#### YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

#### END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

# Table of Contents

	About the Documentation . . . . .	xliii
	Documentation and Release Notes . . . . .	xliii
	Supported Platforms . . . . .	xliii
	Using the Examples in This Manual . . . . .	xliii
	Merging a Full Example . . . . .	xliv
	Merging a Snippet . . . . .	xliv
	Documentation Conventions . . . . .	xlvi
	Documentation Feedback . . . . .	xlvi
	Requesting Technical Support . . . . .	xlvi
	Self-Help Online Tools and Resources . . . . .	xlvi
	Opening a Case with JTAC . . . . .	xlvi
<b>Part 1</b>	<b>Router Interfaces</b>	
<b>Chapter 1</b>	<b>Router Interfaces Overview . . . . .</b>	<b>3</b>
	Router Interfaces Overview . . . . .	4
	Types of Interfaces Overview . . . . .	4
	Understanding Permanent Interfaces . . . . .	5
	Understanding Transient Interfaces . . . . .	5
	Understanding Services Interfaces . . . . .	7
	Understanding Container Interfaces . . . . .	8
	Understanding Traditional APS Concept . . . . .	8
	Container Interfaces Concept . . . . .	9
	APS Support for Container-Based Interfaces . . . . .	9
	Autocopy of APS Parameters . . . . .	9
	Understanding Management Ethernet Interfaces . . . . .	10
	TX Matrix Plus and T1600 Router (Routing Matrix) Management Ethernet Interfaces . . . . .	11
	Understanding Internal Ethernet Interfaces . . . . .	12
	T1600 Routers (Routing Matrix) Internal Ethernet Interfaces . . . . .	14
	Supported Routing Engines by Router . . . . .	14
	M7i Routing Engines . . . . .	15
	M10i Routing Engines . . . . .	15
	M40e Routing Engines . . . . .	16
	M120 Routing Engines . . . . .	16
	M320 Routing Engines . . . . .	17
	MX5, MX10, MX40, and MX80 Routing Engine . . . . .	17
	MX104 Routing Engines . . . . .	18
	MX240 Routing Engines . . . . .	18
	MX480 Routing Engines . . . . .	19
	MX960 Routing Engines . . . . .	20

	MX2008 Routing Engines . . . . .	21
	MX2010 Routing Engines . . . . .	21
	MX2020 Supported Routing Engines . . . . .	21
	PTX3000 Routing Engines . . . . .	22
	PTX5000 Routing Engines . . . . .	22
	T320 Routing Engines . . . . .	23
	T640 Routing Engines . . . . .	23
	T1600 Routing Engines . . . . .	24
	T4000 Routing Engines . . . . .	25
	TX Matrix Routing Engines . . . . .	25
	TX Matrix Plus Routing Engines . . . . .	26
	TX Matrix Plus (with 3D SIBs) Routing Engines . . . . .	26
	Interface Naming Overview . . . . .	27
	Physical Part of an Interface Name . . . . .	27
	Logical Part of an Interface Name . . . . .	33
	Separators in an Interface Name . . . . .	33
	Channel Part of an Interface Name . . . . .	33
	Interface Naming for a Routing Matrix Based on a TX Matrix Router . . . . .	34
	Interface Naming for a Routing Matrix Based on a TX Matrix Plus Router . . . . .	36
	Chassis Interface Naming . . . . .	39
	Examples: Interface Naming . . . . .	39
	Interface Encapsulations Overview . . . . .	41
	Interface Descriptors Overview . . . . .	52
	Physical Part of an Interface Name . . . . .	53
	Interface Names for ACX Series Universal Access Routers . . . . .	53
	Interface Names for M Series and T Series Routers . . . . .	54
	MX Series Router Interface Names . . . . .	54
	Interface Names for PTX Series Routers . . . . .	55
	Displaying Interface Configurations Overview . . . . .	55
<b>Chapter 2</b>	<b>Configuring Physical Interface Properties . . . . .</b>	<b>57</b>
	Physical Interface Configuration Statements Overview . . . . .	58
	Physical Interfaces Properties Statements List . . . . .	68
	Interface Ranges . . . . .	84
	Configuring Interface Ranges . . . . .	84
	Expanding Interface Range Member and Member Range Statements . . . . .	88
	Configuration Inheritance for Member Interfaces . . . . .	89
	Member Interfaces Inheriting Configuration from Configuration Groups . . . . .	90
	Interfaces Inheriting Common Configuration . . . . .	91
	Configuring Inheritance Range Priorities . . . . .	92
	Configuration Expansion Where Interface Range Is Used . . . . .	92
	Specifying an Aggregated Interface . . . . .	93
	Media MTU Overview . . . . .	94
	Media MTU Sizes by Interface Type . . . . .	95
	. . . . .	95
	Media MTU Sizes by Interface Type for M5 and M7i Routers with CFEB, M10 and M10i Routers with CFEB, and M20 and M40 Routers . . . . .	95
	Media MTU Sizes by Interface Type for M40e Routers . . . . .	96
	Media MTU Sizes by Interface Type for M160 Routers . . . . .	97

Media MTU Sizes by Interface Type for M7i Routers with CFEB-E, M10i Routers with CFEB-E, and M320 and M120 Routers . . . . .	98
Media MTU Sizes by Interface Type for MX Series Routers . . . . .	99
Media MTU Sizes by Interface Type for T320 Routers . . . . .	100
Media MTU Sizes by Interface Type for T640 Platforms . . . . .	101
Media MTU Sizes by Interface Type for EX Series Switches and ACX Series Routers . . . . .	101
Media MTU Sizes by Interface Type for PTX Series Packet Transport Routers . . . . .	102
Encapsulation Overhead by Interface Encapsulation Type . . . . .	102
Configuring Interface Description . . . . .	104
Configuring the Media MTU . . . . .	105
Configuring the Interface Speed . . . . .	106
Configuring the Interface Speed on Ethernet Interfaces . . . . .	106
Configuring Aggregated Ethernet Link Speed . . . . .	107
Configuring SONET/SDH Interface Speed . . . . .	109
Configuring the Link Characteristics . . . . .	111
Interface Alias Names Overview . . . . .	112
Example: Adding an Interface Alias Name . . . . .	113
Clock Source Overview . . . . .	117
Configuring the Clock Source . . . . .	118
Configuring Interface Encapsulation on Physical Interfaces . . . . .	119
Understanding Interface Encapsulation on Physical Interfaces . . . . .	119
Encapsulation Capabilities of Physical Interfaces . . . . .	119
Configuring the Encapsulation on a Physical Interface . . . . .	120
Displaying the Encapsulation on a Physical SONET/SDH Interface . . . . .	121
Configuring Interface Encapsulation on PTX Series Packet Transport Routers . . . . .	122
Configuring Keepalives . . . . .	123
Configuring the PPP Challenge Handshake Authentication Protocol . . . . .	126
PPP Challenge Handshake Authentication Protocol . . . . .	126
Configuring the PPP Challenge Handshake Authentication Protocol . . . . .	126
Displaying the Configured PPP Challenge Handshake Authentication Protocol . . . . .	127
Configuring the PPP Password Authentication Protocol On a Physical Interface . . . . .	128
Understanding PPP Password Authentication Protocol . . . . .	128
Configuring the PPP Password Authentication Protocol On a Physical Interface . . . . .	129
Configuring the PPP Password Authentication Protocol On a Logical Interface . . . . .	130
Configuring PPP Address and Control Field Compression . . . . .	131
Configuring the PPP Protocol Field Compression . . . . .	133
Monitoring a PPP Session . . . . .	134
Tracing Operations of the pppd Process . . . . .	135
Configuring the Router as a DCE with Frame Relay Encapsulation . . . . .	136
Receive and Transmit Leaky Bucket Properties Overview . . . . .	137
Configuring Receive and Transmit Leaky Bucket Properties to Reduce Network Congestion . . . . .	138

	Understanding Unidirectional Traffic Flow on Physical Interfaces . . . . .	139
	Enabling Unidirectional Traffic Flow on Physical Interfaces . . . . .	140
	Physical Interface Damping Overview . . . . .	141
	Damping Overview for Shorter Physical Interface Transitions . . . . .	141
	Damping Overview for Longer Physical Interface Transitions . . . . .	142
	Damping Shorter Physical Interface Transitions . . . . .	147
	Damping Longer Physical Interface Transitions . . . . .	148
	Example: Configuring Physical Interface Damping . . . . .	149
	Configuring Multiservice Physical Interface Properties . . . . .	152
	Enabling or Disabling SNMP Notifications on Physical Interfaces . . . . .	153
	Configuring Accounting for the Physical Interface . . . . .	153
	Accounting Profiles Overview . . . . .	153
	Configuring Accounting for the Physical Interface . . . . .	154
	Displaying Accounting Profile for the Physical Interface . . . . .	155
	Disabling a Physical Interface . . . . .	156
	Disabling a Physical Interface . . . . .	156
	Example: Disabling a Physical Interface . . . . .	156
	Effect of Disabling Interfaces on T series PICs . . . . .	157
<b>Chapter 3</b>	<b>Configuring Logical Interface Properties . . . . .</b>	<b>159</b>
	Logical Interfaces Configuration Properties Overview . . . . .	159
	Logical Interfaces Configuration Statements . . . . .	160
	Logical Interfaces Statements List . . . . .	163
	Specifying the Logical Interface Number . . . . .	170
	Adding a Logical Unit Description to the Configuration . . . . .	170
	Configuring the Interface Bandwidth . . . . .	171
	Configuring Interface Encapsulation on Logical Interfaces . . . . .	171
	Understanding Interface Encapsulation on Logical Interfaces . . . . .	172
	Configuring the Encapsulation on a Logical Interface . . . . .	172
	Displaying the Encapsulation on a Logical Interface . . . . .	173
	Configuring Interface Encapsulation on PTX Series Packet Transport Routers . . . . .	173
	Configuring a Point-to-Point Connection . . . . .	175
	Configuring a Multipoint Connection . . . . .	175
	Configuring the PPP Restart Timers . . . . .	175
	Configuring the PPP Clear Loop Detected Timer . . . . .	176
	Configuring the LCP Configure-Request Maximum Sent . . . . .	176
	Configuring the NCP Configure-Request Maximum Sent . . . . .	177
	Configuring Dynamic Profiles for PPP . . . . .	177
	Configuring PPP CHAP Authentication . . . . .	178
	Configuring the PPP Password Authentication Protocol On a Logical Interface . . . . .	178
	Understanding PPP Password Authentication Protocol . . . . .	178
	Configuring the PPP Password Authentication Protocol On a Logical Interface . . . . .	179
	Configuring Accounting for the Logical Interface . . . . .	180
	Accounting Profiles Overview . . . . .	180
	Configuring Accounting for the Logical Interface . . . . .	180
	Displaying Accounting Profile for the Logical Interface . . . . .	181

**Chapter 4**

Enabling or Disabling SNMP Notifications on Logical Interfaces . . . . .	182
Disabling a Logical Interface . . . . .	183
Configuring Logical System Interface Properties . . . . .	183
<b>Configuring Protocol Family and Interface Address Properties . . . . .</b>	<b>185</b>
Protocol Family Configuration and Interface Address Statements . . . . .	185
Configuring the Protocol Family . . . . .	188
Configuring the Interface Address . . . . .	189
Configuring Default, Primary, and Preferred Addresses and Interfaces . . . . .	191
Default, Primary, and Preferred Addresses and Interfaces . . . . .	191
Configuring the Primary Interface for the Router . . . . .	192
Configuring the Primary Address for an Interface . . . . .	192
Configuring the Preferred Address for an Interface . . . . .	193
Operational Behavior of Interfaces When the Same IPv4 Address Is Assigned to Them . . . . .	193
Configuring ICCP for MC-LAG . . . . .	196
Configuring IPCP Options for Interfaces with PPP Encapsulation . . . . .	198
Configuring an Unnumbered Interface . . . . .	200
Overview of Unnumbered Interfaces . . . . .	200
Configuring an Unnumbered Point-to-Point Interface . . . . .	200
Configuring an Unnumbered Ethernet or Demux Interface . . . . .	201
Configuring a Preferred Source Address for Unnumbered Ethernet or Demux Interfaces . . . . .	202
Restrictions for Configuring Unnumbered Ethernet Interfaces . . . . .	203
Displaying the Unnumbered Ethernet Interface Configuration . . . . .	204
Displaying the Configured Preferred Source Address for an Unnumbered Ethernet Interface . . . . .	205
Displaying the Configuration for Unnumbered Ethernet Interface as the Next Hop for a Static Route . . . . .	206
Setting the Protocol MTU . . . . .	206
Disabling the Removal of Address and Control Bytes . . . . .	207
Disabling the Transmission of Redirect Messages on an Interface . . . . .	208
Applying Policers . . . . .	208
Overview of Applying Policers . . . . .	208
Applying Aggregate Policers . . . . .	209
Applying Aggregate Policers . . . . .	209
Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs . . . . .	211
Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs . . . . .	211
Configuring Hierarchical Policers . . . . .	213
Configuring a Single-Rate Two-Color Policer . . . . .	214
Configuring a Single-Rate Color-Blind Policer . . . . .	215
Configuring a Two-Rate Tricolor Marker Policer . . . . .	215
Applying a Filter to an Interface . . . . .	217
Defining Interface Groups in Firewall Filters . . . . .	217
Filter-Based Forwarding on the Output Interface . . . . .	218
Applying a Filter to an Interface . . . . .	218

	Configuring Unicast RPF . . . . .	222
	Configuring Unicast RPF . . . . .	222
	Unicast RPF and Default Route . . . . .	223
	Unicast RPF Behavior with a Default Route . . . . .	223
	Unicast RPF Behavior Without a Default Route . . . . .	224
	Unicast RPF with Routing Asymmetry . . . . .	224
	Configuring Unicast RPF Strict Mode . . . . .	224
	Configuring Unicast RPF Loose Mode . . . . .	226
	Configuring Unicast RPF Loose Mode with Ability to Discard Packets . . . . .	228
	Configuring Unicast RPF on a VPN . . . . .	229
	Configuring Unicast RPF . . . . .	230
	Example: Configuring Unicast Reverse-Path-Forwarding Check . . . . .	231
	Understanding Unicast Reverse Path Forwarding . . . . .	231
	Example: Configuring Unicast Reverse-Path-Forwarding Check . . . . .	231
	Enabling Source Class and Destination Class Usage . . . . .	240
	Source Class and Destination Class Usage . . . . .	240
	Enabling Source Class and Destination Class Usage . . . . .	244
	Understanding Targeted Broadcast . . . . .	249
	Configuring Targeted Broadcast . . . . .	250
	Configuring Targeted Broadcast and Its Options . . . . .	250
	Display Targeted Broadcast Configuration Options . . . . .	251
	Forward IP Packets On the Egress Interface and To the Routing Engine . . . . .	251
	Forward IP Packets On the Egress Interface Only . . . . .	252
<b>Chapter 5</b>	<b>Configuring Circuit and Translational Cross-Connects . . . . .</b>	<b>253</b>
	Circuit and Translational Cross-Connects Overview . . . . .	253
	Defining the Encapsulation for Switching Cross-Connects . . . . .	255
	Defining the Encapsulation for Switching Cross-Connects . . . . .	255
	Configuring PPP or Cisco HDLC Circuits . . . . .	256
	Configuring ATM Circuits . . . . .	256
	Configuring Frame Relay Circuits . . . . .	256
	Configuring Ethernet CCC Circuits . . . . .	258
	Configuring Ethernet VLAN Circuits . . . . .	258
	Defining the Connection for Switching Cross-Connects . . . . .	259
	Configuring MPLS for Switching Cross-Connects . . . . .	259
	Configuring IS-IS or MPLS Traffic for TCC Interfaces . . . . .	259
	Configuring ATM-to-Ethernet Interworking . . . . .	260
	ATM-to-Ethernet Interworking . . . . .	260
	Enabling ATM-to-Ethernet Interworking . . . . .	261
	Configuring the Ethernet Interface . . . . .	261
	Configuring Ethernet Encapsulation . . . . .	262
	Configuring the Outer VLAN Identifier . . . . .	262
	Configuring the Inner VLAN Identifier Range . . . . .	262
	Configuring the Physical Interface VPI . . . . .	262
	Configuring the ATM Logical Interface . . . . .	263
	Configuring the Protocol Family . . . . .	263
	Configuring the Logical Interface VPI . . . . .	263

	Configuring the Logical Interface VCI . . . . .	264
	ATM-To-Ethernet Interworking on ATM MICs . . . . .	264
	Limitations . . . . .	265
	Example: Configuring a CCC over Frame Relay Encapsulated Interface . . . . .	265
	Example: Configuring a TCC . . . . .	266
	Example: Configuring CCC over Aggregated Ethernet . . . . .	267
	Example: Configuring a Remote LSP CCC over Aggregated Ethernet . . . . .	269
	Example: Configuring ATM-to-Ethernet Interworking . . . . .	271
	Example: Configuring ATM-to-Ethernet Interworking on ATM MIC . . . . .	272
	Verifying ATM-to-Ethernet Interworking Configuration on ATM MICs . . . . .	278
	Verifying That The ATM Interface on Router1 Is Configured Correctly . . . . .	278
	Verifying The Status of the MIC on Router1 . . . . .	278
	Verify That OSPF Configuration on Router1 Is Accurate . . . . .	279
	Verify That LDP Configuration on Router1 Is Accurate . . . . .	279
	Verify That Layer 2 Virtual Circuit Session Configuration on Router1 Is Accurate . . . . .	279
	Verifying That the Ethernet Interface on Router2 Is Configured Correctly . .	280
	Verifying the Status of the MIC on Router2 . . . . .	281
	Verify That OSPF Configuration on Router2 Is Accurate . . . . .	281
	Verify That LDP Configuration on Router2 Is Accurate . . . . .	281
	Verify That Layer 2 Virtual Circuit Session Configuration on Router2 Is Accurate . . . . .	281
<b>Part 2</b>	<b>Special Router Interfaces</b>	
<b>Chapter 6</b>	<b>Configuring Discard Interfaces . . . . .</b>	<b>285</b>
	Discard Interfaces Overview . . . . .	285
	Understanding Discard Interfaces . . . . .	285
	Guidelines to Follow When Configuring a Discard Interface . . . . .	285
	Configuring Discard Interfaces . . . . .	286
	Configure a Discard Interface . . . . .	286
	Configure an Input Policy . . . . .	287
	Configure an Output Policy . . . . .	288
<b>Chapter 7</b>	<b>Configuring IP Demultiplexing Interfaces . . . . .</b>	<b>289</b>
	Demultiplexing Interface Overview . . . . .	289
	IP Demux Interface Overview . . . . .	289
	VLAN Demux Interface Overview . . . . .	290
	Guidelines to Remember When Configuring A Demux Interface . . . . .	290
	Points to Remember When Configuring an IP Demux Interface . . . . .	290
	Points to Remember When Configuring a VLAN Demux Interface . . . . .	291
	MAC Address Validation on Static Demux Interfaces . . . . .	291
	Loose . . . . .	291
	Strict . . . . .	292
	Configuring an IP Demultiplexing Interface . . . . .	292
	Configuring an IP Demux Underlying Interface . . . . .	292
	Configuring the IP Demux Interface . . . . .	294

	Configuring MAC Address Validation on Static IP Demux Interfaces . . . . .	296
	Configuring a VLAN Demultiplexing Interface . . . . .	296
	Configuring a VLAN Demux Underlying Interface . . . . .	297
	Configuring the VLAN Demux Interface . . . . .	298
	Configuring MAC Address Validation on Static VLAN Demux Interfaces . . .	300
	Verifying a Demux Interface Configuration . . . . .	301
<b>Chapter 8</b>	<b>Configuring the Loopback Interface . . . . .</b>	<b>303</b>
	Configuring the Loopback Interface . . . . .	303
	Configuring the Loopback Interface . . . . .	303
	Example: Configuring Two Addresses on the Loopback Interface with Host Routes . . . . .	304
	Example: Configuring Two Addresses on the Loopback Interface with Subnetwork Routes . . . . .	305
	Example: Configuring an IPv4 and an IPv6 Address on the Loopback Interface with Subnetwork Routes . . . . .	305
<b>Part 3</b>	<b>Serial Interfaces</b>	
<b>Chapter 9</b>	<b>Serial Interfaces Overview . . . . .</b>	<b>309</b>
	Serial Interfaces Overview . . . . .	309
<b>Chapter 10</b>	<b>Configuring Serial Interfaces . . . . .</b>	<b>311</b>
	Example: Physical Interface Configuration Statements for Serial Interfaces . . .	311
	Configuring the Serial Line Protocol . . . . .	312
	Configuring the Serial Line Protocol . . . . .	312
	Serial Interface Default Settings . . . . .	312
	Serial Interface Default Settings . . . . .	313
	Invalid Serial Interface Statements . . . . .	314
	Configuring the Serial Clocking Mode . . . . .	316
	Configuring the Serial Clocking Mode . . . . .	316
	Inverting the Serial Interface Transmit Clock . . . . .	317
	Configuring the DTE Clock Rate . . . . .	317
	Configuring the Serial Signal Handling . . . . .	318
	Configuring the Serial DTR Circuit . . . . .	321
	Configuring Serial Signal Polarities . . . . .	321
	Configuring Serial Loopback Capability . . . . .	322
	Configuring Serial Line Encoding . . . . .	324
	Specifying a USB Modem Interface on J Series Routers . . . . .	324
<b>Part 4</b>	<b>Monitoring and Troubleshooting Interfaces</b>	
<b>Chapter 11</b>	<b>Monitoring Interfaces . . . . .</b>	<b>329</b>
	Tracing Interface Operations Overview . . . . .	329
	Tracing Operations of an Individual Router Interface . . . . .	329
	Tracing Operations of the Interface Process . . . . .	330
	Monitoring a PPP Session . . . . .	331
	Tracing Operations of the pppd Process . . . . .	332

<b>Chapter 12</b>	<b>Troubleshooting Interfaces . . . . .</b>	<b>335</b>
	Configuring Interface Diagnostics Tools to Test the Physical Layer	
	Connections . . . . .	335
	Configuring Loopback Testing . . . . .	335
	Configuring BERT Testing . . . . .	337
	Starting and Stopping a BERT Test . . . . .	340
	Troubleshooting: em0 Management Interface Link is Down . . . . .	341
	Troubleshooting: fxp0 Management Interface Link is Down . . . . .	343
	Troubleshooting: Faulty Ethernet Physical Interface on an M Series, an MX Series, or a T Series Router . . . . .	344
	Checking the Cable Connection . . . . .	345
	Checking the Physical Link Status of the Interface . . . . .	346
	Checking the Interface Statistics in Detail . . . . .	347
	Performing the Loopback Diagnostic Test . . . . .	349
	Checking Other Possibilities . . . . .	351
	To Enable a Physical Interface . . . . .	352
<b>Part 5</b>	<b>Configuration Statements and Operational Commands</b>	
<b>Chapter 13</b>	<b>Configuration Statements . . . . .</b>	<b>355</b>

# About the Documentation

- [Documentation and Release Notes on page xliii](#)
- [Supported Platforms on page xliii](#)
- [Using the Examples in This Manual on page xliii](#)
- [Documentation Conventions on page xlv](#)
- [Documentation Feedback on page xlvii](#)
- [Requesting Technical Support on page xlvii](#)

## Documentation and Release Notes

---

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

## Supported Platforms

---

For the features described in this document, the following platforms are supported:

- [ACX Series](#)
- [M Series](#)
- [MX Series](#)
- [T Series](#)
- [PTX Series](#)

## Using the Examples in This Manual

---

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming

configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

## Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xsl;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

## Documentation Conventions

[Table 1 on page xlv](#) defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xlvii defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces or emphasizes important new terms.</li> <li>Identifies guide names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS CLI User Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> <li>To configure a stub area, include the <b>stub</b> statement at the [edit protocols ospf area area-id] hierarchy level.</li> <li>The console port is labeled <b>CONSOLE</b>.</li> </ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub</b> <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast</b>   <b>multicast</b>  ( <i>string1</i>   <i>string2</i>   <i>string3</i> )
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp</b> { <b>#</b> Required for dynamic MPLS only
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members</b> [ <i>community-ids</i> ]
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
GUI Conventions		
<b>Bold text like this</b>	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page of the Juniper Networks TechLibrary site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <http://www.juniper.net/techpubs/feedback/>.
- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes:  
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:  
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:  
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

## Router Interfaces Overview

---

Routers typically contain several different types of interfaces suited to various functions. For the interfaces on a router to function, you must configure them. Specify the interface location (that is, the slot where the Flexible PIC Concentrator [FPC], Dense Port Concentrator [DPC], or Modular Port Concentrator [MPC] is installed. You must also specify the location of the Physical Interface Card [PIC] or Modular Interface Card [MIC], and the interface type, for example, SONET/SDH, Asynchronous Transfer Mode [ATM], or Ethernet). Finally, you must specify the encapsulation type and any interface-specific properties that may apply.

You can configure interfaces that are currently present in the router, as well as interfaces that are not currently present but that are expected to be added in the future. Junos OS detects the interface once the hardware has been installed and applies the pre-set configuration to it.

To see which interfaces are currently installed in the router, issue the **show interfaces terse** operational mode command. If an interface is listed in the output, it is physically installed in the router. If an interface is not listed in the output, it is not installed in the router.

For information about which interfaces are supported on your router, see your router's *Interface Module Reference*.

You can configure Junos OS class-of-service (CoS) properties to provide a variety of classes of service for different applications, including multiple forwarding classes for managing packet transmission, congestion management, and CoS-based forwarding. For more information about configuring CoS properties, see the *Class of Service Feature Guide for Routing Devices*.

- *Interfaces Fundamentals for Routing Devices*

## Types of Interfaces Overview

---

Interfaces can be permanent or transient, and are used for networking or services:

- Permanent interfaces—Interfaces that are always present in the router.
- Transient interfaces—Interfaces that can be inserted into or removed from the router depending on your network configuration needs.
- Networking interfaces—Interfaces, such as Ethernet or SONET/SDH interfaces, that primarily provide traffic connectivity.
- Services interfaces—Interfaces that provide specific capabilities for manipulating traffic before it is delivered to its destination.
- Container interfaces—Interfaces that support automatic protection switching (APS) on physical SONET links using a virtual container infrastructure.

Junos OS internally generates nonconfigurable interfaces which are described in *Interfaces Command Reference* and *Services Interfaces*.

## Understanding Permanent Interfaces

Permanent interfaces in the router consist of management Ethernet interfaces and internal Ethernet interfaces, which are described separately in the following topics:

- [Understanding Management Ethernet Interfaces on page 10](#)
- [Understanding Internal Ethernet Interfaces on page 12](#)

---

## Understanding Transient Interfaces

The M Series, MX Series, and T Series routers contain slots for installing Flexible PIC Concentrator [FPC] or Dense Port Concentrator [DPC] (for MX Series routers) or Modular Port Concentrator [MPC] (for MX Series routers). Physical Interface Card [PIC] can be installed in FPCs. Modular Interface Card [MIC] can be inserted into MPCs.

The number of PICs that can be installed varies by router and type of FPC. The PICs provide the actual physical interfaces to the network. The MX Series routers contain slots for installing either DPC boards that provide the physical interfaces to the network or for installing FPCs in which PICs can be installed.

You can insert any DPC or FPC into any slot that supports them in the appropriate router. Typically, you can place any combination of PICs, compatible with your router, in any location on an FPC. (You are limited by the total FPC bandwidth, and by the fact that

some PICs physically require two or four of the PIC locations on the FPC. In some cases, power limitations or microcode limitations may also apply.) To determine DPC and PIC compatibility, see the see your router's *Interface Module Reference*.

You can insert MPC into any slot that supports them in the appropriate router. You can install up to two MICs of different media types in the same MPC as long as the MPC supports those MICs.

These physical interfaces are transient interfaces of the router. They are referred to as transient because you can hot-swap a DPC or FPC or MPC and its PICs or MICs at any time.

You must configure each transient interface based on the slot in which the FPC or DPC or MPC is installed, the location in which the PIC or MIC is installed, and for multiple port PICs or MICs , the port to which you are connecting.

You can configure the interfaces on PICs or MICs that are already installed in the router as well as interfaces on PICs or MICs that you plan to install later. The Junos OS detects which interfaces are actually present, so when the software activates its configuration, it activates only the present interfaces and retains the configuration information for the interfaces that are not present. When the Junos OS detects that an FPC containing PICs or MPC containing MICs has been inserted into the router, the software activates the configuration for those interfaces.

## Understanding Services Interfaces

---

Services interfaces enable you to incrementally add services to your network. The Junos OS supports the following services PICs:

- Adaptive Services (AS) PICs—Allow you to provide multiple services on a single PIC by configuring a set of services and applications. The AS PICs offer a special range of services you configure in one or more service sets.
- ES PIC—Provides a security suite for the IP version 4 (IPv4) and IP version 6 (IPv6) network layers. The suite provides functionality such as authentication of origin, data integrity, confidentiality, replay protection, and nonrepudiation of source. It also defines mechanisms for key generation and exchange, management of security associations, and support for digital certificates.
- Monitoring Services PICs—Enable you to monitor traffic flow and export the monitored traffic. Monitoring traffic allows you to gather and export detailed information about IPv4 traffic flows between source and destination nodes in your network; sample all incoming IPv4 traffic on the monitoring interface and present the data in cflowd record format; perform discard accounting on an incoming traffic flow; encrypt or tunnel outgoing cflowd records, intercepted IPv4 traffic, or both; and direct filtered traffic to different packet analyzers and present the data in its original format. On a Monitoring Services II PIC, you can configure either monitoring interfaces or collector interfaces. A collector interface allows you to combine multiple cflowd records into a compressed ASCII data file and export the file to an FTP server.
- Multilink Services, MultiServices, Link Services, and Voice Services PICs—Enable you to split, recombine, and sequence datagrams across multiple logical data links. The goal of multilink operation is to coordinate multiple independent links between a fixed pair of systems, providing a virtual link with greater bandwidth than any of the members.
- Tunnel Services PIC—By encapsulating arbitrary packets inside a transport protocol, tunneling provides a private, secure path through an otherwise public network. Tunnels connect discontinuous subnetworks and enable encryption interfaces, virtual private networks (VPNs), and Multiprotocol Label Switching (MPLS).
- On M Series and T Series routers, logical tunnel interfaces allow you to connect logical systems, virtual routers, or VPN instances. For more information about VPNs, see the *Junos OS VPNs Library for Routing Devices*. For more information about configuring tunnels, see the *Junos OS Services Interfaces Library for Routing Devices*.

## Understanding Container Interfaces

Container interfaces provide the following features:

- Automatic protection switching (APS) on SONET/SDH and ATM links are supported using the container infrastructure.
- Container physical interfaces and logical interfaces remain up on switchover.
- APS parameters are auto-copied from the container interface to the member links.

**NOTE:** Paired groups and true unidirectional APS are not currently supported.

For more information on SONET/SDH configuration, see *Configuring Container Interfaces for APS on SONET Links*.

Container interfaces features are described in the following sections:

- [Understanding Traditional APS Concept on page 8](#)
- [Container Interfaces Concept on page 9](#)
- [APS Support for Container-Based Interfaces on page 9](#)
- [Autocopy of APS Parameters on page 9](#)

## Understanding Traditional APS Concept

Traditional APS is configured on two independent physical SONET/SDH interfaces: one configured as the working circuit and the other as the protect circuit (see [Figure 1 on page 8](#)). The circuit, named Circuit X in the figure, is the link between the two SONET interfaces.

**Figure 1: APS Interface**

Traditional APS uses routing protocols that run on each individual SONET/SDH interface (since circuit is an abstract construct, instead of being an actual interface). When the working link goes down, the APS infrastructure brings up the protect link and its underlying logical interfaces, and brings down the working link and its underlying logical interfaces,

causing the routing protocols to reconverge. This consumes time and leads to traffic loss even though the APS infrastructure has performed the switch quickly.

## Container Interfaces Concept

To solve this problem, the Junos OS provides a soft interface construct called a container interface (see [Figure 2 on page 9](#)).

**Figure 2: Container Interface**

The container interface allows routing protocols to run on the logical interfaces associated with a virtual *container interface* instead of on the physical SONET/SDH and ATM interfaces. When APS switches the underlying physical link based on a fault condition, the container interface remains up, and the logical interface on the container interface does not flap. The routing protocols remain unaware of the APS switching.

## APS Support for Container-Based Interfaces

With the container interface, APS is configured on the container interface itself. Individual member SONET/SDH and ATM links are either marked as primary (corresponding to the working circuit) or standby (corresponding to the protect circuit) in the configuration. No circuit or group name is specified in the container interface model; physical SONET/SDH and ATM links are put in an APS group by linking them to a single container interface. APS parameters are specified at the container interface level, and are propagated to the individual SONET/SDH and ATM links by the APS daemon.

## Autocopy of APS Parameters

Typical applications require copying APS parameters from the working circuit to the protect circuit, since most of the parameters must be the same for both circuits. This is automatically done in the container interface. APS parameters are specified only once under the container physical interface configuration, and are internally copied over to the individual physical SONET/SDH and ATM links.

## Understanding Management Ethernet Interfaces

---

Management interfaces are the primary interfaces for accessing the device remotely. Typically, a management interface is not connected to the in-band network, but is connected instead to the device's internal network. Through a management interface you can access the device over the network using utilities such as **ssh** and **telnet** and configure the device from anywhere, regardless of its physical location. SNMP can use the management interface to gather statistics from the device.

A management interface lets authorized users and management systems connect to the device over the network. Some Juniper Networks devices have a dedicated management port on the front panel. For other types of platforms, you can configure a management interface on one of the network interfaces. This interface can be dedicated to management or shared with other traffic. Before users can access the management interface, you must configure it. Information required to set up the management interface includes its IP address and prefix. In many types of Junos OS devices (or recommended configurations), it is not possible to route traffic between the management interface and the other ports. Therefore, you should select an IP address in a separate (logical) network, with a separate prefix (netmask).

For devices with dedicated management ports, Junos OS automatically configures the router's management Ethernet interface, as either **em0** or **fxp0**. You can use the **show interfaces terse | match fxp0** or **show interfaces terse | match em0** command to display management interface information.

To use the management Ethernet interface as a management port, you must configure its logical port, **em0.0** or **fxp0.0**, with a valid IP address.

For some SRX Series Services Gateways and J Series Services Routers, you can use any of the built-in Ethernet ports as a management interface. (Platform support depends on the Junos OS release in your installation.) To use a built-in interface as a management Ethernet interface, configure it with a valid IP address. To manually configure J-Web access, include the **interface interface-name** statement at the **[edit system services web-management http]** hierarchy level.

For PTX Series Packet Transport Routers, the Junos OS automatically creates the router's management Ethernet interface, **em0**. To use **em0** as an out-of-band management port, you must configure its logical port (for example, **em0.0**) with a valid IP address.

Internal Ethernet interfaces are automatically created to connect the Routing Engines to the Packet Forwarding Engines in the FPCs.

When you enter the **show interfaces** command on a PTX Series Packet Transport Router, the management Ethernet interface and internal Ethernet interfaces (and logical interfaces) are displayed:

```
user@host> show interfaces ?
...
em0
  em0.0
  ixgbe0
```

```

ixgbe0.0
ixgbe1
ixgbe1.0
...

```

**NOTE:** *Routing Engine upgrade considerations*—When upgrading to a Routing Engine that supports **em0** from a Routing Engine that supports **fxp0**, you must convert existing management Ethernet interface references in the router configuration files from **fxp0**, **fxp1**, or **fxp2** interfaces to **em0** interfaces. Whether you use an automated script or edit the configuration files manually, you must revise any command lines that reference the **fxp0** management Ethernet interface by replacing “**fxp0**” with “**em0**.”

*Reusing scripts for standalone T1600 routers on T1600 routers in a routing matrix*—Automated scripts that you have developed for standalone T1600 routers (T1600 routers that are not in a routing matrix) might contain references to the **fxp0** management Ethernet interface. Before reusing the scripts on T1600 routers in a routing matrix, edit the command lines that reference the **fxp0** management Ethernet interface so that the commands reference the **em0** management Ethernet interface instead.

*Restricted load-sharing next hops with **fxp0***—On M Series Multiservices Edge Routers and T Series Core Routers running Junos OS later than Release 7.0R2.7 or Release 7.1R2.2, the **fxp0** interface does not support load-sharing next hops. This restriction only affects **fxp0** routes.

*CoS not supported on **fxp0***—The **fxp0** interface does not support class of service (CoS).

The Routing Engines in the PTX Series Packet Transport Routers do not support the management Ethernet interface **fxp0**, or the internal Ethernet interfaces **fxp1** or **fxp2**.

## TX Matrix Plus and T1600 Router (Routing Matrix) Management Ethernet Interfaces

For TX Matrix Plus Routers and for T1600 Core Routers with RE-C1800 configured in a routing matrix, the Junos OS automatically creates the router’s management Ethernet interface, **em0**. To use **em0** as a management port, you must configure its logical port, **em0.0**, with a valid IP address.

When you enter the **show interfaces** command on a TX Matrix Plus router, the management Ethernet interfaces (and logical interfaces) are displayed:

```

user@host> show interfaces ?
...
em0

```

em0.0  
...

**NOTE:** The Routing Engines in the TX Matrix Plus router and in the T1600 routers with RE-C1800 configured in a routing matrix do not support the management Ethernet interface fxp0, or the internal Ethernet interfaces fxp1 or fxp2.

## Understanding Internal Ethernet Interfaces

Within a router or packet transport router, internal Ethernet interfaces provide communication between the Routing Engine and the Packet Forwarding Engines. The Junos OS automatically configures internal Ethernet interfaces when the Junos OS boots. The Junos OS boots the packet-forwarding component hardware. When these components are running, the Control Board uses the internal Ethernet interface to transmit hardware status information to the Routing Engine. Information transmitted includes the internal router temperature, the condition of the fans, whether an FPC has been removed or inserted, and information from the LCD on thecraft interface.

To determine the supported internal Ethernet interfaces for your router, see [“Supported Routing Engines by Router” on page 14](#).

**NOTE:** Do not modify or remove the configuration for the internal Ethernet interface that the Junos OS automatically configures. If you do, the router or packet transport router will stop functioning.

- M Series, and MX Series routers and T Series routers—The Junos OS creates the internal Ethernet interface. The internal Ethernet interface connects the Routing Engine **re0** to the Packet Forwarding Engines.

If the router has redundant Routing Engines, another internal Ethernet interface is created on each Routing Engine (**re0** and **re1**) in order to support fault tolerance, two physical links between **re0** and **re1** connect the independent control planes. If one of the links fails, both Routing Engines can use the other link for IP communication.

- TX Matrix Plus routers—On a TX Matrix Plus router, the Routing Engine and Control Board function as a unit, or host subsystem. For each host subsystem in the router, the Junos OS automatically creates two internal Ethernet interfaces, **ixgbe0** and **ixgbe1**.

The `ixgbe0` and `ixgbe1` interfaces connect the TX Matrix Plus Routing Engine to the Routing Engines of every line-card chassis (LCC) configured in the routing matrix.

The TX Matrix Plus Routing Engine connects to a high-speed switch through a 10-Gbps link within the host subsystem. The switch provides a 1-Gbps link to each T1600 Routing Engine. The 1-Gbps links are provided through the UTP Category 5 Ethernet cable connections between the TXP-CBs and the LCC-CBs in the LCCs.

- The TX Matrix Plus Routing Engine connects to a high-speed switch in the local Control Board through a 10-Gbps link within the host subsystem.
- The Gigabit Ethernet switch connects the Control Board to the remote Routing Engines of every LCC configured in the routing matrix.

If a TX Matrix Plus router contains redundant host subsystems, the independent control planes are connected by two physical links between the two 10-Gigabit Ethernet ports on their respective Routing Engines.

- The primary link to the remote Routing Engine is at the `ixgbe0` interface; the 10-Gigabit Ethernet switch on the local Control Board also connects the Routing Engine to the 10-Gigabit Ethernet port accessed by the `ixgbe1` interface on the remote Routing Engine.
- The alternate link to the remote Routing Engine is the 10-Gigabit Ethernet port at the `ixgbe1` interface. This second port connects the Routing Engine to the 10-Gigabit Ethernet switch on the remote Control Board, which connects to the 10-Gigabit Ethernet port at the `ixgbe0` interface on the remote Routing Engine.

If one of the two links between the host subsystems fails, both Routing Engines can use the other link for IP communication.

- LCC in a routing matrix—On an LCC configured in a routing matrix, the Routing Engine and Control Board function as a unit, or host subsystem. For each host subsystem in the LCC, the Junos OS automatically creates two internal Ethernet interfaces, `bcm0` and `em1`, for the two Gigabit Ethernet ports on the Routing Engine.

The `bcm0` interface connects the Routing Engine in each LCC to the Routing Engines of every other LCC configured in the routing matrix.

- The Routing Engine connects to a Gigabit Ethernet switch on the local Control Board through a.
- The switch connects the Control Board to the remote Routing Engines of every other LCC configured in the routing matrix.

If an LCC in a routing matrix contains redundant host subsystems, the independent control planes are connected by two physical links between the Gigabit Ethernet ports on their respective Routing Engines.

- The primary link to the remote Routing Engine is at the `bcm0` interface; the Gigabit Ethernet switch on the local Control Board also connects the Routing Engine to the Gigabit Ethernet port accessed by the `em1` interface on the remote Routing Engine.

- The alternate link to the remote Routing Engine is at the **em1** interface. This second port connects the Routing Engine to the Gigabit Ethernet switch on the remote Control Board, which connects to the Gigabit Ethernet port at the **bcm0** interface on the remote Routing Engine.

If one of the two links between the host subsystems fails, both Routing Engines can use the other link for IP communication.

Each router also has two serial ports, labeled *console* and *auxiliary*, for connecting tty type terminals to the router using standard PC-type tty cables. Although these ports are not network interfaces, they do provide access to the router.

- [Routing Engine Specifications](#)
  - [Understanding Internal Ethernet Interfaces on page 12](#)
  - [Understanding Management Ethernet Interfaces on page 10](#)

## Interface Naming Overview

Each interface has an interface name, which specifies the media type, the slot in which the FPC or DPC is located, the location on the FPC where the PIC is installed, and the PIC or DPC port. The interface name uniquely identifies an individual network connector in the system. You use the interface name when configuring interfaces and when enabling various functions and properties, such as routing protocols, on individual interfaces. The system uses the interface name when displaying information about the interface, for example, in the **show interfaces** command.

The interface name is represented by a physical part, a channel part, and a logical part in the following format:

`physical[:channel].logical`

The channel part of the name is optional for all interfaces except channelized DS3, E1, OC12, and STM1 interfaces.

The following sections provide interface naming configuration guidelines:

- [Physical Part of an Interface Name on page 27](#)
- [Logical Part of an Interface Name on page 33](#)
- [Separators in an Interface Name on page 33](#)
- [Channel Part of an Interface Name on page 33](#)
- [Interface Naming for a Routing Matrix Based on a TX Matrix Router on page 34](#)
- [Interface Naming for a Routing Matrix Based on a TX Matrix Plus Router on page 36](#)
- [Chassis Interface Naming on page 39](#)
- [Examples: Interface Naming on page 39](#)

### Physical Part of an Interface Name

The physical part of an interface name identifies the physical device, which corresponds to a single physical network connector.

**NOTE:**

The internal interface is dependent on the Routing Engine. To identify if the Routing Engine is using this type of interface, use the following command:

```
user@host> show interfaces terse
```

Interface	Admin	Link	Proto	Local	Remote
pfe-1/0/0	up	up			
pfe-1/0/0.16383	up	up	inet		
			inet6		
pfh-1/0/0	up	up			
pfh-1/0/0.16383	up	up	inet

[.....]					
lsi	up	up			
mtun	up	up			
pimd	up	up			
pime	up	up			
tap	up	up			

For more information on the Routing Engines that each chassis supports, the first supported release for the Routing Engine in the specified chassis, the management Ethernet interface, and the internal Ethernet interfaces for each Routing Engine, please refer the link titled *Supported Routing Engines by Chassis* under Related Documentation section.

This part of the interface name has the following format:

*type-fpc/pic/port*

**type** is the media type, which identifies the network device that can be one of the following:

- **ae**—Aggregated Ethernet interface. This is a virtual aggregated link and has a different naming format from most PICs; for more information, see *Aggregated Ethernet Interfaces Overview*.
- **as**—Aggregated SONET/SDH interface. This is a virtual aggregated link and has a different naming format from most PICs; for more information, see *Configuring Aggregated SONET/SDH Interfaces*.
- **at**—ATM1 or ATM2 intelligent queuing (IQ) interface or a virtual ATM interface on a circuit emulation (CE) interface.
- **bcm**—The bcm0 internal Ethernet process is supported on specific Routing engines for various M series and T series routers. For more information please refer the link titled *Supported Routing Engines by Chassis* under Related Documentation section.
- **cau4**—Channelized AU-4 IQ interface (configured on the Channelized STM1 IQ or IQE PIC or Channelized OC12 IQ and IQE PICs).
- **ce1**—Channelized E1 IQ interface (configured on the Channelized E1 IQ PIC or Channelized STM1 IQ or IQE PIC).

- **ci**—Container interface.
- **coc1**—Channelized OC1 IQ interface (configured on the Channelized OC12 IQ and IQE or Channelized OC3 IQ and IQE PICs).
- **coc3**—Channelized OC3 IQ interface (configured on the Channelized OC3 IQ and IQE PICs).
- **coc12**—Channelized OC12 IQ interface (configured on the Channelized OC12 IQ and IQE PICs).
- **coc48**—Channelized OC48 interface (configured on the Channelized OC48 and Channelized OC48 IQE PICs).
- **cp**—Collector interface (configured on the Monitoring Services II PIC).
- **cstm1**—Channelized STM1 IQ interface (configured on the Channelized STM1 IQ or IQE PIC).
- **cstm4**—Channelized STM4 IQ interface (configured on the Channelized OC12 IQ and IQE PICs).
- **cstm16**—Channelized STM16 IQ interface (configured on the Channelized OC48/STM16 and Channelized OC48/STM16 IQE PICs).
- **ct1**—Channelized T1 IQ interface (configured on the Channelized DS3 IQ and IQE PICs, Channelized OC3 IQ and IQE PICs, Channelized OC12 IQ and IQE PICs, or Channelized T1 IQ PIC).
- **ct3**—Channelized T3 IQ interface (configured on the Channelized DS3 IQ and IQE PICs, Channelized OC3 IQ and IQE PICs, or Channelized OC12 IQ and IQE PICs).
- **demux**—Interface that supports logical IP interfaces that use the IP source or destination address to demultiplex received packets. Only one demux interface (**demux0**) exists per chassis. All demux logical interfaces must be associated with an underlying logical interface.
- **dfc**—Interface that supports dynamic flow capture processing on T Series or M320 routers containing one or more Monitoring Services III PICs. Dynamic flow capture enables you to capture packet flows on the basis of dynamic filtering criteria. Specifically, you can use this feature to forward passively monitored packet flows that match a particular filter list to one or more destinations using an on-demand control protocol.
- **ds**—DS0 interface (configured on the Multichannel DS3 PIC, Channelized E1 PIC, Channelized OC3 IQ and IQE PICs, Channelized OC12 IQ and IQE PICs, Channelized DS3 IQ and IQE PICs, Channelized E1 IQ PIC, Channelized STM1 IQ or IQE PIC, or Channelized T1 IQ).
- **dsc**—Discard interface.
- **e1**—E1 interface (including channelized STM1-to-E1 interfaces).
- **e3**—E3 interface (including E3 IQ interfaces).
- **em**—Management and internal Ethernet interfaces. For M Series routers, MX Series routers, T Series routers, and TX Series routers, you can use the **show chassis hardware**

command to display hardware information about the router, including its Routing Engine model. To determine which management interface is supported on your router and Routing Engine combination, see [“Understanding Management Ethernet Interfaces” on page 10](#) and [“Supported Routing Engines by Router” on page 14](#).

- **es**—Encryption interface.
- **et**—100-Gigabit Ethernet interfaces (10, 40, and 100-Gigabit Ethernet interface for PTX Series Packet Transport Routers only).
- **fe**—Fast Ethernet interface.
- **fxp**—Management and internal Ethernet interfaces. For M Series routers, MX Series routers, T Series routers, and TX Series routers, you can use the **show chassis hardware** command to display hardware information about the router, including its Routing Engine model. To determine which management interface is supported on your router and Routing Engine combination, see [“Understanding Management Ethernet Interfaces” on page 10](#) and [“Supported Routing Engines by Router” on page 14](#).
- **ge**—Gigabit Ethernet interface. Some older 10-Gigabit Ethernet interfaces use the **ge** media type to identify the physical part of the network device, but newer 10-Gigabit Ethernet interfaces use the **xe** media type.

**NOTE:** For configuration, the **ge** interface name should be used instead of the **xe** interface name in XENPAK 10-Gigabit Ethernet interface PICs. Refer the following show commands for more information:

```
user@host> show chassis hardware
..
FPC 4          REV 02   710-015839   CZ1853          M120 FPC Type

10GE(LAN),XENPAK
  Xcvr 0         REV 01   740-012045   535TFZX6        XENPAK-SR

user@host> show configuration interfaces ge-4/0/0
unit 0 {
  family inet {
    address 100.0.0.1/24;
  }
}
```

- **gr**—Generic routing encapsulation (GRE) tunnel interface.
- **gre**—Internally generated interface that is configurable only as the control channel for Generalized MPLS (GMPLS). For more information about GMPLS, see the *Junos OS MPLS Applications Library for Routing Devices* and the *Junos OS, Release 15.1*.

**NOTE:** You can configure GRE interfaces (**gre-x/y/z**) only for GMPLS control channels. GRE interfaces are not supported or configurable for other applications..

- **ip**—IP-over-IP encapsulation tunnel interface.
- **ipip**—Internally generated interface that is not configurable.
- **ixgbe**—The internal Ethernet process ixgbe0 and ixgbe1 are used by the RE-DUO-C2600-16G Routing Engine, which is supported on TX Matrix Plus and PTX5000.
- **iw**—Logical interfaces associated with the endpoints of Layer 2 circuit and Layer 2 VPN connections (pseudowire stitching Layer 2 VPNs). For more information about VPNs, see the *Junos OS VPNs Library for Routing Devices*.
- **lc**—Internally generated interface that is not configurable.
- **lo**—Loopback interface. The Junos OS automatically configures one loopback interface (**lo0**). The logical interface **lo0.16383** is a nonconfigurable interface for router control traffic.
- **ls**—Link services interface.
- **lsi**—Internally generated interface that is not configurable.
- **ml**—Multilink interface (including Multilink Frame Relay and MLPPP).
- **mo**—Monitoring services interface (including monitoring services and monitoring services II). The logical interface **mo-fpc/pic/port.16383** is an internally generated, nonconfigurable interface for router control traffic.
- **ms**—Multiservices interface.
- **mt**—Multicast tunnel interface (internal router interface for VPNs). If your router has a Tunnel PIC, the Junos OS automatically configures one multicast tunnel interface (**mt**) for each virtual private network (VPN) you configure. Although it is not necessary to configure multicast interfaces, you can use the **multicast-only** statement to configure the unit and family so that the tunnel can transmit and receive multicast traffic only. For more information, see [multicast-only](#).
- **mtun**—Internally generated interface that is not configurable.
- **oc3**—OC3 IQ interface (configured on the Channelized OC12 IQ and IQE PICs or Channelized OC3 IQ and IQE PICs).
- **pd**—Interface on the rendezvous point (RP) that de-encapsulates packets.
- **pe**—Interface on the first-hop PIM router that encapsulates packets destined for the RP router.
- **pimd**—Internally generated interface that is not configurable.
- **pime**—Internally generated interface that is not configurable.
- **rlsq**—Container interface, numbered from 0 through 127, used to tie the primary and secondary LSQ PICs together in high availability configurations. Any failure of the primary PIC results in a switch to the secondary PIC and vice versa.
- **rms**—Redundant interface for two multiservices interfaces.
- **rsp**—Redundant virtual interface for the adaptive services interface.

- **se**—Serial interface (including EIA-530, V.35, and X.21 interfaces).
- **si**—Services-inline interface, which is hosted on a Trio-based line card.
- **so**—SONET/SDH interface.
- **sp**—Adaptive services interface. The logical interface **sp-fpc/pic/port.16383** is an internally generated, nonconfigurable interface for router control traffic.
- **stm1**—STM1 interface (configured on the OC3/STM1 interfaces).
- **stm4**—STM4 interface (configured on the OC12/STM4 interfaces).
- **stm16**—STM16 interface (configured on the OC48/STM16 interfaces).
- **t1**—T1 interface (including channelized DS3-to-DS1 interfaces).
- **t3**—T3 interface (including channelized OC12-to-DS3 interfaces).
- **tap**—Internally generated interface that is not configurable.
- **umd**—USB modem interface.
- **vsp**—Voice services interface.
- **vc4**—Virtually concatenated interface.
- **vt**—Virtual loopback tunnel interface.
- **xe**—10-Gigabit Ethernet interface. Some older 10-Gigabit Ethernet interfaces use the **ge** media type (rather than **xe**) to identify the physical part of the network device.
- **xt**—Logical interface for Protected System Domains to establish a Layer 2 tunnel connection.

**fpc** identifies the number of the FPC or DPC card on which the physical interface is located. Specifically, it is the number of the slot in which the card is installed.

M40, M40e, M160, M320, M120, T320, T640, and T1600 routers each have eight FPC slots that are numbered 0 through 7, from left to right as you are facing the front of the chassis. For information about compatible FPCs and PICs, see the hardware guide for your router.

On PTX1000 routers, the FPC number is always 0.

The M20 router has four FPC slots that are numbered 0 through 3, from top to bottom as you are facing the front of the chassis. The slot number is printed adjacent to each slot.

MX Series routers support DPCs, FPCs, and Modular Interface Cards (MICs). For information about compatible DPCs, FPCs, PICs, and MICs, see the [MX Series Interface Module Reference](#).

For M5, M7i, M10, and M10i routers, the FPCs are built into the chassis; you install the PICs into the chassis.

The M5 and M7i routers have space for up to four PICs. The M7i router also comes with an integrated Tunnel PIC, or an optional integrated AS PIC, or an optional integrated MS PIC.

The M10 and M10i routers have space for up to eight PICs.

A routing matrix can have up to 32 FPCs (numbered 0 through 31).

For more information about interface naming for a routing matrix, see [“Interface Naming for a Routing Matrix Based on a TX Matrix Router” on page 34](#).

**pic** identifies the number of the PIC on which the physical interface is located. Specifically, it is the number of the PIC location on the FPC. FPCs with four PIC slots are numbered 0 through 3. FPCs with three PIC slots are numbered 0 through 2. The PIC location is printed on the FPC carrier board. For PICs that occupy more than one PIC slot, the lower PIC slot number identifies the PIC location.

**port** identifies a specific port on a PIC or DPC. The number of ports varies depending on the PIC. The port numbers are printed on the PIC.

## Logical Part of an Interface Name

The logical unit part of the interface name corresponds to the logical unit number, which can be a number from 0 through 16,385 for all interface types except demux and PPPoE. For these two interface types only, the range is 0 through 65,535.

In the virtual part of the name, a period (.) separates the port and logical unit numbers:

- Other platforms:

*type-fpc/pic/port.logical*

## Separators in an Interface Name

There is a separator between each element of an interface name.

In the physical part of the name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers.

In the virtual part of the name, a period (.) separates the channel and logical unit numbers.

A colon (:) separates the physical and virtual parts of the interface name.

## Channel Part of an Interface Name

The channel identifier part of the interface name is required only on channelized interfaces. For channelized interfaces, channel 0 identifies the first channelized interface. For channelized IQ and channelized IQE interfaces, channel 1 identifies the first channelized interface. A nonconcatenated (that is, channelized) SONET/SDH OC48 interface has four OC12 channels, numbered 0 through 3.

To determine which types of channelized PICs are currently installed in the router, use the **show chassis hardware** command from the top level of the command-line interface (CLI). Channelized IQ and IQE PICs are listed in the output with “intelligent queuing IQ”

or “enhanced intelligent queuing IQE” in the description. For more information, see *Channelized Interfaces Overview*.

For ISDN interfaces, you specify the B-channel in the form **bc-pim/0/port:n**. *n* is the B-channel ID and can be 1 or 2. You specify the D-channel in the form **dc-pim/0/port:0**.

**NOTE:** For ISDN, the B-channel and D-channel interfaces do not have any configurable parameters. However, when interface statistics are displayed, B-channel and D-channel interfaces have statistical values.

**NOTE:** In the Junos OS implementation, the term *logical interfaces* generally refers to interfaces you configure by including the unit statement at the [edit interfaces *interface-name*] hierarchy level. Logical interfaces have the *.logical* descriptor at the end of the interface name, as in ge-0/0/0.1 or t1-0/0/0.0.1, where the logical unit number is 1.

Although channelized interfaces are generally thought of as logical or virtual, the Junos OS sees T3, T1, and NxDS0 interfaces within a channelized IQ or IQE PIC as physical interfaces. For example, both t3-0/0/0 and t3-0/0/0.1 are treated as physical interfaces by the Junos OS. In contrast, t3-0/0/0.2 and t3-0/0/0.1.2 are considered logical interfaces because they have the .2 at the end of the interface names.

---

## Interface Naming for a Routing Matrix Based on a TX Matrix Router

A routing matrix based on a Juniper Networks TX Matrix router is a multichassis architecture composed of one TX Matrix router and from one to four interconnected T640 routers. From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix router controls all the T640 routers, as shown in [Figure 3 on page 35](#).

Figure 3: Routing Matrix

A TX Matrix router is also referred to as a *switch-card chassis* (SCC). The CLI uses **scc** to refer to the TX Matrix router. A T640 router in a routing matrix is also referred to as a *line-card chassis* (LCC). The CLI uses **lcc** as a prefix to refer to a specific T640 router.

LCCs are assigned numbers 0 through 3, depending on the hardware setup and connectivity to the TX Matrix router. For more information, see the [TX Matrix Router Hardware Guide](#). A routing matrix can have up to four T640 routers, and each T640 router has up to eight FPCs. Therefore, the routing matrix as a whole can have up to 32 FPCs (0 through 31).

In the Junos OS CLI, an interface name has the following format:

*type-fpc/pic/port*

When you specify the **fpc** number for a T640 router in a routing matrix, the Junos OS determines which T640 router contains the specified FPC based on the following assignment:

- On LCC 0, FPC hardware slots 0 through 7 are configured as 0 through 7.
- On LCC 1, FPC hardware slots 0 through 7 are configured as 8 through 15.
- On LCC 2, FPC hardware slots 0 through 7 are configured as 16 through 23.
- On LCC 3, FPC hardware slots 0 through 7 are configured as 24 through 31.

For example, the 1 in **se-1/0/0** refers to FPC hardware slot 1 on the T640 router labeled **lcc0**. The 11 in **t1-11/2/0** refers to FPC hardware slot 3 on the T640 router labeled **lcc1**. The 20 in **so-20/0/1** refers to FPC hardware slot 4 on the T640 router labeled **lcc2**. The 31 in **t3-31/1/0** refers to FPC hardware slot 7 on the T640 router labeled **lcc3**.

[Table 25 on page 36](#) summarizes the FPC numbering for a T640 router in a routing matrix.

**Table 25: FPC Numbering for T640 Routers in a Routing Matrix**

LCC Numbers Assigned to the T640 Router	Configuration Numbers
0	0 through 7
1	8 through 15
2	16 through 23
3	24 through 31

Table 26 on page 36 lists each FPC hardware slot and the corresponding configuration numbers for LCCs 0 through 3.

**Table 26: One-to-One FPC Numbering for T640 Routers in a Routing Matrix**

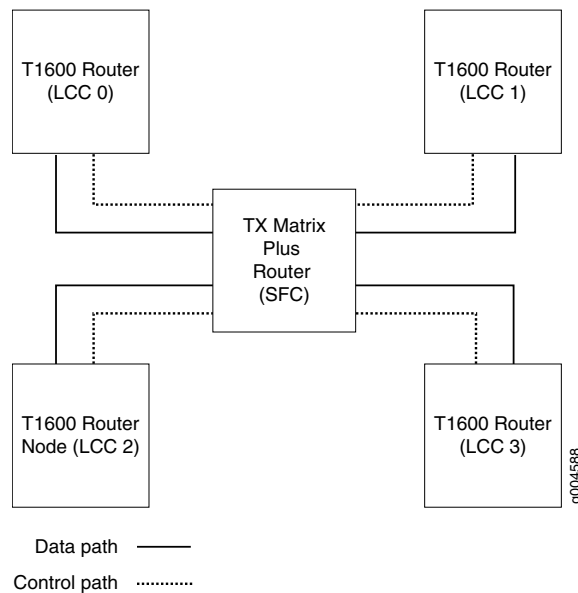

FPC Numbering	T640 Routers							
LCC 0								
Hardware Slots	0	1	2	3	4	5	6	7
Configuration Numbers	0	1	2	3	4	5	6	7
LCC 1								
Hardware Slots	0	1	2	3	4	5	6	7
Configuration Numbers	8	9	10	11	12	13	14	15
LCC 2								
Hardware Slots	0	1	2	3	4	5	6	7
Configuration Numbers	16	17	18	19	20	21	22	23
LCC 3								
Hardware Slots	0	1	2	3	4	5	6	7
Configuration Numbers	24	25	26	27	28	29	30	31

### Interface Naming for a Routing Matrix Based on a TX Matrix Plus Router

A routing matrix based on a Juniper Networks TX Matrix Plus Router is a multichassis architecture composed of one TX Matrix Plus router and from one to four interconnected T1600 routers. From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router controls all the T1600 routers, as shown in Figure 4 on page 37.

Figure 4: Routing Matrix Based on a TX Matrix Plus Router

A TX Matrix Plus router is also referred to as a *switch-fabric chassis* (SFC). The CLI uses **sfc** to refer to the TX Matrix Plus router. A T1600 router in a routing matrix is also referred to as a *line-card chassis* (LCC). The CLI uses **lcc** as a prefix to refer to a specific T1600 router.

LCCs are assigned numbers, 0 through 3, depending on the hardware setup and connectivity to the TX Matrix Plus router. For more information, see the *TX Matrix Plus Router Hardware Guide*. A routing matrix based on a TX Matrix Plus router can have up to four T1600 routers, and each T1600 router has up to eight FPCs. Therefore, the routing matrix as a whole can have up to 32 FPCs (0 through 31).

In the Junos OS CLI, an interface name has the following format:

*type-fpc/pic/port*

When you specify the **fpc** number for a T1600 router in a routing matrix, the Junos OS determines which T1600 router contains the specified FPC based on the following assignment:

- On LCC 0, FPC hardware slots 0 through 7 are configured as 0 through 7.
- On LCC 1, FPC hardware slots 0 through 7 are configured as 8 through 15.
- On LCC 2, FPC hardware slots 0 through 7 are configured as 16 through 23.
- On LCC 3, FPC hardware slots 0 through 7 are configured as 24 through 31.

