## admin-group (for LSPs)

<b>Syntax</b>	<pre>admin-group {   exclude [ group-names ];   include-all [ group-names ];   include-any [ group-names ]; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems logical-system-name protocols mpls], [edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name], [edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name (primary   secondary) path-name], [edit protocols mpls], [edit protocols mpls label-switched-path lsp-name], [edit protocols mpls label-switched-path lsp-name (primary   secondary) path-name]</pre>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Define the administrative groups to include or exclude an LSP and a path's primary and secondary paths.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Administrative Groups for LSPs on page 409</a></li> </ul>

## admin-group-extended

---

Syntax	<pre>admin-group-extended {     apply-groups <i>group-value</i>;     apply-groups-except <i>group-value</i>;     exclude [ <i>group-values</i> ];     include-all [ <i>group-values</i> ];     include-any [ <i>group-values</i> ]; }</pre>
Hierarchy Level	<pre>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>     (primary   secondary) <i>path-name</i>], [edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i> (primary   secondary) <i>path-name</i>]</pre>
Release Information	Statement introduced in Junos OS Release 11.1.
Description	<p>Specifies the group name and group identifier for an administrative group. The group identifier must be within the range of values specified by the <b>admin-groups-extended-range</b> statement. The extended administrative group values are global and must be identically configured on all the supported routers participating in the network. The domain-wide extended administrative groups database, learned from other routers through IGP flooding, is used by CSPF for path computation.</p>
Options	<p><b>apply-groups</b>—Apply the specified administrative groups for the LSP or for the primary and secondary paths.</p> <p><b>apply-groups-except</b>—Exclude the specified administrative groups from the LSP or from the primary and secondary paths.</p> <p><b>exclude</b>—Define the administrative groups to exclude from an LSP or from the primary and secondary paths.</p> <p><b>include-all</b>—Require the LSP to traverse links that include all of the defined administrative groups.</p> <p><b>include-any</b>—Define the administrative groups to include for an LSP for the primary and secondary paths.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Extended Administrative Groups for LSPs on page 411</a></li><li>• <a href="#">Configuring Administrative Groups for LSPs on page 409</a></li><li>• <a href="#">admin-groups-extended on page 1970</a></li></ul>

## admin-groups

---

<b>Syntax</b>	<code>admin-groups {     <i>group-name</i> <i>group-value</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure administrative groups to implement link coloring of resource classes.
<b>Options</b>	<p><b><i>group-name</i></b>—Name of the group. You can assign up to 32 names. The names and their corresponding values must be identical across all routers within a single domain.</p> <p><b><i>group-value</i></b>—Value assigned to the group. The names and their corresponding values must be identical across all routers within a single domain.</p> <p><b>Range:</b> 0 through 31</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Administrative Groups for LSPs on page 409</a></li> <li>• <a href="#">admin-group (for Interfaces) on page 1966</a></li> </ul>

## admin-groups-extended

---

<b>Syntax</b>	<pre>admin-groups-extended <i>group-name</i> {     group-value <i>group-identifier</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-options], [edit protocols mpls interface <i>interface-name</i> ], [edit routing-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	Specifies the group name and group identifier for an administrative group. The group identifier must be within the range of values specified by the <b>admin-groups-extended-range</b> statement. The extended administrative group values are global and must be identically configured on all the supported routers participating in the network. The domain-wide extended administrative groups database, learned from other routers through IGP flooding, is used by CSPF for path computation.
<b>Options</b>	<p><b><i>group-name</i></b>—The range of configurable values is between 32 and 4,294,967,295. The range maximum must be greater than the range minimum.</p> <p><b><i>group-value group-identifier</i></b>—The group identifier must be within the range of configurable values, 32 and 4,294,967,295.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Extended Administrative Groups for LSPs on page 411</a></li><li>• <a href="#">Configuring Administrative Groups for LSPs on page 409</a></li><li>• <a href="#">admin-group-extended on page 1968</a></li><li>• <a href="#">admin-groups-extended-range on page 1971</a></li></ul>

## admin-groups-extended-range

<b>Syntax</b>	<pre>admin-groups-extended-range {     maximum <i>maximum-number</i>;     minimum <i>minimum-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options], [edit routing-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	<p>Enables you to configure extended administrative groups, represented by a 32-bit value, expanding the number of administrative groups supported in the network beyond just 32. In MPLS traffic engineering, a link can be configured with a set of administrative groups (also known as colors or resource classes). Administrative groups are carried in IGP (OSPFv2 and IS-IS) as a 32-bit value assigned to each link. By default, Juniper Networks routers interpret this 32-bit value as a bit mask with each bit representing a group. This normally limits each network to a total of 32 distinct administrative groups (value range 0 through 31).</p> <p>The extended administrative groups configuration accepts a set of interfaces with a corresponding set of extended administrative group names. It converts the names into a set of 32-bit values and propagates this information into the IGP. The extended administrative group values are global and must be identically configured on all the supported routers participating in the network. The domain-wide extended administrative groups database, learned from other routers through IGP flooding, is used by CSPF for path computation.</p>
<b>Options</b>	<p><b>maximum <i>maximum-number</i></b>—The range of configurable values is between 32 and 4,294,967,295. The range maximum must be greater than the range minimum.</p> <p><b>minimum <i>minimum-number</i></b>—The range of configurable values is between 32 and 4,294,967,295. The range maximum must be greater than the range minimum.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Extended Administrative Groups for LSPs on page 411</a></li> <li>• <a href="#">Configuring Administrative Groups for LSPs on page 409</a></li> <li>• <a href="#">admin-group-extended on page 1968</a></li> </ul>

## advertise-mode (MPLS)

---

<b>Syntax</b>	<code>advertise-mode (stub-alias   stub-proxy);</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls egress-protection context-identifier <i>context-id</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> egress-protection context-identifier <i>context-id</i>],</code> <code>[edit protocols mpls egress-protection context-identifier <i>context-id</i>],</code> <code>[edit protocols mpls label-switched-path <i>lsp-name</i> egress-protection context-identifier <i>context-id</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 13.3.
<b>Description</b>	<p>Configure the method for the interior gateway protocol (IGP) to advertise egress protection availability.</p> <p>Egress protection availability is advertised in the IGP. Label protocols along with CSPF use this information to do egress protection.</p>
<b>Options</b>	<p><b>stub-alias</b>—Context identifier has an alias.</p> <p>In the alias method, the LSP end-point address has an explicit backup egress node where the backup node can be learned or configured on the penultimate hop node (PHN) of a protected LSP. With this model, the PHN of a protected LSP sets up the bypass LSP tunnel to back up the egress node by avoiding the primary egress node. This model requires a Junos OS upgrade in core nodes, but is flexible enough to support all traffic engineering constraints.</p> <p><b>stub-proxy</b>—Context-identifier has a stub proxy node.</p> <p>A stub node is one that only appears at the end of an AS path, which means it does not provide transit service. In this mode, known as the virtual or proxy mode, the LSP end-point address is represented as a node with bidirectional links, with the LSP's primary egress node and backup egress node. With this representation, the penultimate hop of the LSP primary egress point can behave like a PLR in setting up a bypass tunnel to back up the egress by avoiding the primary egress node. This model has the advantage that you do not need to upgrade Junos OS on core nodes and thereby helps operators to deploy this technology.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Egress Protection for Layer 3 VPN Edge Protection Overview</i></li><li>• <i>Example: Configuring Layer 3 VPN Egress Protection with RSVP and LDP</i></li></ul>

## advertisement-hold-time

---

<b>Syntax</b>	<code>advertisement-hold-time seconds;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls],</code> <code>[edit protocols mpls]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Do not advertise when the LSP goes from up to down, for a certain period of time known as the hold time.
<b>Options</b>	<b>seconds</b> —Hold time, in seconds. <b>Range:</b> 0 through 65,535 seconds <b>Default:</b> 5 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Damping Advertisement of LSP State Changes on page 438</a></li> </ul>

## allow-fragmentation

---

<b>Syntax</b>	<code>allow-fragmentation;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls path-mtu],</code> <code>[edit protocols mpls path-mtu]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Allow IP packets to be fragmented before they are encapsulated in MPLS.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling Packet Fragmentation on page 660</a></li> </ul>

## always-mark-connection-protection-tlv

---

<b>Syntax</b>	always-mark-connection-protection-tlv;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-systems-name</i> protocols mpls interface <i>interface-name</i> ], [edit protocols mpls interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	<p>(MX Series routers only) Enable you to switch an LSP away from a network node using a bypass LSP. This feature could be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic.</p> <p>This statement marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, you then need to configure the <b>switch-away-lsps</b> statement.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Switching LSPs Away from a Network Node on page 654</a></li></ul>

## associate-backup-pe-groups

---

<b>Syntax</b>	associate-backup-pe-groups;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	<p>Enable an LSP to monitor the status of its destination PE router. You can configure multiple backup PE router groups using the same router's address. Backup PE router groups provide ingress PE router redundancy when point-to-multipoint LSPs are configured for multicast distribution. A failure of this LSP indicates to all of the backup PE router groups that the destination PE router is down. This statement is not tied to a specific backup PE router group. It applies to all groups that are interested in the status of the LSP to the destination address.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling Point-to-Point LSPs to Monitor Egress PE Routers on page 551</a></li></ul>

---

## associate-lsp

---

<b>Syntax</b>	<code>associate-lsp <i>lsp-name</i> {     from <i>from-ip-address</i>; }</code>
<b>Hierarchy Level</b>	<code>[edit protocols mpls label-switched-path <i>lsp-name</i> oam]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1.
<b>Description</b>	Configure associated bidirectional label-switched paths (LSPs) on the two ends of an LSP for sending and receiving GAL and G-Ach OAM messages.
<b>Options</b>	<b>from <i>from-ip-address</i></b> —(Optional) Source address for the associated LSP configuration.  If omitted, this is derived from the <b>to</b> address of the ingress LSP configuration.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring the MPLS Transport Profile for OAM on page 964</a></li></ul>

## auto-bandwidth (MPLS Tunnel)

**Syntax** auto-bandwidth {  
     adjust-interval *seconds*;  
     adjust-threshold *percent*;  
     adjust-threshold-absolute *adjust-threshold-absolute-value*;  
     adjust-threshold-activate-bandwidth *bps*  
     adjust-threshold-overflow-limit *number*;  
     adjust-threshold-underflow-limit *number*;  
     maximum-bandwidth *bps*;  
     minimum-bandwidth *bps*;  
     minimum-bandwidth-adjust-interval  
     minimum-bandwidth-adjust-threshold-change  
     minimum-bandwidth-adjust-threshold-value  
     monitor-bandwidth;  
 }

**Hierarchy Level** [edit protocols mpls label-switched-path *lsp-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 13.2X51-D15 for QFX Series switches.  
 Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.

**Description** Allow an MPLS tunnel to automatically adjust its bandwidth allocation based on the volume of traffic flowing through the tunnel.

