop type. For example, <b>flood</b> for a flood route.
Nhindex	Next-hop index number for the route.

## Sample Output

### show vpls flood instance

```

user@host> show vpls flood instance

Logical system: __example_ls1__
Name: green
CEs: 1
VEs: 1
Flood Routes:

## show vpls flood route

**Syntax** show vpls flood route  
 (all-ce-flood instance-name *instance-name* <logical-system-name *logical-system-name*>  
 |  
 ce-flood interface *interface-name*)

**Release Information** Command introduced in Junos OS Release 8.0.

**Description** Display VPLS route information related to the flood process for either the specified routing instance or the specified interface.

**Options** **all-ce-flood**—Display the flood next-hop route for all customer edge routers for traffic coming from the core of the network.

**ce-flood interface *interface-name***—Display the flood next-hop route for traffic coming from the specified customer edge interface.

**instance-name *instance-name***—Display the flood routes for the specified instance.

**logical-system-name *logical-system-name***—(Optional) Specify the logical system whose flood routes you want to display. You can only specify the default logical system name for VPLS. The default logical system name is **\_\_example\_ls1\_\_** (the name must be entered in the command with the underscore characters).

**Required Privilege Level** view

**List of Sample Output** [show vpls flood route all-ce-flood on page 2349](#)  
[show vpls flood route ce-flood on page 2349](#)

**Output Fields** [Table 233 on page 2348](#) lists the output for the **show vpls flood route** command. Output fields are listed in the approximate order in which they appear.

**Table 233: show vpls flood route Output Fields**

Field Name	Field Description
Flood route prefix	Prefix for the flood route.
Flood route type	Type of flood route (either <b>CE_FLOOD</b> or <b>ALL_CE_FLOOD</b> ).
Flood route owner	VPLS routing instance or interface associated with the flood route.
Nexthop type	Next-hop type. For example, <b>flood</b> for a flood route.
Nexthop index	Next-hop index number for the route.
Interfaces flooding to	Interfaces to which VPLS routes are being flooded.

Table 233: show vpls flood route Output Fields (*continued*)

Field Name	Field Description
Name	Name of the interface.
Type	Type of VPLS router (CE or VE).
Nh type	Next-hop type.
Index	Index number for the flood route.

## Sample Output

### show vpls flood route all-ce-flood

```
user@host: __example_lsi__> show vpls flood route all-ce-flood logical-system-name
__example_lsi__instance-name green
```

```
Flood route prefix: default
Flood route type: ALL_CE_FLOOD
Flood route owner: green
Nexthop type: flood
Nexthop index: 383
  Interfaces Flooding to:
    Name      Type      NhType      Index
    fe-1/2/1.0  CE
```

### show vpls flood route ce-flood

```
user@host: __example_lsi__> show vpls flood route ce-flood interface fe-1/2/1.0
```

```
Flood route prefix: 0x47/16
Flood route type: CE_FLOOD
Flood route owner: fe-1/2/1.0
Nexthop type: flood
Nexthop index: 388
  Interfaces Flooding to:
    Name      Type      NhType      Index
    lsi.49152  VE      indr      262142
```

## show vpls mac-table

---

<b>Syntax</b>	<b>show vpls mac-table</b> <b>&lt;age&gt;</b> <b>&lt;brief   detail   extensive   summary&gt;</b> <b>&lt;bridge-domain <i>bridge-domain-name</i>&gt;</b> <b>&lt;instance <i>instance-name</i>&gt;</b> <b>&lt;interface <i>interface-name</i>&gt;</b> <b>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</b> <b>&lt;mac-address&gt;</b> <b>&lt;vlan-id <i>vlan-id-number</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display learned virtual private LAN service (VPLS) media access control (MAC) address information.
<b>Options</b>	<b>none</b> —Display all learned VPLS MAC address information.  <b>age</b> — (Optional) Display age of a single mac-address.  <b>brief   detail   extensive   summary</b> —(Optional) Display the specified level of output.  <b>bridge-domain <i>bridge-domain-name</i></b> —(Optional) Display learned VPLS MAC addresses for the specified bridge domain.  <b>instance <i>instance-name</i></b> —(Optional) Display learned VPLS MAC addresses for the specified instance.  <b>interface <i>interface-name</i></b> —(Optional) Display learned VPLS MAC addresses for the specified instance.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Display learned VPLS MAC addresses for all logical systems or for the specified logical system.  <b>mac-address</b> —(Optional) Display the specified learned VPLS MAC address information..  <b>vlan-id <i>vlan-id-number</i></b> —(Optional) Display learned VPLS MAC addresses for the specified VLAN.
<b>Required Privilege Level</b>	view

[show vpls mac-table extensive on page 2354](#)

**Output Fields** [Table 234 on page 2351](#) describes the output fields for the **show vpls mac-table** command. Output fields are listed in the approximate order in which they appear.

**Table 234: show vpls mac-table Output fields**

Field Name	Field Description
Age	Age of a single mac-address.
Routing instance	Name of the routing instance.
Bridging domain	Name of the bridging domain.
MAC address	MAC address or addresses learned on a logical interface.
MAC flags	Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>S</b>—Static MAC address configured.</li> <li>• <b>D</b>—Dynamic MAC address learned.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>NM</b>—Nonconfigured MAC.</li> </ul>
Logical interface	Name of the logical interface.
MAC count	Number of MAC addresses learned on a specific routing instance or interface.
Learning interface	Logical interface or logical Label Switched Interface (LSI) the address is learned on.
Base learning interface	Base learning interface of the MAC address. This field is introduced in Junos OS Release 14.2.
Learn VLAN ID/VLAN	VLAN ID of the routing instance or bridge domain in which the MAC address was learned.
VXLAN ID/VXLAN	VXLAN Network Identifier (VNI)
Layer 2 flags	Debugging flags signifying that the MAC address is present in various lists.
Epoch	Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.
Sequence number	Sequence number assigned to this MAC address. Used for debugging.
Learning mask	Mask of Packet Forwarding Engines where this MAC address was learned. Used for debugging.
IPC generation	Creation time of the logical interface when this MAC address was learned. Used for debugging.

## Sample Output

### show vpls mac-table