For example, the 1 in **se-1/0/0** refers to FPC hardware slot 1 on the T1600 router labeled **lcc0**. The 11 in **t1-11/2/0** refers to FPC hardware slot 3 on the T1600 router labeled **lcc1**. The 20 in **so-20/0/1** refers to FPC hardware slot 4 on the T1600 router labeled **lcc2**. The 31 in **t3-31/1/0** refers to FPC hardware slot 7 on the T1600 router labeled **lcc3**.

Table 27 on page 38 summarizes the FPC numbering for a routing matrix based on a TX Matrix Plus router.

**Table 27: FPC Numbering for T1600 Routers in a Routing Matrix**

LCC Numbers Assigned to the T1600 Router	Configuration Numbers
0	0 through 7
1	8 through 15
2	16 through 23
3	24 through 31

Table 28 on page 38 lists each FPC hardware slot and the corresponding configuration numbers for LCCs 0 through 3.

**Table 28: One-to-One FPC Numbering for T1600 Routers in a Routing Matrix**

FPC Numbering	T1600 Routers							
LCC 0								
Hardware Slots	0	1	2	3	4	5	6	7
Configuration Numbers	0	1	2	3	4	5	6	7
LCC 1								
Hardware Slots	0	1	2	3	4	5	6	7
Configuration Numbers	8	9	10	11	12	13	14	15
LCC 2								
Hardware Slots	0	1	2	3	4	5	6	7
Configuration Numbers	16	17	18	19	20	21	22	23
LCC 3								
Hardware Slots	0	1	2	3	4	5	6	7
Configuration Numbers	24	25	26	27	28	29	30	31

## Chassis Interface Naming

You configure some PIC properties, such as framing, at the **[edit chassis]** hierarchy level. Chassis interface naming varies depending on the routing hardware.

- To configure PIC properties for a standalone router, you must specify the FPC and PIC numbers, as follows:

```
[edit chassis]
fpc slot-number {
  pic pic-number {
    ...
  }
}
```

- To configure PIC properties for a T640 or T1600 router configured in a routing matrix, you must specify the LCC, FPC, and PIC numbers, as follows:

```
[edit chassis]
lcc lcc-number {
  fpc slot-number { # Use the hardware FPC slot number
    pic pic-number {
      ...
    }
  }
}
```

For the FPC slot in a T640 router in a routing matrix, specify the actual hardware slot number, as labeled on the T640 router chassis. Do not use the corresponding software FPC configuration numbers shown in [Table 26 on page 36](#).

For the FPC slot in a T1600 router in a routing matrix, specify the actual hardware slot number, as labeled on the T1600 router chassis. Do not use the corresponding software FPC configuration numbers shown in [Table 27 on page 38](#).

For more information about the **[edit chassis]** hierarchy, see the *Junos OS Administration Library*.

## Examples: Interface Naming

This section provides examples of naming interfaces. For an illustration of where slots, PICs, and ports are located, see [Figure 5 on page 40](#).

**Figure 5: Interface Slot, PIC, and Port Locations**

For an FPC in slot 1 with two OC3 SONET/SDH PICs in PIC positions 0 and 1, each PIC with two ports uses the following names:

```
so-1/0/0.0
so-1/0/1.0
so-1/1/0.0
so-1/1/1.0
```

An OC48 SONET/SDH PIC in slot 1 and in concatenated mode appears as a single FPC with a single PIC, which has a single port. If this interface has a single logical unit, it has the following name:

```
so-1/0/0.0
```

An OC48 SONET/SDH PIC in slot 1 and in channelized mode has a number for each channel. For example:

```
so-1/0/0:0
so-1/0/0:1
```

For an FPC in slot 1 with a Channelized OC12 PIC in PIC position 2, the DS3 channels have the following names:

```
t3-1/2/0:0
t3-1/2/0:1
t3-1/2/0:2
...
t3-1/2/0:11
```

For an FPC in slot 1 with four OC12 ATM PICs (the FPC is fully populated), the four PICs, each with a single port and a single logical unit, have the following names:

```
at-1/0/0.0
at-1/1/0.0
at-1/2/0.0
```

at-1/3/0.0

In a routing matrix on the T640 router labeled **lcc1**, for an FPC in slot 5 with four SONET OC192 PICs, the four PICs, each with a single port and a single logical unit, have the following names:

so-13/0/0.0  
so-13/1/0.0  
so-13/2/0.0  
so-13/3/0.0

For an FPC in slot 1 with one 4-port ISDN BRI interface card, port 4 has the following name:

br-1/0/4

The first B-channel, the second B-channel, and the control channel have the following names:

bc-1/0/4:1  
bc-1/0/4:2  
dc-1/0/4:0

## Interface Descriptors Overview

When you configure an interface, you are effectively specifying the properties for a physical interface descriptor. In most cases, the physical interface descriptor corresponds to a single physical device and consists of the following parts:

- The interface name, which defines the media type
- The slot in which the FPC or DPC is located
- The location on the FPC in which the PIC is installed
- The PIC or DPC port
- The interface's channel and logical unit numbers (optional)

Each physical interface descriptor can contain one or more logical interface descriptors. These allow you to map one or more logical (or virtual) interfaces to a single physical device. Creating multiple logical interfaces is useful for ATM, Frame Relay, and Gigabit Ethernet networks, in which you can associate multiple virtual circuits, data-link connections, or virtual LANs (VLANs) with a single interface device.

Each logical interface descriptor can have one or more family descriptors to define the protocol family that is associated with and allowed to run over the logical interface.

The following protocol families are supported:

- Internet Protocol version 4 (IPv4) suite (inet)
- Internet Protocol version 6 (IPv6) suite (inet6)
- Circuit cross-connect (CCC)
- Translational cross-connect (TCC)
- International Organization for Standardization (ISO)
- Multilink Frame Relay end-to-end (MLFR end-to-end)
- Multilink Frame Relay user-to-network interface network-to-network interface (MLFR UNI NNI)
- Multilink Point-to-Point Protocol (MLPPP)
- Multiprotocol Label Switching (MPLS)
- Trivial Network Protocol (TNP)
- (M Series, T Series, and MX Series routers only) Virtual private LAN service (VPLS)

Finally, each family descriptor can have one or more address entries, which associate a network address with a logical interface and hence with the physical interface.

You configure the various interface descriptors as follows:

- You configure the physical interface descriptor by including the **interfaces** *interface-name* statement.
- You configure the logical interface descriptor by including the **unit** statement within the **interfaces** *interface-name* statement or by including the **.logical** descriptor at the end of the interface name, as in **t3-0/0/0.1**, where the logical unit number is 1, as shown in the following examples:

```
[edit]
user@host# set interfaces t3-0/0/0 unit 1
[edit]
user@host# edit interfaces t3-0/0/0.1
[edit interfaces t3-0/0/0]
user@host# set unit 1
```

- You configure the family descriptor by including the **family** statement within the **unit** statement.
- You configure address entries by including the **address** statement within the **family** statement.
- You configure tunnels by including the **tunnel** statement within the **unit** statement.

**NOTE:** The address of a logical interface cannot be the same as a tunnel interface's source or destination address. If you try to configure a logical interface with a tunnel interface's address or vice versa, a commit failure will occur.

## Physical Part of an Interface Name

- [Interface Names for ACX Series Universal Access Routers on page 53](#)
- [Interface Names for M Series and T Series Routers on page 54](#)
- [MX Series Router Interface Names on page 54](#)
- [Interface Names for PTX Series Routers on page 55](#)

## Interface Names for ACX Series Universal Access Routers

ACX Series routers do not have actual PIC devices. Instead they have built-in network ports on the front panel of the router. These ports are named using the same naming convention used for routers with PIC devices with the understanding that the FPC, PIC and port are pseudo devices. When you display information about one of these ports,

you specify the interface type, the slot for the Flexible PIC Concentrator (FPC), the slot on the FPC for the Physical Interface Card (PIC), and the configured port number.

In the physical part of the interface name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers:

*type-fpc/pic/port*

## Interface Names for M Series and T Series Routers

On M Series and T Series routers, when you display information about an interface, you specify the interface type, the slot in which the Flexible PIC Concentrator (FPC) is installed, the slot on the FPC in which the Physical Interface Card (PIC) is located, and the configured port number.

In the physical part of the interface name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers:

*type-fpc/pic/port*

**NOTE:** Exceptions to the *type-fpc/pic/port* physical description include the aggregated Ethernet and aggregated SONET/SDH interfaces, which use the syntax *ae number* and *as number*, respectively.

## MX Series Router Interface Names

On MX Series routers when you display information about an interface, you specify the interface type, the Dense Port Concentrator (DPC), Flexible PIC Concentrator (FPC), or Modular Port Concentrator (MPC) slot, the PIC or MIC slot, and the configured port number.

**NOTE:** Although the MX Series routers use DPCs, FPCs, MPCs, MICs, and PICs, command syntax in this book is shown as *fpc/pic/port* for simplicity.

In the physical part of the interface name, a hyphen (-) separates the media type from the FPC number, and a slash (/) separates the DPC, FPC or MPC, MIC or PIC, and port numbers:

*type-fpc/pic/port*

- *fpc*—Slot in which the DPC, FPC, or MPC is installed.
- *pic*—Slot on the FPC in which the PIC is located.

For DPCs, MICs, and the 16-port MPC, the PIC value is a logical grouping of ports and varies on different platforms.

- *port*—Port number on the DPC, PIC, MPC, or MIC.

## Interface Names for PTX Series Routers

On PTX Series Packet Transport Routers, when you display information about an interface, you specify the interface type, the slot in which the Flexible PIC Concentrator (FPC) is installed, the slot on the FPC in which the Physical Interface Card (PIC) is located, and the configured port number.

### NOTE:

- The PTX router supports Ethernet type interfaces only. The media type portion of the physical interface name, *type*, supports the Ethernet interface type only: **et**.
- In the CLI, all PTX3000 PICs are represented as **pic0**. For more information, see *PTX3000 PIC Description*.

In the physical part of the interface name, a hyphen (-) separates the media type (**et**) from the FPC number, and a slash (/) separates the FPC, PIC, and port numbers:

*type-fpc/pic/port*

## Displaying Interface Configurations Overview

To display a configuration, use either the **show** command in configuration mode or the **show configuration** top-level command. Interfaces are listed in numerical order, from lowest to highest slot number, then from lowest to highest PIC number, and finally from lowest to highest port number.

## Physical Interface Configuration Statements Overview

The software driver for each network media type sets reasonable default values for general interface properties, such as the interface's maximum transmission unit (MTU) size, receive and transmit leaky bucket properties, link operational mode, and clock source.

M Series, MX Series, and T Series routers are factory configured according to the specific router, its features, and its physical interfaces. This section includes a default configuration example showing the statements used to configure the physical interfaces properties. Additional statements are used to set properties for specific interface types and are described in [“Physical Interfaces Properties Statements List” on page 68](#).

To modify any of the default general interface properties, include the appropriate statements at the `[edit interfaces interface-name]` hierarchy level:

**NOTE:** The following configuration hierarchy and its included statements are shown only as an example of a configuration statement hierarchy and should not be referenced for resolving actual configurations. For information on a specific hierarchy level, see the hierarchy level document for that specific hierarchy, for example `[edit interfaces]` Hierarchy Level.

```

## Physical Interfaces Properties Statements List

Table 30 on page 68 lists statements that you can use to configure physical interfaces.

Table 30: Statements for Physical Interface Properties

Statement	Interface Types	Usage Guidelines
<b>802.3ad</b> <b>aex</b>	Aggregated Ethernet interfaces	<i>Aggregated Ethernet Interfaces Overview</i>
<b>access-profile</b> <i>name</i>	Interfaces with Point-to-Point Protocol (PPP) encapsulation	"Configuring the PPP Challenge Handshake Authentication Protocol" on page 126
<b>accounting-profile</b> <i>name</i>	All	"Configuring Accounting for the Physical Interface" on page 153
<b>acfc</b>	Interfaces with PPP encapsulation	<i>Configuring PPPoE</i>
<b>acknowledge-retries</b> <i>number</i>	Link services and voice services interfaces	<i>Junos OS Services Interfaces Library for Routing Devices</i>
<b>acknowledge-timer</b> <i>milliseconds</i>	Link services and voice services interfaces	<i>Junos OS Services Interfaces Library for Routing Devices</i>
<b>action-red-differential-delay</b> ( <b>disable-tx</b>   <b>remove-link</b> )	Link services and voice services interfaces	<i>Junos OS Services Interfaces Library for Routing Devices</i>
<b>advertise-interval</b> <i>milliseconds</i>	SONET/SDH interfaces	<i>Configuring APS Timers</i>
<b>aggregate</b>	Gigabit Ethernet intelligent queuing (IQ and IQE) interfaces and Gigabit Ethernet interfaces with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router)	<i>Configuring Gigabit Ethernet Policers</i>
<b>aggregate</b> <b>asx</b>	Aggregated SONET/SDH interfaces	<i>Configuring Aggregated SONET/SDH Interfaces</i>
<b>aggregated-ether-options</b>	Aggregated Ethernet interfaces	<i>Aggregated Ethernet Interfaces Overview</i>
<b>aggregate-ports</b>	SONET/SDH interfaces	<i>Configuring 4-Port OC192 PIC to Operate in OC768-over-OC192 Mode</i>
<b>aggregated-sonet-options</b>	Aggregated SONET/SDH interfaces	<i>Configuring Aggregated SONET/SDH Interfaces</i>
<b>alarm</b> <b>alarm-name</b> ( <b>syslog</b>   <b>link-down</b> )	10-Gigabit Ethernet interfaces	<i>Configuring 10-Gigabit Ethernet Link Down Notification for Optics Options Alarm or Warning</i>

## Interface Ranges

---

**NOTE:** This task uses Junos OS for EX Series switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring Interface Ranges*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

The Junos OS allows you to group a range of identical interfaces into an *interface range*. You first specify the group of identical interfaces in the interface range. Then you can apply a common configuration to the specified interface range, reducing the number of configuration statements required and saving time while producing a compact configuration.

- [Configuration Expansion Where Interface Range Is Used on page 92](#)

### Configuring Interface Ranges

To configure an interface range, include the **interface-range** statement at the **[edit interfaces]** hierarchy level.

The **interface-range** statement accepts only physical networking interface names in its definition. The following interface types are supported and example CLI descriptors are shown:

- ATM—**at-*fpc/pic/port***
- Channelized—**(coc | cstm)*n-fpc/pic/port***
- DPC—**xe-*fpc/pic/port***
- E1/E3—**(e1 | e3)-*fpc/pic/port***
- Ethernet—**(xe | ge | fe)-*fpc/pic/port***
- ISDN—**isdn-*fpc/pic/port***
- Serial—**se-*fpc/pic/port***
- SONET/SDH—**so-*fpc/pic/port***
- T1/T3—**(t1 | t3)-*fpc/pic/port***

Interfaces can be grouped either as a range of interfaces or using a number range under the **interface-range** statement definition.

Interfaces in an **interface-range** definition can be added as part of a member range or as individual members or multiple members using a number range.

To specify a member range, use the **member-range** statement at the **[edit interfaces interface-range name]** hierarchy level.

To specify interfaces in lexical order, use the **member-range start-range to end-range** statement.

A range for a member statement should contain the following:

- **\***—All, specifies sequential interfaces from 0 through 47.

**CAUTION:** The wildcard **\*** in a member statement does not take into account the interface numbers supported by a specific interface type. Irrespective of the interface type, **\*** includes interface numbers ranging from 0 through 47 to the interface group. Therefore, use **\*** in a member statement with caution.

- **num**—Number, specifies one specific interface by its number.
- **[low-high]**—Numbers between low to high, specifies a range of sequential interfaces.
- **[num1, num2, num3]**—Numbers **num1**, **num2**, and **num3** specify multiple specific interfaces.

#### Example: Specifying an Interface Range Member Range

```
member-range ge-0/0/0 to ge-4/0/40;
```

To specify one or multiple members, use the **member** statement at the **[edit interfaces interface-range name]** hierarchy level.

To specify the list of interface range members individually or for multiple interfaces using regex, use the **member list of interface names** statement.

#### Example: Specifying an Interface Range Member

```
member ge-0/0/0;
member ge-0/*/*
member ge-0/[1-10]/0;
member ge-0/[1,2,3]/3;
```

Regex or wildcards are not supported for interface-type prefixes. For example, prefixes **ge**, **fe**, and **xe** must be mentioned explicitly.

An **interface-range** definition can contain both **member** and **member-range** statements within it. There is no maximum limit on the number of **member** or **member-range** statements within an interface-range. However, at least one **member** or **member-range** statement must exist within an **interface-range** definition.

**Example: Interface Range Common Configuration**

Configuration common to an interface range can be added as a part of the **interface-range** definition, as follows:

```
[edit]
interfaces {
  + interface-range foo {
  + member-range ge-1/0/0 to ge-4/0/40;
  + member ge-0/1/1;
  + member ge-5/[1-10]/*;
    /*Common configuration is added as part of interface-range definition*/
    mtu 256;
    hold-time up 10;
    ether-options {
      flow-control;
      speed {
        100m;
      }
      802.3ad primary;
    }
  }
}
```

An **interface-range** definition having just **member** or **member-range** statements and no common configurations statements is valid.

These defined interface ranges can be used in other configuration hierarchies, in places where an **interface** node exists.

**Example: Interface-Range foo Used Under the Protocols Hierarchy**

```
protocols {
  dot1x {
    authenticator {
      interface foo{
        retries 1;
      }
    }
  }
}
```

**foo** should be an **interface-range** defined at the **[interfaces]** hierarchy level. In the above example, the **interface** node can accept both individual interfaces and interface ranges.

**TIP:** To view an interface range in expanded configuration, use the (**show | display inheritance**) command. For more information, see the *CLI User Guide*.

By default, **interface-range** is not available to configure in the CLI where the **interface** statement is available. The following locations are supported; however, some of the hierarchies shown in this list are product specific:

- protocols dot1x authentication interface
- protocols dvmrp interface
- protocols oam ethernet lmi interface

- protocols esis interface
- protocols igmp interface
- protocols igmp-host client *num* interface
- protocols mld-host client *num* interface
- protocols router-advertisement interface
- protocols isis interface
- protocols ldp interface
- protocols oam ethernet link-fault-management interface
- protocols lldp interface
- protocols link-management peer lmp-control-channel interface
- protocols link-management peer control-channel
- protocols link-management te-link *name* interface
- protocols mld interface
- protocols ospf area *id* interface
- protocols pim interface
- protocols router-discovery interface
- protocols rip group *name* neighbour
- protocols ripng group *name* neighbour
- protocols rsvp interface
- protocols snmp interface
- protocols layer2-control bpdu-block interface
- protocols layer2-control mac-rewrite interface
- protocols mpls interface
- protocols stp interface
- protocols rstp interface
- protocols mstp interface
- protocols vstp interface
- protocols mstp msti *id* interface
- protocols mstp msti vlan *id* interface
- protocols vstp vlan *name* interface
- protocols gvrp interface
- protocols igmp-snooping vlan *name* interface
- protocols lldp interface

- protocols lldp-med interface
- protocols sflow interfaces
- ethernet-switching-options analyzer *name* input [egress | ingress ] interface
- ethernet-switching-options analyzer *name* output interface
- ethernet-switching-options secure-access-port interface
- ethernet-switching-options interfaces ethernet-switching-options voip interface
- ethernet-switching-options redundant-trunk-group group *g1* interface
- ethernet-switching-options redundant-trunk-group group *g1* interface
- ethernet-switching-options bpdu-block interface
- poe interface vlans pro-bng-mc1-bsd1 interface

## Expanding Interface Range Member and Member Range Statements

All **member** and **member-range** statements in an interface range definition are expanded to generate the final list of interface names for the specified interface range.

### Example: Expanding Interface Range Member and Member Range Statements

```
[edit]
interfaces {
  interface-range range-1 {
    member-range ge-0/0/0 to ge-4/0/20;
    member ge-10/1/1;
    member ge-5/[0-5]/*;
    /*Common configuration is added part of the interface-range definition*/
    mtu 256;
    hold-time up 10;
    ether-options {
      flow-control;
      speed {
        100m;
      }
      802.3ad primary;
    }
  }
}
```

For the **member-range** statement, all possible interfaces between **start-range** and **end-range** are considered in expanding the members. For example, the following **member-range** statement:

**member-range ge-0/0/0 to ge-4/0/20**  
expands to:

```
[ge-0/0/0, ge-0/0/1 ... ge-0/0/max_ports
ge-0/1/0 ge-0/1/1 ... ge-0/1/max_ports
ge-0/2/0 ge-0/2/1 ... ge-0/2/max_ports
.
.
ge-0/MAX_PICS/0 ... ge-0/max_pics/max_ports]
```

```

ge-1/0/0 ge-1/0/1 ... ge-1/0/max_ports
.
ge-1/MAX_PICS/0 ... ge-1/max_pics/max_ports
.
.
ge-4/0/0 ge-4/0/1 ... ge-4/0/max_ports]

```

The following **member** statement:

**ge-5/[0-5]/\***

expands to:

```

ge-5/0/0 ... ge-5/0/max_ports
ge-5/1/0 ... ge-5/0/max_ports
.
.
ge-5/5/0 ... ge-5/5/max_ports

```

The following **member** statement:

**ge-5/1/[2,3,6,10]**

expands to:

```

ge-5/1/2
ge-5/1/3
ge-5/1/6
ge-5/1/10

```

## Configuration Inheritance for Member Interfaces

When the Junos OS expands the **member** and **member-range** statements present in an **interface-range**, it creates *interface objects* if they are not explicitly defined in the configuration. The common configuration is copied to all its member interfaces in the **interface-range**.

**Example:** Foreground interface configuration takes priority compared to configuration inherited by the interface through the **interface-range**.

**Configuration Priorities**

```

interfaces {
  interface-range range-1 {
    member-range ge-1/0/0/ to ge-10/0/47;
    mtu 256;
  }
  ge-1/0/1 {
    mtu 1024;
  }
}

```

In the preceding example, interface **ge-1/0/1** will have an MTU value of 1024.

This can be verified with output of the **show interfaces | display inheritance** command, as follows:

```
user@host: # show interfaces | display inheritance
```

```
## 'ge-1/0/0' was expanded from interface-range 'range-1'
##
ge-1/0/0 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
ge-1/0/1 {
  mtu 1024;
}
##
## 'ge-1/0/2' was expanded from interface-range 'range-1'
##
ge-1/0/2 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
.....
.....
##
## 'ge-10/0/47' was expanded from interface-range 'range-1'
##
ge-10/0/47 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
```

## Member Interfaces Inheriting Configuration from Configuration Groups

Interface range member interfaces inherit the config-groups configuration like any other foreground configuration. **interface-range** is similar to any other foreground configuration statement. The only difference is that the **interface-range** goes through a member interfaces expansion before Junos OS reads this configuration.

```
groups {
  global {
    interfaces {
      <*> {
        hold-time up 10;
      }
    }
  }
  apply-groups [global];
  interfaces {
    interface-range range-1 {
      member-range ge-1/0/0 to ge-10/0/47;
      mtu 256;
    }
  }
}
```

The **hold-time** configuration is applied to all members of **interface-range** *range-1*.

This can be verified with **show interfaces | display inheritance** as follows:

```
user@host# show interfaces | display inheritance
ge-1/0/0 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
  ##
  ## 'hold-time' was inherited from group 'global'
  ## '10' was inherited from group 'global'
  ##
  hold-time up 10;
}
ge-1/0/1 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
  ##
  ## 'hold-time' was inherited from group 'global'
  ## '10' was inherited from group 'global'
  ##
  hold-time up 10;
}
ge-10/0/47 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
  ##
  ## 'hold-time' was inherited from group 'global'
  ## '10' was inherited from group 'global'
  ##
  hold-time up 10;
}
```

## Interfaces Inheriting Common Configuration

If an interface is a member of several interface ranges, that interface will inherit the common configuration from all of those interface ranges.

```
[edit]
interfaces {
  interface-range range-1 {
    member-range ge-1/0/0 to ge-10/0/47;
    mtu 256;
  }
}
interfaces {
  interface-range range-1 {
    member-range ge-10/0/0 to ge-10/0/47;
    hold-time up 10;
  }
}
```

In this example, interfaces **ge-10/0/0** through **ge-10/0/47** will have both **hold-time** and **mtu**.

## Configuring Inheritance Range Priorities

The interface ranges are defined in the order of inheritance priority, with the first interface range configuration data taking priority over subsequent interface ranges.

```
[edit]
interfaces {
  interface-range int-grp-one {
    member-range ge-0/0/0 to ge-4/0/40;
    member ge-1/1/1;
    /*Common config is added part of the interface-range definition*/
    mtu 256;
    hold-time up 10;
  }
}
interfaces {
  interface-range int-grp-two {
    member-range ge-5/0/0 to ge-10/0/40;
    member ge-1/1/1;
    mtu 1024;
  }
}
```

Interface **ge-1/1/1** exists in both **interface-range int-grp-one** and **interface-range int-grp-two**. This interface inherits **mtu 256** from **interface-range int-grp-one** because it was defined first.

## Configuration Expansion Where Interface Range Is Used

In this example, **interface-range range-1** is used under the **protocols** hierarchy:

```
[edit]
interfaces {
  interface-range range-1 {
    member ge-10/1/1;
    member ge-5/5/1;
    mtu 256;
    hold-time up 10;
    ether-options {
      flow-control;
      speed {
        100m;
      }
      802.3ad primary;
    }
  }
}
protocols {
  dot1x {
    authenticator {
      interface range-1 {
        retries 1;
      }
    }
  }
}
```

```

    }
  }
}

```

The **interface** node present under **authenticator** is expanded into member interfaces of the **interface-range range-1** as follows:

```

protocols {
  dot1x {
    authenticator {
      interface ge-10/1/1 {
        retries 1;
      }
      interface ge-5/5/1 {
        retries 1;
      }
    }
  }
}

```

The **interface range-1** statement is expanded into two interfaces, ge-10/1/1 and ge-5/5/1, and configuration **retries 1** is copied under those two interfaces.

This configuration can be verified using the **show protocols dot1x | display inheritance** command.

## Specifying an Aggregated Interface

The M Series, MX Series, and T Series routers support aggregated interfaces. To specify an aggregated interface assign a number with the aggregated interface name. For example, configure **aex** at the **[edit interfaces]** hierarchy level, where x is an integer ranging 0 through 127 for M Series and T Series routers and 0 through 479 on MX Series routers.

For aggregated SONET/SDH interfaces, configure **asx** at the **[edit interfaces]** hierarchy level.

**NOTE:** SONET/SDH aggregation is proprietary to the Junos OS and might not work with other software.

If you are configuring VLANs for aggregated Ethernet interfaces, you must include the **vlan-tagging** statement at the **[edit interfaces aex]** hierarchy level to complete the association.

## Media MTU Overview

---

The media maximum transmission unit (MTU) is the largest data unit that can be forwarded without fragmentation.

The default media MTU size used on a physical interface depends on the encapsulation used on that interface. In some cases, the default IP Protocol MTU depends on whether the protocol used is IP version 4 (IPv4) or International Organization for Standardization (ISO).

The default media MTU is calculated as follows:

Default media MTU = Default IP MTU + encapsulation overhead

When you are configuring point-to-point connections, the MTU sizes on both sides of the connections must be the same. Also, when you are configuring point-to-multipoint connections, all interfaces in the subnet must use the same MTU size.

**NOTE:** The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the media MTU. For example, the media MTU for a Gigabit Ethernet Version 2 interface is specified as 1514 bytes, but the largest possible frame size is actually 1518 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

The physical MTU for Ethernet interfaces does not include the 4-byte frame check sequence (FCS) field of the Ethernet frame.

A SONET/SDH interface operating in concatenated mode has a “c” added to the rate descriptor. For example, a concatenated OC48 interface is referred to as OC48c.

If you do not configure an MPLS MTU, the Junos OS derives the MPLS MTU from the physical interface MTU. From this value, the software subtracts the encapsulation-specific overhead and space for the maximum number of labels that might be pushed in the Packet Forwarding Engine. Currently, the software provides for three labels of four bytes each, for a total of 12 bytes.

In other words, the formula used to determine the MPLS MTU is the following:

MPLS MTU = physical interface MTU – encapsulation overhead – 12

## Media MTU Sizes by Interface Type

The media maximum transmission unit (MTU) is the largest data unit that can be forwarded without fragmentation.

If you change the size of the media MTU, you must ensure that the size is equal to or greater than the sum of the protocol MTU and the encapsulation overhead.

#### Media MTU Sizes by Interface Type for MX Series Routers

**Table 35: Media MTU Sizes by Interface Type for MX Series Routers**

Interface Type	Default Media MTU (Bytes)	Maximum MTU (Bytes)	Default IP Protocol MTU (Bytes)
Gigabit Ethernet	1514	<ul style="list-style-type: none"> <li>9192</li> <li>9500 (Junos OS 16.1R1 and later releases)</li> </ul>	1500 (IPv4), 1488 (MPLS), 1497 (ISO)
10-Gigabit Ethernet	1514	<ul style="list-style-type: none"> <li>9192</li> <li>9500 (Junos OS 16.1R1 and later releases)</li> </ul>	1500 (IPv4), 1488 (MPLS), 1497 (ISO)
Multi-Rate Ethernet	1514	<ul style="list-style-type: none"> <li>9192</li> <li>9500 (Junos OS 16.1R1 and later releases)</li> </ul>	1500 (IPv4), 1488 (MPLS), 1497 (ISO)
Tri-Rate Ethernet	1514	<ul style="list-style-type: none"> <li>9192</li> <li>9500 (Junos OS 16.1R1 and later releases)</li> </ul>	1500 (IPv4), 1488 (MPLS), 1497 (ISO)
Channelized SONET/SDH OC3/STM1 (Multi-Rate)	1514	9192	1500 (IPv4), 1488 (MPLS), 1497 (ISO)
DS3/E3 (Multi-Rate)	1514	9192	1500 (IPv4), 1488 (MPLS), 1497 (ISO)

**Table 35: Media MTU Sizes by Interface Type for MX Series Routers** (*continued*)

**NOTE:** Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

**NOTE:** Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

#### Media MTU Sizes by Interface Type for T320 Routers

**Table 36: Media MTU Sizes by Interface Type for T320 Routers**

Interface Type	Default Media MTU (Bytes)	Maximum MTU (Bytes)	Default IP Protocol MTU (Bytes)
ATM	4482	9192	4470
ATM2 IQ	4482	9192	4470
Channelized OC12 IQ	4474	9192	4470
Channelized STM1 IQ	4474	9192	4470
DS3	4471	4500	4470
Fast Ethernet	1514	1533 (4-port) 1532 (12- and 48-port)	1500 (IPv4), 1497 (ISO)

**Table 36: Media MTU Sizes by Interface Type for T320 Routers** (*continued*)

Interface Type	Default Media MTU (Bytes)	Maximum MTU (Bytes)	Default IP Protocol MTU (Bytes)
Gigabit Ethernet	1514	9192	1500 (IPv4), 1497 (ISO)
SONET/SDH	4474	9192	4470
CT3 IQ	4474	9192	4470

**Media MTU Sizes by Interface Type for T640 Platforms****Table 37: Media MTU Sizes by Interface Type for T640 Platforms**

Interface Type	Default Media MTU (Bytes)	Maximum MTU (Bytes)	Default IP Protocol MTU (Bytes)
ATM2 IQ	4482	9192	4470
48-port Fast Ethernet	1514	1532	1500 (IPv4), 1497 (ISO)
Gigabit Ethernet	1514	9192	1500 (IPv4), 1497 (ISO)
SONET/SDH	4474	9192	4470
CT3 IQ	4474	9192	4470

**Media MTU Sizes by Interface Type for EX Series Switches and ACX Series Routers****Table 38: Media MTU Sizes by Interface Type for EX Series Switches and ACX Series Routers**

Interface Type	Default Media MTU (Bytes)	Maximum MTU (Bytes)	Default IP Protocol MTU (Bytes)
Gigabit Ethernet	1514	9192	1500 (IPv4), 1497 (ISO)
10-Gigabit Ethernet	1514	9192	1500 (IPv4), 1497 (ISO)

**NOTE:** On ACX Series routers, you can configure the protocol MTU by including the `mtu` statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] or [edit interfaces *interface-name* unit *logical-unit-number* family inet6] hierarchy level.

- If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
- If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.

### Media MTU Sizes by Interface Type for PTX Series Packet Transport Routers

**Table 39: Media MTU Sizes by Interface Type for PTX Series Packet Transport Routers**

Interface Type	Default Media MTU (Bytes)	Maximum MTU (Bytes)	Default IP Protocol MTU (Bytes)
10-Gigabit Ethernet	1514	9500	1500 (IPv4), 1488 (MPLS), 1497 (ISO)
40-Gigabit Ethernet	1514	9500	1500 (IPv4), 1488 (MPLS), 1497 (ISO)
100-Gigabit Ethernet	1514	9500	1500 (IPv4), 1488 (MPLS), 1497 (ISO)

## Configuring Interface Description

You can include a text description of each physical interface in the configuration file. Any descriptive text you include is displayed in the output of the **show interfaces** commands, and is also exposed in the **ifAlias** Management Information Base (MIB) object. It has no impact on the interface's configuration.

Before you add a text description of a physical interface in the configuration file, you must first configure the interface at the **[edit interfaces]** hierarchy level. To add a text description, include the **description** statement at the **[edit interfaces interface-name]** hierarchy level:

```
[edit]
user@host# edit interfaces interface-name
description text
```

For example:

```
[edit interfaces fe-0/0/1]
description "Backbone connection to PHL01"
```

The description can be a single line of text. If the text contains spaces, enclose it in quotation marks.

**NOTE:** You can configure the extended DHCP relay to include the interface description in the option 82 Agent Circuit ID suboption. See *Using DHCP Relay Agent Option 82 Information* in the *Junos OS Broadband Subscriber Management and Services Library*.

For information about describing logical units, see [“Adding a Logical Unit Description to the Configuration” on page 170](#).

To display the description from the router or switch CLI, use the **show interfaces** command:

```
user@host>
show interfaces fe-0/0/1
Physical interface: fe-0/0/1, Enabled, Physical link is Up
  Interface index: 129, SNMP ifIndex: 23
  Description: Backbone connection to PHL01
  ...
```

To display the interface description from the interfaces MIB, use the **snmpwalk** command from a server. To isolate information for a specific interface, search for the interface index shown in the **SNMP ifIndex** field of the **show interfaces** command output. The **ifAlias** object is in **ifXTable**.

```
user-server>snmpwalk host-fxp0.mylab public ifXTable | grep -e '\.23'
snmpwalk host-fxp0.mylab public ifXTable | grep -e '\.23'
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifName.23 = fe-0/0/1
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifInMulticastPkts.23 = Counter32: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifInBroadcastPkts.23 = Counter32: 0
```

```

ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifOutMulticastPkts.23 = Counter32: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifOutBroadcastPkts.23 = Counter32: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHCInOctets.23 = Counter64: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHCInUcastPkts.23 = Counter64: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHCInMulticastPkts.23 = Counter64: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHCInBroadcastPkts.23 = Counter64: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHCOctets.23 = Counter64: 42
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHCOUcastPkts.23 = Counter64: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHCOMulticastPkts.23 = Counter64: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHCOBroadcastPkts.23 = Counter64: 0
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifLinkUpDownTrapEnable.23 = enabled(1)
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifHighSpeed.23 = Gauge32: 100
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifPromiscuousMode.23 = false(2)
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifConnectorPresent.23 = true(1)
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifAlias.23 = Backbone connection to PHL01
ifMIB.ifMIBObjects.ifXTable.ifXEntry.ifCounterDiscontinuityTime.23 = Timeticks:
(0) 0:00:00.00

```

## Configuring the Media MTU

The media maximum transmission unit (MTU) is the largest data unit that can be forwarded without fragmentation. The default media MTU size used on a physical interface depends on the encapsulation being used on that interface. For a listing of MTU sizes for each encapsulation type, see [“Media MTU Sizes by Interface Type” on page 95](#).

To configure the media-MTU size:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level.

```

[edit ]
user@host# [edit interfaces interface-name]

```

2. Include the **mtu** statement.

```

[edit interfaces interface-name]
mtu bytes;

```

- If you change the size of the media MTU, you must ensure that the size is equal to or greater than the sum of the protocol MTU and the encapsulation overhead. You configure the protocol MTU by including the **mtu** statement at the following hierarchy levels:
  - **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]**

- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

---

**NOTE:**

- Changing the media MTU or protocol MTU causes an interface to be deleted and added again.
  - Because tunnel services interfaces are considered logical interfaces, you cannot configure the MTU setting for the physical interface. This means you cannot include the `mtu` statement at the [edit interfaces *interface-name*] hierarchy level for the following interface types: generic routing encapsulation (`gr-`), IP-IP (`ip-`), loopback (`lo-`), link services (`ls-`), multilink services (`ml-`), and multicast (`pe-`, `pd-`). You can, however, configure the protocol MTU on tunnel interfaces.
  - If you configure an MTU value by including the `mtu` statement at the [edit interfaces *interface-name* unit *logical-unit-number* family *mpls*] hierarchy level, the configured value is used.
-

---

## Configuring the Interface Speed

---

You can configure the interface speed in following ways:

- [Configuring the Interface Speed on Ethernet Interfaces on page 106](#)
- [Configuring Aggregated Ethernet Link Speed on page 107](#)
- [Configuring SONET/SDH Interface Speed on page 109](#)

### Configuring the Interface Speed on Ethernet Interfaces

For M Series and T Series Fast Ethernet 12-port and 48-port PIC interfaces, the management Ethernet interface (**fxp0** or **em0**), and the MX Series Tri-Rate Ethernet copper interfaces, you can explicitly set the interface speed. The Fast Ethernet, **fxp0**, and **em0** interfaces can be configured for 10 Mbps or 100 Mbps (**10m** | **100m**). The MX Series Tri-Rate Ethernet copper interfaces can be configured for 10 Mbps, 100 Mbps, or 1 Gbps (**10m** | **100m** | **1g**). For information about management Ethernet interfaces and to determine the management Ethernet interface type for your router, see “[Understanding Management Ethernet Interfaces](#)” on page 10 and “[Supported Routing Engines by Router](#)” on page 14. MX Series routers, with MX-DPC and Tri-Rate Copper SFPs, support 20x1 Copper to provide backwards compatibility with 100/10BASE-T and 1000BASE-T operation through an Serial Gigabit Media Independent Interface (SGMII) interface.

1. In configuration mode, go to the `[edit interfaces interface-name]` hierarchy level.

```
[edit ]
user@host# edit interfaces interface-name
```

2. To configure the speed, include the `speed` statement at the `[edit interfaces interface-name]` hierarchy level.

```
[edit interfaces interface-name]
user@host# set speed (10m | 100m | 1g | auto | auto-10m-100m);
```

#### NOTE:

- By default, the M Series and T Series routers management Ethernet interface autonegotiates whether to operate at 10 megabits per second (Mbps) or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the `no-concatenate` statement in the `[edit chassis]` configuration hierarchy.
- Starting with Junos OS Release 14.2, the `auto-10m-100m` option allows the fixed tri-speed port to auto negotiate with ports limited by 100m or 10m maximum speed. This option must be enabled only for Tri-rate MPC port, that is, 3D 40x 1GE (LAN) RJ45 MIC on MX platform. This option does not support other MICs on MX platform.
- When you manually configure Fast Ethernet interfaces on the M Series and T Series routers, link mode and speed must both be configured. If both these values are not configured, the router uses autonegotiation for the link and ignores the user-configured settings.
- If the link partner does not support autonegotiation, configure either Fast Ethernet port manually to match its link partner's speed and link mode. When the link mode is configured, autonegotiation is disabled.
- On MX Series routers with tri-rate copper SFP interfaces, if the port speed is negotiated to the configured value and the negotiated speed and interface speed do not match, the link will not be brought up.
- When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled.
- Starting with Junos OS Release 11.4, half-duplex mode is not supported on Tri-Rate Ethernet copper interfaces. When you include the `speed` statement, you must include the `link-mode full-duplex` statement at the same hierarchy level.

## Configuring Aggregated Ethernet Link Speed

On aggregated Ethernet interfaces, you can set the required link speed for all interfaces included in the bundle. Generally, all interfaces that make up a bundle must have the same speed. If you include in the aggregated Ethernet interface an individual link that

has a speed different from the speed that you specify in the **link-speed** parameter, an error message is logged. However, there are exceptions.

Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers. For example, these mixes are supported:

- Member links of different modes (WAN and LAN) for 10-Gigabit Ethernet links.
- Member links of different rates: 10-Gigabit Ethernet, 40-Gigabit Ethernet, 50-Gigabit Ethernet, 100-Gigabit Ethernet, and OC192 (10-Gigabit Ethernet WAN mode)

Starting with Junos OS Release 14.2, aggregated Ethernet supports mixed link speeds on PTX Series Packet Transport Routers.

**NOTE:**

- Member links of 50-Gigabit Ethernet can only be configured using the 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP (PD-1CE-CFP-FPC4).
- Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well. In releases before Junos OS Release 13.2, the 100-Gigabit Ethernet member link configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP cannot be included in an aggregated Ethernet link that includes member links of other interfaces.

---

To configure member links of mixed rates and mixed modes on T640, T1600, T4000, TX Matrix Plus, and PTX routers, you need to configure the **mixed** option for the **[edit interfaces aex aggregated-ether-options link-speed]** statement.

To set the required link speed:

1. Specify that you want to configure the aggregated Ethernet options.

```
user@host# edit interfaces interface-name aggregated-ether-options
```

2. Configure the link speed.

```
[edit interfaces interface-name aggregated-ether-options ]  
user@host# set link-speed speed
```

**speed** can be in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Aggregated Ethernet interfaces on the M120 router can have one of the following speeds:

- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **oc192**—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

- **10m**—Links are 10 Mbps.
- **100m**—Links are 100 Mbps.
- **1g**—Links are 1 Gbps.
- **10g**—Links are 10 Gbps.
- **50g**—Links are 50 Gbps.

Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:

- **100g**—Links are 100 Gbps.
- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **40g**—Links are 40 Gbps.
- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

## Configuring SONET/SDH Interface Speed

To configure the speed of SONET/SDH interfaces in concatenated mode:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level, where the *interface-name* is *so-fpc/pic/port*.

```
[edit]
user@host# edit interfaces so-fpc/pic/port
```

2. Configure interface speed in concatenated mode.

For example, each port of 4-port OC12 PIC can be configured to be in OC3 or OC12 speed independently when this PIC is in 4xOC12 concatenated mode.

```
[edit interfaces so-fpc/pic/port]
user@host# set speed (oc3 | oc12 | oc48)
```

To configure the speed of SONET/SDH interfaces in nonconcatenated mode:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level, where the *interface-name* is *so-fpc/pic/port*.

```
[edit]
user@host# edit interfaces so-fpc/pic/port
```

2. Configure interface speed in nonconcatenated mode.

For example, each port of 4-port OC12 PIC can be configured to be in OC3 or OC12 speed independently when this PIC is in 4xOC12 concatenated mode.

```
[edit interfaces so-fpc/pic/port]
user@host# set speed (oc3 | oc12)
```

To configure the PIC to operate in channelized (multiplexed) mode:

1. In configuration mode, go to the **[edit chassis fpc slot-number pic pic-number]** hierarchy level.

```
[edit]
user@host# [edit chassis fpc slot-number pic pic-number]
```

2. Configure the **no-concatenate** option.

```
[edit interfaces so-fpc/pic/port]
user@host# set no-concatenate
```

**NOTE:** On SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP, you cannot set the interface speed at the **[edit interfaces]** hierarchy level. To enable the speed on these MICs, you need to set the port speed at the **[edit chassis fpc slot-number pic pic-number port port-number]** hierarchy level.

For more information about using the **no-concatenate** statement, see the *Junos OS Administration Library*.

---

Release History Table

Release	Description
14.2	Starting with Junos OS Release 14.2
14.2	Starting with Junos OS Release 14.2, aggregated Ethernet supports mixed link speeds on PTX Series Packet Transport Routers.
13.2	Starting with Junos OS Release 13.2, aggregated Ethernet supports mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers.
13.2	Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP.
11.4	Starting with Junos OS Release 11.4

Documentation

## Configuring the Link Characteristics

By default, the router's management Ethernet interface, **fxp0** or **em0**, autonegotiates whether to operate in full-duplex or half-duplex mode. Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode, and all other interfaces can operate only in full-duplex mode. For Gigabit Ethernet, the link partner must also be set to full duplex.

**NOTE:** When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled.

**NOTE:** When you manually configure Fast Ethernet interfaces on the M Series and T Series routers, link mode and speed must both be configured. If both these values are not configured, the router uses autonegotiation for the link and ignores the user-configured settings.

**NOTE:** When the Fast Ethernet interface on Juniper Networks routers with autonegotiation enabled interoperates with a device configured to operate in half-duplex mode (autonegotiation disabled), the interface defaults to half-duplex mode after the PIC is taken offline and brought back online. This results in packet loss and cyclic redundancy check (CRC) errors.

To explicitly configure an Ethernet interface to operate in either full-duplex or half-duplex mode, include the **link-mode** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
link-mode (full-duplex | half-duplex);
```

## Interface Alias Names Overview

---

You can configure a textual description of a logical unit on a physical interface to be the alias of an interface name. Interface aliasing is supported only at the unit level. If you configure an alias name, the alias name is displayed instead of the interface name in the output of all **show**, **show interfaces**, and other operational mode commands. In Junos OS Release 12.3R8 and later, display of the alias can be suppressed in favor of the actual interface name by using the **display no-interface-alias** parameter along with the show command. Configuring an alias for a logical unit of an interface has no effect on how the interface on the router or switch operates.

When you configure the alias name of an interface, the CLI saves the alias name as the value of the *interface-name* variable in the configuration database. To enable backward compatibility with Junos OS releases in which the support for interface aliases is not available, when the Junos OS processes query the configuration database for the *interface-name* variable, the actual, exact value of the *interface-name* variable is returned instead of the alias name for system operations and computations.

This capability to define interface alias names for physical and logical interfaces is useful in a Junos Node Unifier (JNU) environment that contains a Juniper Networks MX Series 3D Universal Edge Router as a controller and EX Series Ethernet switches, QFX Series devices, and ACX Series Universal Access Routers as satellite devices. The following are the benefits of configuring an alias name, which enables a meaningful, single, and easily identifiable name to be allocated to an interface:

- You can group physical interfaces as one aggregated interface (link aggregation group or LAG bundle) and name that bundle as a satellite connection interface (for example, sat1).
- You can select a logical interface as a member of the LAG bundle or the entire LAG, and name that interface to represent a satellite device port or a service instance (for example, ge-0/0/1).
- You can combine the satellite name and the interface name aliases to wholly represent the satellite port name (for example, sat1:ge-0/0/1 or ge-sat1/0/0/1 or ge-1/0/0/1) in the most easily distinguishable format that denotes a combination of port and satellite parts of the name.

To specify an interface alias, you can use the **alias** statement at the **[edit interfaces *interface-name* unit *logical-unit-number*]** and **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]** hierarchy levels.

**NOTE:** In Juniper Networks M Series Multiservice Edge Routers, if the same alias name is configured on more than one logical interface, the router displays an error message and commit fails.

---

  - [alias on page 402](#)

## Example: Adding an Interface Alias Name

This example shows how to add an alias to the logical unit of an interface. Using an alias to identify interfaces as they appear in the output for operational commands can allow for more meaningful naming conventions and easier identification.

- [Requirements on page 113](#)
- [Overview on page 113](#)
- [Configuration on page 113](#)
- [Verification on page 116](#)

### Requirements

This example uses the following hardware and software components:

- One MX Series router that acts as a controller
- One EX4200 switch that acts as a satellite device
- Junos OS Release 13.3R1 or later

### Overview

You can create an alias for each logical unit on a physical interface. The descriptive text you define for the alias is displayed in the output of the **show interfaces** commands. In Junos OS Release 12.3R8 and later, display of the alias can be suppressed in favor of the actual interface name by using the **display no-interface-alias** parameter along with the show command. The alias configured for a logical unit of an interface has no effect on how the interface on the router or switch operates – it is only a cosmetic label.

### Configuration

Consider a scenario in which alias names are configured on the interfaces of a JNU controller that are connected to a satellite, sat1, in the downlink direction in the JNU management network by using two links. The alias names enable effective, streamlined identification of these interfaces in the operational mode commands that are run on the controller and satellites.

- [Configuring Alias Names for the Controller Interfaces on page 114](#)
- [Results on page 115](#)

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level:

```
set interfaces ae0 unit 0 alias "controller-sat1-downlink1"
```

```
set interfaces ae0.0 family inet address 10.0.0.1/24
set interfaces ae1 unit 0 alias "controller-sat1-downlink1"
set interfaces ae0.0 family inet address 192.0.2.128/25
set interfaces ge-0/0/0 vlan-tagging
set interfaces ge-0/0/0 unit 0 alias "ge-to-corp-gw1"
set interfaces ge-0/0/0.0 vlan-id 101
set interfaces ge-0/0/0.0 family inet address 1.1.1.1/23
set interfaces ge-0/1/0 gigether-options 802.3ad ae0
set interfaces ge-0/1/1 gigether-options 802.3ad ae0
set protocols rip group corporate-firewall neighbor ge-to-corp-gw1
```

---

### Configuring Alias Names for the Controller Interfaces

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To add an alias name to the controller interfaces that are used to connect to the satellite devices in the downlink direction:

1. Configure an alias name for the logical unit of an aggregated Ethernet interface that is used to connect to a satellite, sat1, in the downlink direction. Configure **inet** family and address for the interface.

```
[edit]
user@host# set interfaces ae0 unit 0 alias "controller-sat1-downlink1"
user@host# set interfaces ae0.0 family inet address 10.0.0.1/24
```

2. Configure an alias name for the logical unit of another aggregated Ethernet interface that is used to connect to the same satellite, sat1, in downlink direction. Configure **INET** family and address for the interface.

```
[edit]
user@host# set interfaces ae0 unit 1 alias "controller-sat1-downlink2"
user@host# set interfaces ae0.0 family inet address 10.0.0.3/24
```

3. Configure an alias name for the Gigabit Ethernet interface on the controller and configure its parameters.

```
[edit]
user@host# set interfaces ge-0/0/0 vlan-tagging
user@host# set interfaces ge-0/0/0 unit 0 alias "ge-to-corp-gw1"
user@host# set interfaces ge-0/0/0.0 vlan-id 101
user@host# set interfaces ge-0/0/0.0 family inet address 1.1.1.1/23
```

4. Configure Gigabit Ethernet interfaces to be member links of an **ae-** logical interface.

```
[edit]
user@host# set interfaces ge-0/1/0 gigether-options 802.3ad ae0
user@host# set interfaces ge-0/1/1 gigether-options 802.3ad ae0
```

5. Configure RIP in the network between the controller and the firewall gateway.

```
[edit]
user@host# set protocols rip group corporate-firewall neighbor ge-to-corp-gw1
```

## Results

In configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
    interfaces {
        ae0 {
            unit 0 {
                alias "controller-sat1-downlink1";
                family inet {
                    address 10.0.0.1/24;
                }
            }
            unit 1 {
                alias "controller-sat1-downlink2";
                family inet {
                    address 10.0.0.3/24;
                }
            }
        }
        ge-0/0/0 {
            vlan-tagging;
            unit 0 {
                alias "ge-to-corp-gw1";
                vlan-id 101;
                family inet {
                    address 1.1.1.1/23;
                }
            }
        }
        ge-0/1/0 {
            gigether-options {
                802.3ad ae0;
            }
        }
        ge-0/1/1 {
            gigether-options {
                802.3ad ae0;
            }
        }
    }
    protocols rip {
        group corporate-firewall {
            neighbor ge-to-corp-gw1;
        }
    }
}
```

After you have confirmed that the interfaces are configured, enter the **commit** command in configuration mode.

**NOTE:** In Juniper Networks M Series Multiservice Edge Routers, if the same alias name is configured on more than one logical interface, the router displays an error message and commit fails.

## Verification

To verify that the alias name is displayed instead of the interface name, perform these steps:

- [Verifying the Configuration of the Alias Name for the Controller Interfaces on page 116](#)

### Verifying the Configuration of the Alias Name for the Controller Interfaces

**Purpose** Verify that the alias name is displayed instead of the interface name.

**Action** Display information about all RIP neighbors.

```
user@router> show rip neighbor
```

Neighbor	Local State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
ge-to-corp-gw1	DN	(null)	255.255.255.255	mcast	both	1

**Meaning** The output displays the details of the benchmarking test that was performed. For more information about the **show rip neighbor** operational command, see **show rip neighbor** in the [CLI Explorer](#).

- [alias on page 402](#)

## Clock Source Overview

For both the router and interfaces, the clock source can be an external clock that is received on the interface or the router's internal Stratum 3 clock.

For example, interface A can transmit on interface A's received clock (external, loop timing) or the Stratum 3 clock (internal, line timing, or normal timing). Interface A cannot use a clock from any other source. For interfaces such as SONET/SDH that can use different clock sources, you can configure the source of the transmit clock on each interface.

The clock source resides on the System Control Board (SCB) for M40 routers, the System and Switch Board (SSB) for M20 routers, the Control Board (CB) for M120 routers, and the Miscellaneous Control Subsystem (MCS) for M40e and M160 routers. M7i and M10i routers have a clock source on the Compact Forwarding Engine Board (CFEB) and Enhanced Compact Forwarding Engine Board (CFEB-E).

For T Series and MX Series, the clock source internal Stratum 3 clock resides on the SONET Clock Generator and Switch Control Board (SCB) respectively. By default, the 19.44-MHz Stratum 3 reference clock generates the clock signal for all serial PICs (SONET/SDH) and Plesiochronous Digital Hierarchy (PDH) PICs. PDH PICs include DS3, E3, T1, and E1 PICs.

**NOTE:** M7i and M10i routers do not support external clocking of SONET interfaces.

For information about clocking on channelized interfaces, see *Channelized IQ and IQE Interfaces Properties*. Also see *Configuring the Clock Source on SONET/SDH Interfaces* and *Configuring the Channelized T3 Loop Timing*.

For information about configuring an external synchronization interface that can be used to synchronize the internal Stratum 3 clock to an external source on the M40e, M120, M320, routers and T Series routers, see *Junos OS Administration Library, Configuring Junos OS to Support an External Clock Synchronization Interface for M Series, MX Series, and T Series Routers*.

For information about configuring Synchronous Ethernet on MX 80, MX240, MX480, and MX960 3D Universal Edge Routers, see *Junos OS Administration Library, Synchronous Ethernet Overview* and *Configuring Clock Synchronization Interface on MX Series Routers*.

### Related Documentation

## Configuring the Clock Source

---

For both the router and interfaces, the clock source can be an external clock that is received on the interface or the router's internal Stratum 3 clock.

To set the clock source as external or internal:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the **clocking** option as external or internal.

```
[edit interfaces interface-name]
user@host# set clocking (external | internal)
```

**NOTE:** M7i and M10i routers do not support external clocking of SONET interfaces.

**NOTE:** On Channelized SONET/SDH PICs, if you set the parent (or the master) controller clock to external, then you must set the child controller clocks to the default value—that is, internal.

For example, on the Channelized STM1 PIC, if the clock on the Channelized STM1 interface (which is the master controller) is set to external, then you must not configure the CE1 interface (which is the child controller) clock to external. Instead you must configure the CE1 interface clock to internal.

For information about clocking on channelized interfaces, see *Channelized IQ and IQE Interfaces Properties*. Also see *Configuring the Clock Source on SONET/SDH Interfaces* and *Configuring the Channelized T3 Loop Timing*.

For information about configuring an external synchronization interface that can be used to synchronize the internal Stratum 3 clock to an external source on the M40e, M120, and M320 routers and on the T Series routers, see *Junos OS Administration Library, Configuring Junos OS to Support an External Clock Synchronization Interface for M Series, MX Series, and T Series Routers*.

For information about configuring Synchronous Ethernet on MX80, MX240, MX480, and MX960 3D Universal Edge Routers, see *Junos OS Administration Library, Synchronous Ethernet Overview* and *Configuring Clock Synchronization Interface on MX Series Routers*.

## Configuring Interface Encapsulation on Physical Interfaces

- [Understanding Interface Encapsulation on Physical Interfaces on page 119](#)
- [Encapsulation Capabilities of Physical Interfaces on page 119](#)
- [Configuring the Encapsulation on a Physical Interface on page 120](#)
- [Displaying the Encapsulation on a Physical SONET/SDH Interface on page 121](#)

### Understanding Interface Encapsulation on Physical Interfaces

Point-to-Point Protocol (PPP) encapsulation is the default encapsulation type for physical interfaces. You need not configure encapsulation for any physical interfaces that support PPP encapsulation. If you do not configure encapsulation, PPP is used by default.

For physical interfaces that do not support PPP encapsulation, you must configure an encapsulation to use for packets transmitted on the interface. You can optionally configure an encapsulation on a logical interface, which is the encapsulation used within certain packet types.

### Encapsulation Capabilities of Physical Interfaces

When you configure a point-to-point encapsulation (such as PPP or Cisco HDLC) on a physical interface, the physical interface can have only one logical interface (that is, only one **unit** statement) associated with it. When you configure a multipoint encapsulation (such as Frame Relay), the physical interface can have multiple logical units, and the units can be either point-to-point or multipoint.

Ethernet CCC encapsulation for Ethernet interfaces with standard TPID tagging requires that the physical interface have only a single logical interface. Ethernet interfaces in VLAN mode can have multiple logical interfaces.

For Ethernet interfaces in VLAN mode, VLAN IDs are applicable as follows:

- VLAN ID 0 is reserved for tagging the priority of frames.
- For encapsulation type **vlan-ccc**, VLAN IDs 1 through 511 are reserved for normal VLANs. VLAN IDs 512 and above are reserved for VLAN CCCs.
- For encapsulation type **vlan-vpls**, VLAN IDs 1 through 511 are reserved for normal VLANs, and VLAN IDs 512 through 4094 are reserved for VPLS VLANs. For 4-port Fast Ethernet interfaces, you can use VLAN IDs 512 through 1024 for VPLS VLANs.
- For Gigabit Ethernet interfaces and Gigabit Ethernet IQ and IQE PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), you can configure flexible Ethernet services encapsulation on the physical interface.

For interfaces with **flexible-ethernet-services** encapsulation, all VLAN IDs are valid. VLAN IDs from 1 through 511 are not reserved.

- For encapsulation types **extended-vlan-ccc** and **extended-vlan-vpls**, all VLAN IDs are valid.

The upper limits for configurable VLAN IDs vary by interface type.

When you configure a TCC encapsulation, some modifications are needed to handle VPN connections over unlike Layer 2 and Layer 2.5 links and terminate the Layer 2 and Layer 2.5 protocol locally.

The router performs the following media-specific changes:

- PPP TCC—Both Link Control Protocol (LCP) and Network Control Protocol (NCP) are terminated on the router. Internet Protocol Control Protocol (IPCP) IP address negotiation is not supported. The Junos OS strips all PPP encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to PPP encapsulation.
- Cisco HDLC TCC—Keepalive processing is terminated on the router. The Junos OS strips all Cisco HDLC encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to Cisco HDLC encapsulation.
- Frame Relay TCC—All Local Management Interface (LMI) processing is terminated on the router. The Junos OS strips all Frame Relay encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to Frame Relay encapsulation.
- ATM—Operation, Administration, and Maintenance (OAM) and Interim Local Management Interface (ILMI) processing is terminated at the router. Cell relay is not supported. The Junos OS strips all ATM encapsulation data from incoming frames before forwarding them. For output, the next hop is changed to ATM encapsulation.

## Configuring the Encapsulation on a Physical Interface

By default, PPP is the encapsulation type for physical interfaces. To configure the encapsulation on a physical interface, include the encapsulation statement at the **[edit interfaces *interface-name*]** hierarchy level:

To configure encapsulation on a physical interface:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level.

```
[edit]
user@host# set interfaces so-fpc/pic/port
```

2. Configure the encapsulation type as described in [encapsulation](#).

```
[edit interfaces mo-fpc/pic/port]
user@host# set encapsulation encapsulation-type
```

**NOTE:**

- When you configure a point-to-point encapsulation (such as PPP or Cisco HDLC) on a physical interface, the physical interface can have only one logical interface (that is, only one unit statement) associated with it. When you configure a multipoint encapsulation (such as Frame Relay), the physical interface can have multiple logical units, and the units can be either point-to-point or multipoint.
- When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.
- When vlan-vpls encapsulation is set at the physical interface level, commit check will validate that there should not be any inet family configured within it.

## Displaying the Encapsulation on a Physical SONET/SDH Interface

**Purpose** To display the configured encapsulation and its associated set options on a physical interface when the following are set at the `[edit interfaces interface-name]` hierarchy level:

- interface-name—`so-7/0/0`
- Encapsulation—`ppp`
- Unit—`0`
- Family—`inet`
- Address—`192.168.1.113/32`
- Destination—`192.168.1.114`
- Family—`iso` and `mpls`

**Action** Run the `show` command at the `[edit interfaces interface-name]` hierarchy level.

```
[edit interfaces so-7/0/0]
user@host# show
encapsulation ppp;
unit 0 {
  point-to-point;
  family inet {
    address 192.168.1.113/32 {
      destination 192.168.1.114;
    }
  }
  family iso;
  family mpls;
}
```

**Meaning** The configured encapsulation and its associated set options are displayed as expected. Note that the second set of two **family** statements allow IS-IS and MPLS to run on the interface.

## Configuring Interface Encapsulation on PTX Series Packet Transport Routers

---

This topic describes how to configure interface encapsulation on PTX Series Packet Transport Routers. Use the **flexible-ethernet-services** configuration statement to configure different encapsulation for different logical interfaces under a physical interface. With flexible Ethernet services encapsulation, you can configure each logical interface encapsulation without range restrictions for VLAN IDs.

Supported encapsulations for physical interfaces include:

- **flexible-ethernet-services**
- **ethernet-ccc**
- **ethernet-tcc**

Supported encapsulations for logical interfaces include:

- **ethernet**
- **vlan-ccc**
- **vlan-tcc**

**NOTE:** PTX Series Packet Transport Routers do not support **extended-vlan-cc** and **extended-vlan-tcc** encapsulation on logical interfaces. Instead, you can configure a tag protocol ID (TPID) value of 0x9100 to achieve the same results.

---

To configure flexible Ethernet services encapsulation, include the **encapsulation flexible-ethernet-services** statement at the **[edit interfaces et-fpc/pic/port ]** hierarchy level. For example:

```
interfaces {
  et-fpc/pic/port {
    vlan-tagging;
    encapsulation flexible-ethernet-services;
    unit 0 {
      vlan-id 1000;
      family inet {
        address 11.0.0.20/24;
      }
    }
  }
}
```

```

unit 1 {
    encapsulation vlan-ccc;
    vlan-id 1010;
}
unit 2 {
    encapsulation vlan-tcc;
    vlan-id 1020;
    family tcc {
        proxy {
            inet-address 11.0.2.160;
        }
        remote {
            inet-address 11.0.2.10;
        }
    }
}
}

```

**Related Documentation**

- [Configuring Interface Encapsulation on Physical Interfaces on page 119](#)

## Configuring Keepalives

By default, physical interfaces configured with Cisco HDLC or PPP encapsulation send keepalive packets at 10-second intervals. The Frame Relay term for keepalives is LMI packets; the Junos OS supports both ANSI T1.617 Annex D LMIs and ITU Q933 Annex A LMIs. On ATM networks, OAM cells perform the same function. You configure OAM cells at the logical interface level; for more information, see [Defining the ATM OAM F5 Loopback Cell Period](#).

To disable the sending of keepalives:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level.