**NOTE:** In calculating the value for Max AvgBW (relative to the ingress LSP), the sample collected during make before break (MBB) is ignored to prevent inaccurate results. The first sample after a bandwidth adjustment, or after a change in the LSP ID (regardless of path change), is also ignored.

**Options** **adjust-threshold-absolute** *adjust-threshold-absolute-value*—Configure an absolute value based threshold along with the percentage based threshold that helps avoid the bandwidth getting triggered for LSPs of both small and large bandwidth reservations.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

**Related Documentation**

---

## auto-bandwidth (MPLS Statistics)

---

<b>Syntax</b>	auto-bandwidth;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">statistics</a> ], [edit protocols mpls <a href="#">statistics</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for QFX Series switches. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.
<b>Description</b>	Collect statistics related to automatic bandwidth.
<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Automatic Bandwidth Allocation for LSPs on page 423</a></li><li>• <a href="#">Configuring MPLS to Gather Statistics on page 181</a></li><li>• <a href="#">statistics on page 2149</a></li></ul>

## auto-policing

---

<b>Syntax</b>	<pre>auto-policing {     class all (drop   loss-priority-high   loss-priority-low);     class <i>ctnumber</i> (drop   loss-priority-high   loss-priority-low); }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced for QFX10000 Series switches in release 15.1X53-D40.
<b>Description</b>	Enable the automatic policing of all the MPLS LSPs on the router or logical system.
<b>Options</b>	<p><b>class all</b>—Apply the same policer action to all the class types (<b>ct0</b>, <b>ct1</b>, <b>ct2</b>, and <b>ct3</b>).</p> <p><b>class <i>ctnumber</i></b>—Specific class type (<b>ct0</b>, <b>ct1</b>, <b>ct2</b>, or <b>ct3</b>) to which to apply a policer action.</p> <p>Policer actions—You can specify the following policer actions:</p> <p><b>Default:</b> no action</p> <ul style="list-style-type: none"><li>• <b>drop</b>—Drop all packets.</li><li>• <b>loss-priority-high</b>—Set the packet loss priority (PLP) to high.</li><li>• <b>loss-priority-low</b>—Set the PLP to low.</li></ul>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">policing (Protocols MPLS) on page 2102</a></li><li>• <a href="#">Configuring Automatic Policers on page 94v</a></li></ul>

## backup-pe-group

---

<b>Syntax</b>	<code>backup-pe-group <i>group-name</i> {     backups [ <i>addresses</i> ];     local-address <i>address</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast], [edit logical-systems <i>logical-system-name</i> routing-options multicast], [edit routing-instances <i>routing-instance-name</i> routing-options multicast], [edit routing-options multicast]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0. Statement introduced in Junos OS Release 9.5 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
<b>Description</b>	Configure a backup provider edge (PE) group for ingress PE redundancy when point-to-multipoint label-switched paths (LSPs) are used for multicast distribution.
<b>Options</b>	<i>group-name</i> —Name of the group for PE backups.  The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Ingress PE Redundancy</i></li> </ul>

## bandwidth (Fast Reroute, Signaled, and Multiclass LSPs)

<b>Syntax</b>	<pre>bandwidth <i>bps</i> {     ct0 <i>bps</i>;     ct1 <i>bps</i>;     ct2 <i>bps</i>;     ct3 <i>bps</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls],          [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>],          [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> <b>fast-reroute</b>],          [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> (primary   secondary) <i>path-name</i>],          [edit protocols mpls],          [edit protocols mpls label-switched-path <i>lsp-name</i>],          [edit protocols mpls label-switched-path <i>lsp-name</i> <b>fast-reroute</b>],          [edit protocols mpls label-switched-path <i>lsp-name</i> (primary   secondary) <i>path-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>When configuring an LSP, specify the traffic rate associated with the LSP.</p> <p>When configuring fast reroute, allocate bandwidth for the reroute path. By default, no bandwidth is reserved for the rerouted path. The fast reroute bandwidth does not need to be identical to that allocated for the LSP itself.</p> <p>When configuring a multiclass LSP, use the <b>ctnumber bandwidth</b> statements to specify the bandwidth to be allocated for each class type.</p>
<b>Options</b>	<p><b>bps</b>—Bandwidth, in bits per second. You can specify this as an integer value. You can also use the abbreviations <b>k</b> (for a thousand), <b>m</b> (for a million), or <b>g</b> (for a billion).</p> <p><b>Range:</b> Any positive integer</p> <p><b>Default:</b> 0 (no bandwidth is reserved)</p>

**NOTE:** On the ACX Series, *bps* is the only supported option.

**ctnumber bps**—Bandwidth for the specified class type, in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations **k** (for a thousand), **m** (for a million), or **g** (for a billion [also called a thousand million]).

**Range:** Any positive integer

**Default:** 0 (no bandwidth is reserved)

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## bandwidth (Static LSP)

**Syntax** `bandwidth bps;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols mpls static-label-switched-path *lsp-name* bypass],  
[edit logical-systems *logical-system-name* protocols mpls static-label-switched-path *lsp-name* ingress],  
[edit logical-systems *logical-system-name* protocols mpls static-label-switched-path *lsp-name* transit *incoming-label*],  
[edit protocols mpls static-label-switched-path *lsp-name* bypass],  
[edit protocols mpls static-label-switched-path *lsp-name* ingress],  
[edit protocols mpls static-label-switched-path *lsp-name* transit *incoming-label*]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** When configuring a static LSP, specify the traffic rate associated with the LSP.

**Options** *bps*—Bandwidth, in bits per second. You can specify this as an integer value. You can also use the abbreviations **k** (for a thousand), **m** (for a million), or **g** (for a billion).

**Range:** Any positive integer

**Default:** 0 (no bandwidth is reserved)

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## bandwidth-model

---

<b>Syntax</b>	<pre>bandwidth-model {     extended-mam;     mam;     rdm; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls diffserv-te], [edit protocols mpls diffserv-te]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Configure the bandwidth model for differentiated services. Note that you cannot configure both bandwidth models at the same time.
<b>Options</b>	<p><b>extended-mam</b>—The extended maximum allocation model (MAM) is a bandwidth model based on MAM.</p> <p><b>mam</b>—The MAM is defined in RFC 4125, <i>Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering</i>.</p> <p><b>rdm</b>—The Russian dolls bandwidth allocation model (RDM) is defined in RFC 4127, <i>Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering</i>. RDM makes efficient use of bandwidth by allowing the class types to share bandwidth.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Bandwidth Model on page 944</a></li></ul>

## bandwidth-percent

---

<b>Syntax</b>	<code>bandwidth-percent <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> <a href="#">fast-reroute</a> ], [edit protocols mpls label-switched-path <i>lsp-name</i> <a href="#">fast-reroute</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the percentage of bandwidth to reserve for the detour path in case the primary path for a traffic engineered LSP or a multiclass LSP fails. The percentage configured indicates the percentage of the protected path's bandwidth that is reserved for the detour path.
<b>Options</b>	<b><i>percentage</i></b> —The percentage of the protected path's bandwidth that is reserved for the detour path.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Fast Reroute on page 367</a></li> <li>• <a href="#">Configuring Fast Reroute for Traffic-Engineered LSPs on page 955</a></li> <li>• <a href="#">Configuring Fast Reroute for Multiclass LSPs on page 958</a></li> </ul>

## bfd-liveness-detection (Protocols MPLS)

---

<b>Syntax</b>	<pre>bfd-liveness-detection {     failure-action {         make-before-break teardown-timeout <i>seconds</i>;         teardown;     }     minimum-interval <i>milliseconds</i>;     minimum-receive-interval <i>milliseconds</i>;     minimum-transmit-interval <i>milliseconds</i>;     multiplier <i>detection-time-multiplier</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls label-switched-path <i>lsp-name</i> oam], [edit protocols mpls oam]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. <b>failure-action</b> option added in Junos OS Release 8.5. Statement introduced in Junos OS Release 12.2 for EX Series switches.
<b>Description</b>	Enable Bidirectional Forwarding Detection (BFD) for all of the MPLS LSPs or for just a specific LSP.
<b>Options</b>	<p><b>minimum-interval</b>—Minimum transmit and receive interval. <b>Range:</b> 50 through 255,000 milliseconds <b>Default:</b> 50</p> <p><b>minimum-receive-interval</b>—Minimum receive interval. <b>Range:</b> 50 through 255,000 milliseconds <b>Default:</b> 50</p> <p><b>minimum-transmit-interval</b>—Minimum transmit interval. <b>Range:</b> 50 through 255,000 milliseconds <b>Default:</b> 50</p> <p><b>multiplier</b>—Detection time multiplier. <b>Range:</b> 1 through 255 <b>Default:</b> 3</p> <p>The <b>failure-action</b> statement is explained separately.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring BFD for MPLS IPv4 LSPs on page 83</a></li><li>• <a href="#">Configuring Bidirectional Forwarding Detection for MPLS (CLI Procedure) on page 77</a></li></ul>

## class-of-service (Protocols MPLS)

<b>Syntax</b>	<code>class-of-service</code> <code>class-of-service</code> <i>cos-value</i> ;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>],</p> <p>[edit protocols mpls],</p> <p>[edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],</p> <p>[edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.</p>
<b>Description</b>	<p>Class-of-service (CoS) value given to all packets in the LSP.</p> <p>The CoS value might affect the scheduling or queuing algorithm of traffic traveling along an LSP.</p>
<b>Options</b>	<p><b><i>cos-value</i></b>—CoS value. A higher value typically corresponds to a higher level of service.</p> <p><b>Range:</b> 0 through 7</p> <p><b>Default:</b> If you do not specify a CoS value, the IP precedence bits from the packet's IP header are used as the packet's CoS value.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Class of Service for MPLS LSPs on page 1031</a></li> <li>• <a href="#">Configuring the Ingress Router for Static LSPs on page 468</a></li> <li>• <a href="#">Configuring the Intermediate (Transit) and Egress Routers for Static LSPs on page 471</a></li> </ul>

## connections (MPLS)

---

<b>Syntax</b>	<pre>connections {   <b>remote-interface-switch</b> <i>connection-name</i> {     interface <i>interface-name.unit-number</i>;     transmit-lsp <i>label-switched-path</i>;     receive-lsp <i>label-switched-path</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit protocols]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	<p>Define the connection between two circuits in a CCC connection.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring MPLS on EX8200 and EX4500 Switches on page 42</a></li></ul>

