## wavelength

**Syntax** `wavelength nm;`

**Hierarchy Level** [edit interfaces *interface-name* **optics-options**]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for PTX Series routers.

**Description** For 10-Gigabit or 100-Gigabit Ethernet DWDM interfaces only, configure full C-band ITU-Grid tunable optics.

**Options** *nm*—Wavelength value. It can be one of the following:

**NOTE:** All values are displayed. However, if you configure a value that is not supported by the device, an error message is displayed and the device is not tuned to the specified wavelength.

- **1528.38**—1528.38 nanometers (nm), corresponds to a 50-GHz grid
- **1528.77**—1528.77 nm, corresponds to 50-GHz and 100-GHz grids
- **1529.16**—1529.16 nm, corresponds to a 50-GHz grid
- **1529.55**—1529.55 nm, corresponds to 50-GHz and 100-GHz grids
- **1529.94**—1529.94 nm, corresponds to a 50-GHz grid
- **1530.33**—1530.33 nm, corresponds to 50-GHz and 100-GHz grids
- **1530.72**—1530.72 nm, corresponds to a 50-GHz grid
- **1531.12**—1531.12 nm, corresponds to 50-GHz and 100-GHz grids
- **1531.51**—1531.51 nm, corresponds to a 50-GHz grid
- **1531.90**—1531.90 nm, corresponds to 50-GHz and 100-GHz grids
- **1532.29**—1532.29 nm, corresponds to a 50-GHz grid
- **1532.68**—1532.68 nm, corresponds to 50-GHz and 100-GHz grids
- **1533.07**—1533.07 nm, corresponds to a 50-GHz grid
- **1533.47**—1533.47 nm, corresponds to 50-GHz and 100-GHz grids
- **1533.86**—1533.86 nm, corresponds to a 50-GHz grid
- **1534.25**—1534.25 nm, corresponds to 50-GHz and 100-GHz grids
- **1534.64**—1534.64 nm, corresponds to a 50-GHz grid

- **1535.04**—1535.04 nm, corresponds to 50-GHz and 100-GHz grids
- **1535.43**—1535.43 nm, corresponds to a 50-GHz grid
- **1535.82**—1535.82 nm, corresponds to 50-GHz and 100-GHz grids
- **1536.22**—1536.22 nm, corresponds to a 50-GHz grid
- **1536.61**—1536.61 nm, corresponds to 50-GHz and 100-GHz grids
- **1537.00**—1537.00 nm, corresponds to a 50-GHz grid
- **1537.40**—1537.40 nm, corresponds to 50-GHz and 100-GHz grids
- **1537.79**—1537.79 nm, corresponds to a 50-GHz grid
- **1538.19**—1538.19 nm, corresponds to 50-GHz and 100-GHz grids
- **1538.58**—1538.58 nm, corresponds to a 50-GHz grid
- **1538.98**—1538.98 nm, corresponds to 50-GHz and 100-GHz grids
- **1539.37**—1539.37 nm, corresponds to a 50-GHz grid
- **1539.77**—1539.77 nm, corresponds to 50-GHz and 100-GHz grids
- **1540.16**—1540.16 nm, corresponds to a 50-GHz grid
- **1540.56**—1540.56 nm, corresponds to 50-GHz and 100-GHz grids
- **1540.95**—1540.95 nm, corresponds to a 50-GHz grid
- **1541.35**—1541.35 nm, corresponds to 50-GHz and 100-GHz grids
- **1541.75**—1541.75 nm, corresponds to a 50-GHz grid
- **1542.14**—1542.14 nm, corresponds to 50-GHz and 100-GHz grids
- **1542.54**—1542.54 nm, corresponds to a 50-GHz grid
- **1542.94**—1542.94 nm, corresponds to 50-GHz and 100-GHz grids
- **1543.33**—1543.33 nm, corresponds to a 50-GHz grid
- **1543.73**—1543.73 nm, corresponds to 50-GHz and 100-GHz grids
- **1544.13**—1544.13 nm, corresponds to a 50-GHz grid
- **1544.53**—1544.53 nm, corresponds to 50-GHz and 100-GHz grids
- **1544.92**—1544.92 nm, corresponds to a 50-GHz grid
- **1545.32**—1545.32 nm, corresponds to 50-GHz and 100-GHz grids
- **1545.72**—1545.72 nm, corresponds to a 50-GHz grid
- **1546.12**—1546.12 nm, corresponds to 50-GHz and 100-GHz grids
- **1546.52**—1546.52 nm, corresponds to a 50-GHz grid
- **1546.92**—1546.92 nm, corresponds to 50-GHz and 100-GHz grids
- **1547.32**—1547.32 nm, corresponds to a 50-GHz grid
- **1547.72**—1547.72 nm, corresponds to 50-GHz and 100-GHz grids

- **1548.11**—1548.11 nm, corresponds to a 50-GHz grid
- **1548.51**—1548.51 nm, corresponds to 50-GHz and 100-GHz grids
- **1548.91**—1548.91 nm, corresponds to a 50-GHz grid
- **1549.32**—1549.32 nm, corresponds to 50-GHz and 100-GHz grids
- **1549.72**—1549.72 nm, corresponds to a 50-GHz grid
- **1550.12**—1550.12 nm, corresponds to 50-GHz and 100-GHz grids
- **1550.52**—1550.52 nm, corresponds to a 50-GHz grid
- **1550.92**—1550.92 nm, corresponds to 50-GHz and 100-GHz grids
- **1551.32**—1551.32 nm, corresponds to a 50-GHz grid
- **1551.72**—1551.72 nm, corresponds to 50-GHz and 100-GHz grids
- **1552.12**—1552.12 nm, corresponds to a 50-GHz grid
- **1552.52**—1552.52 nm, corresponds to 50-GHz and 100-GHz grids
- **1552.93**—1552.93 nm, corresponds to a 50-GHz grid
- **1553.33**—1554.33 nm, corresponds to 50-GHz and 100-GHz grids
- **1553.73**—1554.73 nm, corresponds to a 50-GHz grid
- **1554.13**—1554.13 nm, corresponds to 50-GHz and 100-GHz grids
- **1554.54**—1554.54 nm, corresponds to a 50-GHz grid
- **1554.94**—1554.94 nm, corresponds to 50-GHz and 100-GHz grids
- **1555.34**—1555.34 nm, corresponds to a 50-GHz grid
- **1555.75**—1555.75 nm, corresponds to 50-GHz and 100-GHz grids
- **1556.15**—1556.15 nm, corresponds to a 50-GHz grid
- **1556.55**—1556.55 nm, corresponds to 50-GHz and 100-GHz grids
- **1556.96**—1556.96 nm, corresponds to a 50-GHz grid
- **1557.36**—1557.36 nm, corresponds to 50-GHz and 100-GHz grids
- **1557.77**—1557.77 nm, corresponds to a 50-GHz grid
- **1558.17**—1558.17 nm, corresponds to 50-GHz and 100-GHz grids
- **1558.58**—1558.58 nm, corresponds to a 50-GHz grid
- **1558.98**—1558.98 nm, corresponds to 50-GHz and 100-GHz grids
- **1559.39**—1559.39 nm, corresponds to a 50-GHz grid
- **1559.79**—1559.79 nm, corresponds to 50-GHz and 100-GHz grids
- **1560.20**—1560.20 nm, corresponds to a 50-GHz grid
- **1560.61**—1560.61 nm, corresponds to 50-GHz and 100-GHz grids
- **1561.01**—1561.01 nm, corresponds to a 50-GHz grid

- **1561.42**—1561.42 nm, corresponds to 50-GHz and 100-GHz grids
- **1561.83**—1561.83 nm, corresponds to a 50-GHz grid
- **1562.23**—1562.23 nm, corresponds to 50-GHz and 100-GHz grids
- **1562.64**—1562.64 nm, corresponds to a 50-GHz grid
- **1563.05**—1563.05 nm, corresponds to 50-GHz and 100-GHz grids
- **1563.45**—1563.45 nm, corresponds to a 50-GHz grid
- **1563.86**—1563.86 nm, corresponds to 50-GHz and 100-GHz grids
- **1564.27**—1564.27 nm, corresponds to a 50-GHz grid
- **1564.68**—1564.68 nm, corresponds to 50-GHz and 100-GHz grids
- **1565.09**—1565.09 nm, corresponds to a 50-GHz grid
- **1565.50**—1565.50 nm, corresponds to 50-GHz and 100-GHz grids
- **1565.90**—1565.90 nm, corresponds to a 50-GHz grid
- **1566.31**—1566.31 nm, corresponds to 50-GHz and 100-GHz grids
- **1566.72**—1566.72 nm, corresponds to a 50-GHz grid
- **1567.13**—1567.13 nm, corresponds to 50-GHz and 100-GHz grids
- **1567.54**—1567.54 nm, corresponds to a 50-GHz grid
- **1567.95**—1567.95 nm, corresponds to 50-GHz and 100-GHz grids
- **1568.36**—1568.36 nm, corresponds to a 50-GHz grid
- **1568.77**—1568.77 nm, corresponds to 50-GHz and 100-GHz grids

**Default:** 1550.12—1550.12 nm, corresponds to 50-GHz and 100-GHz grids

## action-profile (Defining for CFM)

---

**Syntax**    `action-profile profile-name {`  
              `event {`  
                  `ais-trigger-condition {`  
                      `adjacency-loss;`  
                      `all-defects;`  
                      `cross-connect-ccm;`  
                      `erroneous-ccm;`  
                      `receive-ais;`  
                      `}`  
                  `interface-status-tlv (down | lower-layer-down);`  
                  `port-status-tlv blocked;`  
                  `rdi;`  
                  `}`  
              `action {`  
                  `interface-down;`  
                  `log-and-generate-ais {`  
                      `interval(1m | 1s);`  
                      `level value;`  
                      `priority value;`  
                      `}`  
                  `}`  
              `default-actions {`  
                  `interface-down;`  
                  `}`  
              `}`

**Hierarchy Level**    [edit protocols oam ethernet [connectivity-fault-management](#)]

**Release Information**    Statement introduced in Junos OS Release 8.4.

**Description**    Configure a name and default action for an action profile.

**Options**    *profile-name*—Name of the action profile.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege**    interface—To view this statement in the configuration.  
                  **Level**    interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the threshold value for average frame delay, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.</p> <p>Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.</p> |

| Release Information      | Statement introduced in Junos OS Release 15.1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | <p>Configure the threshold value for average frame delay variation, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay variation is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.</p> <p>Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics. In two-way ETH-DM mode, frame delay and frame delay variation values are based on the time difference between when the initiator MEP transmits a request frame and receives a reply frame from the responder MEP, subtracting the time elapsed at the responder MEP.</p> |

| <b>Description</b>              | <p>Configure the threshold value for average frame loss ratio, in milli-percent, in the upstream or forward direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average forward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. SNMP traps are triggered if you configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold. If you do not configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold, no SNMP traps are generated. You can configure these threshold values with an SLA iterator for ETH-SLM and ETH-LM.</p> <p>ETH-SLM is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic.</p> |

| Description              | <p>Configure the threshold value for average frame loss ratio, in milli-percent, in the backward or downstream direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average backward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. SNMP traps are triggered if you configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold. If you do not configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold, no SNMP traps are generated. You can configure these threshold values with an SLA iterator for ETH-SLM and ETH-LM.</p> <p>ETH-SLM is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic.</p> |

| <b>Description</b>              | <p>Enable loss-threshold-tlv transmission.</p> <p>During a unified ISSU, the control plane may go down for several seconds and cause CFM continuity check packets to get dropped. This may cause the remote maintenance endpoint (MEP) to detect a connectivity loss and mark the MEP as down. To keep the MEP active during a unified ISSU, the loss threshold TLV communicates the minimum threshold value the receiving MEP requires to keep the MEP active. The receiving MEP parses the TLV and updates the loss threshold value, but only if the new threshold value is greater than the locally configured threshold value. You can control the transmission of the loss threshold TLV in continuity check messages PDUs. The <b>convey-loss-threshold</b> statement specifies that the loss threshold TLV must be transmitted as part of the continuity check messages. If the statement is not specified, continuity check messages transmit this TLV only when a unified ISSU is in progress.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Specify whether Ethernet OAM continuity checks are performed for an individual remote maintenance end point (MEP).</p> <p>When you configure the <b>detect-loc</b> statement at [edit protocols oam <b>ethernet link-fault-management interface</b> <i>interface-name</i>] hierarchy level, a loss-of-continuity (LOC) defect is raised when the peer is not found within a period that is equal to 3 times the current keepalive pdu interval. When an LOC defect is raised, a syslog error message is generated.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> When you configure the <b>detect-loc</b> statement at the [edit protocols oam <b>ethernet link-fault-management interface</b> <i>interface-name</i>] hierarchy level, any action-profile configured to bring down the interface is executed when an LOC defect is detected. However, the action-profile is not executed if you have not configured <b>detect-loc</b> statement the <b>detect-loc</b> statement at the [edit protocols oam <b>ethernet link-fault-management interface</b> <i>interface-name</i>] hierarchy level.</p> </div> <p>To view the current LOC status of an interface, execute the <b>show oam ethernet link-fault-management</b> command.</p> |
| <b>Default</b>                  | The MEP does not generate LOC defect messages by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.2R1 for MX Series routers.                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Enables enhanced CFM mode. When you enable enhanced CFM mode, Junos OS supports 32,000 maintenance association end points (MEPs) and maintenance intermediate points (MIPs) each per chassis for bridge, VPLS, L2VPN, and CCC domains. To support enhanced CFM mode, configure the network services mode on the router as <b>enhanced-ip</b> . |
|                                 | <div>  <p><b>NOTE:</b> After enabling CFM mode, restart CFM for the changes to take effect. If you do not restart CFM, CFM automatically restarts after 1 minute.</p> </div>                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.2R1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Enables damping of jnxSoamPmThresholdCrossingAlarm traps sent to the network management system (NMS) by summarizing the flap occurrences over a period of time and sends a single jnxSoamPmThresholdFlapAlarm notification to the NMS. You can enable damping at the global level for the iterator or you can enable damping at the individual threshold type of an iterator. You can specify the duration of time for summarizing flap occurrences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## hardware-assisted-keepalives

**Syntax** hardware-assisted-keepalives [enable | disable];

**Hierarchy Level** [edit protocols [oam ethernet connectivity-fault-management performance-monitoring](#)]

**Release Information** Statement introduced in Junos OS Release 14.2R1.

**Description** For Ethernet interfaces on Modular Port Concentrators (MPCs) in MX Series routers only, delegate the transmission of the continuity check messages (CCMs) to the forwarding ASIC (that is, to the hardware) by enabling inline transmission of CCMs. Inline transmission of CCMs is also known as Inline-KA.

By default, CCMs are transmitted by the CPU of the MPC and not by the hardware. If the duration between transmissions of CCMs is low or if the CCMs for a specific line card scale, we recommend that you enable delegation of the transmission of CCMs to the hardware. By enabling inline transmission of CCMs, you can achieve maximum scaling of CCMs.

**NOTE:** The supported CCM interval values for MPC7E and MPC2E NG Q (MPC2E-3D-NG-Q) are 100ms, 10ms, and 1s.

**Default** Inline transmission is disabled by default.

**Options** **enable**—Enable inline transmission of CCMs.

**NOTE:** Inline transmission of CCMs is not enabled when there is a CFM session already established. To enable inline transmission, you must first deactivate the CFM session using the **deactivate** command and then reactivate the CFM session using the **activate** command.

**disable**—Disable inline transmission of CCMs.

**NOTE:** After disabling inline transmission of CCMs, you must reboot the router for the changes to take effect.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.3R1 for MX Series Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Configure CFM to propagate the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages when the interface is down. When the status of the EVPN provider edge device is standby, the EVPN VPWS service is notified and it sets the interface status to CCC-down. When the interface status is CCC-down, it indicates that the provider edge service is down. When you enable CFM monitoring, CFM propagates the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages. Thus, the customer edge device is aware that the provider edge device is down.</p> <p>Usually, when the interface goes down, CFM propagates the status of the provider edge device via the interface status TLV. If the customer edge device does not support the interface status TLV, you can use the RDI bit to propagate the status of the provider edge device.</p> |

| <b>Description</b>         | <p>Configure the interval between successive transmissions of continuity check messages (CCMs) as part of the connectivity fault detection strategy. When the receiving maintenance association end point (MEP) does not receive a CCM at the configured interval, the <b>loss-threshold</b> statement determines how many CCMs can be lost before the sending MEP is marked as down. The <b>hold-interval</b> statement then determines the frequency at which the database of MEPs in the maintenance association (MA) is flushed in the absence of updates.</p> <p>During a unified in-service software upgrade (ISSU), Junos OS connectivity fault management (CFM) works when the peer device is not a Juniper Networks router. Interoperating with the router of another vendor, the Juniper Networks router retains session information and continues to transmit CCM (continuity check message) PDUs during the unified ISSU upgrade. For this feature to work, you must enable Packet Forwarding Engine keepalives with the <b>hardware-assisted-keepalives</b> statement, and configure the interval between CCMs to be 1 second with <b>interval</b> statement.</p> |
|                            | <p> <b>NOTE:</b> For the continuity check message interval to be configured for 10 milliseconds, periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine by default. You can disable PPM only on the Packet Forwarding Engine. To disable PPM on the Packet Forwarding Engine, use the <b>no-delegate-processing</b> statement at the <code>[edit routing-options ppm]</code> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                            | <p> <b>NOTE:</b> A continuity check interval of 10 milliseconds is not supported for CFM sessions over a label-switched interface (LSI).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## interval (CFM MEP)

**Syntax** interval (1m | 1s);

**Hierarchy Level** [edit protocols oam ethernet connectivity-fault-management action-profile  
*action-profile-name* action log-and-generate-ais]

**Release Information** Statement introduced in Junos OS Release 14.2.

**Description** Configure the interval between AIS messages that are to be received by the MEP as either 1 minute or 1 second.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

```

**Hierarchy Level** [edit protocols **oam** **ethernet** **connectivity-fault-management**]

**Release Information** Statement introduced in Junos OS Release 8.4.  
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.  
Support for multiple down MEP introduced in Junos OS Release 15.1R1 for MX Series Routers.

**Description** Configure the name of the maintenance domain in IEEE-compliant format.

**NOTE:** For MX Series Routers, you can configure multiple down MEPs for a single instance of maintenance domain identifier and maintenance

association name to monitor services provided on Virtual Private LAN Service (VPLS), bridge, circuit cross-connect (CCC), and IPv4 domains.

.....

**Options**    *domain-name*—Name of the maintenance domain.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**                    interface-control—To add this statement to the configuration.

**Related**                • [Creating a Maintenance Domain on page 608](#)

## measurement-interval

---

**Syntax**    `measurement-interval (5|15|30|60)`

**Hierarchy Level**    `[edit protocols oam ethernet cfm performance-monitoring]`  
`[edit protocols oam ethernet cfm performance-monitoring sla-iterator-profiles profile-name]`

### Release Information

**Description**    Configure measurement interval to be used for a performance monitoring session. You must configure the measurement-interval at the `[edit protocols oam ethernet cfm performance-monitoring]` hierarchy level, which is a global level parameter. You can override the configured value by specifying a measurement-interval for the iterator profile at the `[edit protocols oam ethernet cfm performance-monitoring sla-iterator-profiles profile-name]` hierarchy level.

.....  
**NOTE:** When you configure when MEF-36-compliant performance monitoring, you must also configure an enhanced-sla-iterator at the `[edit protocols oam ethernet cfm performance-monitoring]` hierarchy level.  
.....

**Default**    15 minutes

**Required Privilege Level**    `configure`—To enter configuration mode.  
                                         `control`—To modify any configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1.<br>The <b>statistical-loss-measurement</b> option introduced in Junos OS Release 11.2.                                                                                                                                                                                  |
| <b>Description</b>              | Configure the measurement type for the service level agreement (SLA) frames. An SLA frame is a type of packet used to measure frame loss in Ethernet connections.                                                                                                                                                      |
| <b>Options</b>                  | <p><b>loss</b>—Use Y.1731-compliant line module (LM) frames to measure frame loss.</p> <p><b>statistical-loss-measurement</b>— Use Y.1731-compliant two-way data module (DM) frames to statistically measure frame loss.</p> <p><b>two-way-delay</b>—Use Y.1731-compliant two-way DM frames to measure frame loss.</p> |
| <b>Required Privilege Level</b> | Configure—To enter configuration mode.<br>Control—To modify any configuration.                                                                                                                                                                                                                                         |

## performance-monitoring

---

**Syntax**