```

[edit ]
user@host# edit interfaces interface-name

```

2. Include the **no-keepalives** statement at the **[edit interfaces *interface-name*]** hierarchy level.

```

[edit interfaces interface-name]
no-keepalives;

```

To disable the sending of keepalives on a physical interface configured with Cisco HDLC encapsulation for a translational cross-connection:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level.

```

[edit ]
user@host# edit interfaces interface-name

```

2. Include the **no-keepalives** statement with the **encapsulation cisco-hdlc-tcc** statement at the **[edit interfaces *interface-name*]** hierarchy level.

```
[edit interfaces interface-name]  
encapsulation cisco-hdlc-tcc;  
no-keepalives;
```

To disable the sending of keepalives on a physical interface configured with PPP encapsulation for a translational cross-connection:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level.

```
[edit ]  
user@host# edit interfaces interface-name
```

2. Include the **no-keepalives** statement with the **encapsulation ppp-tcc** statement at the **[edit interfaces *interface-name*]** hierarchy level.

```
[edit interfaces interface-name]  
encapsulation ppp-tcc;  
no-keepalives;
```

For more information about translation cross-connections, see Circuit and Translational Cross-Connects Overview.

When you configure PPP over ATM or Multilink PPP over ATM encapsulation, you can enable or disable keepalives on the logical interface. For more information, see Configuring PPP over ATM2 Encapsulation.

To explicitly enable the sending of keepalives:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level.

```
[edit ]  
user@host# edit interfaces interface-name
```

2. Include the **keepalives** statement at the **[edit interfaces *interface-name*]** hierarchy level.

```
[edit interfaces interface-name]  
keepalives;
```

To change one or more of the default keepalive values:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level.

```
[edit ]  
user@host# edit interfaces interface-name
```

2. Include the **keepalives** statement with the appropriate option as **intervalseconds**, **down-countnumber**, and the **up-countnumber**.

```
[edit interfaces interface-name]  
keepalives;
```

**keepalives** <interval *seconds*> <down-count *number*> <up-count *number*>;

On interfaces configured with Cisco HDLC or PPP encapsulation, you can include the following three keepalive statements; note that Frame Relay encapsulation is not affected by these statements:

- **interval *seconds***—The time in seconds between successive keepalive requests. The range is from 1 second through 32767 seconds, with a default of 10 seconds.
- **down-count *number***—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is from 1 through 255, with a default of 3.
- **up-count *number***—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is from 1 through 255, with a default of 1.

**CAUTION:** If interface keepalives are configured on an interface that does not support the keepalives configuration statement (for example, 10-Gigabit Ethernet), the link layer may go down when the PIC is restarted. Avoid configuring the keepalives on interfaces that do not support the keepalives configuration statement.

For information about Frame Relay keepalive settings, see *Configuring Frame Relay Keepalives*.

On MX Series routers with Modular Port Concentrators/Modular Interface Cards (MPCs/MICs), the Packet Forwarding Engine on an MPC/MIC processes and responds to Link Control Protocol (LCP) Echo-Request keepalive packets that the PPP subscriber (client) initiates and sends to the router. The mechanism by which LCP Echo-Request packets are processed by the Packet Forwarding Engine instead of by the Routing Engine is referred to as *PPP fast keepalive*. For more information about how PPP fast keepalive works on an MX Series router with MPCs/MICs, see the *Junos OS Subscriber Access Configuration Guide*.

## Configuring the PPP Challenge Handshake Authentication Protocol

---

- [PPP Challenge Handshake Authentication Protocol on page 126](#)
- [Configuring the PPP Challenge Handshake Authentication Protocol on page 126](#)
- [Displaying the Configured PPP Challenge Handshake Authentication Protocol on page 127](#)

### PPP Challenge Handshake Authentication Protocol

For interfaces with PPP encapsulation, you can configure interfaces to support the PPP Challenge Handshake Authentication Protocol (CHAP), as defined in RFC 1994, PPP Challenge Handshake Authentication Protocol (CHAP). When you enable CHAP on an interface, the interface can authenticate its peer and can be authenticated by its peer. By default, PPP CHAP is disabled. If CHAP is not explicitly enabled, the interface makes no CHAP challenges and denies all incoming CHAP challenges. To enable CHAP, you must create an access profile, and you must configure the interfaces to use CHAP.

### Configuring the PPP Challenge Handshake Authentication Protocol

When you configure an interface to use CHAP, you must assign an access profile to the interface. When an interface receives CHAP challenges and responses, the access profile in the packet is used to look up the shared secret, as defined in RFC 1994. If no matching access profile is found for the CHAP challenge that was received by the interface, the optionally configured default CHAP secret is used. The default CHAP secret is useful if the CHAP name of the peer is unknown, or if the CHAP name changes during PPP link negotiation.

To enable CHAP, you must create an access profile, and you must configure the interfaces to use PAP. For more information on how to configure access profile, see *Configuring Access Profiles for L2TP or PPP Parameters*.

To configure the PPP challenge handshake authentication protocol, on each physical interface with PPP encapsulation, perform the following steps.

1. To assign an access profile to an interface, include the **access-profile** statement at the **[edit interfaces interface-name ppp-options chap]** hierarchy level.

```
[edit interfaces interface-name ppp-options chap]  
user@host# set access-profile name
```

**NOTE:** You must include the **access-profile** statement when you configure the CHAP authentication method. If an interface receives a CHAP challenge or response from a peer that is not in the applied access profile, the link is immediately dropped unless a default CHAP secret has been configured.

2. The default CHAP secret is used when no matching CHAP access profile exists, or if the CHAP name changes during PPP link negotiation. To configure a default CHAP

secret for an interface, include the **default-chap-secret** statement at the **[edit interfaces *interface-name* ppp-options chap]** hierarchy level.

```
[edit interfaces interface-name ppp-options chap]
user@host# set default-chap-secret name
```

3. To configure the name the interface uses in CHAP challenge and response packets, include the **local-name** statement at the **[edit interfaces *interface-name* ppp-options chap]** hierarchy level:

```
[edit interfaces interface-name ppp-options chap]
user@host# set local-name name
```

**NOTE:**

- The local name is any string from 1 through 32 characters in length, starting with an alphanumeric or underscore character, and including only the following characters:  
a-z A-Z 0-9 % @ # / \ . \_ -
- By default, when CHAP is enabled on an interface, the interface uses the router's system hostname as the name sent in CHAP challenge and response packets.

4. You can configure the interface not to challenge its peer, and only respond when challenged. To configure the interface not to challenge its peer, include the **passive** statement at the **[edit interfaces *interface-name* ppp-options chap]** hierarchy level:

```
[edit interfaces interface-name ppp-options chap]
user@host# set passive;
```

**NOTE:** By default, when CHAP is enabled on an interface, the interface always challenges its peer and responds to challenges from its peer.

## Displaying the Configured PPP Challenge Handshake Authentication Protocol

**Purpose** To display the configured PPP CHAP at the **[edit access]** and **[edit interfaces]** hierarchy levels.

- Access profile—**pe-A-ppp-clients**
- default CHAP secret data—**"\$ABC123"**
- hostname for the CHAP challenge and response packets—**"pe-A-so-1/1/1"**
- Interface—**so-1/1/2**

**Action**

- Run the **show** command at the **[edit access]** hierarchy level.  
**profile pe-A-ppp-clients;**

```
client cpe-1 chap-secret "$ABC123";
    # SECRET-DATA
[edit interfaces so-1/2/0]
encapsulation ppp;
ppp-options {
  chap {
    access-profile pe-A-ppp-clients;
    default-chap-secret "$ABC123";
    local-name "pe-A-so-1/1/1";
  }
}
```

- Run the **show** command at the **[edit interfaces s0-1/1/2]** hierarchy level.

```
ppp-options {
  chap {
    access-profile pe-A-ppp-clients;
    default-chap-secret "$ABC123";
    local-name "pe-A-so-1/1/2";
  }
}
```

**Meaning** The configured CHAP and its associated set options are displayed as expected.

---

## Configuring the PPP Password Authentication Protocol On a Physical Interface

- [Understanding PPP Password Authentication Protocol on page 128](#)
- [Configuring the PPP Password Authentication Protocol On a Physical Interface on page 129](#)
- [Configuring the PPP Password Authentication Protocol On a Logical Interface on page 130](#)

### Understanding PPP Password Authentication Protocol

For interfaces with PPP encapsulation, you can configure interfaces to support the Password Authentication Protocol (PAP), as defined in RFC 1334, *PAP Authentication Protocols*. If authentication is configured, the PPP link negotiates using CHAP or PAP protocol for authentication during the Link Control Protocol (LCP) negotiation phase. PAP is only performed after the link establishment phase (LCP up) portion of the authentication phase.

During authentication, the PPP link sends a PAP authentication-request packet to the peer with an ID and password. The authentication-request packet is sent every 2 seconds, similar to the CHAP challenge, until a response is received (acknowledgment packet, nonacknowledgment packet). If an acknowledgment packet is received, the PPP link transitions to the next state, the network phase. If a nonacknowledgment packet is received, an LCP terminate request is sent, and the PPP link goes back to the link establishment phase. If no response is received, and an optional retry counter is set to **true**, a new request acknowledgment packet is resent. If the retry counter expires, the PPP link transitions to the LCP negotiate phrase.

You can configure the PPP link with PAP in passive mode. By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

## Configuring the PPP Password Authentication Protocol On a Physical Interface

When you configure an interface to use PAP, you must assign an access profile to the interface. When an interface receives PAP authentication requests, the access profile in the packet is used to look up the password.

To enable PAP, you must create an access profile, and you must configure the interfaces to use PAP. For more information on how to configure access profile, see *Configuring Access Profiles for L2TP or PPP Parameters*.

To configure the PPP password authentication protocol, on each physical interface with PPP encapsulation, perform the following steps.

1. To assign an access profile to an interface, include the **access-profile** statement at the **[edit interfaces interface-name ppp-options pap]** hierarchy level.

```
[edit interfaces interface-name ppp-options pap]
user@host# set access-profile name
```

2. To configure the name the interface uses in PAP request and response packets, include the **local-name** statement at the **[edit interfaces interface-name ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name ppp-options pap]
user@host# set local-name name
```

3. You need to configure the password to be used for authentication. To configure the host password for sending PAP requests, include the **local-password** statement at the **[edit interfaces interface-name ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name ppp-options pap]
user@host# set local-password password
```

**NOTE:** By default, when PAP is enabled on an interface, the interface uses the router's system hostname as the name sent in PAP request and response packets.

4. To configure the interface to authenticate with PAP in passive mode, include the **passive** statement at the **[edit interfaces interface-name ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name ppp-options pap]
user@host# set passive
```

**NOTE:** By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

## Configuring the PPP Password Authentication Protocol On a Logical Interface

When you configure an interface to use PAP, you must assign an access profile to the interface. When an interface receives PAP authentication requests, the access profile in the packet is used to look up the password. If no matching access profile is found for the PAP authentication request that was received by the interface, the optionally configured default PAP password is used.

To configure the PPP password authentication protocol, on each logical interface with PPP encapsulation, perform the following steps.

1. To configure the default PAP password, include the **pap-password** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name unit logical-unt-number ppp-options pap]
user@host# set default-pap-password password
```

2. To configure the name the interface uses in PAP request and response packets, include the **local-name** statement at the **[edit interfaces *interface-name* unit *logical-unt-number* ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name ppp-options pap]
user@host# set local-name name
```

3. You need to configure the password to be used for authentication. To configure the host password for sending PAP requests, include the **local-password** statement at the **[edit interfaces *interface-name* ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name unit logical-unt-number ppp-options pap]
user@host# set local-password password
```

**NOTE:** By default, when PAP is enabled on an interface, the interface uses the router's system hostname as the name sent in PAP request and response packets.

- To configure the interface to authenticate with PAP in passive mode, include the **passive** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number ppp-options pap]
user@host# set passive
```

**NOTE:** By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

## Configuring PPP Address and Control Field Compression

For interfaces with PPP, PPP CCC, or PPP TCC encapsulation, you can configure compression of the Data Link Layer address and control fields, as defined in RFC 1661, *The Point-to-Point Protocol (PPP)*. By default, the address and control fields are not compressed. This means PPP-encapsulated packets are transmitted with two 1-byte fields (0xff and 0x03). If you configure address and control field compression (ACFC) and ACFC is successfully negotiated with the local router's peer, the local router transmits packets without these 2 bytes. ACFC allows you to conserve bandwidth by transmitting less data.

On M320, M120, and T Series routers, ACFC is not supported for any ISO family protocols. Do not include the **acfc** statement at the **[edit interfaces *interface-name* ppp-options compression]** hierarchy level when you include the **family iso** statement at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level.

**NOTE:** The address and control fields cannot be compressed in Link Control Protocol (LCP) packets.

The PPP session restarts when you configure or modify compression options.

To configure ACFC:

- In configuration mode, go to the **[edit interfaces *interface-name* ppp-options]** hierarchy level.

```
[edit ]
user@host# edit interfaces interface-name ppp-options
```

- Include the **compression** statement at the **[edit interfaces *interface-name* ppp-options]** hierarchy level, and specify **acfc**.

```
[edit interfaces interface-name ppp-options]  
compression acfc;
```

To monitor the configuration, issue the **show interfaces *interface-name*** command. Configured options are displayed in the **link flags** field for the physical interface. Successfully negotiated options are displayed in the **flags** field for the logical interface. In this example, both ACFC and PFC are configured, but neither compression feature has been successfully negotiated.

```
user@router# run show interfaces so-0/1/1  
Physical interface: so-0/1/1, Enabled, Physical link is Up  
Interface index: 133, SNMP ifIndex: 27

Payload scrambler: Enabled  
Device flags : Present Running  
Interface flags: Point-To-Point SNMP-Traps 16384  
Link flags : No-Keepalives ACFC PFC  
LCP state: Opened  
NCP state: inet: Opened, inet6: Not-configured, iso: Not-configured, mpls:  
Not-configured  
CHAP state: Not-configured  
CoS queues : 4 supported  
Last flapped : 2004-12-29 10:49:32 PST (00:18:35 ago)  
Input rate : 0 bps (0 pps)  
Output rate : 0 bps (0 pps)  
SONET alarms : None  
SONET defects : None  
Logical interface so-0/1/1.0 (Index 68) (SNMP ifIndex 169)  
Flags: Point-To-Point SNMP-Traps ACFC Encapsulation: PPP  
Protocol inet, MTU: 4470  
Flags: None  
Addresses, Flags: Is-Preferred Is-Primary  
Destination: 3.3.3/24, Local: 3.3.3.2, Broadcast: 3.3.3.255
```

This configuration causes the local router to try to negotiate ACFC with its peer. If ACFC is successfully negotiated, the local router sends packets with compressed address and control fields. When you include the **compression acfc** statement in the configuration, the PPP session restarts, and the local router sends the ACFC option in the LCP Configure-Request packet. The ACFC option informs the local router's peer that the local router can receive packets with compression. If the peer indicates that it, too, can receive packets with compression, then ACFC is negotiated. If ACFC is successfully negotiated, the local router can receive packets with or without the address and control bytes included.

- [compression on page 457](#)
- [acfc on page 382](#)

## Configuring the PPP Protocol Field Compression

For interfaces with PPP, PPP CCC, or PPP TCC encapsulation, you can configure protocol field compression. By default, the protocol field is not compressed. This means PPP-encapsulated packets are transmitted with a two-byte protocol field. For example, IPv4 packets are transmitted with the protocol field set to 0x0021, and MPLS packets are transmitted with the protocol field set to 0x0281.

For all protocols with identifiers in the range 0x0000 through 0x00ff, you can configure the router to compress the protocol field to one byte, as defined in RFC 1661, *The Point-to-Point Protocol (PPP)*. Protocol field compression (PFC) allows you to conserve bandwidth by transmitting less data.

**NOTE:** The protocol field cannot be compressed in Link Control Protocol (LCP) packets.

The PPP session restarts when you configure or modify compression options.

To configure PFC:

1. In configuration mode, go to the `[edit interfaces interface-name ppp-options]` hierarchy level.

`[edit ]`

`user@host# edit interfaces interface-name ppp-options`

2. Include the **compression** statement at the `[edit interfaces interface-name ppp-options]` hierarchy level, and specify **pfc**.

`[edit interfaces interface-name ppp-options]`

`compression pfc;`

To monitor the configuration, issue the **show interfaces *interface-name*** command.

Configured options are displayed in the **link flags** field for the physical interface.

Successfully negotiated options are displayed in the **flags** field for the logical interface.

In this example, both ACFC and PFC are configured, but neither compression feature has been successfully negotiated.

```
user@router# run show interfaces so-0/1/1
```

```
Physical interface: so-0/1/1, Enabled, Physical link is Up
```

```
Interface index: 133, SNMP ifIndex: 27
```

```
Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC3,  
Loopback: None, FCS: 16,
```

```
Payload scrambler: Enabled
```

```
Device flags : Present Running
```

```
Interface flags: Point-To-Point SNMP-Traps 16384
```

```
Link flags : No-Keepalives ACFC PFC
```

```

```

This configuration causes the local router to try to negotiate PFC with its peer. If PFC is successfully negotiated, the local router sends packets with compressed protocol fields. When you include the **compression pfc** statement in the configuration, the PPP session restarts, and the local router sends the PFC option in the LCP Configure-Request packet. The PFC option informs the local router's peer that the local router can receive packets with compression. If the peer indicates that it, too, can receive packets with compression, then PFC is negotiated. If PFC is successfully negotiated, the local router can receive packets with either 2-byte (uncompressed) or 1-byte (compressed) protocol fields.

[pfc on page 811](#)

---

## Monitoring a PPP Session

You can monitor PPP packet exchanges. When monitoring is enabled, packets exchanged during a session are logged by default to `/var/log/pppd`, or to the file specified in the **traceoptions** statement.

To monitor a PPP session:

1. In configuration mode, go to the **[edit protocols ppp]** hierarchy level.

```
[edit ]
user@host# edit protocols ppp
```

2. Include the **monitor-session** statement.

```
[edit protocols ppp]
user@host# monitor-session (interface-name | all);
```

When monitoring is configured, the operational mode commands **show ppp summary** and **show ppp interface** display a **Monitored** flag in the **Session flags** column or line.

Related Documentation [monitor-session on page 727](#)

## Tracing Operations of the pppd Process

You can trace the operations of the router's pppd process.

To trace the router's pppd process:

1. In configuration mode, go to the **[edit protocols ppp]** hierarchy level.

```
[edit ]
user@host# edit protocols ppp
```

2. Include the **traceoptions** statement.

```
[edit protocols ppp]
traceoptions {
  file filename <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  level severity-level;
  no-remote-trace;
}
```

- To specify more than one tracing operation, include multiple **flag** statements.

You can specify the following flags in the **traceoptions** statement:

- **access**—Trace access code
- **address-pool**—Trace address pool code
- **all**—Trace all areas of code
- **auth**—Trace authentication code
- **chap**—Trace challenge handshake authentication protocol code
- **ci**—Trace CI code
- **config**—Trace configuration code
- **ifdb**—Trace interface database code
- **lcp**—Trace LCP state machine code
- **memory**—Trace memory management code
- **message**—Trace message processing code
- **mlppp**—Trace multilink point-to-point protocol code
- **ncp**—Trace NCP state machine code
- **pap**—Trace password authentication protocol code
- **ppp**—Trace PPP protocol processing code
- **radius**—Trace RADIUS processing code
- **redundancy**—Trace redundancy code

- **rtsock**—Trace routing socket code
- **session**—Trace session management code
- **signal**—Trace signal handling code
- **timer**—Trace timer code
- **ui**—Trace user interface code

Related [traceoptions on page 960](#)

## Configuring the Router as a DCE with Frame Relay Encapsulation

---

By default, when you configure an interface with Frame Relay encapsulation, the routing platform is assumed to be data terminal equipment (DTE). That is, the routing platform is assumed to be at a terminal point on the network.

When you configure the router to be a data circuit-terminating equipment (DCE), keepalives are disabled by default.

To configure the router to be DCE:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit]  
user@host# edit interfaces interface-name
```

2. Configure the **dce** option to respond to Frame Relay status enquiry messages.

```
[edit interfaces interface-name]  
user@host# set dce
```

Perform one of the following tasks for back-to-back Frame Relay connections:

- Disable sending of keepalives on both sides of the connection.
- Configure one side of the connection as a DTE (the default Junos configuration) by removing the **dce** statement from the configuration and the other as a DCE.

## Receive and Transmit Leaky Bucket Properties Overview

Congestion control is particularly difficult in high-speed networks with high volumes of traffic. When congestion occurs in such a network, it is usually too late to react. You can avoid congestion by regulating the flow of packets into your network. Smoother flows prevent bursts of packets from arriving at (or being transmitted from) the same interface and causing congestion.

For all interface types except ATM, Fast Ethernet, Gigabit Ethernet, and channelized IQ and IQE, you can configure leaky bucket properties, which allow you to limit the amount of traffic received on and transmitted by a particular interface. You effectively specify what percentage of the interface's total capacity can be used to receive or transmit packets. You might want to set leaky bucket properties to limit the traffic flow from a link that is known to transmit high volumes of traffic.

**NOTE:** Instead of configuring leaky bucket properties, you can limit traffic flow by configuring policers. Policers work on all interfaces. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

The leaky bucket is used at the host-network interface to allow packets into the network at a constant rate. Packets might be generated in a bursty manner, but after they pass through the leaky bucket, they enter the network evenly spaced. In some cases, you might want to allow short bursts of packets to enter the network without smoothing them out. By controlling the number of packets that can accumulate in the bucket, the **threshold** property controls burstiness. The maximum number of packets entering the network in time units is **threshold + rate \* t**.

By default, leaky buckets are disabled and the interface can receive and transmit packets at the maximum line rate.

For each DS3 channel on a channelized OC12 interface, you can configure unique receive and transmit buckets.

**NOTE:** HDLC payload scrambling conflicts with traffic shaping configured using leaky bucket properties. If you configure leaky bucket properties, you must disable payload scrambling, because the Junos OS rejects configurations that have both features enabled. For more information, see *Configuring SONET/SDH HDLC Payload Scrambling for Link Stability*.

## Understanding Unidirectional Traffic Flow on Physical Interfaces

By default, physical interfaces are bidirectional; that is, they both transmit and receive traffic. You can configure unidirectional link mode on a 10-Gigabit Ethernet interface that creates two new physical interfaces that are unidirectional. The new transmit-only and receive-only interfaces operate independently, but both are subordinate to the original parent interface.

The unidirectional interfaces enable the configuration of a unidirectional link topology. Unidirectional links are useful for applications such as broadband video services where almost all traffic flow is in one direction, from the provider to the user. Unidirectional link mode conserves bandwidth by enabling it to be differentially dedicated to transmit and receive interfaces. In addition, unidirectional link mode conserves ports for such applications because the transmit-only and receive-only interfaces act independently. Each can be connected to different routers, for example, reducing the total number of ports required.

**NOTE:** Unidirectional link mode is currently supported on only the following hardware:

- 4-port 10-Gigabit Ethernet DPC on the MX960 router
- 10-Gigabit Ethernet IQ2 PIC and 10-Gigabit Ethernet IQ2E PIC on the T Series router

The transmit-only interface is always operationally up. The operational status of the receive-only interface depends only on local faults; it is independent of remote faults and of the status of the transmit-only interface.

On the parent interface, you can configure attributes common to both interfaces, such as clocking, framing, `giether-options`, and `sonet-options`. On each of the unidirectional interfaces, you can configure encapsulation, MAC address, MTU size, and logical interfaces.

Unidirectional interfaces support IP and IPv6. Packet forwarding takes place by means of static routes and static ARP entries, which you can configure independently on both unidirectional interfaces.

Only transmit statistics are reported on the transmit-only interface (and shown as zero on the receive-only interface). Only receive statistics are reported on the receive-only interface (and shown as zero on the transmit-only interface). Both transmit and receive statistics are reported on the parent interface.

## Physical Interface Damping Overview

Physical interface damping limits the advertisement of the up and down transitions (flapping) on an interface. Each time a transition occurs, the interface state is changed, which generates an advertisement to the upper-level routing protocols. Damping helps reduce the number of these advertisements.

From the viewpoint of network deployment, physical interface flaps fall into the following categories:

- Nearly instantaneous multiple flaps of short duration (milliseconds).
- Periodic flaps of long duration (seconds).

Figure 6 on page 141 is used to describe these types of interface flaps and the damping configuration that you can use in each case.

Figure 6: Two Router Interfaces Connected Through Transport Equipment

**NOTE:** We recommend that you use similar damping configurations on both ends of the physical interface. Configuring damping on one end and not having interface damping on the other end can result in undesired behavior.

The following sections describe the types of interface damping depending upon the transition time length.

- [Damping Overview for Shorter Physical Interface Transitions on page 141](#)
- [Damping Overview for Longer Physical Interface Transitions on page 142](#)

### Damping Overview for Shorter Physical Interface Transitions

Figure 6 on page 141 shows two routers with two transport devices between them. If a redundant link between the two transport devices fails, link switching is performed. Link switching takes a number of milliseconds. As shown in Figure 7 on page 142, during switching, both router interfaces might encounter multiple flaps with an up-and-down duration of several milliseconds. These multiple flaps, if advertised to the upper-level routing protocols, might result in undesired route updates. This is why you might want to damp these interface flaps.

**NOTE:** Damping is suitable only with routing protocols.

For shorter physical interface transitions, you configure interface damping with the **hold-time** statement on the interface. The hold timer enables interface damping by not advertising interface transitions until the hold timer duration has passed. When a hold-down timer is configured and the interface goes from up to down, the down hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still *down*, then the router begins to advertise the interface as being down. Similarly, when a hold-up timer is configured and an interface goes from down to up, the up hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still *up*, then the router begins to advertise the interface as being up.

Figure 7: Multiple Flaps of Short Duration (Milliseconds)

### Damping Overview for Longer Physical Interface Transitions

When the link between a router interface and the transport devices is not stable, this can lead to periodic flapping, as shown in [Figure 8 on page 143](#). Flaps occur in the order of seconds or more, with an up-and-down flap duration in the order of a second or more. In this case, using the hold timer feature might not produce optimal results as it cannot suppress the relatively longer and repeated interface flaps. Increasing the hold time duration to seconds still allows the system to send route updates on the flapping interface, so fails to suppress periodically flapping interfaces on the system.

Figure 8: Periodic Flaps of Long Duration (Seconds)

For longer periodic interface flaps, you configure interface damping with the **damping** statement on the interface. This damping method uses an exponential back-off algorithm to suppress interface up-and-down event reporting to the upper-level protocols. Every time an interface goes down, a penalty is added to the interface penalty counter. If at some point the accumulated penalty exceeds the suppress level, the interface is placed in the suppress state, and further interface link up and down events are not reported to the upper-level protocols.

**NOTE:**

- Only PTX Series routers, T Series routers, MX960 routers, MX480 routers, MX240 routers, MX80 routers, and M10i routers support interface damping for longer periodic interface flaps on all the line cards.
- Penalty added on every interface flap is 1000.
- The system does not indicate whether an interface is down because of suppression or that is the actual state of the physical interface. Because of this, SNMP link traps and Operation, Administration, and Maintenance (OAM) protocols cannot differentiate the damped version of the link state from the real version. Therefore, the traps and protocols might not work as expected.
- You can verify suppression by viewing the information in the Damping field of the `show interface extensive` command output.

At all times, the interface penalty counter follows an exponential decay process.

[Figure 9 on page 145](#) and [Figure 10 on page 146](#) show the decay process as it applies to recovery when the physical level link is down or up. As soon as the accumulated penalty reaches the lower boundary of the reuse level, the interface is marked as unsuppressed,

and further changes in the interface link state are again reported to the upper-level protocols. You use the **max-suppress** option to configure the maximum time for restricting the accumulation of the penalty beyond the value of the maximum penalty. The value of the maximum penalty is calculated by the software. The maximum penalty corresponds to the time it would take max-suppress to decay and reach the reuse level. The penalty continues to decay after crossing the reuse level.

[Figure 9 on page 145](#) and [Figure 10 on page 146](#) show the accumulated penalty, and the decay over time as a curve. Whenever the penalty is below the reuse level and the physical level link changes state, state changes are advertised to the system and cause SNMP state changes.

[Figure 9 on page 145](#) shows the penalty dropping below the reuse level when the physical link is down. The system is notified of a state change only after the physical level link transitions to up.

Figure 9: Physical-Level Link Is Down When the Penalty Falls Below the Reuse Level

Figure 10 on page 146 shows the penalty dropping below the reuse level when the physical link is up. The system is notified of a state change immediately.

Figure 10: Physical-Level Link Is Up When the Penalty Falls Below the Reuse Level

## Damping Shorter Physical Interface Transitions

By default, when an interface changes from being up to being down, or from down to up, this transition is advertised immediately to the hardware and Junos OS. In some situations—for example, when an interface is connected to an add/drop multiplexer (ADM) or wavelength-division multiplexer (WDM), or to protect against SONET/SDH framer holes—you might want to damp interface transitions. This means not advertising the interface's transition until a certain period of time has passed, called the *hold-time*. When you have damped interface transitions and the interface goes from up to down, the down hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still *down*, then the router begins to advertise the interface as being down. Similarly, when an interface goes from down to up, the up hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still *up*, then the router begins to advertise the interface as being up. For information about physical interface damping, see [“Physical Interface Damping Overview” on page 141](#).

This task applies to damping shorter physical interface transitions in milliseconds. To damp longer physical interface transitions in seconds, see [“Damping Longer Physical Interface Transitions” on page 148](#).

To configure damping of shorter physical interface transitions:

1. Select the interface to damp, where the interface name is *interface-type-fpc/pic/port*:

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the hold-time for link up and link down.

```
[edit interfaces interface-name]
user@host# set hold-time up milliseconds down milliseconds
```

The hold time can be a value from 0 through 4,294,967,295 milliseconds. The default value is 0, which means that interface transitions are not damped. Junos OS advertises the transition within 100 milliseconds of the time value you specify.

For most Ethernet interfaces, hold timers are implemented using a one-second polling algorithm. For 1-port, 2-port, and 4-port Gigabit Ethernet interfaces with small form-factor pluggable transceivers (SFPs), hold timers are interrupt-driven.

**NOTE:** The hold-time option is not available for controller interfaces.

## Damping Longer Physical Interface Transitions

---

Physical interface damping limits the advertisement of the up and down transitions (flapping) on an interface. An unstable link between a router interface and the transport devices can lead to periodic flapping. Longer flaps occur with a period of about five seconds or more, with an up-and-down duration of one second. For these longer periodic interface flaps, you configure interface damping with the **damping** statement on the interface. This damping method uses an exponential back-off algorithm to suppress interface up and down event reporting to the upper-level protocols. Every time an interface goes down, a penalty is added to the interface penalty counter. If at some point the accumulated penalty exceeds the suppress level **max-suppress**, the interface is placed in the suppress state, and further interface state up and down transitions are not reported to the upper-level protocols.

---

### NOTE:

- Only PTX Series routers, T Series routers, MX2010 routers, MX2020 routers, MX960 routers, MX480 routers, MX240 routers, MX80 routers, and M10i routers support interface damping for longer periodic interface flaps.
- The system does not indicate whether an interface is down because of suppression or that is the actual state of the physical interface. Because of this, SNMP link traps and Operation, Administration, and Maintenance (OAM) protocols cannot differentiate the damped version of the link state from the real version. Therefore, the traps and protocols might not work as expected.
- You can verify suppression by viewing the information in the Damping field of the **show interface extensive** command output.

---

You can view the damping parameters with the **show interfaces extensive** command.

To configure damping of longer physical interface transitions:

1. Select the interface to damp, where the interface name is *interface-type-fpc/pic/port* or an interface range:

```
[edit]  
user@host# edit interfaces interface-name
```

2. Enable longer interface transition damping on a physical interface:

```
[edit interfaces interface-name damping]  
user@host# set enable
```

3. (Optional) Set the maximum time in seconds that an interface can be suppressed no matter how unstable the interface has been.

**NOTE:** Configure `max-suppress` to a value that is greater than the value of `half-life`; otherwise, the configuration is rejected.

```
[edit interfaces interface-name damping]
user@host# set max-suppress maximum-seconds
```

4. (Optional) Set the decay half-life in seconds, which is the interval after which the accumulated interface penalty counter is reduced by half if the interface remains stable.

**NOTE:** Configure `max-suppress` to a value that is greater than the value of `half-life`; otherwise, the configuration is rejected.

```
[edit interfaces interface-name damping]
user@host# set half-life seconds
```

5. (Optional) Set the reuse threshold (no units). When the accumulated interface penalty counter falls below this value, the interface is no longer suppressed.

```
[edit interfaces interface-name damping]
user@host# set reuse number
```

6. (Optional) Set the suppression threshold (no units). When the accumulated interface penalty counter exceeds this value, the interface is suppressed.

```
[edit interfaces interface-name damping]
user@host# set suppress number
```

- [damping on page 474](#)

## Example: Configuring Physical Interface Damping

This example shows how to configure damping for a physical interface on a PTX Series Packet Transport Router.

- [Requirements on page 150](#)
- [Overview on page 150](#)

- [Configuration on page 150](#)
- [Verification on page 151](#)

## Requirements

This example uses the following hardware and software components:

- One PTX Series Packet Transport Router
- One or more routers that provide input packets and receive output packets
- Junos OS Release 14.1 or later

## Overview

Physical interface damping provides a smoothing of the up and down transitions (flapping) on an interface. Each time a transition occurs, the interface state is changed, which generates an advertisement to the upper-level routing protocols. Damping helps reduce the number of these advertisements.

From the viewpoint of network deployment, physical interface flaps fall into these categories:

- Nearly instantaneous multiple flaps of short duration (milliseconds). For shorter physical interface transitions, you configure interface damping with the **hold-time** statement on the interface. The hold timer enables interface damping by not advertising interface transitions until the hold timer duration has passed. When a hold-down timer is configured and the interface goes from up to down, the interface is not advertised to the rest of the system as being down until it has remained down for the hold-down timer period. Similarly, when a hold-up timer is configured and an interface goes from down to up, it is not advertised as being up until it has remained up for the hold-up timer period.
- Periodic flaps of long duration (seconds). For longer periodic interface flaps, you configure interface damping with the **damping** statement on the interface. This damping method uses an exponential back-off algorithm to suppress interface up and down event reporting to the upper-level protocols. Every time an interface goes down, a penalty is added to the interface penalty counter. If at some point the accumulated penalty exceeds the suppress level, the interface is placed in the suppress state, and further interface state up transitions are not reported to the upper-level protocols.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces xe-6/0/0 damping half-life 11 max-suppress 2222 reuse 3333 suppress 4444
```

**Step-by-Step Procedure**

To configure damping on the PTX Series Packet Transport Router:

1. Enable damping on the interface, set the half-life interval, maximum suppression, reuse, and suppress values:

```
[edit interface]
user@router# set xe-6/0/0 damping half-life 11 max-suppress 2222 reuse 3333
suppress 4444
```

2. Commit configuration:

```
[edit]
user@router# commit
```

---

**Results**

From configuration mode, confirm your configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@router# show interfaces
xe-6 {
  damping {
    half-life 11;
    max-suppress 2222;
    reuse 3333;
    suppress 4444;
  }
}
```

**Verification**

To confirm that the configuration is working properly, perform this task:

- [Verifying Interface Damping on xe6 on page 151](#)

---

**Verifying Interface Damping on xe6**

**Purpose** Verify that damping is enabled on the interface and that the damping parameter values are correctly set.

**Action** From operational mode, run the **show interfaces extensive** command.

```
user@router# run show interfaces xe-6/0/0 extensive
Physical interface: xe-6/0/0, Enabled, Physical link is Up
Interface index: 158, SNMP ifIndex: 535, Generation: 161
Link-level type: Ethernet, MTU: 1514, LAN-PHY mode, Speed: 10Gbps, BPDU Error:
None, Loopback: None,
Source filtering: Disabled, Flow control: Enabled
Device flags   : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
Link flags     : None
CoS queues    : 8 supported, 8 maximum usable queues
Hold-times    : Up 0 ms, Down 0 ms
Damping       : half-life: 11 sec, max-suppress: 2222 sec, reuse: 3333,
suppress: 4444, state: unsuppressed
```

**Meaning** Damping is enabled and configured successfully on the xe-6 interface.

---

## Configuring Multiservice Physical Interface Properties

The adaptive services (AS), collector, monitoring services, and monitoring services II interfaces are multiservice interfaces specifically designed to enable IP services. To configure multiservice physical interface properties on the collector, monitoring services, and AS interfaces, include the **multiservice-options** statement:

```
multiservice-options {
  (core-dump | no-core-dump);
  (syslog | no-syslog);
  flow-control-options {
    down-on-flow-control;
    dump-on-flow-control;
    reset-on-flow-control;
  }
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *cp-fpc/pic/port*]
- [edit interfaces *mo-fpc/pic/port*]
- [edit interfaces *sp-fpc/pic/port*]

For more information about the services interfaces, see the *Junos OS Services Interfaces Library for Routing Devices*.

## Enabling or Disabling SNMP Notifications on Physical Interfaces

By default, Simple Network Management Protocol (SNMP) notifications are sent when the state of an interface or a connection changes. You can enable or disable these notification based on you requirements.

To explicitly enable sending SNMP notifications on the physical interface, perform the following steps:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the **traps** option to enable sending of Simple Network Management Protocol (SNMP) notifications when the state of the connection changes.

```
[edit interfaces interface-name]
user@host# set traps
```

To disable sending SNMP notifications on the physical interface, perform the following steps:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the **no-traps** option to disable sending of Simple Network Management Protocol (SNMP) notifications when the state of the connection changes.

```
[edit interfaces interface-name]
user@host# set no-traps
```

## Configuring Accounting for the Physical Interface

- [Accounting Profiles Overview on page 153](#)
- [Configuring Accounting for the Physical Interface on page 154](#)
- [Displaying Accounting Profile for the Physical Interface on page 155](#)

### Accounting Profiles Overview

Juniper Networks routers and switches can collect various kinds of data about traffic passing through the router and switch. You can set up one or more *accounting profiles* that specify some common characteristics of this data, including the following:

- The fields used in the accounting records

- The number of files that the router or switch retains before discarding, and the number of bytes per file
- The polling period that the system uses to record the data

You configure the profiles and define a unique name for each profile using statements at the **[edit accounting-options]** hierarchy level. There are two types of accounting profiles: interface profiles and filter profiles. You configure interface profiles by including the **interface-profile** statement at the **[edit accounting-options]** hierarchy level. You configure filter profiles by including the **filter-profile** statement at the **[edit accounting-options]** hierarchy level. For more information, see the *Network Management Administration Guide*.

You apply filter profiles by including the **accounting-profile** statement at the **[edit firewall filter *filter-name*]** and **[edit firewall family *family* filter *filter-name*]** hierarchy levels. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

## Configuring Accounting for the Physical Interface

### Before you begin

---

You must configure a profile to collect error and statistic information for input and output packets on a particular physical interface. An accounting profile specifies what statistics should be collected and written to a log file. For more information on how to configure an accounting-data log file, see the *Configuring Accounting-Data Log Files*.

An interface profile specifies the information collected and written to a log file. You can configure a profile to collect error and statistic information for input and output packets on a particular physical interface.

1. To configure which statistics should be collected for an interface, include the **fields** statement at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level.

```
[edit accounting-options interface-profile profile-name]  
user@host# set fields field-name
```

2. Each accounting profile logs its statistics to a file in the **/var/log** directory. To configure which file to use, include the **file** statement at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level.

```
[edit accounting-options interface-profile profile-name]  
user@host# set file filename
```

**NOTE:** You must specify a **file** statement for the interface profile that has already been configured at the **[edit accounting-options]** hierarchy level. For more information, see the [Configuring Accounting-Data Log Files](#)

---

3. Each interface with an accounting profile enabled has statistics collected once per interval time specified for the accounting profile. Statistics collection time is scheduled

evenly over the configured interval. To configure the interval, include the interval statement at the `[edit accounting-options interface-profile profile-name]` hierarchy level.

```
[edit accounting-options interface-profile profile-name]
user@host# set interval minutes
```

**NOTE:** The minimum interval allowed is 1 minute. Configuring a low interval in an accounting profile for a large number of interfaces might cause serious performance degradation.

4. To configure the interfaces on which the accounting needs to be performed, apply the interface profile to a physical interface by including the **accounting-profile** statement at the `[edit interfaces interface-name]` hierarchy level.

```
[edit interfaces]
user@host# set interface-name accounting-profile profile-name
```

## Displaying Accounting Profile for the Physical Interface

**Purpose** To display the configured accounting profile a particular physical interface at the `[edit accounting-options interface-profile profile-name]` hierarchy level:

- interface-name—ge-1/0/1
- Interface profile —if\_profile
- File name—if\_stats
- Interval—15 minutes

- Action**
- Run the **show** command at the `[edit edit interfaces ge-1/0/1]` hierarchy level.

```
[edit interfaces ge-1/0/1]
accounting-profile if_profile;
```

- Run the **show** command at the `[edit accounting-options]` hierarchy level.

```
interface-profile if_profile {
  interval 15;
  file if_stats {
    fields {
      input-bytes;
      output-bytes;
      input-packets;
      output-packets;
      input-errors;
      output-errors;
    }
  }
}
```

**Meaning** The configured accounting and its associated set options are displayed as expected.

## Disabling a Physical Interface

---

- [Disabling a Physical Interface on page 156](#)
- [Example: Disabling a Physical Interface on page 156](#)
- [Effect of Disabling Interfaces on T series PICs on page 157](#)

### Disabling a Physical Interface

You can disable a physical interface, marking it as being down, without removing the interface configuration statements from the configuration.

**CAUTION:** Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.

To disable a physical interface:

1. In configuration mode, go to **[edit interfaces *interface-name*]** hierarchy level.

```
[edit]
user@host# edit interfaces ge-fpc/pic/port
```

2. Include the **disable** statement.

```
[edit interfaces at-fpc/pic/port ]
user@host# set disable
```

**NOTE:** On the router, when you use the disable statement at the edit interfaces hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet PICs with SFP and XFP transceivers do support it and the laser will be turned off when the interface is disabled.

**WARNING:** Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.

### Example: Disabling a Physical Interface

Sample interface configuration:

```
[edit interfaces]
```

```

user@host# show
ge-0/3/2 {
  unit 0 {
    description CE2-to-PE1;
    family inet {
      address 20.1.1.6/24;
    }
  }
}

```

Disabling the interface:

```

[edit interfaces ge-0/3/2]
user@host# set disable

```

Verifying the interface configuration:

```

[edit interfaces ge-0/3/2]
user@host# show
disable; # Interface is marked as disabled.
unit 0 {
  description CE2-to-PE1;
  family inet {
    address 20.1.1.6/24;
  }
}

```

## Effect of Disabling Interfaces on T series PICs

The following table describes the effect of using the **set interfaces disable** *interface\_name* statement on T series PICs.

**Table 41: Effect of set interfaces disable <interface\_name> on T series PICs**

PIC Model Number	PIC Description	Type of PIC	Behaviour
PF-12XGE-SFPP	10-Gigabit Ethernet LAN/WAN PIC with SFP+ (T4000 Router)	5	Tx laser disabled
PF-24XGE-SFPP	10-Gigabit Ethernet LAN/WAN PIC with Oversubscription and SFP+ (T4000 Router)	5	Tx laser disabled
PF-1CGE-CFP	100-Gigabit Ethernet PIC with CFP (T4000 Router)	5	Tx laser disabled
PD-4XGE-XFP	10-Gigabit Ethernet, 4-port LAN/WAN XFP	4	Tx laser disabled
PD-5-10XGE-SFPP	10-Gigabit LAN/WAN with SFP+	4	Tx laser disabled
PD-1XLE-CFP	40-Gigabit with CFP	4	Tx laser disabled
PD-1CE-CFP-FPC4	100-Gigabit with CFP	4	Tx laser disabled
PD-TUNNEL	40-Gigabit Tunnel Services	4	NA

Table 41: Effect of set interfaces disable <interface\_name> on T series PICs (*continued*)

PIC Model Number	PIC Description	Type of PIC	Behaviour
PD-4OC192-SON-XFP	OC192/STM64, 4-port XFP	4	Tx laser not disabled
PD-1OC768-SON-SR	OC768c/STM256, 1-port	4	Tx laser not disabled

## Logical Interfaces Configuration Properties Overview

---

For a physical interface device to function, you must configure at least one logical interface on that device. For each logical interface, you must specify the protocol family that the interface supports. You can also configure other logical interface properties. These vary by Physical Interface Card (PIC) and encapsulation type, but include the IP address of the interface, and whether the interface supports multicast traffic, data-link connection

identifiers (DLCIs), virtual channel identifiers (VCIs) and virtual path identifiers (VPIs), and traffic shaping.

## Logical Interfaces Configuration Statements

---

To configure logical interface properties, include the following statements:

```
unit logical-unit-number {
  accept-source-mac {
    mac-address mac-address {
      policer {
        input cos-policer-name;
        output cos-policer-name;
      }
    }
  }
  accounting-profile name;
  allow-any-vci;
  atm-scheduler-map (map-name | default);
  backup-options {
    interface interface-name;
  }
  bandwidth rate;
  cell-bundle-size cells;
  clear-dont-fragment-bit;
  compression {
    rtp {
      f-max-period number;
      queues [ queue-numbers ];
      port {
        minimum port-number;
        maximum port-number;
      }
    }
  }
  compression-device interface-name;
  copy-tos-to-outer-ip-header;
  demux-destination family;
  demux-source family;
  demux-options {
    underlying-interface interface-name;
  }
  description text;
  interface {
    l2tp-interface-id name;
    (dedicated | shared);
  }
  dialer-options {
    activation-delay seconds;
    callback;
    callback-wait-period time;
```

```

deactivation-delay seconds;
dial-string [ dial-string-numbers ];

## Specifying the Logical Interface Number

---

Each logical interface must have a logical unit number. The logical unit number corresponds to the logical unit part of the interface name. For more information, see [“Interface Naming Overview” on page 27](#).

Point-to-Point Protocol (PPP), Cisco High-level Data Link Control (HDLC), and Ethernet circuit cross-connect (CCC) encapsulations support only a single logical interface, whose logical unit number must be 0. Frame Relay and ATM encapsulations support multiple logical interfaces, so you can configure one or more logical unit numbers.

You specify the logical unit number by including the **unit** statement:

```
unit logical-unit-number {  
    ...  
}
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name*]
- [edit logical-systems *logical-system-name* interfaces *interface-name*]

The logical unit number can be in the range 0 through 65,535 for demux and PPPoE static interfaces only. The logical unit number can be in the range 0 through 16,385 for all other static interface types.

## Adding a Logical Unit Description to the Configuration

---

You can include a text description of each logical unit in the configuration file. Any descriptive text you include is displayed in the output of the **show interfaces** commands, and is also exposed in the **ifAlias** Management Information Base (MIB) object. It has no impact on the interface's configuration. To add a text description, include the **description** statement:

```
description text;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

The description can be a single line of text. If the text contains spaces, enclose it in quotation marks.

**NOTE:** You can configure the extended DHCP relay to include the interface description in the option 82 Agent Circuit ID suboption. See *“Using DHCP Relay Agent Option 82 Information”* in the *Junos OS Broadband Subscriber Management and Services Library*.

---

For information about describing physical interfaces, see [“Configuring Interface Description” on page 104](#).

## Configuring the Interface Bandwidth

By default, the Junos OS uses the physical interface's speed for the MIB-II object, **ifSpeed**. You can configure the logical unit to populate the **ifSpeed** variable by configuring a bandwidth value for the logical interface. The **bandwidth** statement sets an informational-only parameter; you cannot adjust the actual bandwidth of an interface with this statement.

**NOTE:** We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the **bandwidth** statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

$$\text{cost} = \text{reference-bandwidth} / \text{bandwidth},$$

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the **bandwidth** statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

To configure the bandwidth value for a logical interface, include the **bandwidth** statement:

**bandwidth** *rate*;

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

**rate** is the peak rate, in bps or cps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation **c**; values expressed in cells per second are converted to bits per second using the formula 1 cps = 384 bps. The value can be any positive integer. The **bandwidth** statement is valid for all logical interfaces, except multilink interfaces.

## Configuring Interface Encapsulation on Logical Interfaces

- [Understanding Interface Encapsulation on Logical Interfaces on page 172](#)
- [Configuring the Encapsulation on a Logical Interface on page 172](#)
- [Displaying the Encapsulation on a Logical Interface on page 173](#)

## Understanding Interface Encapsulation on Logical Interfaces

You can configure an encapsulation on a logical interface, which is the encapsulation used within certain packet types.

The following restrictions apply to logical interface encapsulation:

- With the atm-nlpid, atm-cisco-nlpid, and atm-vc-mux encapsulations, you can configure the inet family only.
- With the CCC circuit encapsulations, you cannot configure a family on the logical interface.
- A logical interface cannot have frame-relay-ccc encapsulation unless the physical device also has frame-relay-ccc encapsulation.
- A logical interface cannot have frame-relay-tcc encapsulation unless the physical device also has frame-relay-tcc encapsulation. In addition, you must assign this logical interface a DLCI from 512 through 1022 and configure it as point-to-point.
- A logical interface cannot have frame-relay-ether-type or frame-relay-ether-type-tcc encapsulation unless the physical interface has flexible-frame-relay encapsulation and is on an IQ or IQE PIC.
- For frame-relay-ether-type-tcc encapsulation, you must assign this logical interface a DLCI from 512 through 1022.
- For interfaces that carry IP version 6 (IPv6) traffic, you cannot configure ether-over-atm-llc encapsulation.
- When you use ether-over-atm-llc encapsulation, you cannot configure multipoint interfaces.
- A logical interface cannot have vlan-ccc or vlan-vpls encapsulation unless the physical device also has vlan-ccc or vlan-vpls encapsulation, respectively. In addition, you must assign this logical interface a VLAN ID from 512 through 1023; if the VLAN ID is 511 or lower, it is subject to the normal destination filter lookups in addition to source address filtering. For more information, see *Configuring VLAN and Extended VLAN Encapsulation*.
- You can create an ATM cell-relay circuit by configuring an entire ATM physical device or an individual virtual circuit (VC). When you configure an entire device, only cell-relay encapsulation is allowed on the logical interfaces. For more information, see *Configuring an ATM Cell-Relay Circuit Overview*.

## Configuring the Encapsulation on a Logical Interface

Generally, you configure an interface's encapsulation at the **[edit interfaces interface-name]** hierarchy level. However, for some encapsulation types, such as Frame Relay, ATM, and Ethernet virtual local area network (VLAN) encapsulations, you can also configure the encapsulation type that is used inside the Frame Relay, ATM, or VLAN circuit itself.

To configure encapsulation on a logical interface:

1. In configuration mode, go to the `[edit interfaces interface-name unit logical-unit-number]` or `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]` hierarchy level.

```
[edit]
user@host# set interfaces at-fpc/pic/port unit logical-unit-number
```

2. Configure the encapsulation type as described in [encapsulation \(Logical Interface\)](#).

```
[edit interfaces at-fpc/pic/port unit logical-unit-number]
user@host# set encapsulation encapsulation-type
```

## Displaying the Encapsulation on a Logical Interface

**Purpose** To display the configured encapsulation and its associated set options on a physical interface when the following are set at the `[edit interfaces interface-name]` or `[edit logical-systems logical-system-name interfaces interface-name]` hierarchy level:

- interface-name—at-1/1/0
- Encapsulation—atm-ccc-cell-relay
- Unit—120

**Action** Run the `show` command at the `[edit interfaces interface-name]` hierarchy level.

```
[edit interfaces at-1/1/0]
user@host# show
encapsulation atm-ccc-cell-relay;
unit 120 {
  encapsulation atm-ccc-cell-relay;
}
```

**Meaning** The configured encapsulation and its associated set options are displayed as expected.

- Related Documentation**
- [encapsulation \(Logical Interface\) on page 532](#)
  - *Configuring VLAN and Extended VLAN Encapsulation*
  - *Configuring an ATM1 Cell-Relay Circuit Overview*

## Configuring Interface Encapsulation on PTX Series Packet Transport Routers

This topic describes how to configure interface encapsulation on PTX Series Packet Transport Routers. Use the **flexible-ethernet-services** configuration statement to configure different encapsulation for different logical interfaces under a physical interface. With flexible Ethernet services encapsulation, you can configure each logical interface encapsulation without range restrictions for VLAN IDs.

Supported encapsulations for physical interfaces include:

- **flexible-ethernet-services**
- **ethernet-ccc**
- **ethernet-tcc**

Supported encapsulations for logical interfaces include:

- **ethernet**
- **vlan-ccc**
- **vlan-tcc**

**NOTE:** PTX Series Packet Transport Routers do not support **extended-vlan-cc** and **extended-vlan-tcc** encapsulation on logical interfaces. Instead, you can configure a tag protocol ID (TPID) value of 0x9100 to achieve the same results.

---

To configure flexible Ethernet services encapsulation, include the **encapsulation flexible-ethernet-services** statement at the **[edit interfaces et-fpc/pic/port ]** hierarchy level. For example:

```
interfaces {
  et-fpc/pic/port {
    vlan-tagging;
    encapsulation flexible-ethernet-services;
    unit 0 {
      vlan-id 1000;
      family inet {
        address 11.0.0.20/24;
      }
    }
    unit 1 {
      encapsulation vlan-ccc;
      vlan-id 1010;
    }
    unit 2 {
      encapsulation vlan-tcc;
      vlan-id 1020;
      family tcc {
        proxy {
          inet-address 11.0.2.160;
        }
        remote {
          inet-address 11.0.2.10;
        }
      }
    }
  }
}
```

**Related Documentation**

- [Configuring Interface Encapsulation on Physical Interfaces on page 119](#)

## Configuring a Point-to-Point Connection

By default, all interfaces are assumed to be point-to-point connections. You must ensure that the maximum transmission unit (MTU) sizes on both sides of the connection are the same.

For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection by including the **point-to-point** statement:

```
point-to-point;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

## Configuring a Multipoint Connection

By default, all interfaces are assumed to be point-to-point connections. To configure an interface to be a multipoint connection, include the **multipoint** statement:

```
multipoint;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

## Configuring the PPP Restart Timers

You can configure a restart timer for the Link Control Protocol (LCP) and Network Control Protocol (NCP) components of a PPP session. You can configure the LCP restart timer on interfaces with PPP, PPP TCC, PPP over Ethernet, PPP over ATM, and PPP over Frame Relay encapsulations. You can configure the NCP restart timer on interfaces with PPP and PPP TCC encapsulations and on multilink PPP bundle interfaces.

To configure the restart timer for the NCP component of a PPP session, include the **ncp-restart-timer** statement, and specify the number of milliseconds.

To configure the restart timer for the LCP component of a PPP session, include the **lcp-restart-timer** statement, and specify the number of milliseconds:

```
lcp-restart-timer milliseconds;  
ncp-restart-timer milliseconds;
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* ppp-options]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* ppp-options]

To monitor the configuration, issue the **show interfaces *interface-name*** command. Configured options are displayed in the **PPP parameters** field for the physical interface.

```
user@host> run show interfaces t1-0/0/0:1:1.0 detail
Logical interface t1-0/0/0:1:1.0 (Index 67) (SNMP ifIndex 40)
(Generation 156)
Flags: Hardware-Down Device-Down Point-To-Point SNMP-Traps 0x4000
Encapsulation: PPP
PPP parameters:
  LCP restart timer: 2000 msec
  NCP restart timer: 2000 msec
Protocol inet, MTU: 1500, Generation: 163, Route table: 0
Flags: Protocol-Down
Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
  Destination: 1.1.1/24, Local: 1.1.1.2, Broadcast: 1.1.1.255,
```

---

## Configuring the PPP Clear Loop Detected Timer

When a Point-to-Point Protocol (PPP) session detects a loop, the loop detected flag is set. If the flag is not cleared by the protocol after the loopback is cleared, the clear loop detected timer clears the flag after the specified time has elapsed.

To configure the clear loop detected timer for the LCP component of a PPP session, include the **loopback-clear-timer** statement, and specify the number of seconds.

**loopback-clear-timer** *seconds*;

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* ppp-options]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* ppp-options]

To monitor the configuration, issue the **show interfaces *interface-name* extensive** command.

---

## Configuring the LCP Configure-Request Maximum Sent

Link Control Protocol (LCP) Configure-Request is used to establish a link. You can configure the maximum number of LCP Configure-Requests to send. The router stops sending LCP Configure-Requests after the specified maximum number is sent. To configure the LCP Configure-Request maximum, use the **lcp-max-conf-req** statement at the [edit interfaces *interface-name* unit *number* ppp-options] hierarchy level. The *number* range is from 0 to 65,535; where 0 specifies no limit and the LCP Configure-Request is sent indefinitely. The default is 254.

Related Documentation • [lcp-max-conf-req on page 664](#)

## Configuring the NCP Configure-Request Maximum Sent

Network Control Protocol (NCP) Configure-Request is used to establish a link. You can configure the maximum number of NCP Configure-Requests to send. The router stops sending NCP Configure-Requests after the specified maximum number is sent. To configure the NCP Configure-Request maximum, use the **ncp-max-conf-req** statement at the **[edit interfaces *interface-name* unit *number* ppp-options]** hierarchy level. The *number* range is from 0 to 65,535; where 0 specifies no limit and NCP Configure-Request is sent indefinitely. The default is 254.

Related Documentation • [ppp-options on page 832](#)

## Configuring Dynamic Profiles for PPP

A dynamic profile acts as a template that enables you to create, update, or remove a configuration that includes attributes for client access (for example, interface or protocol) or service (for example, IGMP). Using these profiles you can consolidate all of the common attributes of a client (and eventually a group of clients) and apply the attributes simultaneously.

After they are created, the profiles reside in a profile library on the router. You can then use the **dynamic-profile** statement to attach profiles to interfaces. To assign a dynamic profile to a PPP interface, you can include the **dynamic-profile** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* ppp-options]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number ppp-options]
  dynamic-profile profile-name;
```

To monitor the configuration, issue the **show interfaces *interface-name*** command.

For information about dynamic profiles, see *Dynamic Profiles Overview* in the *Junos Subscriber Access Configuration Guide*.

For information about creating dynamic profiles, see *Configuring a Basic Dynamic Profile* in the *Junos Subscriber Access Configuration Guide*.

For information about assigning a dynamic profile to a PPP interface, see *Attaching Dynamic Profiles to Static PPP Subscriber Interfaces* in the *Junos Subscriber Access Configuration Guide*.

**NOTE:** Dynamic profiles for PPP subscribers are supported only on PPPoE interfaces for this release.

Related Documentation • [Configuring Dynamic Authentication for PPP Subscribers](#)

## Configuring PPP CHAP Authentication

---

For interfaces with PPP encapsulation, you can configure interfaces to support the PPP Challenge Handshake Authentication Protocol (CHAP), as defined in RFC 1994, *PPP Challenge Handshake Authentication Protocol (CHAP)*. When you enable CHAP on an interface, the interface can authenticate its peer and can be authenticated by its peer.

For information about configuring CHAP, see [“Configuring the PPP Challenge Handshake Authentication Protocol” on page 126](#).

## Configuring the PPP Password Authentication Protocol On a Logical Interface

---

- [Understanding PPP Password Authentication Protocol on page 178](#)
- [Configuring the PPP Password Authentication Protocol On a Logical Interface on page 179](#)

### Understanding PPP Password Authentication Protocol

The Password Authentication Protocol (PAP) provides a simple method for the peer to establish its identity using a two-way handshake. This is done only upon initial link establishment.

After the link is established, an ID and password pair is repeatedly sent by the peer to the authenticator until authentication is acknowledged or the connection is terminated.

For interfaces with PPP encapsulation, you can configure interfaces to support the Password Authentication Protocol (PAP), as defined in RFC 1334, *PAP Authentication Protocols*. If authentication is configured, the PPP link negotiates using CHAP or PAP protocol for authentication during the Link Control Protocol (LCP) negotiation phase. PAP is only performed after the link establishment phase (LCP up) portion of the authentication phase.

During authentication, the PPP link sends a PAP authentication-request packet to the peer with an ID and password. The authentication-request packet is sent every 2 seconds, similar to the CHAP challenge, until a response is received (acknowledgment packet, nonacknowledgment packet). If an acknowledgment packet is received, the PPP link transitions to the next state, the network phase. If a nonacknowledgment packet is received, an LCP terminate request is sent, and the PPP link goes back to the link establishment phase. If no response is received, and an optional retry counter is set to **true**, a new request acknowledgment packet is resent. If the retry counter expires, the PPP link transitions to the LCP negotiate phase.

You can configure the PPP link with PAP in passive mode. By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

## Configuring the PPP Password Authentication Protocol On a Logical Interface

When you configure an interface to use PAP, you must assign an access profile to the interface. When an interface receives PAP authentication requests, the access profile in the packet is used to look up the password. If no matching access profile is found for the PAP authentication request that was received by the interface, the optionally configured default PAP password is used.

To configure the PPP password authentication protocol, on each logical interface with PPP encapsulation, perform the following steps.

1. The default PAP password is used when no matching PAP access profile exists, or if the PAP access profile name changes during PPP link negotiation. To configure the default PAP password, include the **pap-password** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name unit logical-unt-number ppp-options pap]
user@host# set default-pap-password password
```

2. To configure the name the interface uses in PAP request and response packets, include the **local-name** statement at the **[edit interfaces *interface-name* unit *logical-unt-number* ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name ppp-options pap]
user@host# set local-name name
```

**NOTE:** By default, when PAP is enabled on an interface, the interface uses the router's system hostname as the name sent in PAP request and response packets.

3. You need to configure the password to be used for authentication. To configure the host password for sending PAP requests, include the **local-password** statement at the **[edit interfaces *interface-name* ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name unit logical-unt-number ppp-options pap]
user@host# set local-password password
```

4. To configure the interface to authenticate with PAP in passive mode, include the **passive** statement at the **[edit interfaces *interface-name* unit *logical-unt-number* ppp-options pap]** hierarchy level:

```
[edit interfaces interface-name unit logical-unt-number ppp-options pap]
user@host# set passive
```

**NOTE:** By default, when PAP is enabled on an interface, the interface expects authenticate-request packets from the peer. However, the interface can be configured to send authentication request packets to the peer by configuring PAP to operate in passive mode. In PAP passive mode, the interface sends the authenticate-request packets to the peer only if the interface receives the PAP option from the peer during LCP negotiation—in passive mode, the interface does not authenticate the peer.