## constituent-list

<b>Syntax</b>	<pre>constituent-list <i>constituent-list-name</i> {   (administrative-group [ <i>group-names</i> ]   administrative-group-extended [     <i>extended-administrative-group-names</i> ]   srlg [ <i>srlg-names</i> ] ); }</pre>
<b>Hierarchy Level</b>	[edit logical systems <i>logical-systems-name</i> protocols mpls] [edit protocols mpls]
<b>Release Information</b>	Statement introduced in Junos OS Release 17.1 for all platforms.
<b>Description</b>	Create a list of traffic engineering attributes called constituent attributes, which are the link and node attributes whose logical combination makes up an abstract hop. The constituent attributes are listed under administrative groups, extended administrative groups, and Shared Risk Link Groups (SRLGs).
<b>Options</b>	<p><b><i>constituent-list-name</i></b>—Name of the constituent list that includes constituent traffic engineering attributes for use in the abstract hop definition.</p> <p><b><i>administrative-group [ group-names ]</i></b>—Names of administrative groups to include in the constituent list.</p> <p><b><i>administrative-group-extended [ extended-administrative-group-names ]</i></b>—Names of extended administrative groups to include in the constituent list.</p> <p><b><i>srlg [ srlg-names ]</i></b>—Names of SRLGs to include in the constituent list.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Abstract Hops for MPLS LSPs on page 339</a></li> <li>• <a href="#">abstract-hop on page 1959</a></li> <li>• <a href="#">show mpls abstract-hop-membership on page 2445</a></li> <li>• <a href="#">show mpls lsp abstract-computation on page 2499</a></li> </ul>

## container-label-switched-path

---

<b>Syntax</b>	<pre>container-label-switched-path <i>lsp-name</i> {     disable;     description <i>description</i>;     label-switched-path-template;     splitting-merging;     suffix <i>string</i>;     to <i>ip-address</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2. Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.
<b>Description</b>	Configure a multi-label-switched path (LSP) tunnel between the ingress and the egress routers. The container LSP consists of several member LSPs to the same destination.
<b>Options</b>	<p><b>disable</b>—Disable MPLS container-label-switched path.</p> <p><b>description <i>description</i></b>—Text describing the container LSP.</p> <p><b>suffix <i>string</i></b>—Suffix to generate names of member LSPs of the container LSP.</p> <p><b>to <i>ip-address</i></b>—IP address of the egress router.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## corouted-bidirectional

---

<b>Syntax</b>	corouted-bidirectional;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify that the label-switched path be established as a corouted bidirectional packet LSP. You cannot configure this statement at the same time as the <b>corouted-bidirectional-passive</b> statement.
<b>Default</b>	This statement is disabled by default.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Corouted Bidirectional LSPs on page 442</a></li><li>• <a href="#">corouted-bidirectional-passive on page 1990</a></li></ul>

## corouted-bidirectional-passive

---

<b>Syntax</b>	corouted-bidirectional-passive;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify that the label-switched path be a passive LSP associated with a bidirectional LSP when it is signaled at the ingress router. This passive LSP enables the MPLS application to utilize the reverse LSP. You cannot configure this statement at the same time as the <b>corouted-bidirectional</b> statement.
<b>Default</b>	This statement is disabled by default.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Corouted Bidirectional LSPs on page 442</a></li><li>• <a href="#">corouted-bidirectional on page 1989</a></li></ul>

## credibility

<b>Syntax</b>	<pre>credibility {   direct;   isis-level-1;   isis-level-2;   ospf;   static;   unknown; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls traffic-engineering database export], [edit protocols mpls traffic-engineering database export]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2. Statement introduced in Junos OS Release 17.1R1 on QFX Series and QFX10000 switches.
<b>Description</b>	<p>Configure preference values for entries from BGP-TE to the traffic engineering database. A protocol with a higher credibility value is preferred over a protocol with a lower credibility value.</p> <p>The credibility order for the BGP-TE protocols is as follows:</p> <ul style="list-style-type: none"> <li>• <b>Unknown</b>—80</li> <li>• <b>OSPF</b>—81</li> <li>• <b>ISIS Level 1</b>—82</li> <li>• <b>ISIS Level 2</b>—83</li> <li>• <b>Static</b>—84</li> <li>• <b>Direct</b>—85</li> </ul>
<b>Options</b>	<p><b>direct</b>—Entries sourced from directly connected links.</p> <p><b>isis-level-1</b>—Entries sourced from IS-IS Level 1.</p> <p><b>isis-level-2</b>—Entries sourced from IS-IS Level 2.</p> <p><b>ospf</b>—Entries sourced from OSPF.</p> <p><b>static</b>—Entries sourced from static configuration.</p> <p><b>unknown</b>—Entries sourced from unknown entities.</p> <p><b>Range:</b> 0 through 512</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

---

## database

---

<b>Syntax</b>	<pre>database {     export;     import; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls traffic-engineering], [edit protocols mpls traffic-engineering]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2. Statement introduced in Junos OS Release 17.1R1 for QFX Series and QFX10000 switches.
<b>Description</b>	Include link and node entries from the traffic engineering database into the <b>lsdist.0</b> routing information base (RIB), so it gets picked up by the BGP export policy.  The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <a href="#">traffic-engineering on page 2165</a>

## delay (querier)

<b>Syntax</b>	<pre> delay {   traffic-class tc-value {     average-sample-size sample size;     padding-size size;     query-interval milliseconds;     rtt-delay-threshold rtt threshold value;     twcd-delay-threshold twcd threshold value;   } } </pre>
<b>Hierarchy Level</b>	<p>[edit protocols mpls <a href="#">oam performance-monitoring querier</a>],  [edit protocols mpls <a href="#">label-switched-path lsp-name oam performance-monitoring querier</a>],  [edit protocols mpls <a href="#">label-switched-path lsp-name primary path-name oam performance-monitoring querier</a>],  [edit protocols mpls <a href="#">label-switched-path lsp-name secondary path-name oam performance-monitoring querier</a>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1.
<b>Description</b>	<p>Configure delay measurement options.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.  routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Pro-Active Loss and Delay Measurements on page 207</a></li> <li>• <a href="#">On-Demand Packet Loss and Delay Measurement for UHP LSPs Overview on page 182</a></li> <li>• <a href="#">performance-monitoring (Protocols MPLS) on page 2101</a></li> </ul>

## delay (responder)

---

<b>Syntax</b>	<pre>delay {     min-query-interval <i>milliseconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls <a href="#">oam performance-monitoring responder</a> ], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> <a href="#">oam performance-monitoring responder</a> ], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> primary <i>path-name</i> <a href="#">oam performance-monitoring responder</a> ], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> secondary <i>path-name</i> <a href="#">oam performance-monitoring responder</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1.
<b>Description</b>	Configure delay measurement options.
<b>Options</b>	<p><b>min-query-interval <i>milliseconds</i></b>—(Optional) Specify the minimum query interval that the responder supports. If the minimum query interval of the responder is greater than the query interval configured at querier, the effective message query rate will be the minimum query interval configured for the responder.</p> <p><b>Default:</b> 10 seconds</p> <p><b>Range:</b> 1000 through 4294967295 milliseconds</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Pro-Active Loss and Delay Measurements on page 207</a></li><li>• <a href="#">On-Demand Packet Loss and Delay Measurement for UHP LSPs Overview on page 182</a></li><li>• <a href="#">performance-monitoring (Protocols MPLS) on page 2101</a></li></ul>

## description (Protocols MPLS)

<b>Syntax</b>	<code>description text;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> bypass],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>],</p> <p>[edit protocols mpls label-switched-path <i>lsp-name</i>],</p> <p>[edit protocols mpls static-label-switched-path <i>lsp-name</i> bypass],</p> <p>[edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</p> <p>[edit protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.</p>
<b>Description</b>	Provides a textual description of the LSP. Enclose any descriptive text that includes spaces in quotation marks (" "). Any descriptive text you include is displayed in the output of the <b>show mpls lsp detail</b> command and has no effect on the operation of the LSP.
<b>Options</b>	<b>text</b> —Provide a textual description of the LSP. The description text can be no more than 80 characters in length.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Text Description for LSPs on page 405</a></li> </ul>

## description (Protocols Layer 2 VPN)

---

<b>Syntax</b>	<code>description text;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn site <i>site-name</i> interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn site <i>site-name</i> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Describe the VPN or virtual private LAN service (VPLS) routing instance.
<b>Options</b>	<b>text</b> —Provide a text description. If the text includes one or more spaces, enclose it in quotation marks (" "). Any descriptive text you include is displayed in the output of the <b>show route instance detail</b> command and has no effect on operation.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Site</a></li><li>• <a href="#">Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 1159</a></li></ul>

## deselect-on-bandwidth-failure

---

<b>Syntax</b>	<code>deselect-on-bandwidth-failure {     tear-lsp; }</code>
<b>Hierarchy Level</b>	[edit protocols mpls], [edit protocols mpls label-switched-path <i>path-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1.
<b>Description</b>	Deselect an active path if it does not meet the bandwidth criteria required for path selection.
<b>Options</b>	<b>tear-lsp</b> — Bring down an active path if none of the paths are able to reserve the required bandwidth.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## diffserv-te

<b>Syntax</b>	<pre> diffserv-te {   bandwidth-model {     extended-mam;     mam;     rdm;   }   te-class-matrix {     tnumber {       priority <i>priority</i>;       traffic-class {         ctnumber <i>priority priority</i>;       }     }   } } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify properties for differentiated services in traffic engineering.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Routers for DiffServ-Aware Traffic Engineering on page 943</a></li> </ul>

## disable (Protocols MPLS)

---

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">interface interface-name</a> ], [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path lsp-name</a> ], [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path lsp-name</a> auto-bandwidth], [edit protocols mpls], [edit protocols mpls <a href="#">interface interface-name</a> ], [edit protocols mpls <a href="#">label-switched-path lsp-name</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.
<b>Description</b>	Disable the functionality of the configured object.
<b>Default</b>	The configured object is enabled (operational) unless explicitly disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">label-switched-path on page 2040</a></li><li>• <a href="#">interface on page 2035</a></li></ul>

## dual-transport

---

<b>Syntax</b>	<pre> dual-transport {   inet-lsr-id <i>inet-lsr-id</i>;   inet6-lsr-id <i>inet6-lsr-id</i>; } </pre>
<b>Hierarchy Level</b>	[edit protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 16.1 for the M320 Series, MX Series, and PTX Series.
<b>Description</b>	Configure to allow Junos LDP to establish the TCP connection over IPv4 with IPv4 neighbors, and over IPv6 with IPv6 neighbors as a single-stack LSR. <b>inet-lsr-id</b> and <b>inet6-lsr-id</b> are the two LSR IDs that have to be configured to establish an LDP session over IPv4 and IPv6 TCP transport. These two IDs should be non-zero and must be configured with different values.
<b>Options</b>	<p><b>inet-lsr-id <i>inet-lsr-id</i></b>— Configure the LSR ID to establish an LDP session over IPv4 TCP transport.</p> <p><b>inet6-lsr-id <i>inet6-lsr-id</i></b>— Configure the LSR ID to establish an LDP session over IPv6 TCP transport.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">LDP Native IPv6 Support Overview on page 726</a></li> <li>• <a href="#">Example: Configuring LDP Native IPv6 Support on page 826</a></li> <li>• <a href="#">Configuring LDP Native IPv6 Support on page 825</a></li> <li>• <a href="#">family (Protocols LDP) on page 2015</a></li> </ul>