```
performance-monitoring {
 delegate-server-processing;
 hardware-assisted-timestamping;
 hardware-assisted-keepalives;
 sla-iterator-profiles {
 profile-name {
 avg-fd-twoway-threshold;
 avg-ifdv-twoway-threshold;
 avg-flr-forward-threshold;
 avg-flr-backward-threshold;
 disable;
 calculation-weight {
 delay delay-weight;
 delay-variation delay-variation-weight;
 }
 cycle-time milliseconds;
 iteration-period connections;
 measurement-type (loss | statistical-frame-loss | two-way-delay);
 }
 }
}
```

**Hierarchy Level** [edit protocols [oam ethernet connectivity-fault-management](#)]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** Specify performance monitoring support for Ethernet frame delay measurement.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** Configure—To enter configuration mode.  
Control—To modify any configuration.

| <b>Description</b>              | <p>Configures Junos OS to send the sender ID TLV along with the packets. The sender ID TLV is an optional TLV that is sent in continuity check messages (CCMs), loopback messages, and Link Trace Messages (LTMs), as specified in the IEEE 802.1ag standard. TLVs (type, length, and value) are described in the IEEE 802.1ag standard for Connectivity Fault Management (CFM) as a method of encoding variable-length and optional information in a protocol data unit (PDU).</p> |

## sla-iterator-profiles

---

**Syntax**    sla-iterator-profiles {  
              *profile-name* {  
                  avg-fd-twoway-threshold;  
                  avg-ifdv-twoway-threshold;  
                  avg-flr-forward-threshold;  
                  avg-flr-backward-threshold;  
                  calculation-weight {  
                      delay *delay-weight*;  
                      delay-variation *delay-variation-weight*;  
                  }  
                  cycle-time *milliseconds*;  
                  flap-trap-monitor *seconds*  
                  iteration-period *iteration-period-value*;  
                  measurement-type (loss | statistical-frame-loss | two-way-delay);  
              }  
          }

**Hierarchy Level**    [edit protocols [oam ethernet connectivity-fault-management performance-monitoring](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1.

**Description**    Configure an iterator application and specify the iterator profile options.

**Options**    *profile-name*—Name of the iterator profile. For more information about configuring the iterator profile, see [“Configuring an Iterator Profile” on page 749](#).

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    Configure—To enter configuration mode.  
                                  Control—To modify any configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.<br>Statement introduced in Junos OS Release 13.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | <p>For Gigabit Ethernet intelligent queuing (IQ) interfaces only, accept traffic from and to the specified remote media access control (MAC) address.</p> <p>The <b>accept-source-mac</b> statement is equivalent to the <b>source-address-filter</b> statement, which is valid for aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only. To allow the interface to receive packets from specific MAC addresses, include the <b>accept-source-mac</b> statement.</p> <p>On untagged Gigabit Ethernet interfaces, you should not configure the <b>source-address-filter</b> statement and the <b>accept-source-mac</b> statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the <b>source-address-filter</b> statement and the <b>accept-source-mac</b> statement with an identical MAC address specified in both filters.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |

**NOTE:** The **policer** statement is not supported on PTX Series Packet Transport Routers.

**NOTE:** On QFX platforms, if you configure source MAC addresses for an interface using the *static-mac* or *persistent-learning* statements and later configure a different MAC address for the same interface using the **accept-source-mac** statement, the MAC addresses that you previously configured for the interface remain in the ethernet-switching table and can still be used to send packets to the interface.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## action-profile (Defining for LFM)

---

**Syntax**    `action-profile profile-name {  
                  action {  
                    link-down;  
                    send-critical-event;  
                    syslog;  
                  }  
                  event {  
                    link-adjacency-loss;  
                    link-event-rate {  
                      frame-error count;  
                      frame-period count;  
                      frame-period-summary count;  
                      symbol-period count;  
                    }  
                    protocol-down;  
                  }  
                }`

**Hierarchy Level**    [edit protocols [oam](#) [ethernet](#) [link-fault-management](#)]

**Release Information**    Statement introduced in Junos OS Release 8.5.

**Description**    Configure a name, one or more actions, and the events that trigger the action for an action profile.

**Options**    *profile-name*—Name of the action profile.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family *family*],

[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the interface address.

**Options** *address*—Address of the interface.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, and the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
 xe-0/0/0 {
 unit 0 {
 family inet {
 address 192.168.1.1/8;
 }
 }
 }
 xe-0/0/1 {
 unit 0 {
 family inet {
 address 192.168.1.1/8;
 }
 }
 }
}
```

For more information on configuring the same address on multiple interfaces, see *Configuring the Interface Address*.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

```

**Hierarchy Level** [edit protocols pppoe service-name-tables *table-name* **service** *service-name*]

**Release Information** Statement introduced in Junos OS Release 10.0.  
**drop**, **delay**, **terminate**, **dynamic-profile**, **routing-instance**, and **static-interface** options introduced in Junos OS Release 10.2.

**Description** Specify the action taken by the interface for the specified agent circuit identifier/agent remote identifier (ACI/ARI) pair when the interface receives a PPPoE Active Discovery Initiation (PADI) control packet that includes the vendor-specific tag with ACI/ARI pair information. You can configure an ACI/ARI pair for a named service, **empty** service, or **any** service in a PPPoE service name table. A maximum of 8000 ACI/ARI pairs are supported per PPPoE service name table. You can distribute the ACI/ARI pairs in any combination among the named, **empty**, and **any** service entries in the service name table.

You can use an asterisk (\*) as a wildcard character to match ACI/ARI pairs, the ACI alone, or the ARI alone. The asterisk can be placed only at the beginning, the end, or both the beginning and end of the identifier string. You can also specify an asterisk alone for either the ACI or the ARI. You cannot specify only an asterisk for both the ACI and the ARI. When you specify a single asterisk as the identifier, that identifier is ignored in the PADI packet.

For example, suppose you care about matching only the ACI and do not care what value the ARI has in the PADI packet, or even whether the packet contains an ARI value. In this case you can set the **remote-id-string** to a single asterisk. Then the interface ignores the ARI received in the packet and the interface takes action based only on matching the specified ACI.

**Default** The default action is terminate.

**Options** **aci *circuit-id-string***—Identifier for the agent circuit ID that corresponds to the DSLAM interface that initiated the service request. This is a string of up to 63 characters.

**ari *remote-id-string***—Identifier for the subscriber associated with the DSLAM interface that initiated the service request. This is a string of up to 63 characters.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## arp (Interfaces)

**Syntax** `arp ip-address (mac | multicast-mac) mac-address publish;`

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address*],  
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*  
family inet address *address*]

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries, mapping IP addresses to MAC addresses.

**NOTE:** By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the family inet statement. By including the arp statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet policer] hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the unnumbered-address statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] hierarchy level.

**Options** *ip-address*—IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing **address** statement.

*mac mac-address*—MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, 0000.5e00.5355 or 00:00:5e:00:53:55.

*multicast-mac mac-address*—Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, 0000.5e00.5355 or 00:00:5e:00:53:55.

**publish**—(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.

**NOTE:** For unicast MAC addresses only, if you include the **publish** option, the router or switch replies to proxy ARP requests.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

---

## asynchronous-notification

---

**Syntax** (asynchronous-notification | no-asynchronous-notification);

**Hierarchy Level** [edit interfaces *ge-fpc/pic/port* gigether-options ]

**Release Information** Statement introduced in Junos OS Release 8.3.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description** (MX Series routers, T Series routers) For all Gigabit Ethernet interfaces (1-Gigabit, 10-Gigabit, and 100-Gigabit), configure support for notification of link down alarm generation and transfer.

(M120 and M320 routers) For all 10-Gigabit Ethernet PIC interfaces, configure support for notification of link down alarm generation and transfer.

- **asynchronous-notification**—Support notification of link down alarm generation and transfer.
- **no-asynchronous-notification**—Prohibit notification of link down alarm generation and transfer.

**Default** Support for notification of link down alarm generation and transfer is not enabled.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## auto-negotiation

---

|                            |                                                                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | (auto-negotiation   no-auto-negotiation) <remote-fault (local-interface-online   local-interface-offline)>;                                                                                                                      |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> ether-options],<br>[edit interfaces <i>interface-name</i> <b>gigether-options</b> ],<br>[edit interfaces <i>ge-pim</i> /0/0 <b>switch-options</b> <b>switch-port</b> <i>port-number</i> ] |
| <b>Release Information</b> | Statement introduced in Junos OS Release 7.6.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.                  |
| <b>Description</b>         | For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series switches, explicitly enable autonegotiation only.  |

- **auto-negotiation**—Enables autonegotiation. This is the default.
- **no-auto-negotiation**—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed.

When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.

**NOTE:** On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:

1. Delete the **no-auto-negotiation** statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set **no-auto-negotiation**, and commit the configuration.

---

On EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

**NOTE:** On T4000 routers, the **auto-negotiation** command is ignored for interfaces other than Gigabit Ethernet.

---

**NOTE:** On ACX Series routers, when you configure fiber interfaces (fiber media mode) to operate at 1 Gbps, you need to always enable autonegotiation (auto-negotiation) to negotiate the speed and duplex settings. You cannot disable autonegotiation (no-auto-negotiation) in the fiber media mode. In copper interfaces (copper media mode), autonegotiation is enabled by default. To disable autonegotiation, you need to explicitly configure the link speed to 10 or 100 Mbps, set no-auto-negotiation, and commit the configuration.

**Default** Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.

**Options** **remote-fault (local-interface-online | local-interface-offline)**—(Optional) For M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers only, manually configure remote fault on an interface.

**Default:** local-interface-online

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## bridge-domains

**Syntax**

```
bridge-domains {
 bridge-domain-name {
 bridge-options {
 ...bridge-options-configuration...
 }
 domain-type bridge;
 interface interface-name;
 no-irb-layer-2-copy;
 no-local-switching;
 routing-interface routing-interface-name;
 vlan-id (all | none | number);
 vlan-id-list [vlan-id-numbers];
 vlan-tags outer number inner number;
 bridge-options {
 interface interface-name {
 mac-pinning
 static-mac mac-address;
 }
 interface-mac-limit limit;
 mac-statistics;
 mac-table-size limit;
 no-mac-learning;
 }
 }
}
```

**Hierarchy Level** [edit],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name*],  
[edit routing-instances *routing-instance-name*]

**Release Information** Statement introduced in Junos OS Release 8.4.  
Support for logical systems added in Junos OS Release 9.6.  
Support for the **no-irb-layer-2-copy** statement added in Junos OS Release 10.2.

**Description** (MX Series routers only) Configure a domain that includes a set of logical ports that share the same flooding or broadcast characteristics in order to perform Layer 2 bridging.

**Options** *bridge-domain-name*—Name of the bridge domain.

**NOTE:** You cannot use the slash (/) character as part of the bridge domain name. If you do, the configuration will not commit.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

**Related** • *Configuring a Bridge Domain*  
**Documentation** • *Configuring a Layer 2 Virtual Switch*

## bfd-liveness-detection (LAG)

**Syntax**

```

bfd-liveness-detection {
 authentication {
 algorithm algorithm-name;
 key-chain key-chain-name;
 loose-check;
 }
 detection-time {
 threshold milliseconds;
 }
 holddown-interval milliseconds;
 local-address bfd-local-address;
 minimum-interval milliseconds;
 minimum-receive-interval milliseconds;
 multiplier number;
 neighbor bfd-neighbor-address;
 no-adaptation;
 transmit-interval {
 minimum-interval milliseconds;
 threshold milliseconds;
 }
 version (1 | automatic);
}

```

**Hierarchy Level** [edit interfaces *aex* aggregated-ether-options]

**Release Information** Statement introduced in Junos OS Release 13.3.

**Description** Configure Bidirectional Forwarding Detection (BFD) timers and authentication for aggregated Ethernet interfaces.

**Options** **holddown-interval *milliseconds***— Specify a time limit, in milliseconds, indicating the time that a BFD session remains up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

**Range:** 0 through 255,000

**Default:** 0

**local-address *bfd-local-address***— Specify the loopback address or the AE interface address of the source of the BFD session.

**NOTE:** Beginning with Release 16.1R2, Junos OS checks and validates the configured micro BFD **local-address** against the interface or loopback IP address before the configuration commit. Junos OS performs this check on both IPv4 and IPv6 micro BFD address configurations, and if they do not match, the commit fails.

**minimum-interval *milliseconds***— Specify a minimum time interval after which the local routing device transmits a BFD packet and then expects to receive a reply from the BFD neighbor. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** statement.

**Range:** 1 through 255,000

**minimum-receive-interval *milliseconds***— Specify the minimum time interval after which the routing device expects to receive a reply from the BFD neighbor.

**Range:** 1 through 255,000

**multiplier *number***— Specify the number of BFD packets that were not received by the BFD neighbor before the originating interface is declared down.

**Range:** 1 through 255

**neighbor *bfd-neighbor-address***— Specify the loopback address or the AE interface address of a remote destination to send BFD packets.

**no-adaptation**— Disable the BFD adaptation. Include this statement if you do not want the BFD sessions to adapt to changing network conditions. We recommend that you do not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**version**— Configure the BFD version to detect (BFD version 1) or autodetect (the BFD version).

**NOTE:** The version option is not supported on the QFX Series.

---

**Default:** automatic

The remaining statements are explained separately. See [CLI Explorer](#).

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Specify whether captive portal authentication needs to be enabled or disabled. You can set up captive portal authentication (hereafter referred to as captive portal) on a switch to redirect Web browser requests to a login page that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network. |
| <b>Default</b>                  | Not enabled                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b> | Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>         | Specify the design elements of a captive portal login page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>banner-message</b>—The first screen displayed before the captive portal login page is displayed—for example, a disclaimer message.<br/><b>Range:</b> 1–2047 characters</p> <p><b>footer-bgcolor</b> —The hexadecimal color code for the color of the footer bar across the bottom of the captive portal login page—for example, #2E8B57 (sea green).<br/><b>Values:</b> # symbol followed by six characters.</p> <p><b>footer-message</b>—Text message displayed in the footer bar across the bottom of the captive portal login page.<br/><b>Range:</b> 1–2047 characters<br/><b>Default:</b> Copyright ©2010, Juniper Networks Inc.</p> <p><b>footer-text-color</b> — Color of the text in the footer.<br/><b>Default:</b> The default color is white.</p> <p><b>form-header-bgcolor</b> —The hexadecimal color code for the background color of the header bar across the top of the form area of the captive portal login page.<br/><b>Values:</b> # symbol followed by six characters.</p> <p><b>form-header-message</b>—Text message displayed in the header bar across the top of the form area of the captive portal login page.<br/><b>Range:</b> 1–255 characters</p> |

**Default: Captive Portal User Authentication**

**form-header-text-color**—Color of the text in the form header.

**Default:** The default color is black.

**form-reset-label**—Label displayed in the button that the user can select to clear the username and password fields on the form.

**Range:** 1–255 characters

**Default:** Reset

**form-submit-label**—Label displayed in the button that the user selects to submit their login information—for example, **Log In**.

**Range:** 1–255 characters

**Default:** Log In

**header-bgcolor**—The hexadecimal color code for the color of the header bar across the top of the captive portal login page.

**Values:** # symbol followed by six characters.

**header-logo**—Filename of the file containing the image of the logo displayed at the top of the captive portal login page. The image file can be in GIF, JPEG, or PNG format.

**Default:** The Juniper Networks logo

**header-message**—Text displayed in the header bar across the bottom of the captive portal login page.

**Range:** 1–2047 characters

**Default:** User Authentication

**header-text-color**—Color of the text in the header.

**Default:** The default color is white.

**post-authentication-url**—URL to which the users are directed upon successful authentication—for example **www.mycafe.com**.

**Range:** 1–255 characters

**Default:** The page originally requested by the user.

| <b>Description</b>              | <p>Disable distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all PPM processing for LACP packets on the Routing Engine.</p> <p>This statement disables distributed PPM processing for only LACP packets. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the <b>no-delegate-processing</b> statement in the [edit routing-options ppm] hierarchy.</p> <div><p><b>BEST PRACTICE:</b> We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.</p></div> |
| <b>Default</b>                  | Distributed PPM processing is enabled for all packets that use PPM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>         | <p>Specify the set of ciphers used to encrypt traffic on an Ethernet link that is secured with Media Access Control Security (MACsec). The encryption used by MACsec ensures that the data in the Ethernet frame cannot be viewed by anybody monitoring traffic on the link. MACsec encryption is optional and user-configurable.</p> <p>MACsec utilizes the Galois/Counter Mode Advanced Encryption Standard (GCM-AES). The default cipher suite used for MACsec is GCM-AES-128, with a maximum key length of 128 bits. MACsec also supports GCM-AES-256, with a maximum key length of 256 bits.</p> <p>GCM-AES-128 and GCM-AES-256 use a 32-bit packet number as part of the initial value that has to be unique for every packet sent with a given secure association key (SAK). When the permutations of the 32-bit packet number are exhausted, the SAK must be refreshed. The frequency of SAK refreshes can be reduced by using a cipher suite with Extended Packet Numbering (XPN), which increases the size of the packet number to 64-bits. Both GCM-AES-128 and GCM-AES-256 are available with XPN.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 20px;"> <p> <b>NOTE:</b> When enabling MACsec on a QFX10016 or QFX10008 switch, we recommend using either the GCM-AES-XPN-128 or GCM-AES-XPN-256 cipher suite.</p> </div> |
| <b>Default</b>             | If the <code>cipher-suite</code> statement is not configured, the default cipher suite used for encryption is GCM-AES-128.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## ckn (MX Series)

---

**Syntax** *ckn hexadecimal-number;*

**Hierarchy Level** [edit security macsec connectivity-association *connectivity-association-name* pre-shared-key]

**Release Information** Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description** Specifies the connectivity association key name (CKN) for a pre-shared key.

A pre-shared key includes a CKN and a connectivity association key (CAK). A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using dynamic security keys. The MACsec Key Agreement (MKA) protocol is enabled once the pre-shared keys are successfully exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link

**Default** No CKN exists, by default.

**Options** *hexadecimal-number*—The key name, in hexadecimal format.

The key name is 32 hexadecimal characters in length. If you enter a key name that is less than 32 characters long, the remaining characters are set to 0.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## community-vlans (MX Series)

**Syntax** `community-vlans [ number number-number ];`

**Hierarchy Level** [edit [bridge-domains](#) *bridge-domain-name* ],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*  
[bridge-domains](#) *bridge-domain-name* bridge-options],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name*  
[bridge-domains](#) *bridge-domain-name* ,  
 [edit routing-instances *routing-instance-name* [bridge-domains](#) *bridge-domain-name* ],

**Release Information** Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers.

**Description** Configure the specified community VLAN to be a secondary VLAN of the specified primary VLAN. A *community* VLAN is used to transport frames among members of a community, which is a subset of users within the VLAN, and to forward frames upstream to the primary VLAN.

**NOTE:** When you specify this configuration statement, the VLAN ID of a logical interface that you associate with a bridge domain that matches with the VLAN ID or list of IDs that you specify using the `community-vlans` state is treated as a community port.

**Options** *number*—Individual VLAN IDs separated by a space.

**Required Privilege Level** system—To view this statement in the configuration.  
 system—control—To add this statement to the configuration.

| <b>Description</b>              | Specify the compatible version mode to be used. When compatibility-version is set to value 1, the node operates in ITU-T Recommendation G.8032/Y.1344 version 1 compatible mode. In this mode all the supported external commands are blocked, ring-id is forced to be 1 and mode of operation is set to revertive mode. |

 }  
 security-mode security-mode;  
}`

**Hierarchy Level** [edit security macsec]

**Release Information** Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description** Create or configure a MACsec connectivity association.

A connectivity association is not applying MACsec to traffic until it is associated with an interface. MACsec connectivity associations are associated with interfaces using the **interfaces** statement in the [edit security macsec] hierarchy.

**Default** No connectivity associations are present, by default.

**Options** *connectivity-association-name*—Name of the MACsec connectivity association.  
**Range:** 1 through 32 alphanumeric characters. Allowed characters are [a-z, A-Z, 0-9]

The remaining statements are explained separately.

**Hierarchy Level** [edit protocols [oam](#) [ethernet](#)]

**Release Information** Statement introduced in Junos OS Release 8.4.

**Description** For Ethernet interfaces on M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M120, M320, MX Series, and T Series routers, specify connectivity fault management for IEEE 802.1ag Operation, Administration, and Management (OAM) support. In Junos OS Release 9.3 and later, this statement is also supported on aggregated Ethernet interfaces.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

---

## control-channel

---

**Syntax** control-channel *channel-name* {  
    vlan *vlan-id*;  
    interface name *interface-name*  
}

**Hierarchy Level** [edit protocols [protection-group ethernet-ring name](#) ([east-interface](#) | [west-interface](#))]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** Configure the Ethernet RPS control channel logical interface to carry the RAPS PDU. The related physical interface is the physical ring port.

**Options** **vlan *vlan-id***—If the control channel logical interface is a trunk port, then a dedicated **vlan *vlan-id*** defines the dedicated VLAN channel to carry the RAPS traffic. Only configure the **vlan-id** when the control channel logical interface is the trunk port.

**interface name *interface-name***—Interface name of the control channel.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0.<br>Support at <code>[edit protocols pppoe service-name-tables table-name service service-name agent-specifier aci circuit-id-string ari remote-id-string]</code> hierarchy level introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Configure the PPPoE underlying interface on the router to wait a specified number of seconds after receiving a PPPoE Active Discovery Initiation (PADI) control packet from a PPPoE client before sending a PPPoE Active Discovery Offer (PADO) packet to indicate that it can service the client request</p> <p>The router (PPPoE server) does not check whether another server has already sent a PADO packet during the delay period in response to the PPPoE client's PADI packet. It is up to the PPPoE client to determine whether another PPPoE server has responded to its PADI request, or if it must respond to the delayed PADO packet to establish a PPPoE session.</p> |
| <b>Options</b>                  | <b>seconds</b> —Number of seconds that the PPPoE underlying interface waits after receiving a PADI packet from a PPPoE client before sending a PADO packet in response.<br><b>Range:</b> 1 through 120 seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                             | <p>Configure the number of aggregated logical devices available to the router.</p> <p>Starting in Junos release 14.2, for MX series routers, aggregate Ethernet interfaces created under a logical system can be individually named. Prior to 14.2, ae interfaces were named automatically (AE1, AE2) etc. upon setting the device count. This change allows administrators to use custom naming schemes. System resources are only allocated for named ae interfaces, regardless of how many were declared in the device count. (In Junos 14.2 and earlier, ae naming occurred automatically up to the number specified for device count, and system resources were allocated whether a given ae interface was used or not.)</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Configure whether the secure channel applies MACsec security to traffic entering or leaving an interface.</p> <p>If you need to apply MACsec on traffic entering and leaving an interface, you need to create one secure channel to apply MACsec on incoming traffic and another secure channel to apply MACsec on outgoing traffic within the same connectivity association. When you associate the connectivity association with an interface, MACsec is applied on traffic entering and leaving that interface.</p> <p>You only use this configuration option when you are configuring MACsec using static secure association keys (SAK) security mode. When you are configuring MACsec using static connectivity association keys (CAK) security mode, two secure channels that are not user-configurable—one inbound secure channel and one outbound secure channel—are automatically created within the connectivity association.</p> |
| <b>Default</b>                  | <p>This statement does not have a default value.</p> <p>If you have configured a secure channel to enable MACsec using static SAK security mode, you must specify whether the secure channel applies MACsec to traffic entering or leaving an interface. A candidate configuration that contains a secure channel that has not configured a direction cannot be committed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## dot1x

---

**Syntax**