---

## Configuring Accounting for the Logical Interface

---

- [Accounting Profiles Overview on page 180](#)
- [Configuring Accounting for the Logical Interface on page 180](#)
- [Displaying Accounting Profile for the Logical Interface on page 181](#)

### Accounting Profiles Overview

Juniper Networks routers and switches can collect various kinds of data about traffic passing through the router and switch. You can set up one or more *accounting profiles* that specify some common characteristics of this data, including the following:

- The fields used in the accounting records
- The number of files that the router or switch retains before discarding, and the number of bytes per file
- The polling period that the system uses to record the data

You configure the profiles and define a unique name for each profile using statements at the **[edit accounting-options]** hierarchy level. There are two types of accounting profiles: interface profiles and filter profiles. You configure interface profiles by including the **interface-profile** statement at the **[edit accounting-options]** hierarchy level. You configure filter profiles by including the **filter-profile** statement at the **[edit accounting-options]** hierarchy level. For more information, see the *Network Management Administration Guide*.

You apply filter profiles by including the **accounting-profile** statement at the **[edit firewall filter *filter-name*]** and **[edit firewall family *family* filter *filter-name*]** hierarchy levels. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

## Configuring Accounting for the Logical Interface

### Before you begin

---

You must configure a profile to collect error and statistic information for input and output packets on a particular logical interface. An accounting profile specifies what statistics should be collected and written to a log file. For more information on how to configure an accounting-data log file, see the *Configuring Accounting-Data Log Files*.

An interface profile specifies the information collected and written to a log file. You can configure a profile to collect error and statistic information for input and output packets on a particular logical interface.

1. To configure which statistics should be collected for an interface, include the **fields** statement at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level.

```
[edit accounting-options interface-profile profile-name]  
user@host# set fields field-name
```

2. Each accounting profile logs its statistics to a file in the **/var/log** directory. To configure which file to use, include the **file** statement at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level.

```
[edit accounting-options interface-profile profile-name]  
user@host# set file filename
```

**NOTE:** You must specify a file statement for the interface profile that has already been configured at the **[edit accounting-options]** hierarchy level. For more information, see the [Configuring Accounting-Data Log Files](#)

3. Each interface with an accounting profile enabled has statistics collected once per interval time specified for the accounting profile. Statistics collection time is scheduled evenly over the configured interval. To configure the interval, include the **interval** statement at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level.

```
[edit accounting-options interface-profile profile-name]  
user@host# set interval minutes
```

**NOTE:** The minimum interval allowed is 1 minute. Configuring a low interval in an accounting profile for a large number of interfaces might cause serious performance degradation.

4. To configure the interfaces on which the accounting needs to be performed, apply the interface profile to a logical interface by including the **accounting-profile** statement at the **[edit interfaces interface-name unit *logical-unit-number*]** hierarchy level.

```
[edit interfaces]  
user@host# set interface-name unit logical-unit-number accounting-profile profile-name
```

## Displaying Accounting Profile for the Logical Interface

**Purpose** To display the configured accounting profile a particular logical interface at the **[edit accounting-options interface-profile *profile-name*]** hierarchy level:

- interface-name—ge-1/0/1
- Logical unit number—1
- Interface profile —**if\_profile**
- File name—**if\_stats**
- Interval—15 minutes

**Action** • Run the **show** command at the **[edit interfaces ge-1/0/1 unit 1]** hierarchy level.

```
[edit interfaces ge-1/0/1 unit 1]
accounting-profile if_profile;
```

- Run the **show** command at the **[edit accounting-options]** hierarchy level.

```
interface-profile if_profile {
  interval 15;
  file if_stats {
    fields {
      input-bytes;
      output-bytes;
      input-packets;
      output-packets;
      input-errors;
      output-errors;
    }
  }
}
```

**Meaning** The configured accounting and its associated set options are displayed as expected.

---

## Enabling or Disabling SNMP Notifications on Logical Interfaces

By default, Simple Network Management Protocol (SNMP) notifications are sent when the state of an interface or a connection changes. To explicitly enable these notifications on the logical interface, include the **traps** statement; to disable these notifications on the logical interface, include the **no-traps** statement:

```
(traps | no-traps);
```

You can include these statements at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

## Disabling a Logical Interface

You can unconfigure a logical interface, effectively disabling that interface, without removing the logical interface configuration statements from the configuration. To do this, include the **disable** statement:

```
disable;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

When an interface is disabled, a route (pointing to the reserved target “REJECT”) with the IP address of the interface and a 32-bit subnet mask is installed in the routing table. See *Routing Protocols*.

## Configuring Logical System Interface Properties

With Junos OS, you can partition a single physical router into multiple logical devices that perform independent routing tasks. Because logical systems perform a subset of the tasks once handled by the physical router, logical systems offer an effective way to maximize the use of a single router.

1. Configure the physical interface that needs to be partitioned into multiple logical systems.

```
[edit]
user@host# set interfaces interface-name description description
```

2. Create the logical system interface on the logical unit.

```
[edit]
user@host# set logical-systems name interfaces interface-name unit
logical-unit-number description description
```

3. Configure the required properties for the logical system.

```
[edit logical-systems name]
user@host# set interfaces interface-name unit logical-unit-number family name
address address
```

**Related Documentation**

## Protocol Family Configuration and Interface Address Statements

---

For each logical interface, you must configure one or more protocol families. You can also configure interface address properties. To do this, include the following statements:

```
family family {  
  accounting {  
    destination-class-usage;  
    source-class-usage {  
      direction;  
    }  
  }  
}
```

```

    }
}
address address {
    destination address;
}
bundle interface-name;
filter {
    dialer filter-name;
    input filter-name;
    output filter-name;

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

For information about interface-specific protocol and address properties, see *Configuring T1 and NxDSO Interfaces*.

**Related Documentation** • [Configuring T1 and NxDS0 Interfaces](#)

## Configuring the Protocol Family

A protocol family is a group of logical properties within an interface configuration. Protocol families include all the protocols that make up a protocol suite. To use a protocol within a particular suite, you must configure the entire protocol family as a logical property for an interface.

Junos OS protocol families include the following common protocol suites:

- **Inet**—Supports IP protocol traffic, including OSPF, BGP, and Internet Control Message Protocol (ICMP).
- **Inet6**—Supports IPv6 protocol traffic, including RIP for IPv6 (RIPng), IS-IS, and BGP.
- **ISO**—Supports IS-IS traffic.
- **MPLS**—Supports MPLS.

In addition to the common protocol suites, JUNOS protocol families sometimes use the following protocol suites. For more information see, [family](#).

To configure the logical interface's protocol family, include the **family** statement, specifying the selected family. To configure the protocol family, following are the minimum configuration tasks under the **[edit interfaces interface-name unit logical-unit-number family family]** hierarchy.

**Table 43: Protocol Family Configuration Tasks**

Task	Find Details Here
Configure MTU	<a href="#">"Configuring the Media MTU" on page 105</a>
Configure the unit and family so that the interface can transmit and receive multicast traffic only	<a href="#">Restricting Tunnels to Multicast Traffic</a>
Disable the sending of redirect messages by the router	<a href="#">Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch</a>
Assign an address to an interface	<a href="#">"Configuring the Interface Address" on page 189</a>

**Related Documentation** • [family on page 561](#)

## Configuring the Interface Address

---

You assign an address to an interface by specifying the address when configuring the protocol family. For the **inet** or **inet6** family, configure the interface IP address. For the **iso** family, configure one or more addresses for the loopback interface. For the **ccc**, **ethernet-switching**, **tcc**, **mpls**, **tnp**, and **vppls** families, you never configure an address.

**NOTE:** The point-to-point (PPP) address is taken from the loopback interface address that has the primary attribute. When the loopback interface is configured as an unnumbered interface, it takes the primary address from the donor interface.

To assign an address to an interface, perform the following steps:

1. Configure the interface address at the **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]** hierarchy level.
  - To configure an IPv4 address on routers and switches running Junos OS, use the **interface *interface-name* unit *number* family inet address *a.b.c.d/nn*** statement at the **[edit interfaces]** hierarchy level.

```
[edit interfaces ]
```

```
user@host# set interface-name unit logical-unit-number family inet address a.b.c.d/nn
```

#### NOTE:

- Juniper Networks routers and switches support /31 destination prefixes when used in point-to-point Ethernet configurations; however, they are not supported by many other devices, such as hosts, hubs, routers, or switches. You must determine if the peer system also supports /31 destination prefixes before configuration.
- You can configure the same IPv4 address on multiple physical interfaces. When you assign the same IPv4 address to multiple physical interfaces, the operational behavior of those interfaces differs, depending on whether they are implicitly or explicitly point-to-point .
- By default, all interfaces are assumed to be point-to-point (PPP) interfaces. For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection.
- If you configure the same IP address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration. The remaining IP address configurations are ignored, leaving some interfaces without an assigned address. Interfaces without an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

- To configure an IPv6 address on routers and switches running Junos OS, use the **interface *interface-name* unit *number* family inet6 address *aaaa:bbbb:::zzzz/nn*** statement at the **[edit interfaces]** hierarchy level.

```
[edit interfaces ]
```

```
user@host# set interface-name unit logical-unit-number family inet6 address  
aaaa:bbbb:::zzzz/nn
```

#### NOTE:

- You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values. The double colon (::) represents all bits set to 0.
- You must manually configure the router or switch advertisement and advertise the default prefix for autoconfiguration to work on a specific interface.

2. [Optional] Set the broadcast address on the network or subnet .

```
[edit interfaces interface-name unit logical-unit-number family family address address],
user@host# set broadcast address
```

**NOTE:** The broadcast address must have a host portion of either all ones or all zeros. You cannot specify the addresses 0.0.0.0 or 255.255.255.255

3. [Optional] specify the remote address of the connection for the encrypted, PPP-encapsulated, and tunnel interfaces.

```
[edit logical-systems logical-system-name interfaces interface-name unit
  logical-unit-number family family address address]
user@host# set destination address
```

4. [Optional] For interfaces that carry IP version 6 (IPv6) traffic, configure the host to assign itself a unique 64-Bit IP Version 6 interface identifier (EUI-64).

```
[edit logical-systems logical-system-name interfaces interface-name unit
  logical-unit-number family family address address]
user@host# set eui-64
```

## Configuring Default, Primary, and Preferred Addresses and Interfaces

- [Default, Primary, and Preferred Addresses and Interfaces on page 191](#)
- [Configuring the Primary Interface for the Router on page 192](#)
- [Configuring the Primary Address for an Interface on page 192](#)
- [Configuring the Preferred Address for an Interface on page 193](#)

### Default, Primary, and Preferred Addresses and Interfaces

The router has a default address and a primary interface, and interfaces have primary and preferred addresses.

The *default address* of the router is used as the source address on unnumbered interfaces. The routing protocol process tries to pick the default address as the router ID, which is used by protocols, including OSPF and internal BGP (IBGP).

The *primary interface* for the router is the interface that packets go out when no interface name is specified and when the destination address does not imply a particular outgoing interface.

An interface's *primary address* is used by default as the local address for broadcast and multicast packets sourced locally and sent out the interface. An interface's *preferred address* is the default local address used for packets sourced by the local router to destinations on the subnet.

The default address of the router is chosen using the following sequence:

1. The primary address on the loopback interface **lo0** that is not **127.0.0.1** is used.
2. The primary address on the primary interface is used.

## Configuring the Primary Interface for the Router

The *primary interface* for the router has the following characteristics:

- It is the interface that packets go out when you type a command such as ping 255.255.255.255—that is, a command that does not include an interface name (there is no interface **type-0/0/0.0** qualifier) and where the destination address does not imply any particular outgoing interface.
- It is the interface on which multicast applications running locally on the router, such as Session Announcement Protocol (SAP), do group joins by default.
- It is the interface from which the default local address is derived for packets sourced out an unnumbered interface if there are no non-127 addresses configured on the loopback interface, **lo0**.

By default, the multicast-capable interface with the lowest-index address is chosen as the primary interface. If there is no such interface, the point-to-point interface with the lowest index address is chosen. Otherwise, any interface with an address could be picked. In practice, this means that, on the router, the **fxp0** or **em0** interface is picked by default.

To configure a different interface to be the primary interface, include the **primary** statement:

```
primary;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

## Configuring the Primary Address for an Interface

The *primary address* on an interface is the address that is used by default as the local address for broadcast and multicast packets sourced locally and sent out the interface. For example, the local address in the packets sent by a **ping interface so-0/0/0.0 255.255.255.255** command is the primary address on interface **so-0/0/0.0**. The primary address flag also can be useful for selecting the local address used for packets sent out unnumbered interfaces when multiple non-127 addresses are configured on the loopback interface, **lo0**. By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.

To set a different primary address, include the **primary** statement:

```
primary;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family* address *address*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family* address *address*]

## Configuring the Preferred Address for an Interface

The *preferred address* on an interface is the default local address used for packets sourced by the local router to destinations on the subnet. By default, the numerically lowest local address is chosen. For example, if the addresses 172.16.1.1/12, 172.16.1.2/12, and 172.16.1.3/12 are configured on the same interface, the preferred address on the subnet (by default, 172.16.1.1) would be used as a local address when you issue a **ping 172.16.1.5** command.

To set a different preferred address for the subnet, include the **preferred** statement:

**preferred;**

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family* address *address*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family* address *address*]

## Operational Behavior of Interfaces When the Same IPv4 Address Is Assigned to Them

You can configure the same IPv4 address on multiple physical interfaces. When you assign the same IPv4 address to multiple physical interfaces, the operational behavior of those interfaces differs, depending on whether they are implicitly or explicitly point-to-point .

**NOTE:** By default, all interfaces are assumed to be point-to-point (PPP) interfaces. For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection.

**NOTE:** If you configure the same IP address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration. The remaining IP address configurations are ignored, leaving some interfaces without an assigned address. Interfaces without an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

In the following example, the IP address configuration for interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
}
```

The following examples show the sample configuration of assigning the same IPv4 address to implicitly and explicitly point-to-point interfaces, and their corresponding **show interfaces terse** command outputs to see their operational status.

#### Configuring same IPv4 address on implicitly PPP interfaces:

```
[edit]
user@host# show
ge-0/1/0 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
ge-3/0/1 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
```

The sample output shown below for the above configuration reveals that only **ge-0/1/0.0** was assigned the same IPv4 address **200.1.1.1/24** and its **link** state was **up**, while **ge-3/0/1.0** was not assigned the IPv4 address, though its **link** state was up,

which means that it will be operational only when it gets a unique IPv4 address other than **200.1.1.1/24**.

```
user@host> show interfaces terse ge*
Interface           Admin Link Proto  Local          Remote
      ge-0/1/0             up   up
      ge-0/1/0.0           up   up   inet    200.1.1.1/24
                        multiservice
      ge-0/1/1             up   down
      ge-3/0/0             up   down
      ge-3/0/1             up   up
      ge-3/0/1.0           up   up   inet
                        multiservice
```

Configuring same IPv4 address on explicitly PPP interfaces:

```
[edit]
user@host# show
so-0/0/0 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
so-0/0/3 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
```

The sample output shown below for the above configuration reveals that both **so-0/0/0.0** and **so-0/0/3.0** were assigned the same IPv4 address **200.1.1.1/24** and that their **link** states were down, which means that to make them operational at least one of them will have to be configured with a unique IPv4 address other than **200.1.1.1/24**.

```
user@host> show interfaces terse so*
Interface           Admin Link Proto  Local          Remote
so-0/0/0             up   up
so-0/0/0.0           up   down inet    200.1.1.1/24
so-0/0/1             up   up
so-0/0/2             up   down
so-0/0/3             up   up
so-0/0/3.0           up   down inet    200.1.1.1/24
so-1/1/0             up   down
so-1/1/1             up   down
so-1/1/2             up   up
so-1/1/3             up   up
so-2/0/0             up   up
so-2/0/1             up   up
so-2/0/2             up   up
so-2/0/3             up   down
```

---

## Configuring ICCP for MC-LAG

For multichassis link aggregation (MC-LAG), you must configure Inter-Control Center Communications Protocol (ICCP) to exchange information between two MC-LAG peers.

To enable ICCP, include the **iccp** statement at the **[edit protocols]** hierarchy level:

```
[edit protocols]
iccp {
  authentication-key string;
  local-ip-addr ipv4-address;
  peer ip-address {
    authentication-key string;
    liveness-detection {
      detection-time {
        threshold milliseconds;
      }
      minimum-interval milliseconds;
      minimum-receive-interval milliseconds;
      multiplier number;
      no-adaptation;
      transmit-interval {
        minimum-interval milliseconds;
        threshold milliseconds;
      }
      version (1 | automatic);
    }
    local-ip-addr ipv4-address;
    redundancy-group-id-list [ redundancy-groups ];
    session-establishment-hold-time value;
  }
  session-establishment-hold-time value;
  traceoptions;
}
```

The **local-ip-address** statement sets the source address. This could be a specified address or interface address. The **session-establishment-hold-time** statement determines whether a chassis takes over as the master at the ICCP session.

The **authentication-key** statement is provided by TCP Message Digest 5 (md5) option for an ICCP TCP session. The **redundancy-group-id-list** statement specifies the redundancy groups between ICCP peers and the **liveness-detection** hierarchy configures Bidirectional Forwarding Detection (BFD) protocol options.

**NOTE:** ICCP is based on TCP and it uses IP routes to reach the MC-LAG peer. To ensure that the ICCP session is as resilient as possible, we recommend that you configure alternative routes between the ICCP end-point IP addresses. Alternatively, configure a LAG interface that has two or more interfaces between the MC-LAG pairs to prevent session failure when there are no alternative routes.

For Inter-Control Center Communications Protocol (ICCP) in a multichassis link aggregation group (MC-LAG) configured in an active-active bridge domain, you must ensure that you configure the same peer IP address hosting the MC-LAG by including the **peer ip-address** statement at the **[edit protocols iccp]** hierarchy level and the **multi-chassis-protection peer ip-address** statement at the **[edit interfaces interface-name]** hierarchy level. Multichassis protection reduces the configuration at the logical interface level for MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces. If the ICCP is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the **peer** statement.

For example, the following statements illustrate how the same peer IP address can be configured for both the ICCP peer and multichassis protection link:

```
set interfaces ae1 unit 0 multi-chassis-protection 10.255.34.112 interface ae0.0
set protocols iccp peer 10.255.34.112 redundancy-group-id-list 1
```

Although you can commit an MC-LAG configuration with various parameters defined for it, you can configure multichassis protection between two peers without configuring the ICCP peer address. You can also configure multiple ICCP peers and commit such a configuration.

**Related  
Documentation**

## Configuring IPCP Options for Interfaces with PPP Encapsulation

For interfaces with PPP encapsulation, you can configure IPCP to negotiate IP address assignments and to pass network-related information such as Windows Name Service (WINS) and Domain Name System (DNS) servers, as defined in RFC 1877, *PPP Internet Protocol Control Protocol Extensions for Name Server Addresses*.

When you enable a PPP interface, you can configure an IP address, enable the interface to negotiate an IP address assignment from the remote end, or allow the interface to be unnumbered. You can also assign a destination profile to the remote end. The destination profile includes PPP properties, such as primary and secondary DNS and NetBIOS Name Servers (NBNSs). These options are described in the following sections:

**NOTE:** The Junos OS does not request name servers from the remote end; the software does, however, send name servers to the remote end if requested.

### Before you begin

You must configure the PPP encapsulation on the interface before configuring the IPCP option. On the logical interface, the following PPP encapsulation types are supported:

- `atm-mlppp-llc`
- `atm-ppp-llc`
- `atm-ppp-vc-mux`
- `multilink-ppp`

For more information about PPP encapsulation, see [“Configuring Interface Encapsulation on Logical Interfaces” on page 171](#) and [Configuring ATM Interface Encapsulation](#)

- To configure an IP address for the interface, include the **address** statement in the configuration. For more information, see [“Configuring the Interface Address” on page 189](#).

If you include the **address** statement in the configuration, you cannot include the **negotiate-address** or **unnumbered-address** statement in the configuration.

When you include the **address** statement in the interface configuration, you can assign PPP properties to the remote end.

**NOTE:** The option to negotiate an IP address is not allowed in MLFR and MFR encapsulations.

- To enable the interface to obtain an IP address from the remote end, include the **negotiate-address** statement at the `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy level.

`[edit interfaces interface-name unit logical-unit-number family inet]`

```
user@host# set negotiate-address
```

**NOTE:** If you include the `negotiate-address` statement in the configuration, you cannot include the `address` or `unnumbered-address` statement in the configuration.

- To configure an interface to be unnumbered, include the `unnumbered-address` and `destination` statements in the configuration.

```
[edit interfaces interface-name unit logical-unit-number family inet]
user@host# set unnumbered-address interface-name
user@host# set destination address
```

**NOTE:**

- The `unnumbered-address` statement enables the local address to be derived from the specified interface. The interface name must include a logical unit number and must have a configured address (see “[Configuring the Interface Address](#)” on page 189). Specify the IP address of the remote interface with the `destination` statement.
- If you include the `unnumbered-address` statement in the configuration, you cannot include the `address` or `negotiate-address` statement in the interface configuration.

- To assign PPP properties to the remote end include the `destination-profile` statement:

```
[edit interfaces interface-name unit logical-unit-number family inet address address]
user@host# set destination-profile name

[edit interfaces interface-name unit logical-unit-number family inet unnumbered-address
 interface-name]
user@host# set destination-profile name
```

**NOTE:**

- You can assign PPP properties to the remote end, after you include the `address` or `unnumbered-address` statement in the interface configuration.
- You define the profile at the `[edit access group-profile name ppp]` hierarchy level. For more information, see *Example: Group Profile Configuration*

## Configuring an Unnumbered Interface

---

This topic includes the following information:

- [Overview of Unnumbered Interfaces on page 200](#)
- [Configuring an Unnumbered Point-to-Point Interface on page 200](#)
- [Configuring an Unnumbered Ethernet or Demux Interface on page 201](#)
- [Configuring a Preferred Source Address for Unnumbered Ethernet or Demux Interfaces on page 202](#)
- [Restrictions for Configuring Unnumbered Ethernet Interfaces on page 203](#)
- [Displaying the Unnumbered Ethernet Interface Configuration on page 204](#)
- [Displaying the Configured Preferred Source Address for an Unnumbered Ethernet Interface on page 205](#)
- [Displaying the Configuration for Unnumbered Ethernet Interface as the Next Hop for a Static Route on page 206](#)

### Overview of Unnumbered Interfaces

When you need to conserve IP addresses, you can configure unnumbered interfaces. Setting up an unnumbered interface enables IP processing on the interface without assigning an explicit IP address to the interface. For IPv6, in which conserving addresses is not a major concern, you can configure unnumbered interfaces to share the same subnet across multiple interfaces. IPv6 unnumbered interfaces are only supported on Ethernet interfaces. The statements you use to configure an unnumbered interface depend on the type of interface you are configuring: a point-to-point interface or an Ethernet interface:

### Configuring an Unnumbered Point-to-Point Interface

1. In configuration mode, go to the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level.

`[edit ]`

`user@host# edit interfaces interface-name unit logical-unit-number`

2. To configure an unnumbered point-to-point interface, configure the protocol family, but do not include the **address** statement.

`[edit interfaces interface-name unit logical-unit-number]`

`user@host# set family`

## NOTE:

- For interfaces with PPP encapsulation, you can configure an unnumbered interface by including the `unnumbered-interface` statement in the configuration. For more information, see [“Configuring IPCP Options for Interfaces with PPP Encapsulation” on page 198](#).
- When configuring unnumbered interfaces, you must ensure that a source address is configured on some interface in the router. This address is the default address. We recommend that you do this by assigning an address to the loopback interface (lo0), as described in [“Configuring the Loopback Interface” on page 303](#). If you configure an address (other than a martian) on the lo0 interface, that address is always the default address, which is preferable because the loopback interface is independent of any physical interfaces and therefore is always accessible.

## Configuring an Unnumbered Ethernet or Demux Interface

1. In configuration mode, go to the `[edit interfaces interface-name unit logical-unit-number family family-name]` hierarchy level.

```
[edit ]
```

```
user@host# edit interfaces interface-name unit logical-unit-number family family-name
```

2. To configure an unnumbered Ethernet or demultiplexing interface, include the `unnumbered-address` statement in the configuration.

```
[edit interfaces interface-name unit logical-unit-number family family-name]
```

```
user@host# set unnumbered-address interface-name
```

3. (Optional) To specify the unnumbered Ethernet interface as the next-hop interface for a configured static route, include the `qualified-next-hop` statement at the `[edit routing-options static route destination-prefix]` hierarchy level. This feature enables you to specify independent preferences and metrics for static routes on a next-hop basis.

```
[edit routing-options static route destination-prefix]
```

```
user@host# set qualified-next-hop (address | interface-name)
```

---

**NOTE:**

- The `unnumbered-address` statement currently supports configuration of unnumbered demux interfaces only for the IPv4 address family. You can configure unnumbered Ethernet interfaces for both IPv4 and IPv6 address families.
  - The interface that you configure to be unnumbered *borrow*s an assigned IP address from another interface, and is referred to as the *borrower interface*. The interface from which the IP address is borrowed is referred to as the *donor interface*. In the `unnumbered-address` statement, *interface-name* specifies the donor interface. For an unnumbered Ethernet interface, the donor interface can be an Ethernet, ATM, SONET, or loopback interface that has a logical unit number and configured IP address and is not itself an unnumbered interface. For an unnumbered IP demultiplexing interface, the donor interface can be an Ethernet or loopback interface that has a logical unit number and configured IP address and is not itself an unnumbered interface. In addition, for either Ethernet or demux, the donor interface and the borrower interface must be members of the same routing instance and the same logical system.
  - When you configure an unnumbered Ethernet or demux interface, the IP address of the donor interface becomes the source address in packets generated by the unnumbered interface.
  - You can configure a host route that points to an unnumbered Ethernet or demux interface. For information about host routes, see the *MPLS Applications Feature Guide*.
- 

## Configuring a Preferred Source Address for Unnumbered Ethernet or Demux Interfaces

When a loopback interface with multiple secondary IP addresses is configured as the donor interface for an unnumbered Ethernet or demux interface, you can optionally specify any one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet or demux interface. This feature enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet or demux interfaces in your network.

1. In configuration mode, go to the `[edit interfaces interface-name unit logical-unit-number family family-name]` hierarchy level.

`[edit ]`

`user@host# edit interfaces interface-name unit logical-unit-number family family-name`

2. To configure a secondary address on a loopback donor interface as the preferred source address for an unnumbered Ethernet or demux interface, include the `preferred-source-address` option in the `unnumbered-address` statement:

`[edit interfaces interface-name unit logical-unit-number family family-name]`

`user@host# set unnumbered-address interface-name <preferred-source-address  
address`

**NOTE:**

The following considerations apply when you configure a preferred source address on an unnumbered Ethernet or demux interface:

- The **unnumbered-address** statement currently supports the configuration of a preferred source address only for the IPv4 address family for demux interfaces, and for IPv4 and IPv6 address families for Ethernet interfaces.
- If you do not specify the preferred source address, the router uses the default primary IP address of the donor interface.
- You cannot delete an address on a donor loopback interface while it is being used as the preferred source address for an unnumbered Ethernet or demux interface.

## Restrictions for Configuring Unnumbered Ethernet Interfaces

The following restrictions apply when you configure unnumbered Ethernet interfaces:

- The **unnumbered-address** statement currently supports the configuration of unnumbered Ethernet interfaces for IPv4 and IPv6 address families.
- You cannot assign an IP address to an Ethernet interface that is already configured as an unnumbered interface.
- The donor interface for an unnumbered Ethernet interface must have one or more configured IP addresses.
- The donor interface for an unnumbered Ethernet interfaced cannot be configured as unnumbered.
- An unnumbered Ethernet interface does not support configuration of the following **address** statement options: **arp**, **broadcast**, **primary**, **preferred**, and **vrrp-group**. For information about these options, see [“Configuring the Interface Address” on page 189](#).
- Running IGMP and PIM are supported only on unnumbered Ethernet interfaces that directly face the host and have no downstream PIM neighbors. IGMP and PIM are not supported on unnumbered Ethernet interfaces that act as upstream interfaces in a PIM topology.
- Running OSPF and IS-IS on unnumbered Ethernet interfaces is not supported. However, you can run OSPF over unnumbered Ethernet interfaces configured as a Point-to-Point connection.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
}
```

For more information on configuring the same address on multiple interfaces, see [“Configuring the Interface Address” on page 189](#).

---

## Displaying the Unnumbered Ethernet Interface Configuration

**Purpose** To display the configured unnumbered interface at the `[edit interfaces interface-name unit logical-unit-number]` hierarchy level:

- Unnumbered interface —ge-1/0/0
- Donor interface —ge-0/0/0
- Donor interface address —4.4.4.1/24

The unnumbered interface “borrows” an IP address from the donor interface.

**Action** • Run the `show` command at the `[edit]` hierarchy level.

```
interfaces {
  ge-0/0/0 {
    unit 0 {
      family inet {
        address 4.4.4.1/24;
      }
    }
  }
  ge-1/0/0 {
    unit 0 {
```

```

        family inet {
            unnumbered-address ge-0/0/0.0;
        }
    }
}

```

**Meaning** The sample configuration that is described works correctly on M and T Series routers. For unnumbered interfaces on MX Series routers, you must additionally configure static routes on an unnumbered Ethernet interface by including the **qualified-next-hop** statement at the **[edit routing-options static route destination-prefix]** hierarchy level to specify the unnumbered Ethernet interface as the next-hop interface for a configured static route.

## Displaying the Configured Preferred Source Address for an Unnumbered Ethernet Interface

**Purpose** To display the configuration of preferred source address for an unnumbered interface at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet]** hierarchy level:

- Unnumbered interface —ge-4/0/0
- Donor interface —lo0
- Donor interface primary address—2.2.2.1/32
- Donor interface secondary address—3.3.3.1/32

**Action** • Run the **show** command at the **[edit]** hierarchy level.

```

interfaces {
  lo0 {
    unit 0 {
      family inet {
        address 2.2.2.1/32;
        address 3.3.3.1/32;
      }
    }
  }
}
interfaces {
  ge-4/0/0 {
    unit 0 {
      family inet {
        unnumbered-address lo0.0 preferred-source-address 3.3.3.1;
      }
    }
  }
}

```

**Meaning** The loopback interface **lo0** is the donor interface from which unnumbered Ethernet interface **ge-4/0/0** “borrows” an IP address.

The example shows one of the loopback interface's secondary addresses, 3.3.3.1, as the preferred source address for the unnumbered Ethernet interface.

## Displaying the Configuration for Unnumbered Ethernet Interface as the Next Hop for a Static Route

**Purpose** To display the unnumbered interface configured as the next hop for the static route at the `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy level:

- Unnumbered interface —ge-0/0/0
- Donor interface —lo0
- Donor interface primary address—5.5.5.1/32
- Donor interface secondary address—6.6.6.1/32
- Static route—7.7.7.1/32

**Action** • Run the `show` command at the `[edit]` hierarchy level.

```
interfaces {
  lo0 {
    unit 0 {
      family inet {
        address 5.5.5.1/32;
        address 6.6.6.1/32;
      }
    }
  }
}
```

**Meaning** In this example, `ge-0/0/0` is the unnumbered interface and a loopback interface, `lo0`, is the donor interface from which `ge-0/0/0` “borrows” an IP address. The example also configures a static route to `7.7.7.1/32` with a next hop through unnumbered interface `ge-0/0/0.0`.

---

## Setting the Protocol MTU

When you initially configure an interface, the protocol maximum transmission unit (MTU) is calculated automatically. If you subsequently change the media MTU, the protocol MTU on existing address families automatically changes.

For a list of default protocol MTU values, see [“Media MTU Sizes by Interface Type” on page 95](#).

To modify the MTU for a particular protocol family, include the `mtu` statement:

```
mtu bytes;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

If you increase the size of the protocol MTU, you must ensure that the size of the media MTU is equal to or greater than the sum of the protocol MTU and the encapsulation overhead. For a list of encapsulation overhead values, see “[Encapsulation Overhead by Interface Encapsulation Type](#)” on page 102. If you reduce the media MTU size, but there are already one or more address families configured and active on the interface, you must also reduce the protocol MTU size. (You configure the media MTU by including the **mtu** statement at the [edit interfaces *interface-name*] hierarchy level.)

**NOTE:** Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

The maximum number of data-link connection identifiers (DLCIs) is determined by the MTU on the interface. If you have keepalives enabled, the maximum number of DLCIs is 1000, with the MTU set to 5012.

The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the MTU. For example, the default protocol MTU for a Gigabit Ethernet interface is 1500 bytes, but the largest possible frame size is actually 1504 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

- Related Documentation**
- [Media MTU Overview on page 94](#)
  - [Configuring the Media MTU on page 105](#)

## Disabling the Removal of Address and Control Bytes

For Point-to-Point Protocol (PPP) CCC-encapsulated interfaces, the address and control bytes are removed by default before the packet is encapsulated into a tunnel.

You can disable the removal of address and control bytes. To do this, include the **keep-address-and-control** statement:

```
keep-address-and-control;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *ccc*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *ccc*]

- Related Documentation**
- [keep-address-and-control on page 655](#)

## Disabling the Transmission of Redirect Messages on an Interface

---

By default, the interface sends protocol redirect messages. To disable the sending of these messages on an interface, include the **no-redirects** statement:

```
no-redirects;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

To disable the sending of protocol redirect messages for the entire router or switch, include the **no-redirects** statement at the [edit system] hierarchy level.

### Related Documentation

- [no-redirects on page 768](#)

## Applying Policers

---

- [Configuring a Single-Rate Color-Blind Policer on page 215](#)
- [Configuring a Two-Rate Tricolor Marker Policer on page 215](#)

## Overview of Applying Policers

Policies allow you to perform simple traffic policing on specific interfaces or Layer 2 virtual private networks (VPNs) without configuring a firewall filter. To apply policies, include the **policer** statement:

```
policer {  
  arp policer-template-name;  
  input policer-template-name;  
  output policer-template-name;  
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

In the **family** statement, the protocol family can be **ccc**, **inet**, **inet6**, **mpls**, **tcc**, or **vpls**.

In the **arp** statement, list the name of one policer template to be evaluated when Address Resolution Protocol (ARP) packets are received on the interface. By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the **family inet** statement. If you want more stringent or lenient policing of ARP packets, you can configure an interface-specific policer and apply it to the interface. You configure an ARP policer just as you would configure any other policer, at the **[edit firewall policer]** hierarchy level. If you apply this policer to an interface, the default ARP packet policer is overridden. If you delete this policer, the default policer takes effect again.

In the **input** statement, list the name of one policer template to be evaluated when packets are received on the interface.

In the **output** statement, list the name of one policer template to be evaluated when packets are transmitted on the interface.

**NOTE:** To use policing on a CCC or TCC interface, you must configure the CCC or TCC protocol family.

You can configure a different policer on each protocol family on an interface, with one input policer and one output policer for each family. When you apply policers, you can configure the family **ccc**, **inet**, **inet6**, **mpls**, **tcc**, or **vpls** only, and one ARP policer for the family **inet** protocol only. Each time a policer is referenced, a separate copy of the policer is installed on the packet forwarding components for that interface.

If you apply both policers and firewall filters to an interface, input policers are evaluated before input firewall filters, and output policers are evaluated after output firewall filters.

If you apply the policer to the interface **lo0**, it is applied to packets received or transmitted by the Routing Engine.

On T Series, M120, and M320 platforms, if the interfaces are on the same FPC, the filters or policers do not act on the sum of traffic entering and exiting the interfaces.

For more information about policers, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

## Applying Aggregate Policers

- [Applying Aggregate Policers on page 209](#)

### Applying Aggregate Policers

By default, if you apply a policer to multiple protocol families on the same logical interface, the policer restricts traffic for each protocol family individually. For example, a policer with a 50 Mbps bandwidth limit applied to both IPv4 and IPv6 traffic would allow the interface to accept 50 Mbps of IPv4 traffic and 50 Mbps of IPv6 traffic. If you apply an aggregate policer, the policer would allow the interface to receive only 50 Mbps of IPv4 and IPv6 traffic combined.

To configure an aggregate policer, include the **logical-interface-policer** statement at the **[edit firewall policer *policer-template-name*]** hierarchy level:

```
[edit firewall policer policer-template-name]  
logical-interface-policer;
```

For the policer to be treated as an aggregate, you must apply it to multiple protocol families on a single logical interface by including the **policer** statement:

```
policer {  
  arp policer-template-name;  
  input policer-template-name;  
  output policer-template-name;  
}
```

You can include these statements at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]**

In the **family** statement, the protocol family can be **ccc**, **inet**, **inet6**, **mpls**, **tcc**, or **vpls**.

The protocol families on which you do not apply the policer are not affected by the policer. For example, if you configure a single logical interface to accept MPLS, IPv4, and IPv6 traffic and you apply the logical interface policer **policer1** to only the IPv4 and IPv6 protocol families, MPLS traffic is not subject to the constraints of **policer1**.

If you apply **policer1** to a different logical interface, there are two instances of the policer. This means the Junos OS polices traffic on separate logical interfaces separately, not as an aggregate, even if the same logical-interface policer is applied to multiple logical interfaces on the same physical interface port.

#### ***Example: Applying Aggregate Policers***

Configure two logical interface policers: **aggregate\_police1** and **aggregate\_police2**. Apply **aggregate\_police1** to IPv4 and IPv6 traffic received on logical interface **fe-0/0/0.0**. Apply **aggregate\_police2** to CCC and MPLS traffic received on logical interface **fe-0/0/0.0**. This configuration causes the software to create only one instance of **aggregate\_police1** and one instance of **aggregate\_police2**.

Apply **aggregate\_police1** to IPv4 and IPv6 traffic received on another logical interface **fe-0/0/0.1**. This configuration causes the software to create a new instance of **aggregate\_police1**, one that applies to unit 0 and another that applies to unit 1.

```
[edit firewall]  
policer aggregate_police1 {  
  logical-interface-policer;  
  if-exceeding {  
    bandwidth-limit 100m;  
    burst-size-limit 500k;  
  }  
  then {  
    discard;  
  }  
}
```

```

    }
  }
  policer aggregate_police2 {
    logical-interface-policer;
    if-exceeding {
      bandwidth-limit 10m;
      burst-size-limit 200k;
    }
    then {
      discard;
    }
  }
}
[edit interfaces fe-0/0/0]
unit 0 {
  family inet {
    policer {
      input aggregate_police1;
    }
  }
  family inet6 {
    policer {
      input aggregate_police1;
    }
  }
  family ccc {
    policer {
      input aggregate_police2;
    }
  }
  family mpls {
    policer {
      input aggregate_police2;
    }
  }
}
unit 1 {
  family inet {
    policer {
      input aggregate_police1;
    }
  }
  family inet6 {
    policer {
      input aggregate_police1;
    }
  }
}
}

```

## Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs

- [Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs on page 211](#)

### Applying Hierarchical Policers on Enhanced Intelligent Queuing PICs

M40e, M120, and M320 edge routers and T Series core routers with Enhanced Intelligent Queuing (IQE) PICs support hierarchical policers in the ingress direction and allow you

to apply a hierarchical policer for the premium and aggregate (premium plus normal) traffic levels to an interface. Hierarchical policers provide cross-functionality between the configured physical interface and the Packet Forwarding Engine.

Before you begin, there are some general restrictions that apply to hierarchical policers:

- Only one type of policer can be configured for a logical or physical interface. For example, a hierarchical policer and a regular policer in the same direction for the same logical interface is not allowed.
- The chaining of the policers—that is, applying policers to both a port and the logical interfaces of that port—is not allowed.
- There is a limit of 64 policers per interface in case there is no BA classification, providing a single policer per DLCI.
- Only one kind of policer can be applied on a physical or logical interface.
- The policer should be independent of BA classification. Without BA classification, all traffic on an interface will be treated either as EF or non-EF, based on the configuration. With BA classification, an interface can support up to 64 policers. Again, the interface here may be a physical interface or logical interface (for example, DLCI).
- With BA classification, the miscellaneous traffic (the traffic *not* matching with any of the BA classification DSCP/EXP bits) will be policed as non-EF traffic. No separate policers will be installed for this traffic.

### **Hierarchical Policers Overview**

Hierarchical policing uses two token buckets, one for aggregate (non-EF) traffic and one for premium (EF) traffic. Which traffic is EF and which is non-EF is determined by the class-of-service configuration. Logically, hierarchical policing is achieved by chaining two policers.

**Figure 11: Hierarchical Policers**

In the example in [Figure 11 on page 212](#), EF traffic is policed by Premium Policers and non-EF traffic is policed by Aggregate Policers. What that means is, for EF traffic the out-of-spec action will be the one that is configured for Premium Policers, but the in-spec EF traffic will still consume the tokens from the Aggregate Policers.

But EF traffic will never be submitted to the out-of-spec action of the Aggregate Policers. Also, if the out-of-spec action of the Premium Policers is not set to Discard, those out-of-spec packets will not consume the tokens from the Aggregate Policers. Aggregate Policers only police the non-EF traffic. As you can see, the Aggregate Policers token bucket can go negative, if all the tokens are consumed by the non-EF traffic and then you get bursts of EF traffic. But that will be for a very short time, and over a period of time it will average out. For example:

- *Premium Policer*: Bandwidth 2 Mbps, OOS Action: Discard
- *Aggregate Policer*: Bandwidth 10 Mbps, OOS Action: Discard

In the above case, EF traffic is guaranteed 2 Mbps and the non-EF traffic will get from 8 Mbps to 10 Mbps, depending on the input rate of the EF traffic.

### ***Hierarchical Policing Characteristics***

Hierarchical token bucket features include:

- Ingress traffic is first classified into EF and non-EF traffic prior to applying a policer:
  - Classification is performed by Q-tree lookup
- Channel number selects a shared token bucket policer:
  - Dual token bucket policer is divided into two single bucket policers:
    - Policer1—EF traffic
    - Policer2—non-EF traffic
- Shared token bucket is used to police the traffic as follows:
  - Policer1 is set to EF rate (for example, 2 Mbps)
  - Policer2 is set to aggregate interface policed rate (for example, 10 Mbps).
  - EF traffic gets applied to Policer1.
    - If traffic is in-spec it is allowed to pass and decrement from both Policer1 and Policer2.
    - If traffic is out-of-spec it can be discarded or marked with a new FC or loss priority. Policer2 will not do anything with out-of-spec EF traffic.
  - Non-EF traffic gets applied only to Policer2.
    - If traffic is in-spec it is allowed to pass through and decremented Policer2.
    - If traffic is out-of-spec it is discarded or marked with a new FC or set with a new drop priority.
- Rate-limit the port speed to a desired rate at Layer 2
- Rate-limit the EF traffic
- Rate-limit the non-EF traffic
- Policing drops counted per color

## **Configuring Hierarchical Policers**

To configure a hierarchical policer, apply the **policing-priority** statement to the proper forwarding class and configure a hierarchical policer for the aggregate and premium level. For more information about class of service, see the *Class of Service Feature Guide for Routing Devices*.

**NOTE:** Hierarchical policers can only be configured on SONET physical interfaces hosted on an IQE PIC. Only aggregate and premium levels are supported.

#### CoS Configuration of Forwarding Classes for Hierarchical Policers

```
[edit class-of-service forwarding-classes]
class fc1 queue-num 0 priority high policing-priority premium;
class fc2 queue-num 1 priority low policing-priority normal;
class fc3 queue-num 2 priority low policing-priority normal;
class fc4 queue-num 3 priority low policing-priority normal;
```

For detailed information on class-of-service configuration and statements, see the *Class of Service Feature Guide for Routing Devices*.

#### Firewall Configuration for Hierarchical Policers

```
[edit firewall hierarchical-policer foo]
aggregate {
  if-exceeding {
    bandwidth-limit 70m;
    burst-size-limit 1500;
  }
  then {
    discard;
  }
}
premium {
  if-exceeding {
    bandwidth-limit 50m;
    burst-size-limit 1500;
  }
  then {
    discard;
  }
}
```

You can apply the hierarchical policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-hierarchical-policer foo;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-hierarchical-policer foo;
```

### Configuring a Single-Rate Two-Color Policer

You can configure a single-rate two-color policer as follows:

```
[edit firewall policer foo]
if-exceeding {
  bandwidth-limit 50m;
  burst-size-limit 1500;
}
then {
  discard;
}
```

You can apply the policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-policer foo;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-policer foo;
```

## Configuring a Single-Rate Color-Blind Policer

This section describes single-rate color blind and color aware policers.

You can configure a single-rate color blind policer as follows:

```
[edit firewall three-color-policer foo]
single-rate {
  color-blind;
  committed-information-rate 50m;
  committed-burst-size 1500;
  excess-burst-size 1500;
}
```

You can apply the single-rate color blind policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color foo;
```

You can configure a single-rate color-aware policer as follows:

```
[edit firewall three-color-policer bar]
single-rate {
  color-aware;
  committed-information-rate 50m;
  committed-burst-size 1500;
  excess-burst-size 1500;
}
```

You can apply the single-rate color-aware policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color foo;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-three-color bar;
```

## Configuring a Two-Rate Tricolor Marker Policer

Ingress policing is implemented using a two-rate tricolor marker (trTCM). This is done with a dual token bucket (DTB) that maintains two rates, committed, and a peak. Egress static policing also uses a token bucket.

The token buckets perform the following ingress policing functions:

- (1K) trTCM - Dual token bucket (red, yellow, and green marking)
- Policing is based on Layer 2 packet size:
  - After +/- byte adjust offset
- Marking is color aware and color blind:
  - Color aware needs to have the color set by q-tree lookup based on:
    - ToS
    - EXP
- Programmable marking actions:
  - Color (red, yellow, green)
  - Drop based on color and congestion profile
- Policer is selected based on the arriving channel number:
  - Channel number LUT produces policer index and queue index
  - Multiple channels can share the same policer (LUT produces same policer index)
- Support ingress policing and trTCM at the following levels:
  - Queue
  - Logical interface (ifl/DLCI)
  - Physical interface (ifd)
  - Physical port (controller ifd)
  - Any combinations of logical interface, physical interface, and port
- Support percentage of interface speed and bits per second

Rate limits may be applied to selected queues on ingress and on predefined queues at egress. The token bucket operates in color aware and color blind modes (specified by RFC 2698).

#### **Configuring a Color-Blind trTCM**

```
[edit firewall three-color-policer foo]
two-rate {
  color-blind;
  committed-information-rate 50m;
  committed-burst-size 1500;
  peak-information-rate 100m;
  peak-burst-size 3k;
}
```

You can apply the three-color two-rate color-blind policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color foo;
```

You also have the option to apply the policer at the physical port level as follows:

#### Configuring a Color-Aware trTCM

```
[edit interfaces so-0/1/0 layer2-policer]
input-three-color foo;
```

```
[edit firewall three-color-policer bar]
two-rate {
  color-aware;
  committed-information-rate 50m;
  committed-burst-size 1500;
  peak-information-rate 100m;
  peak-burst-size 3k;
}
```

You can apply the three-color two-rate color-aware policer as follows:

```
[edit interfaces so-0/1/0 unit 0 layer2-policer]
input-three-color bar;
```

You also have the option to apply the policer at the physical port level as follows:

```
[edit interfaces so-0/1/0 layer2-policer]
input-three-color bar;
```

## Applying a Filter to an Interface

- [Defining Interface Groups in Firewall Filters on page 217](#)
- [Applying a Filter to an Interface on page 218](#)

### Defining Interface Groups in Firewall Filters

When applying a firewall filter, you can define an interface to be part of an *interface group*. Packets received on that interface are tagged as being part of the group. You can then match these packets using the **interface-group** match statement, as described in the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

To define the interface to be part of an interface group, include the **group** statement:

```
group filter-group-number;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family filter]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family filter]`

**NOTE:** The number 0 is not a valid interface group number.

### Filter-Based Forwarding on the Output Interface

---

If port-mirrored packets are to be distributed to multiple monitoring or collection interfaces, based on patterns in packet headers, it is helpful to configure a filter-based forwarding (FBF) filter on the port-mirroring egress interface.

When an FBF filter is installed as an output filter, a packet that is forwarded to the filter has already undergone at least one route lookup. After the packet is classified at the egress interface by the FBF filter, it is redirected to another routing table for additional route lookup. To avoid packet looping inside the Packet Forwarding Engine, the route lookup in the latter routing table (designated by an FBF routing instance) must result in a different next hop from any next hop specified in a table that has already been applied to the packet.

If an input interface is configured for FBF, the source lookup is disabled for those packets headings to a different routing instance, since the routing table is not set up to handle the source lookup.

For more information about FBF configuration, see the *Junos OS Routing Protocols Library*. For more information about port mirroring, see the *Junos OS Services Interfaces Library for Routing Devices*.

### Applying a Filter to an Interface

To apply firewall filters to an interface, include the **filter** statement:

```
filter {  
  group filter-group-number;  
  input filter-name;  
  input-list [ filter-names ];  
  output filter-name;  
  output-list [ filter-names ];  
}
```

To apply a single filter, include the **input** statement:

```
filter {  
  input filter-name;  
}
```

To apply a list of filters to evaluate packets received on an interface, include the **input-list** statement.

```
filter {  
  input-list [ filter-names ];  
}
```

Up to 16 filter names can be included in an input list.

To apply a list of filters to evaluate packets transmitted on an interface, include the **output-list** statement.

```
filter {  
  output-list [ filter-names ];  
}
```

When you apply filters using the **input-list** statement or the **output-list** statement, a new filter is created with the name *<interface-name>.<unit-direction>*. This filter is exclusively interface-specific.

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

In the **family** statement, the protocol family can be **ccc**, **inet**, **inet6**, **mpls**, or **vpls**.

In the **group** statement, specify the interface group number to associate with the filter.

In the **input** statement, list the name of one firewall filter to be evaluated when packets are received on the interface.

In the **input-list** statement, list the names of filters to evaluate when packets are received on the interface. You can include up to 16 filter names.

In the **output** statement, list the name of one firewall filter to be evaluated when packets are transmitted on the interface.

**NOTE:** Output filters do not work for broadcast and multicast traffic, including VPLS traffic (except in MX Series routers with MPC/MIC interfaces), as shown in “[Applying a Filter to an Interface](#)” on page 218.

**NOTE:** On an MX Series router, you cannot apply as an output filter, a firewall filter configured at the [edit firewall filter family **ccc**] hierarchy level. Firewall filters configured for the family **ccc** statement can be applied only as input filters.

In the **output-list** statement, list the names of filters to evaluate when packets are transmitted on the interface. You can include up to 16 filter names.

You can use the same filter one or more times. On M Series routers (except the M320 and M120 routers), if you apply a firewall filter or policer to multiple interfaces, the filter or policer acts on the sum of traffic entering or exiting those interfaces.

On T Series, M120, and M320 routers, interfaces are distributed among multiple packet forwarding components. Therefore, on these routers, if you apply a firewall filter or policer to multiple interfaces, the filter or policer acts on the traffic stream entering or exiting each interface, regardless of the sum of traffic on the multiple interfaces.

For more information on Understanding Ethernet Frame Statistics, see the *MX Series Layer 2 Configuration Guide*.

If you apply the filter to the interface **lo0**, it is applied to packets received or transmitted by the Routing Engine. You cannot apply MPLS filters to the management interface (**fxp0** or **em0**) or the loopback interface (**lo0**).

Filters applied at the **[set interfaces lo0 unit 0 family any filter input]** hierarchy level are not installed on T4000 Type 5 FPCs.

For more information about firewall filters, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*. For more information about MPLS filters, see the *MPLS Applications Feature Guide*.

**Example: Input Filter  
for VPLS Traffic**

For M Series and T Series routers only, apply an input filter to VPLS traffic. Output filters do not work for broadcast and multicast traffic, including VPLS traffic. Note that on MX Series routers with MPC/MIC interfaces, the VPLS filters on the egress is applicable to broadcast, multicast, and unknown unicast traffic.

```
[edit interfaces]
fe-2/2/3 {
  vlan-tagging;
  encapsulation vlan-vpls;
  unit 601 {
    encapsulation vlan-vpls;
    vlan-id 601;
    family vpls {
      filter {
        input filter1; # Works for multicast destination MAC address
        output filter1; # Does not work for multicast destination MAC address
      }
    }
  }
}

[edit firewall]
family vpls {
  filter filter1 {
    term 1 {
      from {
        destination-mac-address {
          01:00:0c:cc:cc:cd/48;
        }
      }
      then {
        discard;
      }
    }
    term 2 {
      then {
        accept;
      }
    }
  }
}
```

**Example: Filter-Based Forwarding at the Output Interface**

The following example illustrates the configuration of filter-based forwarding at the output interface. In this example, the packet flow follows this path:

1. A packet arrives at interface **fe-1/2/0.0** with source and destination addresses **10.50.200.1** and **10.50.100.1** respectively.
2. The route lookup in routing table **inet.0** points to the egress interface **so-0/0/3.0**.
3. The output filter installed at **so-0/0/3.0** redirects the packet to routing table **fbf.inet.0**.
4. The packet matches the entry **10.50.100.0/25** in the **fbf.inet.0** table, and finally leaves the router from interface **so-2/0/0.0**.

```
[edit interfaces]
so-0/0/3 {
  unit 0 {
    family inet {
      filter {
        output fbf;
      }
      address 10.50.10.2/25;
    }
  }
}
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.50.50.2/25;
    }
  }
}
so-2/0/0 {
  unit 0 {
    family inet {
      address 10.50.20.2/25;
    }
  }
}
[edit firewall]
filter fbf {
  term 0 {
    from {
      source-address {
        10.50.200.0/25;
      }
    }
    then routing-instance fbf;
  }
  term d {
    then count d;
  }
}
[edit routing-instances]
fbf {
  instance-type forwarding;
  routing-options {
```

```
static {
    route 10.50.100.0/25 next-hop so-2/0/0.0;
}
}
[edit routing-options]
interface-routes {
    rib-group inet fbf-group;
}
static {
    route 10.50.100.0/25 next-hop 10.50.10.1;
}
rib-groups {
    fbf-group {
        import-rib [inet.0 fbf.inet.0];
    }
}
```

---

## Configuring Unicast RPF

- [Configuring Unicast RPF on page 222](#)
- [Unicast RPF and Default Route on page 223](#)
- [Configuring Unicast RPF Strict Mode on page 224](#)
- [Configuring Unicast RPF Loose Mode on page 226](#)
- [Configuring Unicast RPF Loose Mode with Ability to Discard Packets on page 228](#)
- [Configuring Unicast RPF on a VPN on page 229](#)
- [Configuring Unicast RPF on page 230](#)

## Configuring Unicast RPF

For interfaces that carry IPv4 or IPv6 traffic, you can reduce the impact of denial of service (DoS) attacks by configuring unicast reverse path forwarding (RPF). Unicast RPF helps determine the source of attacks and rejects packets from unexpected source addresses on interfaces where unicast RPF is enabled.

### NOTE:

- You can protect a network by applying unicast RPF check feature at the edge (on customer facing interfaces) of the network. In an ISP environment, this can impact the network which can impose on a scaled setup. In case if you have already protected the edge of your network, a packet with a spoofed IP source address would not even appear in a core facing interface. In this case, unicast RPF check is not necessary. Enabling unicast RPF feature can impact the control plane performance, so use it where it is required. So it is strongly recommended not to enable this feature on the network core (internal) interfaces.

---

The following sections describe unicast RPF in detail:

## Unicast RPF and Default Route

When the active route cannot be chosen from the routes in a routing table, the router chooses a default route. A default route is equivalent to an IP address of 0.0.0.0/0. If you configure a default route, and you configure unicast RPF on an interface that the default route uses, unicast RPF behaves differently than it does otherwise. For information about configuring default routes, see the *Junos OS Routing Protocols Library*.

To determine whether the default route uses an interface, enter the **show route** command:

```
user@host> show route address
```

**address** is the next-hop address of the configured default route. The default route uses the interfaces shown in the output of the **show route** command.

The following sections describe how unicast RPF behaves when a default route uses an interface and when a default route does not use an interface:

- [Unicast RPF Behavior with a Default Route on page 223](#)
- [Unicast RPF Behavior Without a Default Route on page 224](#)
- [Unicast RPF with Routing Asymmetry on page 224](#)

### Unicast RPF Behavior with a Default Route

On all routers except those with MPCs and the MX80 router, unicast RPF behaves as follows if you configure a default route that uses an interface configured with unicast RPF:

- Loose mode—All packets are automatically accepted. For this reason, we recommend that you not configure unicast RPF loose mode on interfaces that the default route uses.
- Strict mode—The packet is accepted when the source address of the packet matches any of the routes (either default or learned) that can be originated from the interface. Note that routes can have multiple destinations associated with them; therefore, if one of the destinations matches the incoming interface of the packet, the packet is accepted.

On all routers with MPCs and the MX80 router, unicast RPF behaves as follows if you configure a default route that uses an interface configured with unicast RPF:

- Loose mode—All packets except the packets whose source is learned from the default route are accepted. All packets whose source is learned from the default route are dropped at the Packet Forwarding Engine. The default route is treated as if the route does not exist.
- Strict mode—The packet is accepted when the source address of the packet matches any of the routes (either default or learned) that can be originated from the interface. Note that routes can have multiple destinations associated with them; therefore, if one of the destinations matches the incoming interface of the packet, the packet is accepted.

On all routers, the packet is not accepted when either of the following is true:

- The source address of the packet does not match a prefix in the routing table.
- The interface does not expect to receive a packet with this source address prefix.

### Unicast RPF Behavior Without a Default Route

If you do not configure a default route, or if the default route does not use an interface configured with unicast RPF, unicast RPF behaves as described in “Configuring Unicast RPF Strict Mode” on page 224 and “Configuring Unicast RPF Loose Mode” on page 226. To summarize, unicast RPF without a default route behaves as follows:

- Strict mode—The packet is not accepted when either of the following is true:
  - The packet has a source address that does not match a prefix in the routing table.
  - The interface does not expect to receive a packet with this source address prefix.
- Loose mode—The packet is not accepted when the packet has a source address that does not match a prefix in the routing table.

### Unicast RPF with Routing Asymmetry

In general, we recommend that you not enable unicast RPF on interfaces that are internal to the network because internal interfaces are likely to have *routing asymmetry*. Routing asymmetry means that a packet’s outgoing and return paths are different. Routers in the core of the network are more likely to have asymmetric reverse paths than routers at the customer or provider edge. Figure 12 on page 224 shows unicast RPF in an environment with routing asymmetry.

Figure 12: Unicast RPF with Routing Asymmetry

In Figure 12 on page 224, if you enable unicast RPF on interface `so-0/0/0`, traffic destined for Router A is not rejected. If you enable unicast RPF on interface `so-1/0/1`, traffic from Router A is rejected.

If you need to enable unicast RPF in an asymmetric routing environment, you can use fail filters to allow the router to accept incoming packets that are known to be arriving by specific paths. For an example of a fail filter that accepts packets with a specific source and destination address, see “Configuring Unicast RPF” on page 230.

## Configuring Unicast RPF Strict Mode

In strict mode, unicast RPF checks whether the incoming packet has a source address that matches a prefix in the routing table, and whether the interface expects to receive a packet with this source address prefix.

If the incoming packet fails the unicast RPF check, the packet is not accepted on the interface. When a packet is not accepted on an interface, unicast RPF counts the packet and sends it to an optional fail filter. If the fail filter is not configured, the default action is to silently discard the packet.

The optional fail filter allows you to apply a filter to packets that fail the unicast RPF check. You can define the fail filter to perform any filter operation, including accepting, rejecting, logging, sampling, or policing.

When unicast RPF is enabled on an interface, Bootstrap Protocol (BOOTP) packets and Dynamic Host Configuration Protocol (DHCP) packets are not accepted on the interface. To allow the interface to accept BOOTP packets and DHCP packets, you must apply a fail filter that accepts all packets with a source address of **0.0.0.0** and a destination address of **255.255.255.255**. For a configuration example, see [“Configuring Unicast RPF” on page 230](#).

For more information about unicast RPF, see the *Junos OS Routing Protocols Library*. For more information about defining fail filters, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

To configure unicast RPF, include the **rpf-check** statement:

```
rpf-check <fail-filter filter-name>;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6)]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6)]**

Using unicast RPF can have several consequences when implemented with traffic filters:

- RPF fail filters are evaluated after input filters and before output filters.
- If you configure a filter counter for packets dropped by an input filter, and you want to know the total number of packets dropped, you must also configure a filter counter for packets dropped by the RPF check.
- To count packets that fail the RPF check and are accepted by the RPF fail filter, you must configure a filter counter.
- If an input filter forwards packets anywhere other than the inet.0 or inet6.0 routing tables, the unicast RPF check is not performed.
- If an input filter forwards packets anywhere other than the routing instance the input interface is configured for, the unicast RPF check is not performed.

Configure unicast RPF strict mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of **0.0.0.0** and a destination address of **255.255.255.255**.

To configure unicast RPF in strict mode:

1. Configure the fail filter:

```
[edit firewall]
filter rpf-special-case-dhcp-bootp {
  term allow-dhcp-bootp {
    from {
      source-address {
        0.0.0.0/32;
      }
      address {
        255.255.255.255/32;
      }
    }
    then {
      count rpf-dhcp-bootp-traffic;
      accept;
    }
  }
  term default {
    then {
      log;
      reject;
    }
  }
}
```

2. Configure unicast RPF on interfaces:

```
[edit]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        rpf-check fail-filter rpf-special-case-dhcp-bootp;
      }
    }
  }
}
```

3. Commit the configuration.

```
[edit]
commit;
```

## Configuring Unicast RPF Loose Mode

By default, unicast RPF uses strict mode. Unicast RPF loose mode is similar to unicast RPF strict mode and has the same configuration restrictions. The only check in loose mode is whether the packet has a source address with a corresponding prefix in the routing table; loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. If a corresponding prefix is not found, unicast RPF loose mode does not accept the packet. As in strict mode, loose mode counts the failed packet and optionally forwards it to a fail filter, which either accepts, rejects, logs, samples, or polices the packet.

To configure unicast RPF loose mode, include the **mode**:

1. **mode** loose;

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) rpf-check <fail-filter *filter-name*>]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) rpf-check <fail-filter *filter-name*>]

2. For example:

In this example, no special configuration beyond device initialization is required.

Configure unicast RPF loose mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255.

To configure unicast RPF in loose mode:

- a. Configure the fail filter:

```
[edit firewall]
filter rpf-special-case-dhcp-bootp {
  term allow-dhcp-bootp {
    from {
      source-address {
        0.0.0.0/32;
      }
      address {
        255.255.255.255/32;
      }
    }
    then {
      count rpf-dhcp-bootp-traffic;
      accept;
    }
  }
  term default {
    then {
      log;
      reject;
    }
  }
}
```

- b. Configure unicast RPF on interfaces:

```
[edit]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        rpf-check fail-filter rpf-special-case-dhcp-bootp;
        mode loose;
      }
    }
  }
}
```

```
    }  
  }  
}
```

- c. Commit the configuration.