## dynamic-tunnels

<b>Syntax</b>	<pre>dynamic-tunnels <i>tunnel-name</i> {   destination-networks <i>prefix</i>;   gre;   rsvp-te <i>entry-name</i> {     destination-networks <i>network-prefix</i>;     label-switched-path-template (Multicast) {       default-template;       template-name;     }   }   source-address <i>address</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   routing-options], [edit logical-systems <i>logical-system-name</i> routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options], [edit routing-options]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>
<b>Description</b>	Configure a dynamic tunnel between two PE routers.
<div>  <b>NOTE:</b> ACX Series routers do not support the <code>gre</code> statement. </div>	
<b>Options</b>	<p><b><i>tunnel-name</i></b>—Name of the dynamic tunnel.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring a Two-Tiered Virtualized Data Center for Large Enterprise Networks</i></li> </ul>

## egress-protection (MPLS)

<b>Syntax</b>	<pre>egress-protection {   context-identifier <i>context-id</i> {     primary   protector;     metric <i>igp-metric-value</i>;     advertise-mode (stub-alias   stub-proxy);   } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4. Options <b>primary</b> , <b>protector</b> , and <b>metric</b> introduced in Junos OS Release 11.4R3. Option <b>advertise-mode</b> introduced in Junos OS Release 13.3.
<b>Description</b>	Enables an Edge Protection Virtual Circuit (EPVC) for the MPLS protocol.
<b>Options</b>	<p><b>context-identifier <i>context-id-ip-address</i></b>—(Optional) The context identifier IPv4 address.</p> <p><b>metric <i>igp-metric-value</i></b>—(Optional) The IGP metric value ranging from 2 through 16777215.</p> <p><b>(primary   protector)</b>—On the primary PE router, configure as type <b>primary</b>. On the protector PE router, configure as type <b>protector</b>.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Egress Protection for Layer 3 VPN Services</i></li> <li>• <i>Example: Configuring Layer 3 VPN Egress Protection with RSVP and LDP</i></li> </ul>

## encapsulation-type (Layer 2 VPNs)

<b>Syntax</b>	encapsulation-type (atm-aal5   atm-cell   atm-cell-port-mode   atm-cell-vc-mode   atm-cell-vp-mode   cesop   cisco-hdlc   ethernet   ethernet-vlan   frame-relay   frame-relay-port-mode   interworking   ppp   satop-e1   satop-e3   satop-t1   satop-t3);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols l2circuit neighbor <i>address</i> interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn neighbor <i>address</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls], [edit protocols l2circuit neighbor <i>address</i> interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn neighbor <i>address</i> ], [edit routing-instances <i>routing-instance-name</i> protocols vpls], [edit routing-instances <i>routing-instance-name</i> protocols vpls neighbor <i>address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Specify the type of Layer 2 traffic originating from the CE device. Only the <b>ethernet</b> and <b>ethernet-vlan</b> encapsulation types are supported for VPLS. Not all encapsulation types are supported on the switches. See the switch CLI.
<b>Options</b>	<b>atm-aal5</b> —ATM Adaptation Layer (AAL/5)  <b>atm-cell</b> —ATM cell relay  <b>atm-cell-port-mode</b> —ATM cell relay port promiscuous mode  <b>atm-cell-vc-mode</b> —ATM VC cell relay nonpromiscuous mode  <b>atm-cell-vp-mode</b> —ATM virtual path (VP) cell relay promiscuous mode  <b>cesop</b> —CESOP-based Layer 2 VPN  <b>cisco-hdlc</b> —Cisco Systems-compatible HDLC  <b>ethernet</b> —Ethernet  <b>ethernet-vlan</b> —Ethernet VLAN  <b>frame-relay</b> —Frame Relay  <b>frame-relay-port-mode</b> —Frame Relay port mode  <b>interworking</b> —Layer 2.5 interworking VPN  <b>ppp</b> —PPP

**satsop-e1**—SATSOP-E1-based Layer 2 VPN

**satsop-e3**—SATSOP-E3-based Layer 2 VPN

**satsop-t1**—SATSOP-T1-based Layer 2 VPN

**satsop-t3**—SATSOP-T3-based Layer 2 VPN

**Default:** For VPLS networks, the default encapsulation type is **ethernet**.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## encoding-type

**Syntax** encoding-type (ethernet | packet | pdh | sonet-sdh);

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* lsp-attributes],  
[edit protocols mpls label-switched-path *lsp-name* lsp-attributes]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the encoding type of payload carried by the LSP. It can be any of the following:

- **ethernet**—Ethernet
- **packet**—Packet
- **pdh**—Plesiochronous digital hierarchy (PDH)
- **sonet-sdh**—SONET/SDH

**Default** packet

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## entropy-label

---

<b>Syntax</b>	entropy-label { <code>ingress-policy</code> <i>ingress-policy-name</i> ; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols <code>ldp</code> ],
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.
<b>Description</b>	Assists the transit router in load-balancing MPLS traffic across ECMP paths or Link Aggregation groups by introducing the entropy label to the MPLS label stack. The entropy label allows routers to load balance MPLS traffic by using a hash-input without the need to perform deep packet inspection. Deep packet inspection requires more of the router's processing power and is not a capability shared by all routers.
<b>Options</b>	The other statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Entropy Label for LSPs on page 444</a></li></ul>

## entropy-label

<b>Syntax</b>	<pre>entropy-label {     import <i>policy-name</i>;     no-next-hop-validation; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system name</i> protocols bgp family inet labeled-unicast],          [edit logical-systems <i>logical-system name</i> protocols bgp group <i>group-name</i> family inet labeled-unicast],          [edit logical-systems <i>logical-system name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> labeled-unicast],          [edit protocols bgp family inet labeled-unicast],          [edit protocols bgp group <i>group-name</i> family inet labeled-unicast],          [edit protocols bgp group <i>group-name</i> neighbor <i>address</i> labeled-unicast]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 15.1.          Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.</p>
<b>Description</b>	<p>Insert the entropy label into the BGP labeled unicast LSP packets, which assists the transit router in load-balancing BGP traffic across equal-cost multipaths or link aggregation groups. The ingress label edge router inspects the flow information of a packet and maps it to an entropy label, which is inserted into the BGP label stack. LSRs in the core use this entropy label as the key to hash the packet and direct it to the correct path.</p>
<b>Options</b>	<p><b>import <i>policy-name</i></b>— (Optional) Specify a policy that lists the routes that allow the use of entropy labels.</p> <p><b>no-next-hop-validation</b>— (Optional) Do not validate the next-hop field in the entropy label capability attribute against the route next hop.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.          routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>labeled-unicast</i></li> <li>• <a href="#">policy-statement on page 2104</a></li> <li>• <i>Configuring an Entropy Label for a BGP Labeled Unicast LSP</i></li> <li>• <a href="#">Example: Configuring an Entropy Label for a BGP Labeled Unicast LSP on page 446</a></li> <li>• <i>Understanding Entropy Label for BGP Labeled Unicast LSP</i></li> </ul>

## ethernet-vlan (Protocols Link Management)

---

<b>Syntax</b>	ethernet-label { vlan-id-range <i>vlan-id-range</i> ; }
<b>Hierarchy Level</b>	[edit protocols link-management te-link <i>te-link-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2.
<b>Description</b>	Specify the TE-link to be used for Layer 2 VLAN label-switched path (LSP).
<b>Options</b>	<b>vlan-id-range</b> <i>vlan-id-range</i> —Pool of VALN IDs.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## ether-pseudowire

---

<b>Syntax</b>	ether-pseudowire { zero-control-word; }
<b>Hierarchy Level</b>	[edit forwarding-options enhanced-hash-key family mpls]
<b>Release Information</b>	Statement introduced in Junos OS Release 16.1 for the MX Series.
<b>Description</b>	Load-balance IP over Ethernet pseudowire. Presence of zero-control-word in the payload indicates an Ethernet frame.  <b>zero-control-word</b> — Precedes Ethernet packet to indicate the start Ethernet frame in an MPLS ether-pseudowire payload.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>enhanced-hash-key</i></li><li>• <i>hash-key</i></li><li>• <a href="#">family mpls on page 2016</a></li><li>• <a href="#">MPLS Encapsulated Payload Load-balancing Overview on page 179</a></li></ul>

## exclude (for Administrative Groups)

<b>Syntax</b>	<code>exclude [ <i>group-names</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls <b>label-switched-path</b> <i>lsp-name</i> <b>admin-group</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls <b>label-switched-path</b> <i>lsp-name</i> (<b>primary</b>   <b>secondary</b>) <i>path-name</i> <b>admin-group</b>],</p> <p>[edit protocols mpls <b>label-switched-path</b> <i>lsp-name</i> <b>admin-group</b>],</p> <p>[edit protocols mpls <b>label-switched-path</b> <i>lsp-name</i> (<b>primary</b>   <b>secondary</b>) <i>path-name</i> <b>admin-group</b>]</p>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Define the administrative groups to exclude for an LSP or for a path's primary and secondary paths.
<b>Options</b>	<b><i>group-names</i></b> —Names of one or more groups defined with the <b>admin-groups</b> statement.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Administrative Groups for LSPs on page 409</a></li> </ul>

## exclude (for Fast Reroute)

---

<b>Syntax</b>	(exclude [ <i>group-names</i> ]   no-exclude);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> fast-reroute], [edit protocols mpls label-switched-path <i>lsp-name</i> fast-reroute]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
<b>Description</b>	Control exclusion of administrative groups: <ul style="list-style-type: none"><li>• <b>exclude</b>—Define the administrative groups to exclude for fast reroute.</li><li>• <b>no-exclude</b>—Disable administrative group exclusion.</li></ul>
<b>Options</b>	<b>group-names</b> —Names of one or more groups defined with the <b>admin-groups</b> statement.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Fast Reroute on page 367</a></li><li>• <a href="#">admin-groups on page 1969</a></li></ul>

## exclude-srlg

<b>Syntax</b>	exclude-srlg;
<b>Hierarchy Level</b>	[edit protocols mpls], [edit logical-systems logical-system-name protocols mpls], [edit protocols mpls label-switched-path <i>path-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>path-name</i> ], [edit protocols rsvp interface <i>interface-name</i> link-protection], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>destination</i> ], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>destination</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Exclude Shared Risk Link Group (SRLG) links for the secondary path for critical links where it is imperative to keep the secondary and primary label-switched paths completely disjoint from any common SRLG.</p> <p>When specified, the Constrained Shortest Path First (CSPF) algorithm excludes any link belonging to the set of SRLGs in the primary path. When not specified and if a link belongs to the set of SRLGs in the primary path, CSPF adds the SRLG cost to the metric, but still accepts the link for computing the path.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Excluding SRLG Links Completely for the Secondary LSP on page 220</a></li> </ul>