```
dot1x {
 authenticator {
 authentication-profile-name access-profile-name;
 interface interface-id {
 maximum-requests integer;
 quiet-period seconds;
 reauthentication (disable | interval seconds);
 retries integer;
 server-timeout seconds;
 supplicant (single);
 supplicant-timeout seconds;
 transmit-period seconds;
 }
 }
}
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** For the MX Series only, specifies settings for using 802.1x Port-Based Network Access Control.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0.<br>Support at [ <code>edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> <i>agent-specifier</i></code> <code>aci <i>circuit-id-string</i> ari <i>remote-id-string</i></code> ] hierarchy level introduced in Junos OS Release 10.2.                                                                                                                   |
| <b>Description</b>              | Direct the router to drop (ignore) a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client that contains the specified service name tag or agent circuit identifier/agent remote identifier (ACI/ARI) information. This action effectively denies the client's request to provide the specified service, or to accept requests from the subscriber or subscribers represented by the ACI/ARI information. |

| Release Information      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description              | <p>Specify a dynamic profile to instantiate a dynamic PPPoE interface. You can associate a dynamic profile with a named service entry, <b>empty</b> service entry, or <b>any</b> service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The dynamic profile associated with a service entry in a PPPoE service name table overrides the dynamic profile associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the <b>dynamic-profile</b> statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the <b>static-interface</b> statement at this level. The <b>dynamic-profile</b> and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| Options                  | <b><i>profile-name</i></b> —Name of the dynamic profile that the router uses to instantiate a dynamic PPPoE interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## east-interface

**Syntax**

```
east-interface {
 node-id mac-address;
 control-channel channel-name {
 vlan number;
 interface name interface-name
 }
 interface-none
 ring-protection-link-end;
}
```

**Hierarchy Level** [edit protocols **protection-group ethernet-ring** *ring-name*]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** Define one of the two interface ports for Ethernet ring protection, the other being defined by the **west-interface** statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

EX Series switches do not use the node-id statement--the node ID is automatically configured on the switches using the MAC address.

**NOTE:** Always configure this port first, before configuring the **west-interface** statement.

**NOTE:** The Node ID is not configurable on EX Series switches. The node ID is automatically configured using the MAC address.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers ( <b>ethernet</b> , <b>vlan-ccc</b> , and <b>vlan-tcc</b> options only).<br>Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers. Only the <b>atm-ccc-cell-relay</b> and <b>atm-ccc-vc-mux</b> options are supported on ACX Series routers.<br>Statement introduced in Junos OS Release 17.3R1 for QFX10000 Series switches ( <b>ethernet-ccc</b> and <b>vlan-ccc</b> options only).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>atm-ccc-cell-relay</b>—Use ATM cell-relay encapsulation.</p> <p><b>atm-ccc-vc-mux</b>—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the <b>ccc</b> family only.</p> <p><b>atm-cisco-nlpid</b>—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-mlppp-llc</b>—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.</p> <p><b>atm-nlpid</b>—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-ppp-llc</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.</p> <p><b>atm-ppp-vc-mux</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.</p> |

**atm-snap**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

**atm-tcc-snap**—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

**atm-tcc-vc-mux**—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**atm-vc-mux**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the **inet** family only.

**ether-over-atm-llc**—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

**ether-vpls-over-atm-llc**—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**ether-vpls-over-fr**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

**NOTE:** The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

---

**ether-vpls-over-ppp**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

**ethernet**—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

**ethernet-ccc**—Use Ethernet CCC encapsulation on Ethernet interfaces.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ppp**—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the **ppp** family only.

**frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**gre-fragmentation**—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet's size exceeds the tunnel's maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

**multilink-frame-relay-end-to-end**—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**multilink-ppp**—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

**ppp-over-ether**—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

**ppp-over-ether-over-atm-llc**—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

**vxlan**—Use VXLAN data plane encapsulation for EVPN.

## encapsulation (Physical Interface)

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | encapsulation (atm-ccc-cell-relay   atm-pvc   cisco-hdlc   cisco-hdlc-ccc   cisco-hdlc-tcc   ethernet-bridge   ethernet-ccc   ethernet-over-atm   ethernet-tcc   ethernet-vpls   ethernet-vpls-fr   ether-vpls-over-atm-llc   ethernet-vpls-ppp   extended-frame-relay-ccc   extended-frame-relay-ether-type-tcc   extended-frame-relay-tcc   extended-vlan-bridge   extended-vlan-ccc   extended-vlan-tcc   extended-vlan-vpls   flexible-ethernet-services   flexible-frame-relay   frame-relay   frame-relay-ccc   frame-relay-ether-type   frame-relay-ether-type-tcc   frame-relay-port-ccc   frame-relay-tcc   generic-services   multilink-frame-relay-uni-nni   ppp   ppp-ccc   ppp-tcc   vlan-ccc   vlan-vci-ccc   vlan-vpls);                                                                                                                                                                                                    |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> ],<br>[edit interfaces rlsq <i>number:number</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 11.1 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers ( <b>flexible-ethernet-services</b> , <b>ethernet-ccc</b> , and <b>ethernet-tcc</b> options only).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>         | Specify the physical link-layer encapsulation type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                            | <div>  <p><b>NOTE:</b> Not all encapsulation types are supported on the switches. See the switch CLI.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Default</b>             | ppp—Use serial PPP encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <div>  <p><b>NOTE:</b> Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on the EX Series switches.</p> </div> <p><b>atm-ccc-cell-relay</b>—Use ATM cell-relay encapsulation.</p> <p><b>atm-pvc</b>—Defined in RFC 2684, <i>Multiprotocol Encapsulation over ATM Adaptation Layer 5</i>. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).</p> <p><b>cisco-hdlc</b>—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:</p> |

- CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.
- TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

**cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.

**cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.

**ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.

**ethernet-ccc**—Use Ethernet CCC encapsulation on Ethernet interfaces that must accept packets carrying standard Tag Protocol ID (TPID) values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, CCC is not supported.

**ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.

**ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

**ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the **ccc** family only.

**extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

**extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

**extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the **ccc** family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

**extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

**extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

**flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

**flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

**frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

**NOTE:** When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

---

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

**frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.

**generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.

**multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.

**ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.

**vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

#### NOTE:

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
- Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure family **inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>          | [edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Enable MACsec encryption within a secure channel.</p> <p>You can enable MACsec without enabling encryption. If a connectivity association with a secure channel that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the frame, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic has not been tampered with and does not represent a security threat.</p> <p>Traffic traversing a MAC-enabled point-to-point Ethernet link traverses the link at the same speed regardless of whether encryption is enabled or disabled. You cannot increase the speed of traffic traversing a MACsec-enabled Ethernet link by disabling encryption.</p> <p>This command is used to enable encryption when MACsec is configured using secure association key (SAK) security mode only. When MACsec is configuring using static connectivity association key (CAK) security mode, the encryption setting is configured outside of the secure channel using the <b>no-encryption</b> configuration statement.</p> |
| <b>Default</b>                  | MACsec encryption is disabled when MACsec is configured using static SAK security mode, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Release Information      | Statement introduced in Junos OS Release 15.1R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description              | <div> <b>NOTE:</b> On EX9200 and QFX10000 switches, enhanced convergence is applicable for unicast traffic only—for example, when a MAC address is learned over an MC-AE interface, or an ARP entry is resolved over an MC-AE interface.</div> <div>Improves Layer 2 and Layer 3 convergence time when a multichassis aggregated Ethernet (MC-AE) link goes down or comes up in a bridge domain or VLAN. Convergence time is improved because the traffic on the MC-AE interface is switched to the interchassis link (ICL) without waiting for a MAC address update.</div> <div>If you have configured an IRB interface over an MC-AE interface that has enhanced convergences enabled, then you must configure enhanced convergence on the IRB interface as well. Enhanced convergence must be enabled for both Layer 2 and Layer 3 interfaces.</div> |

**Hierarchy Level** [edit protocols [oam](#)]

**Release Information** Statement introduced in Junos OS Release 8.2.

**Description** For Ethernet interfaces on EX Series switches, and M320, MX Series, and T Series routers, provide fault signaling and detection for 802.3ah Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## ethernet-ring

**Syntax**

```
ethernet-ring ring-name {
 control-vlan (vlan-id | vlan-name);
 data-channel {
 vlan number
 }
 east-interface {
 control-channel channel-name {
 vlan number;
 interface name interface-name
 }
 }
 guard-interval number;
 node-id mac-address;
 restore-interval number;
 ring-protection-link-owner;
 west-interface {
 control-channel channel-name {
 vlan number;
 }
 }
}
```

**Hierarchy Level** [edit protocols [protection-group](#)]

**Release Information**

Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** For Ethernet PICs on MX Series routers or for EX Series switches, , specify the Ethernet ring in an Ethernet ring protection switching configuration.

**Options** *ring-name*—Name of the Ethernet protection ring.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## ethernet-switch-profile

**Syntax**

```

ethernet-switch-profile {
 ethernet-policer-profile {
 input-priority-map {
 ieee802.1p premium [values];
 }
 output-priority-map {
 classifier {
 premium {
 forwarding-class class-name {
 loss-priority (high | low);
 }
 }
 }
 }
 }
 policer cos-policer-name {
 aggregate {
 bandwidth-limit bps;
 burst-size-limit bytes;
 }
 premium {
 bandwidth-limit bps;
 burst-size-limit bytes;
 }
 }
 storm-control storm-control-profile;
 tag-protocol-id tpid;
}
mac-learn-enable;
}

```

**Hierarchy Level** [edit interfaces *interface-name* [gigether-options](#)],  
 [edit interfaces *interface-name* [aggregated-ether-options](#)],  
 [edit interfaces *interface-name* aggregated-ether-options],  
 [edit interfaces *interface-name* ether-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.  
 Statement introduced in Junos OS Release 13.2 for the QFX Series.  
 Statement introduced in Junos OS Release 13.2X50-D15 for the EX Series switches.

**Description**

**NOTE:** On QFX Series standalone switches, the `ethernet-policer-profile` CLI hierarchy and the `mac-learn-enable` statement are supported only on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, aggregated Ethernet with Gigabit Ethernet IQ interfaces, the built-in Gigabit Ethernet port on the M7i router); 100-Gigabit

Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, configure VLAN tag and MAC address accounting and filtering properties.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** When you gather interfaces into a bridge domain, the `no-mac-learn-enable` statement at the [edit interfaces *interface-name* *gigether-options* ethernet-switch-profile] hierarchy level is not supported. You must use the `no-mac-learning` statement at the [edit bridge-domains *bridge-domain-name* bridge-options interface *interface-name*] hierarchy level to disable MAC learning on an interface in a bridge domain. For information on disabling MAC learning for a bridge domain, see the *MX Series Layer 2 Configuration Guide*.

## event (LFM)

---

**Syntax**    event {  
              link-adjacency-loss;  
              link-event-rate {  
                  frame-error *count*;  
                  frame-period *count*;  
                  frame-period-summary *count*;  
                  symbol-period *count*;  
              }  
              protocol-down;  
          }

**Hierarchy Level**    [edit protocols [oam ethernet link-fault-management action-profile](#)]

**Release Information**    Statement introduced in Junos OS Release 8.5.

**Description**    Configure threshold values for link events in an action profile.  
  
                  The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit interfaces *interface-name* **unit** *logical-unit-number*],  
[edit logical-systems *logical-system-name* interfaces *interface-name* **unit** *logical-unit-number*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Option **max-sessions-vs-a-ignore** introduced in Junos OS Release 11.4.

**Description** Configure protocol family information for the logical interface.

**NOTE:** Not all subordinate statements are available to every protocol family.

---

Options *family*—Protocol family:

- **any**—Protocol-independent family used for Layer 2 packet filtering

**NOTE:** This option is not supported on T4000 Type 5 FPCs.

- **bridge**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation. You can optionally configure this protocol family for the logical interface on which you configure VPLS.
- **ethernet-switching**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation
- **ccc**—Circuit cross-connect protocol suite. You can configure this protocol family for the logical interface of CCC physical interfaces. When you use this encapsulation type, you can configure the **ccc** family only.
- **inet**—Internet Protocol version 4 suite. You must configure this protocol family for the logical interface to support IP protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).
- **inet6**—Internet Protocol version 6 suite. You must configure this protocol family for the logical interface to support IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), BGP, and Virtual Router Redundancy Protocol for IPv6 (VRRP).
- **iso**—International Organization for Standardization Open Systems Interconnection (ISO OSI) protocol suite. You must configure this protocol family for the logical interface to support IS-IS traffic.
- **mlfr-end-to-end**—Multilink Frame Relay FRF.15. You must configure this protocol or multilink Point-to-Point Protocol (MLPPP) for the logical interface to support multilink bundling.
- **mlfr-uni-nni**—Multilink Frame Relay FRF.16. You must configure this protocol or **mlfr-end-to-end** for the logical interface to support link services and voice services bundling.
- **multilink-ppp**—Multilink Point-to-Point Protocol. You must configure this protocol (or **mlfr-end-to-end**) for the logical interface to support multilink bundling.
- **mpls**—Multiprotocol Label Switching (MPLS). You must configure this protocol family for the logical interface to participate in an MPLS path.
- **pppoe**—Point-to-Point Protocol over Ethernet
- **tcc**—Translational cross-connect protocol suite. You can configure this protocol family for the logical interface of TCC physical interfaces.

- **tnp**—Trivial Network Protocol. This protocol is used to communicate between the Routing Engine and the router's packet forwarding components. The Junos OS automatically configures this protocol family on the router's internal interfaces only, as discussed in *Understanding Internal Ethernet Interfaces*.
- **vpls**—(M Series and T Series routers only) Virtual private LAN service. You can optionally configure this protocol family for the logical interface on which you configure VPLS. VPLS provides an Ethernet-based point-to-multipoint Layer 2 VPN to connect customer edge (CE) routers across an MPLS backbone. When you configure a VPLS encapsulation type, the **family vpls** statement is assumed by default.