```
[edit]  
commit;
```

## Configuring Unicast RPF Loose Mode with Ability to Discard Packets

Starting with Junos OS Release 12.1, unicast RPF loose mode has the ability to discard packets with the source address pointing to the discard interface. This feature is supported on MX Series routers and on T Series routers with Type 1 FPCs, Type 2 FPCs, and Type 3 FPCs. Using unicast RPF loose mode, along with Remote Triggered Black Hole (RTBH) filtering, provides an efficient way to discard packets coming from known attack sources. BGP policies in edge routers ensure that packets with untrusted source addresses have their next hop set to a discard route. When a packet arrives at the router with an untrusted source address, unicast RPF performs a route lookup of the source address. Because the source address route points to a discard next hop, the packet is dropped and a counter is incremented. This feature is supported on both IPv4 (inet) and IPv6 (inet6) address families.

To configure unicast RPF loose mode with the ability to discard packets, include the **rpf-loose-mode-discard family inet** statement at the **[edit forwarding-options]** hierarchy level:

```
rpf-loose-mode-discard {  
  family {  
    inet;  
  }  
}
```

In this example, no special configuration beyond device initialization is required.

Configure unicast RPF loose mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255.

To configure unicast RPF loose mode with the ability to discard packets:

1. Configure the fail filter:

```
[edit firewall]  
filter rpf-special-case-dhcp-bootp {  
  term allow-dhcp-bootp {  
    from {  
      source-address {  
        0.0.0.0/32;  
      }  
      address {  
        255.255.255.255/32;  
      }  
    }  
  }  
}
```

```

    }
  }
  then {
    count rpf-dhcp-bootp-traffic;
    accept;
  }
}
term default {
  then {
    log;
    reject;
  }
}
}
}

```

2. Configure unicast RPF on interfaces:

```

[edit]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        rpf-check fail-filter rpf-special-case-dhcp-bootp;
        mode loose;
      }
    }
  }
}

```

3. Configure the ability to discard packets.

```

[edit]
forwarding-options {
  rpf-loose-mode-discard {
    family {
      inet;
    }
  }
}

```

4. Commit the configuration.

```

[edit]
commit;

```

## Configuring Unicast RPF on a VPN

You can configure unicast RPF on a VPN interface by enabling unicast RPF on the interface and including the **interface** statement at the **[edit routing-instances *routing-instance-name*]** hierarchy level.

You can configure unicast RPF only on the interfaces you specify in the routing instance. This means the following:

- For Layer 3 VPNs, unicast RPF is supported on the CE router interface.
- Unicast RPF is not supported on core-facing interfaces.
- For virtual-router routing instances, unicast RPF is supported on all interfaces you specify in the routing instance.
- If an input filter forwards packets anywhere other than the routing instance the input interface is configured for, the unicast RPF check is not performed.

For more information about VPNs and virtual-router routing instances, see the *Junos OS VPNs Library for Routing Devices*. For more information about FBF, see the *Junos OS Routing Protocols Library*.

Configure unicast RPF on a Layer 3 VPN interface:

```
[edit interfaces]
so-0/0/0 {
  unit 0 {
    family inet {
      rpf-check;
    }
  }
}
[edit routing-instance]
VPN-A {
  interface so-0/0/0.0;
}
```

## Configuring Unicast RPF

Configure unicast RPF strict mode, and apply a fail filter that allows the interface to accept BOOTP packets and DHCP packets. The filter accepts all packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255.

```
[edit firewall]
filter rpf-special-case-dhcp-bootp {
  term allow-dhcp-bootp {
    from {
      source-address {
        0.0.0.0/32;
      }
      address {
        255.255.255.255/32;
      }
    }
    then {
      count rpf-dhcp-bootp-traffic;
      accept;
    }
  }
  term default {
    then {
```

```

        log;
        reject;
    }
}
[edit]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        rpf-check fail-filter rpf-special-case-dhcp-bootp;
      }
    }
  }
}

```

## Example: Configuring Unicast Reverse-Path-Forwarding Check

- [Understanding Unicast Reverse Path Forwarding on page 231](#)
- [Example: Configuring Unicast Reverse-Path-Forwarding Check on page 231](#)

### Understanding Unicast Reverse Path Forwarding

IP spoofing can occur during a denial-of-service (DoS) attack. IP spoofing allows an intruder to pass IP packets to a destination as genuine traffic, when in fact the packets are not actually meant for the destination. This type of spoofing is harmful because it consumes the destination's resources.

A unicast reverse-path-forwarding (RPF) check is a tool to reduce forwarding of IP packets that might be spoofing an address. A unicast RPF check performs a route table lookup on an IP packet's source address, and checks the incoming interface. The router or switch determines whether the packet is arriving from a path that the sender would use to reach the destination. If the packet is from a valid path, the router or switch forwards the packet to the destination address. If it is not from a valid path, the router or switch discards the packet. Unicast RPF is supported for the IPv4 and IPv6 protocol families, as well as for the virtual private network (VPN) address family.

**NOTE:** Reverse path forwarding is not supported on the interfaces you configure as tunnel sources. This affects only the transit packets exiting the tunnel.

### Example: Configuring Unicast Reverse-Path-Forwarding Check

Unicast reverse path forwarding (RPF) helps protect against DoS and DDoS attacks by verifying the unicast source address of each packet that arrives on an ingress interface where unicast RPF is enabled.

This example shows how to help defend ingress interfaces against denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by configuring unicast RPF to filter incoming traffic.

- [Requirements on page 232](#)
- [Overview on page 232](#)
- [Configuration on page 233](#)
- [Verification on page 238](#)

---

## Requirements

In this example, no special configuration beyond device initialization is required.

---

## Overview

Large amounts of unauthorized traffic such as attempts to flood a network with fake (bogus) service requests in a DoS attack can consume network resources and deny service to legitimate users. One way to help prevent DoS and DDoS attacks is to verify that incoming traffic originates from legitimate network sources.

Unicast RPF helps ensure that a traffic source is legitimate (authorized) by comparing the source address of each packet that arrives on an interface to the forwarding table entry for its source address. If the device uses the same interface that the packet arrived on to reply to the packet's source, this verifies that the packet originated from an authorized source, and the device forwards the packet. If the device does not use the same interface that the packet arrived on to reply to the packet's source, the packet might have originated from an unauthorized source, and the device discards the packet.

In this example, Device B has unicast RPF configured. Device A is using OSPF to advertise a prefix for the link that connects to Device D. OSPF is enabled on the links between Device B and Device C and the links between Device A and Device C, but not on the links between Device A and Device B. Therefore, Device B learns about the route to Device D through Device C.

If ingress filtering is used in an environment where DHCP or BOOTP is used, it should be ensured that the packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255 are allowed to reach the relay agent in routers when appropriate.

This example also includes a fail filter. When a packet fails the unicast RPF check, the fail filter is evaluated to determine if the packet should be accepted anyway. The fail filter in this example allows Device B's interfaces to accept Dynamic Host Configuration Protocol (DHCP) packets. The filter accepts all packets with a source address of 0.0.0.0 and a destination address of 255.255.255.255.

[Figure 13 on page 233](#) shows the sample network.

Figure 13: Unicast RPF Sample Topoolgy

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

- Device A**
- ```

set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.1/30
set interfaces fe-0/0/2 unit 5 family inet address 10.0.0.5/30
set interfaces fe-0/0/1 unit 17 family inet address 10.0.0.17/30
set interfaces fe-0/1/1 unit 25 family inet address 10.0.0.25/30
set interfaces fe-1/1/1 unit 29 family inet address 10.0.0.29/30
set protocols ospf export send-direct
set protocols ospf area 0.0.0.0 interface fe-0/1/1.25
set protocols ospf area 0.0.0.0 interface fe-1/1/1.29
set policy-options policy-statement send-direct from protocol direct
set policy-options policy-statement send-direct from route-filter 10.0.0.16/30 exact
set policy-options policy-statement send-direct then accept

```
- Device B**
- ```

set interfaces fe-1/2/0 unit 2 family inet rpf-check fail-filter rpf-special-case-dhcp
set interfaces fe-1/2/0 unit 2 family inet address 10.0.0.2/30
set interfaces fe-1/1/1 unit 6 family inet rpf-check fail-filter rpf-special-case-dhcp
set interfaces fe-1/1/1 unit 6 family inet address 10.0.0.6/30
set interfaces fe-0/1/1 unit 9 family inet rpf-check fail-filter rpf-special-case-dhcp
set interfaces fe-0/1/1 unit 9 family inet address 10.0.0.9/30
set interfaces fe-0/1/0 unit 13 family inet rpf-check fail-filter rpf-special-case-dhcp
set interfaces fe-0/1/0 unit 13 family inet address 10.0.0.13/30
set protocols ospf area 0.0.0.0 interface fe-0/1/1.9
set protocols ospf area 0.0.0.0 interface fe-0/1/0.13
set routing-options forwarding-table unicast-reverse-path active-paths
set firewall filter rpf-special-case-dhcp term allow-dhcp from source-address 0.0.0.0/32
set firewall filter rpf-special-case-dhcp term allow-dhcp from destination-address 255.255.255.255/32
set firewall filter rpf-special-case-dhcp term allow-dhcp then count rpf-dhcp-traffic
set firewall filter rpf-special-case-dhcp term allow-dhcp then accept
set firewall filter rpf-special-case-dhcp term default then log
set firewall filter rpf-special-case-dhcp term default then reject

```
- Device C**
- ```

set interfaces fe-1/2/0 unit 10 family inet address 10.0.0.10/30

```

```
set interfaces fe-0/0/2 unit 14 family inet address 10.0.0.14/30
set interfaces fe-1/0/2 unit 21 family inet address 10.0.0.21/30
set interfaces fe-1/2/2 unit 26 family inet address 10.0.0.26/30
set interfaces fe-1/2/1 unit 30 family inet address 10.0.0.30/30
set protocols ospf area 0.0.0.0 interface fe-1/2/0.10
set protocols ospf area 0.0.0.0 interface fe-0/0/2.14
set protocols ospf area 0.0.0.0 interface fe-1/2/2.26
set protocols ospf area 0.0.0.0 interface fe-1/2/1.30
```

Device D      set interfaces fe-1/2/0 unit 18 family inet address 10.0.0.18/30

Device E      set interfaces fe-1/2/0 unit 22 family inet address 10.0.0.22/30

### *Configuring Device A*

**Step-by-Step Procedure**      The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure Device A:

1.    Configure the interfaces.

```
[edit interfaces]
user@A# set fe-1/2/0 unit 1 family inet address 10.0.0.1/30

user@A# set fe-0/0/2 unit 5 family inet address 10.0.0.5/30

user@A# set fe-0/0/1 unit 17 family inet address 10.0.0.17/30

user@A# set fe-0/1/1 unit 25 family inet address 10.0.0.25/30

user@A# set fe-1/1/1 unit 29 family inet address 10.0.0.29/30
```

2.    Configure OSPF.

```
[edit protocols ospf]
user@A# set export send-direct
user@A# set area 0.0.0.0 interface fe-0/1/1.25
user@A# set area 0.0.0.0 interface fe-1/1/1.29
```

3.    Configure the routing policy.

```
[edit policy-options policy-statement send-direct]
user@A# set from protocol direct
user@A# set from route-filter 10.0.0.16/30 exact
user@A# set then accept
```

4.    If you are done configuring Device A, commit the configuration.

```
[edit]
user@A# commit
```

**Configuring Device B**

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure Device B:

1. Configure the interfaces.
 

```
[edit interfaces]
user@B# set fe-1/2/0 unit 2 family inet address 10.0.0.2/30

user@B# set fe-1/1/1 unit 6 family inet address 10.0.0.6/30

user@B# set fe-0/1/1 unit 9 family inet address 10.0.0.9/30

user@B# set fe-0/1/0 unit 13 family inet address 10.0.0.13/30
```
2. Configure OSPF.
 

```
[edit protocols ospf area 0.0.0.0]
user@B# set interface fe-0/1/1.9
user@B# set interface fe-0/1/0.13
```
3. Configure unicast RPF, and apply the optional fail filter.
 

```
[edit interfaces]
user@B# set fe-1/2/0 unit 2 family inet rpf-check fail-filter rpf-special-case-dhcp

user@B# set fe-1/1/1 unit 6 family inet rpf-check fail-filter rpf-special-case-dhcp

user@B# set fe-0/1/1 unit 9 family inet rpf-check fail-filter rpf-special-case-dhcp

user@B# set fe-0/1/0 unit 13 family inet rpf-check fail-filter rpf-special-case-dhcp
```
4. (Optional) Configure the fail filter that gets evaluated if a packet fails the RPF check.
 

```
[edit firewall filter rpf-special-case-dhcp]
user@B# set term allow-dhcp from source-address 0.0.0.0/32
user@B# set term allow-dhcp from destination-address 255.255.255.255/32
user@B# set term allow-dhcp then count rpf-dhcp-traffic
user@B# set term allow-dhcp then accept
user@B# set term default then log
user@B# set term default then reject
```
5. (Optional) Configure only active paths to be considered in the RPF check.
 

This is the default behavior.

```
[edit routing-options forwarding-table]
user@B# set unicast-reverse-path active-paths
```

6. If you are done configuring Device B, commit the configuration.

```
[edit]
user@B# commit
```

### Results

Confirm your configuration by issuing the **show firewall**, **show interfaces**, **show protocols**, **show routing-options**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device A  user@A# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
fe-0/0/2 {
  unit 5 {
    family inet {
      address 10.0.0.5/30;
    }
  }
}
fe-0/0/1 {
  unit 17 {
    family inet {
      address 10.0.0.17/30;
    }
  }
}
fe-0/1/1 {
  unit 25 {
    family inet {
      address 10.0.0.25/30;
    }
  }
}
fe-1/1/1 {
  unit 29 {
    family inet {
      address 10.0.0.29/30;
    }
  }
}

user@A# show protocols
ospf {
  export send-direct;
  area 0.0.0.0 {
    interface fe-0/1/1.25;
```

```

        interface fe-1/1/1.29;
    }
}

user@A# show policy-options
policy-statement send-direct {
    from {
        protocol direct;
        route-filter 10.0.0.16/30 exact;
    }
    then accept;
}

```

**Device B**

```

user@B# show firewall
filter rpf-special-case-dhcp {
    term allow-dhcp {
        from {
            source-address {
                0.0.0.0/32;
            }
            destination-address {
                255.255.255.255/32;
            }
            destination-address {
                255.255.255.255/32;
            }
        }
        then {
            count rpf-dhcp-traffic;
            accept;
        }
    }
    term default {
        then {
            log;
            reject;
        }
    }
}

user@B# show interfaces
fe-1/2/0 {
    unit 2 {
        family inet {
            rpf-check fail-filter rpf-special-case-dhcp;
            address 10.0.0.2/30;
        }
    }
}
fe-1/1/1 {
    unit 6 {
        family inet {
            rpf-check fail-filter rpf-special-case-dhcp;
            address 10.0.0.6/30;
        }
    }
}

```

```
fe-0/1/1 {  
  unit 9 {  
    family inet {  
      rpf-check fail-filter rpf-special-case-dhcp;  
      address 10.0.0.9/30;  
    }  
  }  
}  
fe-0/1/0 {  
  unit 13 {  
    family inet {  
      rpf-check fail-filter rpf-special-case-dhcp;  
      address 10.0.0.13/30;  
    }  
  }  
}
```

user@B# show protocols

```
ospf {  
  area 0.0.0.0 {  
    interface fe-0/1/1.9;  
    interface fe-0/1/0.13;  
  }  
}
```

user@B# show routing-options

```
forwarding-table {  
  unicast-reverse-path active-paths;  
}
```

Enter the configurations on Device C, Device D, and Device E, as shown in [“CLI Quick Configuration” on page 233](#).

---

### Verification

Confirm that the configuration is working properly.

- [Confirm That Unicast RPF Is Enabled on page 238](#)
- [Confirm That the Source Addresses Are Blocked on page 239](#)
- [Confirm That the Source Addresses Are Unblocked on page 239](#)

#### ***Confirm That Unicast RPF Is Enabled***

**Purpose** Make sure that the interfaces on Device B have unicast RPF enabled.

**Action** user@B> show interfaces fe-0/1/0.13 extensive

```

Logical interface fe-0/1/0.13 (Index 73) (SNMP ifIndex 553) (Generation 208)
Flags: SNMP-Traps 0x4000 Encapsulation: ENET2
Traffic statistics:
  Input bytes :          999390
  Output bytes :        1230122
  Input packets:         12563
  Output packets:        12613
Local statistics:
  Input bytes :          998994
  Output bytes :        1230122
  Input packets:         12563
  Output packets:        12613
Transit statistics:
  Input bytes :           396          0 bps
  Output bytes :           0          0 bps
  Input packets:           0          0 pps
  Output packets:          0          0 pps
Protocol inet, MTU: 1500, Generation: 289, Route table: 22
Flags: Sendbcst-pkt-to-re, uRPF
RPF Failures: Packets: 0, Bytes: 0
Addresses, Flags: Is-Preferred Is-Primary
  Destination: 10.0.0.12/30, Local: 10.0.0.13, Broadcast: 10.0.0.15,
Generation: 241

```

**Meaning** The **uRPF** flag confirms that unicast RPF is enabled on this interface.

#### *Confirm That the Source Addresses Are Blocked*

**Purpose** Use the **ping** command to make sure that Device B blocks traffic from unexpected source addresses.

**Action** From Device A, ping Device B's interfaces, using 10.0.0.17 as the source address.

```

user@A> ping 10.0.0.6 source 10.0.0.17
PING 10.0.0.6 (10.0.0.6): 56 data bytes
^C
--- 10.0.0.6 ping statistics ---
3 packets transmitted, 0 packets received, 100% packet loss

```

**Meaning** As expected, the ping operation fails.

#### *Confirm That the Source Addresses Are Unblocked*

**Purpose** Use the **ping** command to make sure that Device B does not block traffic when the RPF check is deactivated.

**Action** 1. Deactivate the RPF check on one of the interfaces.

2. Rerun the ping operation.

```
user@B> deactivate interfaces fe-1/1/1.6 family inet rpf-check

user@A> ping 10.0.0.6 source 10.0.0.17
PING 10.0.0.2 (10.0.0.2): 56 data bytes
64 bytes from 10.0.0.2: icmp_seq=0 ttl=63 time=1.316 ms
64 bytes from 10.0.0.2: icmp_seq=1 ttl=63 time=1.263 ms
^C
--- 10.0.0.2 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.263/1.289/1.316/0.027 ms
```

**Meaning** As expected, the ping operation succeeds.

## Enabling Source Class and Destination Class Usage

- [Source Class and Destination Class Usage on page 240](#)
- [Enabling Source Class and Destination Class Usage on page 244](#)

### Source Class and Destination Class Usage

For interfaces that carry IPv4, IPv6, MPLS, or peer AS billing traffic, you can maintain packet counts based on the entry and exit points for traffic passing through your network. Entry and exit points are identified by source and destination prefixes grouped into disjoint sets defined as *source classes* and *destination classes*. You can define classes based on a variety of parameters, such as routing neighbors, autonomous systems, and route filters.

Source class usage (SCU) counts packets sent to customers by performing lookup on the IP source address. SCU makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. You must enable SCU accounting on both the inbound and outbound physical interfaces, and the route for the source of the packet must be in located in the forwarding table.

**NOTE:** SCU and DCU accounting do not work with directly connected interface routes. Source class usage does not count packets coming from sources with direct routes in the forwarding table because of software architecture limitations.

Destination class usage (DCU) counts packets from customers by performing lookup of the IP destination address. DCU makes it possible to track traffic originating from the customer edge and destined for specific prefixes on the provider core router.

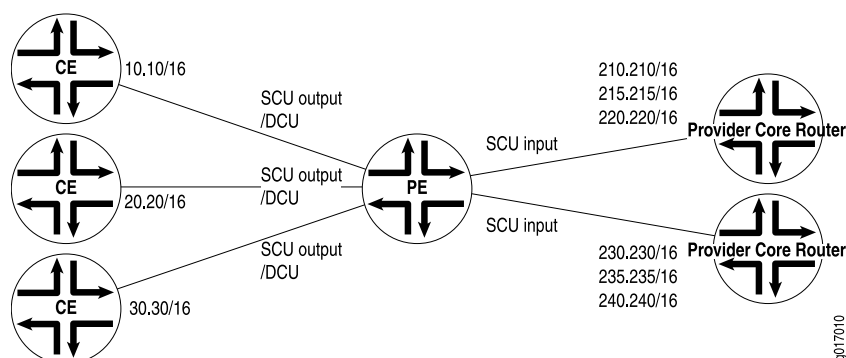

**NOTE:** We recommend that you stop the network traffic on an interface before you modify the DCU or SCU configuration for that interface. Modifying the DCU or SCU configuration without stopping the traffic might corrupt the DCU or SCU statistics. Before you restart the traffic after modifying the configuration, enter the clear interfaces statistics command.

Figure 14 on page 241 illustrates an Internet service provider (ISP) network. In this topology, you can use DCU to count packets customers send to specific prefixes. For example, you can have three counters, one per customer, that count the packets destined for prefix 210.210/16 and 220.220/16.

You can use SCU to count packets the provider sends from specific prefixes. For example, you can count the packets sent from prefix 210.210/16 and 215.215/16 and transmitted on a specific output interface.

**Figure 14: Prefix Accounting with Source and Destination Classes**

You can configure up to 126 source classes and 126 destination classes. For each interface on which you enable destination class usage and source class usage, the Junos OS maintains an interface-specific counter for each corresponding class up to the 126 class limit.

**NOTE:** For transit packets exiting the router through the tunnel, forwarding path features, such as RPF, forwarding table filtering, source class usage, and destination class usage are not supported on the interfaces you configure as the output interface for tunnel traffic. For firewall filtering, you must allow the output tunnel packets through the firewall filter applied to input traffic on the interface that is the next-hop interface towards the tunnel destination.

**NOTE:**

Performing DCU accounting when an output service is enabled produces inconsistent behavior in the following configuration:

- Both SCU input and DCU are configured on the packet input interface.
- SCU output is configured on the packet output interface.
- Interface services is enabled on the output interface.

For an incoming packet with source and destination prefixes matching the SCU and DCU classes respectively configured in the router, both SCU and DCU counters will be incremented. This behavior is not harmful or negative. However, it is inconsistent with non-serviced packets, in that only the SCU count will be incremented (because the SCU class ID will override the DCU class ID in this case).

To enable packet counting on an interface, include the **accounting** statement:

```
accounting {  
  destination-class-usage;  
  source-class-usage {  
    direction;  
  }  
}
```

**direction** can be one of the following:

- **input**—Configure at least one expected ingress point.
- **output**—Configure at least one expected egress point.
- **input output**—On a single interface, configure at least one expected ingress point and one expected egress point.

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6 | mpls)]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family (inet | inet6 | mpls)]

For SCU to work, you must configure at least one input interface and at least one output interface.

The ability to count a single packet for both SCU and DCU accounting depends on the underlying physical interface.

- For traffic over MPC/MIC interfaces, a single incoming packet is counted for both SCU and DCU accounting if both SCU and DCU are configured. To ensure the outgoing packet is counted, include the **source-class-usage output** statements in the configuration of the outgoing interface.

- For traffic over DPC interfaces, an incoming packet is counted only once, and SCU takes priority over DCU. This means that when a packet arrives on an interface on which you include the **source-class-usage input** and **destination-class-usage** statements in the configuration, and when the source and destination both match accounting prefixes, the Junos OS associates the packet with the source class only.

For traffic over MPC interfaces, SCU and DCU accounting is performed after output filters are evaluated. If a packet matches a firewall filter match condition, the packet is included in SCU or DCU accounting except in the case where the action of the matched term is **discard**.

On T Series, M120, and M320 routers, the source class and destination classes are not carried across the router fabric. The implications of this are as follows:

- On T Series, M120, and M320 routers, SCU and DCU accounting is performed before the packet enters the fabric.
- On M7i, M10i, M120, and M320 routers, on MX Series routers with non-MPC, and on T Series routers, SCU and DCU accounting is performed before output filters are evaluated. Consequently, if a packet matches a firewall filter match condition, the packet is included in SCU or DCU accounting; the packet is counted for any term action (including the **discard** action).
- On M120, M320, and T Series routers, the **destination-class** and **source-class** statements are supported at the **[edit firewall family *family-name* filter *filter-name* term *term-name* from]** hierarchy level only for the filter applied to the forwarding table. On M7i, M10i, and MX Series routers, these statements are supported.

Once you enable accounting on an interface, the Junos OS maintains packet counters for that interface, with separate counters for **inet**, **inet6**, and **mpls** protocol families. You must then configure the source class and destination class attributes in policy action statements, which must be included in forwarding-table export policies.

**NOTE:** When configuring policy action statements, you can configure only one source class for each matching route. In other words, more than one source class cannot be applied to the same route.

In Junos OS Release 9.3 and later, you can configure SCU accounting for Layer 3 VPNs configured with the **vrf-table-label** statement. Include the **source-class-usage** statement at the **[edit routing-instances *routing-instance-name* vrf-table-label]** hierarchy level. The **source-class-usage** statement at this hierarchy level is supported only for the virtual routing and forwarding (VRF) instance type.

**NOTE:** DCU counters cannot be enabled on the label-switched interface (LSI) that is created dynamically when the **vrf-table-label** statement is configured within a VRF. For more information, see the *Junos OS VPNs Library for Routing Devices*.

For a complete discussion about source and destination class accounting profiles, see the *Network Management Administration Guide*. For more information about MPLS, see the *MPLS Applications Feature Guide*.

## Enabling Source Class and Destination Class Usage

Figure 15: Prefix Accounting with Source and Destination Classes

Configure DCU and SCU output on one interface:

```
[edit]
interfaces {
  so-6/1/0 {
    unit 0 {
      family inet {
        accounting {
          destination-class-usage;
          source-class-usage {
            output;
          }
        }
      }
    }
  }
}
```

### 1. Complete SCU Configuration

Source routers A and B use loopback addresses as the prefixes to be monitored. Most of the configuration tasks and actual monitoring occur on transit Router SCU.

The loopback address on Router A contains the origin of the prefix that is to be assigned to source class A on Router SCU. However, no SCU processing happens on this router. Therefore, configure Router A for basic OSPF routing and include your loopback interface and interface **so-0/0/2** in the OSPF process.

### 2. Router A

```
[edit]
interfaces {
  so-0/0/2 {
    unit 0 {
      family inet {
        address 10.255.50.2/24;
      }
    }
  }
}
```

```

    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 10.255.192.10/32;
    }
  }
}
}
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/2.0;
      interface lo0.0;
    }
  }
}
}

```

### 3. Router SCU

Last, apply the policy to the forwarding table.

Router SCU handles the bulk of the activity in this example. On Router SCU, enable source class usage on the inbound and outbound interfaces at the **[edit interfaces interface-name unit unit-number family inet accounting]** hierarchy level. Make sure you specify the expected traffic: input, output, or, in this case, both.

Next, configure a route filter policy statement that matches the prefixes of the loopback addresses from routers A and B. Include statements in the policy that classify packets from Router A in one group named **scu-class-a** and packets from Router B in a second class named **scu-class-b**. Notice the efficient use of a single policy containing multiple terms.

```

[edit]
interfaces {
  so-0/0/1 {
    unit 0 {
      family inet {
        accounting {
          source-class-usage {
            input;
            output;
          }
        }
      }
      address 10.255.50.1/24;
    }
  }
}
so-0/0/3 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          input;

```

```
        output;
      }
    }
    address 10.255.10.3/24;
  }
}
lo0 {
  unit 0 {
    family inet {
      address 10.255.6.111/32;
    }
  }
}
}
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/1.0;
      interface so-0/0/3.0;
    }
  }
}
routing-options {
  forwarding-table {
    export scu-policy;
  }
}
policy-options {
  policy-statement scu-policy {
    term 0 {
      from {
        route-filter 10.255.192.0/24 orlonger;
      }
      then source-class scu-class-a;
    }
    term 1 {
      from {
        route-filter 10.255.165.0/24 orlonger;
      }
      then source-class scu-class-b;
    }
  }
}
```

#### 4. Router B

Just as Router A provides a source prefix, Router B's loopback address matches the prefix assigned to **scu-class-b** on Router SCU. Again, no SCU processing happens on this router, so configure Router B for basic OSPF routing and include your loopback interface and interface **so-0/0/4** in the OSPF process.

```
interfaces {
  so-0/0/4 {
    unit 0 {
      family inet {
```

```

        address 10.255.10.4/24;
    }
}
lo0 {
    unit 0 {
        family inet {
            address 10.255.165.226/32;
        }
    }
}
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/4.0;
            interface lo0.0;
        }
    }
}

```

#### 5. Enabling Packet Counting for Layer 3 VPNs

You can use SCU and DCU to count packets on Layer 3 VPNs. To enable packet counting for Layer 3 VPN implementations at the egress point of the MPLS tunnel, you must configure a virtual loopback tunnel interface (**vt**) on the PE router, map the virtual routing and forwarding (VRF) instance type to the virtual loopback tunnel interface, and send the traffic received from the VPN out the source class output interface, as shown in the following example:

Configure a virtual loopback tunnel interface on a provider edge router equipped with a tunnel PIC:

```

[edit interfaces]
vt-0/3/0 {
    unit 0 {
        family inet {
            accounting {
                source-class-usage {
                    input;
                }
            }
        }
    }
}

```

6. Map the VRF instance type to the virtual loopback tunnel interface.

In Junos OS Release 9.3 and later, you can configure SCU accounting for Layer 3 VPNs configured with the **vrf-table-label** statement. Include the **source-class-usage** statement at the **[edit routing-instances *routing-instance-name* vrf-table-label]** hierarchy level. The **source-class-usage** statement at this hierarchy level is supported only for the virtual routing and forwarding (VRF) instance type. DCU is not supported when the **vrf-table-label** statement is configured. For more information, see the *Junos OS VPNs Library for Routing Devices*.

```
[edit routing-instances]
VPN-A {
  instance-type vrf;
  interface at-2/1/1.0;
  interface vt-0/3/0.0;
  route-distinguisher 10.255.14.225:100;
  vrf-import import-policy-A;
  vrf-export export-policy-A;
  protocols {
    bgp {
      group to-r4 {
        local-address 10.27.253.1;
        peer-as 400;
        neighbor 10.27.253.2;
      }
    }
  }
}
```

7. Send traffic received from the VPN out the source class output interface:

```
[edit interfaces]
at-2/1/0 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          output;
        }
      }
    }
  }
}
```

For more information about VPNs, see the *Junos OS VPNs Library for Routing Devices*.  
For more information about virtual loopback tunnel interfaces, see the *Junos OS Services Interfaces Library for Routing Devices*.

## Understanding Targeted Broadcast

Targeted broadcast is a process of flooding a target subnet with Layer 3 broadcast IP packets originating from a different subnet. The intent of targeted broadcast is to flood the target subnet with the broadcast packets on a LAN interface without broadcasting to the entire network. Targeted broadcast is configured with various options on the egress interface of the router or switch and the IP packets are broadcast only on the LAN (egress) interface. Targeted broadcast helps you implement remote administration tasks such as backups and wake-on LAN (WOL) on a LAN interface, and supports virtual routing and forwarding (VRF) instances.

Regular Layer 3 broadcast IP packets originating from a subnet are broadcast within the same subnet. When these IP packets reach a different subnet, they are forwarded to the Routing Engine (to be forwarded to other applications). Because of this, remote administration tasks such as backups cannot be performed on a particular subnet through another subnet. As a workaround you can enable targeted broadcast, to forward broadcast packets that originate from a different subnet.

Layer 3 broadcast IP packets have a destination IP address that is a valid broadcast address for the target subnet. These IP packets traverse the network in the same way as unicast IP packets until they reach the destination subnet. In the destination subnet, if the receiving router has targeted broadcast enabled on the egress interface, the IP packets are forwarded to an egress interface and the Routing Engine or to an egress interface only. The IP packets are then translated into broadcast IP packets which flood the target subnet only through the LAN interface (if there is no LAN interface, the packets are discarded), and all hosts on the target subnet receive the IP packets. If targeted broadcast is not enabled on the receiving router, the IP packets are treated as regular Layer 3 broadcast IP packets and are forwarded to the Routing Engine. If targeted broadcast is enabled without any options, the IP packets are forwarded to the Routing Engine.

Targeted broadcast can be configured to forward the IP packets only to an egress interface, which is helpful when the router is flooded with packets to process, or to both an egress interface and the Routing Engine.

**NOTE:** Targeted broadcast does not work when the targeted broadcast option `forward-and-send-to-re` and the traffic sampling option `sampling` are configured on the same egress interface of an M320 router, a T640 router, or an MX960 router. To overcome this scenario, you must either disable one of these options or enable the `sampling` option with the targeted broadcast option `forward-only` on the egress interface. For information about traffic sampling, see *Configuring Traffic Sampling*.

**NOTE:** Any firewall filter that is configured on the Routing Engine loopback interface (lo0) cannot be applied to IP packets that are forwarded to the Routing Engine as a result of a targeted broadcast. This is because broadcast packets are forwarded as flood next hop and not as local next hop traffic, and you can only apply a firewall filter to local next hop routes for traffic directed towards the Routing Engine.

## Configuring Targeted Broadcast

The following sections explain how to configure targeted broadcast on an egress interface and its options:

- [Configuring Targeted Broadcast and Its Options on page 250](#)
- [Display Targeted Broadcast Configuration Options on page 251](#)

### Configuring Targeted Broadcast and Its Options

You can configure targeted broadcast on an egress interface with different options. You can either allow the IP packets destined for a Layer 3 broadcast address to be forwarded on the egress interface and to send a copy of the IP packets to the Routing Engine or you can allow the IP packets to be forwarded on the egress interface only. Note that the packets are broadcast only if the egress interface is a LAN interface.

To configure targeted broadcast and its options:

1. Configure the physical interface.  

```
[edit]  
user@host# set interfaces interface-name
```
2. Configure the logical unit number at the `[edit interfaces interface-name]` hierarchy level.  

```
[edit interfaces interface-name]  
user@host# set unit logical-unit-number
```
3. Configure the protocol family as `inet` at the `[edit interfaces interface-name unit interface-unit-number]` hierarchy level.  

```
[edit interfaces interface-name unit interface--unit-number]  
user@host# set family inet
```
4. Configure targeted broadcast at the `[edit interfaces interface-name unit interface-unit-number family inet]` hierarchy level.  

```
[edit interfaces interface-name unit interface--unit-number family inet]
```

```
user@host# set targeted-broadcast
```

5. Specify one of the following options as per requirement:

- To allow IP packets destined for a Layer 3 broadcast address to be forwarded on the egress interface and to send a copy of the IP packets to the Routing Engine.

```
[edit interfaces interface-name unit interface-unit-number family inet
targeted-broadcast]
user@host# set forward-and-send-to-re
```

- To allow IP packets to be forwarded on the egress interface only.

```
[edit interfaces interface-name unit interface-unit-number family inet
targeted-broadcast]
user@host# set forward-only
```

**NOTE:** Targeted broadcast does not work when the targeted broadcast option `forward-and-send-to-re` and the traffic sampling option `sampling` are configured on the same egress interface of an M320 router, a T640 router, or an MX960 router. To overcome this scenario, you must either disable one of these options or enable the `sampling` option with the targeted broadcast option `forward-only` on the egress interface. For information about traffic sampling, see *Configuring Traffic Sampling*.

## Display Targeted Broadcast Configuration Options

The following topics display targeted broadcast configuration with its various options:

- [Forward IP Packets On the Egress Interface and To the Routing Engine on page 251](#)
- [Forward IP Packets On the Egress Interface Only on page 252](#)

### Forward IP Packets On the Egress Interface and To the Routing Engine

**Purpose** Display the configuration when targeted broadcast is configured on the egress interface to forward the IP packets on the egress interface and to send a copy of the IP packets to the Routing Engine.

**Action** To display the configuration run the `show` command at the `[edit interfaces interface-name unit interface-unit-number family inet]` where the interface name is `ge-2/0/0`, the unit value is set to `0`, the protocol family is set to `inet`.

```
[edit interfaces interface-name unit interface-unit-number family inet]
user@host#show
targeted-broadcast {
    forward-and-send-to-re;
}
```

### Forward IP Packets On the Egress Interface Only

---

**Purpose** Display the configuration when targeted broadcast is configured on the egress interface to forward the IP packets on the egress interface only.

**Action** To display the configuration run the **show** command at the **[edit interfaces *interface-name* unit *interface-unit-number* family inet]** where the interface name is ge-2/0/0, the unit value is set to 0, the protocol family is set to inet.

```
[edit interfaces interface-name unit interface-unit-number family inet]
user@host#show
targeted-broadcast {
    forward-only;
}
```

## Circuit and Translational Cross-Connects Overview

---

Circuit cross-connect (CCC) and translational cross-connect (TCC) allow you to configure transparent connections between two circuits, where a circuit can be a Frame Relay data-link connection identifier (DLCI), an Asynchronous Transfer Mode (ATM) virtual circuit (VC), a Point-to-Point Protocol (PPP) interface, a Cisco High-level Data Link Control (HDLC) interface, or a Multiprotocol Label Switching (MPLS) label-switched path (LSP).

Using CCC or TCC, packets from the source circuit are delivered to the destination circuit with, at most, the Layer 2 address being changed. No other processing, such as header checksums, time-to-live (TTL) decrementing, or protocol processing, is done.

To connect interfaces of the same type, use CCC. To connect unlike interfaces, use TCC.

CCC and TCC circuits fall into three categories: logical interfaces, which include ATM VCs and Frame Relay DLCIs; physical interfaces, which include PPP and Cisco HDLC; and paths, which include LSPs. The three circuit categories provide three types of cross-connect:

- Layer 2 switching (interface-to-interface)—Cross-connects between logical interfaces provide what is essentially Layer 2 switching.
- MPLS tunneling (interface-to-LSP)—Cross-connects between interfaces and LSPs allow you to connect two distant interface circuits by creating MPLS tunnels that use LSPs as the conduit.
- LSP stitching (LSP-to-LSP)—Cross-connects between LSPs provide a way to “stitch” together two label-switched paths, including paths that fall in two different traffic engineering database (TED) areas.

The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first interface.

For most CCC connections that connect interfaces, the interfaces must be of the same type; that is, ATM to ATM, Frame Relay to Frame Relay, PPP to PPP, or Cisco HDLC to Cisco HDLC.

ATM-to-Ethernet interworking cross-connect circuits connect logical interfaces configured on an ATM2 and Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet IQ2 and IQ2-E physical interfaces.

For all TCC connections that connect interfaces, the interfaces can be of unlike types. Mainly, TCC is used for Layer 2.5 virtual private networks (VPNs), but it can also be used as a simple “unlike circuit” switch.

Switching cross-connects join logical interfaces to form what is essentially Layer 2 switching.

[Figure 16 on page 254](#) illustrates a Layer 2 switching circuit cross-connect. In this topology, Router A and Router C have Frame Relay connections to Router B, which is a Juniper Networks router. CCC allows you to configure Router B to act as a Frame Relay (Layer 2) switch. To do this, configure a circuit from Router A to Router C that passes through Router B, effectively configuring Router B as a Frame Relay switch with respect to these routers. This configuration allows Router B to transparently switch packets (frames) between Router A and Router C without regard to the packets’ contents or the Layer 3 protocols. The only processing that Router B performs is to translate DLCI 600 to 750.

**Figure 16: Layer 2 Switching Circuit Cross-Connect**

If the Router A-to-Router B and Router B-to-Router C circuits are PPP, for example, the Link Control Protocol and Network Control Protocol exchanges occur between Router A and Router C. These messages are handled transparently by Router B, allowing

Router A and Router C to use various PPP options (such as header or address compression and authentication) that Router B might not support. Similarly, Router A and Router C exchange keepalives, providing circuit-to-circuit connectivity status.

You can configure Layer 2 switching cross-connects on PPP, Cisco HDLC, Frame Relay, Ethernet CCC, Ethernet VLAN, and ATM circuits. With CCC, only like interfaces can be connected in a single cross-connect. With TCC, unlike interfaces can be connected in a single cross-connect. In Layer 2 switching cross-connects, the exchanges take place between point-to-point links.

This chapter discusses the Layer 2 switching cross-connect configuration tasks. For information about MPLS tunneling and LSP stitching, see the *Junos OS MPLS Applications Library for Routing Devices*.

For information about Layer 2 and Layer 2.5 VPNs, see the *Junos OS VPNs Library for Routing Devices*.

For restrictions for MPLS on QFX switches, see *MPLS Feature Support on QFX Series and EX4600 Switches*.

## **Defining the Encapsulation for Switching Cross-Connects**

- [Defining the Encapsulation for Switching Cross-Connects on page 255](#)
- [Configuring PPP or Cisco HDLC Circuits on page 256](#)
- [Configuring ATM Circuits on page 256](#)
- [Configuring Frame Relay Circuits on page 256](#)
- [Configuring Ethernet CCC Circuits on page 258](#)
- [Configuring Ethernet VLAN Circuits on page 258](#)

## **Defining the Encapsulation for Switching Cross-Connects**

To configure Layer 2 or Layer 2.5 switching cross-connects, configure the CCC or TCC encapsulation on the router that is acting as the switch (Router B in [Figure 16 on page 254](#)).

**NOTE:** When you use CCC encapsulation, you can configure the `ccc` family only. Likewise, when you use TCC encapsulation, you can configure the `tcc` family only.

This section contains the following topics:

## Configuring PPP or Cisco HDLC Circuits

For PPP or Cisco HDLC circuits, specify the encapsulation by including the **encapsulation** statement at the `[edit interfaces interface-name]` hierarchy level. This statement configures the entire physical device. For these circuits to work, you must configure a logical interface unit 0.

```
[edit interfaces interface-name]  
encapsulation (ppp-ccc | cisco-hdlc-ccc | ppp-tcc | cisco-hdlc-tcc);  
unit 0;
```

## Configuring ATM Circuits

For ATM circuits, include the **vpi** statement `[edit interfaces interface-name atm-options]` hierarchy level:

```
[edit interfaces at-fpc/pic/port]  
atm-options {  
  vpi vpi-identifier;  
}
```

On the logical interface, include the following statements:

```
point-to-point;  
encapsulation (atm-ccc-cell-relay | atm-ccc-vc-mux | atm-tcc-vc-mux | atm-tcc-snap);  
vci vpi-identifier.vci-identifier;
```

You can include the logical interface statements at the following hierarchy levels:

- `[edit interfaces at-fpc/pic/port unit logical-unit-number]`
- `[edit logical-systems logical-system-name interfaces at-fpc/pic/port unit logical-unit-number]`

For each VC, configure whether it is a circuit or a regular logical interface. The default interface type is point-to-point.

## Configuring Frame Relay Circuits

For Frame Relay circuits, include the **encapsulation** statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit interfaces interface-name]  
encapsulation type;
```

On the logical interface, include the following statements:

```
point-to-point;
```

```
encapsulation type;
dlci dlci-identifier;
```

You can include the logical interface statements at the following hierarchy levels:

- [edit interfaces *interface-name* **unit** *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* **unit** *logical-unit-number*]

The encapsulation type can be one of the following:

- Flexible Frame Relay (**flexible-frame-relay**)—Intelligent queuing (IQ) interfaces can use flexible Frame Relay encapsulation. You use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.
- Frame Relay CCC version (**frame-relay-ccc**)—For E1, E3, SONET/SDH, T1, and T3 interfaces, this encapsulation type is the same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.
- Frame Relay TCC version (**frame-relay-tcc**)—Similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- Extended CCC version (**extended-frame-relay-ccc**)—This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. The logical interface must have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.
- Extended TCC version (**extended-frame-relay-tcc**)—Similar to extended Frame Relay CCC, this encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC, which is used for circuits with different media on either side of the connection.
- Port CCC version (**frame-relay-port-ccc**)—Defined in the IETF document *Frame Relay Encapsulation over Pseudo-Wires* (expired December 2002). This encapsulation type allows you to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.

For each DLCI, configure whether it is a circuit or a regular logical interface. The DLCI for regular interfaces must be from 1 through 511. For CCC and TCC interfaces, it must be from 512 through 1022. This restriction does not apply to IQ interfaces. The default interface type is point to point.

## Configuring Ethernet CCC Circuits

You can configure Ethernet CCC encapsulation on Fast Ethernet, Gigabit Ethernet, and aggregated Ethernet interfaces.

**NOTE:** CCC over aggregated Ethernet requires an M Series Enhanced Flexible PIC Concentrator (FPC).

For Ethernet CCC circuits, specify the encapsulation by including the **encapsulation** statement at the **[edit interfaces *interface-name*]** hierarchy level. This statement configures the entire physical device.

```
[edit interfaces interface-name]  
encapsulation ethernet-ccc;  
unit logical-unit-number {  
  ...  
}  
[edit interfaces aex]  
encapsulation ethernet-ccc;  
unit logical-unit-number {  
  ...  
}
```

## Configuring Ethernet VLAN Circuits

You can configure Ethernet virtual local area network (VLAN) circuits on Fast Ethernet, Gigabit Ethernet, and aggregated Ethernet interfaces. For Ethernet VLAN circuits, specify the encapsulation by including the **encapsulation** statement at the **[edit interfaces *interface-name*]** hierarchy level. This statement configures the entire physical device. You must also enable VLAN tagging. To do this, include the following statements:

```
[edit interfaces interface-name]  
vlan-tagging;  
encapsulation (extended-vlan-ccc | vlan-ccc);  
[edit interfaces aex]  
vlan-tagging;  
encapsulation vlan-ccc;
```

On the logical interface, include the following statements:

```
encapsulation vlan-ccc;  
vlan-id number;
```

You can include the logical interface statements at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

Ethernet interfaces in VLAN mode can have multiple logical interfaces. For encapsulation type **vlan-ccc**, VLAN IDs 1 through 511 are reserved for normal VLANs, and VLAN IDs

512 through 1023 are reserved for CCC VLANs. For encapsulation type **extended-vlan-ccc**, VLAN IDs 1 through 4094 are valid. VLAN ID 0 is reserved for tagging the priority of frames.

## Defining the Connection for Switching Cross-Connects

To configure Layer 2 switching cross-connects, define the connection between the two circuits. You configure this on the router that is acting as the switch (Router B in [Figure 16 on page 254](#)). The connection joins the interface that comes from the circuit's source to the interface that leads to the circuit's destination. When you specify the interface names, include the logical portion of the name, which corresponds to the logical unit number. The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first interface.

```
[edit protocols]
connections {
  remote-interface-switch connection-name {
    interface interface-name.unit-number;
  }
  lsp-switch connection-name {
    transmit-lsp lsp-number;
    receive-lsp lsp-number;
  }
}
```

## Configuring MPLS for Switching Cross-Connects

For Layer 2 switching cross-connects to work, you must configure MPLS. The following is a minimal MPLS configuration:

```
[edit protocols]
mpls {
  interface (interface-name | all);
}
```

For more information, see the *MPLS Applications Feature Guide*.

### Related Documentation

- [Defining the Connection for Switching Cross-Connects on page 259](#)

## Configuring IS-IS or MPLS Traffic for TCC Interfaces

Layer 2.5 VPNs on T Series, M120, MX Series, and M320 routers support IPv4, IS-IS, and MPLS traffic types. By default, IPv4 traffic runs on T Series, M120, MX Series, and M320 routers and over TCC interfaces. To configure IS-IS (ISO traffic) or MPLS traffic on Layer 2.5 VPNs, you must configure the same traffic type on both ends of the Layer 2.5 VPN.

**NOTE:** Some platform and FPC combinations can not pass TCC encapsulated ISO traffic. See *Platforms/FPCs That Cannot Forward TCC Encapsulated ISO Traffic* for details.

To specify which traffic can run over a TCC interface, include the **protocols** statement with the appropriate value (**inet**, **mpls**, and **iso**) at the **[edit interfaces *interface-name* unit *logical-unit-number* family tcc]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number family tcc]  
protocols [ inet iso mpls ];
```

**NOTE:** Layer 2.5 VPNs running on M Series Multiservice Edge Routers support only IPv4 traffic. IPv6 is not supported on Layer 2.5 VPNs.

When enabling ISO over a Layer 2.5 VPN that is configured on a CE Ethernet interface, you must also include the **point-to-point** statement at the **[edit protocols isis interface *interface-name*]** hierarchy level:

```
[edit protocols isis interface interface-name]  
point-to-point;
```

For more information about Layer 2.5 VPNs, see the *Junos OS VPNs Library for Routing Devices* and the *Translational Cross-Connect and Layer 2.5 VPNs Feature Guide*.

- [Configuring the Logical Interface VPI on page 263](#)
- [Configuring the Logical Interface VCI on page 264](#)

### ATM-to-Ethernet Interworking

The ATM-to-Ethernet interworking feature is useful where ATM2 interfaces are used to terminate ATM DSLAM traffic. The ATM traffic can be forwarded with encapsulation type **ccc** (circuit cross-connect) to a local or remote Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet IQ2 and IQ2-E interface or label-switched path (LSP). The ATM VPI and VCI are converted to stacked VLAN inner and outer VLAN tags.

These ATM-to-Ethernet interworking circuits can be mapped to individual logical interfaces configured on an ATM2 IQ interface and Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet IQ2 and IQ2-E physical interface.

The ATM-to-Ethernet interworking cross-connect essentially provides Layer 2 switching, and statistics are reported at the logical interface level.

During conversion from ATM to Ethernet, the least significant 12 bits of the ATM cell VCI are copied to the Ethernet frame inner VLAN tag. Cells received on an ATM logical interface configured with encapsulation type **vlan-vci-ccc** and falling within the configured VCI range are reassembled into packets and forwarded to a designated Ethernet logical interface that is configured with encapsulation type **vlan-vci-ccc**.

During conversion from Ethernet to ATM, the Ethernet frame inner VLAN tags that fall within the configured range, are copied to the least significant 12 bits of the ATM cell VCI. The ATM logical interface uses its configured VPI when segmenting the Ethernet packets into cells.

ATM-to-Ethernet interworking is supported on M120, M320, and T Series routers.

ATM-to-Ethernet interworking is supported on MX Series routers with aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces. This feature is available on all Enhanced Queuing (EQ) DPCs and Enhanced DPCS for MX Series routers.

**NOTE:** This feature is *not* supported on MX Series routers with ATM interfaces.

For more information on MX Series ATM-to-Ethernet interworking, see the *MX Series Solutions Guide*.

The following sections discuss ATM-to-Ethernet interworking:

## Enabling ATM-to-Ethernet Interworking

To enable the ATM-to-Ethernet interworking cross-connect function, include the **vlan-vci-tagging** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
vlan-vci-tagging;
```

## Configuring the Ethernet Interface

Configure the Ethernet or aggregated Ethernet physical interface by including the **encapsulation** statement with the **vlan-vci-ccc** option at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
encapsulation vlan-vci-ccc;
```

When the encapsulation type **vlan-vci-ccc** is configured on the physical interface, all logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.

## Configuring Ethernet Encapsulation

Configure the Ethernet logical interface by including the **encapsulation** statement with the **vlan-vci-ccc** option at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number]  
encapsulation vlan-vci-ccc;
```

The chassis configuration cannot contain the **atm-l2circuit-mode** statement if any logical interfaces are configured with the **vlan-vci-ccc** encapsulation option.

## Configuring the Outer VLAN Identifier

Configure the Ethernet logical interface outer VLAN ID by including the **vlan-id** statement specifying the outer VLAN ID at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number]  
vlan-id outer-vlan-identifier;
```

It is the administrator's responsibility to ensure that the outer VLAN tag and VPI match and the inner VLAN tags fall within the VCI range of the VPI.

The allowable VPI range is from 0 to 255. So the outer VLAN tags must not be configured for values above 255.

## Configuring the Inner VLAN Identifier Range

Configure the Ethernet logical interface inner VLAN ID range by including the **inner-vlan-id-range** statement and specifying the starting VLAN ID and ending VLAN ID at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number]  
inner-vlan-id-range start start-id end end-id;
```

VLAN IDs 0 and 4095 are reserved by IEEE 801.1q and must not be used for the inner or outer VLAN ID.

VCIs 0 through 31 are reserved for ATM management purposes by convention. Therefore inner VLAN IDs 1 through 31 should not be used.

VLAN ID 1 might be used by Ethernet switches for certain bridge management services, so using VLAN ID 1 for the inner or outer VLAN ID is discouraged.

## Configuring the Physical Interface VPI

Configure the ATM physical interface VPI by including the **vpi** statement at the **[edit interfaces *interface-name* atm-options]** hierarchy level:

```
[edit interfaces interface-name atm-options]  
vpi virtual-path-identifier;
```

VPI 0 is reserved, and must not be used.

ATM F4/F5 OAM is not supported for VPIs used in ATM-to-Ethernet interworking cross-connects. Any F4/F5 OAM cells received are discarded.

Only one logical interface may be declared per virtual path specified in the **atm-options** statement hierarchy.

It is not necessary to dedicate all the VPIs of an ATM2 interface for ATM-to-Ethernet interworking cross-connects.

## Configuring the ATM Logical Interface

Configure the ATM logical interface by including the **encapsulation** statement and specifying the encapsulation type **vlan-vci-ccc** at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number]
  encapsulation vlan-vci-ccc;
```

An ATM logical interface configured with the encapsulation type **vlan-vci-ccc** only supports the **epd-threshold**, **shaping**, **traps | no-traps**, **disable**, and **description** statements. No other configuration statements are supported. ATM interface CoS features are not supported by logical interfaces configured with the encapsulation type **vlan-vci-ccc**.

The ATM2 OC48 PIC does not support the encapsulation type **vlan-vci-ccc**.

The encapsulation type **vlan-vci-ccc** only supports the **ccc** protocol family. Attempts to configure any other interface protocol family are rejected.

## Configuring the Protocol Family

Configure the ATM logical interface protocol family by including the **family** statement and specifying the **ccc** option at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number]
  family ccc;
```

## Configuring the Logical Interface VPI

Configure the ATM logical interface virtual path identifier by including the **vpi** statement at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number]
  vpi virtual-path-identifier;
```

VPI 0 is reserved, and must not be used.

It is the administrator's responsibility to ensure the outer VLAN tag and VPI match and the inner VLAN tags fall within the VCI range of the VPI.

Once a VPI is used in an ATM-to-Ethernet interworking cross-connect, it cannot be used with any other logical interface, even if the **vpi.vci** value falls outside the VCI range for the cross-connect.

## Configuring the Logical Interface VCI

Configure the ATM logical interface virtual channel identifier range by including the **vci-range** statement and specifying the starting VCI and ending VCI at the **[edit interfaces interface-name unit logical-unit-number]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number]  
vci-range start start-vci end end-vci;
```

Do not use VCIs 0 through 31, which are reserved for ATM management purposes by convention.

---

## ATM-To-Ethernet Interworking on ATM MICs

ATM-to-Ethernet interworking supports transmission of ATM packets over Ethernet. It specifically provides support for exchange of Layer 2 and Layer 3 Protocol Data Units (PDUs) between ATM and Ethernet domains. On MX Series 3D Universal Edge Routers with ATM MICs, you can exchange Ethernet frames between ATM and Ethernet domains over a MPLS pseudowire or a Layer 2 cross-connect by using translational cross connect (TCC). For more information about TCC, see [“Circuit and Translational Cross-Connects Overview” on page 253](#).

Consider the following basic ATM-to-Ethernet Interworking topology where the provider edge router PE1 is connected to an ATM domain and the Provider Edge router PE2 is connected to an Ethernet domain (see Figure 1). The customer edge routers CE1 and CE2 are customer-managed devices. The PE routers are connected by means of an MPLS pseudowire. The ATM traffic on the PE1–CE1 link can comprise untagged Ethernet frames over ATM format. The Ethernet traffic on PE2–CE2 link can comprise untagged, single-VLAN or double-VLAN tagged Ethernet frames depending on the configuration of the PE2 router.

For ATM-to-Ethernet Interworking, the virtual path identifier (VPI) and virtual circuit identifier (VCI) values on the ATM link are mapped to the outer and inner VLAN tag on the Ethernet link. Mapping implies that either the same value is copied or a one-to-one translation is performed. If VLAN translation is enabled, instead of copying the value, a one-to-one translation is performed on the Ethernet facing PE, using a lookup table.

ATM cells that are received on the PE1 router are reassembled into ATM Adaptation Layer 5 (AAL5) logical link control (LLC) frames. The router removes the header and footer and adds two VLAN tags (outer and inner) to the untagged Ethernet payload based on the configuration. The VLAN IDs must correspond to the VPI and VCI of the ATM cell. You must add an MPLS label before transmitting the dual-VLAN-tagged Ethernet frame over the MPLS pseudowire. You can also add other optional MPLS tags.

**NOTE:** If the AAL5 frame sent by CE1 is not encapsulated with LLC and if the untagged Ethernet payload includes the frame check sequence (FCS), PE1 rejects the AAL5 frame. Also, PE1 can transmit and receive only a dual VLAN-tagged Ethernet frame without FCS. Inclusion of FCS can result in packet drops or data corruption.

---

On the PE2 router, the MPLS label and optional MPLS tags are removed and the Ethernet frame is transmitted toward the CE2 router. You can modify or remove one or both VLAN tags before forwarding the frame to the CE2 router.

## Limitations

Following are the limitations of the ATM-to-Ethernet interworking feature on MX Series routers with ATM MICs:

- The ATM-to-Ethernet interworking feature is not backward compatible or does not interoperate with the ATM-Ethernet interworking feature supported on M Series and T Series Routers. The functionality is the same but the implementation is different.
- The total number of VCIs supported is 4000 for the ATM MIC. This is an existing system limit.
- If an ATM logical interface is configured with **vci-range** of *N* VCIs, then *N* VCIs are deducted from the available pool of 4000 VCIs.
- ATM quality of service (QoS) is not supported with the **vlan-vci-ccc** encapsulation. If you use the **vci-range** statement then the **vlan-vci-ccc** encapsulation supports multiple VCIs on a single logical interface. This is a hardware limitation.

## Example: Configuring CCC over Aggregated Ethernet

See the topology in [Figure 19 on page 268](#). In this topology, CE Routers A and C have aggregated Ethernet connections to PE Router B. With CCC, you specify that the circuit

from Router A is connected to the circuit from Router C. Router B functions as a cross-connect switch between the two circuits. For a back-to-back connection, all VLAN IDs must be the same on Router A through Router C. You configure Router A and Router C as standard aggregated Ethernet interfaces. For more information about aggregated Ethernet, see *Aggregated Ethernet Interfaces Overview*.

**Figure 19: Interface-to-Interface Circuit Cross-Connect over Aggregated Ethernet Interfaces**

**On Router A**

```

[edit interfaces]
ae0 {
  vlan-tagging;
  aggregated-ether-options {
    minimum-links 1;
    link-speed 1g;
  }
  unit 0 {
    vlan-id 600;
    family inet {
      address 192.168.1.1/30;
    }
  }
}

```

**On Router B**

```

[edit interfaces]
ae0 {
  encapsulation vlan-ccc;
  vlan-tagging;
  aggregated-ether-options {
    minimum-links 1;
    link-speed 1g;
  }
}
unit 0 { # CCC switch
  encapsulation vlan-ccc;
  vlan-id 600;
  family ccc;
}
ae1 {
  encapsulation vlan-ccc;
  vlan-tagging;
  aggregated-ether-options {
    minimum-links 1;
    link-speed 100m;
  }
}
unit 0 {
  encapsulation vlan-ccc;
  vlan-id 600;
  family ccc;
}
}

```

```
[edit protocols]
mpls {
  interface all;
}
connections {
  interface-switch layer2-cross-connect {
    interface ae0.0;
    interface ae1.0;
  }
}
```

On Router C

```
[edit interfaces]
ae1 {
  vlan-tagging;
  aggregated-ether-options {
    minimum-links 1;
    link-speed 1g;
  }
  unit 0 {
    vlan-id 600;
    family inet {
      address 192.168.1.2/30;
    }
  }
}
```

## Example: Configuring a Remote LSP CCC over Aggregated Ethernet

See the topology in [Figure 20 on page 269](#). In this topology, CE Router G has an aggregated Ethernet connection to PE Router F. CE Router D has an aggregated Ethernet connection to PE Router E. Router E and Router F have an MPLS LSP between them. With remote CCC, you specify that the circuit from Router D is connected to the circuit from Router G. The circuit from Router D is connected to the LSP on Router E; the circuit from Router G is connected to the LSP on Router F. In other words, **ae0.0** and **ae1.0** are connected using **lsp1-2** and **lsp2-1**. You configure Router D and Router G as standard aggregated Ethernet interfaces. For more information about aggregated Ethernet, see *Aggregated Ethernet Interfaces Overview*.

**Figure 20: Remote Interface-LSP-Interface Circuit Cross-Connect over Aggregated Ethernet Interfaces**

On Router D

```
[edit interface]
ae0 {
  aggregated-ether-options {
    minimum-links 1;
    link-speed 1g;
    lacp {
      active;
    }
  }
}
```

```
        periodic fast;
    }
}
unit 0 {
    family inet {
        address 192.168.2.1/30;
    }
}
}
```

**On Router E**

```
[edit interfaces]
ae0 {
    encapsulation ethernet-ccc;
    aggregated-ether-options {
        minimum-links 1;
        link-speed 100m;
        lacp {
            active;
            periodic fast;
        }
    }
}
unit 0 {
    encapsulation vlan-ccc; # default
    family ccc; # default
}
}
[edit protocols]

    interface ae1.0;
    receive-lsp lsp1_2;
    transmit-lsp lsp2_1;
  }
}

```

On Router G

```

[edit interface]
ae1 {
  aggregated-ether-options {
    minimum-links 1;
    link-speed 1g;
    lacp {
      active;
      periodic fast;
    }
  }
}
unit 0 {
  family inet {
    address 192.168.2.2/30;
  }
}
}

```

## Example: Configuring ATM-to-Ethernet Interworking

The following example shows the configuration of the ATM and Ethernet interfaces for an ATM-to-Ethernet interworking cross connect. In the example ATM DSLAM traffic is terminated on an ATM2 interface. The ATM traffic is forwarded using encapsulation type **vlan-vci-ccc** to a local Ethernet IQ2 and IQ2-E interface. See the topology in [Figure 21 on page 271](#).

Figure 21: ATM-to-Ethernet Interworking

In this example, the ATM traffic comes from the DSLAM to the router on ATM interface **at-4/0/0** and is forwarded out on Ethernet interface **ge-2/2/1**.