## exp

<b>Syntax</b>	<pre>exp classifier-name {     import (classifier-name   default);     forwarding-class class-name {         loss-priority level {             code-points [aliases] [3-bit-patterns];         }     } }</pre>
<b>Hierarchy Level</b>	[edit class-of-service classifiers], [edit class-of-service code-point-aliases], [edit class-of-service interfaces <i>interface-name</i> unit <i>logical-unit-number</i> rewrite-rules], [edit class-of-service rewrite-rules]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1 for EX Series switches.
<b>Description</b>	<p>Define the experimental bits (EXP) code point mapping that is applied to MPLS packets. You can define an <b>exp</b> classifier only on EX3200 switches, EX4200 and EX8200 standalone switches, and EX8200 Virtual Chassis. You can bind an <b>exp</b> rewrite rule on EX8200 standalone switches and EX8200 Virtual Chassis.</p> <p>EX Series switches support only one EXP code mapping on the switch (either default or custom). It is applied globally and implicitly to all the MPLS-enabled interfaces on the switch. You cannot bind it or disable it on individual interfaces.</p>
<b>Options</b>	<p><b>classifier-name</b>—Name of the classifier.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Using CoS with MPLS Networks on EX Series Switches on page 1043</a></li> <li>• <a href="#">Configuring MPLS on Provider Edge EX8200 and EX4500 Switches Using Circuit Cross-Connect (CLI Procedure) on page 71</a></li> <li>• <a href="#">Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure) on page 66</a></li> <li>• <a href="#">Configuring CoS on Provider Switches of an MPLS Network (CLI Procedure) on page 1042</a></li> </ul>

## expand-loose-hop

---

<b>Syntax</b>	expand-loose-hop;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.6. Point-to-multipoint LSP support introduced in Junos OS Release 11.2.
<b>Description</b>	<p>Allow an LSP to traverse multiple OSPF areas within a service provider's network.</p> <p>Allows a point-to-multipoint LSP to span multiple domains in a network. Effectively, this allows you to configure one or more sub-LSPs (branches) in separate network domains. Examples of such domains include OSPF areas and autonomous systems (ASs). A sub-LSP of an inter-domain point-to-multipoint LSP can be intra-area, inter-area, or inter-AS, depending on the location of the egress node (leaf) with respect to the ingress node (source). Only OSPF areas are supported for inter-domain point-to-multipoint LSPs. IS-IS levels are not supported.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling Interarea Traffic Engineering on page 895</a></li> <li>• <a href="#">Configuring Inter-Domain Point-to-Multipoint LSPs on page 547</a></li> </ul>

## explicit-null (Protocols MPLS)

---

<b>Syntax</b>	explicit-null;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.
<b>Description</b>	Advertise label 0 to the egress router of an LSP.
<b>Default</b>	If you do not include the <b>explicit-null</b> statement in the MPLS configuration, label 3 (implicit null) is advertised.
	<div> <b>NOTE:</b> Junos OS does not support explicit null routes with next hops to virtual tunnel (vt-) interfaces.</div>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RSVP to Pop the Label on the Ultimate-Hop Router on page 664</a></li></ul>

## export (MPLS Traffic engineering database)

---

<b>Syntax</b>	<pre>export {     <a href="#">credibility</a>;     policy <i>policy-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls traffic-engineering database], [edit protocols mpls traffic-engineering database]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2.
<b>Description</b>	Configure the traffic engineering database export-related parameters.
<b>Options</b>	<p><b>policy <i>policy-name</i></b>—Name of the export policy.</p> <p>The remaining statement is explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">traffic-engineering on page 2165</a></li></ul>

## failure-action (Protocols MPLS)

---

<b>Syntax</b>	<pre>failure-action {     make-before-break teardown-timeout <i>seconds</i>;     teardown; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls oam bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> oam bfd-liveness-detection], [edit protocols mpls label-switched-path <i>lsp-name</i> oam bfd-liveness-detection], [edit protocols mpls oam bfd-liveness-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4.
<b>Description</b>	Configure route and next-hop properties in the event of a Bidirectional Forwarding Detection (BFD) protocol session failure event on an RSVP label-switched path (LSP). The failure event could be an existing BFD session that has gone down or a BFD session that never came up. RSVP adds back the route or next hop when the relevant BFD session comes back up.
<b>Options</b>	<p><b>make-before-break</b>—When a BFD session fails for an RSVP LSP, an attempt is made to signal a new LSP path before tearing down the old LSP path.</p> <p><b>teardown</b>—When a BFD session fails for an RSVP LSP, the associated LSP path is taken down and resigaled immediately.</p> <p><b>teardown-timeout <i>seconds</i></b>—When you configure the <b>make-before-break</b> option, you can specify a time in seconds for the <b>teardown-timeout</b> option. At the end of the time specified, the associated RSVP LSP is automatically torn down and resigaled.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Failure Action for the BFD Session on an RSVP LSP on page 86</a></li></ul>

## family

---

<b>Syntax</b>	<pre>family {   inet;   inet6; }</pre>
<b>Hierarchy Level</b>	[edit protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 16.1 for the M320 Series, MX Series, and PTX Series.
<b>Description</b>	Configure the address family as inet for IPv4 or inet6 for IPv6, or both. If the address family is not configured, then the default address family is IPv4.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">LDP Native IPv6 Support Overview on page 726</a></li><li>• <a href="#">Example: Configuring LDP Native IPv6 Support on page 826</a></li><li>• <a href="#">Configuring LDP Native IPv6 Support on page 825</a></li><li>• <a href="#">dual-transport on page 1999</a></li></ul>

## family mpls

---

**Syntax**

```
family mpls {
  all-labels;
  label-1;
  label-2;
  label-3;
  no-labels;
  no-label-1-exp;
  payload {
    ether-pseudowire {
      zero-control-word;
    }
    ip {
      disable;
      layer-3-only;
      port-data {
        source-msb;
        source-lsb;
        destination-msb;
        destination-lsb;
      }
    }
  }
}
```

**Hierarchy Level** [edit forwarding-options hash-key]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**no-label-1-exp** option introduced in Junos OS Release 8.0.  
**label-3** and **no-labels** options introduced in Junos OS Release 8.1.  
**ether-pseudowire** statement introduced in Junos OS Release 9.1 (M320 and T Series routers only); support extended to M120 and MX Series routers in Junos OS Release 9.4.  
**all-labels** and **payload ip disable** options introduced in Junos OS Release 12.1X48R2. (PTX Series Packet Transport Routers only).  
**zero-control-word** option introduced in Junos OS Release 16.1 for the M Series, MX Series, and PTX Series.

**Description** For aggregated Ethernet and SONET/SDH interfaces only, configure load balancing based on MPLS labels and payload. Only the IPv4 protocol is supported.

**Options** **family mpls**—(Aggregated Ethernet interfaces, aggregated SONET/SDH interfaces, and multiple equal-cost MPLS next hops only) Incorporate MPLS label and payload information into the hash key for per-flow load balancing. Only the IPv4 protocol is supported.

- **all-labels**—(PTX Series Packet Transport Routers only) Up to eight MPLS labels are included in the hash key to identify the uniqueness of a flow in the Packet Forwarding Engine. This is the default setting.

- **label-1**—(M120, M320, MX Series, and T Series routers only) Include the first MPLS label into the hash key. This is used for a one-label packet for per-flow load balancing IPv4 VPLS traffic based on IP information and MPLS labels.
- **label-2**—(M120, M320, MX Series, and T Series routers only) Include the second MPLS label into the hash key. This is used for a two-label packet for per-flow load balancing IPv4 VPLS traffic based on IP information and MPLS labels. To use the second MPLS label in the hash key, include both the **label-1** and **label-2** statements at the **[edit forwarding-options hash-key family mpls]** hierarchy level. By default, the router provides hashing on the first and second labels. If both labels are specified, the entire first label and the first 16 bits of the second label are hashed.
- **label-3**—(M120, M320, MX Series, and T Series routers only) Include the third MPLS label into the hash key. To use the third MPLS label, include the **label-1**, **label-2**, and **label-3** statements at the **[edit forwarding-options hash-key family mpls]** hierarchy level.
- **no-labels**—Include no MPLS labels into the hash key.

- **no-label-1-exp**—(M120, M320, MX Series, and T Series routers only) The EXP bit of the first label is not used in the hash calculation to avoid reordering complications.
- **payload**—Incorporate bits from the IP payload into the hash key for per-flow load balancing Layer 2 information based on MPLS labels.
  - **disable**—(PTX Series Packet Transport Routers only) Exclude IP payload from the hash key.
  - **ether-pseudowire**—(M120, M320, MX Series, and T Series routers only) Load-balance IPv4 traffic over Layer 2 Ethernet pseudowires.
  - **zero-control-word**—(M Series, MX Series, and PTX Series) Precedes Ethernet packet to indicate the start of an Ethernet frame in an MPLS ether-pseudowire payload.
  - **ip**—Include the IP address of the IPv4 or IPv6 payload into the hash key for per-flow load balancing Layer 2 information based on MPLS labels. For the PTX Series Packet Transport Routers, this is the default setting with both Layer 3 and Layer 4 IP information included in the hash key.
    - **disable**—(PTX Series Packet Transport Routers only) Exclude IP payload from the hash key.
    - **layer-3-only**—Include only Layer 3 IP information from the IP payload data into the hash key for per-flow load balancing Layer 2 information based on MPLS labels.
    - **port-data**—(M120, M320, MX Series, and T Series routers only) Include the source and destination port field information into the hash key. By default, the most significant byte and least significant byte of the source and destination port fields are hashed. To select specific bytes to be hashed, include one or more of the **source-msb**, **source-lsb**, **destination-msb**, and **destination-lsb** options at the **[edit forwarding-options hash-key family mpls payload ip port-data]** hierarchy level. To prevent all four bytes from being hashed, include the **layer-3-only** statement at the **[edit forwarding-options hash-key family mpls payload ip]** hierarchy level.
      - **destination-lsb**—Include the least-significant byte of the destination port.
      - **destination-msb**—Include the most-significant byte of the destination port.
      - **source-lsb**—Include the least-significant byte of the source port.
      - **source-msb**—Include the most-significant byte of the source port.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                     interface-control—To add this statement to the configuration.