MX Series routers support dynamic profiles for VPLS pseudowires, VLAN identifier translation, and automatic bridge domain configuration.

For more information about VPLS, see the *Junos OS VPNs Library for Routing Devices*.

The remaining statements are explained separately. See [CLI Explorer](#).

## fast-aps-switch

|                            |                                                                                                                                                                                                                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>fast-aps-switch;</code>                                                                                                                                                                                                                                                                         |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> sonet-options aps]                                                                                                                                                                                                                                             |
| <b>Release Information</b> | Statement introduced in Junos OS Release 12.1.                                                                                                                                                                                                                                                        |
| <b>Description</b>         | (M320 routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only, EX Series switches, and MX series routers with Channelized OC3/STM1 Circuit Emulation PIC with SFP only using container interfaces) Reduce the Automatic Protection Switching (APS) switchover time in Layer 2 circuits. |

### NOTE:

- The fast APS switching feature is supported only within a single chassis on a MX series router using a container interface.
- Configuring this statement reduces the APS switchover time only when the Layer 2 circuit encapsulation type for the interface receiving traffic from a Layer 2 circuit neighbor is SAToP.
- When the `fast-aps-switch` statement is configured in revertive APS mode, you must configure an appropriate value for revert time to achieve reduction in APS switchover time.
- To prevent the logical interfaces in the data path from being shut down, configure appropriate hold-time values on all the interfaces in the data path that support TDM.
- The `fast-aps-switch` statement cannot be configured when the APS annex-b option is configured.
- The interfaces that have the `fast-aps-switch` statement configured cannot be used in virtual private LAN service (VPLS) environments.

## flow-control

---

**Syntax** (flow-control | no-flow-control);

**Hierarchy Level** [edit interfaces *interface-name* [aggregated-ether-options](#)],  
[edit interfaces *interface-name* ether-options],  
[edit interfaces *interface-name* [fastether-options](#)],  
[edit interfaces *interface-name* [gigether-options](#)],  
[edit interfaces *interface-name* multiservice-options],  
[edit interfaces interface-range *name* [aggregated-ether-options](#)],  
[edit interfaces interface-range *name* ether-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 in EX Series switches.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description** For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

**NOTE:** On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

---

**Default** Flow control is enabled.

**NOTE:** Flow control is enabled by default only on physical interfaces and it is disabled by default on aggregated Ethernet interfaces.

---

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Threshold for sending frame error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.</p> <p>The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.</p> |
| <b>Options</b>                  | <p><b>count</b>—Threshold count for frame error events.</p> <p><b>Range:</b> 0 through 100</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Threshold for sending frame period error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.</p> |

| <b>Hierarchy Level</b>     | <code>[edit interfaces xe-<i>fpc/pic/port</i>]</code><br><code>[edit interfaces et-<i>fpc/pic/port</i>] (PTX Series Packet Transport Routers and MX Series Routers)</code>                                          |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 12.3R2 for PTX Series Packet Transport Routers.                                                                           |
| <b>Description</b>         | For routers supporting the 10-Gigabit Ethernet interface, configure the framing format. WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600, T4000, and PTX Series Packet Transport Routers routers only. |

### NOTE:

- The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).
- On PTX Series routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ .
- When the PHY mode changes, interface traffic is disrupted because of port reinitialization.

| <b>Description</b>              | When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL link receives notification, restores the link, and waits for the restore interval before issuing another block on the same link. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value. |
| <b>Options</b>                  | <i>number</i> —Guard timer interval, in milliseconds.<br><b>Range:</b> 10 through 2000 ms<br><b>Default:</b> 500 ms                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Specifies the time period for which the Link Aggregation Control Protocol (LACP) maintains the state of a child (member) link as expired or default.</p> <p>When a child link goes from the current state to the expired state, the LACP monitors the reception of protocol data units (PDUs) on the child link for the configured hold-up time interval and does not allow the child link to transition back to the current state. This configuration thus prevents excessive flapping of a child link on an aggregated Ethernet interface.</p> <p>The configured hold-up timer value is applicable to all the child links within a link aggregated (LAG) interface. By default, this feature is disabled.</p> |

## id (MACsec for MX Series)

**Syntax** id {  
     mac-address *mac-address*;  
     port-id *port-id-number*;  
 }

**Hierarchy Level** [edit security macsec connectivity-association *connectivity-association-name* secure-channel *secure-channel-name*]

**Release Information** Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description** Specify a MAC address and a port that traffic on the link must be from to be accepted by the interface when MACsec is enabled using static secure association key (SAK) security mode.

**Options** The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
 admin-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Enable IGMP snooping on the router.

NOTE: IGMP snooping must be disabled on the router before enabling ISSU.

|                                 |                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Specifies that the SCI tag should be appended to each packet on a link that has enabled MACsec.</p> <p>SCI tags are automatically appended to packets leaving a MACsec-enabled interface on an MX240, MX480, or MX960 router. This option is, therefore, redundant to be configured.</p> <p>This option is used only when connecting a router to a host device that requires SCI tagging. SCI tags are eight octets long, so appending an SCI tag to all traffic on the link adds a significant amount of unneeded overhead.</p> |
| <b>Default</b>                  | SCI tagging is enabled on MX Series routers that have enabled MACsec using static connectivity association key (CAK) security mode, by default.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b> | Statement introduced before Junos OS Release 11.1.<br>Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | <p>Add the configured number of bytes to the length of a packet entering the interface.</p> <p>Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.</p> <p>Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.</p> <p>You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.</p> |

**NOTE:** vSRX supports policer overhead on Layer 3 policers only.

---

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

**NOTE:** vSRX only supports fpc 0 pic 0. When you commit the `ingress-policer-overhead` statement, the vSRX takes the PIC offline and then back online.

---

You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

**Options** *bytes*—Number of bytes added to a frame entering an interface.

**Range:** 0–255 bytes

**Default:** 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Description</b>         | Specify an LLDP interface.                                                                                     |
| <b>Options</b>             | <i>interface-name</i> —A valid physical interface name.                                                        |

**NOTE:** On MX Series and T Series routers, you run LLDP on a physical interface, such as `ge-1/0/0`, and not at the logical interface (unit) level.

Starting with Junos OS Release 14.2, you can also specify LLDP neighbor details for management interfaces, such as `fxp` or `me`, on MX Series routers.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

---

**all**—Run LLDP on all interfaces.

**disable**—Disable LLDP on the specified interface

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Use this statement to configure the 802.1x Port-Based Network Access Control protocol-specific Ethernet interface options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default</b>             | The default values are provided for the options below on the respective statement pages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <p><b>maximum-requests</b>—Specify the maximum number of retransmission times for an EAPOL Request packet to the client before it times out the authentication session.</p> <p><b>quiet-period</b>—Specify the number of seconds the port remains in the wait state following a failed authentication exchange with the client, before reattempting the authentication.</p> <p><b>reauthentication</b>—Includes two options:</p> <ul style="list-style-type: none"> <li>• <b>disable</b>—Periodic reauthentication of the client is disabled.</li> <li>• <b>interval</b>—Specify the periodic reauthentication time interval.</li> </ul> <p><b>retries</b>—Specify the number of tries after which the port remains in the wait state for <b>quiet-period</b> seconds before reattempting the authentication.</p> <p><b>server-timeout</b>—Specify the number of seconds the port waits for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.</p> <p><b>supplicant (<i>single</i>)</b>—Specify supplicant single mode. See the usage guidelines to configure other modes.</p> <p><b>supplicant-timeout</b>—Specify the number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.</p> |

**transmit-period**—Specify the number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## interface (OAM Link-Fault Management)

---

**Syntax**

```
interface interface-name {
 apply-action-profile profile-name;
 link-discovery (active | passive);
 pdu-interval interval;
 pdu-threshold threshold-value;
 remote-loopback;
 event-thresholds {
 frame-error count;
 frame-period count;
 frame-period-summary count;
 symbol-period count;
 }
 negotiation-options {
 allow-remote-loopback;
 no-allow-link-events;
 }
}
```

**Hierarchy Level** [edit protocols [oam ethernet link-fault-management](#)]

**Release Information** Statement introduced in Junos OS Release 8.2.

**Description** For Ethernet interfaces on M320, MX Series, and T Series routers, configure IEEE 802.3ah Operation, Administration, and Management (OAM) support.

**Options** **interface *interface-name***—Interface to be enabled for IEEE 802.3ah link fault management OAM support.

The remaining statements are described separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Applies the specified connectivity association to the specified interface to enable MACsec.</p> <p>One connectivity association can be applied to multiple interfaces.</p> <p>You must always use this statement to apply a connectivity association to an interface to enable MACsec. You must complete this configuration step regardless of whether MACsec is enabled using static connectivity association key (CAK) security mode or static secure association key (SAK) security mode.</p> <p>If you are enabling MACsec using static SAK security mode and need to configure MACsec on inbound and outbound traffic on the same interface, you must configure a connectivity association with one secure channel for inbound traffic and a second secure channel for outbound traffic. The connectivity association is then applied to the interface using this statement to enable MACsec for traffic entering and leaving the interface.</p>                                                                                                                                                                                                                  |
|                                 | <div>  <p><b>NOTE:</b> Starting in Junos OS Release 16.1R2, when Media Access Control Security (MACsec) is enabled on an interface, the interface flow control capability is enabled by default, regardless of the configuration that you set using the (flow-control   no-flow-control) statement at the [edit interfaces <i>interface-name</i> gicether-options] hierarchy level. When MACsec is disabled, interface flow control is restored to the configuration that you set using the flow-control statement at the [edit interfaces] hierarchy level. When MACsec is enabled, additional header bytes are added to the packet by the MACsec PHY. With line rate traffic, when MACsec is enabled and flow control is disabled, the pause frames sent by the MACsec PHY are terminated by the MIC's MAC (enhanced 20-port Gigabit Ethernet MICs on MX Series routers) and not transferred to the Packet Forwarding Engine, causing framing errors. Therefore, when MACsec is enabled on an interface, flow control is also automatically enabled on such an interface.</p> </div> |
| <b>Default</b>                  | Interfaces are not associated with any connectivity associations, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Specifies the static security key to exchange to enable MACsec using static secure association key (SAK) security mode.</p> <p>The key string is a 32-digit hexadecimal number. The key string and the security association must match on both sides of an Ethernet connection to secure traffic using MACsec when enabling MACsec using SAK security mode.</p> <p>You must configure at least two security associations with unique security association numbers and key strings to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.</p> |
| <b>Default</b>                  | This statement does not have a default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <b><i>key-string</i></b> —Specifies the key to exchange with the other end of the link on the secure channel. The <i>key-string</i> is a 32-digit hexadecimal string that is created by the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Specifies the key server priority used by the MACsec Key Agreement (MKA) protocol to select the key server when MACsec is enabled using static connectivity association key (CAK) security mode.</p> <p>The switch with the lower <i>priority-number</i> is selected as the key server.</p> <p>If the <i>priority-number</i> is identical on both sides of a point-to-point link, the MKA protocol selects the device with the lower MAC address as the key server.</p> |
| <b>Default</b>                  | The default key server priority number is 16.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b><i>priority-number</i></b>—Specifies the MKA server election priority number.</p> <p>The <i>priority-number</i> can be any number between 0 and 255. The lower the number, the higher the priority.</p>                                                                                                                                                                                                                                                              |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                 |

                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.  
                              **fast-failover** option introduced in Junos OS Release 12.2.  
                              Support for logical systems introduced in Junos OS Release 14.1.

**Description**    Configure the Link Aggregation Control Protocol (LACP) for aggregated Ethernet interfaces only.

When you configure the **accept-data** statement at the [edit interfaces aeX **aggregated-ether-options lACP**] hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.

**NOTE:** When you configure the **accept-data** statement at the [edit interfaces aeX **aggregated-ether-options lACP**] hierarchy level, this behavior occurs:

- By default, the **accept-data** statement is not configured when LACP is enabled.
  - You can configure the **accept-data** statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
  - When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the **accept-data** statement is configured.
-

**Default** If you do not specify LACP as either **active** or **passive**, LACP remains passive.

**Options** **active**—Initiate transmission of LACP packets.

**admin-key *number***—Specify an administrative key for the router or switch.

**NOTE:** You must also configure multichassis link aggregation (MC-LAG) when you configure the **admin-key**.

**fast-failover**—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

**passive**—Respond to LACP packets.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs. |
| <b>Options</b>                  | <b>(active   passive)</b> —Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.                                                     |

| Release Information      | Statement introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description              | <p>Configure link degrade monitoring on an interface and specify the corrective action to be triggered when a link degrade event is detected. Deleting the configuration disables the feature. When configured, the feature monitors the quality of physical links on Ethernet interfaces (10-Gigabit, 40-Gigabit, and 100-Gigabit) and triggers the user-configured action when the link's bit error rate (BER) value breaches the preconfigured threshold. This feature can detect a BER value as low as <math>10^{-13}</math> to <math>10^{-5}</math>.</p> |
| Options                  | <p><b>actions media based</b>—Action to be taken when a link degrade event is detected. A media-based action brings down the physical link at both local and remote ends of the interface, and stops BER monitoring at the local end until an autorecovery is triggered.</p> <p>The remaining statements are described separately.</p>                                                                                                                                                                                                                        |

**Release Information** Statement introduced in Junos OS Release 8.2.

**Description** For Ethernet interfaces on M320, M120, MX Series, and T Series routers and EX Series switches, specify fault signaling and detection for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Description</b>              | Set the device's link connection characteristic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><i>mode</i>—Link characteristics:</p> <ul style="list-style-type: none"> <li>• <b>automatic</b>—Link mode is negotiated. This is the default for EX Series switches.</li> <li>• <b>full-duplex</b>—Connection is full duplex.</li> <li>• <b>half-duplex</b>—Connection is half duplex.</li> </ul> <p><b>Default:</b> Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode. The router's or switch's management Ethernet interface, <b>fxp0</b> or <b>em0</b>, and the built-in Fast Ethernet interfaces on the FIC (M7i router) autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.</p> |
|                                 | <p> <b>NOTE:</b> On EX Series switches, if no-auto-negotiation is specified in [edit interfaces <i>interface-name</i> ether-options], you can select only full-duplex or half-duplex. If auto-negotiation is specified, you can select any mode.</p>                                                                                                                                                                                                                                                                                                                                                                                   |
|                                 | <p> <b>NOTE:</b> Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | <p>On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the <b>primary</b> and <b>backup</b> statements at the <b>[edit interfaces ge-fpc/pic/port gigheter-options 802.3ad aex]</b> hierarchy level or the <b>[edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex]</b> hierarchy level.</p> <p>On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.</p> <p>For Junos OS link protection, specify <b>link-protection</b> at the following hierarchy levels:</p> <ul style="list-style-type: none"> <li>• <b>[edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]</b></li> <li>• <b>[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]</b> hierarchy level or at the <b>[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]</b> hierarchy level.</li> </ul> <p>To disable link protection, use the <b>delete interface ae aggregate-ether-options link-protection</b> statement at the <b>[edit interfaces aex aggregated-ether-options]</b> hierarchy level or the <b>[edit interfaces aex aggregated-ether-options lacp]</b> hierarchy level.</p> |
| <b>Options</b>                  | The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Release Information      | Statement introduced in Junos OS Release 17.3R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description              | <p>User can specify the <a href="#">link-protection-revertive</a> statement in the link protection configuration at the aggregated Ethernet interface level to set revertive mode. In revertive mode, adding a higher-priority link to the aggregated Ethernet bundle results in recalculation of the priorities and traffic will switch from the currently active link to the newly added, higher-priority link. Recalculation of priorities is performed only while link event such as addition\deletion and UP/Down operation on link, that is, configuration of this option will not result in any recalculation immediately until next link-event occurs.</p> <p>In addition to enabling static link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the <b>primary</b> and <b>backup</b> statements at the [edit interfaces <i>ge-fpc/pic/port</i> <b>gigether-options</b> 802.3ad aex] hierarchy level or the [edit interfaces <i>fe-fpc/pic/port</i> <b>fastether-options</b> 802.3ad aex] hierarchy level.</p> <p>For static link protection, specify <b>link-protection</b> at the following hierarchy levels:</p> <ul style="list-style-type: none"><li>• [edit interfaces <i>ge-fpc/pic/port</i> <b>ether-options</b> 802.3ad aex]</li><li>• [edit interfaces <i>xe-fpc/pic/port</i> <b>ether-options</b> 802.3ad aex] hierarchy level or at the [edit interfaces <i>xe-fpc/pic/port</i> <b>ether-options</b> 802.3ad aex] hierarchy level.</li></ul> <p>To disable static link protection, use the <b>delete interface ae aggregate-ether-options link-protection</b> statement at the [edit interfaces aex <a href="#">aggregated-ether-options</a>] hierarchy level.</p> |
| Options                  | The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>         | For aggregated Ethernet interfaces only, set the required link speed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b><i>speed</i></b>—For aggregated Ethernet links, you can specify <b><i>speed</i></b> in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p>Aggregated Ethernet links on the M120 router can have one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>oc192</b>—Links are OC192 or STM64c.</li> </ul> <p>Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>10m</b>—Links are 10 Mbps.</li> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> </ul> <p>Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>100g</b>—Links are 100 Gbps.</li> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>40g</b>—Links are 40 Gbps.</li> </ul> |

- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

**mixed**—Enables bundling of different Ethernet rate links in the same Aggregated Ethernet interface.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                     interface-control—To add this statement to the configuration.

## lmi (Ethernet OAM)

**Syntax**

```
lmi {
 status-counter count;
 polling-verification-timer value;
 interface name {
 uni-id uni-name;
 status-counter number;
 polling-verification-timer value;
 evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
 evc evc-name {
 default-evc;
 vlan-list vlan-id-list;
 }
 }
}
```

**Hierarchy Level** [edit protocols [oam](#) [ethernet](#)]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet Local Management Interface (E-LMI).

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (**ge**), 10-Gigabit Ethernet (**xe**), and Aggregated Ethernet (**ae**) interfaces configured on MX Series routers with DPC only.

**Options**

- status-counter *count***—Status counter (N393), defaults to 4.
- interface *name***—Polling verification timer (T392), defaults to 15 seconds.
- uni-id *uni-name***—(Optional) Defaults to the physical interface name.
- status-counter *number***—(Optional) Defaults to a global value.
- polling-verification-timer *value***—(Optional) Defaults to a global value.
- evc-map-type (all-to-one-bundling | bundling | service-multiplexing)**—Specify the Ethernet virtual connection (EVC) map type.
- evc *evc-name***—Specify the name of the EVC.
- default-evc**—Set the specified EVC as the default EVC.
- vlan-list *vlan-id-list***—Specify a group of VLANs to assign to the EVC.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## load-balance

**Syntax**

```
load-balance {
 adaptive{
 pps;
 scan-interval multiple;
 tolerance percentage;
 }
 no-adaptive;
 per-packet;
}
```

**Hierarchy Level** [edit interfaces aex aggregated-ether-options]

**Release Information** Statement introduced in Junos OS Release 13.3.  
Statement introduced in Junos OS Release 14.1 for PTX Series Packet Transport Routers.