```

[edit interfaces]
ge-2/2/1 {
  vlan-vci-tagging;
  encapsulation vlan-vci-ccc;
  unit 0 {

```

```
        encapsulation vlan-vci-ccc;
        vlan-id 100;
        inner-vlan-id-range start 100 end 500;
    }
}
at-4/0/0 {
    atm-options {
        vpi 100;
    }
    unit 0 {
        encapsulation vlan-vci-ccc;
        family ccc;
        vpi 100;
        vci-range start 100 end 500;
    }
}
```

## Example: Configuring ATM-to-Ethernet Interworking on ATM MIC

This example shows how to configure the ATM and Ethernet interfaces for an ATM-to-Ethernet interworking cross-connect.

- [Requirements on page 272](#)
- [Overview on page 272](#)
- [Configuration on page 273](#)

### Requirements

This example uses the following hardware and software components:

- One MX Series router with ATM MIC
- One MX Series router with Ethernet MIC
- Junos OS Release 16.1R1 or later release

### Overview

Configuring ATM-to-Ethernet Interworking enables exchange of Ethernet frames between an ATM domain and an Ethernet domain on MX Series routers with ATM MIC. The ATM domain can be connected to the Ethernet domain over an MPLS pseudowire.

---

#### Topology

Consider a sample topology in which provider edge (PE) router (ATMRouter) is an MX Series router with an ATM MIC and PE router (EthernetRouter) is an MX Series router with an Ethernet MIC. CE1 and CE2 are the customer edge routers or customer-managed devices. ATMRouter and EthernetRouter are connected by means of an MPLS pseudowire. The ATM traffic between ATMRouter and CE1 comprises untagged Ethernet over ATM

cells. The Ethernet traffic between EthernetRouter and CE2 comprises double-VLAN-tagged Ethernet frames.

When a packet is sent from CE1 to CE2 (ATM-to-Ethernet), ATMRouter accepts ATM cells from CE1 with virtual circuit identifier (VCI) in the range 10/50 to 10/100 and reassembles ATM cells into AAL5 frames. ATMRouter extracts the Ethernet frame from the AAL5 frame payload. ATMRouter adds two VLAN tags with VLAN IDs corresponding to the virtual path identifier (VPI) and VCI of the received ATM cell. The dual-tagged-Ethernet frame is then encapsulated into a MPLS packet and sent over the pseudowire to EthernetRouter.

EthernetRouter strips the MPLS encapsulation and the dual-VLAN-tagged Ethernet frame is sent to CE2. The outer VLAN ID is rewritten to 20 and the inner VLAN ID remains the same. The packet arrives at CE2.

The reverse happens when a packet is sent from CE2 to CE1.

## Configuration

To enable exchange of Ethernet frames between an ATM domain and an Ethernet domain according to the topology mentioned in the overview section, perform these tasks:

- [Configuring ATMRouter on page 273](#)
- [Configuring EthernetRouter on page 275](#)

### Configuring ATMRouter

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the interfaces on ATMRouter:

1. To configure the MIC to use SONET framing, include the **framing** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
user@host# set fpc 1 pic 0 framing sonet port 0 framing sonet speed oc3-stm1
```

2. In configuration mode, go to the **[edit interfaces]** hierarchy level. Configure the Ethernet core interface that connects ATMRouter to EthernetRouter and specify the description of the Ethernet interface for your reference.

```
[edit]
user@host# edit interfaces
user@host# edit ge-1/0/0
user@host# set description PE2Facing
```

3. Configure a logical unit for the Ethernet interface, specify the family as **inet**, and assign an IP address to the interface. Also, specify the family as **mpls** to enable ATMRouter to connect to EthernetRouter.

```
[edit interfaces ge-1/0/0]
```

```
user@host# edit unit 0
user@host# set family inet address 192.0.0.1/24
user@host # set family mpls
user@host# top
```

4. In configuration mode, at the **[edit interfaces]** hierarchy level, configure the ATM interface that connects to CE1 and specify the description of the ATM interface for your reference. Also, define the virtual path identifier for this interface by using the **vpi** statement and specify a value from 1 through 255. The value zero (0) is reserved and must not be used.

```
[edit]
user@host# edit interfaces
user@host# edit at-1/2/0
user@host# set description CE1Facing
user@host# set atm-options vpi 10
```

5. Configure a logical unit for the ATM interface. Also, configure the ATM logical interface by specifying the encapsulation and the protocol family. The encapsulation type **vlan-vci-vcc** supports only the **ccc** protocol family. Any attempts to configure any other interface protocol family is rejected.

```
[edit interfaces at-1/2/0]
user@host# edit unit 0
user@host# set encapsulation vlan-vci-vcc family ccc
```

6. Configure the VPI and VCI for the logical interface. The VPI value 0 is reserved and must not be used. VCI values from 0 through 31 are reserved for ATM management purposes by convention.

```
[edit interfaces at-1/2/0 unit 0]
user@host# set vpi 10 vci-range start 100 end 110
user@host# top
```

7. Configure the physical loopback interface at the **[edit interfaces]** hierarchy level.

```
[edit]
user@host# set interfaces lo0 unit 0 family inet address 198.51.100.1/32
```

8. Configure the route identifier that specifies the routing device's IP address. The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier is usually the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.

```
[edit]
user@host # set router-options router-id 198.51.100.1
```

9. At the **[edit protocols]** hierarchy level, configure the interface on which to configure MPLS as well as the loopback interface.

```
[edit protocols]
user@host# edit mpls
user@host# set interface ge-1/0/0.0
user@host# set interface lo0.0
user@host# top
```

10. At the **[edit protocols]** hierarchy level, configure a single-area OSPF network by specifying the area ID and associated interfaces (Ethernet interface and the loopback interface).

```
[edit protocols]
user@host# edit ospf
user@host# set area 0.0.0.0 interface ge-1/0/0.0
user@host# set area 0.0.0.0 interface lo0.0
user@host# top
```

11. Create an LDP instance on the Ethernet interface and the loopback interface at the **[edit]** hierarchy level. LDP is required as the signaling protocol for Layer 2 circuits.

```
[edit]
user@host# edit protocols ldp
user@host# set interface ge-1/0/0.0
user@host# set interface lo0.0
user@host# top
```

12. Establish the Layer 2 circuit by specifying the **l2circuit** statement at the **[edit protocols]** hierarchy level. The **neighbor** parameter specifies the IP address of the PE neighbor. The **interface** name refers to the local CE-facing interface that forms the Layer 2 circuit. The **VCI ID** must match the ID of the PE neighbor.

```
[edit]
user@host# edit protocols l2circuit
user@host# edit neighbor 198.51.100.2 interface at-1/2/0.0
user@host# set static incoming label 1000000 outgoing label 1000000
user@host# set virtual-circuit-id 5
user@host# set no-control-word
user@host# set ignore-encapsulation-mismatch
user@host# set ignore-mtu-mismatch
```

### Configuring EthernetRouter

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the interfaces on EthernetRouter:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level. Configure the Ethernet core interface that connects EthernetRouter to ATMRouter and specify the description of the Ethernet interface for your reference.

```
[edit]
```

```
user@host# edit interfaces
user@host# edit ge-1/0/0
user@host# set description PE1Facing
```

2. Configure a logical unit for the Ethernet interface and specify the family as **inet** and assign an IP address to the Ethernet interface. Also, specify the family as **mpls** to enable EthernetRouter to connect to ATMRouter.

```
[edit interfaces ge-1/0/0]
user@host# edit unit 0
user@host# set family inet address 192.0.0.2/24
user@host# set family mpls
user@host# top
```

3. At the **[edit interfaces]** hierarchy level, configure the Ethernet interface that connects to CE2 and specify the description of the interface for your reference. Also, specify **flexible-vlan-tagging** to support transmission of 802.1Q VLAN single-tag and dual-tag frames on the same port. Specify **extended-vlan-ccc** as the encapsulation to enable tagging for translational cross-connect (TCC).

```
[edit]
user@host# edit interfaces
user@host# edit ge-1/0/1
user@host# set description CE2Facing
user@host# set flexible-vlan-tagging
user@ost# set encapsulation extended-vlan-ccc
user@host# set gigether-options ethernet-switch-profile tag-protocol-id [0x8100
0x9100 0x88a8]
```

4. Configure a logical unit for the Ethernet interface. Also, configure mixed tagging. Mixed tagging enables you to configure two logical interfaces on the same Ethernet port, one with single-tag framing and one with dual-tag framing. You can also specify the protocol family.

```
[edit interfaces ge-1/0/1]
user@host# edit unit 0
user@host# set vlan-tags outer 0x88a8.10 inner-range 0x8100.100-110
user2host# set family ccc;
```

5. Configure the physical loopback interface at the **[edit interfaces]** hierarchy level.

```
[edit]
user@host# set interfaces lo0 unit 0 family inet address 198.51.100.2/32
```

6. Configure the route identifier that specifies the routing device's IP address. The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier is usually the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.

```
[edit]
```

```
user@host # set router-options router-id 198.51.100.2
```

7. At the **[edit protocols]** hierarchy level, configure the interface on which to configure MPLS as well as the loopback interface.

```
[edit protocols]
user@host# edit mpls
user@host# set interface ge-1/0/0.0
user@host# set interface lo0.0
user@host# top
```

8. At the **[edit protocols]** hierarchy level, configure a single-area OSPF network by specifying the area ID and associated interfaces (Ethernet interface and the loopback interface).

```
[edit protocols]
user@host# edit ospf
user@host# set area 0.0.0.0 interface ge-1/0/0.0
user@host# set area 0.0.0.0 interface lo0.0
user@host# top
```

9. Create an LDP instance on the Ethernet interface and the loopback interface at the **[edit]** hierarchy level. LDP is required as the signaling protocol for Layer 2 circuits.

```
[edit]
user@host# edit protocols ldp
user@host# set interface ge-1/0/0.0
user@host# set interface lo0.0
user@host# top
```

10. Establish the Layer 2 circuit by specifying the **l2circuit** statement at the **[edit protocols]** hierarchy level. The **neighbor** parameter specifies the IP address of the PE neighbor. The **interface** name refers to the local CE-facing interface that forms the Layer 2 circuit. The **VCI ID** must match the ID of the PE neighbor.

```
[edit]
user@host# edit protocols l2circuit
user@host# edit neighbor 198.51.100.1 interface ge-1/0/1.0
user@host# set static incoming label 1000000 outgoing label 1000000
user@host# set virtual-circuit-id 5
user@host# set no-control-word
user@host# set ignore-encapsulation-mismatch
user@host# set ignore-mtu-mismatch
```

## Verifying ATM-to-Ethernet Interworking Configuration on ATM MICs

---

To verify that the ATM-to-Ethernet interworking feature is configured correctly, perform these tasks on both the routers:

- [Verifying That The ATM Interface on Router1 Is Configured Correctly on page 278](#)
- [Verifying The Status of the MIC on Router1 on page 278](#)
- [Verify That OSPF Configuration on Router1 Is Accurate on page 279](#)
- [Verify That LDP Configuration on Router1 Is Accurate on page 279](#)
- [Verify That Layer 2 Virtual Circuit Session Configuration on Router1 Is Accurate on page 279](#)
- [Verifying That the Ethernet Interface on Router2 Is Configured Correctly on page 280](#)
- [Verifying the Status of the MIC on Router2 on page 281](#)
- [Verify That OSPF Configuration on Router2 Is Accurate on page 281](#)
- [Verify That LDP Configuration on Router2 Is Accurate on page 281](#)
- [Verify That Layer 2 Virtual Circuit Session Configuration on Router2 Is Accurate on page 281](#)

### Verifying That The ATM Interface on Router1 Is Configured Correctly

**Purpose** To verify that the ATM interface (at-1/2/0) on Router1 is configured correctly.

**Action** From operational mode, enter the **show interfaces** command.

```
user@host> show interfaces at-1/2/0 terse
Interface      Admin Link Proto  Local      Remote
at-1/2/0       up    up
at-1/2/0.0     up    up    ccc
at-1/2/0.32767 up    up
```

**Meaning** The ATM interface on Router1 is operational.

### Verifying The Status of the MIC on Router1

**Purpose** To verify the status of the MIC.

**Action** From operational mode, enter the **show chassis fpc pic-status** command.

```
user@host> show chassis fpc pic-status
Slot 0 Online
  PIC 2 Online 10x 1GE(LAN) -EH SFP
  PIC 3 Online 10x 1GE(LAN) -EH SFP
Slot 1 Online
  PIC 0 Online 2x0C12/8x0C3 CC-CE
  PIC 2 Online 10x 1GE(LAN) SFP
  PIC 3 Online 10x 1GE(LAN) SFP
Slot 2 Online
  PIC 0 Online 4x 10GE(LAN) SFP+
```

**Meaning** ATM MIC on FPC slot 1 is online and operational.

### Verify That OSPF Configuration on Router1 Is Accurate

**Purpose** To verify that routers are adjacent and able to exchange OSPF data.

**Action** From operational mode, enter the **show ospf neighbor** command.

```
user@host> show ospf neighbor
Address      Interface      State      ID              Pri  Dead
192.0.0.1    ge-1/0/0.0    Full      198.51.100.2   128  36
```

**Meaning** The adjacent router is online and can accept OSPF data.

### Verify That LDP Configuration on Router1 Is Accurate

**Purpose** To view LDP session information.

**Action** From operational mode, enter the **show ldp session** command.

```
user@host> show ldp session
Address State Connection Hold time Adv. Mode
198.51.100.2 Operational Open 26 DU
```

**Meaning** The output indicates that the session is operational and that the connection is open. It also indicates that the session will close in 26 seconds.

### Verify That Layer 2 Virtual Circuit Session Configuration on Router1 Is Accurate

**Purpose** To view the Layer 2 virtual circuits from the local PE router (Router1) to its neighbors.

**Action** From operational mode, enter the **show l2circuit connections** command.

```
user@host> show l2circuit connections
Layer-2 Circuit Connections:
Legend for connection status (St)
EI -- encapsulation invalid NP -- interface h/w not present
MM -- mtu mismatch Dn -- down
EM -- encapsulation mismatch VC-Dn -- Virtual circuit Down

and VCI Interworking
Flow Label Transmit: No, Flow Label Receive: No
```

**Meaning** The command output displays the Layer 2 virtual circuits from Router1 to its neighbors.

## Verifying That the Ethernet Interface on Router2 Is Configured Correctly

**Purpose** To verify that the Ethernet interface (ge-1/0/1) on Router2 is configured correctly.

**Action** From operational mode, enter the **show interfaces** command.

```
user@host> show interfaces ge-1/0/1 terse
Interface Admin Link Proto Local Remote
ge-1/0/1      up   up
ge-1/0/1.0    up   up   ccc
ge-1/0/1.32767 up   up   multiservice
```

**Meaning** The Ethernet interface on Router2 is operational.

## Verifying the Status of the MIC on Router2

**Purpose** To verify the status of the MIC.

**Action** From operational mode, enter the **show chassis fpc pic-status** command.

```
user@host> show chassis fpc pic-status
Slot 2 Online MPC Type 1 3D Q
  PIC 0 Online 10x 1GE(LAN) SFP
  PIC 1 Online 10x 1GE(LAN) SFP
  PIC 2 Online 2x0C12/8x0C3 CC-CE
  PIC 0 Online 4x 10GE(LAN) SFP+
```

**Meaning** MIC 2 on MPC slot 2 is online and operational.

## Verify That OSPF Configuration on Router2 Is Accurate

**Purpose** To verify that routers are adjacent and able to exchange OSPF data.

**Action** From operational mode, enter the **show ospf neighbor** command.

```
user@host> show ospf neighbor
Address      Interface      State      ID              Pri  Dead
192.0.0.1    ge-1/0/0.0    Full      198.51.100.0   128  32
```

**Meaning** The adjacent router is online and can accept OSPF data.

## Verify That LDP Configuration on Router2 Is Accurate

**Purpose** To view LDP session information.

**Action** From operational mode, enter the **show ldp session** command.

```
user@host> show ldp session
Address State Connection Hold time Adv. Mode
198.51.100.0 Operational Open 22 DU
```

**Meaning** The output indicates that the session is operational and that the connection is open. It also indicates that the session will close in 22 seconds.

## Verify That Layer 2 Virtual Circuit Session Configuration on Router2 Is Accurate

**Purpose** To view the Layer 2 virtual circuits from the local PE router (Router2) to its neighbors.

**Action** From operational mode, enter the **show l2circuit connections** command.

```
user@host> show l2circuit connections
Layer-2 Circuit Connections:
Legend for connection status (St)
EI -- encapsulation invalid NP -- interface h/w not present

## CHAPTER 6

# Configuring Discard Interfaces

- [Discard Interfaces Overview on page 285](#)
- [Configuring Discard Interfaces on page 286](#)

### Discard Interfaces Overview

---

The discard interface *dsc* is not a physical interface, but a virtual interface that discards packets.

The following sections explain discard interfaces in detail:

- [Understanding Discard Interfaces on page 285](#)
- [Guidelines to Follow When Configuring a Discard Interface on page 285](#)

### Understanding Discard Interfaces

The discard interface allows you to identify the ingress point of a denial-of-service (DoS) attack. When your network is under attack, the target host IP address is identified, and the local policy forwards attacking packets to the discard interface. When traffic is routed out of the discard interface, the traffic is silently discarded.

The discard interface allows you to protect a network from DoS attacks by identifying the target IP address that is being attacked and configuring a policy to forward all packets to a discard interface. All packets forwarded to the discard interface are dropped. See *Example: Forwarding Packets to the Discard Interface*.

You can configure the **inet** family protocol on the discard interface, which allows you to apply an output filter to the interface. If you apply an output filter to the interface, the action specified by the filter is executed before the traffic is discarded.

Once you configure a discard interface, you must then configure a local policy to forward attacking traffic to the discard interface.

### Guidelines to Follow When Configuring a Discard Interface

Keep the following guidelines in mind when configuring the discard interface:

- Only the logical interface unit 0 is supported.
- The **filter** and **address** statements are optional.

- Although you can configure an input filter and a filter group, these configuration statements have no effect because traffic is not transmitted from the discard interface.
- The discard interface does not support class of service (CoS).

**Related  
Documentation**

- [Configuring Discard Interfaces on page 286](#)
- [Example: Forwarding Packets to the Discard Interface](#)

---

## Configuring Discard Interfaces

The discard (dsc) interface is not a physical interface, but a virtual interface that discards packets. You can configure one discard interface. This interface allows you to identify the ingress point of a denial-of-service (DoS) attack. When your network is under attack, the target host IP address is identified, and the local policy forwards attacking packets to the discard interface. Traffic routed out of the discard interface is silently discarded.

The following sections explain how to forward packets to a discard interface by configuring a discard interface with an input filter and an output filter along with an input policy to associate a community with the discard interface and an output policy to set up the community on the routes injected into the network:

- [Configure a Discard Interface on page 286](#)
- [Configure an Input Policy on page 287](#)
- [Configure an Output Policy on page 288](#)

### Configure a Discard Interface

To configure a discard interface:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level.

```
[edit]
user@host# edit interfaces
```

2. Configure the discard interface.

```
[edit interfaces]
user@host# edit dsc
```

3. Configure the logical interface and the protocol family.

```
[edit interfaces dsc]
user@host# edit unit 0 family family
```

4. Configure an input filter to be applied to received packets.

```
[edit interfaces dsc unit 0 family family]
user@host# set filter input filter-name
```

5. Configure an output filter to be applied to transmitted packets.

```
[edit interfaces dsc unit 0 family family]
user@host# set filter output filter-name
```

6. Configure the interface IP address and the remote address of the connection.

```
[edit interfaces dsc unit 0 family family]
user@host# set address ip-address destination ip-address
```

7. Commit the configuration and go to the top of the hierarchy level.

```
[edit interfaces dsc unit 0 family family]
user@host# commit
user@host# top
```

## Configure an Input Policy

You must configure an input policy to associate a community with the discard interface.

To configure an input policy to associate a community with the discard interface:

1. In configuration mode, go to the **[edit policy-options]** hierarchy level.

```
[edit]
user@host# edit policy-options
```

2. Configure the BGP community information option with a name and configure the number of community members as needed.

```
[edit policy-options]
user@host# set community community-name members community-id
```

3. Configure a routing policy.

```
[edit policy-options]
user@host# edit policy-statement statement-name
```

4. Configure a policy term with a name.

```
[edit policy-options policy-statement statement-name]
user@host# edit term term-variable
```

5. Configure the conditions to match the source of a route with the **from** statement with the BGP community members.

```
[edit policy-options policy-statement statement-name term term-variable]
user@host# set from community value
```

6. Configure the action that is to be taken when the if and to conditions match with the **then** statement. In this case, configure the next-hop address of the remote end of the point-to-point interface and accept the action.

```
[edit policy-options policy-statement statement-name term term-variable]
user@host# set then next-hop address
```

```
user@host# set then accept
```

7. Commit the configuration and go to the top of the hierarchy level.

```
[edit policy-options policy-statement statement-name term term-variable]  
user@host# commit  
user@host# top
```

## Configure an Output Policy

You must configure an output policy to set up the community on the routes injected into the network.

To configure an output policy.

1. In configuration mode, go to the **[edit policy-options]** hierarchy level.

```
[edit]  
user@host# edit policy-options
```

2. Configure a routing policy.

```
[edit policy-options]  
user@host# edit policy-statement statement-name
```

3. Configure a policy term with a name.

```
[edit policy-options policy-statement statement-name]  
user@host# edit term term-variable
```

4. Configure the list of prefix-lists of routes to match with a name.

```
[edit policy-options policy-statement statement-name term term-variable]  
user@host# set from prefix-list name
```

5. Configure the action that is to be taken when the if and to conditions match with the **then** statement. In this case, configure the BGP community properties (set, add, and delete) associated with a route.

```
[edit policy-options policy-statement statement-name term term-variable]  
user@host# set then community (set | add | delete) community-name
```

6. Commit the configuration and go to the top of the hierarchy level.

```
[edit interfaces dsc unit 0 family family]  
user@host# commit  
user@host# top
```

## CHAPTER 7

# Configuring IP Demultiplexing Interfaces

- [Demultiplexing Interface Overview on page 289](#)
- [Configuring an IP Demultiplexing Interface on page 292](#)
- [Configuring a VLAN Demultiplexing Interface on page 296](#)

## Demultiplexing Interface Overview

---

Demultiplexing (demux) interfaces are logical interfaces that share a common, underlying interface. You can create logical subscriber interfaces using static or dynamic demultiplexing interfaces. In addition, you can use IP demultiplexing interfaces or VLAN demultiplexing interfaces when creating logical subscriber interfaces.

Demux interfaces are supported on M120 or MX Series routers only.

Demux interfaces support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, or aggregated Ethernet underlying interfaces.

**NOTE:** You can also configure demux interfaces dynamically. For information about how to configure dynamic IP demux or dynamic VLAN demux interfaces, see *Configuring Dynamic Subscriber Interfaces Using IP Demux Interfaces in Dynamic Profiles* or *Configuring Dynamic Subscriber Interfaces Using VLAN Demux Interfaces in Dynamic Profiles*.

To configure static demux interfaces, see “[Configuring a VLAN Demultiplexing Interface](#)” on page 296 and “[Configuring an IP Demultiplexing Interface](#)” on page 292.

- [IP Demux Interface Overview on page 289](#)
- [VLAN Demux Interface Overview on page 290](#)
- [Guidelines to Remember When Configuring A Demux Interface on page 290](#)
- [MAC Address Validation on Static Demux Interfaces on page 291](#)

## IP Demux Interface Overview

IP demux interfaces use the IP source address or IP destination address to demultiplex received packets when the subscriber is not uniquely identified by a Layer 2 circuit.

To determine which IP demux interface to use, the destination or source prefix is matched against the destination or source address of packets that the underlying interface receives. The underlying interface family type must match the demux interface prefix type.

## VLAN Demux Interface Overview

VLAN demux interfaces use the VLAN ID to demultiplex received packets when the subscriber is not uniquely identified. A VLAN demux interface uses an underlying logical interface to receive packets.

To determine which VLAN demux interface to use, the VLAN ID is matched against that which the underlying interface receives.

**NOTE:** VLAN demux subscriber interfaces over aggregated Ethernet physical interfaces are supported only for MX Series routers that have only Trio MPCs installed. If the router has other MPCs in addition to Trio MPCs, the CLI accepts the configuration but errors are reported when the subscriber interfaces are brought up.

## Guidelines to Remember When Configuring A Demux Interface

Keep the following guidelines in mind when configuring the demux interface:

- Demux interfaces are supported on M120 or MX Series routers only.
- You can configure only one **demux0** interface per chassis, but you can define logical demux interfaces on top of it (for example, **demux0.1**, **demux0.2**, and so on).
- If the address in a received packet does not match any demux prefix, the packet is logically received on the underlying interface. For this reason, the underlying interface is often referred to as the *primary* interface.
- [Points to Remember When Configuring an IP Demux Interface on page 290](#)
- [Points to Remember When Configuring a VLAN Demux Interface on page 291](#)

### Points to Remember When Configuring an IP Demux Interface

---

In addition to the guidelines in “[Guidelines to Remember When Configuring A Demux Interface](#)” on page 290, the following guidelines are to be noted when configuring an IP demux interface:

- You must associate demux interfaces with an underlying logical interface.

**NOTE:** IP demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

- The demux underlying interface must reside on the same logical system as the demux interfaces that you configure over it.

- IP demux interfaces currently supports the Internet Protocol version 4 (IPv4) suite inet and Internet Protocol version 6 (IPv6) suite inet6 family types.
- You can configure more than one demux prefix for a given demux unit. However, you cannot configure the exact same demux prefix on two different demux units with the same underlying interface.
- You can configure overlapping demux prefixes on two different demux units with the same underlying prefix. However, under this configuration, best match rules apply (in other words, the most specific prefix wins).

### Points to Remember When Configuring a VLAN Demux Interface

In addition to the guidelines in “[Guidelines to Remember When Configuring A Demux Interface](#)” on page 290, the following guidelines are to be noted when configuring a VLAN demux interface:

- You must associate VLAN demux interfaces with an underlying logical interface.

**NOTE:** VLAN demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

- The demux underlying interface must reside on the same logical system as the demux interfaces that you configure over it.
- VLAN demux interfaces currently supports the Internet Protocol version 4 (IPv4) suite inet and Internet Protocol version 6 (IPv6) suite inet6 family types.

### MAC Address Validation on Static Demux Interfaces

MAC address validation enables the router to validate that received packets contain a trusted IP source and an Ethernet MAC source address.

MAC address validation is supported on static demux interfaces on MX Series routers only.

There are two types of MAC address validation that you can configure:

- [Loose on page 291](#)
- [Strict on page 292](#)

#### Loose

Forwards packets when both the IP source address and the MAC source address match one of the trusted address tuples.

Drops packets when the IP source address matches one of the trusted tuples, but the MAC address does not support the MAC address of the tuple

Continues to forward packets when the source address of the incoming packet does not match any of the trusted IP addresses.

### Strict

---

Forwards packets when both the IP source address and the MAC source address match one of the trusted address tuples.

Drops packets when the MAC address does not match the tuple's MAC source address, or when IP source address of the incoming packet does not match any of the trusted IP addresses.

## Configuring an IP Demultiplexing Interface

---

Demultiplexing (demux) interfaces are logical interfaces that share a common, underlying interface. You can configure IP demultiplexing interfaces or VLAN demultiplexing interfaces.

To configure an IP demux interface, you must configure the demux prefixes that are used by the underlying interface and then configure the IP demultiplexing interface as explained in the following tasks:

1. [Configuring an IP Demux Underlying Interface on page 292](#)
2. [Configuring the IP Demux Interface on page 294](#)
3. [Configuring MAC Address Validation on Static IP Demux Interfaces on page 296](#)

### Configuring an IP Demux Underlying Interface

An IP demux interface uses an underlying logical interface to receive packets. To determine which IP demux interface to use, the destination or source prefix is matched against the destination or source address of packets that the underlying interface receives. The underlying interface family type must match the demux interface prefix type.

**NOTE:** IP demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

---

To configure a logical interface as an IP demux underlying interface with demux source:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]  
user@host# edit interfaces
```

2. Configure the interface as fe-x/y/z and the logical interface with the **unit** statement. Note that IP demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces. In this procedure, we show a Fast Ethernet interface as an example.

```
[edit interfaces]
user@host# edit fe-x/y/z unit logical-unit-number
```

3. Configure the logical demux source family type on the IP demux underlying interface as inet or inet6, or both.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# set demux-source (inet | inet6)
```

or

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# set demux-source [inet inet6]
```

4. (Optional) To improve datapath performance for DHCPv4 subscribers, specify that only subscribers with 32-bit prefixes are allowed to come up on the interface.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# set host-prefix-only
```

**NOTE:** This step requires that you specify the **demux-source** as only **inet**. A commit error occurs if you specify only **inet6** or both **inet** and **inet6**.

5. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# commit
user@host# top
```

To configure a logical interface as an IP demux underlying interface with demux destination:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the interface as fe-x/y/z and the logical interface with the **unit** statement. Note that IP demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

```
[edit interfaces]
user@host# edit fe-x/y/z unit logical-unit-number unit logical-unit-number
```

3. Configure the logical demux destination family type on the IP demux underlying interface as inet or inet6.

```
[edit interfaces fe-x/y/z unit logical-unit-number]  
user@host# set demux-destination (inet | inet6)
```

4. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces fe-x/y/z unit logical-unit-number]  
user@host# commit  
user@host# top
```

## Configuring the IP Demux Interface

You can configure one or more logical demux source prefixes or destination prefixes after specifying an underlying interface for the static demux interface to use. This underlying interface must reside on the same logical system as the demux interface.

You configure demux prefixes for use by the underlying interface. The demux prefixes can represent individual hosts or networks. For a given demux interface unit, you can configure either demux source or demux destination prefixes but not both.

You can choose not to configure a demux source or demux destination prefix. This type of configuration results in a transmit-only interface.

To configure the IP demux interface with source prefix:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]  
user@host# edit interfaces
```

2. Configure the interface as a logical demux interface (for example, demux0 interface) and configure the logical interface with the **unit** statement.

**NOTE:** You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).

```
[edit interfaces]  
user@host# edit demux0 unit logical-unit-number
```

3. Configure the underlying interface on which the demux interface is running under the **demux-options** statement.

```
[edit interfaces demux0 unit logical-unit-number]  
user@host# set demux-options underlying-interface interface-name
```

4. Configure the protocol family.

```
[edit interfaces demux0 unit logical-unit-number]  
user@host# edit family family
```

5. Configure one or more logical demux source prefixes (IP address). The prefixes are matched against the source address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

```
[edit interfaces demux0 unit logical-unit-number family family]
user@host# set demux-source source-prefix
```

6. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces demux0 unit logical-unit-number family family]
user@host# commit
user@host# top
```

To configure the IP demux interface with destination prefix:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the interface as a logical demux interface (for example, demux0 interface) and configure the logical interface with the **unit** statement.

**NOTE:** You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).

```
[edit interfaces]
user@host# edit demux0 unit logical-unit-number
```

3. Configure the underlying interface on which the demux interface is running under the **demux-options** statement.

```
[edit interfaces demux0 unit logical-unit-number]
user@host# set demux-options underlying-interface interface-name
```

4. Configure the protocol family.

```
[edit interfaces demux0 unit logical-unit-number]
user@host# edit family family
```

5. Configure one or more logical demux destination prefixes. The prefixes are matched against the destination address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

```
[edit interfaces demux0 unit logical-unit-number family family]
user@host# set demux-destination destination-prefix
```

6. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces demux0 unit logical-unit-number family family]  
user@host# commit  
user@host# top
```

## Configuring MAC Address Validation on Static IP Demux Interfaces

MAC address validation enables the router to validate that received packets contain a trusted IP source and an Ethernet MAC source address.

To configure MAC address validation for an IP demux interface:

1. In configuration mode, go to the **[edit interfaces demux0 unit *logical-unit-number*]** hierarchy level:

```
[edit]  
user@host# edit interfaces demux0 unit logical-unit-number
```

2. Configure the protocol family for the interface.

```
[edit interfaces demux0 unit logical-unit-number]  
user@host# edit family family
```

3. Configure the **mac-validate** statement to validate source MAC address with loose or strict options.

```
[edit interfaces demux0 unit logical-unit-number family family]  
user@host# set mac-validate (loose | strict)
```

4. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces demux0 unit logical-unit-number family family]  
user@host# commit  
user@host# top
```

## Configuring a VLAN Demultiplexing Interface

Demultiplexing (demux) interfaces are logical interfaces that share a common, underlying interface. You can configure IP demultiplexing interfaces or VLAN demultiplexing interfaces.

To configure a VLAN demux interface, you must configure the demux prefixes that are used by the underlying interface and then configure the VLAN demultiplexing interface as explained by the following tasks:

1. [Configuring a VLAN Demux Underlying Interface on page 297](#)
2. [Configuring the VLAN Demux Interface on page 298](#)

3. [Configuring MAC Address Validation on Static VLAN Demux Interfaces on page 300](#)
4. [Verifying a Demux Interface Configuration on page 301](#)

## Configuring a VLAN Demux Underlying Interface

A VLAN demux interface uses an underlying logical interface to receive packets. To determine which VLAN demux interface to use, the VLAN ID is matched against that which the underlying interface receives.

**NOTE:** VLAN demux interfaces currently support only Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet underlying interfaces.

VLAN demux subscriber interfaces over aggregated Ethernet physical interfaces are supported only for MX Series routers that have only Trio MPCs installed. If the router has other MPCs in addition to Trio MPCs, the CLI accepts the configuration but errors are reported when the subscriber interfaces are brought up

To configure a logical interface as a VLAN demux underlying interface with demux source:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the interface as fe-x/y/z and the logical interface with the **unit** option.

```
[edit interfaces]
user@host# edit fe-x/y/z unit logical-unit-number unit logical-unit-number
```

3. Configure the VLAN ID. The VLAN ID is used to determine which VLAN demux interface to use, that is the VLAN ID is matched against that which the underlying interface receives.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# set vlan-id number
```

4. Configure the logical demux source family type on the VLAN demux underlying interface as inet or inet6.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# set demux-source (inet | inet6)
```

5. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# commit
user@host# top
```

To configure a logical interface as a VLAN demux underlying interface with demux destination:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the interface as fe-x/y/z and the logical interface with the **unit** option.

```
[edit interfaces]
user@host# edit fe-x/y/z unit logical-unit-number unit logical-unit-number
```

3. Configure the VLAN ID. The VLAN ID is used to determine which VLAN demux interface to use, that is the VLAN ID is matched against that which the underlying interface receives.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# set vlan-id number
```

4. Configure the logical demux destination family type on the VLAN demux underlying interface as inet or inet6.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# set demux-destination (inet | inet6)
```

5. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces fe-x/y/z unit logical-unit-number]
user@host# commit
user@host# top
```

## Configuring the VLAN Demux Interface

You can configure one or more logical demux source prefixes or destination prefixes after specifying an underlying interface for the static demux interface to use. This underlying interface must reside on the same logical system as the demux interface.

You configure demux prefixes for use by the underlying interface. The demux prefixes can represent individual hosts or networks. For a given demux interface unit, you can configure either demux source prefix or demux destination prefixes but not both.

You can choose not to configure a demux source prefix or a demux destination prefix. This type of configuration results in a transmit-only interface

To configure VLAN demux interface with demux source prefix:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the interface as a logical demux interface (for example, demux0 interface) and configure the logical interface with the **unit** statement.

**NOTE:** You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).

[edit interfaces]

user@host# edit demux0 unit *logical-unit-number*

3. Configure the underlying interface on which the demux interface is running under the **demux-options** statement.

[edit interfaces demux0 unit *logical-unit-number*]

user@host# set demux-options underlying-interface *interface-name*

4. Configure the protocol family for the interface.

[edit interfaces demux0 unit *logical-unit-number*]

user@host# edit family *family*

5. Configure one or more logical demux source prefixes. The prefixes are matched against the source address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

[edit interfaces demux0 unit *logical-unit-number* family *family*]

user@host# set demux-source *source-prefix*

6. Save the configuration and move to top of the hierarchy level.

[edit interfaces demux0 unit *logical-unit-number*]

user@host# commit

user@host# top

To configure VLAN demux interface with demux destination prefix:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

[edit]

user@host# edit interfaces

2. Configure the interface as a logical demux interface (for example, demux0 interface) and configure the logical interface with the **unit** statement.

**NOTE:** You can configure only one demux0 interface per chassis, but you can define logical demux interfaces on top of it (for example, demux0.1, demux0.2, and so on).

[edit interfaces]

```
user@host# edit demux0 unit logical-unit-number
```

3. Configure the underlying interface on which the demux interface is running under the **demux-options** statement.

```
[edit interfaces demux0 unit logical-unit-number]  
user@host# set demux-options underlying-interface interface-name
```

4. Configure the protocol family for the interface.

```
[edit interfaces demux0 unit logical-unit-number]  
user@host# edit family family
```

5. Configure one or more logical demux destination prefixes. The prefixes are matched against the destination address of packets that the underlying interface receives. When a match occurs, the packet is processed as if it was received on the demux interface.

```
[edit interfaces demux0 unit logical-unit-number family family]  
user@host# set demux-destination destination-prefix
```

6. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces demux0 unit logical-unit-number]  
user@host# commit  
user@host# top
```

## Configuring MAC Address Validation on Static VLAN Demux Interfaces

MAC address validation enables the router to validate that received packets contain a trusted IP source and an Ethernet MAC source address.

To configure MAC address validation for a VLAN demux interface:

1. In configuration mode, go to the **[edit interfaces demux0 unit *logical-unit-number*]** hierarchy level:

```
[edit]  
user@host# edit interfaces demux0 unit logical-unit-number
```

2. Configure the protocol family for the interface.

```
[edit interfaces demux0 unit logical-unit-number]  
user@host# edit family family
```

3. Configure the **mac-validate** statement to validate source MAC address with loose or strict options.

```
[edit interfaces demux0 unit logical-unit-number family family]  
user@host# set mac-validate (loose | strict)
```

4. Save the configuration and move to top of the hierarchy level.

```
[edit interfaces demux0 unit logical-unit-number family family]
user@host# commit
user@host# top
```

## Verifying a Demux Interface Configuration

**Purpose** Check the configuration of a demux interface and its underlying interface when the following are configured:

- Two VLANs are configured, where each VLAN consists of two IP demux interfaces.
- One VLAN demultiplexes based on the source address
- The other VLAN demultiplexes based on the destination address.

**Action** From configuration mode on the MX Series router, run the **show interfaces fe-0/0/0** and **show interfaces demux0** configuration mode commands.

```
user@host> show interfaces fe-0/0/0
```

```
vlan-tagging;
unit 100 {
  vlan-id 100;
  demux-source inet; # Enable demux of inet prefixes
  family inet {
    address 10.1.1.1/24;
    filter {
      input vlan1-primary-in-filter;
      output vlan1-primary-out-filter;
    }
    mac-validate loose;
  }
}
unit 200 {
  vlan-id 200;
  demux-destination inet; # Enable demux of inet using destination addresses
  family inet {
    address 20.1.1.1/24;
  }
}
unit 300 {
  vlan-id 300;
  demux-source inet; # Enable demux of inet using source addresses
  family inet {
    address 20.1.2.1/24;
  }
}
```

```
user@host> show interfaces demux0
```

```
unit 101 {
  description vlan1-sub1;
  demux-options {
    underlying-interface fe-0/0/0.100;
  }
  family inet {
    demux-source 10.1.1.0/24;
  }
}
```

```
filter {
  input vlan1-sub1-in-filter;
  output vlan1-sub1-out-filter;
}
mac-validate loose;
}
}
unit 102 {
  description vlan1-sub2;
  demux-options {
    underlying-interface fe-0/0/0.100;
  }
  family inet {
    demux-source {
      10.1.0.0/16;
      10.2.1.0/24;
    }
    filter {
      input vlan1-sub2-in-filter;
      output vlan1-sub2-out-filter;
    }
    mac-validate loose;
  }
}
unit 202 {
  description vlan2-sub2;
  demux-options {
    underlying-interface fe-0/0/0.200;
  }
  family inet {
    demux-destination 100.1.2.0/24;
  }
}
unit 302 {
  description vlan2-sub2;
  demux-options {
    underlying-interface fe-0/0/0.300;
  }
  family inet {
    demux-source 100.1.2.0/24;
  }
}
```

# Configuring the Loopback Interface

- [Configuring the Loopback Interface on page 303](#)

## Configuring the Loopback Interface

---

- [Configuring the Loopback Interface on page 303](#)
- [Example: Configuring Two Addresses on the Loopback Interface with Host Routes on page 304](#)
- [Example: Configuring Two Addresses on the Loopback Interface with Subnetwork Routes on page 305](#)
- [Example: Configuring an IPv4 and an IPv6 Address on the Loopback Interface with Subnetwork Routes on page 305](#)

## Configuring the Loopback Interface

When specifying the loopback address, do not include a destination prefix. Also, in most cases, do not specify a loopback address on any unit other than unit 0.

**NOTE:** For Layer 3 virtual private networks (VPNs), you can configure multiple logical units for the loopback interface. This allows you to configure a logical loopback interface for each virtual routing and forwarding (VRF) routing instance. For more information, see the *Junos OS VPNs Library for Routing Devices*.

For some applications, such as SSL for Junos XML protocol, the address for the interface lo0.0 must be 127.0.0.1.

You can configure loopback interfaces using a subnetwork address for both inet and inet6 address families. Many protocols require a subnetwork address as their source address. Configuring a subnetwork loopback address as a donor interface enables these protocols to run on unnumbered interfaces.

If you configure the loopback interface, it is automatically used for unnumbered interfaces. If you do not configure the loopback interface, the router chooses the first interface to come online as the default. If you configure more than one address on the loopback interface, we recommend that you configure one to be the primary address to ensure

that it is selected for use with unnumbered interfaces. By default, the primary address is used as the source address when packets originate from the interface.

For more information about unnumbered interfaces, see [“Configuring an Unnumbered Interface” on page 200](#). For more information about primary addresses, see [“Configuring the Interface Address” on page 189](#).

On the router, you can configure one physical loopback interface, **lo0**, and one or more addresses on the interface.

1. To configure the physical loopback interface, include the following statements at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
lo0 {
  unit 0 {
    family inet {
      address loopback-address;
      address <loopback-address2>;
      ...
    }
    family inet6 {
      address loopback-address;
    }
  }
}
```

### Example: Configuring Two Addresses on the Loopback Interface with Host Routes

To configure two addresses on the loopback interface with host routes:

```
[edit]
user@host# edit interfaces lo0 unit 0 family inet
[edit interfaces lo0 unit 0 family inet]
user@host# set address 172.16.0.1
[edit interfaces lo0 unit 0 family inet]
user@host# set address 10.0.0.1
[edit interfaces lo0 unit 0 family inet]
user@host# top
[edit]
user@host# show
interfaces {
  lo0 {
    unit 0 {
      family inet {
        10.0.0.1;
        127.0.0.1;
        172.16.0.1;
      }
    }
  }
}
```

### Example: Configuring Two Addresses on the Loopback Interface with Subnetwork Routes

To configure two addresses on the loopback interface with subnetwork routes:

```
[edit]
user@host# edit interfaces lo0 unit 0 family inet
[edit interfaces lo0 unit 0 family inet]
user@host# set address 192.16.0.1/24
[edit interfaces lo0 unit 0 family inet]
user@host# set address 10.2.0.1/16
[edit interfaces lo0 unit 0 family inet]
user@host# top
[edit]
user@host# show
interfaces {
  lo0 {
    unit 0 {
      family inet {
        10.2.0.1/16;
        127.0.0.1/32;
        192.16.0.1/24;
      }
    }
  }
}
```

### Example: Configuring an IPv4 and an IPv6 Address on the Loopback Interface with Subnetwork Routes

To configure an IPv4 and an IPv6 address on the loopback interface with subnetwork routes:

```
[edit]
user@host# edit interfaces lo0 unit 0 family inet
[edit interfaces lo0 unit 0 family inet]
user@host# set address 192.16.0.1/24
[edit interfaces lo0 unit 0 family inet]
user@host# up
[edit interfaces lo0 unit 0 family]
user@host# edit interfaces lo0 unit 0 family inet6
[edit interfaces lo0 unit 0 family inet6]
user@host# set address 3ffe::1:200:f8ff:fe75:50df/64
[edit interfaces lo0 unit 0 family inet6]
user@host# top
[edit]
user@host# show
interfaces {
  lo0 {
    unit 0 {
      family inet {
        127.0.0.1/32;
        192.16.0.1/24;
      }
      family inet6 {
```

```
        3ffe::1:200:f8ff:fe75:50df/64;  
    }  
}  
}
```

## CHAPTER 9

# Serial Interfaces Overview

- [Serial Interfaces Overview on page 309](#)

### Serial Interfaces Overview

---

Devices that communicate over a serial interface are divided into two classes: data terminal equipment (DTE) and data circuit-terminating equipment (DCE). Juniper Networks Serial Physical Interface Cards (PICs) have two ports per PIC and support full-duplex data transmission. These PICs support DTE mode only. On the Serial PIC, you can configure three types of serial interfaces:

- EIA-530—An Electronics Industries Alliance (EIA) standard for the interconnection of DTE and DCE using serial binary data interchange with control information exchanged on separate control circuits.
- V.35—An ITU-T standard describing a synchronous, physical layer protocol used for communications between a network access device and a packet network. V.35 is most commonly used in the United States and in Europe.
- X.21—An ITU-T standard for serial communications over synchronous digital lines. The X.21 protocol is used primarily in Europe and Japan.

The following standards apply to serial interfaces:

- TIA/EIA Standard 530, *High-Speed 25-Position Interface for Data Terminal Equipment and Data Circuit-Terminating Equipment*, defines the signals on the cable and specifies the connector at the end of the cable.
- TIA/EIA Standard 232, *Interface between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange*, describes the physical interface and protocol for serial data communication.
- ITU-T Recommendation V.35, *Data Transmission at 48 kbit/s Using 60-108 kHz Group Band Circuits*. Note that the Juniper Networks Serial PIC supports V.35 interfaces with speeds higher than 48 kilobits per second.
- ITU-T Recommendation X.21, *Interface Between Data Terminal Equipment and Data Circuit-Terminating Equipment for Synchronous Operation on Public Data Networks*.

There are no serial interface-specific logical properties. For information about general logical properties that you can configure, see *Configuring Logical Interface Properties*. This

support on serial interfaces is the same as the existing LFI and MLPPP support on T1 and E1 interfaces.

## Example: Physical Interface Configuration Statements for Serial Interfaces

---

To configure serial physical interface properties, include the **serial-options** statement at the **[edit interfaces se- *fpc/pic/port*]** hierarchy level .

```
[edit interfaces se-fpc/pic/port]
serial-options {
  clock-rate rate;
  clocking-mode (dce | internal | loop);
  control-polarity (negative | positive);
  cts-polarity (negative | positive);
  dcd-polarity (negative | positive);
  dce-options {
    control-signal (assert | de-assert | normal);
    cts (ignore | normal | require);
    dcd (ignore | normal | require);
    dsr (ignore | normal | require);
    dtr signal-handling-option;
    ignore-all;
    indication (ignore | normal | require);
    rts (assert | de-assert | normal);
    tm (ignore | normal | require);
  }
  dsr-polarity (negative | positive);
  dte-options {
    control-signal (assert | de-assert | normal);
    cts (ignore | normal | require);
```

```
    dcd (ignore | normal | require);
    dsr (ignore | normal | require);
    dtr signal-handling-option;
    ignore-all;
    indication (ignore | normal | require);
    rts (assert | de-assert | normal);
    tm (ignore | normal | require);
}
dtr-circuit (negative | positive);
dtr-polarity (negative | positive);
encoding (nrz | nrzi);
idle-cycle-flag flag;
indication-polarity (negative | positive);
line-protocol protocol;
loopback mode;
rts-polarity (negative | positive);
tm-polarity (negative | positive);
transmit-clock invert;
}
```

---

## Configuring the Serial Line Protocol

- [Configuring the Serial Line Protocol on page 312](#)
- [Serial Interface Default Settings on page 312](#)

### Configuring the Serial Line Protocol

By default, serial interfaces use the EIA-530 line protocol. You can configure each port on the PIC independently to use one of the following line protocols:

- EIA-530
- V.35
- X.21

To configure the serial line protocol:

1. Include the **line-protocol** statement, specifying the **eia530**, **v.35**, or **x.21** option:

```
    line-protocol protocol;
```

You can include these statements at the following hierarchy levels:

- **[edit interfaces se-*pim*/0/*port* serial-options]**
- **[edit interfaces se-*fpc*/*pic*/*port* serial-options]**

For more information about serial interfaces, see the following sections:

### Serial Interface Default Settings

- [Serial Interface Default Settings on page 313](#)
- [Invalid Serial Interface Statements on page 314](#)

## Serial Interface Default Settings

- [EIA-530 Interface Default Settings on page 313](#)
- [V.35 Interface Default Settings on page 313](#)
- [X.21 Interface Default Settings on page 314](#)

### EIA-530 Interface Default Settings

If you do not include the **line-protocol** statement or if you explicitly configure the default EIA-530 line protocol, the default settings are as follows:

```
dce-options | dte-options {
  cts normal;
  dcd normal;
  dsr normal;
  dtr normal;
  rts normal;
  tm normal;
}
clock-rate 16.384mhz;
clocking-mode loop;
cts-polarity positive;
dcd-polarity positive;
dsr-polarity positive;
dtr-circuit balanced;
dtr-polarity positive;
encoding nrz;
rts-polarity positive;
tm-polarity positive;
```

**NOTE:** On M Series routers, you can set the DCE clocking mode for EIA-530 interfaces and commit. An error message is not displayed and the CLI is not blocked.

You can include the **line-protocol** statement at the following hierarchy levels:

- **[edit interfaces se-pim/0/port serial-options]**
- **[edit interfaces se-fpc/pic/port serial-options]**

### V.35 Interface Default Settings

If you include the **line-protocol v.35** statement, the default settings are as follows:

```
dce-options | dte-options {
  cts normal;
  dcd normal;
  dsr normal;
  dtr normal;
  rts normal;
}
clock-rate 16.384mhz;
clocking-mode loop;
```

```
cts-polarity positive;
dcd-polarity positive;
dsr-polarity positive;
dtr-circuit balanced;
dtr-polarity positive;
encoding nrz;
rts-polarity positive;
```

You can include the **line-protocol** statement at the following hierarchy levels:

- **[edit interfaces se-*pim*/0/*port* serial-options]**
- **[edit interfaces se-*fpc*/*pic*/*port* serial-options]**

### ***X.21 Interface Default Settings***

If you include the **line-protocol x.21** statement, the default settings are as follows:

```
dce-options | dte-options {
  control-signal normal;
  indication normal;
}
clock-rate 16.384mhz;
clocking-mode loop;
control-polarity positive;
encoding nrz;
indication-polarity positive;
```

You can include the **line-protocol** statement at the following hierarchy levels:

- **[edit interfaces se-*pim*/0/*port* serial-options]**
- **[edit interfaces se-*fpc*/*pic*/*port* serial-options]**

---

### **Invalid Serial Interface Statements**

The following sections show the invalid configuration statements for each type of serial interface. If you include the following statements in the configuration, an error message indicates the location of the error and the configuration is not activated.

- [Invalid EIA-530 Interface Statements on page 314](#)
- [Invalid V.35 interface Statements on page 315](#)
- [Invalid X.21 Interface Statements on page 315](#)

### ***Invalid EIA-530 Interface Statements***

If you do not include the **line-protocol** statement or if you explicitly configure the default EIA-530 line protocol, the following statements are invalid:

```
dce-options | dte-options {
  control-signal (assert | de-assert | normal);
  indication (ignore | normal | require);
}
control-polarity (negative | positive);
indication-polarity (negative | positive);
```

You can include the **line-protocol** statement at the following hierarchy levels:

- [edit interfaces *se-pim/0/port* serial-options]
- [edit interfaces *se-fpc/pic/port* serial-options]

### ***Invalid V.35 Interface Statements***

If you include the **line-protocol v.35** statement, the following statements are invalid:

```
dce-options | dte-options {
  control-signal (assert | de-assert | normal);
  indication (ignore | normal | require);
  tm (ignore | normal | require);
}
control-polarity (negative | positive);
indication-polarity (negative | positive);
loopback (dce-local | dce-remote);
tm-polarity (negative | positive);
```

You can include the **line-protocol** statement at the following hierarchy levels:

- [edit interfaces *se-pim/0/port* serial-options]
- [edit interfaces *se-fpc/pic/port* serial-options]

### ***Invalid X.21 Interface Statements***

If you include the **line-protocol x.21** statement, the following statements are invalid:

```
dce-options | dte-options {
  cts (ignore | normal | require);
  dcd (ignore | normal | require);
  dsr (ignore | normal | require);
  dtr (assert | de-assert | normal);
  rts (assert | de-assert | normal);
  tm (ignore | normal | require);
}
clocking-mode (dce | internal);
cts-polarity (negative | positive);
dce-polarity (negative | positive);
dsr-polarity (negative | positive);
dtr-circuit (balanced | unbalanced);
dtr-polarity (negative | positive);
loopback (dce-local | dce-remote);
rts-polarity (negative | positive);
tm-polarity (negative | positive);
```

You can include the **line-protocol** statement at the following hierarchy levels:

- [edit interfaces *se-pim/0/port* serial-options]
- [edit interfaces *se-fpc/pic/port* serial-options]

## Configuring the Serial Clocking Mode

- [Configuring the Serial Clocking Mode on page 316](#)
- [Inverting the Serial Interface Transmit Clock on page 317](#)
- [Configuring the DTE Clock Rate on page 317](#)

### Configuring the Serial Clocking Mode

By default, serial interfaces use loop clocking mode. For EIA-530 and V.35 interfaces, you can configure each port on the PIC independently to use loop, DCE, or internal clocking mode. For X.21 interfaces, only loop clocking mode is supported.

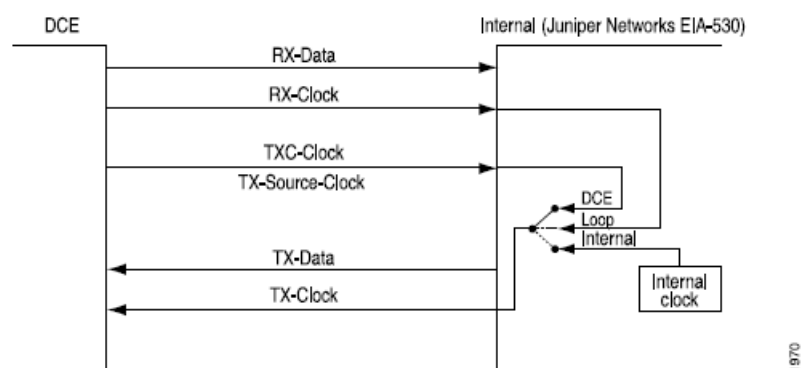

The three clocking modes work as follows:

- Loop clocking mode—Uses the DCE's RX clock to clock data from the DCE to the DTE.
- DCE clocking mode—Uses the TXC clock, which is generated by the DCE specifically to be used by the DTE as the DTE's transmit clock.
- Internal clocking mode—Also known as line timing, uses an internally generated clock. You can configure the speed of this clock by including the **clock-rate** statement at the **[edit interfaces se-pim/0/port serial-options]** or **[edit interfaces se-fpc/pic/port dte-options]** hierarchy levels. For more information about the DTE clock rate, see [“Configuring the DTE Clock Rate” on page 317](#).

Note that DCE clocking mode and loop clocking mode use external clocks generated by the DCE.

[Figure 22 on page 316](#) shows the clock sources of loop, DCE, and internal clocking modes.

Figure 22: Serial Interface Clocking Mode

To configure the clocking mode of a serial interface, include the **clocking-mode** statement:

```
clocking-mode (dce | internal | loop);
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces se-pim/0/port serial-options]**

- [edit interfaces *se-fpc/pic/port* serial-options]

## Inverting the Serial Interface Transmit Clock

When an externally timed clocking mode (DCE or loop) is used, long cables might introduce a phase shift of the DTE-transmitted clock and data. At high speeds, this phase shift might cause errors. Inverting the transmit clock corrects the phase shift, thereby reducing error rates.

By default, the transmit clock is not inverted. To invert the transmit clock, include the **transmit-clock invert** statement:

```
transmit-clock invert;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *se-pim/0/port* serial-options]
- [edit interfaces *se-fpc/pic/port* serial-options]

## Configuring the DTE Clock Rate

By default, the serial interface has a clock rate of 16.384 MHz. For EIA-530 and V.35 interfaces with internal clocking mode configured, you can configure the clock rate.

To configure the clock rate, include the **clock-rate** statement:

```
clock-rate rate;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *se-pim/0/port* serial-options]
- [edit interfaces *se-fpc/pic/port* serial-options]

You can configure the following interface speeds:

- 2.048 MHz
- 2.341 MHz
- 2.731 MHz
- 3.277 MHz
- 4.096 MHz
- 5.461 MHz
- 8.192 MHz
- 16.384 MHz

Although the serial interface is intended for use at the default rate of 16.384 MHz, you might need to use a slower rate if any of the following conditions prevail:

- The interconnecting cable is too long for effective operation.
- The interconnecting cable is exposed to an extraneous noise source that might cause an unwanted voltage in excess of +1 volt measured differentially between the signal conductor and circuit common at the load end of the cable, with a 50-ohm resistor substituted for the generator.
- You need to minimize interference with other signals.
- You need to invert signals.

For detailed information about the relationship between signaling rate and interface cable distance, see the following standards:

- EIA-422-A, *Electrical Characteristics of Balanced Voltage Digital Interface Circuits*
- EIA-423-A, *Electrical Characteristics of Unbalanced Voltage Digital Interface Circuits*

#### Related Documentation

- [Serial Interfaces Overview on page 309](#)

## Configuring the Serial Signal Handling

By default, normal signal handling is enabled for all signals. For each signal, the **normal** option applies to the normal signal handling for that signal, as defined by the following standards:

- TIA/EIA Standard 530
- ITU-T Recommendation V.35
- ITU-T Recommendation X.21

[Table 44 on page 318](#) shows the serial interface modes that support each signal type.

**Table 44: Signal Handling by Serial Interface Type**

| Signal                    | Serial Interfaces |
|---------------------------|-------------------|
| <b>From-DCE signals</b>   |                   |
| Clear to send (CTS)       | EIA-530 and V.35  |
| Data carrier detect (DCD) | EIA-530 and V.35  |
| Data set ready (DSR)      | EIA-530 and V.35  |
| Indication                | X.21 only         |
| Test mode (TM)            | EIA-530 only      |
| <b>To-DCE signals</b>     |                   |
| Control signal            | X.21 only         |

Table 44: Signal Handling by Serial Interface Type (*continued*)

| Signal                    | Serial Interfaces |
|---------------------------|-------------------|
| Data transfer ready (DTR) | EIA-530 and V.35  |
| Request to send (RTS)     | EIA-530 and V.35  |

You configure serial interface signal characteristics by including the **dce-options** or **dte-options** statement:

```
dce-options | dte-options {
  control-signal (assert | de-assert | normal);
  cts (ignore | normal | require);
  dcd (ignore | normal | require);
  dsr (ignore | normal | require);
  dtr signal-handling-option;
  ignore-all;
  indication (ignore | normal | require);
  rts (assert | de-assert | normal);
  tm (ignore | normal | require);
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *se-pim/0/port* serial-options]
- [edit interfaces *se-fpc/pic/port* serial-options]

For EIA-530 and V.35 interfaces, configure to-DCE signals by including the **dtr** and **rts** statements, specifying the **assert**, **de-assert**, or **normal** option:

```
dtr (assert | de-assert | normal);
rts (assert | de-assert | normal);
```

For X.21 interfaces, configure to-DCE signals by including the **control-signal** statement, specifying the **assert**, **de-assert**, or **normal** option:

```
control-signal (assert | de-assert | normal);
```

*Assertion* is when the positive side of a given signal is at potential high-level output voltage (Voh), while the negative side of the same signal is at potential low-level output voltage (Vol). *Deassertion* is when the positive side of a given signal is at potential Vol, while the negative side of the same signal is at potential Voh.

For the DTR signal, you can configure normal signal handling using the signal for automatic resynchronization by including the **dtr** statement, and specifying the **auto-synchronize** option:

```
dtr {
  auto-synchronize {
    duration milliseconds;
    interval seconds;
  }
}
```

The pulse duration of resynchronization can be from 1 through 1000 milliseconds. The offset interval for resynchronization can be from 1 through 31 seconds.

For EIA-530 and V.35 interfaces, configure from-DCE signals by including the **cts**, **dcd**, and **dsr** statements, specifying the **ignore**, **normal**, or **require** option:

```
cts (ignore | normal | require);  
dcd (ignore | normal | require);  
dsr (ignore | normal | require);
```

For X.21 interfaces, configure from-DCE signals by including the **indication** statement, specifying the **ignore**, **normal**, or **require** option:

```
indication (ignore | normal | require);
```

For EIA-530 interfaces only, you can configure from-DCE test-mode (TM) signaling by including the **tm** statement, specifying the **ignore**, **normal**, or **require** option:

```
tm (ignore | normal | require);
```

To specify that the from-DCE signal must be asserted, include the **require** option in the configuration. To specify that the from-DCE signal must be ignored, include the **ignore** option in the configuration.

**NOTE:** For V.35 and X.21 interfaces, you cannot include the **tm** statement in the configuration.

For X.21 interfaces, you cannot include the **cts**, **dcd**, **dsr**, **dtr**, and **rts** statements in the configuration.

For EIA-530 and V.35 interfaces, you cannot include the **control-signal** and **indication** statements in the configuration.

For a complete list of serial options statements that are not supported by each serial interface mode, see [“Invalid Serial Interface Statements” on page 314](#).

---

To return to the default normal signal handling, delete the **require**, **ignore**, **assert**, **de-assert**, or **auto-synchronize** statement from the configuration, as shown in the following example:

```
[edit]  
user@host# delete interfaces se-fpc/pic/port dte-options control-leads cts require
```

To explicitly configure normal signal handling, include the **control-signal** statement with the **normal** option:

```
control-signal normal;
```

You can configure the serial interface to ignore all control leads by including the **ignore-all** statement:

```
ignore-all;
```

You can include the **ignore-all** statement in the configuration only if you do not explicitly enable other signal handling options at the **[edit interfaces se-pim/0/port serial-options dce-options]** or **[edit interfaces se-fpc/pic/port serial-options dte-options]** hierarchy levels.

You can include the **control-signal**, **cts**, **dcd**, **dsr**, **dtr**, **indication**, **rts**, and **tm** statements at the following hierarchy levels:

- **[edit interfaces se-pim/0/port serial-options dte-options]**
- **[edit interfaces se-fpc/pic/port serial-options dte-options]**

## Configuring the Serial DTR Circuit

A balanced circuit has two currents that are equal in magnitude and opposite in phase. An unbalanced circuit has one current and a ground; if a pair of terminals is unbalanced, one side is connected to electrical ground and the other carries the signal. By default, the DTR circuit is balanced.

For EIA-530 and V.35 interfaces, configure the DTR circuit by including the **dtr-circuit** statement:

```
dtr-circuit (balanced | unbalanced);
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces se-pim/0/port serial-options]**
- **[edit interfaces se-fpc/pic/port serial-options]**

## Configuring Serial Signal Polarities

Serial interfaces use a differential protocol signaling technique. Of the two serial signals associated with a circuit, the one referred to as the A signal is denoted with a plus sign, and the one referred to as the B signal is denoted with a minus sign; for example, DTR+ and DTR-. If DTR is low, then DTR+ is negative with respect to DTR-. If DTR is high, then DTR+ is positive with respect to DTR-.