## fast-reroute (Protocols MPLS)

<b>Syntax</b>	<pre>fast-reroute {   (bandwidth <i>bps</i>   bandwidth-percent <i>percentage</i>);   (exclude [ <i>group-names</i> ]   no-exclude );   hop-limit <i>number</i>;   (include-all [ <i>group-names</i> ]   no-include-all);   (include-any [ <i>group-names</i> ]   no-include-any); }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.</p>
<b>Description</b>	Establish detours for the LSP so that if a node or link in the LSP fails, the traffic on the LSP can be rerouted with minimal packet loss.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Fast Reroute on page 367</a></li> <li>• <a href="#">Fast Reroute Overview on page 364</a></li> <li>• <a href="#">MPLS Feature Support on QFX Series and EX4600 Switches on page 18</a></li> <li>• <a href="#">Understanding Interprovider and Carrier-of-Carriers VPNs on page 1305</a></li> </ul>

## fate-sharing

---

<b>Syntax</b>	<pre>fate-sharing {     group <i>group-name</i> {         cost <i>value</i>;         from <i>address</i> &lt;to <i>address</i>&gt;;     } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options], [edit routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
<b>Description</b>	<p>Specify a backup path in case the primary path becomes unusable.</p> <p>You specify one or more objects with common characteristics within a group. All objects are treated as /32 host addresses. The objects can be a LAN interface, a router ID, or a point-to-point link. Sequence is insignificant.</p> <p>Changing the fate-sharing database does not affect existing established LSPs until the next CSPF reoptimization. The fate-sharing database does affect fast-reroute detour path computations.</p>
<b>Options</b>	<p><b>cost <i>value</i></b>—Cost assigned to the group. <b>Range:</b> 1 through 65,535 <b>Default:</b> 1</p> <p><b>from <i>address</i></b>—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate <b>from</b> addresses in the group.</p> <p><b>group <i>group-name</i></b>—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.</p> <p><b>to <i>address</i></b>—(Optional) Address of egress router. For point-to-point link objects, you must specify both a <b>from</b> and a <b>to</b> address.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## forwarding-table

---

<b>Syntax</b>	forwarding-table { export [ <i>policy--names</i> ]; (indirect-next-hop   no-indirect-next-hop); }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options], [edit routing-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
<b>Description</b>	Configure information about the routing device's forwarding table.  The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Options</b>	<b>remnant-holdtime</b> —Sets the remnant hold time, which is required for the MXVC-ISSU, where the recommended value is 900..
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Per-Packet Load Balancing</i></li> </ul>

## from (Protocols MPLS)

---

<b>Syntax</b>	from <i>address</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.
<b>Description</b>	Specify the source address to use for the LSP.  The address you specify does not affect the outgoing interface used by the LSP.
<b>Default</b>	If you do not include this statement, the software automatically selects the loopback interface as the address.
<b>Options</b>	<i>address</i> —IP address.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Ingress Router Address for LSPs on page 392</a></li></ul>

## gp-id

<b>Syntax</b>	<code>gp-id (ethernet   hdlc   ipv4   pos-scrambling-crc-16   pos-no-scrambling-crc-16   pos-scrambling-crc-32   pos-no-scrambling-crc-32   ppp);</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> lsp-attributes], [edit protocols mpls label-switched-path <i>lsp-name</i> lsp-attributes]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. <b>pos-scrambling-crc-16</b> , <b>pos-no-scrambling-crc-16</b> , <b>pos-scrambling-crc-32</b> , and <b>pos-no-scrambling-crc-32</b> options added in Junos OS Release 8.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the type of payload carried by the LSP. It can be any of the following: <ul style="list-style-type: none"> <li>• <b>ethernet</b>—Ethernet (GPID value: 33)</li> <li>• <b>hdlc</b>—High-level Data Link Control (HDLC) (GPID value: 44)</li> <li>• <b>ipv4</b>—IP version 4 (GPID value: 0x0800)</li> <li>• <b>pos-no-scrambling-crc-16</b>—for interoperability with other vendors' equipment (GPID value: 29)</li> <li>• <b>pos-no-scrambling-crc-32</b>—for interoperability with other vendors' equipment (GPID value: 30)</li> <li>• <b>pos-scrambling-crc-16</b>—for interoperability with other vendors' equipment (GPID value: 31)</li> <li>• <b>pos-scrambling-crc-32</b>—for interoperability with other vendors' equipment (GPID value: 32)</li> <li>• <b>ppp</b>—Point-to-Point Protocol (PPP) (GPID value: 50)</li> </ul>
<b>Default</b>	<b>ipv4</b>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the GPID on page 1086</a></li> </ul>

## gre (Routing Options)

---

<b>Syntax</b>	gre; next-hop-based-tunnel;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options dynamic-tunnels <i>tunnel-name</i> ], [edit routing-options dynamic-tunnels <i>tunnel-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1. <b>next-hop-based-tunnel</b> option introduced in Junos OS Release 16.2.
<b>Description</b>	Enable generic routing encapsulation (GRE) type for IPv4 to automatically establish label-switched paths (LSPs) for any new provider edge (PE) router added to a full mesh of LSPs.
<b>Options</b>	<p><b>next-hop-based-tunnel</b>—Create a tunnel composite next hop for every dynamic GRE tunnel configured. The tunnel composite next hop includes the dynamic tunnel's encapsulation data and a VPN label (when chained composite next hop is not enabled). When this option is not configured, the default interface-based tunnel mode is enabled. By configuring this option, a device can scale up to 32,000 IP tunnels, which is otherwise restricted to the system limit on the number of interfaces supported.</p> <p>At a given point in time, either the next-hop-based dynamic tunnel or the default interface-based dynamic GRE tunnel can exist on a device. A switchover from one tunnel mode to another deletes the existing tunnels and creates new tunnels in the new tunnel mode. As a result, a tunnel mode switchover can impact network performance.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MPLS-Signaled LSPs to Use GRE Tunnels on page 101</a></li></ul>

## hop-limit

<b>Syntax</b>	<code>hop-limit <i>number</i>;</code>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path</i> <i>lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path</i> <i>lsp-name</i> <i>fast-reroute</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path</i> <i>lsp-name</i> (<i>primary</i>   <i>secondary</i>) <i>path-name</i>], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>], [edit protocols mpls], [edit protocols mpls <i>label-switched-path</i> <i>lsp-name</i>], [edit protocols mpls <i>label-switched-path</i> <i>lsp-name</i> <i>fast-reroute</i>], [edit protocols mpls <i>label-switched-path</i> <i>lsp-name</i> (<i>primary</i>   <i>secondary</i>) <i>path-name</i>], [edit protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Specify the maximum number of routers that an LSP can traverse. This limit can be applied to any of the following:</p> <ul style="list-style-type: none"> <li>LSPs—The configured hop limit includes the ingress and egress routers. You can specify a hop limit for an LSP and for both primary and secondary paths.</li> <li>Fast reroute detour—Specify the number of additional routers a fast reroute detour can traverse relative to the protected LSP. For example, if an LSP traverses 4 routers, any detour for the LSP can be no more than 10 router hops, including the ingress and egress routers.</li> <li>Link protection bypass—Specify the maximum number of routers that a link protection bypass can traverse.</li> </ul>
<b>Options</b>	<p><b><i>number</i></b>—Maximum number of hops.</p> <p><b>Range:</b> 2 through 255 (for an LSP or for a link protection bypass); 0 through 255 (for fast reroute)</p> <p><b>Default:</b> 255 (for an LSP or for a link protection bypass); 6 (for fast reroute)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring Fast Reroute on page 367</a></li> <li><a href="#">Limiting the Number of Hops in LSPs on page 421</a></li> </ul>

- [Configuring the Hop Limit for Bypass LSPs on page 678](#)

## import (MPLS Traffic Engineering Database)

---

Syntax	<pre>import {   bgp-ls-identifier <i>domain-identifier</i>;   identifier <i>identifier</i>;   policy <i>policy-name</i>;   igp-topology{     bgp-link-state;   } }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls traffic-engineering database], [edit protocols mpls traffic-engineering database]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Configure the traffic engineering database import parameters.
Options	<p><b>bgp-ls-identifier</b> <i>domain-identifier</i>—BGP-TE domain identifier.</p> <p><b>identifier</b> <i>identifier</i>—BGP-TE identifier.</p> <p><b>Range:</b> 2 through 18446744073709551615</p> <p><b>policy</b> <i>policy-name</i>—Name of the import policy.</p> <p><b>igp-topology</b>—Download IGP topology information into the traffic engineering database (TED). In Junos OS, the IGP installs topology information into a database called the traffic engineering database. The traffic engineering database contains the aggregated topology information. The IGP routes are installed by the traffic engineering database on behalf of the corresponding IGP into a user-visible routing table called lsdist.0, subject to route policies.</p> <p><b>bgp-link-state</b>—Export IGP topology information into BGP-Link State (BGP-LS) from the lsdist.0 routing table. The lsdist.0 routing table stores the network topology information from the traffic engineering database. The BGP-LS reads IGP entries from lsdist.0 and advertises the information to BGP peers.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	• <a href="#">traffic-engineering on page 2165</a>

## ip-tunnel-rpf-check

<b>Syntax</b>	<pre>ip-tunnel-rpf-check {     mode (<i>strict</i>   <i>loose</i>);     fail-filter <i>filter-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit routing-instances <i>routing-instance-name</i> routing-options forwarding-table]
<b>Release Information</b>	Statement introduced in Junos OS Release 17.1 for MX Series Routers with MICs.
<b>Description</b>	<p>Configure the system to enable anti-spoofing protection for next-hop-based dynamic tunnels, where reverse path forwarding checks are placed to ensure that the tunnel traffic is received from a legitimate source through designated IP tunnel, where the source is reachable on the same tunnel on which the packet was received.</p> <p>When a packet comes from a nondesignated source, the reverse path forwarding check fails in the strict mode, and passes in the loose mode. When a packet comes from a nonexistent source, the reverse path forwarding check fails.</p> <p>By default, the reverse path forwarding check is in strict mode, where the packets are not forwarded if the source of the packet is from a nondesignated tunnel.</p>
<b>Options</b>	<p><b>mode (<i>strict</i>   <i>loose</i>)</b>—(Optional) Specify the mode of the reverse path forwarding check to enable anti-spoofing protection for next-hop-based dynamic tunnels.</p> <p>In the strict mode (default), the reverse path forwarding check fails when the packet is received from a nondesignated tunnel source. The check passes only for packets from designated tunnels.</p> <p>In the loose mode, the reverse path forwarding check passes even if the packet is received from a nondesignated tunnel source.</p> <p>When the packet is from a nonexistent tunnel source, the reverse path forwarding check fails in both the strict and loose modes.</p> <p><b>Default:</b> If you omit the mode statement, the default behavior is strict mode.</p> <p><b>fail-filter <i>filter-name</i></b>—(Optional) Attach a filter to the Layer 3 VPN to log packets that failed the reverse path forwarding check.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Anti-Spoofing Protection for Next-Hop-Based Dynamic Tunnels Overview on page 292</a></li> <li>• <a href="#">Example: Configuring Anti-Spoofing Protection for Next-Hop-Based Dynamic Tunnels on page 295</a></li> </ul>

## include-all (for Administrative Groups)

---

<b>Syntax</b>	<code>include-all [ <i>group-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> admin-group],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls <b>label-switched-path</b> <i>lsp-name</i> (<b>primary</b>   <b>secondary</b>) <i>path-name</i> admin-group],</code> <code>[edit protocols mpls label-switched-path <i>lsp-name</i> admin-group],</code> <code>[edit protocols mpls <b>label-switched-path</b> <i>lsp-name</i> (<b>primary</b>   <b>secondary</b>) <i>path-name</i> admin-group]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Require the LSP to traverse links that include all of the defined administrative groups.
<b>Options</b>	<b><i>group-names</i></b> —One or more names of groups defined with the <b>admin-groups</b> statement.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Administrative Groups for LSPs on page 409</a></li><li>• <a href="#">admin-groups on page 1969</a></li></ul>

## include-all (for Fast Reroute)

---

<b>Syntax</b>	(include-all [ <i>group-names</i> ]   no-include-all);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> fast-reroute], [edit protocols mpls label-switched-path <i>lsp-name</i> fast-reroute]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
<b>Description</b>	Control inclusion of administrative groups: <ul style="list-style-type: none"><li>• <b>include-all</b>—Define the administrative groups that must all be included for fast reroute.</li><li>• <b>no-include-all</b>—Disable administrative group inclusion.</li></ul>
<b>Options</b>	<b><i>group-names</i></b> —One or more names of groups defined with the <b>admin-groups</b> statement.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Fast Reroute on page 367</a></li></ul>