**Description** Load-balances the received traffic across all the available paths of aggregated Ethernet bundles for better link utilization.

**Options**

**adaptive**— (MX Series and PTX Series) Corrects a genuine traffic imbalance by using a feedback mechanism to distribute the traffic across the links of an Aggregated Ethernet bundle.

**no-adaptive**— (MX Series and PTX Series) Disables the adaptive load-balancing solution configured to distribute traffic by using a feedback mechanism.

**per-packet**— (MX Series only) Randomly sprays packets to the aggregate next hops in a round-robin manner to avoid traffic imbalance.

**Required Privilege** interface - To view statement in the configuration.  
**Level** interface-control - To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Define the capability to perform uniform load balancing and also perform rebalancing is introduced on MX Series routers with MPCs, except MPC3Es and MPC4Es. Rebalancing is not supported when load-balancing is skewed or distorted owing to a change in the number of flows. The mechanism to record and retain states for the flows and distribute the traffic load accordingly is added. As a result, for m number of flows, they are distributed among n member links of a LAG bundle or among the unilist of next-hops in an ECMP link. This method of splitting the load among member links is called stateful load balancing and it uses 5-tuple information (source and destination addresses, protocol, source and destination ports). Such a method can be mapped directly to the flows, or to a precompute hash based on certain fields in the flow. As a result, the deviation observed on each child link is reduced. |
| <b>Options</b>                  | <b>stateful</b> —Define the stateful load-distribution mechanism for traffic flows on aggregated Ethernet interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Define the load-balancing type to inform the Packet Forwarding Engine regarding the appropriate memory pattern to be used for traffic flows. The approximate number of flows for effective load-balancing for each keyword is a derivative.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>low</b>—Define a low load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is less or minimal (between 1 and 100 flows).</p> <p><b>medium</b>—Define a medium or moderate load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is relatively higher (between 100 and 1000 flows).</p> <p><b>large</b>—Define a high load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is excessive or reaches the maximum supported flows (between 1000 and 10,000 flows).</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## loopback (Aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet)

**Syntax** (loopback | no-loopback);

**Hierarchy Level** [edit interfaces *interface-name* [aggregated-ether-options](#)],  
[edit interfaces *interface-name* ether-options],  
[edit interfaces *interface-name* [fastether-options](#)],  
[edit interfaces *interface-name* [gigether-options](#)],  
[edit interfaces interface-range *name* ether-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

**Description** For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode.

### NOTE:

- By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system.
- IPv6 Neighbor Discovery Protocol (NDP) addresses are not supported on Gigabit Ethernet interfaces when loopback mode is enabled on the interface. That is, if the loopback statement is configured at the [edit interfaces *ge-fpc/pic/port* [gigether-options](#)] hierarchy level, an NDP address cannot be configured at the [edit interfaces *ge-fpc/pic/port* unit *logical-unit-number* family inet6 address] hierarchy level.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2.                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Enables loopback tracking on Ethernet interfaces. When loopback tracking is enabled and the Ethernet Operation, Administration, and Management (OAM) link-fault management process (lfmd) detects its own generated packets on an interface, it marks the interface as down. When the loopback issue resolves, the interface is brought back up. |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.                                                                                                                                                                                                   |
| <b>Description</b>              | For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP, specify a remote MAC address on which to count incoming and outgoing packets.   |
| <b>Options</b>                  | <b><i>mac-address</i></b> —MAC address. Specify the MAC address as six hexadecimal bytes in one of the following formats: <i>nnnn.nnnn.nnnn</i> or <i>nn:nn:nn:nn:nn:nn</i> . For example, 0011.2233.4455 or 00:11:22:33:44:55.<br><br><b><i>policer</i></b> —MAC policer. For more information, see <a href="#">policer (MAC)</a> .          |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Specify a MAC address to enable MACsec using static secure association key (SAK) security mode. The <b>mac-address</b> variables must match on the sending and receiving ends of a link to enable MACsec using static SAK security mode.</p> <p>If you are configuring a MAC address on a secure channel in the outbound direction, you should specify the MAC address of the interface as the <b>mac-address</b>.</p> <p>If you are configuring a MAC address on a secure channel in the inbound direction, you should specify the MAC address of the interface at the other end of the link as the <b>mac-address</b>.</p> <p>You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.</p> |
| <b>Default</b>                  | No MAC address is specified in the secure channel, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <b>mac-address</b> —The MAC address, in six groups of two hexadecimal digits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Support for statement under the <b>[edit interfaces aex aggregated-ether-options ethernet-switch-profile]</b> hierarchy introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | <p>For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, for 100-Gigabit Ethernet Type 5 PIC with CFP, and for MPC3E, MPC4E, MPC5E, MPC5EQ, and MPC6E MPCs, configure dynamic learning of the source and destination MAC addresses. By default, the interface is not allowed to dynamically learn source and destination MAC addresses.</p> <p>To disable dynamic learning of the source and destination MAC addresses after it has been configured, you must delete <b>mac-learn-enable</b> from the configuration.</p> <p>MPCs support MAC address accounting for an individual interface or an aggregated Ethernet interface member link only after the interface has received traffic from the MAC source. If traffic is only exiting an interface, the MAC address is not learned and MAC address accounting does not occur.</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Configure MAC RADIUS authentication for specific interfaces. MAC RADIUS authentication allows LAN access to permitted MAC addresses. When a new MAC address appears on an interface, the switch consults the RADIUS server to check whether the MAC address is a permitted address. If the MAC address is configured on the RADIUS server, the device is allowed access to the LAN.</p> <p>If MAC RADIUS is configured, the switch first tries to get a response from the host for 802.1X authentication. If the host is unresponsive, the switch attempts to authenticate using MAC RADIUS.</p> <p>To restrict authentication to MAC RADIUS only, use the <b>restrict</b> option. In restrictive mode, all 802.1X packets are eliminated and the attached device on the interface is considered a nonresponsive host.</p> |
| <b>Options</b>                  | <p><b>flap-on-disconnect</b>—(Optional) When the RADIUS server sends a disconnect message to a supplicant, the switch resets the interface on which the supplicant is authenticated. If the interface is configured for multiple supplicant mode, the switch resets all the supplicants on the specified interface. This option takes effect only when the <b>restrict</b> option is also set.</p> <p><b>restrict</b>—(Optional) Restricts authentication to MAC RADIUS only. When <b>mac-radius restrict</b> is configured the switch drops all 802.1X packets. This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface, and eliminates the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.</p>               |