By default, all signal polarities are positive. You can reverse this polarity on a Juniper Networks serial interface. You might need to do this if signals are miswired as a result of reversed polarities.

For EIA-530 and V.35 interfaces, configure signal polarities by including the **cts-polarity**, **dcd-polarity**, **dsr-polarity**, **dtr-polarity**, **rts-polarity**, and **tm-polarity** statements:

```
cts-polarity (negative | positive);
dcd-polarity (negative | positive);
dsr-polarity (negative | positive);
dtr-polarity (negative | positive);
rts-polarity (negative | positive);
tm-polarity (negative | positive);
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *se-pim/0/port* serial-options]
- [edit interfaces *se-fpc/pic/port* serial-options]

For X.21 interfaces, configure signal polarities by including the **control-polarity** and **indication-polarity** statements:

**control-polarity** (negative | positive);  
**indication-polarity** (negative | positive);

You can include these statements at the following hierarchy levels:

- [edit interfaces *se-pim/0/port* serial-options]
- [edit interfaces *se-fpc/pic/port* serial-options]

## Configuring Serial Loopback Capability

From the router, remote line interface unit (LIU) loopback loops the TX (transmit) data and TX clock back to the router as RX (receive) data and RX clock. From the line, LIU loopback loops the RX data and RX clock back out the line as TX data and TX clock, as shown in [Figure 23 on page 322](#).

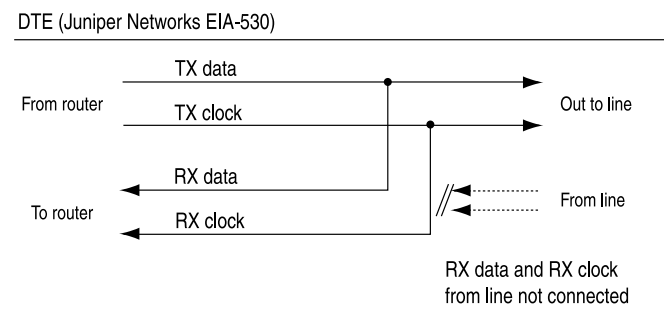

**Figure 23: Serial Interface LIU Loopback**

1972

DCE local and DCE remote control the EIA-530 interface-specific signals for enabling local and remote loopback on the link partner DCE. Local loopback is shown in [Figure 24 on page 322](#).

**Figure 24: Serial Interface Local Loopback**

1971

For EIA-530 interfaces, you can configure DCE local, DCE remote, local, and remote (LIU) loopback capability.

For V.35, you can configure remote LIU and local loopback capability. DCE local and DCE remote loopbacks are not supported on V.35 and X.21 interfaces. Local and remote loopbacks are not supported on X.21 interfaces.

To configure the loopback capability on a serial interface, include the **loopback** statement, specifying the **dce-local**, **dce-remote**, **local**, or **remote** option:

**loopback mode;**

You can include this statement at the following hierarchy levels:

- **[edit interfaces se-pim/0/port serial-options]**
- **[edit interfaces se-fpc/pic/port serial-options]**

To disable the loopback capability, remove the **loopback** statement from the configuration:

```
[edit]
user@host# delete interfaces se-fpc/pic/port serial-options loopback
```

You can determine whether there is an internal or external problem by checking the error counters in the output of the **show interface se-fpc/pic/port extensive** command:

```
user@host> show interfaces se-fpc/pic/port extensive
```

To Configure Serial Loopback Capability:

1. To determine the source of a problem, loop the packets on the local router, the local DCE, the remote DCE, and the remote line interface unit (LIU).
2. To do this, include the **no-keepalives** and **encapsulation cisco-hdlc** statements at the **[edit interfaces se-fpc/pic/port]** hierarchy level, and the **loopback local** option at the **[edit interfaces se-pim/0/port serial-options]** or **[edit interfaces se-fpc/pic/port serial-options]** hierarchy level. With this configuration, the link stays up, so you can loop ping packets to a remote router. The **loopback local** statement causes the interface to loop within the PIC just before the data reaches the transceiver.

```
[edit interfaces]
se-1/0/0 {
  no-keepalives;
  encapsulation cisco-hdlc;
  serial-options {
    loopback local;
  }
  unit 0 {
    family inet {
      address 10.100.100.1/24;
    }
  }
}
```

**Related Documentation** [Serial Interfaces Overview on page 309](#)

## Configuring Serial Line Encoding

---

By default, serial interfaces use non-return to zero (NRZ) line encoding. You can configure non-return to zero inverted (NRZI) line encoding if necessary.

To have the interface use NRZI line encoding, include the **encoding** statement, specifying the **nrzi** option:

```
encoding nrzi;
```

To explicitly configure the default NRZ line encoding, include the **encoding** statement, specifying the **nrz** option:

```
encoding nrz;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces se-pim/0/port serial-options]**
- **[edit interfaces se-fpc/pic/port serial-options]**

When setting the line encoding parameter, you must set the same value for paired ports. Ports 0 and 1 must share the same value.

## Specifying a USB Modem Interface on J Series Routers

---

The J Series routers contain two USB ports controlled by a single USB controller. One USB port can support USB devices, while the other one can act as a USB modem.

The USB modem provides a dial-in remote management interface, and supports dialer interface features by sharing the same dial pool as a dialer interface. The dial pool allows the logical dialer interface (**dln**) and the physical interface (**umd0**) to be bound together dynamically on a per-call basis.

The following dialer interface features are supported by the USB modem interface:

- Encapsulation PPP
- CoS
- NAT
- Interface statistics
- Packet capture
- GRE tunnel
- Stateful firewall
- Traffic sampling

To configure a USB modem interface, include the following statements at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
```

```

umd0 {
  dialer-options {
    pool pool-name <priority priority>;
  }
  modem-options {
    dialin (console | routable);
    init-command-string initialization-command-string;
  }
}

```

The pool name specified at the **[edit interfaces umd0 dialer-options pool]** hierarchy level must be the same as the pool name specified at the **[edit interfaces dl*n* unit logical-unit-number dialer-options pool]** hierarchy level.

Configure the USB modem to operate as a dial-in WAN backup interface by including the **dialin** statement and specifying the **routable** option. If the USB modem is to be used as a dial-in console, specify the **console** option in the **dialin** statement.

When the Services Router applies the modem AT commands configured in the **init-command-string** statement or the default sequence of initialization commands to the modem, it compares them to the initialization commands already configured on the modem and makes the following changes:

- If the commands are the same, the router overrides the existing modem values that do not match. For example, if the initialization commands on the modem include S0=0 and the router's **init-command-string** configuration includes S0=2, the Services Router applies S0=2.
- If the initialization commands on the modem do not include a command in the router's **init-command-string** statement configuration, the router adds it. For example, if the **init-command-string** statement includes the command L2, but the modem commands do not include it, the router adds L2 to the initialization commands configured on the modem.

Include the following statements at the **[edit interfaces dl*n*]** hierarchy level to support a minimum configuration for a dialer interface connected to a USB modem:

```

[edit interfaces dln]
encapsulation ppp;
unit logical-unit-number;
dialer-options {
  dial-string dial-string-numbers;
  pool pool-name <priority priority>;
}
ppp-options {
  chap;
  access-profile name;
  local-name name;
  passive;
}
family inet {
  mtu bytes;
  address address {
    destination address;
  }
}

```

```
}  
}
```

For more information about configuring dial-in, see *Configuring ISDN Logical Interface Properties*.

## PART 4

# Monitoring and Troubleshooting Interfaces

- [Monitoring Interfaces on page 329](#)
- [Troubleshooting Interfaces on page 335](#)

# Monitoring Interfaces

- [Tracing Interface Operations Overview on page 329](#)
- [Tracing Operations of an Individual Router Interface on page 329](#)
- [Tracing Operations of the Interface Process on page 330](#)
- [Monitoring a PPP Session on page 331](#)
- [Tracing Operations of the pppd Process on page 332](#)

## Tracing Interface Operations Overview

---

You can trace the operations of individual router interfaces and those of the interface process (dcd). For a general discussion of tracing and of the precedence of multiple tracing operations, see the *Junos OS Administration Library*.

For information about the operations of Virtual Router Resolution Protocol (VRRP)-enabled interfaces, see the *Junos OS High Availability Library for Routing Devices*.

**Related  
Documentation**

- [Tracing Operations of an Individual Router Interface on page 329](#)
- [Tracing Operations of the Interface Process on page 330](#)

## Tracing Operations of an Individual Router Interface

---

To trace the operations of individual router interfaces, perform the following steps:

1. In configuration mode, go to the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit]
user@host# edit interfaces interface-name
```

2. Configure the **traceoptions** option.

```
[edit interfaces interface-name]
user@host# edit traceoptions
```

3. Configure the tracing flag.

```
[edit interfaces interface-name traceoptions]
user@host# set flag flag-option
```

You can specify the following interface tracing flags:

- **all**—Trace all interface operations.
- **event**—Trace all interface events.
- **ipc**—Trace all interface interprocess communication (IPC) messages.
- **media**—Trace all interface media changes.

The interfaces **traceoptions** statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system **syslog** files.

For more information about trace operations, see [“Tracing Operations of the Interface Process” on page 330](#).

## Tracing Operations of the Interface Process

---

To trace the operations of the router or switch interface process, dcd, perform the following steps:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level:

```
[edit]
user@host# edit interfaces
```

2. Configure the **traceoptions** statement.

```
[edit interfaces]
user@host# edit traceoptions
```

3. Configure the **no-remote-trace** option to disable remote tracing.

```
[edit interfaces traceoptions]
user@host# set no-remote-trace
```

4. Configure the **file filename** option.

```
[edit interfaces traceoptions]
user@host# edit file
```

5. Configure the **files number** option, **match regular-expression** option, **size size** option, and **world-readable | no-world-readable** option.

```
[edit interfaces traceoptions file]
user@host# set files number
user@host# set match regular-expression
user@host# set size size
user@host# set word-readable | no-world-readable
```

6. Configure the tracing flag.

```
[edit interfaces traceoptions]
user@host# set flag flag-option
```

7. Configure the **disable** option in **flag *flag-option*** statement to disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

```
[edit interfaces traceoptions]
user@host# set flag flag-option disable
```

You can specify the following flags in the **interfaces traceoptions** statement:

- **all**—Enable all configuration logging.
- **change-events**—Log changes that produce configuration events.
- **gres-events**—Log the events related to GRES.
- **resource-usage**—Log the resource usage for different states.
- **config-states**—Log the configuration state machine changes.
- **kernel**—Log configuration IPC messages to kernel.
- **kernel-detail**—Log details of configuration messages to kernel.
- **select-events**—Log the events on select state machine.

By default, interface process operations are placed in the file named `dcd` and three 1-MB files of tracing information are maintained.

For general information about tracing, see the tracing and logging information in the *Junos OS Administration Library*.

## Monitoring a PPP Session

You can monitor PPP packet exchanges. When monitoring is enabled, packets exchanged during a session are logged by default to `/var/log/pppd`, or to the file specified in the **traceoptions** statement.

To monitor a PPP session:

1. In configuration mode, go to the **[edit protocols ppp]** hierarchy level.

```
[edit ]
user@host# edit protocols ppp
```

2. Include the **monitor-session** statement.

```
[edit protocols ppp]
user@host# monitor-session (interface-name | all);
```

When monitoring is configured, the operational mode commands **show ppp summary** and **show ppp interface** display a **Monitored** flag in the **Session flags** column or line.

## Tracing Operations of the pppd Process

---

You can trace the operations of the router's pppd process.

To trace the router's pppd process:

1. In configuration mode, go to the **[edit protocols ppp]** hierarchy level.

```
[edit ]
user@host# edit protocols ppp
```

2. Include the **traceoptions** statement.

```
[edit protocols ppp]
traceoptions {
  file filename <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  level severity-level;
  no-remote-trace;
}
```

- To specify more than one tracing operation, include multiple **flag** statements.

You can specify the following flags in the **traceoptions** statement:

- **access**—Trace access code
- **address-pool**—Trace address pool code
- **all**—Trace all areas of code
- **auth**—Trace authentication code
- **chap**—Trace challenge handshake authentication protocol code
- **ci**—Trace CI code
- **config**—Trace configuration code
- **ifdb**—Trace interface database code
- **lcp**—Trace LCP state machine code
- **memory**—Trace memory management code
- **message**—Trace message processing code

- **mlppp**—Trace multilink point-to-point protocol code
- **ncp**—Trace NCP state machine code
- **pap**—Trace password authentication protocol code
- **ppp**—Trace PPP protocol processing code
- **radius**—Trace RADIUS processing code
- **redundancy**—Trace redundancy code
- **rtsock**—Trace routing socket code
- **session**—Trace session management code
- **signal**—Trace signal handling code
- **timer**—Trace timer code
- **ui**—Trace user interface code

### Configuring Loopback Testing

Loopback testing allows you to verify the connectivity of a circuit. You can configure any of the following interfaces to execute a loopback test: aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, E1, E3, NxDSO, serial, SONET/SDH, T1, and T3.

The physical path of a network data circuit usually consists of segments interconnected by devices that repeat and regenerate the transmission signal. The transmit path on one device connects to the receive path on the next device. If a circuit fault occurs in the form of a line break or a signal corruption, you can isolate the problem by using a loopback test. Loopback tests allow you to isolate segments of the circuit and test them separately.

To do this, configure a *line loopback* on one of the routers. Instead of transmitting the signal toward the far-end device, the line loopback sends the signal back to the originating router. If the originating router receives back its own Data Link Layer packets, you have verified that the problem is beyond the originating router. Next, configure a line loopback farther away from the local router. If this originating router does not receive its own Data Link Layer packets, you can assume that the problem is on one of the segments between the local router and the remote router's interface card. In this case, the next troubleshooting step is to configure a line loopback closer to the local router to find the source of the problem.

The following types of loopback testing are supported by Junos OS:

- DCE local—Loops packets back on the local data circuit-terminating equipment (DCE).
- DCE remote—Loops packets back on the remote DCE.
- Local—Useful for troubleshooting physical PIC errors. Configuring local loopback on an interface allows transmission of packets to the channel service unit (CSU) and then to the circuit toward the far-end device. The interface receives its own transmission, which includes data and timing information, on the local router's PIC. The data received from the CSU is ignored. To test a local loopback, issue the **show interfaces *interface-name*** command. If PPP keepalives transmitted on the interface are received by the PIC, the **Device Flags** field contains the output **Loop-Detected**.
- Payload—Useful for troubleshooting the physical circuit problems between the local router and the remote router. A payload loopback loops data only (without clocking information) on the remote router's PIC. With payload loopback, overhead is recalculated.
- Remote—Useful for troubleshooting the physical circuit problems between the local router and the remote router. A remote loopback loops packets, including both data and timing information, back on the remote router's interface card. A router at one end of the circuit initiates a remote loopback toward its remote partner. When you configure a remote loopback, the packets received from the physical circuit and CSU are received by the interface. Those packets are then retransmitted by the PIC back toward the CSU and the circuit. This loopback tests all the intermediate transmission segments.

Table 45 on page 336 shows the loopback modes supported on the various interface types.

**Table 45: Loopback Modes by Interface Type**

| Interface                                            | Loopback Modes   | Usage Guidelines                                                                                                                                                                                                                                                     |

Table 45: Loopback Modes by Interface Type (*continued*)

| Interface        | Loopback Modes                           | Usage Guidelines                                                                                                                                    |
|------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Serial (EIA-530) | DCE local, DCE remote, local, and remote | <a href="#">"Configuring Serial Loopback Capability" on page 322</a>                                                                                |
| SONET/SDH        | Local and remote                         | <i>Configuring SONET/SDH Loopback Capability to Identify a Problem as Internal or External</i>                                                      |
| T1 and T3        | Local, payload, and remote               | <i>Configuring T1 Loopback Capability and Configuring T3 Loopback Capability</i><br><br><i>See also Configuring the T1 Remote Loopback Response</i> |

To configure loopback testing, include the **loopback** statement:

```
user@host# loopback mode;
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* [aggregated-ether-options](#)]
- [edit interfaces *interface-name* [ds0-options](#)]
- [edit interfaces *interface-name* [e1-options](#)]
- [edit interfaces *interface-name* [e3-options](#)]
- [edit interfaces *interface-name* [fastether-options](#)]
- [edit interfaces *interface-name* [gigether-options](#)]
- [edit interfaces *interface-name* [serial-options](#)]
- [edit interfaces *interface-name* [sonet-options](#)]
- [edit interfaces *interface-name* [t1-options](#)]
- [edit interfaces *interface-name* [t3-options](#)]

## Configuring BERT Testing

To configure BERT:

- Configure the duration of the test.

```
[edit interfaces interface-name interface-type-options]
user@host# bert-period seconds;
```

You can configure the BERT period to last from 1 through 239 seconds on some PICs and from 1 through 240 seconds on other PICs. By default, the BERT period is 10 seconds.

- Configure the error rate to monitor when the inbound pattern is received.

```
[edit interfaces interface-name interface-type-options]
user@host# bert-error-rate rate;
```

*rate* is the bit error rate. This can be an integer from 0 through 7, which corresponds to a bit error rate from  $10^{-0}$  (1 error per bit) to  $10^{-7}$  (1 error per 10 million bits).

- Configure the bit pattern to send on the transmit path.

```
[edit interfaces interface-name interface-type-options]
user@host# bert-algorithm algorithm;
```

*algorithm* is the pattern to send in the bit stream. For a list of supported algorithms, enter a ? after the **bert-algorithm** statement; for example:

```
[edit interfaces t1-0/0/0 t1-options]
user@host# set bert-algorithm ?
Possible completions:
pseudo-2e11-o152      Pattern is 2^11 -1 (per 0.152 standard)
pseudo-2e15-o151      Pattern is 2^15 - 1 (per 0.152 standard)
pseudo-2e20-o151      Pattern is 2^20 - 1 (per 0.151 standard)
pseudo-2e20-o153      Pattern is 2^20 - 1 (per 0.153 standard)
...
```

For specific hierarchy information, see the individual interface types.

**NOTE:** The four-port E1 PIC supports only the following algorithms:

```
pseudo-2e11-o152      Pattern is 2^11 -1 (per 0.152 standard)
pseudo-2e15-o151      Pattern is 2^15 - 1 (per 0.151 standard)
pseudo-2e20-o151      Pattern is 2^20 - 1 (per 0.151 standard)
pseudo-2e23-o151      Pattern is 2^23 (per 0.151 standard)
```

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.

**NOTE:** The 12-port T1/E1 Circuit Emulation (CE) PIC supports only the following algorithms:

```
all-ones-repeating    Repeating one bits
all-zeros-repeating    Repeating zero bits
alternating-double-ones-zeros Alternating pairs of ones and zeros
alternating-ones-zeros Alternating ones and zeros
pseudo-2e11-o152      Pattern is 2^11 -1 (per 0.152 standard)
pseudo-2e15-o151      Pattern is 2^15 - 1 (per 0.151 standard)
pseudo-2e20-o151      Pattern is 2^20 - 1 (per 0.151 standard)
pseudo-2e7             Pattern is 2^7 - 1
pseudo-2e9-o153        Pattern is 2^9 - 1 (per 0.153 standard)
repeating-1-in-4        1 bit in 4 is set
repeating-1-in-8        1 bit in 8 is set
repeating-3-in-24       3 bits in 24 are set
```

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.

**NOTE:** The IQE PICs support only the following algorithms:

```

all-ones-repeating    Repeating one bits
all-zeros-repeating   Repeating zero bits
alternating-double-ones-zeros Alternating pairs of ones and zeros
alternating-ones-zeros Alternating ones and zeros
pseudo-2e9-o153      Pattern is 2^9 -1 (per 0.153 (511 type) standard)
pseudo-2e11-o152     Pattern is 2^11 -1 (per 0.152 and 0.153 (2047 type)
standards)
pseudo-2e15-o151     Pattern is 2^15 -1 (per 0.151 standard)
pseudo-2e20-o151     Pattern is 2^20 -1 (per 0.151 standard)
pseudo-2e20-o153     Pattern is 2^20 -1 (per 0.153 standard)
pseudo-2e23-o151     Pattern is 2^23 -1 (per 0.151 standard)
repeating-1-in-4      1 bit in 4 is set
repeating-1-in-8      1 bit in 8 is set
repeating-3-in-24     3 bits in 24 are set

```

When you issue the help command from the CLI, all BERT algorithm options are displayed, regardless of the PIC type, and no commit check is available. Unsupported patterns for a PIC type can be viewed in system log messages.

**NOTE:** BERT is supported on the PDH interfaces of the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP and the DS3/E3 MIC. The following BERT algorithms are supported:

```

all-ones-repeating    Repeating one bits
all-zeros-repeating   Repeating zero bits
alternating-double-ones-zeros Alternating pairs of ones and zeros
alternating-ones-zeros Alternating ones and zeros
repeating-1-in-4      1 bit in 4 is set
repeating-1-in-8      1 bit in 8 is set
repeating-3-in-24     3 bits in 24 are set
pseudo-2e9-o153      Pattern is 2^9 - 1 (per 0.153 standard)
pseudo-2e11-o152     Pattern is 2^11 - 1 (per 0.152 standard)
pseudo-2e15-o151     Pattern is 2^15 - 1 (per 0.151 standard)
pseudo-2e20-o151     Pattern is 2^20 - 1 (per 0.151 standard)
pseudo-2e20-o153     Pattern is 2^20 - 1 (per 0.153 standard)
pseudo-2e23-o151     Pattern is 2^23 (per 0.151 standard)

```

Table 46 on page 339 shows the BERT capabilities for various interface types.

**Table 46: BERT Capabilities by Interface Type**

| Interface                                              | T1 BERT          | T3 BERT | Comments                                                             |
|--------------------------------------------------------|------------------|---------|----------------------------------------------------------------------|

|------------------------------------|--------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E1 or T1                           | Yes (port 0–3)     | Yes (port 0–3)              | <ul style="list-style-type: none"> <li>Single port at a time</li> <li>Limited algorithms</li> </ul>                                                                           |
| E3 or T3                           | Yes (port 0–3)     | Yes (port 0–3)              | <ul style="list-style-type: none"> <li>Single port at a time</li> </ul>                                                                                                       |
| Channelized OC12                   | —                  | Yes (channel 0–11)          | <ul style="list-style-type: none"> <li>Single channel at a time</li> <li>Limited algorithms</li> <li>No bit count</li> </ul>                                                  |
| Channelized STM1                   | Yes (channel 0–62) | —                           | <ul style="list-style-type: none"> <li>Multiple channels</li> <li>Only one algorithm</li> <li>No error insert</li> <li>No bit count</li> </ul>                                |
| Channelized T3 and Multichannel T3 | Yes (channel 0–27) | Yes (port 0–3 on channel 0) | <ul style="list-style-type: none"> <li>Multiple ports and channels</li> <li>Limited algorithms for T1</li> <li>No error insert for T1</li> <li>No bit count for T1</li> </ul> |

These limitations do not apply to channelized IQ interfaces. For information about BERT capabilities on channelized IQ interfaces, see *Channelized IQ and IQE Interfaces Properties*.

## Starting and Stopping a BERT Test

Before you can start the BERT test, you must disable the interface. To do this, include the **disable** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]
  disable;
```

After you configure the BERT properties and commit the configuration, begin the test by issuing the **test interface *interface-name interface-type-bert-start*** operational mode command:

```
user@host> test interface interface-name interface-type-bert-start
```

The test runs for the duration you specify with the **bert-period** statement. If you want to terminate the test sooner, issue the **test interface *interface-name interface-type-bert-stop*** command:

```
user@host> test interface interface-name interface-type-bert-stop
```

For example:

```
user@host> test interface t3-1/2/0 t3-bert-start
user@host> test interface t3-1/2/0 t3-bert-stop
```

To view the results of the BERT test, issue the **show interfaces extensive | find BERT** command:

```
user@host> show interfaces interface-name extensive | find BERT
```

For more information about running and evaluating the results of the BERT procedure, see the [CLI Explorer](#).

**NOTE:** To exchange BERT patterns between a local router and a remote router, include the `loopback remote` statement in the interface configuration at the remote end of the link. From the local router, issue the `test interface` command.

## Troubleshooting: em0 Management Interface Link is Down

**Problem** **Description:** **Ethernet Link Down** alarm is raised when you run the `show chassis alarm` operational mode command on a T640 router, a T1600 router, T4000 router, or a TX Matrix Plus router.

**Diagnosis** Perform the following tests to check if the em0 management interface is down on the master Routing Engine or the backup Routing Engine:

1. Run the `show chassis alarms` command.

### show chassis alarms

```
user@host0> show chassis alarms
1 alarms currently active
Alarm time Class Description
2011-10-19 11:13:02 MYT Major Host 1 em0 : Ethernet Link Down
```

Is the alarm **Ethernet Link Down** displayed against the em0 interface of the master Routing Engine (Host 0)?

- Yes: Contact JTAC for further assistance.
- No: Continue to the next diagnostic test.

2. Run the `show interfaces em0` and the `show interfaces em0 terse` operational mode commands.

### show interfaces em0

```
user@host> show interfaces em0
Physical interface: em0, Enabled, Physical link is Up
Interface index: 1, SNMP ifIndex: 1
Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
Device flags : Present Running
Interface flags: SNMP-Traps
...
```

### show interfaces em0 terse

```
user@host> show interfaces em0 terse
Interface Admin Link Proto Local Remote
em0 up up
em0.0 up up inet 10.100.100.1/30
```

Is the em0 interface on the master Routing Engine **up**?

- Yes: Continue to resolution.
- No: Contact JTAC for further assistance

#### Resolution *To Resolve This Issue*

From the aforementioned diagnosis, we ascertain that the chassis alarm has been raised for the em0 management interface in the backup Routing Engine (Host 1) and not for the master Routing Engine (Host 0).

Implement one of the following solutions on the backup Routing Engine to resolve this issue:

- Disable the em0 interface in the backup Routing Engine:
  1. In configuration mode, go to the **[edit groups re1]** hierarchy level.

```
user@host1# edit groups re1
```
  2. Disable the em0 interface.

```
[edit groups re1]
user@host1# set interfaces em0 disable
```
- Ignore the alarm:
  1. In configuration mode, go to the **[edit chassis]** hierarchy level.

```
user@host1# edit chassis
```
  2. Ignore the **Ethernet link down** alarm on the management interface by setting the **management-ethernet link-down** alarm option to **ignore**.

```
[edit chassis]
user@host1# set alarm management-ethernet link-down ignore
```

- Related Documentation**
- [Supported Routing Engines by Router on page 14](#)
  - *show chassis alarms*

## Troubleshooting: fxp0 Management Interface Link is Down

**Problem** **Description:** **Ethernet Link Down** alarm is raised when you run the **show chassis alarm** operational mode command on an M Series router, an MX Series router, a T320 router, a T640 router, a T1600 router, or on a TX Matrix router.

**Diagnosis** Perform the following tests to check if the fxp0 interface is down on the master Routing Engine or the backup Routing Engine:

1. Run the **show chassis alarms** command.

### show chassis alarms

```
user@host0> show chassis alarms
1 alarms currently active
Alarm time Class Description
2011-10-19 11:13:02 MYT Major Host 1 fxp0 : Ethernet Link Down
```

Is the alarm **Ethernet Link Down** displayed against the fxp0 interface of the master Routing Engine (Host 0)?

- Yes: Contact JTAC for further assistance.
- No: Continue to the next diagnostic test.

2. Run the **show interfaces fxp0** and the **show interfaces fxp0 terse** operational mode commands.

### show interfaces fxp0

```
user@host> show interfaces fxp0
Physical interface: fxp0, Enabled, Physical link is Up
Interface index: 1, SNMP ifIndex: 1
Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
Device flags : Present Running
Interface flags: SNMP-Traps
...
```

### show interfaces fxp0 terse

```
user@host> show interfaces fxp0 terse
Interface Admin Link Proto Local Remote
fxp0 up up
fxp0.0 up up inet 10.100.100.1/30
```

Is the fxp0 interface on the master Routing Engine **up**?

- Yes: Continue to resolution.

- No: Contact JTAC for further assistance

**Resolution**    *To Resolve This Issue*

From the diagnosis, we ascertain that the chassis alarm has been raised for the fxp0 management interface in the backup Routing Engine (Host 1) and not for the master Routing Engine (Host 0).

Implement one of the following solutions on the backup Routing Engine to avoid this issue:

- Disable the fxp0 interface in the backup Routing Engine:
  1. In configuration mode, go to the **[edit groups re1]** hierarchy level.  
`user@host1# edit groups re1`
  2. Disable the fxp0 interface.  
`[edit groups re1]  
user@host1# set interfaces fxp0 disable`
- Ignore the alarm:
  1. In configuration mode, go to the **[edit chassis]** hierarchy level.  
`user@host1# edit chassis`
  2. Ignore the **Ethernet link down** alarm on the management interface by setting the **management-ethernet link-down** alarm option to **ignore**.  
`[edit chassis]  
user@host1# set alarm management-ethernet link-down ignore`

## Troubleshooting: Faulty Ethernet Physical Interface on an M Series, an MX Series, or a T Series Router

---

You can follow the basic troubleshooting checklist as explained in the following topics from one through five to troubleshoot an Ethernet physical interface on an M Series, MX Series, or a T Series router.

1. [Checking the Cable Connection on page 345](#)
2. [Checking the Physical Link Status of the Interface on page 346](#)
3. [Checking the Interface Statistics in Detail on page 347](#)

4. [Performing the Loopback Diagnostic Test on page 349](#)
5. [Checking Other Possibilities on page 351](#)
6. [To Enable a Physical Interface on page 352](#)

## Checking the Cable Connection

**Problem**    **Description:** Packets are not received or transmitted over the Ethernet physical interface.

- Diagnosis**
1. Is the correct cable connected to the correct port?
    - Yes: Continue to [“Checking the Physical Link Status of the Interface” on page 346](#).
    - No: See [“Resolving Cabling Issue” on page 345](#).

**Resolution**    ***Resolving Cabling Issue***

Perform one or more of the following steps to resolve the cabling issue:

1. Connect the cable properly on the local and remote ends without any loose connections.
2. Swap the Ethernet cable for a known good cable if the existing cable is damaged.
3. Connect a single-mode fiber cable to a single-mode interface only and a multimode fiber cable to a multimode interface only. To check fiber optic cable integrity, see [“Checking Fiber Optic Cable Integrity” on page 345](#).
4. Connect the correct small form-factor pluggable transceiver (SFP) on both sides of the cable.

***Checking Fiber Optic Cable Integrity***

To check the integrity of fiber optic cable with an external cable diagnostic testing tool:

**NOTE:** A single-mode fiber cable must be connected to a single-mode interface and a multi-mode fiber cable must be connected to a multi-mode interface.

1. Measure the received light level at the receiver ( $R_x$ ) port to see whether the received light level is within the receiver specification of the Ethernet interface.

2. Measure transmitted light level at the transmitter ( $T_x$ ) port to see whether the transmitted light level is within the transmitter specification of the Ethernet interface.

## Checking the Physical Link Status of the Interface

**Problem**    **Description:** Unable to transmit and receive packets on the Ethernet interface even though the cable connection is correct.

**Solution**    To display the physical link status of the interface, run the **show interface *interface-name* media** operational mode command. For example, on the ge-5/0/1 interface.

```
user@host> show interfaces ge-5/0/1 media
Physical interface: ge-5/0/1, Enabled, Physical link is Up
  Interface index: 317, SNMP ifIndex: 1602
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, BPDU Error: None,
  MAC-REWRITE Error: None, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online, Speed-negotiation: Disabled,
  Auto-MDIX: Enabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  Link flags     : None
  CoS queues     : 8 supported, 8 maximum usable queues
  Current address: 2c:6b:f5:4c:26:73, Hardware address: 2c:6b:f5:4c:26:73
  Last flapped   : 2012-11-30 01:25:37 UTC (03:46:55 ago)
  Input rate     : 880 bps (1 pps)
  Output rate    : 312 bps (0 pps)
  Active alarms  : None
  Active defects : None
  MAC statistics:
    Input bytes: 901296, Input packets: 9799, Output bytes: 976587, Output packets:
10451
  Filter statistics:
    Filtered packets: 68, Padded packets: 0, Output packet errors: 0
  Autonegotiation information:
    Negotiation status: Complete
    Link partner:
      Link mode: Full-duplex, Flow control: Symmetric/Asymmetric, Remote fault:
OK
    Local resolution:
      Flow control: Symmetric, Remote fault: Link OK
  Interface transmit statistics: Disabled
```

For information about **show interfaces *interface-name* media**, see [show interfaces \(Gigabit Ethernet\)](#).

---

**Diagnosis**    1. Are there any connectivity problems such as input errors and packet loss even though the **Enabled** field displays **Physical link is Up** status and the **Active alarms** and **Active defect** field displays **None**?

- Yes: Go to [“Checking the Interface Statistics in Detail” on page 347](#).

- No: Continue to the next diagnostic test.
2. Does the **Enabled** field display **Physical link is Down** status and the **Active alarms and Active defect** field display **Link**?
- Yes: The interface is either not connected correctly or is not receiving a valid signal. Go to [“Resolving Cabling Issue” on page 345](#).
  - No: Continue.

## Checking the Interface Statistics in Detail

**Problem**    **Description:** The physical interface is not working even though the **Enabled** field displays **Physical link is Up** status and the **Active alarms and Active defect** field displays **None**.

**Solution**    To display the interface statistics in detail, run the **show interface *interface-name* extensive** operational command. For example, on ge-5/0/1 interface.

```
user@host> show interfaces ge-5/0/1 extensive
Physical interface: ge-5/0/1, Enabled, Physical link is Up
  Interface index: 317, SNMP ifIndex: 1602, Generation: 322
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, BPDU Error: None,
  MAC-REWRITE Error: None, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online, Speed-negotiation: Disabled,
  Auto-MDIX: Enabled
  Device flags       : Present Running
  Interface flags:   SNMP-Traps Internal: 0x4000
  Link flags         : None
  CoS queues         : 8 supported, 8 maximum usable queues
  Hold-times         : Up 0 ms, Down 0 ms
  Current address:   2c:6b:f5:4c:26:73, Hardware address: 2c:6b:f5:4c:26:73
  Last flapped      : 2012-11-30 01:25:37 UTC (04:38:32 ago)

```

For information about **show interfaces *interface-name* detail**, see [show interfaces \(Gigabit Ethernet\)](#).

- Diagnosis**
1. Does the **Policed discards**, **L2 channel errors**, **Input DA rejects**, or the **Input SA rejects** field display any errors?

For information about the errors, see [show interfaces \(Gigabit Ethernet\)](#).

- Yes: Resolve the errors as needed. Resolving these errors is beyond the scope of this topic.
- No: Continue with “Performing the Loopback Diagnostic Test” on page 349.

## Performing the Loopback Diagnostic Test

**Problem**    **Description:** The interface cable is connected correctly and there are no alarms or errors associated with the Ethernet physical interface yet the interface is not working.

**Solution**    To check whether the Ethernet port or PIC is faulty, you must perform the internal loopback test and hardware loopback test.

To perform a internal loopback diagnostic test on an Ethernet interface, for example on ge-5/0/1 interface:

1. In configuration mode, go to the **[edit interfaces ge-5/0/1]** hierarchy level.

```

[edit]
user@host# edit interface ge-5/0/1

```

2. Set the **gigether-options** option as loopback, commit the configuration and quit configuration mode.

```

[edit interfaces ge-5/0/1]
user@host# set gigether-options loopback
user@host# commit
user@host# quit

```

3. In operational mode, execute the **show interfaces ge-5/0/1 media** command.

```

user@host> show interfaces ge-5/0/1 media
Physical interface: ge-5/0/1, Enabled, Physical link is Up
Interface index: 317, SNMP ifIndex: 1602

```

```

Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, BPDU Error: None,
MAC-REWRITE Error: None, Loopback: Enabled,
Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
Remote fault: Online, Speed-negotiation: Disabled,
Auto-MDIX: Enabled
Device flags : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
Link flags : None
CoS queues : 8 supported, 8 maximum usable queues
Current address: 2c:6b:f5:4c:26:73, Hardware address: 2c:6b:f5:4c:26:73
Last flapped : 2012-11-30 01:25:37 UTC (03:46:55 ago)
Input rate : 880 bps (1 pps)
Output rate : 312 bps (0 pps)
Active alarms : None
Active defects : None
MAC statistics:
Input bytes: 901296, Input packets: 9799, Output bytes: 976587, Output
packets: 10451
Filter statistics:
Filtered packets: 68, Padded packets: 0, Output packet errors: 0
Autonegotiation information:
Negotiation status: Complete
Link partner:
Link mode: Full-duplex, Flow control: Symmetric/Asymmetric, Remote
fault: OK
Local resolution:
Flow control: Symmetric, Remote fault: Link OK
Interface transmit statistics: Disabled

```

**NOTE:** Delete the loopback statement after completing your diagnosis.

Execute one of the following steps for a hardware loopback diagnostic test as needed:

- For an Ethernet PIC with a fiber optic interface—Physically loop the  $T_x$  and  $R_x$  port and check the status of the physical link with the **show interfaces *interface-name* media** operational mode command.
- For an Ethernet PIC with an RJ-45 Ethernet interface—Build a loopback plug by crossing pin 1 ( $T_x +$ ) to pin 3 ( $R_x +$ ) together and pin 2 ( $T_x -$ ) and pin 6 ( $R_x -$ ) together and check the status of the physical link with the **show interfaces *interface-name* media** operational mode command.

**NOTE:** For information about loopback testing, see *Performing Loopback Testing for Fast Ethernet and Gigabit Ethernet Interfaces*.

- Diagnosis**
1. Does the **Enabled** field display **Physical link is Up** status and the **Active alarms and Active defect** field display **None** when you perform the loopback test?

- Yes: Go to the [“Checking Other Possibilities” on page 351](#) section.
  - No: Continue to the next diagnostic test.
2. When the Ethernet interface is connected to a remote Ethernet device over multiple patch panels, check to see whether the connection can be looped back at the different patch panels so you can conduct a loopback diagnostic test. Is the loopback diagnostic test successful?
- Yes: Go to the [“Checking Other Possibilities” on page 351](#) section.
  - No: Contact JTAC for further assistance.

## Checking Other Possibilities

**Problem**    **Description:** Loopback diagnostic test is successful but unable to transmit and receive packets on the Ethernet interface.

**Solution**    Use the following commands as needed to troubleshoot an Ethernet interface, for example, an ge-5/0/1 interface:

- Run the **show interfaces *interface-name* terse** operational command to check if the physical interface and logical interfaces are administratively disabled. For example, on ge-5/0/1 interface.

```
user@host> show interfaces ge-5/0/1 terse
```

| Interface  | Admin | Link | Proto | Local       | Remote |
|------------|-------|------|-------|-------------|--------|
| ge-5/0/1   | up    | up   |       |             |        |
| ge-5/0/1.0 | up    | up   | inet  | 20.1.1.2/24 |        |

- Diagnosis**
1. Does the physical interface and its corresponding logical interfaces display **down** in the output of the **show interfaces *interface-name* terse** operational mode command?
    - Yes: Enable the interfaces as shown in [“To Enable a Physical Interface” on page 352](#).
    - No: Continue to the next diagnostic test.
  2. Are the **speed**, **duplex**, and **auto-negotiation** fields in the output of **show interfaces *interface-name* extensive** operational mode command correctly set for the interface?

**NOTE:** Check if the associated Flexible PIC Concentrator (FPC), Modular Port Concentrator (MPC), or Dense Port Concentrator (DPC) and its Modular Interface Card (MIC) or PIC with its 10-gigabit small form-factor pluggable transceiver (XFP) or SFP supports speed and auto-negotiation settings.

- Yes: Check *Monitoring Fast Ethernet and Gigabit Ethernet Interfaces* for more troubleshooting tips.
- No: Contact JTAC for further assistance.

## To Enable a Physical Interface

To enable a physical interface:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level.

```
[edit]  
user@host# edit interfaces
```

2. Check if the interface is administratively disabled by executing the **show** command on the interface. For example on ge-5/0/1 interface.

```
user@host# show ge-5/0/1
```

```
disable;
```

3. Enable the interface and commit.

```
[edit interfaces  
user@host# delete interface-name disable  
user@host# commit
```

| <b>Description</b>              | Specify the type of VLAN Ethernet packet accepted by an interface that is associated with a VLAN dynamic profile or stacked VLAN dynamic profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>any</b>—Any packet type. Specifies that any incoming packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes. This option is used when configuring wholesaling in a Layer 2 network.</p> <p><b>dhcp-v4</b>—IPv4 DHCP packet type. Specifies that incoming IPv4 DHCP discover packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes</p> <p>.....</p> <p> <b>NOTE:</b> The DHCP-specific <b>mac-address</b> and <b>option-82</b> options are rejected if the <b>accept</b> statement is not set to <b>dhcp-v4</b>.</p> <p>.....</p> <p><b>dhcp-v6</b>—IPv6 DHCP packet type. Specifies that incoming IPv6 DHCP discover packets trigger the dynamic creation of a VLAN with properties determined by the auto-configure interface configuration stanza and associated profile attributes.</p> <p><b>inet</b>—IPv4 Ethernet and ARP packet type.</p> <p><b>inet6</b>—IPv6 Ethernet packet type.</p> <p><b>pppoe</b>—Point-to-Point Protocol over Ethernet packet type.</p> <p>.....</p> <p> <b>NOTE:</b> The <b>pppoe</b> VLAN Ethernet packet type option is supported only for MPC/MIC interfaces.</p> <p>.....</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## accept-source-mac

---

**Syntax**

```
accept-source-mac {  
    mac-address mac-address {  
        policer {  
            input cos-policer-name;  
            output cos-policer-name;  
        }  
    }  
}
```

[edit logical-systems *logical-system-name* interfaces *interface-name* **unit** *logical-unit-number*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.  
Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description** For Gigabit Ethernet intelligent queuing (IQ) interfaces only, accept traffic from and to the specified remote media access control (MAC) address.

The **accept-source-mac** statement is equivalent to the **source-address-filter** statement, which is valid for aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only. To allow the interface to receive packets from specific MAC addresses, include the **accept-source-mac** statement.

On untagged Gigabit Ethernet interfaces, you should not configure the **source-address-filter** statement and the **accept-source-mac** statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the **source-address-filter** statement and the **accept-source-mac** statement with an identical MAC address specified in both filters.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** The **policer** statement is not supported on PTX Series Packet Transport Routers.

---

**NOTE:** On QFX platforms, if you configure source MAC addresses for an interface using the *static-mac* or *persistent-learning* statements and later configure a different MAC address for the same interface using the **accept-source-mac** statement, the MAC addresses that you previously configured for the interface remain in the ethernet-switching table and can still be used to send packets to the interface.

## action-profile (Defining for CFM)

---

**Syntax**    `action-profile profile-name {`  
              `event {`  
                  `ais-trigger-condition {`  
                      `adjacency-loss;`  
                      `all-defects;`  
                      `cross-connect-ccm;`  
                      `erroneous-ccm;`  
                      `receive-ais;`  
                  `}`  
                  `interface-status-tlv (down | lower-layer-down);`  
                  `port-status-tlv blocked;`  
                  `rdi;`  
              `}`  
              `action {`  
                  `interface-down;`  
                  `log-and-generate-ais {`  
                      `interval(1m | 1s);`  
                      `level value;`  
                      `priority value;`  
                  `}`  
              `}`  
              `default-actions {`  
                  `interface-down;`  
              `}`  
          `}`

**Hierarchy Level**    [edit protocols oam ethernet [connectivity-fault-management](#)]

**Release Information**    Statement introduced in Junos OS Release 8.4.

**Description**    Configure a name and default action for an action profile.

**Options**    *profile-name*—Name of the action profile.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

## action-profile (Defining for LFM)

**Syntax**

```

action-profile profile-name {
  action {
    link-down;
    send-critical-event;
    syslog;
  }
  event {
    link-adjacency-loss;
    link-event-rate {
      frame-error count;
      frame-period count;
      frame-period-summary count;
      symbol-period count;
    }
    protocol-down;
  }
}

```

**Hierarchy Level** [edit protocols [oam](#) [ethernet](#) [link-fault-management](#)]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Configure a name, one or more actions, and the events that trigger the action for an action profile.

**Options** *profile-name*—Name of the action profile.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

```

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family *family*],

[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the interface address.

**Options** *address*—Address of the interface.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, and the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/8;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/8;
      }
    }
  }
}
```

For more information on configuring the same address on multiple interfaces, see [“Configuring the Interface Address” on page 189](#).

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## advertise-interval

**Syntax** `advertise-interval milliseconds;`

**Hierarchy Level** [edit interfaces *interface-name* sonet-options [aps](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Modify the Automatic Protection Switching (APS) interval at which the protect and working routers send packets to their neighbors to advertise that they are operational. A router considers its neighbor to be operational for a period, called the hold time, that is, by default, three times the advertisement interval.

**Options** *milliseconds*—Interval between advertisement packets.  
**Range:** 1 through 65,534 milliseconds  
**Default:** 1000 milliseconds

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Specify the action taken by the interface for the specified agent circuit identifier/agent remote identifier (ACI/ARI) pair when the interface receives a PPPoE Active Discovery Initiation (PADI) control packet that includes the vendor-specific tag with ACI/ARI pair information. You can configure an ACI/ARI pair for a named service, <b>empty</b> service, or <b>any</b> service in a PPPoE service name table. A maximum of 8000 ACI/ARI pairs are supported per PPPoE service name table. You can distribute the ACI/ARI pairs in any combination among the named, <b>empty</b>, and <b>any</b> service entries in the service name table.</p> <p>You can use an asterisk (*) as a wildcard character to match ACI/ARI pairs, the ACI alone, or the ARI alone. The asterisk can be placed only at the beginning, the end, or both the beginning and end of the identifier string. You can also specify an asterisk alone for either the ACI or the ARI. You cannot specify only an asterisk for both the ACI and the ARI. When you specify a single asterisk as the identifier, that identifier is ignored in the PADI packet.</p> <p>For example, suppose you care about matching only the ACI and do not care what value the ARI has in the PADI packet, or even whether the packet contains an ARI value. In this case you can set the <b>remote-id-string</b> to a single asterisk. Then the interface ignores the ARI received in the packet and the interface takes action based only on matching the specified ACI.</p> |
| <b>Default</b>             | The default action is terminate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## aggregate (Gigabit Ethernet CoS Policer)

---

**Syntax**

```
aggregate {  
    bandwidth-limit bps;  
    burst-size-limit bytes;  
}
```

**Hierarchy Level** [edit interfaces *interface-name* gigether-options [ethernet-switch-profile](#)  
[ethernet-policer-profile](#) [policer](#) *cos-policer-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Define a policer to apply to nonpremium traffic.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## aggregate (Hierarchical Policer)

---

**Syntax**    aggregate {  
              if-exceeding {  
                  bandwidth-limit *bandwidth*;  
                  burst-size-limit *burst*;  
              }  
              then {  
                  discard;  
              }  
          }

**Hierarchy Level**    [edit firewall [hierarchical-policer](#)]

**Release Information**    Statement introduced in Junos OS Release 9.5.

**Description**    On M40e, M120, and M320 (with FFPC and SFPC) edge routers and T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs, T4000 routers with Type 5 FPC and Enhanced Scaling Type 4 FPC, configure an aggregate hierarchical policer.

**Options**    Options are described separately.

**Required Privilege Level**    firewall—To view this statement in the configuration.  
                                  firewall-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure a textual description of a physical interface or the logical unit of an interface to be the alias of an interface name. The alias name can be a single line of text. If the text contains spaces, enclose it in quotation marks. If you configure an alias name, the alias name is displayed instead of the interface name in the output of all <b>show</b> , <b>show interfaces</b> , and other operational mode commands. In Junos OS Release 12.3R8 and later, display of the alias can be suppressed in favor of the actual interface name by using the <b>display no-interface-alias</b> parameter along with the show command. |
| <b>Options</b>                  | <b><i>alias-name</i></b> —Text to denote an easily identifiable, meaningful alias name for the interface. If the text includes spaces, enclose the entire text in quotation marks.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>              | <p>For a generic routing encapsulation (GRE) tunnel, enable fragmentation of GRE-encapsulated packets whose size exceeds the maximum transmission unit (MTU) value of a link that the packet passes through. The don't-fragment (DF) bit is not set in the outer IP header of GRE-encapsulated packets.</p> <p>To enable the reassembly of fragmented GRE-encapsulated packets on GRE tunnel interfaces at the endpoint of the GRE tunnel, include the <i>reassemble-packets</i> statement for the interface.</p> |
| <b>Default</b>                  | If you do not include the <b>allow-fragmentation</b> statement, fragmentation of GRE-encapsulated packets is disabled.                                                                                                                                                                                                                                                                                                                                                                                            |

## aps

---

**Syntax**    `aps {  
          advertise-interval milliseconds;  
          annex-b  
          authentication-key key;  
          (break-before-make | no-break-before-make);  
          fast-aps-switch;  
          force;  
          hold-time milliseconds;  
          lockout;  
          neighbor address;  
          paired-group group-name;  
          preserve-interface;  
          protect-circuit group-name;  
          request;  
          revert-time seconds;  
          switching-mode (bidirectional | unidirectional);  
          working-circuit group-name;  
          }`

**Hierarchy Level**    [edit interfaces *interface-name* **sonet-options**]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Configure Automatic Protection Switching (APS) on the router.

For DS3 channels on a channelized OC12 interface, configure APS on channel 0 only. If you configure APS on channels 1 through 11, it is ignored.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**

## arp (Interfaces)

**Syntax** `arp ip-address (mac | multicast-mac) mac-address publish;`

**Hierarchy Level** `[edit interfaces interface-name unit logical-unit-number family inet address address],  
[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number  
family inet address address]`

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries, mapping IP addresses to MAC addresses.

**NOTE:** By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the family inet statement. By including the arp statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet policer] hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the unnumbered-address statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] hierarchy level.

**Options** *ip-address*—IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing **address** statement.

*mac mac-address*—MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, 0000.5e00.5355 or 00:00:5e:00:53:55.

*multicast-mac mac-address*—Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, 0000.5e00.5355 or 00:00:5e:00:53:55.

**publish**—(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.

**NOTE:** For unicast MAC addresses only, if you include the **publish** option, the router or switch replies to proxy ARP requests.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

---

## asynchronous-notification

---

**Syntax** (asynchronous-notification | no-asynchronous-notification);

**Hierarchy Level** [edit interfaces *ge-fpc/pic/port* **gigether-options** ]

**Release Information** Statement introduced in Junos OS Release 8.3.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description** (MX Series routers, T Series routers) For all Gigabit Ethernet interfaces (1-Gigabit, 10-Gigabit, and 100-Gigabit), configure support for notification of link down alarm generation and transfer.

(M120 and M320 routers) For all 10-Gigabit Ethernet PIC interfaces, configure support for notification of link down alarm generation and transfer.

- **asynchronous-notification**—Support notification of link down alarm generation and transfer.
- **no-asynchronous-notification**—Prohibit notification of link down alarm generation and transfer.

**Default** Support for notification of link down alarm generation and transfer is not enabled.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## authenticator

---

**Syntax**     authenticator {  
                 authentication-profile-name *access-profile-name*;  
                 **interface** *interface-id* {  
                     maximum-requests *integer*;  
                     quiet-period *seconds*;  
                     reauthentication (disable | interval *seconds*);  
                     retries *integer*;  
                     server-timeout *seconds*;  
                     supplicant (*single*);  
                     supplicant-timeout *seconds*;  
                     transmit-period *seconds*;  
                 }  
               }

**Hierarchy Level**     [edit protocols dot1x]

**Release Information**     Statement introduced in Junos OS Release 9.3.

**Description**     Specify an authentication profile for user or client authentication and configure the Ethernet interface for 802.1x protocol operation.

**Options**     **authentication-profile-name** *access-profile-name*—Specifies the RADIUS authentication profile for user or client authentication.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**     protocols—To view this statement in the configuration.  
                                 protocols-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> ether-options],<br>[edit interfaces <i>interface-name</i> <b>gigether-options</b> ],<br>[edit interfaces <i>ge-pim</i> /0/0 <b>switch-options</b> <b>switch-port</b> <i>port-number</i> ] |
| <b>Release Information</b> | Statement introduced in Junos OS Release 7.6.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.                  |

**Description** For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series switches, explicitly enable autonegotiation only.

- **auto-negotiation**—Enables autonegotiation. This is the default.
- **no-auto-negotiation**—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed.

When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.

**NOTE:** On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:

1. Delete the **no-auto-negotiation** statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set **no-auto-negotiation**, and commit the configuration.

On EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

**NOTE:** On T4000 routers, the **auto-negotiation** command is ignored for interfaces other than Gigabit Ethernet.

|                                 |                                                                                                                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.                                                                                                                         |
| <b>Options</b>                  | <b>remote-fault (local-interface-online   local-interface-offline)</b> —(Optional) For M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers only, manually configure remote fault on an interface.<br><b>Default:</b> local-interface-online |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                          |

## bandwidth (Interfaces)

---

|                            |                                                                                                                                                                                                                |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>bandwidth rate;</code>                                                                                                                                                                                   |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                      |
| <b>Description</b>         | Configure the bandwidth value for an interface. This statement is valid for all logical interface types except multilink and aggregated interfaces.                                                            |

**NOTE:** We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the **bandwidth** statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

$$\text{cost} = \text{reference-bandwidth} / \text{bandwidth},$$

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the **bandwidth** statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b>                  | <b>rate</b> —Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation <b>c</b> ; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.<br><b>Range:</b> Not limited. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers.</p>                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | Configure the pattern to send in the bit stream during a bit error rate test (BERT). Applies to T1, E3, T3, and multichannel DS3 interfaces, the channelized interfaces (DS3, OC12, STM1), and channelized IQ and IQE interfaces (E1, E3 and DS3).                                                                                                                                                                                                                     |

**NOTE:** When configuring CE1 or CT1 interfaces on 10-port Channelized E1/T1 IQE PICs, the `bert-algorithm` statement must be included at the `[edit interfaces ce1-fpc/pic/port]` or `[edit interfaces ct1-fpc/pic/port]` hierarchy level as appropriate.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b> | <p><b><i>algorithm</i></b>—Pattern to send in the bit stream. There are two categories of test patterns: pseudorandom and repetitive. Both patterns conform to CCITT/ITU O.151, O.152, O.153, and O.161 standards. The algorithm can be one of the following patterns:</p> <ul style="list-style-type: none"> <li>• <b>all-ones-repeating</b>—Pattern is all ones.</li> <li>• <b>all-zeros-repeating</b>—Pattern is all zeros.</li> <li>• <b>alternating-double-ones-zeros</b>—Pattern is alternating pairs of ones and zeros.</li> <li>• <b>alternating-ones-zeros</b>—Pattern is alternating ones and zeros.</li> <li>• <b>pseudo-2e3</b>—Pattern is <math>2^3 - 1</math>.</li> <li>• <b>pseudo-2e4</b>—Pattern is <math>2^4 - 1</math>.</li> <li>• <b>pseudo-2e5</b>—Pattern is <math>2^5 - 1</math>.</li> <li>• <b>pseudo-2e6</b>—Pattern is <math>2^6 - 1</math>.</li> <li>• <b>pseudo-2e7</b>—Pattern is <math>2^7 - 1</math>.</li> <li>• <b>pseudo-2e9-o153</b>—Pattern is <math>2^9 - 1</math>, as defined in the O153 standard.</li> <li>• <b>pseudo-2e10</b>—Pattern is <math>2^{10} - 1</math>.</li> </ul> |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- **pseudo-2e11-o152**—Pattern is  $2^{11} - 1$ , as defined in the O152 standard.
- **pseudo-2e15-o151**—Pattern is  $2^{15} - 1$ , as defined in the O151 standard.
- **pseudo-2e17**—Pattern is  $2^{17} - 1$ .
- **pseudo-2e18**—Pattern is  $2^{18} - 1$ .
- **pseudo-2e20-o151**—Pattern is  $2^{20} - 1$ , as defined in the O151 standard.
- **pseudo-2e20-o153**—Pattern is  $2^{20} - 1$ , as defined in the O153 standard.
- **pseudo-2e21**—Pattern is  $2^{21} - 1$ .
- **pseudo-2e22**—Pattern is  $2^{22} - 1$ .
- **pseudo-2e23-o151**—Pattern is  $2^{23} - 1$ , as defined in the O151 standard.
- **pseudo-2e25**—Pattern is  $2^{25} - 1$ .
- **pseudo-2e28**—Pattern is  $2^{28} - 1$ .
- **pseudo-2e29**—Pattern is  $2^{29} - 1$ .
- **pseudo-2e31**—Pattern is  $2^{31} - 1$ .
- **pseudo-2e32**—Pattern is  $2^{32} - 1$ .
- **repeating-1-in-4**—One bit in four is set to 1; the others are set to 0.
- **repeating-1-in-8**—One bit in eight is set to 1; the others are set to 0.
- **repeating-3-in-24**—Three bits in twenty four are set to 1; the others are set to 0.

**Default:** pseudo-2e3

| <b>Description</b>                                                                                                                                                                  | Set the broadcast address on the network or subnet. On a subnet you cannot specify a host address of 0 (0.0.0.0), nor can you specify a broadcast address (255.255.255.255). For example, in the statement <b>set interface ge-0/0/0 unit 0 family inet address 10.1.1.0/24</b> , the subnet address 10.1.1.0 has the host address of 0. Hence, you cannot configure this address. Similarly, for the subnet, you cannot use the broadcast address 10.1.1.255/24. |
| <b>Default</b>                                                                                                                                                                      | The default broadcast address has a host portion of all ones.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                                                                                                                                                                      | <b>address</b> —Broadcast address. The address must have a host portion of either all ones or all zeros. You cannot specify the addresses 0.0.0.0 or 255.255.255.255.                                                                                                                                                                                                                                                                                             |

| <b>Description</b>              | <p>On J Series Services Routers with interfaces configured for ISDN with callback, specify the amount of time the dialer waits before calling back the caller. The default wait time is 5 seconds. The wait time is necessary because, when a call is rejected, the switch waits for up to 4 seconds on point-to-multipoint connections to ensure no other device accepts the call before sending the DISCONNECT message to the originator of the call. However, the default time of 5 seconds may not be sufficient for different switches or may not be needed on point-to-point connections.</p> <p>To configure callback mode, include the <b>callback</b> statement at the <code>[edit interfaces <i>dl</i>n unit <i>logical-unit-number</i> <b>dialer-options</b>]</code> hierarchy level.</p> <p>If the <b>callback</b> statement is configured, you cannot use the <b>caller <i>caller-id</i></b> statement at the <code>[edit interfaces <i>dl</i>n unit <i>logical-unit-number</i> <b>dialer-options</b>]</code> hierarchy level.</p> |
| <b>Options</b>                  | <b><i>time</i></b> —Time the dialer waits before calling back the caller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | On J Series Services Routers with interfaces configured for ISDN, specify the dialer to accept a specified caller number or accept all incoming calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>caller-id</b>—Incoming caller number. You can configure multiple caller IDs on a dialer. The caller ID of the incoming call is matched against all caller IDs configured on all dialers. The dialer matching the caller ID is looked at for further processing. Only a precise match is a valid match. For example, the configured caller ID 1-222-333-4444 or 222-333-4444 will match the incoming caller ID 1-222-333-4444.</p> <p>If the incoming caller ID has fewer digits than the number configured, it is not a valid match. Duplicate caller IDs are not allowed on different dialers; however, for example, the numbers 1-408-532-1091, 408-532-1091, and 532-1091 can still be configured on different dialers.</p> <p>Only one B-channel can map to one dialer. If one dialer is already mapped, any other call mapping to the same dialer is rejected (except in the case of a multilink dialer). If no dialer caller is configured on a dialer, that dialer will not accept any calls.</p> <p><b>accept-all</b>—Any incoming call in an associated interface is accepted.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | For T3 interfaces only, enable or disable C-bit parity mode, which controls the type of framing that is present on the transmitted T3 signal. When C-bit parity mode is enabled, the C-bit positions are used for the far-end block error (FEBE), far-end alarm and control (FEAC), terminal data link, path parity, and mode indicator bits, as defined in ANSI T1.107a-1989. For ATM and ATM2 IQ2 and IQ2-E interfaces, M23 framing is used when the <b>no-cbit-parity</b> statement is included. For all other interfaces, M13 framing is used when the <b>no-cbit-parity</b> statement is included. |
| <b>Default</b>                  | C-bit parity mode is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | For ATM encapsulation only, define a constant bit rate bandwidth utilization in the traffic-shaping profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | Unspecified bit rate (UBR); that is, bandwidth utilization is unlimited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>rate</b>—Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation <b>c</b>; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.</p> <p>For ATM1 and ATM2 OC3 interfaces, the maximum available rate is 100 percent of <i>line-rate</i>, or 135,600,000 bps. For ATM1 OC12 interfaces, the maximum available rate is 50 percent of <i>line-rate</i>, or 271,263,396 bps. For ATM2 IQ interfaces, the maximum available rate is 542,526,792 bps.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Allow each side of a link to challenge its peer, using a “secret” known only to the authenticator and that peer. The secret is not sent over the link.</p> <p>By default, PPP CHAP is disabled. If CHAP is not explicitly enabled, the interface makes no CHAP challenges and denies all incoming CHAP challenges.</p> <p>For ATM2 IQ interfaces only, you can configure CHAP on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:</p> <ul style="list-style-type: none"> <li>• <b>atm-ppp-llc</b>—PPP over AAL5 LLC encapsulation.</li> <li>• <b>atm-ppp-vc-mux</b>—PPP over AAL5 multiplex encapsulation.</li> </ul> |
|                                 | <p> <b>BEST PRACTICE:</b> On inline service (si) interfaces for L2TP, only the <b>chap</b> statement itself is typically used for subscriber management. We recommend that you leave the subordinate statements at their default values.</p>                                                                                                                                                                                                                                                                                                                                                                       |
|                                 | <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>         | For interfaces with PPP encapsulation on which the PPP Challenge Handshake Authentication Protocol (CHAP) is configured, configure the shared secret (the CHAP secret key associated with a peer), as defined in RFC 1994. |

**NOTE:** This statement is not supported for L2TP LNS on MX Series routers.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br><b>interface</b> option added in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers. |
| <b>Description</b>         | For interfaces that can use various clock sources, configure the source of the transmit clock on each interface.                                                                                          |

**NOTE:** On Channelized SONET/SDH PICs, if you set the parent (or the master) controller clock to **external**, then you must set the child controller clocks to the default value—that is, **internal**.