## include-any (for Administrative Groups)

---

<b>Syntax</b>	<code>include-any [ <i>group-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> admin-group],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i> admin-group],</code> <code>[edit protocols mpls label-switched-path <i>lsp-name</i> admin-group],</code> <code>[edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i> admin-group]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Define the administrative groups to include for an LSP or for a path's primary and secondary paths.
<b>Options</b>	<b><i>group-names</i></b> —One or more names of groups defined with the <b>admin-groups</b> statement.
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Administrative Groups for LSPs on page 409</a></li></ul>

## include-any (for Fast Reroute)

---

<b>Syntax</b>	(include-any [ <i>group-names</i> ]   no-include-any);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> fast-reroute], [edit protocols mpls label-switched-path <i>lsp-name</i> fast-reroute]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
<b>Description</b>	Control inclusion of administrative groups: <ul style="list-style-type: none"> <li>• <b>include-any</b>—Define the administrative groups to include for fast reroute.</li> <li>• <b>no-include-any</b>—Disable administrative group inclusion.</li> </ul>
<b>Options</b>	<b><i>group-names</i></b> —One or more names of groups defined with the <b>admin-groups</b> statement.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Fast Reroute on page 367</a></li> </ul>

## ingress (LSP)

---

<b>Syntax</b>	<pre>ingress {   bandwidth <i>bps</i>;   class-of-service <i>cos-value</i>;   description <i>string</i>;   entropy-label;   install {     destination-prefix &lt;active&gt;;   }   link-protection bypass-name <i>name</i>;   metric <i>metric</i>;   next-hop (<i>address</i>   <i>interface-name</i>   <i>address/interface-name</i>);   node-protection bypass-name <i>name</i> next-next-label <i>label</i>;   no-install-to-address;   policing {     filter <i>filter-name</i>;     no-auto-policing;   }   preference <i>preference</i>;   push <i>out-label</i>;   to <i>address</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1. <b>entropy-label</b> option introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Configure an ingress LSR for a static LSP.  The remaining statements are explained separately
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Static LSPs on page 468</a></li></ul>

## install (Protocols MPLS)

<b>Syntax</b>	install { <i>destination-prefix</i> <active>; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.
<b>Description</b>	Associate one or more prefixes with an LSP. When the LSP is up, all the prefixes are installed as entries into the inet.3 or inet6.3 routing table.
<b>Options</b>	<b>active</b> —(Optional) Install the route into the inet.0 or inet6.0 routing table. This allows you to issue a <b>ping</b> or <b>traceroute</b> command on this address.
<div style="display: flex; align-items: center;">  <div> <p><b>NOTE:</b> The install <i>destination-prefix</i> <b>active</b> statement is not supported on static LSPs. When the install <i>destination-prefix</i> <b>active</b> statement is configured for a static LSP, the MPLS routes do not get installed into the inet.0 routing table.</p> </div> </div>	
<p><i>destination-prefix</i>—IPv4 or IPv6 address to associate with the LSP.</p>	
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Adding LSP-Related Routes to the inet.3 or inet6.3 Routing Table on page 370</a></li> </ul>

## ingress-policy

---

<b>Syntax</b>	<code>ingress-policy [ <i>ingress-policy-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit logical-system <i>logical-system-name</i> protocols ldp <a href="#">entropy-label</a>]</code> , <code>[edit logical-system <i>logical-system-name</i> protocols ldp <a href="#">oam</a>]</code> , <code>[edit protocols ldp <a href="#">entropy-label</a>]</code> , <code>[edit protocols ldp <a href="#">oam</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced at the <code>[edit protocols ldp <a href="#">entropy-label</a>]</code> hierarchy level in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.
<b>Description</b>	<p>Configure an LDP ingress policy for either the entropy label or Operation, Administration, and Management (OAM).</p> <p>For OAM, configure the ingress policy to choose which forwarding equivalence classes (FECs) need to have OAM enabled. If the FEC passes through the policy or if the FEC is explicitly configured, OAM is enabled for a FEC. For FECs chosen using a policy, the BFD parameters configured under <code>[edit protocols ldp oam bfd-liveness-detection]</code> are applied.</p>
<b>Options</b>	<i>ingress-policy-names</i> —Specify the names of the ingress policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring OAM Ingress Policies for LDP on page 976</a></li><li>• <a href="#">Configuring the Entropy Label for LSPs on page 444</a></li></ul>

## interface (Protocols MPLS)

<b>Syntax</b>	<pre>interface (<i>interface-name</i>   all) {   disable;   admin-group [ <i>group-names</i> ];   srlg <i>srlg-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.</p>
<b>Description</b>	Enable MPLS on one or more interfaces.
<b>Options</b>	<p><b><i>interface-name</i></b>—Name of the interface on which to configure MPLS. To configure all interfaces, specify <b>all</b>. For details about specifying interfaces, see the <i>Junos OS Network Interfaces Library for Routing Devices</i>.</p> <p><b><i>srlg srlg-name</i></b>—Name of the SRLG to associate with an interface.</p> <p>The remaining options are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Intermediate (Transit) and Egress Routers for Static LSPs on page 471</a></li> <li>• <a href="#">Example: Configuring SRLG on page 210</a></li> </ul>

## interface (MPLS)

---

<b>Syntax</b>	interface (all   <i>interface-name</i> );
<b>Hierarchy Level</b>	[edit protocols <a href="#">mpls</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Enable MPLS on all interfaces on the switch or on the specified interface.
<b>Default</b>	MPLS is disabled.
<b>Options</b>	<p><b>all</b>—All interfaces on the switch.</p> <p><b><i>interface-name</i></b>—Name of an interface:</p> <ul style="list-style-type: none"><li>• Aggregated Ethernet—<b>aex</b></li><li>• Gigabit Ethernet—<b>ge-<i>fpc/pic/port</i></b></li></ul>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## inter-domain

---

<b>Syntax</b>	inter-domain;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>label-switched-path-name</i> ], [edit protocols mpls label-switched-path <i>label-switched-path-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Allows the router to search for routes in the IGP database. You need to configure this statement on routers that might be unable to locate a path using intra-domain CSPF (by looking in the traffic engineering database (TED)). When you configure inter-area or inter-AS LSPs, the <b>inter-domain</b> statement is required.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring an LSP Across ASs on page 434</a></li><li>• <a href="#">label-switched-path on page 2040</a></li></ul>

## ip-tunnel-rpf-check

---

<b>Syntax</b>	<pre>ip-tunnel-rpf-check {     mode (<i>strict</i>   <i>loose</i>);     fail-filter <i>filter-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit routing-instances <i>routing-instance-name</i> routing-options forwarding-table]
<b>Release Information</b>	Statement introduced in Junos OS Release 17.1 for MX Series Routers with MICs.
<b>Description</b>	<p>Configure the system to enable anti-spoofing protection for next-hop-based dynamic tunnels, where reverse path forwarding checks are placed to ensure that the tunnel traffic is received from a legitimate source through designated IP tunnel, where the source is reachable on the same tunnel on which the packet was received.</p> <p>When a packet comes from a nondesignated source, the reverse path forwarding check fails in the strict mode, and passes in the loose mode. When a packet comes from a nonexistent source, the reverse path forwarding check fails.</p> <p>By default, the reverse path forwarding check is in strict mode, where the packets are not forwarded if the source of the packet is from a nondesignated tunnel.</p>
<b>Options</b>	<p><b>mode (<i>strict</i>   <i>loose</i>)</b>—(Optional) Specify the mode of the reverse path forwarding check to enable anti-spoofing protection for next-hop-based dynamic tunnels.</p> <p>In the strict mode (default), the reverse path forwarding check fails when the packet is received from a nondesignated tunnel source. The check passes only for packets from designated tunnels.</p> <p>In the loose mode, the reverse path forwarding check passes even if the packet is received from a nondesignated tunnel source.</p> <p>When the packet is from a nonexistent tunnel source, the reverse path forwarding check fails in both the strict and loose modes.</p> <p><b>Default:</b> If you omit the mode statement, the default behavior is strict mode.</p> <p><b>fail-filter <i>filter-name</i></b>—(Optional) Attach a filter to the Layer 3 VPN to log packets that failed the reverse path forwarding check.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Anti-Spoofing Protection for Next-Hop-Based Dynamic Tunnels Overview on page 292</a></li><li>• <a href="#">Example: Configuring Anti-Spoofing Protection for Next-Hop-Based Dynamic Tunnels on page 295</a></li></ul>

---

## ipv6-tunneling

---

<b>Syntax</b>	ipv6-tunneling;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 14.1X53-D30 for QFX Series switches.
<b>Description</b>	Allow IPv6 routes to be resolved over an MPLS network by converting LDP and RSVP routes stored in the inet.3 routing table to IPv4-mapped IPv6 addresses and then copying them into the inet6.3 routing table. This routing table can be used to resolve next hops for both inet6 and inet6-vpn routes.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Tunneling IPv6 Traffic over MPLS IPv4 Networks on page 269</a></li></ul>

Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. <b>cross-credibility-cspf</b> option introduced in Junos OS Release 14.2. <b>self-ping-duration</b> and <b>no-self-ping</b> options introduced in Junos OS Release 16.1.
Description	Configure an LSP to use in dynamic MPLS. When configuring an LSP, you must specify the address of the egress router in the <b>to</b> statement. All remaining statements are optional.

- Options**
- lsp-name***—Name that identifies the LSP. The name can be up to 64 characters and can contain letters, digits, periods, and hyphens. To include other characters, enclose the name in quotation marks. The name must be unique within the ingress router.
  - cross-credibility-cspf***—Enable path computation across credibility levels. The constraint path computation is run across multi-protocol links and nodes, instead of a credibility-by-credibility basis.
  - link-protection***—Enable protection for LSP from link faults only.
  - no-self-ping***—Disable self-ping for the LSP.

**NOTE:** Starting in Junos OS 17.4, you can override the behavior of self-ping running by default using ***no-self-ping*** statement.

***self-ping-duration seconds***—Specify the duration (in seconds) for which to run the self-ping mechanism unless the ping succeeds sooner.

LSP self-ping for an LSP starts at the ingress label edge router (LER), once a Resv message for that LSP has been received. The configured self-ping time indicates the duration for which the self-ping mechanism runs once the LSP instance is signaled to be UP.

By default, self-ping is enabled. The LSP types like CCC, P2MP, VLAN-based , and non-default instances do not support self-ping .

The self-ping mechanism runs until the self-ping probe is received back (at which point the traffic is immediately switched to it) , or until the configured self-ping duration for the LSP is over (at which point traffic is switched over).