 }
 }
```

**Hierarchy Level** [edit security]

**Release Information** Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description** Configure Media Access Control Security (MACsec) on MX Series routers.

**Options** The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the maximum number of active PPPoE sessions using either static or dynamic PPPoE interfaces that the router can establish with the specified named service, <b>empty</b> service, or <b>any</b> service entry in a PPPoE service name table. The router maintains a count of active PPPoE sessions for each service entry to determine when the maximum sessions limit has been reached.</p> <p>The router uses the <b>max-sessions</b> value for a PPPoE service name table entry in conjunction with the <b>max-sessions</b> value configured for the PPPoE underlying interface, and with the maximum number of PPPoE sessions supported on your router. If your configuration exceeds any of these maximum session limits, the router is unable to establish the PPPoE session.</p> |
| <b>Options</b>                  | <p><b>number</b>—Maximum number of active PPPoE sessions that the router can establish with the specified PPPoE service name table entry, in the range 1 to the platform-specific maximum PPPoE sessions supported for your router. The default value is equal to the maximum number of PPPoE sessions supported on your routing platform.</p> <p>For information about scaling values for PPPoE interfaces, access the <i>Subscriber Management Scaling Values (XLS)</i> spreadsheet from the Downloads box on the <i>Junos OS Subscriber Management</i> pathway page for the current release.</p>                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Configure the router to ignore (clear) the value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks vendor-specific attribute (VSA) [26-143], and restore the PPPoE maximum session value on the underlying interface to the value configured in the CLI with the <b>max-sessions</b> statement. The PPPoE maximum session value specifies the maximum number of concurrent static or dynamic PPPoE logical interfaces (sessions) that the router can activate on the PPPoE underlying interface, or the maximum number of active static or dynamic PPPoE sessions that the router can establish with a particular service entry in a PPPoE service name table.</p>                                                                                                                                                                                                            |
| <b>Default</b>                  | If you do not include the <b>max-sessions-vsa-ignore</b> statement, the maximum session value returned by RADIUS in the Max-Clients-Per-Interface VSA takes precedence over the PPPoE maximum session value configured with the <b>max-sessions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | <p>Enable multichassis link aggregation groups (MC-LAG), which enables one device to form a logical LAG interface with two or more other devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>chassis-id</b>—Specify the chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links.</p> <p><b>Values:</b> 0 or 1</p> <p><b>events</b>—Specify an action if a specific MC-LAG event occurs.</p> <p><b>iccp-peer-down</b>—Specify an action if the ICCP peer of this node goes down.</p> <p><b>force-icl-down</b>—If the node's ICCP peer goes down, bring down the interchassis-link logical interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**prefer-status-control-active**—Specify that the node configured as **status-control active** become the active node if the peer of this node goes down.

When ICCP goes down, you can use this keyword to make a mc-lag PE to become the active PE. For example, if you want mc-lag PE1 to be Active on ICCP down, then configure this keyword in PE1. It is not recommended to configure this keyword in both the mc-lag PEs.

**NOTE:** The **prefer-status-control-active** statement can be configured with the **status-control standby** configuration to prevent the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the **hold-time down** value (at the [edit interfaces *interface-name*] hierarchy level) for the interchassis link with the **status-control standby** configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the **status-control active** configuration goes down, the router or switch with the **status-control standby** configuration does not go into standby mode.

To make the **prefer-status-control-active** configuration work with the **status-control standby** configuration when an interchassis-link logical interface is configured on aggregate Ethernet interface, you must either configure the **lACP periodic interval** statement at the [edit interface *interface-name* aggregated-ether-options] hierarchy level as **slow** or configure the **detection-time threshold** statement at the [edit protocols iccp peer liveness-detection] hierarchy level as less than 3 seconds.

**init-delay-time seconds**—To minimize traffic loss, specify the number of seconds in which to delay bringing the multichassis aggregated Ethernet interface back to the up state when you reboot an MC-LAG peer.

**mc-ae-id mc-ae-id**—Specify the identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number.

**Range:** 1 through 65,535

**mode (active-active | active-standby)**—Specify whether the MC-LAG is in active-active or active-standby mode.

**NOTE:** You can configure IPv4 (inet) and IPv6 (inet6) addresses on mc-ae interfaces when the active-standby mode is configured.

**redundancy-group *group-id***—Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions.

**Range:** 1 through 4,294,967,294

**revert-time**—Wait interval (in minutes) before the switchover to the preferred node is performed when the **switchover-mode** is configured as revertive.

**Range:** 1 through 10

**status-control (active | standby)**—Specify whether the chassis becomes active or remains in standby mode when an interchassis link failure occurs.

**switchover-mode (non-revertive | revertive)**—Specify whether Junos OS should trigger a link switchover to the preferred node when the active node is available.

**NOTE:** For revertive mode to automatically switch over to the preferred node, the **status-control** statement should be configured as active.

---

**init-delay-time *seconds***—To minimize traffic loss, specify the number of seconds by which to delay bringing the multichassis aggregated Ethernet (mc-ae) interface back to the up state when you reboot an MC-LAG peer.

| <b>Description</b>              | For aggregated Ethernet, SONET/SDH, multilink, link services, and voice services interfaces only, set the minimum number of links that must be up for the bundle to be labeled up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b><i>number</i></b>—Number of links.</p> <p><b>Range:</b> On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, the valid range for minimum-links number is 1 through 64. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX8200 switches, the range of valid values for minimum-links number is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled up.</p> <p><b>Default:</b> 1</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Specifies that all traffic travelling on the MACsec-secured link must be MACsec-secured to be forwarded onward.</p> <p>When the <b>must-secure</b> option is enabled, all traffic that is not MACsec-secured that is received on the interface is dropped.</p> <p>When the <b>must-secure</b> option is disabled, all traffic from devices that support MACsec is MACsec-secured while traffic received from devices that do not support MACsec is forwarded through the network.</p> <p>The <b>must-secure</b> option is particularly useful in scenarios where multiple devices, such as a phone and a PC, are accessing the network through the same Ethernet interface. If one of the devices supports MACsec while the other device does not support MACsec, the device that doesn't support MACsec can continue to send and receive traffic over the network—provided the <b>must-secure</b> option is disabled—while traffic to and from the device that supports MACsec is MACsec-secured. In this scenario, traffic to the device that is not MACsec-secured must be VLAN-tagged.</p> |
| <b>Default</b>                  | The <b>must-secure</b> option is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for Layer 2 VPNs and VPLS introduced in Junos OS Release 10.4.  
 Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.  
 Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.  
 Support at the [set interfaces *interface-name* **unit** *logical-unit-number* **family** *ccc*] hierarchy level introduced in Junos OS Release 12.3R3 for MX Series routers.

**Description** Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

To route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named *irb* or *vlan*, respectively).

**CAUTION:** For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

---

**NOTE:**

The MTU for an IRB interface is calculated by removing the Ethernet header overhead [6(DMAC)+6(SMAC)+2(EtherType)]. Because, the MTU is the lower value of the MTU configured on the IRB interface and the MTU configured on the IRB's associated bridge domain IFDs or IFLs, the IRB MTU is calculated as follows:

- In case of Layer 2 IFL configured with the `flexible-vlan-tagging` statement, the IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
  - In case of Layer 2 IFL configured with the `vlan-tagging` statement, the IRB MTU is calculated by including a single VLAN 4 bytes overhead.
-

## NOTE:

- If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.
- Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxp0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.
- On ACX Series routers, you can configure the protocol MTU by including the `mtu` statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] or [edit interfaces *interface-name* unit *logical-unit-number* family inet6] hierarchy level.
  - If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
  - If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.
- Starting in Release 14.2, MTU for IRB interfaces is calculated by removing the Ethernet header overhead (6(DMAC)+6(SMAC)+2(EtherType)), and the MTU is a minimum of the two values:
  - Configured MTU
  - Associated bridge domain's physical or logical interface MTU
    - For Layer 2 logical interfaces configured with flexible-vlan-tagging, IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
    - For Layer 2 logical interfaces configured with vlan-tagging, IRB MTU is calculated by including single VLAN 4 bytes overhead.

NOTE: Changing the Layer 2 logical interface option from vlan-tagging to flexible-vlan-tagging or vice versa adjusts the logical interface MTU by 4 bytes with the existing MTU size. As a result, the Layer 2 logical interface is deleted and re-added, and the IRB MTU is re-computed appropriately.

For more information about configuring MTU for specific interfaces and router or switch combinations, see *Configuring the Media MTU*.

**Options**    *bytes*—MTU size.

**Range:** 256 through 9192 bytes, 256 through 9216 (EX Series switch interfaces), 256 through 9500 bytes (Junos OS 12.1X48R2 for PTX Series routers), 256 through 9500 bytes (Junos OS 16.1R1 for MX Series routers)

**NOTE:** Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

---

**Default:** 1500 bytes (INET, INET6, and ISO families), 1448 bytes (MPLS), 1514 bytes (EX Series switch interfaces)

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

## multi-chassis-protection

**Syntax**    multi-chassis-protection {  
                   peer *a.b.c.d* {  
                     interface *interface-name*;  
                   }  
                 }

**Hierarchy Level**    [edit interfaces *interface-name*]

**Release Information**    Statement introduced in Junos OS Release 11.1.

**Description**    For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, you can use this statement under the physical interface level to reduce the configuration at the logical interface level if the following assumption exists:

If there are  $n + 1$  logical interfaces under **ae0**, from **ae0.0** through **ae0.n**, there will be  $n + 1$  logical interfaces under **ge-0/0/0** as well, from **ge-0/0/0.0** through **ge-0/0/0.n**, and each **ge-0/0/0** logical interface will be a protection link for the **ae0** logical interface.

**NOTE:** A bridge domain cannot have MC-AE logical interfaces which belong to different redundancy groups.

If the Inter-Chassis Control Protocol (ICCP) connection is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer.

The remaining statements are explained separately. See [CLI Explorer](#).

**Options**    interface *interface-name*—Specify the interface: interface *interface-name-fpc/pic/port*

**Required Privilege Level**    interface—To view this statement in the configuration.  
                   interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure mixed tagging support for untagged packets on a port for the following:</p> <ul style="list-style-type: none"> <li>• M Series routers with Gigabit Ethernet IQ PICs with SFP and Gigabit Ethernet IQ2 PICs with SFP configured for 802.1Q flexible VLAN tagging</li> <li>• MX Series routers with Gigabit Ethernet DPCs and MICs, Tri-Rate Ethernet DPCs and MICs, and 10-Gigabit Ethernet DPCs and MICs and MPCs configured for 802.1Q flexible VLAN tagging</li> <li>• T4000 routers with 100-Gigabit Ethernet Type 5 PIC with CFP</li> <li>• EX Series switches with Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces</li> </ul> <p>When the <b>native-vlan-id</b> statement is included with the <b>flexible-vlan-tagging</b> statement, untagged packets are accepted on the same mixed VLAN-tagged port.</p> |

**NOTE:** The logical interface on which untagged packets are received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface, otherwise the untagged packets are dropped.

To configure the logical interface, include the **vlan-id** statement (matching the **native-vlan-id** statement on the physical interface) at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level.

When the **native-vlan-id** statement is included with the **interface-mode** statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.

Starting in Junos OS Release 17.1R1, you can send untagged traffic without a native VLAN ID to the remote end of the network. To do this, remove the native VLAN ID from the untagged traffic configuration by setting the **no-native-vlan-insert** statement. If you do not configure this statement, the native VLAN ID is added to the untagged traffic.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | By default, the untagged packets are dropped. That is, if you do not configure the <b>native-vlan-id</b> option, the untagged packets are dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Disables MACsec encryption for a connectivity association that is configured to enable MACsec using static connectivity association key (CAK) or dynamic security mode.</p> <p>You can enable MACsec without enabling encryption. If a connectivity association that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the packet, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic does not represent a security threat.</p> <p>This command is used to disable encryption when MACsec is configured using static CAK or dynamic security mode only. When MACsec is configuring using static secure association key (SAK) security mode, the encryption setting is managed in the secure channel using the <b>encryption</b> configuration statement.</p> |
| <b>Default</b>                  | MACsec encryption is enabled if MACsec is enabled using static CAK or dynamic security mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b> | Statement introduced in Junos OS Release 17.1R1.                                                                                                                                                                                                                                                                                                |
| <b>Description</b>         | <p>Send traffic without the native VLAN ID (<b>native-vlan-id</b>) to the remote end of the network if untagged traffic is received.</p> <p>If this statement is not configured, then <b>native-vlan-id</b> is added to untagged traffic. But if this statement is configured, then <b>native-vlan-id</b> is not added to untagged traffic.</p> |

**NOTE:**

- This feature works only on MX Series routers with MPCs/MICs. Configuring this statement on MX Series routers with DPCs results in no behavioral change. However, if you configure the statement on aggregated Ethernet (ae) interfaces with logical interfaces across MPCs/MICs and DPCs, then the MPCs/MICs and DPCs behave differently.
- In the egress direction, this feature is disrupted by VLAN normalization. Because of normalization, the egress interface cannot distinguish between untagged traffic and tagged traffic. And untagged traffic is sent out with **native-vlan-id**. Consider this while configuring both VLAN normalization and new **native-vlan-id** statement.

There will be a problem with ingress firewall filter if filter term includes **native-vlan-id**. With no-native-vlan-insert statement configured, **native-vlan-id** will not be inserted to untagged traffic. So, firewall filter term will not match with untagged traffic. But if incoming traffic have VLAN ID which is equal to **native-vlan-id**, then firewall filter term will match and firewall will work.

- When this feature is used with AE, all sub-interfaces of AE should be in same type of FPC.
- 

|                                 |                                                                                                                                                                                                                           |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | By default, <b>native-vlan-id</b> is inserted to untagged traffic. That is, if this statement is not configured, then <b>native-vlan-id</b> is inserted to untagged traffic.                                              |

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>         | Prevent the router from sending the AC-Name and AC-Cookie tags in the PPPoE Active Discovery Session (PADS) packet. When you configure this statement, it affects PADS packets sent on all PPPoE interfaces configured on the router after the command is issued; it has no effect on previously created PPPoE interfaces. By default, the AC-Name and AC-Cookie tags are transmitted in the PADS packet, along with the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags. |

**NOTE:** In Junos OS Release 12.1 and earlier, only the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags are contained in the PADS packet by default. The AC-Name and AC-Cookie tags are not transmitted in the PADS packet by default.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2.                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Configure a node on the sub-ring to operate in non-virtual channel mode. If this option is enabled then all the nodes in the sub-ring are configured with this option. Also, the <b>non-vc-mode</b> option should be used with care and only for open rings. Using this option for closed rings creates loops for RAPS control messages. |

| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | <p>Specifies the number of octets in an Ethernet frame that are sent in unencrypted plain-text when encryption is enabled for MACsec.</p> <p>Setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the remaining traffic. Setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the remaining traffic.</p> <p>You would typically forward traffic with the first 30 or 50 octets unencrypted if a feature needed to see the data in the octets to perform a function, but you otherwise prefer to encrypt the remaining data in the frames traversing the link. Load balancing features, in particular, typically need to see the IP and TCP/UDP headers in the first 30 or 50 octets to properly load balance traffic.</p> <p>You configure the <b>offset</b> in the [edit security macsec connectivity-association <i>connectivity-association-name</i>] hierarchy when you are enabling MACsec using static connectivity association key (CAK) or dynamic security mode.</p> <p>You configure the <b>offset</b> in the [edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i>] hierarchy when you are enabling MACsec using static secure association key (SAK) security mode.</p> |
| <b>Default</b>             | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>0</b>—Specifies that no octets are unencrypted. When you set the offset to 0, all traffic on the interface where the connectivity association or secure channel is applied is encrypted.</p> <p><b>30</b>—Specifies that the first 30 octets of each Ethernet frame are unencrypted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                            | <p> <b>NOTE:</b> In IPv4 traffic, setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 30, therefore, is typically used when a feature needs this information to perform a task on IPv4 traffic.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Release Information** Statement introduced in Junos OS Release 8.2.  
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

**Description** For Ethernet interfaces on M320, M120, MX Series, and T Series routers and PTX Series Packet Transport Routers, provide IEEE 802.3ah Operation, Administration, and Maintenance (OAM) support.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | Enable the mechanism to perform an even, effective distribution of traffic flows across member links of an aggregated Ethernet interface ( <b>ae</b> ) bundle on MX Series routers with MPCs, except MPC3Es and MPC4Es. When multiple flows are transmitted out of an <b>ae</b> interface, the flows must be distributed across the different member links evenly to enable an effective and optimal load-balancing behavior. To obtain a streamlined and robust method of load-balancing, the member link of the aggregated Ethernet interface bundle that is selected each time for load balancing plays a significant part. |
| <b>Options</b>                  | <b>per-flow</b> —Enable the stateful load-distribution mechanism per traffic flow on an aggregated Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, use the <b>multi-chassis-protection</b> statement under the physical interface level to reduce the configuration at the logical interface level. If the interchassis control protocol connection (ICCP) is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the <b>peer</b> statement. You must also specify the peer's physical interface. |
| <b>Options</b>                  | <p><b><i>a.b.c.d</i></b>—Specify the IP address of the peer.</p> <p><b>interface <i>interface-name</i></b>—Specify the peer's physical interface: interface <i>interface-name-fpc/pic/port</i></p>                                                                                                                                                                                                                                                                                                                                                    |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | For Gigabit Ethernet IQ , Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, define a CoS policer template to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits. The premium policer is not supported on MX Series routers or for Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router). |
| <b>Options</b>                  | <p><b><i>cos-policer-name</i></b>—Name of one policer to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b> | Statement introduced in Junos OS Release 13.3R5, 14.2R2, 14.1R4, and 12.3R9.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | For Link Layer Discovery Protocol, configure the value to be used for port description TLV.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | <p><b>interface-alias</b>—Use the <i>ifAlias</i> MIB object value to generate the port description TLV.</p> <p><b>interface-description</b>—Use the <i>ifDescr</i> MIB object value to generate the port description TLV.</p> <p><b>Default:</b> By default, <b>interface-alias</b> is used for generation of port description TLV. The <b>interface-alias</b> value is same as description of an interface configured by statement <b>set interface <i>name</i> description <i>description</i></b>.</p> |

**NOTE:** The LLDP MIB *lldpLocPortDesc* value gets changed depending on the setting of **port-description-type** statement. That is:

- If you configure the **port-description-type interface-alias** statement, the MIB variable *lldpLocPortDesc* displays the value same as that of MIB variable *ifAlias*, which is same as the description of the interface. By default, the MIB variable *lldpLocPortDesc* displays the value same as that of MIB variable *ifAlias*.
- If you configure the **port-description-type interface-description** statement, the MIB variable *lldpLocPortDesc* displays the value of MIB variable *ifDescr*, which is same as that of interface name.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specify a port ID in a secure channel when enabling MACsec using static secure association key (SAK) security mode. The port IDs must match on a sending and receiving secure channel on each side of a link to enable MACsec.</p> <p>Once the port numbers match, MACsec is enabled for all traffic on the connection.</p> <p>You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.</p> |
| <b>Default</b>                  | No port ID is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <i>port-id-number</i> —The port ID number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.3R1                                                                                                                                                                         |
| <b>Description</b>         | For Link Layer Discovery Protocol, configure the port ID type, length, and value (TLV).                                                                                                                                 |
| <b>Options</b>             | <b>interface-name</b> —Use the interface name to generate the port ID TLV.<br><b>Default:</b> Use the SNMP index of the interface to generate the port ID TLV. This is the default option used to generate port ID TLV. |

**NOTE:** For QFX5200 switches, the default value used to generate port ID TLV in LLDP messages is interface name, not SNMP index.

**NOTE:** The `show lldp neighbors` command displays the content of the port ID TLV received from the peer in the port Info field. Changing the configuration of `port-id-subtype` affects the display of the `show lldp neighbors` command on the peer device running Junos OS.

When the value of `port-id-subtype` is set to `locally-assigned`, which is the default value, the `show lldp neighbors` command on the peer device running Junos OS displays the SNMP index as the port information for the local device.

When the value of `port-id-subtype` is set to `interface-name`, the `show lldp neighbors` command on the peer device running Junos OS displays the interface name as the port information for the local device.

The value of the MIB variable instance `lldpLocPortId` depends on the entity that is used to generate the port ID TLV. If the port ID TLV generation is configured to use the `interface-name` in the command `set port-id-subtype interface-name`, then the value of the MIB variable `lldpLocPortId` instance is the interface name and not the SNMP index.

Hierarchy Level [edit dynamic-profiles *profile-name* interfaces]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Configure the dynamic PPPoE logical interface in a dynamic profile. When the router creates a dynamic PPPoE logical interface on an underlying Ethernet interface configured with PPPoE (**ppp-over-ether**) encapsulation, it uses the information in the dynamic profile to determine the properties of the dynamic PPPoE logical interface.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.<br>Support for the <b>\$junos-preferred-source-address</b> and <b>\$junos-preferred-source-ipv6-address</b> predefined variables introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | <p>For unnumbered Ethernet interfaces configured with a loopback interface as the donor interface, specify one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. To configure the preferred source address dynamically, instead of using this statement, you must include the <b>\$junos-preferred-source-address</b> predefined variable for IPv4 (family inet) addresses or the <b>\$junos-preferred-source-ipv6-address</b> predefined variable for IPv6 (family inet6) addresses.</p> <p>Configuration of a preferred source address for unnumbered Ethernet interfaces is supported for IPv4 and IPv6 address families.</p> |
|                                 | <p> <b>NOTE:</b> When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the <b>\$junos-routing-instance</b> predefined variable, you must not configure a preferred source address, whether with the <b>\$junos-preferred-source-address</b> predefined variable, the <b>\$junos-preferred-source-ipv6-address</b> predefined variable, or the <b>preferred-source-address</b> statement. Configuring the preferred source address in this circumstance causes a commit failure.</p>                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <b>address</b> —Secondary IP address of the donor loopback interface. Alternatively, use the <b>\$junos-preferred-source-address</b> or the <b>\$junos-preferred-source-ipv6-address</b> predefined variable to dynamically apply a preferred source address to the unnumbered Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Specifies the pre-shared key used to enable MACsec using static connectivity association key (CAK) security mode.</p> <p>A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the pre-shared keys are successfully verified and exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link.</p> |
| <b>Default</b>                  | No pre-shared keys exist, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | The remaining statements are explained separately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the IP address for which the TCC router is proxying. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only. Ethernet TCC is not supported on the T640 router. |
| <b>Options</b>                  | <b>inet-address</b> —Configure the IP address of the neighbor to the TCC router.                                                                                                                                                                                                                                                                                                                                   |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | <p> <b>NOTE:</b> On EX4300 switches, <b>push</b> is not supported at the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>output-vlan-map</b>]</code> hierarchy level.</p> <p>Specify the VLAN rewrite operation to add a new VLAN tag to the top of the VLAN stack. An outer VLAN tag is pushed in front of the existing VLAN tag.</p> <p>You can use this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.</p> <p>If you include the <b>push</b> statement in the configuration, you must also include the <b>pop</b> statement at the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> <b>output-vlan-map</b>]</code> hierarchy level.</p> |

## recovery

**Syntax**    recovery {  
              (auto | manual);  
              timer *timer-value*;  
          }

**Hierarchy Level**    [edit interfaces *interfaces-name* link-degrade-monitor]

**Release Information**    Statement introduced in Junos OS Release 15.1.

**Description**    Configure the mechanism to be used to recover a degraded link. The recovery options supported are auto and manual.

**Options**    **auto**—Recover a degraded link automatically. Use this option with the media-based action when there are no Layer 2 or Layer 3 protocols configured on the interface. If this option is configured, the degraded link is monitored at user-configured intervals; and if the link quality is found to have improved (if bit error rate hits the clear threshold), the link is automatically recovered. With this configuration, you must configure a timer value.

**manual**— Recover a degraded link manually. Use this option with the media-based action configuration when Layer 2 and Layer 3 protocols are configured on the interface. If this option is configured, you need to use the **request interface link-degrade-recover interface-name** statement to recover the link.

**NOTE:** The manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while autorecovery is in progress.

**timer *timer-value***—Specify the interval value (in seconds) after which autorecovery of the degraded link must be triggered. This option is applicable if you configure the autorecovery option. The interval period starts from the time the link is degraded. The default interval is 1800 seconds. The autorecovery attempt is repeated until the link is recovered or the link monitoring feature is disabled through configuration.

**NOTE:** During autorecovery, you might notice link flaps at the remote end of the link.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the location of the remote router. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only.  |
| <b>Options</b>                  | <b>mac-address</b> —Configure the MAC address of the remote site.<br><br><b>inet-address</b> —Configure the IP address of the remote site.                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | <b>interface</b> —To view this statement in the configuration.<br><b>interface-control</b> —To add this statement to the configuration.                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Specifies the size of the replay protection window.</p> <p>This statement has to be configured to enable replay protection.</p> <p>When MACsec is enabled on an Ethernet link, an ID number is assigned to each packet entering the link. The ID number of the packet is checked by the receiving interface after the packet has traversed the MACsec-enabled link.</p> <p>When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving interface. For instance, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.</p> <p>Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.</p> <p>Replay protection should not be enabled in cases where packets are expected to arrive out of order.</p> |
| <b>Default</b>                  | Replay protection is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b><i>number-of-packets</i></b>—Specifies the size of the replay protection window, in packets.</p> <p>When this variable is set to 0, all packets that arrive out-of-order are dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Use in conjunction with the <b>dynamic-profile</b> statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, <b>empty</b> service entry, or <b>any</b> service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the <b>routing-instance</b> statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the <b>static-interface</b> statement at this level. The <b>routing-instance</b> and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| <b>Options</b>                  | <b><i>routing-instance-name</i></b> —Name of the routing instance in which the router instantiates the dynamic PPPoE interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## sa-multicast (100-Gigabit Ethernet)

|                            |                                                                                                                      |
|----------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | sa-multicast;                                                                                                        |
| <b>Hierarchy Level</b>     | [edit chassis fpc slot pic slot forwarding-mode]                                                                     |
| <b>Release Information</b> | Statement introduced in Junos OS Release 10.4.                                                                       |
| <b>Description</b>         | Configure the 100-Gigabit Ethernet PIC or MIC to interoperate with other Juniper Networks 100-Gigabit Ethernet PICs. |

**NOTE:** The default packet steering mode for PD-1CE-CFP-FPC4 is SA multicast bit mode. No SA multicast configuration is required to enable this mode.

sa-multicast supports interoperability between the following PICs and MICs:

- 100-Gigabit Ethernet Type 5 PIC with CFP (PF-1CGE-CFP) and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4) .
- 100-Gigabit Ethernet MICs and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4).

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Create and configure a secure channel to enable and configure MACsec when MACsec is enabled using static secure association key (SAK) security mode.</p> <p>You do not need to use this option to enable MACsec using static connectivity association key (CAK) security mode. All configuration for MACsec using static CAK security mode is done inside of the connectivity association but outside of the secure channel. When MACsec is enabled using static CAK security mode, an inbound and an outbound secure channel—neither of which is user-configurable—is automatically created within the connectivity association.</p> |
| <b>Options</b>                  | The remaining statements are explained separately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specifies the number of one of the security associations in the secure channel when MACsec is enabled using static secure association key (SAK) security mode. Because SAKs are created by the key server when MACsec is enabled using static connectivity association key (CAK) security mode, the <b>security-association</b> statement is not used when enabling MACsec using static CAK security mode.</p> <p>You must configure at least two security associations to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.</p> |
| <b>Default</b>                  | No security keys are configured, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b><i>security-association-number</i></b>—Specifies the security association number and creates the SAK.</p> <p>The security association number is a whole number between 0 and 3. You can configure two security associations in a secure channel when enabling MACsec using static security keys.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>For EX Series switches configured for 802.1X authentication, specify the server fail fallback action the switch takes when all RADIUS authentication servers are unreachable.</p> <p>When you specify the action <i>vlan-name</i> or <i>vlan-id</i>, the VLAN must already be configured on the switch.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>                  | Authentication is denied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>deny</b>—Force fail the supplicant authentication. No traffic will flow through the interface.</p> <p><b>permit</b>—Force succeed the supplicant authentication. Traffic will flow through the interface as if it were successfully authenticated by the RADIUS server.</p> <p><b>use-cache</b>—Force succeed the supplicant authentication only if it was previously authenticated successfully. This action ensures that already authenticated supplicants are not affected.</p> <p><b>vlan-id</b>—Move supplicant on the interface to the VLAN specified by this numeric identifier. This action is allowed only if it is the first supplicant connecting to the interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.</p> <p><b>vlan-name</b>—Move supplicant on the interface to the VLAN specified by this name. This action is allowed only if it is the first supplicant connecting to an interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>For EX Series switches configured for 802.1X authentication, specify that when the switch receives an Extensible Authentication Protocol Over LAN (EAPoL) Access-Reject message during the authentication process between the switch and the RADIUS authentication server, supplicants attempting access to the LAN are granted access and moved to a specific VLAN. Any VLAN name or VLAN ID sent by a RADIUS server as part of the EAPoL Access-Reject message is ignored.</p> <p>When you specify the VLAN ID or VLAN name, the VLAN must already be configured on the switch.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |
| <b>Default</b>                  | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## service (PPPoE)