```
user@host> show vpls mac-table
MAC flags (S -static MAC, D -dynamic MAC,
           SE -Statistics enabled, NM -Non configured MAC)

Routing instance : vpls_ldp1
VLAN : 223
  MAC          MAC          Logical
  address      flags      interface
  00:00:5e:00:53:5d  D      ge-0/2/5.400

MAC flags (S -static MAC, D -dynamic MAC,
           SE -Statistics enabled, NM -Non configured MAC)

Routing instance : vpls_red
VLAN : 401
  MAC          MAC          Logical
  address      flags      interface
  00:00:5e:00:53:12  D      lsi.1051138
  00:00:5e:00:53:f0  D      lsi.1051138
```

### show vpls mac-table (with Layer 2 Services over GRE Interfaces)

```
user@host> show vpls mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned
           SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

Routing instance : vpls_4site:1000
Bridging domain : __vpls_4site:1000__, MAC          MAC          Logical
  address      flags      interface
  00:00:5e:00:53:f4  D,SE      ge-4/2/0.1000
  00:00:5e:00:53:33  D,SE      lsi.1052004

  00:00:5e:00:53:32  D,SE      lsi.1048840
  00:00:5e:00:53:14  D,SE      lsi.1052005
  00:00:5e:00:53:f7  D,SE      vtep.1052010
  00:00:5e:00:53:3f  D,SE      vtep.1052011
```

### show vpls mac-table age (for GE interface)

```
user@host> show vpls mac-table age 00:00:5e:00:53:1a instance vpls_instance_1
MAC Entry Age information
Current Age: 4 seconds
```

### show vpls mac-table age (for AE interface)

```
user@host> show vpls mac-table age 000:00:5e:00:53:1a instance vpls_instance_1
MAC Entry Age information
Current Age on FPC1: 102 seconds
Current Age on FPC2: 94 seconds
```

### show vpls mac-table count

```
user@host> show vpls mac-table count
0 MAC address learned in routing instance __example_private1__
```

MAC address count per interface within routing instance:

Logical interface	MAC count
lc-0/0/0.32769	0
lc-0/1/0.32769	0
lc-0/2/0.32769	0
lc-2/0/0.32769	0
lc-0/3/0.32769	0
lc-2/1/0.32769	0
lc-9/0/0.32769	0
lc-11/0/0.32769	0
lc-2/2/0.32769	0
lc-9/1/0.32769	0
lc-11/1/0.32769	0
lc-2/3/0.32769	0
lc-9/2/0.32769	0
lc-11/2/0.32769	0
lc-11/3/0.32769	0
lc-9/3/0.32769	0

MAC address count per learn VLAN within routing instance:

Learn VLAN ID	MAC count
0	0

1 MAC address learned in routing instance vpls\_ldp1

MAC address count per interface within routing instance:

Logical interface	MAC count
lsi.1051137	0
ge-0/2/5.400	1

MAC address count per learn VLAN within routing instance:

Learn VLAN ID	MAC count
0	1

1 MAC address learned in routing instance vpls\_red

MAC address count per interface within routing instance:

Logical interface	MAC count
ge-0/2/5.300	1

MAC address count per learn VLAN within routing instance:

Learn VLAN ID	MAC count
0	1

### show vpls mac-table detail

```
user@host> show vpls mac-table detail

```

## show vpls statistics

<b>Syntax</b>	show vpls statistics <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	(T Series and M Series routers, except for the M160 router) Display virtual private LAN service (VPLS) statistics.
<b>Options</b>	<p><b>none</b>—Display VPLS statistics for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display VPLS statistics for a specific VPLS routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show vpls statistics on page 2356</a> <a href="#">show vpls statistics instance on page 2357</a>
<b>Output Fields</b>	Table 235 on page 2355 lists the output fields for the <b>show vpls statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 235: show vpls statistics Output Fields**

Field Name	Field Description
Instance	Name of the VPLS instance.
Local interface	Name of the local VPLS virtual loopback tunnel interface, <b>vt-fpc/pic/port.nnnnn</b> , where <b>nnnnn</b> is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain.
Index	Number associated with the next hop.
Remote provider edge router	Address of the remote provider edge router.
Multicast packets	Number of multicast packets received.
Multicast bytes	Number of multicast bytes received.
Flood packets	Number of VPLS flood packets received.

Table 235: show vpls statistics Output Fields (*continued*)

Field Name	Field Description
Flood bytes	Number of VPLS flood bytes received.
Current MAC count	Number of MAC addresses learned by the interface and the configured maximum limit on the number of MAC addresses that can be learned.

## Sample Output

### show vpls statistics

```
user@host> show vpls statistics
```

```
VPLS statistics:
```

```
Instance: green
```

```