For example, on the Channelized STM1 PIC, if the clock on the Channelized STM1 interface (which is the master controller) is set to **external**, then you must not configure the CE1 interface (which is the child controller) clock to **external**. Instead you must configure the CE1 interface clock to **internal**.

| <b>Description</b>         | Define a community or extended community for use in a routing policy match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b><i>name</i></b>—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b><i>invert-match</i></b>—Invert the results of the community expression matching. The <b>community</b> match condition defines a regular expression and if it matches the community attribute of the received prefix, Junos OS returns a TRUE result. If not, Junos OS returns a FALSE result. The <b><i>invert-match</i></b> statement makes Junos OS behave to the contrary. If there is a match, Junos OS returns a FALSE result. If there is no match, Junos OS returns a TRUE result.</p> <p><b><i>members community-ids</i></b>—One or more community members. If you specify more than one member, you must enclose all members in brackets.</p> <p>The format for <b><i>community-ids</i></b> is:</p> <p><b><i>as-number:community-value</i></b></p> <p>Starting in Junos OS Release 15.1, you can apply a wildcard member <b><i>segmented-nh.*:0</i></b> to apply the BGP policy to all the S-PMSI A-D routes carrying extended community information.</p> <p><b><i>as-number</i></b> is the AS number and can be a value in the range from 0 through 65,535.<br/> <b><i>community-value</i></b> is the community identifier and can be a number in the range from 0 through 65,535.</p> <p>You also can specify <b><i>community-ids</i></b> for communities as one of the following well-known community names, which are defined in RFC 1997, <i>BGP Communities Attribute</i>:</p> <ul style="list-style-type: none"> <li>• <b><i>no-export</i></b>—Routes containing this community name are not advertised outside a BGP confederation boundary.</li> </ul> |

- **no-advertise**—Routes containing this community name are not advertised to other BGP peers.
- **no-export-subconfed**—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.

You can explicitly exclude BGP community information with a static route using the **none** option. Include **none** when configuring an individual route in the **route** portion of the **static** statement to override a **community** option specified in the **defaults** portion of the statement.

The format for extended **community-ids** is the following:

*type:administrator:assigned-number*

**type** is the type of extended community and can be either a **bandwidth**, **target**, **origin**, **domain-id**, **src-as**, or **rt-import** community or a 16-bit number that identifies a specific BGP extended community. The **target** community identifies the destination to which the route is going. The **origin** community identifies where the route originated. The **domain-id** community identifies the OSPF domain from which the route originated. The **src-as** community identifies the autonomous system from which the route originated. The **rt-import** community identifies the route to install in the routing table.

**NOTE:** For **src-as**, you can specify only an AS number and not an IP address. For **rt-import**, you can specify only an IP address and not an AS number.

---

**administrator** is the administrator. It is either an AS number or an IPv4 address prefix, depending on the type of extended community.

**assigned-number** identifies the local provider.

The format for linking a bandwidth with an AS number is:

*bandwidth:as-number:bandwidth*

**as-number** specifies the AS number and **bandwidth** specifies the bandwidth in bytes per second.

**NOTE:** In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295. To configure a target or origin extended community that includes a 4-byte AS number in the plain-number format, append the letter “L” to the end of number. For example, a target community with the 4-byte AS number 334,324 and an assigned number of 132 is represented as `target:334324L:132`.

In Junos OS Release 9.2 and later, you can also use AS-dot notation when defining a 4-byte AS number for the target and origin extended communities. Specify two integers joined by a period: *16-bit high-order value in decimal.16-bit low-order value in decimal*. For example, the 4-byte AS number represented in plain-number format as 65546 is represented in AS-dot notation as 1.10.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Hierarchy Level** [edit protocols [oam](#) [ethernet](#)]

**Release Information** Statement introduced in Junos OS Release 8.4.

**Description** For Ethernet interfaces on M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M120, M320, MX Series, and T Series routers, specify connectivity fault management for IEEE 802.1ag Operation, Administration, and Management (OAM) support. In Junos OS Release 9.3 and later, this statement is also supported on aggregated Ethernet interfaces.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

---

## container-devices

---

**Syntax** container-devices {  
device-count *number*;  
}

**Hierarchy Level** [edit chassis]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Specify the container devices configuration. The **number** option specifies the number of sequentially numbered container interfaces, from **ci0** to **ci127** maximum.

**Options** **number**—Number of container devices.  
**Range:** 1 through 128

**Required Privilege Level** chassis—To view this statement in the configuration.  
chassis-control—To add this statement to the configuration.

| <b>Description</b>              | Major alarm error thresholds for T1 CRC errors. When the threshold is exceeded for one second, a defect condition is declared. If the defect condition continues for the monitoring period, an alarm condition is declared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | 10-second monitoring period for all settings except 1e-5. The 1e-5 value uses a 50-second monitoring period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>              | Minor alarm error thresholds for T1 CRC errors. When the threshold is exceeded for one second, a defect condition is declared. If the defect condition continues for the monitoring period, an alarm condition is declared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>                  | 10-second monitoring period for values 1e-3, 5e-4, 1e-4, and 5e-5. The 1e-5 value uses a 50-second monitoring period. The 5e-6 value uses a 100-second monitoring period. The 1e-6 value uses a 500-second monitoring period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Release Information | Statement introduced in Junos OS Release 14.1 for PTX Series Packet Transport Routers and T Series Core Routers.<br>Statement introduced in Junos OS Release 14.2 for MX960, MX480, MX240, and MX80 3D Universal Edge Routers and M10i Multiservice Edge Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description         | <p>Limit the number of advertisements of the up and down transitions (flapping) on an interface. Each time a transition occurs, the interface state is changed, which generates an advertisement to the upper-level routing protocols. Damping helps reduce the number of these advertisements. Every time an interface goes down, a penalty is added to the interface penalty counter. Penalty added on every interface flap is 1000.</p> <p>If at some point the accumulated penalty exceeds the suppress level <b>max-suppress</b>, the interface is placed in the suppress state, and further interface state up and down transitions are not reported to the upper-level protocols.</p>                                                                                                                                                                                                                             |
| Options             | <p><b>enable</b>—Enable damping on a per-interface basis. If damping is enabled on an interface, it is suppressed during interface flaps that match the configuration settings.</p> <p><b>Default:</b> Disabled</p> <p><b>half-life <i>seconds</i></b>—Decay half-life. <i>seconds</i> is the interval after which the accumulated interface penalty counter is reduced by half if the interface remains stable.</p> <hr/> <p> <b>NOTE:</b> For the half-life, configure a value that is less than the max-suppress value. If you do not, the configuration is rejected.</p> <hr/> <p><b>Range:</b> 1 through 30</p> <p><b>Default:</b> 5</p> <p><b>max-suppress <i>seconds</i></b>—Maximum hold-down time. <i>seconds</i> is the maximum time that an interface can be suppressed no matter how unstable the interface has been.</p> |

**NOTE:** For max-suppress, configure a value that is greater than the half-life. If you do not, the configuration is rejected.

**Range:** 1 through 20,000

**Default:** 20

**reuse *number***—Reuse threshold. When the accumulated interface penalty counter falls below *number*, the interface is no longer suppressed.

**Range:** 1 through 20,000

**Default:** 1000

**suppress *number***—Cutoff (suppression) threshold. When the accumulated interface penalty counter exceeds *number*, the interface is suppressed.

**Range:** 1 through 20,000

**Default:** 2000

## dce-options

---

**Syntax**    `dce-options {  
              control-signal (assert | de-assert | normal);  
              cts (ignore | normal | require);  
              dcd (ignore | normal | require);  
              dsr (ignore | normal | require);  
              dtr signal-handling-option;  
              ignore-all;  
              indication (ignore | normal | require);  
              rts (assert | de-assert | normal);  
              tm (ignore | normal | require);  
          }`

**Hierarchy Level**    [edit interfaces *interface-name* `serial-options`]

**Release Information**    Statement introduced in Junos OS Release 8.3.  
                              Statement previously known as **control-leads**.

**Description**    For J Series Services Routers, configure the serial interface signal characteristics.  
  
                      The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring the Serial Signal Handling on page 318](#)

## demux0 (Static Interface)

---

**Syntax**

```
demux0 {  
    unit logical-unit-number {  
        demux-options {  
            underlying-interface interface-name  
        }  
        family family {  
            access-concentrator name;  
            {  
                destination-prefix;  
            }  
            direct-connect;  
            duplicate-protection;  
            dynamic-profile profile-name;  
            {  
                source-prefix;  
            }  
            max-sessions number;  
            service-name-table table-name  
            targeted-distribution;  
            unnumbered-address interface-name <preferred-source-address address>;  
        }  
        vlan-id number;  
        vlan-tags outer [tpid].vlan-id [inner [tpid].vlan-id];  
    }  
}
```

**Hierarchy Level** [edit interfaces],  
[edit logical-systems *logical-system-name* interfaces]

**Release Information** Statement introduced in Junos OS Release 9.0.

**Description** Configure the logical demultiplexing (demux) interface.

Logical IP demux interfaces do not support IPv4 and IPv6 dual stack.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.

    }

```

**Hierarchy Level** [edit **dynamic-profiles** *profile-name* **interfaces**]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Configure the logical demultiplexing (demux) interface in a dynamic profile.

Logical IP demux interfaces do not support IPv4 and IPv6 dual stack.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## disable (Interface)

|                            |                                                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | disable;                                                                                                                                                                                                                                             |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> ],<br>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.                                  |
| <b>Description</b>         | Disable a physical or a logical interface, effectively unconfiguring it.                                                                                                                                                                             |

### CAUTION:

- Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.
- If aggregated SONET links are configured between a T1600 router and a T4000 router, interface traffic is disrupted when you disable the physical interface configured on the T1600 router. If you want to remove the interface, we recommend that you deactivate the interface instead of disabling it.

### NOTE:

- When you use the disable statement at the [edit interfaces] hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet (GE) PICs with SFP and XFP transceivers and ATM MIC with SFP do support it and the laser will be turned off when the interface is disabled. If the ATM MIC with SFP is part of an APS group, then the laser will not be turned off when you use the disable statement at the [edit interfaces] hierarchy level..
- When you disable or deactivate an interface, then all the references made to the deactivated interface must be removed from the routing instance.

**WARNING:** Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## disable (Link Protection)

**Syntax** disable;

**Hierarchy Level** [edit interfaces aeX aggregated-ether-options lacp link-protection]

**Release Information** Statement introduced in Junos OS Release 9.3.  
Statement introduced in Junos OS Release 11.4 for EX Series switches.  
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

**Description** Disable LACP link protection on the interface.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring LACP for Aggregated Ethernet Interfaces*
- *Configuring LACP Link Protection of Aggregated Ethernet Interfaces (CLI Procedure)*

## disable-mlppp-inner-ppp-pfc

**Syntax** disable-mlppp-inner-ppp-pfc;

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number*],  
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

**Release Information** Statement introduced in Junos OS Release 8.2.

**Description** For MLPPP interfaces only, disable compression of the inner PPP header in the MLPPP payload. By default, compression is enabled.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.<br>Statement introduced in Junos OS Release 15.1X53-D10 for QFX10000 switches.                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | For a generic routing encapsulation (GRE) tunnel, disable fragmentation of GRE-encapsulated packets. This sets the do-not-fragment (DF) bit in the outer IP header of the GRE-encapsulated packets so that they do not get fragmented anywhere in the path. When the size of a GRE-encapsulated packet is greater than the MTU of a link that the packet passes through, the GRE-encapsulated packet is dropped. |
| <b>Default</b>                  | By default, fragmentation of GRE-encapsulated packets is disabled.                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0.<br>Support at [edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> <b>agent-specifier</b> <i>aci circuit-id-string ari remote-id-string</i> ] hierarchy level introduced in Junos OS Release 10.2.                                                                                                                                                     |
| <b>Description</b>              | Direct the router to drop (ignore) a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client that contains the specified service name tag or agent circuit identifier/agent remote identifier (ACI/ARI) information. This action effectively denies the client's request to provide the specified service, or to accept requests from the subscriber or subscribers represented by the ACI/ARI information. |

| <b>Description</b>              | <p>Specify a dynamic profile to instantiate a dynamic PPPoE interface. You can associate a dynamic profile with a named service entry, <b>empty</b> service entry, or <b>any</b> service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The dynamic profile associated with a service entry in a PPPoE service name table overrides the dynamic profile associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the <b>dynamic-profile</b> statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the <b>static-interface</b> statement at this level. The <b>dynamic-profile</b> and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| <b>Options</b>                  | <b><i>profile-name</i></b> —Name of the dynamic profile that the router uses to instantiate a dynamic PPPoE interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Hierarchy Level**    [\[edit\]](#)

**Release Information**    Statement introduced in Junos OS Release 9.2.  
Support at the **filter**, **policer**, **hierarchical-policer**, **three-color-policer**, and **policy options** hierarchy levels introduced in Junos OS Release 11.4.

**Description**    Create dynamic profiles for use with DHCP or PPP client access.

**Options**    *profile-name*—Name of the dynamic profile; string of up to 80 alphanumeric characters.  
The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## e3-options

---

**Syntax**    e3-options {  
              `atm-encapsulation` (direct | plcp);  
              `bert-algorithm` *algorithm*;  
              `bert-error-rate` *rate*;  
              `bert-period` *seconds*;  
              `buildout` *feet*;  
              `compatibility-mode` (digital-link | kentrox | larscom) <subrate *value*>;  
              `fcs` (16 | 32);  
              `framing` (g.751 | g.832);  
              `idle-cycle-flag` *value*;  
              `invert-data`;  
              `loopback` (local | remote);  
              (`payload-scrambler` | `no-payload-scrambler`);  
              `start-end-flag` *value*;  
              (`unframed` | `no-unframed`);  
          }

**Hierarchy Level**    [edit interfaces *interface-name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Configure E3-specific physical interface properties.

For ATM1 interfaces, you can configure a subset of E3 options statements.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**

## east-interface

**Syntax**

```
east-interface {
  node-id mac-address;
  control-channel channel-name {
    vlan number;
    interface name interface-name
  }
  interface-none
  ring-protection-link-end;
}
```

**Hierarchy Level** [edit protocols [protection-group ethernet-ring ring-name](#)]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** Define one of the two interface ports for Ethernet ring protection, the other being defined by the **west-interface** statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

EX Series switches do not use the node-id statement--the node ID is automatically configured on the switches using the MAC address.

**NOTE:** Always configure this port first, before configuring the **west-interface** statement.

**NOTE:** The Node ID is not configurable on EX Series switches. The node ID is automatically configured using the MAC address.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

---

## egress-policer-overhead

---

**Syntax** `egress-policer-overhead bytes;`

**Hierarchy Level** `[edit chassis fpc slot-number pic pic-number]`

**Release Information** Statement introduced before Junos OS Release 11.1.

**Description** Add the specified number of bytes to the actual length of an Ethernet frame when determining the actions of Layer 2 policers, MAC policers, or queue rate limits applied to output traffic on the line card. You can configure egress policer overhead to account for egress *shaping* overhead bytes added to output traffic on the line card.

On M Series and T Series routers, this statement is supported on Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs and Enhanced IQ2 (IQ2E) PICs. On MX Series routers, this statement is supported for interfaces configured on Dense Port Concentrators (DPCs).

**NOTE:** This statement is not supported on Modular Interface Cards (MICs) or Modular Port Concentrators (MPCs) in MX Series routers.

**Options** *bytes*—Number of bytes added to a packet exiting an interface.

**Range:** 0–255 bytes

**Default:** 0

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers ( <b>ethernet</b> , <b>vlan-ccc</b> , and <b>vlan-tcc</b> options only).<br>Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers. Only the <b>atm-ccc-cell-relay</b> and <b>atm-ccc-vc-mux</b> options are supported on ACX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>         | Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>atm-ccc-cell-relay</b>—Use ATM cell-relay encapsulation.</p> <p><b>atm-ccc-vc-mux</b>—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the <b>ccc</b> family only.</p> <p><b>atm-cisco-nlpid</b>—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-mlppp-llc</b>—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.</p> <p><b>atm-nlpid</b>—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-ppp-llc</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.</p> <p><b>atm-ppp-vc-mux</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.</p> |

**atm-snap**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

**atm-tcc-snap**—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

**atm-tcc-vc-mux**—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**atm-vc-mux**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the **inet** family only.

**ether-over-atm-llc**—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

**ether-vpls-over-atm-llc**—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**ether-vpls-over-fr**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

**NOTE:** The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

**ether-vpls-over-ppp**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

**ethernet**—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

**ethernet-ccc**—Use Ethernet CCC encapsulation on Ethernet interfaces.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ppp**—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the **ppp** family only.

**frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**gre-fragmentation**—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet's size exceeds the tunnel's maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

**multilink-frame-relay-end-to-end**—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**multilink-ppp**—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

**ppp-over-ether**—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

**ppp-over-ether-over-atm-llc**—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

**vxlan**—Use VXLAN data plane encapsulation for EVPN.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 11.1 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers ( <b>flexible-ethernet-services</b> , <b>ethernet-ccc</b> , and <b>ethernet-tcc</b> options only).                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>         | Specify the physical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | <b>ppp</b> —Use serial PPP encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Options

**NOTE:** Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on the EX Series switches.

**atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.

**atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).

**cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:

- CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.
- TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

**cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.

**cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.

**ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.

**ethernet-ccc**—Use Ethernet CCC encapsulation on Ethernet interfaces that must accept packets carrying standard Tag Protocol ID (TPID) values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, CCC is not supported.

**ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.

**ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

**ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the **ccc** family only.

**extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

**extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

**extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the **ccc** family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

**extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

**extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

---

**flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

**flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

**frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

**NOTE:** When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

**frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

**generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.

**multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.

**ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.

**vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:**

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
  - Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure family **inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.

| <b>Description</b>              | <p>For ATM2 IQ interfaces only, define the early packet discard (EPD) threshold on a VC. The EPD threshold is a limit on the number of transmit packets that can be queued. Packets that exceed the limit are discarded. For interfaces configured in trunk mode, you can also configure dual EPD thresholds depending on the packet loss priorities (PLPs).</p>                                                                                                                                                                                                                                                  |
| <b>Default</b>                  | <p>Approximately 1 percent of the available cell buffers. If shaping is enabled, the default EPD threshold is proportional to the shaping rate according to the following formula:</p> $\text{default epd-threshold} = \text{number of buffers} * \text{shaping rate} / \text{line rate}$ <p>The minimum EPD threshold value is 48 cells. If the default EPD threshold formula results in an EPD threshold of less than 48 cells, the result will be ignored, and the minimum value of 48 cells will be used.</p>                                                                                                 |
| <b>Options</b>                  | <p><b>cells</b>—Maximum number of cells.</p> <p><b>Range:</b> For 1-port and 2-port OC12 interfaces, 48 through 425,984 cells</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Hierarchy Level** [edit protocols [oam](#)]

**Release Information** Statement introduced in Junos OS Release 8.2.

**Description** For Ethernet interfaces on EX Series switches, and M320, MX Series, and T Series routers, provide fault signaling and detection for 802.3ah Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## ethernet-policer-profile

```
Syntax ethernet-policer-profile {
    input-priority-map {
        ieee802.1p premium [ values ];
    }
    output-priority-map {
        classifier {
            premium {
                forwarding-class class-name {
                    loss-priority (high | low);
                }
            }
        }
    }
    policer cos-policer-name {
        aggregate {
            bandwidth-limit bps;
            burst-size-limit bytes;
        }
        premium {
            bandwidth-limit bps;
            burst-size-limit bytes;
        }
    }
}
```

**Hierarchy Level** [edit interfaces *interface-name* gigether-options [ethernet-switch-profile](#)],  
[edit interfaces *interface-name* aggregated-ether-options [ethernet-switch-profile](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description**

**NOTE:** On QFX Series standalone switches, this statement hierarchy is only supported on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet, Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure a class of service (CoS)-based policer. Policing applies to the inner VLAN identifiers, not to the outer tag. For Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), the **premium** policer is not supported.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

---

## ethernet-ring

---

**Syntax**

```
ethernet-ring ring-name {  
    control-vlan (vlan-id | vlan-name);  
    data-channel {  
        vlan number  
    }  
    east-interface {  
        control-channel channel-name {  
            vlan number;  
            interface name interface-name  
        }  
    }  
    guard-interval number;  
    node-id mac-address;  
    restore-interval number;  
    ring-protection-link-owner;  
    west-interface {  
        control-channel channel-name {  
            vlan number;  
        }  
    }  
}
```

**Hierarchy Level** [edit protocols [protection-group](#)]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** For Ethernet PICs on MX Series routers or for EX Series switches, , specify the Ethernet ring in an Ethernet ring protection switching configuration.

**Options** *ring-name*—Name of the Ethernet protection ring.  
  
The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## ethernet-switch-profile

**Syntax**

```
ethernet-switch-profile {
  ethernet-policer-profile {
    input-priority-map {
      ieee802.1p premium [values];
    }
    output-priority-map {
      classifier {
        premium {
          forwarding-class class-name {
            loss-priority (high | low);
          }
        }
      }
    }
  }
  policer cos-policer-name {
    aggregate {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
    premium {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
  }
  storm-control storm-control-profile;
  tag-protocol-id tpid;
}
mac-learn-enable;
```

**Hierarchy Level** [edit interfaces *interface-name* [gigether-options](#)],  
[edit interfaces *interface-name* [aggregated-ether-options](#)],  
[edit interfaces *interface-name* aggregated-ether-options],  
[edit interfaces *interface-name* ether-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.  
Statement introduced in Junos OS Release 13.2 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X50-D15 for the EX Series switches.

**Description**

**NOTE:** On QFX Series standalone switches, the `ethernet-policer-profile` CLI hierarchy and the `mac-learn-enable` statement are supported only on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, aggregated Ethernet with Gigabit Ethernet IQ interfaces, the built-in Gigabit Ethernet port on the M7i router); 100-Gigabit

Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, configure VLAN tag and MAC address accounting and filtering properties.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** When you gather interfaces into a bridge domain, the `no-mac-learn-enable` statement at the [edit interfaces *interface-name* *gigether-options* ethernet-switch-profile] hierarchy level is not supported. You must use the `no-mac-learning` statement at the [edit bridge-domains *bridge-domain-name* bridge-options interface *interface-name*] hierarchy level to disable MAC learning on an interface in a bridge domain. For information on disabling MAC learning for a bridge domain, see the *MX Series Layer 2 Configuration Guide*.

|                                 |                                                                                                                                                                                                                                                                                             |

## event (LFM)

---

**Syntax**

```
event {  
  link-adjacency-loss;  
  link-event-rate {  
    frame-error count;  
    frame-period count;  
    frame-period-summary count;  
    symbol-period count;  
  }  
  protocol-down;  
}
```

**Hierarchy Level** [edit protocols [oam ethernet link-fault-management action-profile](#)]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Configure threshold values for link events in an action profile.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## fast-aps-switch

|                            |                                                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | fast-aps-switch;                                                                                                                                                                         |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> sonet-options <b>aps</b> ]                                                                                                                        |
| <b>Release Information</b> | Statement introduced in Junos OS Release 12.1.                                                                                                                                           |
| <b>Description</b>         | (M320 routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only and EX Series switches) Reduce the Automatic Protection Switching (APS) switchover time in Layer 2 circuits. |

### NOTE:

- Configuring this statement reduces the APS switchover time only when the Layer 2 circuit encapsulation type for the interface receiving traffic from a Layer 2 circuit neighbor is SAToP.
- When the fast-aps-switch statement is configured in revertive APS mode, you must configure an appropriate value for revert time to achieve reduction in APS switchover time.
- To prevent the logical interfaces in the data path from being shut down, configure appropriate hold-time values on all the interfaces in the data path that support TDM.
- The fast-aps-switch statement cannot be configured when the APS annex-b option is configured.
- The interfaces that have the fast-aps-switch statement configured cannot be used in virtual private LAN service (VPLS) environments.

**Hierarchy Level** [edit interfaces *interface-name* **unit** *logical-unit-number*],  
[edit logical-systems *logical-system-name* interfaces *interface-name* **unit** *logical-unit-number*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Option **max-sessions-vs-a-ignore** introduced in Junos OS Release 11.4.

**Description** Configure protocol family information for the logical interface.

**NOTE:** Not all subordinate statements are available to every protocol family.

**Options** *family*—Protocol family:

- **any**—Protocol-independent family used for Layer 2 packet filtering

**NOTE:** This option is not supported on T4000 Type 5 FPCs.

---

- **bridge**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation. You can optionally configure this protocol family for the logical interface on which you configure VPLS.
- **ethernet-switching**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation
- **ccc**—Circuit cross-connect protocol suite. You can configure this protocol family for the logical interface of CCC physical interfaces. When you use this encapsulation type, you can configure the **ccc** family only.
- **inet**—Internet Protocol version 4 suite. You must configure this protocol family for the logical interface to support IP protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).
- **inet6**—Internet Protocol version 6 suite. You must configure this protocol family for the logical interface to support IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), BGP, and Virtual Router Redundancy Protocol for IPv6 (VRRP).
- **iso**—International Organization for Standardization Open Systems Interconnection (ISO OSI) protocol suite. You must configure this protocol family for the logical interface to support IS-IS traffic.
- **mlfr-end-to-end**—Multilink Frame Relay FRF.15. You must configure this protocol or multilink Point-to-Point Protocol (MLPPP) for the logical interface to support multilink bundling.
- **mlfr-uni-nni**—Multilink Frame Relay FRF.16. You must configure this protocol or **mlfr-end-to-end** for the logical interface to support link services and voice services bundling.
- **multilink-ppp**—Multilink Point-to-Point Protocol. You must configure this protocol (or **mlfr-end-to-end**) for the logical interface to support multilink bundling.
- **mpls**—Multiprotocol Label Switching (MPLS). You must configure this protocol family for the logical interface to participate in an MPLS path.
- **pppoe**—Point-to-Point Protocol over Ethernet
- **tcc**—Translational cross-connect protocol suite. You can configure this protocol family for the logical interface of TCC physical interfaces.

- **tnp**—Trivial Network Protocol. This protocol is used to communicate between the Routing Engine and the router's packet forwarding components. The Junos OS automatically configures this protocol family on the router's internal interfaces only, as discussed in [“Understanding Internal Ethernet Interfaces” on page 12](#).
- **vpls**—(M Series and T Series routers only) Virtual private LAN service. You can optionally configure this protocol family for the logical interface on which you configure VPLS. VPLS provides an Ethernet-based point-to-multipoint Layer 2 VPN to connect customer edge (CE) routers across an MPLS backbone. When you configure a VPLS encapsulation type, the **family vpls** statement is assumed by default.

MX Series routers support dynamic profiles for VPLS pseudowires, VLAN identifier translation, and automatic bridge domain configuration.

For more information about VPLS, see the *Junos OS VPNs Library for Routing Devices*.

The remaining statements are explained separately. See [CLI Explorer](#).

| <b>Description</b>              | <p>For E1/E3, SONET/SDH, and T1/T3 interfaces, configure the frame checksum (FCS) on the interface. The checksum must be the same on both ends of the interface.</p> <p>On a channelized OC12 interface, the SONET/SDH <b>fcs</b> statement is not supported. To configure FCS on each DS3 channel, you must include the <b>t3-options fcs</b> statement in the configuration for each channel. For SONET/SDH, the channelized OC12 interface supports DS3 to STS-1 to OC12. For SDH, the channelized OC12 interface supports NxDS3 to NxVC3 to AU3 to STM.</p> |
|                                 | <div>  <p><b>NOTE:</b> When configuring E1 or T1 interfaces on 10-port Channelized E1/T1 IQE PICs, the <b>fcs</b> statement must be included at the [edit interfaces e1-<i>fpc/pic/port</i>] or [edit interfaces t1-<i>fpc/pic/port</i>] hierarchy level as appropriate.</p> </div>                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>16</b>—Use a 16-bit frame checksum on the interface.</p> <p><b>32</b>—Use a 32-bit frame checksum on the interface. Using a 32-bit checksum provides more reliable packet verification, but some older equipment might not support 32-bit checksums.</p> <p><b>Default:</b> 16</p>                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>For T3 interfaces only, configure the router so a remote CSU can place the local router into loopback.</p> <p>If you configure remote or local loopback with the T3 <b>loopback</b> statement, the router does not respond to FEAC requests from the CSU even if you include the <b>feac-loop-respond</b> statement in the configuration. For the router to respond, you must delete the <b>loopback</b> statement from the configuration.</p> <p>You must rollback the setting done on the remote CSU prior to deactivating the <b>feac-loop-respond</b> statement. If the remote CSU cannot comply, clear the remote loop through local configuration to achieve the cleanup. For example, configure remote loopback on the interface and then delete the remote loopback.</p> |
| <b>Default</b>                  | The router does not respond to FEAC requests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1R1<br>Statement introduced in Junos OS Release 16.1X65D30 for PTX1000 routers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>(MX Series Routers with MPC7E, MPC8E, and MPC9E, PTX1000) Enable or disable RS-FEC (Reed-Solomon Forward Error Correction) for a 100-Gigabit Ethernet interface. By default, the Junos OS software enables or disables forward error correction based on the plugged-in optics. For instance, Junos OS software enables RS-FEC for 100G SR4 optics and disables RS-FEC for 100G LR4 optics.</p> <p>This statement allows you to override the default behavior and explicitly enable or disable RS-FEC. For instance, you can extend the reach of 100G LR4 optics when you explicitly enable RS-FEC for the optics. RS-FEC is compliant with IEEE 802.3-2015 Clause 91.</p> <p>Once you enable or disable RS-FEC using this statement, this behavior applies to any 100-Gigabit Ethernet optical transceiver installed in the port associated with the interface. Delete the statement and commit the configuration to return to the default behavior.</p> |
| <b>Default</b>                  | Junos OS software automatically enables or disables RS-FEC based on the type of pluggable optics used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Description              | <p> <b>NOTE:</b> On EX Series switches, the <code>group</code>, <code>input-list</code>, <code>output-filter</code> statements are not supported under the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet]</code>, <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6]</code>, and <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls]</code> hierarchies.</p> <p>Apply a filter to an interface. You can also use filters for encrypted traffic. When you configure filters, you can configure them under the <b>family</b> <code>ethernet-switching</code>, <code>inet</code>, <code>inet6</code>, <code>mpls</code>, or <code>vpls</code> only.</p> |
| Options                  | <p><b>group</b> <i>filter-group-number</i>—Define an interface to be part of a filter group. The default filter group number is 0.</p> <p><b>Range:</b> 0 through 255</p> <p><b>input</b> <i>filter-name</i>—Name of one filter to evaluate when packets are received on the interface.</p> <p><b>output</b> <i>filter-name</i>—Name of one filter to evaluate when packets are transmitted on the interface.</p> <p>The remaining statements are explained separately. | <b>Description</b>              | Apply a filter to an interface. You can also use filters for encrypted traffic. When you configure filters, you can configure the family <b>inet</b> , <b>inet6</b> , <b>mpls</b> , or <b>vpls</b> only.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>input <i>filter-name</i></b>—Name of one filter to evaluate when packets are received on the interface.</p> <p><b>output <i>filter-name</i></b>—Name of one filter to evaluate when packets are transmitted on the interface.</p>                                                                                                                                                                                                                                                                                                                                                                      |

## flow-control

**Syntax** (flow-control | no-flow-control);

**Hierarchy Level** [edit interfaces *interface-name* [aggregated-ether-options](#)],  
[edit interfaces *interface-name* ether-options],  
[edit interfaces *interface-name* [fastether-options](#)],  
[edit interfaces *interface-name* [gigether-options](#)],  
[edit interfaces *interface-name* [multiservice-options](#)],  
[edit interfaces interface-range *name* [aggregated-ether-options](#)],  
[edit interfaces interface-range *name* ether-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 in EX Series switches.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description** For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

**NOTE:** On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

**Default** Flow control is enabled.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## flow-control-options

---

**Syntax**    flow-control-options {  
              down-on-flow-control;  
              dump-on-flow-control;  
              reset-on-flow-control;  
              }

**Hierarchy Level**    [edit interfaces *mo-fpc/pic/port* multiservice-options]

**Release Information**    Statement introduced before Junos OS Release 8.4.

**Description**    Configure the flow control options for application recovery in case of a prolonged flow control failure.

- **down-on-flow-control**—Bring interface down during prolonged flow control.
- **dump-on-flow-control**—Cause core dump during prolonged flow control.

**NOTE:** Starting with Junos OS Release 15.1, on MX Series routers with MS-MICs and MS-MPCs, instead of an eJunos kernel core file, the multiservices PIC management daemon (mshpmand) core file is generated when a prolonged flow control failure occurs and when you configure the setting to generate a core dump during prolonged flow control (by using the **dump-on-flow-control** option with the **flow-control-options** statement). The watchdog functionality continues to generate a kernel core file in such scenarios.

---

- **reset-on-flow-control**—Reset interface during prolonged flow control.

**Usage Guidelines**    See *Configuring Flow Monitoring*.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Threshold for sending frame error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.</p> <p>The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.</p> |
| <b>Options</b>                  | <p><b>count</b>—Threshold count for frame error events.</p> <p><b>Range:</b> 0 through 100</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Threshold for sending frame period error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.</p> |

| <b>Description</b>              | <p>Threshold for sending frame period summary error events or taking the action specified in the action profile.</p> <p>An errored frame second is any 1-second period that has at least one errored frame. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period window. The default window is 60 seconds. The window is not configurable.</p> |
| <b>Options</b>                  | <p><b>count</b>—Threshold count for frame period summary error events.</p> <p><b>Range:</b> 0 through 100</p>                                                                                                                                                                                                                                                                                                                |

|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>framing (lan-phy   wan-phy);</code>                                                                                                                                                                   |
| <b>Hierarchy Level</b>     | <code>[edit interfaces xe-fpc/pic/port]</code><br><code>[edit interfaces et-fpc/pic/port]</code> (PTX Series Packet Transport Routers and MX Series Routers)                                                |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 12.3R2 for PTX Series Packet Transport Routers.                                                                   |
| <b>Description</b>         | For routers supporting the 10-Gigabit Ethernet interface, configure the framing format. WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600, T4000, and PTX Series Packet Transport Routers only. |

### NOTE:

- The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).
- On PTX Series routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+.
- When the PHY mode changes, interface traffic is disrupted because of port reinitialization.

| <b>Description</b>              | When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL link receives notification, restores the link, and waits for the restore interval before issuing another block on the same link. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value. |
| <b>Options</b>                  | <i>number</i> —Guard timer interval, in milliseconds.<br><b>Range:</b> 10 through 2000 ms<br><b>Default:</b> 500 ms                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>For Ethernet interfaces on Enhanced and Enhanced Queuing Dense Port Concentrators (DPCs) in MX Series routers only, enable hardware-assisted timestamping support for Ethernet frame delay measurement.</p> <p>By default, the ETH-DM feature calculates frame delays using software-based timestamping of the ETH-DM PDU frames sent and received by the MEPs in the session. As an option that can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction, you can enable hardware-assisted timestamping of session frames in the receive direction.</p> |

## hierarchical-policer

**Syntax** hierarchical-policer *name* {  
 aggregate {  
   if-exceeding {  
     bandwidth-limit *bandwidth*;  
     burst-size-limit *burst*;  
   }  
   then {  
     discard;  
   }  
 }  
 premium {  
   if-exceeding {  
     bandwidth-limit *bandwidth*;  
     burst-size-limit *burst*;  
   }  
   then {  
     discard;  
   }  
 }  
}

**Hierarchy Level** [edit firewall]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** For M40e, M120, and M320 (with FFPC and SFPC) edge routers and T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs, specify a hierarchical policer.

**Options** Options are described separately.

**Required Privilege Level** firewall—To view this statement in the configuration.  
 firewall-control—To add this statement to the configuration.

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 10.1.</p> <p><b>implicit-hierarchy</b> option added in Junos OS Release 13.1.</p> <p>Support on GRE tunnel interfaces configured on physical interfaces on MICs or MPCs in MX Series routers added in Junos OS Release 13.3.</p> <p>Support for up to four hierarchy levels added in Junos OS Release 16.1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | <p>Configure hierarchical scheduling options on the interface.</p> <p>The statement is supported on the following interfaces:</p> <ul style="list-style-type: none"><li>• MIC and MPC interfaces in MX Series routers</li><li>• GRE tunnel interfaces configured on physical interfaces hosted on MIC or MPC line cards in MX Series routers</li></ul> <p>To enable hierarchical scheduling on MX Series routers, configure the <b>hierarchical-scheduler</b> statement at each member physical interface level of a particular aggregated Ethernet interface as well as at that aggregated Ethernet interface level. On other routing platforms, it is enough if you include this statement at the aggregated Ethernet interface level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <p><b>implicit-hierarchy</b>—Configure four-level hierarchical scheduling. When you include the <b>implicit-hierarchy</b> option, a hierarchical relationship is formed between the CoS scheduler nodes at level 1, level 2, level 3, and level 4. The <b>implicit-hierarchy</b> option is supported only on MPC/MIC subscriber interfaces and interface sets on MX Series routers.</p> <p><b>maximum-hierarchy-levels <i>number</i></b>—Specify the maximum number of hierarchical scheduling levels allowed for node scaling, from 2 through 4 levels. The default number of levels is 3. The <b>maximum-hierarchy-levels</b> option is supported on MPC/MIC or EQ DPC subscriber interfaces and interface sets on MX Series routers.</p> <ul style="list-style-type: none"><li>• If you set <b>maximum-hierarchy-levels</b> to 2, interface sets are not allowed. In this case, if you configure a level 2 interface set, you generate Packet Forwarding Engine errors.</li><li>• If you do not include the <b>maximum-hierarchy-levels</b> option, keeping the default number of hierarchy levels at 3, interface sets can be at either level 2 or level 3, depending on whether the member logical interfaces within the interface set have a traffic control profile. If any member logical interface has a traffic control profile, then the interface set is a level 2 CoS scheduler node. If no member logical interface has a traffic control profile, the interface set is at level 3.</li></ul> |

| <b>Description</b>         | Specify the <b>hold-time</b> value to use to damp shorter interface transitions milliseconds. The hold timer enables interface damping by not advertising interface transitions until the hold timer duration has passed. When a hold-down timer is configured and the interface goes from up to down, the down hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still down, then the router begins to advertise the interface as being down. Similarly, when a hold-up timer is configured and an interface goes from down to up, the up hold-time timer is triggered. Every interface transition that occurs during the hold-time is ignored. When the timer expires and the interface state is still up, then the router begins to advertise the interface as being up. |

### NOTE:

- We recommend that you configure the hold-time value after determining an appropriate value by performing repeated tests in the actual hardware environment. This is because the appropriate value for hold-time depends on the hardware (XFP, SFP, SR, ER, or LR) used in the networking environment.
- The hold-time option is not available for controller interfaces.

**NOTE:** On MX Series routers with MPC3E and MPC4E, we recommend that you do not configure the hold-down timer to be less than 1 second. On MX Series routers with MPC5EQ-100G10G (MPC5EQ) or MPC6E (MX2K-MPC6E) with 100-Gigabit Ethernet MIC with CFP2 OTN interfaces, we recommend that you do not configure the hold-down timer to be less than 3 seconds.

**Default** Interface transitions are not damped.

**Options**    **down *milliseconds***—Hold time to use when an interface transitions from up to down. Junos OS advertises the transition within 100 milliseconds of the time value you specify.

**Range:** 0 through 4,294,967,295

**Default:** 0 (interface transitions are not damped)

**up *milliseconds***—Hold time to use when an interface transitions from down to up. Junos OS advertises the transition within 100 milliseconds of the time value you specify.

**Range:** 0 through 4,294,967,295

**Default:** 0 (interface transitions are not damped)

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**                    interface-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>         | For ATM over SONET/SDH and SONET/SDH interfaces only, apply up and down hold times to SONET/SDH defect triggers. When you apply a down hold time to a defect, the defect must remain present for at least the hold-time period before the interface is marked down. When you apply an up hold time to a defect, the defect must remain absent for at least the hold-time period before the interface is marked up, assuming no other defect is outstanding. |

### NOTE:

- When up or down hold times are applied to SONET defect triggers of a 10-Gigabit Ethernet WAN-PHY interface, only the defects generated in the WAN Interface Sublayer (WIS) are damped. Therefore, if the hold times are applied to SONET defect triggers only, a 10-Gigabit Ethernet WAN-PHY interface might be marked up or down because of the faults that are generated in other layers, such as the Physical Coding Sublayer (PCS) or Physical Medium Attachment Sublayer (PMA), 10 Gigabit Media Independent Interface (XGMII) Extender Sublayer (XGXS), and Media Access Control (MAC). To damp the interface up or down events of a 10-Gigabit Ethernet WAN-PHY interface, you need to apply up or down hold-times for the interface at the [edit interfaces *interface-name*] hierarchy level.
- On M Series and T Series platforms with Channelized SONET IQ PICs and Channelized SONET IQE PICs, the SONET defect alarm trigger hold-time statement is not supported.

**Default** If you do not include this statement, when a defect is detected the interface is marked down immediately, and when the defect becomes absent the interface is marked up immediately.

**Options** **down *milliseconds***—Hold time to wait before the interface is marked down.

**Range:** 1 through 65,534 milliseconds

**Default:** No hold time

**up *milliseconds***—Hold time to wait before the interface is marked up.

**Range:** 1 through 65,534 milliseconds

**Default:** No hold time

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## host (Interfaces)

---

**Syntax**

```
host hostname {  
    services severity-level;  
    facility-override facility-name;  
    log-prefix prefix-value;  
    port port-number;  
}
```

**Hierarchy Level** [edit interfaces *interface-name* services-options syslog]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the hostname for the system logging utility.

**Options** *hostname*—Name of the system logging utility host machine. This can be the local Routing Engine or an external server address.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | If you do not include this statement, no ICCP protocol tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>traceoptions</b>—Set Interchassis Control Protocol (ICCP) tracing options.</p> <p><b>local-ip-address</b>—Specify the source address where the ICCP packet is routed.</p> <p><b>session-establishment-hold-time</b>—Specify if the chassis takes over as the master at the ICCP session.</p> <p><b>authentication-key</b>—Specify TCP Message Digest 5 (MD5) option for an ICCP TCP session.</p> <p><b>peer ip-address</b>—Specify the IP address of the peer that hosts an MC-LAG. You must configure ICCP for both peers that host the MC-LAG.</p> <p><b>redundancy-group-id-list</b>—Specify the redundancy groups between two ICCP peers.</p> <p><b>liveness-detection</b>—Specify Bidirectional Forwarding Detection (BFD) protocol options.</p> |

## idle-cycle-flag

**Syntax** `idle-cycle-flag value;`

**Hierarchy Level** [edit interfaces e1-*fpc/pic/port*],  
 [edit interfaces t1-*fpc/pic/port*],  
 [edit interfaces *interface-name* [ds0-options](#)],  
 [edit interfaces *interface-name* [e1-options](#)],  
 [edit interfaces *interface-name* [e3-options](#)],  
 [edit interfaces *interface-name* [serial-options](#)],  
 [edit interfaces *interface-name* [t1-options](#)],  
 [edit interfaces *interface-name* [t3-options](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers.

**Description** Configure the value that the DS0, E1, E3, T1, or T3 interface transmits during idle cycles.

**NOTE:** When configuring E1 or T1 interfaces on 10-port Channelized E1/T1 IQE PICs, the `idle-cycle-flag` statement must be included at the [edit interfaces e1-*fpc/pic/port*] or [edit interfaces t1-*fpc/pic/port*] hierarchy level as appropriate.

**Options** *value*—Value to transmit in the idle cycles:

- **flags**—Transmit the value 0x7E.
- **ones**—Transmit the value 0xFF (all ones).

**Default:** `Flags`

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.2 for MX Series routers with MPCs.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>For MX Series routers, <b>if-exceeding-pps</b> allows you to configure a packets-per-second (pps)-based trigger for a premium or aggregate component of a hierarchical policier. When applied to the loopback interface (lo0), this kind of trigger can help protect the Routing Engine from DDoS attacks. When applied in other areas, to either transit or control traffic, it is a more fine-grained monitor.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |
| <b>Required Privilege Level</b> | <p>firewall—To view this statement in the configuration.</p> <p>firewall-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Enable IGMP snooping on the router.

**NOTE:** IGMP snooping must be disabled on the router before enabling ISSU.

|                                 |                                                                                                                                                     |

**Range:** 1 through 5

**Default:** 1

**minimum-links *number***—IMA group minimum active links.

**Range:** 1 through 8

**Default:** 1

**symmetry (symmetrical-config-and-operation | symmetrical-config-asymmetrical-operation)**—IMA group symmetry mode selection.

**test-procedure**—Specify an IMA link interface test.

**ima-test-start**—Start IMA group test.

**ima-test-stop**—Stop IMA group test.

**interface *name***—Interface name of the IMA link to test.

**pattern *number***—IMA test pattern.

**Range:** 1 through 254

**Default:** 170

**period *seconds***—Length of IMA pattern test in seconds.

**Range:** 1 through 4,294,967,294.

**Default:** 10

**transmit-clock (common |independent)**—Transmit clock configuration.

**Default:** common

**version (1.0 |1.1)**—IMA specification version.

| <b>Release Information</b> | Statement introduced before Junos OS Release 11.1.<br>Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | <p>Add the configured number of bytes to the length of a packet entering the interface.</p> <p>Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.</p> <p>Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.</p> <p>You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.</p> |

**NOTE:** vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

**NOTE:** vSRX only supports fpc 0 pic 0. When you commit the `ingress-policer-overhead` statement, the vSRX takes the PIC offline and then back online.

You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

**Options** *bytes*—Number of bytes added to a frame entering an interface.

**Range:** 0–255 bytes

**Default:** 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## interface (IEEE 802.1ag OAM Connectivity-Fault Management)

---

**Syntax** interface (*interface-name* | ((*ge-* | *xe-*) (*fpc/pic/port* | *fpc/pic/port.unit-number* | *fpc/pic/port.unit-number* *vlan* *vlan-id*)));

**Hierarchy Level** [edit protocols [oam ethernet connectivity-fault-management](#) maintenance-domain *domain-name* maintenance-association *ma-name* [mep mep-id](#)]

**Release Information** Statement introduced in Junos OS Release 8.4.

**Description** For Ethernet interfaces on M320, MX Series, and T Series routers, configure IEEE 802.1ag Operation, Administration, and Management (OAM) support.

For Gigabit Ethernet interfaces and 10-Gigabit Ethernet interfaces on MX Series routers, configure IEEE 802.1ag Connectivity Fault Management (CFM) support on trunk interface ports.

**Options** **interface-name**—Interface to which the MEP is attached. It could be a physical Ethernet interface, logical Ethernet interface, or on a specific VLAN of a trunk port interface (MX Series only).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## interface (OAM Link-Fault Management)

**Syntax**    `interface interface-name {  
               apply-action-profile profile-name;  
               link-discovery (active | passive);  
               pdu-interval interval;  
               pdu-threshold threshold-value;  
               remote-loopback;  
               event-thresholds {  
                   frame-error count;  
                   frame-period count;  
                   frame-period-summary count;  
                   symbol-period count;  
               }  
               negotiation-options {  
                   allow-remote-loopback;  
                   no-allow-link-events;  
               }  
           }`

**Hierarchy Level**    [edit protocols [oam](#) [ethernet](#) [link-fault-management](#)]

**Release Information**    Statement introduced in Junos OS Release 8.2.

**Description**    For Ethernet interfaces on M320, MX Series, and T Series routers, configure IEEE 802.3ah Operation, Administration, and Management (OAM) support.

**Options**    `interface interface-name`—Interface to be enabled for IEEE 802.3ah link fault management OAM support.

The remaining statements are described separately.

**Required Privilege Level**    `interface`—To view this statement in the configuration.  
                                   `interface-control`—To add this statement to the configuration.

**Related Documentation**    • *Enabling IEEE 802.3ah OAM Support*

## interface (Port Mirroring)

---

|                                 |                                                                                                                                            |

## interface-range

**Syntax** `interface-range name {  
     member-range interface-name-fpc/pic/port to interface-name-fpc/pic/port;  
     member interface-name-fpc/pic/port;  
     member interface-name-fpc/[low-high]/*;  
     member interface-name-fpc/[pic1,pic2,pic3...picN]/port  
     /*Common config is added as part of interface-range definition, as follows*/  
     mtu 256;  
     hold-time up 10;  
     ether-options {  
         flow-control;  
         speed {  
             100m;  
         }  
         802.3ad primary;  
     }  
}`

**Hierarchy Level** [edit [interfaces](#)]

**Release Information** Statement introduced in Junos OS Release 10.0.

**Description** Specify a set of identical interfaces as an interface group, to which you can apply a common configuration to the entire set of interfaces. This group can consist of both lexical member ranges of interfaces specified using the **member-range** *interface-type-fpc/pic/port* to *xx-fpc/pic/port* option (regex not supported), and of individual or non-sequential members using the **member** *interface-type-fpc/pic/port* option (with regex support to specify the *fpc/pic/port* values).

**Options** **member-range**—Adds interfaces in lexical order. Regex is not supported.

**Format:**—**member-range** <start-range> to <end-range>

**Example:**—**member-range** ge-0/0/0 to ge-4/0/40;

**member**—To add individual interfaces or multiple interfaces using regex.

**Format:**—**member** <list of interface names>

**Example:**—**member** ge-0/0/0;

**member** ge-0/1/1;

**member** ge-0/\*/\*;

**member** ge-0/[1-10]/0;

**member** ge-1/[1,3,6,10]/12

**Required Privilege** interface—To view this statement in the configuration.

**Level** interface-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring Interface Ranges on page 84](#)

## interface-transmit-statistics

---

**Syntax** interface-transmit-statistics;

**Hierarchy Level** [edit interface *interface-name*]

**Release Information** Statement introduced in Junos OS Release 11.4 R3 for MX Series devices.

**Description** Configure the interface to report the transmitted load statistics. If this statement is not included in the configuration, the interface statistics show the offered load on the interface, and not the actual transmitted load.

**NOTE:** This is not supported on Enhanced IQ (IQE) and Enhanced IQ2 (IQ2E) PICs.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | For IQ and IQE interfaces only, configure the sublevel interface type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>bc</b>—Dual—Port Channelized E1 and T1 ISDN PRI interface type. You can specify this interface type at the <code>[edit interfaces <i>interface-name</i> partition <i>partition-number</i> timeslot <i>timeslot-range</i>]</code> hierarchy level to create a bearer (B) channel <code>bc-pim/0/port:channel</code> interface for each time you want to function as an ISDN PRI B-channel.</p> <p><b>coc1</b>—Channelized OC1 interface type. You can specify this interface type at the <code>[edit interfaces <i>interface-name</i> partition <i>partition-number</i> oc-slice <i>oc-slice-range</i> interface-type coc12-fpc/pic/port]</code> hierarchy level.</p> <p><b>ct1</b>—Channelized T1 interface type. You can specify this interface type at the <code>[edit interfaces <i>interface-name</i> partition <i>partition-number</i> interface-type ct3-fpc/pic/port&lt;:channel&gt;]</code> hierarchy level.</p> <p><b>ct3</b>—Channelized T3 interface type. You can specify this interface type at the <code>[edit interfaces <i>interface-name</i> partition <i>partition-number</i> oc-slice <i>oc-slice-range</i> interface-type coc1-fpc/pic/port:channel no-partition]</code> hierarchy level.</p> <p><b>dc</b>—Dual-Port Channelized E1 and T1 ISDN PRI interface type. You can specify this interface type at the <code>[edit interfaces <i>interface-name</i> partition <i>partition-number</i> timeslot <i>timeslot-range</i>]</code> hierarchy level to create a (D) channel <code>dc-pim/0/port</code> to control the B-channels.</p> <p><b>ds</b>—DS0 interface type. You can specify this interface type at the <code>[edit interfaces <i>interface-name</i> partition <i>partition-number</i> interface-type (ce1-fpc/pic/port   ct1-fpc/pic/port&lt;:channel&gt;)]</code> hierarchy level.</p> <p><b>so</b>—SONET/SDH interface type. You can specify this interface type at the <code>[edit interfaces <i>interface-name</i> partition <i>partition-number</i> oc-slice <i>oc-slice-range</i> interface-type coc12-fpc/pic/port]</code> hierarchy level.</p> <p><b>t1</b>—T1 interface type. You can specify this interface type at the <code>[edit interfaces <i>interface-name</i> partition <i>partition-number</i> oc-slice <i>oc-slice-range</i> interface-type (coc12-fpc/pic/port   coc1-fpc/pic/port)]</code> hierarchy level.</p> |

**t3**—T3 interface type. You can specify this interface type at the **[edit interfaces interface-name partition partition-number oc-slice oc-slice-range interface-type (coc12-fpc/pic/port | coc1-fpc/pic/port:channel no-partition)]** hierarchy level.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## interfaces

**Syntax** interfaces { ... }

**Hierarchy Level** [edit]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure interfaces on the router or switch.

**Default** The management and internal Ethernet interfaces are automatically configured. You must configure all other interfaces.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit [dynamic-profiles](#) *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Define interfaces for dynamic profiles.

**Options** *interface-name*—The interface variable (`$junos-interface-ifd-name`). The interface variable is dynamically replaced with the interface the DHCP client accesses when connecting to the router.

**NOTE:** Though we do not recommend it, you can also enter the specific name of the interface you want to assign to the dynamic profile.

The remaining statements are explained separately.

| <b>Description</b>         | <p>Configure the interval between successive transmissions of continuity check messages (CCMs) as part of the connectivity fault detection strategy. When the receiving maintenance association end point (MEP) does not receive a CCM at the configured interval, the <b>loss-threshold</b> statement determines how many CCMs can be lost before the sending MEP is marked as down. The <b>hold-interval</b> statement then determines the frequency at which the database of MEPs in the maintenance association (MA) is flushed in the absence of updates.</p> <p>During a unified in-service software upgrade (ISSU), Junos OS connectivity fault management (CFM) works when the peer device is not a Juniper Networks router. Interoperating with the router of another vendor, the Juniper Networks router retains session information and continues to transmit CCM (continuity check message) PDUs during the unified ISSU upgrade. For this feature to work, you must enable Packet Forwarding Engine keepalives with the <b>hardware-assisted-keepalives</b> statement, and configure the interval between CCMs to be 1 second with <b>interval</b> statement.</p> |
|                            | <p> <b>NOTE:</b> For the continuity check message interval to be configured for 10 milliseconds, periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine by default. You can disable PPM only on the Packet Forwarding Engine. To disable PPM on the Packet Forwarding Engine, use the <b>no-delegate-processing</b> statement at the [edit routing-options ppm] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                            | <p> <b>NOTE:</b> A continuity check interval of 10 milliseconds is not supported for CFM sessions over a label-switched interface (LSI).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## inverse-arp

---

**Syntax** inverse-arp;

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number*],  
[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* multipoint-destination *destination*],  
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*],  
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet *address address* multipoint-destination *destination*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For ATM encapsulation, enable responses to receive inverse ATM ARP requests. For Frame Relay encapsulation, enable responses to receive inverse Frame Relay ARP requests.

**Default** Inverse ARP is disabled on all ATM and Frame Relay interfaces.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>On MX and T Series routers, you can specify periodic packet management (PPM) as centralized. By default, the PPM is distributed.</p> <p>MX Series routers support Link Aggregation Control Protocol (LACP) with fast hellos during unified ISSU. This support is disabled by default. You must enable the <b>fast-hello-issu</b> option on the main router and on the peer routers before starting unified ISSU. Note that the peer router must also be an MX Series router for this functionality to work.</p> |
| <b>Default</b>                  | Distributed PPM processing is enabled for all packets that use PPM.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>ppm</b>—Set PPM to centralized.</p> <p><b>fast-hello-issu</b>—Enable LACP with fast hellos during unified ISSU.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.</p> <p><b>fast-failover</b> option introduced in Junos OS Release 12.2.</p> <p>Support for logical systems introduced in Junos OS Release 14.1.</p>                |
| <b>Description</b>         | <p>Configure the Link Aggregation Control Protocol (LACP) for aggregated Ethernet interfaces only.</p> <p>When you configure the <b>accept-data</b> statement at the [edit interfaces aeX <b>aggregated-ether-options lcp</b>] hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.</p> |

**NOTE:** When you configure the **accept-data** statement at the [edit interfaces aeX **aggregated-ether-options lcp**] hierarchy level, this behavior occurs:

- By default, the **accept-data** statement is not configured when LACP is enabled.
- You can configure the **accept-data** statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the **accept-data** statement is configured.

**Default** If you do not specify LACP as either **active** or **passive**, LACP remains passive.

**Options** **active**—Initiate transmission of LACP packets.

**admin-key *number***—Specify an administrative key for the router or switch.

**NOTE:** You must also configure multichassis link aggregation (MC-LAG) when you configure the **admin-key**.

**fast-failover**—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

**passive**—Respond to LACP packets.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs. |
| <b>Options</b>                  | (active   passive)—Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.                                                             |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                             |

| Description              | <p>On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the <b>primary</b> and <b>backup</b> statements at the <b>[edit interfaces ge-fpc/pic/port gigether-options 802.3ad aex]</b> hierarchy level or the <b>[edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex]</b> hierarchy level.</p> <p>On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.</p> <p>For Junos OS link protection, specify <b>link-protection</b> at the following hierarchy levels:</p> <ul style="list-style-type: none"><li>• <b>[edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]</b></li><li>• <b>[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]</b> hierarchy level or at the <b>[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]</b> hierarchy level.</li></ul> <p>To disable link protection, use the <b>delete interface ae aggregate-ether-options link-protection</b> statement at the <b>[edit interfaces aex aggregated-ether-options]</b> hierarchy level or the <b>[edit interfaces aex aggregated-ether-options lACP]</b> hierarchy level.</p> |
| Options                  | The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | For aggregated Ethernet interfaces only, set the required link speed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b><i>speed</i></b>—For aggregated Ethernet links, you can specify <b><i>speed</i></b> in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p>Aggregated Ethernet links on the M120 router can have one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>oc192</b>—Links are OC192 or STM64c.</li> </ul> <p>Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>10m</b>—Links are 10 Mbps.</li> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> </ul> <p>Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>100g</b>—Links are 100 Gbps.</li> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>40g</b>—Links are 40 Gbps.</li> </ul> |

- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

**mixed**—Enables bundling of different Ethernet rate links in the same Aggregated Ethernet interface.

## lmi (Ethernet OAM)

**Syntax**

```
lmi {
    status-counter count;
    polling-verification-timer value;
    interface name {
        uni-id uni-name;
        status-counter number;
        polling-verification-timer value;
        evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
        evc evc-name {
            default-evc;
            vlan-list vlan-id-list;
        }
    }
}
```

**Hierarchy Level** [edit protocols [oam](#) [ethernet](#)]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet Local Management Interface (E-LMI).

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (**ge**), 10-Gigabit Ethernet (**xe**), and Aggregated Ethernet (**ae**) interfaces configured on MX Series routers with DPC only.

**Options**

- status-counter *count***—Status counter (N393), defaults to 4.
- interface *name***—Polling verification timer (T392), defaults to 15 seconds.
- uni-id *uni-name***—(Optional) Defaults to the physical interface name.
- status-counter *number***—(Optional) Defaults to a global value.
- polling-verification-timer *value***—(Optional) Defaults to a global value.
- evc-map-type (all-to-one-bundling | bundling | service-multiplexing)**—Specify the Ethernet virtual connection (EVC) map type.
- evc *evc-name***—Specify the name of the EVC.
- default-evc**—Set the specified EVC as the default EVC.
- vlan-list *vlan-id-list***—Specify a group of VLANs to assign to the EVC.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## lmi-type

---

**Syntax** lmi-type (ansi | itu | c-lmi);

**Hierarchy Level** [edit interfaces *interface-name* [lmi](#)],  
[edit interfaces *interface-name* [mlfr-uni-nni-bundle-options](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Set Frame Relay Local Management Interface (LMI) type.

**NOTE:** Consortium LMI is supported on all MPCs and I-chip based FPCs.

---

**Options** ansi—Use ANSI T1.617 Annex D LMIs.

itu—Use ITU Q933 Annex A LMIs.

c-lmi—Use Consortium LMI.

**Default:** ansi

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Provide module redundancy for demux subscribers on aggregated Ethernet bundles configured with targeted distribution. Backup links for a subscriber are chosen on a different EQ DPC or MPC from the primary link, based on the link with the fewest number of subscribers among the links on different modules. If all links are on a single module when this is configured, backup links are not provisioned.</p> <p>By default, link redundancy is provided for the aggregated Ethernet bundle.</p> |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Configure the T3 line buildout. A T3 interface has two settings for the T3 line buildout: a short setting, which is less than 255 feet (68 meters), and a long setting, which is greater than 255 feet and shorter than 450 feet (137 meters).</p> <p>This statement applies to copper-cable-based T3 interfaces only. You cannot configure a line buildout for a DS3 channel on a channelized OC12 interface, which runs over fiber-optic cable.</p> |
| <b>Default</b>                  | A T3 interface uses the short line buildout setting ( <b>no-long-buildout</b> ) for wires shorter than 255 feet (68 meters).                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Configuring the T3 Line Buildout</i></li></ul>                                                                                                                                                                                                                                                                                                                                                                |

## loop-timing

|                            |                                                                                                                                                                                                           |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | (loop-timing   no-loop-timing);                                                                                                                                                                           |
| <b>Hierarchy Level</b>     | [edit interfaces ct3- <i>fpc/pic/port</i> <b>t3-options</b> ],<br>[edit interfaces e1- <i>fpc/pic/port:0</i> <b>sonet-options</b> ],<br>[edit interfaces stm1- <i>fpc/pic/port</i> <b>sonet-options</b> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                         |
| <b>Description</b>         | For channelized IQ interfaces and non-IQ channelized STM1 interfaces only, configure the SONET/SDH or DS3-level clocking source.                                                                          |

**NOTE:** On M Series, MX Series, and T Series routers, under E1 channels, loop timing can be configured only at channel 0. When you configure on channel 0, it is applicable on all channels as internal by default.

|                                 |                                                                                                                                                                                                                                  |