```
Syntax service service-name {
 drop;
 delay seconds;
 terminate;
 dynamic-profile profile-name;
 routing-instance routing-instance-name;
 max-sessions number;
 agent-specifier {
 aci circuit-id-string ari remote-id-string {
 drop;
 delay seconds;
 terminate;
 dynamic-profile profile-name;
 routing-instance routing-instance-name;
 static-interface interface-name;
 }
 }
 }
```

**Hierarchy Level** [edit protocols pppoe [service-name-tables table-name](#)]

**Release Information** Statement introduced in Junos OS Release 10.0.  
**any**, **dynamic-profile**, **routing-instance**, **max-sessions**, and **static-interface** options introduced in Junos OS Release 10.2.

**Description** Specify the action taken by the interface on receipt of a PPPoE Active Discovery Initiation (PADI) control packet for the specified named service, **empty** service, or **any** service in a PPPoE service name table. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service.

**Default** The default action is terminate.

**Options** **service-name**—Service entry in the PPPoE service name table:

- **service-name**—Named service entry of up to 32 characters; for example, **premiumService**. You can configure a maximum of 512 named service entries across all PPPoE service name tables on the router.
- **empty**—Service entry of zero length that represents an unspecified service. Each PPPoE service name table includes one **empty** service entry by default.
- **any**—Default service for non-empty service entries that do not match the named or **empty** service entries configured in the PPPoE service name table. Each PPPoE service name table includes one **any** service entry by default.

The remaining statements are explained separately. See [CLI Explorer](#).

| <b>Description</b>              | <p>Create and configure a PPPoE service name table. Specify the action taken for each service and remote access concentrator on receipt of a PPPoE Active Discovery Initiation (PADI) packet. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service. A maximum of 32 PPPoE service name tables is supported per router.</p>                                                                                       |
| <b>Options</b>                  | <p><b>table-name</b>—Name of the PPPoE service name table, a string of up to 32 alphanumeric characters.</p> <p>The remaining statements are explained separately. | Release Information      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description              | For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the <b>source-filtering</b> statement in the configuration to enable source address filtering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Options                  | <p><b>mac-address</b>—MAC address filter. You can specify the MAC address as <i>nn:nn:nn:nn:nn:nn</i> or <i>nnnn.nnnn.nnnn</i>, where <i>n</i> is a decimal digit. To specify more than one address, include multiple <b>mac-address</b> options in the <b>source-address-filter</b> statement.</p> <p>If you enable the VRRP on a Fast Ethernet or Gigabit Ethernet interface, as described in <a href="#">“VRRP and VRRP for IPv6 Overview” on page 361</a>, and if you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the <b>source-address-filter</b> statement. MAC addresses ranging from <b>00:00:5e:00:01:00</b> through <b>00:00:5e:00:01:ff</b> are reserved for VRRP, as defined in RFC 3768, <i>Virtual Router Redundancy Protocol</i>. When you configure the VRRP group, the group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.</p> <p>On untagged Gigabit Ethernet interfaces, you should not configure the <b>source-address-filter</b> statement and the <b>accept-source-mac</b> statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the <b>source-address-filter</b> statement and the <b>accept-source-mac</b> statement with an identical MAC address specified in both filters.</p> |
| Required Privilege Level | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Syntax**    `speed (10m | 100m | 1g | auto | auto-10m-100m);`

**Hierarchy Level**    `[edit interfaces interface-name],`  
`[edit interfaces ge-pim/0/0 switch-options switch-port port-number]`

**Release Information**    Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**    Configure the interface speed. This statement applies to the management Ethernet interface (**fxp0** or **em0**), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet port on the FIC (M7i router), Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, and Gigabit Ethernet interfaces on EX Series switches.

When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.

**NOTE:** On MX Series routers with Tri-rate Enhanced DPC (DPCE-R-40GE-TX), when you configure the interface speed using the **auto-10m-100m** option, the speed is negotiated to the highest value possible (100 Mbps), if the same value is configured on both sides of the link. However, when you view the interface speed of the DPC, using the **show interfaces** command, the value of the speed is not accurately displayed. For instance, if you configure the speed of the Tri-rate enhanced DPC, as 100Mbps on both sides of the link, the interface speed of the DPC is negotiated to 100 Mbps. However, the interface speed of the DPC displays 1 bps. This is an issue with the **show interfaces** command only. The actual interface speed is 100 Mbps.

**Options**    You can specify the speed as either **10m** (10 Mbps), **100m** (100 Mbps), and on MX Series routers, **1g** (1 Gbps). You can also specify the **auto** option on MX Series routers.

For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:

- **10m**—10 Mbps
- **100m**—100 Mbps
- **1g**—1 Gbps
- **auto**—Automatically negotiate the speed (10 Mbps, 100 Mbps, or 1 Gbps) based on the speed of the other end of the link.

- **auto-10m-100m**—Automatically negotiate the speed (10 Mbps or 100 Mbps) based on the speed of the other end of the link.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## speed (MX Series DPC)

**Syntax** speed (auto | 1Gbps | 100Mbps | 10Mbps);

**Hierarchy Level** [edit interfaces *ge-fpc/pic/port*]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** On MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs you can set auto negotiation of speed. To specify the auto negotiation speed, use the **speed (auto | 1Gbps | 100Mbps | 10Mbps)** statement under the [edit interface *ge-fpc/pic/port*] hierarchy level. The **auto** option will attempt to automatically match the rate of the connected interface. To set port speed negotiation to a specific rate, set the port speed to **1Gbps**, **100Mbps**, or **10Mbps**.

**NOTE:** If the negotiated speed and the interface speed do not match, the link will not be brought up. Half duplex mode is not supported.

**Options** You can specify the speed as either **auto** (autonegotiate), **10Mbps** (10 Mbps), **100Mbps** (100 Mbps), or **1Gbps** (1 Gbps).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Reserve the specified static PPPoE interface for use only by the PPPoE client with matching agent circuit identifier (ACI) and agent remote identifier (ARI) information. You can specify only one static interface per ACI/ARI pair configured for a named service entry, <b>empty</b> service entry, or <b>any</b> service entry in the PPPoE service name table.</p> <p>The static interface associated with an ACI/ARI pair takes precedence over the general pool of static interfaces associated with the PPPoE underlying interface.</p> <p>If you include the <b>static-interface</b> statement in the configuration, you cannot also include either the <b>dynamic-profile</b> statement or the <b>routing-instance</b> statement. The <b>dynamic-profile</b>, <b>routing-instance</b>, and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| <b>Options</b>                  | <b><i>interface-name</i></b> —Name of the static PPPoE interface reserved for use by the PPPoE client with matching ACI/ARI information. Specify the interface in the format <b>pp0.logical</b> , where <b>logical</b> is a logical unit number from 0 through 16385 for static interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Configure the MAC-based method used to authenticate clients for 802.1X or captive portal authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default</b>                  | single                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>single</b>—Authenticates only the first client that connects to an authenticator port. All other clients connecting to the authenticator port after the first are permitted free access to the port without further authentication. If the first authenticated client logs out, all other supplicants are locked out until a client authenticates again.</p> <p><b>single-secure</b>—Authenticates only one client to connect to an authenticator port. The host must be directly connected to the switch.</p> <p><b>multiple</b>—Authenticates multiple clients individually on one authenticator port. You can configure the number of clients per port. If you also configure a maximum number of devices that can be connected to a port through port security settings, the lower of the configured values is used to determine the maximum number of clients allowed per port.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## switch-port

---

**Syntax**    `switch-port port-number {  
                  (auto-negotiation | no-auto-negotiation);  
                  speed (10m | 100m | 1g);  
                  link-mode (full-duplex | half-duplex);  
                  }`

**Hierarchy Level**    [edit interfaces *ge-pim/0/0* [switch-options](#)]

**Release Information**    Statement introduced in Junos OS Release 8.4.

**Description**    Configuration of the physical port characteristics, done under the single physical interface.

**Default**    Autonegotiation is enabled by default. If the link speed and duplex are also configured, the interfaces use the values configured as the desired values in the negotiation.

**Options**    *port-number*—Ports are numbered 0 through 5 on the 6-port Gigabit Ethernet uPIM, 0 through 7 on the 8-port Gigabit Ethernet uPIM, and 0 through 15 on the 16-port Gigabit Ethernet uPIM.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**    interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the threshold for sending symbol period events or taking the action specified in the action profile.</p> <p>A symbol error is any symbol code error on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period window. The default period window is the number of symbols that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.</p> |
| <b>Options</b>                  | <p><b>count</b>—Threshold count for symbol period events.</p> <p><b>Range:</b> 0 through 100</p>                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Define the LACP system identifier at the aggregated Ethernet interface level.</p> <p>The user-defined system identifier in LACP enables two ports from two separate routers (M Series or MX Series routers) to act as though they were part of the same aggregate group.</p> <p>The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.</p> |

| <b>Description</b>              | <p>Define LACP system priority at the aggregated Ethernet interface level. This system priority value takes precedence over a system priority value configured at the global <b>[edit chassis]</b> hierarchy level.</p> <p>The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.</p> |
| <b>Options</b>                  | <p><b>priority</b>—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.</p> <p><b>Range:</b> 0 through 65535</p> <p><b>Default:</b> 127</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, aggregated Ethernet with Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, and the built-in Gigabit Ethernet port on the M7i router), define the TPIDs expected to be sent or received on a particular VLAN. For each Gigabit Ethernet port, you can configure up to eight TPIDs using the <b>tag-protocol-id</b> statement; but only the first four TPIDs are supported on IQ2 and IQ2-E interfaces.</p> <p>For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers only the default TPID value (<b>0x8100</b>) is supported.</p> <p>For Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, define the TPIDs expected to be sent or received on a particular VLAN. The default TPID value is <b>0x8100</b>. Other supported values are <b>0x88a8</b>, <b>0x9100</b>, and <b>0x9200</b>.</p> |
| <b>Options</b>                  | <i>tpids</i> —TPIDs to be accepted on the VLAN. Specify TPIDs in hexadecimal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces only, configure the outer TPID value. All TPIDs you include in input and output VLAN maps must be among those you specify at the [edit interfaces <i>interface-name</i> <b>gigether-options ethernet-switch-profile tag-protocol-id [ <i>tpids</i> ]</b>] hierarchy level.</p> <p>For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers the default TPID value (0x8100) is supported.</p>                                                           |
| <b>Default</b>                  | If the <b>tag-protocol-id</b> statement is not configured, the TPID value is 0x8100.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>                                                                                                                                                                                                                                                   | Configure primary and backup links for manual targeting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                                                                                                                                                                                                                                                       | <p><b>backup</b>—Specify a backup member link per subscriber when you configure manual targeting. Configuring a backup link is optional.</p> <p><b>group</b>—(Optional) Assign a group name for subscribers with similar bandwidth usage. Subscribers that are configured for targeted distribution without a group name are added to the <b>default</b> group and distributed evenly across member links. Grouping of subscribers is supported only for static subscribers.</p> <p><b>Default:</b> default</p> <p><b>primary</b>—Specify a primary member link per subscriber when you configure manual targeting. You must always configure a primary link when you configure manual targeting.</p> <p><b>weight <i>weight-value</i></b>—Specify the weight for all the targeted subscribers like PPPoE, demux, and conventional VLANs based on the customers preferences, class of service (CoS), or bandwidth requirement. Member links for logical interfaces of aggregated Ethernet logical interfaces are assigned based on the value of the weight . When a new VLAN is added to the same aggregated Ethernet bundle, then the primary member link selected for targeting is the one with the minimum primary load and the backup link selected for targeting is the one with the minimum overall load.</p> |
| <div>  <p><b>NOTE:</b> The <b>weight <i>weight-value</i></b> statement is supported only at the [edit interfaces <i>name</i> unit <i>unit-number</i>] hierarchy level.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## thresholds

---

**Syntax** thresholds {  
    clear *clear-value*;  
    interval *interval-value*;  
    set *set-value*;  
    warning-clear *warning-clear-value*;  
    warning-set *warning-set-value*;  
}

**Hierarchy Level** [edit interfaces *interfaces-name* link-degrade-monitor]

**Release Information** Statement introduced in Junos OS Release 15.1.

**Description** Configure the BER threshold values (such as set and clear thresholds) at which different corrective actions must be triggered on a degraded interface.

**Options** **clear *clear-value***—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 12.

**interval *interval-value***—The number of consecutive link degrade events that are considered before any corrective action is taken. The supported value range for the interval is 1 through 256, and the default interval is 10.

**set *set-value***—The BER threshold value at which the link is considered degraded and a corrective action, specified by the user, is triggered. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 7.

**warning clear *warning-clear-value***—The link clear warning threshold. Every time this threshold value is reached, a system message is logged to indicate that the link degrade condition has been cleared on the interface. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 11.

**warning set *warning-set-value***—The link degrade warning threshold. Every time this threshold value is reached, a system message is logged to indicate that a link degrade has occurred on the interface. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 9.

**NOTE:** The lower the BER with high confidence level, the longer it takes to estimate it. In such cases, a few packet drops might be noticed (based on the bit error distribution) before a link degrade event is detected.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | Set LLDP protocol-level tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>             | The default LLDP protocol-level trace options are inherited from the global <b>traceoptions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place spanning-tree protocol tracing output in the file <b>/var/log/stp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file only</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. The following are the LLDP-specific tracing options:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations.</li><li>• <b>config</b>—Log configuration events.</li><li>• <b>interface</b>—Trace interface update events.</li><li>• <b>protocol</b>—Trace protocol information.</li><li>• <b>rtsock</b>—Trace socket events.</li></ul> |

- **vlan**—Trace vlan update events.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events. This is the default. If you do not specify this option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-world-readable**—(Optional) Prevent any user from reading the log file. This is the default. If you do not include this option, tracing output is appended to an existing trace file.

**size *maximum-file-size***—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

|                                 |                                                             |
|---------------------------------|-------------------------------------------------------------|
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.        |
|                                 | routing-control—To add this statement to the configuration. |

|                              |                                                       |

| <b>Description</b>         | Configure trace options for the protection group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | Trace options are not set by default. On some EX Series switches, logging of basic ERPS state transitions is set by default. You can configure trace options on those switches to obtain more details than are provided by the default log. See <a href="#">“Understanding Ethernet Ring Protection Switching Functionality” on page 248</a> for additional information about default logging of the basic state transitions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <b>/var/log</b>. You can include the following file options:</p> <ul style="list-style-type: none"><li>• <b>no-stamp</b>—(Optional) Do not timestamp trace file.</li><li>• <b>no-world-readable</b>—(Optional) Do not allow any user to read the log file.</li><li>• <b>replace</b>—(Optional) Replace the trace file rather than appending to it.</li><li>• <b>size</b>—(Optional) Maximum trace file size (10240..4294967295).</li><li>• <b>world-readable</b>—(Optional) Allow any user to read the log file.</li></ul> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. The following flags are available for both EX Switches and MX Series routers:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all</li><li>• <b>config</b> —Trace configuration messages</li><li>• <b>debug</b>—Trace debug messages</li><li>• <b>events</b>—Trace events to the protocol state machine</li><li>• <b>normal</b>—Trace normal messages</li><li>• <b>pdu</b> —Trace RAPS PDU reception and transmission</li><li>• <b>periodic-packet-management</b>—Trace periodic packet management state and events</li><li>• <b>state-machine</b>—Trace RAPS state machine</li></ul> |

- **timers**—Trace protocol timers

**Required Privilege Level**    system—To view this statement in the configuration.  
                                         system-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | Define tracing operations for the interface process (dcd).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | If you do not include this statement, no interface-specific tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. By default, interface process tracing output is placed in the file <b>dcd</b>.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b></li><li>• <b>change-events</b>—Log changes that produce configuration events</li><li>• <b>config-states</b>—Log the configuration state machine changes</li><li>• <b>kernel</b>—Log configuration IPC messages to kernel</li><li>• <b>kernel-detail</b>—Log details of configuration messages to kernel</li></ul> <p><b>no-world-readable</b>—(Optional) Disallow any user to read the log file.</p> |

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your router

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**match** *regex*—(Optional) Refine the output to include only those lines that match the given regular expression.

| <b>Release Information</b> | Statement introduced in Junos OS Release 7.6.<br>Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Define tracing operations for the LACP protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>             | If you do not include this statement, no LACP protocol tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. By default, interface process tracing output is placed in the file <b>lacpd</b>.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All LACP tracing operations</li><li>• <b>configuration</b>—Configuration code</li><li>• <b>packet</b>—Packets sent and received</li><li>• <b>process</b>—LACP process events</li><li>• <b>protocol</b>—LACP protocol state machine</li><li>• <b>routing-socket</b>—Routing socket events</li><li>• <b>startup</b>—Process startup events</li></ul> <p><b>no-world-readable</b>—(Optional) Prevent any user from reading the log file.</p> |

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option:

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your router

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>         | <p>Define tracing operations at the MACsec level. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>The interfaces <b>traceoptions</b> statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the <b>syslog</b> file in the directory <b>/var/log/dcd</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Default</b>             | If you do not include this statement, no tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the trace file, all files are placed in the directory <b>/var/log/dcd</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches the maximum value, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. The following are the tracing operation options:</p> <p><b>all</b>—Trace all operations.</p> <p><b>config</b>—Trace configuration messages.</p> <p><b>debug</b>—Trace debug messages.</p> <p><b>normal</b>—Trace normal messages.</p> <p><b>no-world-readable</b>—(Optional) Prevent any user from reading the log file.</p> |

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.1 for MPC7E-10G on MX Series routers.<br>Statement introduced in Junos OS Release 17.3R1 for JNP-MIC1-MACSEC MIC on MX10003 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | <p>Define tracing operations for individual MACsec interfaces. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>The interfaces <b>traceoptions</b> statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the system <b>syslog</b> file in the directory <b>/var/log/dcd</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | If you do not include this statement, no tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the tracefile, all files are placed in the directory <b>/var/log/dcd</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches the maximum value, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. The following are the tracing operation options:</p> <p><b>all</b>—Trace all operations.</p> <p><b>keys</b>—Trace key creation or generation information.</p> <p><b>mka-packets</b>—Trace MACsec Key Agreement (MKA) protocol input and output packet information.</p> <p><b>normal</b>—Trace all normal events and messages.</p> <p><b>state</b>—Trace MKA protocol state information.</p> <p><b>to-secy</b>—Trace MKA to security entity state change information.</p> |

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

**world-readable**—(Optional) Allow any user to read the log file.

## traceoptions (PPPoE)

**Syntax** `traceoptions {  
     file <filename> <files number> <match regular-expression> <size maximum-file-size>  
     <world-readable | no-world-readable>;  
     filter {  
         aci regular-expression;  
         ari regular-expression;  
         service-name regular-expression;  
         underlying-interface interface-name;  
     }  
     flag flag;  
     level (all | error | info | notice | verbose | warning);  
     no-remote-trace;  
}`

**Hierarchy Level** [edit protocols pppoe]

**Release Information** Statement introduced in Junos OS Release 9.6.  
 Option **filter** introduced in Junos OS Release 12.3

**Description** Define tracing operations for PPPoE processes.

**Options** **file filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

**files number**—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**disable**—Disable this trace flag.

**filter**—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

**BEST PRACTICE:** Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.

- **aci regular-expression**—Regular expression to match the agent circuit identifier provided by PPPoE client.

- **ari** *regular-expression*—Regular expression to match the agent remote identifier provided by PPPoE client.
- **service** *regular-expression*—Regular expression to match the name of PPPoE service.
- **underlying-interface** *interface-name*—Name of a PPPoE underlying interface. You cannot use a regular expression for this filter option.

**flag** *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **config**—Trace configuration events.
- **events**—Trace events.
- **gres**—Trace GRES events.
- **init**—Trace initialization events.
- **interface-db**—Trace interface database operations.
- **memory**—Trace memory processing events.
- **protocol**—Trace protocol events.
- **rtsock**—Trace routing socket events.
- **session-db**—Trace connection events and flow.
- **signal**—Trace signal operations.
- **state**—Trace state handling events.
- **timer**—Trace timer processing.
- **ui**—Trace user interface processing.

**level**—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**Default:** **error**

**match** *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size** *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                           |                                                           |
|---------------------------|-----------------------------------------------------------|
| <b>Required Privilege</b> | trace—To view this statement in the configuration.        |
| <b>Level</b>              | trace-control—To add this statement to the configuration. |

|                              |                                                                                                                                                               |

| <b>Hierarchy Level</b>     | [edit protocols authentication-access-control]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Release Information</b> | Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | Define tracing operations for the 802.1X protocol, LLDP, and captive portal authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>             | Tracing operations are disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size by using the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations.</li> <li>• <b>config-internal</b>—Trace internal configuration operations.</li> <li>• <b>dot1x-event</b>—Trace 802.1x events.</li> <li>• <b>dot1x-debug</b>—Trace 802.1x events.</li> <li>• <b>dot1x-ipc</b>—Trace IPC interactions.</li> <li>• <b>eapol</b>—Trace EAPOL packets transmitted and received.</li> <li>• <b>general</b>—Trace general operations.</li> <li>• <b>normal</b>—Trace normal operations.</li> <li>• <b>parse</b>—Trace reading of the configuration.</li> <li>• <b>regex-parse</b>—Trace regular-expression parsing operations.</li> <li>• <b>state</b>—Trace protocol state changes.</li> </ul> |

- **task**—Trace protocol task operations.
- **timer**—Trace protocol timer operations.
- **vlan**—Trace VLAN transactions.

**match *regex***—(Optional) Refine the output to include lines that contain the regular expression.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files with the **files** option, you also must specify a maximum file size.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Specifies the transmit interval for MACsec Key Agreement (MKA) protocol data units (PDUs).</p> <p>The MKA transmit interval setting sets the frequency for how often the MKA PDU is sent to the directly connected device to maintain MACsec on a point-to-point Ethernet link. A lower <i>interval</i> increases bandwidth overhead on the link; a higher <i>interval</i> optimizes the MKA protocol data unit exchange process.</p> <p>The transmit interval settings must be identical on both ends of the link when MACsec using static connectivity association key (CAK) security mode is enabled.</p> <p>We recommend increasing the interval to 6000 ms in high-traffic load environments.</p> |
| <b>Default</b>                  | The default transmit interval is 2000 milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the <b>\$junos-loopback-interface-address</b> predefined variable.<br><br>You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <b>interface-name</b> —Name of the interface from which the local address is derived. The specified interface must have a logical unit number, a configured IP address, and must not be an unnumbered interface. This value can be a specific interface name or the <b>\$junos-loopback-interface</b> predefined variable.<br><br>When defining the <b>unnumbered-address</b> statement using a static interface, keep the following in mind: <ul style="list-style-type: none"> <li>If you choose to include the <b>routing-instance</b> statement at the [edit dynamic-profiles] hierarchy level, that statement must be configured with a dynamic value by using the <b>\$junos-routing-instance</b> predefined variable. In addition, whatever static unnumbered interface you specify must belong to that routing instance; otherwise, the profile instantiation fails.</li> <li>If you choose to not include the <b>routing-instance</b> statement at the [edit dynamic-profiles] hierarchy level, the unnumbered-address statement uses the default routing instance. The use of the default routing instance requires that the unnumbered interface be configured statically and that it reside in the default routing instance.</li> </ul> |

**NOTE:** When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the **\$junos-routing-instance** predefined variable, you must not configure a preferred source address, whether with the **\$junos-preferred-source-address** predefined variable, the **\$junos-preferred-source-ipv6-address** predefined variable, or the

**preferred-source-address** statement. Configuring the preferred source address in this circumstance causes a commit failure.

When defining the **unnumbered-address** statement using the **\$junos-loopback-interface** predefined variable, keep the following in mind:

- To use the **\$junos-loopback-interface** predefined variable, the dynamic profile must also contain the **routing-instance** statement configured with the **\$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The applied loopback interface is based on the dynamically obtained routing instance of the subscriber.

**address**—(Optional) Secondary IP address of the donor interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. This value can be a static IP address, the **\$junos-preferred-source-address** predefined variable for the inet family, or the **\$junos-preferred-source-ipv6-address** predefined variable for the inet6 family.

When defining the **preferred-source-address** value using a static IP address, keep the following in mind:

- The unnumbered interface must be statically configured.
- The IP address specified as the **preferred-source-address** must be configured in the specified unnumbered interface.

When defining the **preferred-source-address** value using the **\$junos-preferred-source-address** or the **\$junos-preferred-source-ipv6-address** predefined variables, keep the following in mind:

- You must configure the **unnumbered-address** statement using the **\$junos-loopback-interface** predefined variable.
- You must configure the **routing-instance** statement using the **\$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The preferred source address chosen is based on the dynamically applied loopback address which is in turn derived from the dynamically obtained routing instance of the subscriber. The configured loopback address with the closest network match to the user IP address is selected as the preferred source address.

## version-3

---

|                            |                                                               |
|----------------------------|---------------------------------------------------------------|
| <b>Syntax</b>              | version-3;                                                    |
| <b>Hierarchy Level</b>     | [edit protocols vrrp]                                         |
| <b>Release Information</b> | Statement introduced in Junos OS Release 12.2.                |
| <b>Description</b>         | Enable Virtual Router Redundancy Protocol version 3 (VRRPv3). |

---

### NOTE:

- Even though the version-3 statement can be configured only at the [edit protocols vrrp] hierarchy level, VRRPv3 is enabled on all the configured logical systems as well.
  - When enabling VRRPv3, you must ensure that VRRPv3 is enabled on all the VRRP routers in the network. This is because VRRPv3 does not interoperate with the previous versions of VRRP.
-

## vlan-id-list (Ethernet VLAN Circuit)

|                            |                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>vlan-id-list [vlan-id vlan-id–vlan-id];</code>                                                                                                                                             |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ] |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.5.                                                                                                                                                    |
| <b>Description</b>         | Binds a single-tag logical interface to a list of VLAN IDs. Configures a logical interface to receive and forward any tag frame whose VLAN ID tag matches the list of VLAN IDs you specify.      |

### NOTE:

When you create a circuit cross-connect (CCC) using VLAN-bundled single-tag logical interfaces on Layer 2 VPN routing instances, the circuit automatically uses ethernet encapsulation. For Layer 2 VPN, you need to include the `encapsulation-type` statement and specify the value `ethernet` at either of the following hierarchy levels:

- [edit routing-instances *routing-instance-name* protocols l2vpn]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols l2vpn]

For more information about the `encapsulation-type` configuration statement and the Layer 2 encapsulation types `ethernet` and `ethernet-vlan`, see the *Junos OS VPNs Library for Routing Devices*.

**Options** `[vlan-id vlan-id–vlan-id]`—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

**Range:** 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

**NOTE:** Configuring `vlan-id-list` with the entire `vlan-id` range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name
vlan-tagging;
```

```
unit number {
 vlan-id-range 1-4094;
}

[edit interfaces interface-name]
unit 0;
```

---

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>     | <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],</code><br><code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</code> |
| <b>Release Information</b> | Statement introduced in Junos OS Release 8.4.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                                                 |
| <b>Description</b>         | Bind a range of VLAN IDs to a logical interface.                                                                                                                                                                         |
| <b>Options</b>             | <b>number</b> —The first number is the lowest VLAN ID in the range the second number is the highest VLAN ID in the range.<br><b>Range:</b> 1 through 4094                                                                |

**NOTE:** Configuring `vlan-id-range` with the entire `vlan-id` range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
 vlan-id-range 1-4094;
}

[edit interfaces interface-name]
unit 0;
```

VLAN ID 0 is reserved for tagging the priority of frames.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.5.                                                                                                                                                                                   |
| <b>Description</b>         | (MX Series routers only) Binds a dual-tag logical interface to a list of VLAN IDs. Configures the logical interface to receive and forward any dual-tag frame whose inner VLAN ID tag matches the list of VLAN IDs you specify. |

### NOTE:

To create a circuit cross-connect (CCC) using VLAN-bundled dual-tag logical interfaces on Layer 2 VPN routing instances, you must include the `encapsulation-type` statement and specify the value `ethernet-vlan` at the one of the following hierarchy levels:

- `[edit routing-instances routing-instance-name protocols l2vpn]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]`

For more information about the `encapsulation-type` configuration statement and the Layer 2 encapsulation types `ethernet` and `ethernet-vlan`, see the *Junos OS VPNs Library for Routing Devices*.

**Options** `inner-list [vlan-id vlan-id vlan-id-vlan-id]`—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

**Range:** 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

`outer <tpid.>vlan-id`—An optional Tag Protocol ID (TPID) and a valid VLAN ID.

**Range:** For TPID, specify a hexadecimal value in the format `0xnnnn`.

**Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

**NOTE:** Configuring `inner-list` with the entire `vlan-id` range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through

4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
 vlan-tags outer vid inner-list 1-4094;
}

[edit interfaces interface-name]
vlan-tagging;
unit number {
 vlan-id vid;
}
```

---

## vlan-tags (Stacked VLAN Tags)

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>vlan-tags inner <i>tpid.vlan-id</i> inner-list <i>value</i> inner-range <i>vid1—vid2</i> outer <i>tpid.vlan-id</i>;</code>                                                                                                                                                                                                                                                                                                            |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ]                                                                                                                                                                                                                                            |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.                                                                                                                                                                                                                                                                                              |
| <b>Description</b>         | Bind TPIDs and 802.1Q VLAN tag IDs to a logical interface. TPID fields are used to identify the frame as an IEEE 802.1Q-tagged frame.                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>inner <i>tpid.vlan-id</i></b>—A TPID and a valid VLAN identifier. TPID is a 16-bit field set to a value of 0x8100 in order to identify the frame as an IEEE 802.1Q-tagged frame.</p> <p><b>Range:</b> (most routers) For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.</p> <p><b>inner-list <i>value</i></b>— List or a set of VLAN identifiers.</p> |

**NOTE:** This is supported on MX Series routers with Trio-based FPCs.

**inner-range *tpid. vid1—vid2***—Specify a TPID and a range of VLAN IDs where vid1 is the start of the range and vid2 is the end of the range.

**NOTE:** On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the inner-range *tpid. vid1—vid2* option with the `vlan-tags` statement for ISP-facing interfaces.

**Range:** For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

**outer *tpid.vlan-id***—A TPID and a valid VLAN identifier.

**Range:** (most routers) For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

**NOTE:** Configuring inner-range with the entire `vlan-id` range consumes system resources and is not a best practice. The inner-range must be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through 4094), it

has the same result as not specifying a range; however, it consumes Packet Forwarding Engine resources such as VLAN lookup table entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
stacked-vlan-tagging;
unit number {
 vlan-tags outer vid inner-range 1-4094;
}

[edit interfaces interface-name]
vlan-tagging;
unit number {
 vlan-id vid;
}
```

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

- [stacked-vlan-tagging on page 1336](#)

## wait-to-block-interval

**Syntax** wait-to-block-interval *number*;

**Hierarchy Level** [edit protocols [protection-group ethernet-ring](#) *ring-name*]

**Release Information** Statement introduced in Junos OS Release 14.2.

**Description** Enable the Wait to Block (WTB) timer interval when clearing force switch and manual switch commands.

**Options** *number*—Wait-to-block interval, in seconds.  
**Range:** 5 through 10 s  
**Default:** 5 s

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## west-interface

**Syntax**

```
west-interface {
 node-id mac-address;
 control-channel channel-name {
 vlan number;
 interface name interface-name
 }
 interface-none
 ring-protection-link-end;
 virtual-control-channel {
 west-interface name;
 east-interface name;
 }
}
```

**Hierarchy Level** [edit protocols [protection-group ethernet-ring ring-name](#)]

**Release Information** Statement introduced in Junos OS Release 9.5.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** Define one of the two interface ports for Ethernet ring protection, the other being defined by the **east-interface** statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

**NOTE:** Always configure this port second, after configuring the **east-interface** statement.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Clear the specified aggregate Ethernet interface load balancing state and re-create it newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.</p> <p>If you observe load distribution to be not very effective, you can clear the load-balancing states or use rebalancing functionality to cause an automatic clearance of the hardware states. When you configure the rebalancing facility, traffic flows can get redirected to different links, which can cause packet reordering.</p> |
| <b>Options</b>                  | <p><b>aeX</b>—Name of a particular aggregated Ethernet interface.</p> <p><b><i>logical-unit-number</i></b>—Number of the logical unit of the interface.</p> <p><b>forwarding-options load-balance state</b>—Cause the load-balancing state to be cleared for the specific interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Sample Output

#### clear interfaces aeX aggregate forwarding-options

```
user@host> clear interfaces ae1 aggregate forwarding-options load-balance state
```

---

## clear interfaces aggregate forwarding-options load-balance state

---

**Syntax** clear interfaces aggregate forwarding-options load-balance state

**Release Information** Command introduced in Junos OS Release 13.2R1.

**Description** Clear all the aggregate Ethernet interface load balancing states and re-create them newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.

**Options** *interface-name*—Name of a particular interface.

**Required Privilege Level** clear

### Sample Output

#### clear security mka statistics

```
user@switch> clear security mka statistics
```

## monitor ethernet delay-measurement

**Syntax** monitor ethernet delay-measurement  
 maintenance-domain *md-name*  
 maintenance-association *ma-name*  
 (one-way | two-way)  
 (*remote-mac-address* | mep *remote-mep-id*)  
 <count *frame-count*>  
 <local-mep *mep-id*>  
 <wait *interval-seconds*>  
 <priority *802.1p value*>  
 <size>  
 <no-session-id-tlv>  
 <xml>

**Release Information** Command introduced in Junos OS Release 9.5.  
**local-mep** option introduced in Junos OS Release 15.1.

**Description** Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +c to explicitly quit the **monitor ethernet delay-measurement** command and return to the CLI command prompt.

To start an Ethernet frame delay measurement session, the router initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the runtime output of the **monitor ethernet delay-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

**Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

**Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

- Options**
- maintenance-domain *md-name***—Name of an existing CFM maintenance domain.
  - maintenance-association *ma-name***—Name of an existing CFM maintenance association.
  - one-way**—Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (IDM) frame and the time at which the receiver MEP receives the frame.
  - two-way**—Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.
  - mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.
  - remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.
  - count *frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.
  - local-mep *mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance association end point.
  - wait *interval-seconds***—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.
  - priority *802.1p value***—(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.
  - size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.
  - no-session-id-tlv**—(Optional) Prevent insertion of the session ID TLV in the request frame.
  - xml**—(Optional) Allow the output of the command to be displayed in XML format supported by both one-way delay measurement and two-way delay measurement. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

**Additional Information** To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

**Required Privilege Level** trace and maintenance

**List of Sample Output** [monitor ethernet delay-measurement one-way on page 1434](#)  
[monitor ethernet delay-measurement two-way on page 1435](#)  
[monitor ethernet delay-measurement two-way \(Invalid DMR Frames Received\) on page 1435](#)

**Output Fields** The **monitor ethernet delay-measurement** command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- [Table 88 on page 1433](#) lists the run-time output fields for the **monitor ethernet delay-measurement one-way** command.
- [Table 89 on page 1434](#) lists the run-time output fields for the **monitor ethernet delay-measurement two-way** command.

Output fields are listed in the approximate order in which they appear.

**Table 88: monitor ethernet delay-measurement one-way Output Fields**

| Output Field Name         | Output Field Description                                                                       |
|---------------------------|------------------------------------------------------------------------------------------------|
| One-way ETH-DM request to | Unicast MAC address of the remote peer MEP.                                                    |
| Interface                 | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached. |
| 1DM Frames sent           | PDU frames sent to the remote MEP in this ETH-DM session.                                      |
| Packets transmitted       | Total number of 1DM PDU frames sent to the remote MEP during this measurement session.         |

Table 88: monitor ethernet delay-measurement one-way Output Fields (*continued*)

| Output Field Name       | Output Field Description                              |
|-------------------------|-------------------------------------------------------|
| Average delay           | Average two-way frame delay measured in this session. |
| Average delay variation | Average frame jitter measured in this session.        |
| Best case delay         | Lowest two-way frame delay measured in this session.  |
| Worst case delay        | Highest two-way frame delay measured in this session. |

**NOTE:** For one-way delay measurement, these CLI output fields display **NA** ("not applicable") at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

Table 89: monitor ethernet delay-measurement two-way Output Fields

| Output Field Name                                   | Output Field Description                                                                                        |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Two-way Ethernet frame delay measurement request to | Unicast MAC address of the remote peer MEP.                                                                     |
| Interface                                           | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.                  |
| DMR received from                                   | Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.               |
| Delay                                               | Two-way delay, in microseconds, for the initiator-transmitted DMM frame.                                        |
| Delay variation                                     | Difference, in microseconds, between the current and previous delay values. This is also known as frame jitter. |
| Packets transmitted                                 | Total number of DMM PDU frames sent to the remote MEP in this measurement session.                              |
| Valid packets received                              | Total number of DMR PDU frames received from the remote MEP in this measurement session.                        |
| Average delay                                       | Average two-way frame delay measured in this session.                                                           |
| Average delay variation                             | Average frame jitter measured in this session.                                                                  |
| Best case delay                                     | Lowest two-way frame delay measured in this session.                                                            |
| Worst case delay                                    | Highest two-way frame delay measured in this session.                                                           |

## Sample Output

```

## monitor ethernet loss-measurement

**Syntax**    `monitor ethernet loss-measurement`  
                  `maintenance-domain md-name`  
                  `maintenance-association ma-name`  
                  `(remote-mac-address | mep remote-mep-id)`  
                  `<count frame-count>`  
                  `<local-mep mep-id>`  
                  `<wait interval-seconds>`  
                  `<priority 802.1p value>`  
                  `<no-session-id-tlv>`  
                  `<xml>`

**Release Information**    Command introduced in Junos OS Release 11.1.  
                  **local-mep** option introduced in Junos OS Release 15.1

**Description**    Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval. For MX Series routers, supports point-to-point down MEPs for Ethernet interfaces (as per IEEE 802.1ag over VPWS).

**NOTE:** If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the **monitor ethernet loss-measurement** command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the **monitor ethernet loss-measurement** command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

**Options**    **maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

**maintenance-association *ma-name***—Name of an existing CFM maintenance association.

**mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.

***remote-mac-address***—Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn* (for

example, **0011.2233.4455** or **00:11:22:33:44:55**). Multicast MAC addresses are not supported.

**count** *frame-count*—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.

**local-mep** *mep-id*—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

**wait** *interval-seconds*—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

**priority** *802.1p value*—(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.

**no-session-id-tlv**—(Optional) Disable the **session id TLV** argument set in the request frame.

**xml**—(Optional) Allow the output of the command to be displayed in XML format.

**Additional Information** To display the iterator output for an LM session, run the following command:

- **show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator <profile> maintenance-association <MA> maintenance-domain <MD> local-mep <MEP> remote-mep <RMEP>**

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management loss-statistics**
- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain *md-name* maintenance-association *ma-name*** command, as described in the [CLI Explorer](#).

For a complete description of Ethernet frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

| LMR received from                          | Unicast MAC address of the remote MEP that transmitted this LMR frame in response to a loss measurement message (LMM) frame.                                                   |
| Near-end frame loss                        | Count of frame loss associated with ingress data frames.                                                                                                                       |
| Far-end frame loss                         | Count of frame loss associated with egress data frames.                                                                                                                        |
| Near-end loss ratio                        | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface. |
| Far-end loss ratio                         | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.  |
| LMM packets transmitted                    | Total number of LMM PDU frames sent to the remote MEP in this measurement session.                                                                                             |
| LMR packets received                       | Total number of LMR PDU frames received from the remote MEP in this measurement session.                                                                                       |
| Average near-end frame loss                | Average frame loss measured in this session associated with ingress data frames.                                                                                               |
| Average near-end loss ratio                | Average frame loss ratio measured in this session associated with ingress data frames.                                                                                         |
| Average far-end frame loss                 | Average frame loss measured in this session associated with egress data frames.                                                                                                |
| Average far-end loss ratio                 | Average frame loss ratio measured in this session associated with egress data frames.                                                                                          |
| Near-end best case frame loss              | Lowest frame loss measured in this session associated with ingress data frames.                                                                                                |
| Near-end best case loss ratio              | Lowest frame loss ratio measured in this session associated with ingress data frames.                                                                                          |

Table 90: monitor ethernet loss-measurement output fields (*continued*)

| Output Field Name              | Output Field Description                                                               |
|--------------------------------|----------------------------------------------------------------------------------------|
| Near-end worst case frame loss | Highest frame loss measured in this session associated with ingress data frames.       |
| Near-end worst case loss ratio | Highest frame loss ratio measured in this session associated with ingress data frames. |
| Far-end best case frame loss   | Lowest frame loss measured in this session associated with egress data frames.         |
| Far-end best case loss ratio   | Lowest frame loss ratio measured in this session associated with egress data frames.   |
| Far-end worst case frame loss  | Highest frame loss measured in this session associated with egress data frames.        |
| Far-end worst case loss ratio  | Highest frame loss ratio measured in this session associated with egress data frames.  |

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

## Sample Output

### monitor ethernet loss-measurement

```
user@host> monitor ethernet loss-measurement mep 2 64:87:88:6a:da:94 maintenance-domain
md maintenance-association ma count 10
ETH-LM request to 64:87:88:6a:da:94, Interface ge-2/3/2.0