When LSP self-ping-duration is enabled, the LSP behavior reverts back to a timer-based mechanism similar to the ***optimize-switchover-delay***, where a specific amount of time is provided for all the downstream nodes to install the forwarding path before switchover. When LSP self-ping-duration is not enabled, the default behavior is to wait for an infinite amount of time for the self-ping to succeed before switching the traffic.

**Range:** 1 through 65535 seconds

**NOTE:** Starting in Junos OS 17.4R1, the default time-out duration for which the self-ping runs on an LSP instance is reduced from 65535 (runs until success) to 1800 seconds. You can also configure the self ping duration value between 1 to 65535 (runs until success) seconds.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## label-switched-path

---

**Syntax** label-switched-path *lsp-name* to *remote-provider-edge-switch*;

**Hierarchy Level** [edit protocols [mpls](#)]

**Release Information** Statement introduced in Junos OS Release 9.5 for EX Series switches.

**Description** Define a label-switched path (LSP) to the remote provider edge switch to use for MPLS traffic. You must specify this statement on the provider edge switch.

**Options** *lsp-name* —Name that identifies the LSP. The name can be up to 32 characters and can contain letters, digits, periods, and hyphens. To include other characters, enclose the name in quotation marks. The name must be unique on the ingress switch.

*remote-provider-edge-switch* —Either the loopback address or the switch address.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## label-switched-path-template (Container LSP)

---

<b>Syntax</b>	label-switched-path-template { (default-template   lsp-template-name); }
<b>Hierarchy Level</b>	[edit protocols mpls container-label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2. Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.
<b>Description</b>	Specify the LSP template. An LSP template is used as the basis for other dynamically generated LSPs.
<b>Options</b>	<b>default-template</b> —Specify that the default LSP template be used for the dynamically generated LSPs.  <b>lsp-template-name</b> —Specify the name of an LSP to be used as a template for the dynamically generated LSPs.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">container-label-switched-path on page 1988</a></li> </ul>

## ldp-tunneling

---

<b>Syntax</b>	ldp-tunneling;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable the LSP to be used for LDP tunneling.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling LDP over RSVP-Established LSPs on page 874</a></li> </ul>

## least-fill

---

See [random](#)

## link-protection (Dynamic LSPs)

---

<b>Syntax</b>	link-protection;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
<b>Description</b>	<p>Enable link protection on the specified LSP, which helps to ensure that traffic sent over a specific interface to a neighboring router can continue to reach the router if that interface fails. For point-to-multipoint LSPs, including this statement extends link protection to all of the paths used by the LSP.</p> <p>To fully enable link protection, you must also include the <b>link-protection</b> statement at the [edit protocols rsvp interface <i>interface-name</i>] or [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i>] hierarchy level.</p>
<b>Default</b>	Link protection is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Link Protection for Point-to-Multipoint LSPs on page 549</a></li><li>• <a href="#">Configuring Node Protection or Link Protection for LSPs on page 682</a></li><li>• <a href="#">link-protection (RSVP) on page 2199</a></li></ul>

## link-protection (Static LSPs)

<b>Syntax</b>	link-protection bypass-name <i>name</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i> ], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1.
<b>Description</b>	Enable link protection on the specified static LSP. Link protection helps to ensure that traffic sent over a specific interface to a neighboring router can continue to reach the router if that interface fails.
<b>Default</b>	Link protection is disabled.
<b>Options</b>	bypass-name <i>name</i> —Bypass LSP name.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Static LSPs on page 468</a></li> <li>• <a href="#">Example: Configuring a Collection of Paths to Create an RSVP-Signaled Point-to-Multipoint LSP on page 507</a></li> </ul>

## load-balance-label-capability

---

<b>Syntax</b>	load-balance-label-capability;
<b>Hierarchy Level</b>	[edit forwarding-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1.
<b>Description</b>	Enables the router to push and pop the load balancing label and causes LDP and RSVP to advertise the entropy label TLV to neighboring routers.

**NOTE:** Although you can enable and disable the load-balance-label capability at the same time using the load-balance-label-capability and the no-load-balance-label-capability statements, respectively, at the [edit forwarding-options] hierarchy level, it is recommended that only one of the statements be configured at a given point in time. The no-load-balance-label-capability statement overrides the load-balance-label-capability statement when both the statements are configured together.

---

<b>Required Privilege</b>	interface—To view this statement in the configuration.
<b>Level</b>	interface-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Entropy Label for LSPs on page 444</a></li><li>• <a href="#">no-load-balance-label-capability on page 2079</a></li></ul>
------------------------------	--

## log-updown (Protocols MPLS)

**Syntax**

```
log-updown {
  no-trap {
    mpls-lsp-traps;
    rfc3812-traps;
  }
  (syslog | no-syslog);
  trap;
  trap-path-down;
  trap-path-up;
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols mpls],  
[edit protocols mpls]

**Release Information** Statement introduced before Junos OS Release 7.4.  
The **mpls-lsp-traps** and **rfc-3812-traps** options added in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.

**Description** Log a message or send an SNMP trap whenever an LSP makes a transition from up to down, or vice versa, and whenever an LSP switches from one active path to another. Only the ingress router performs these operations.

**NOTE:** System log messages for LSPs are generated by default. To disable the default logging of messages for LSPs, configure the **no-syslog** option under the **log-updown** statement.

**Default** There is no default behavior for this statement. If you do not specify the options, the configuration cannot be committed.

**Options** **no-syslog**—Do not log a message to the system log file.

**no-trap**—Do not send an SNMP trap.

**syslog**—Log a message to the system log file.

**trap**—Send an SNMP trap.

**trap-path-down**—Send an SNMP trap when an LSP path goes down.

**trap-path-up**—Send an SNMP trap when an LSP path comes up.

The **no-trap** statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

---

## longest-match

---

**Syntax** longest-match {  
    policy *value* [(*expression*) ] [*values* ];  
}

**Hierarchy Level** [edit protocols ldp]

**Release Information** Statement introduced in Junos OS Release 16.1 for the M Series, MX Series, and PTX Series.

**Description** Enable longest match to allow LDP to learn the routes aggregated or summarized across OSPF areas or IS-IS levels in inter-domain.

**Options** policy *value* [(*expression*) ] [*values* ]— Specify policy to provide per prefix granularity.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## **lsp-attributes**

---

<b>Syntax</b>	<pre>lsp-attributes {     encoding-type (ethernet   packet   pdh   sonet-sdh);     gpid (ethernet   hdlc   ipv4   pos-scrambling-crc-16   pos-no-scrambling-crc-16           pos-scrambling-crc-32   pos-no-scrambling-crc-32   ppp);     signal-bandwidth type;     switching-type (fiber   lambda   psc-1   tdm); }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. <b>pos-scrambling-crc-16</b> , <b>pos-no-scrambling-crc-16</b> , <b>pos-scrambling-crc-32</b> , and <b>pos-no-scrambling-crc-32</b> options added in Junos OS Release 8.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Define the parameters signaled during LSP setup. These usually determine the nature of the resource (label) allocated for the LSP.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MPLS LSPs for GMPLS on page 1085</a></li></ul>

## lsping-channel-type

---

<b>Syntax</b>	lsping-channle-type { ipv4; on-demand-cv; }
<b>Hierarchy Level</b>	[edit protocols mpls label-switched-path <i>lsp-name</i> oam mpls-tp-mode] [edit protocols mpls oam mpls-tp-mode]
<b>Release Information</b>	Statement introduced in Junos OS Release 16.1.
<b>Description</b>	Specify the control-channel types for MPLS-TP mode. By default, LSPING (0x0008) is used, and the GACH-TLV is used along with this channel type.  As per RFC 7026, GACH-TLV is deprecated for ipv4 and on-demand-cv channel types.
<b>Options</b>	<b>ipv4</b> —Channel type 0x0021. This channel type uses the IP/UDP encapsulation and provides interoperability support with other vendor devices using IP addressing.  <b>on-demand-cv</b> —Channel type 0x0025. This is a new pseudowire channel type and is used for on-demand CV without IP/UDP encapsulation, where IP addressing is not available or non-IP encapsulation is preferred.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">mpls-tp-mode on page 2068</a></li> </ul>

## maximum-bandwidth (Protocols MPLS)

---

<b>Syntax</b>	<code>maximum-bandwidth <i>bps</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the maximum amount of bandwidth in bits per second (bps).
<b>Options</b>	<i>bps</i> —Maximum amount of bandwidth.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 425</a></li></ul>

## maximum-helper-recovery-time

---

<b>Syntax</b>	<code>maximum-helper-recovery-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols rsvp <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-system-name</i> protocols rsvp <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the length of time the router or switch retains the state of its Resource Reservation Protocol (RSVP) neighbors while they undergo a graceful restart.
<b>Options</b>	<i>seconds</i> —Length of time that the router retains the state of its Resource Reservation Protocol (RSVP) neighbors while they undergo a graceful restart. <b>Range:</b> 1 through 3600 <b>Default:</b> 180
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Graceful Restart Options for RSVP, CCC, and TCC</a></li><li>• <a href="#">maximum-helper-restart-time (RSVP) on page 2059</a></li></ul>

## maximum-helper-restart-time (RSVP)

---

<b>Syntax</b>	<code>maximum-helper-restart-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols rsvp <a href="#">graceful-restart</a> ], [edit logical-systems <i>logical-system-name</i> protocols rsvp <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the length of time the router or switch waits after it discovers that a neighboring router has gone down before it declares the neighbor down. This value is applied to all RSVP neighbor routers and should be based on the time that the slowest RSVP neighbor requires for restart.
<b>Options</b>	<b><i>seconds</i></b> —The time the router or switch waits after it discovers that a neighboring router has gone down before it declares the neighbor down. <b>Range:</b> 1 through 1800 <b>Default:</b> 60
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Graceful Restart Options for RSVP, CCC, and TCC</i></li> <li>• <a href="#">maximum-helper-recovery-time on page 2058</a></li> </ul>

## maximum-labels

---

<b>Syntax</b>	<code>maximum-labels <i>maximum-labels</i>;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1. Statement introduced in Junos OS Release 17.2R1 for QFX10000 switches.
<b>Description</b>	<p>On the logical interface, specify the maximum number of MPLS labels upon which MPLS can operate.</p> <p>You can configure this statement on the following devices:</p> <ul style="list-style-type: none"><li>• MX Series 3D Universal Edge Router</li><li>• M120 Multiservice Edge Router</li><li>• M320 Multiservice Edge Router with Enhanced III FPCs</li><li>• M7i Multiservice Edge Router and M10i Multiservice Edge Router with Enhanced Compact Forwarding Engine Board (CFEB-E)</li><li>• T640, T1600, T4000, TX Matrix, and TX Matrix Plus routers with Enhanced Scaling FPC1, Enhanced Scaling FP2, Enhanced Scaling FPC3, and Enhanced Scaling FPC4</li><li>• QFX10000 switches.</li></ul>
<b>Options</b>	<p><i>maximum-labels</i>—Maximum number of labels.</p> <p><b>Range:</b> 3 through 5</p> <p><b>Default:</b> 3</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Maximum Number of MPLS Labels on page 356</a></li><li>• <i>Junos OS VPNs Library for Routing Devices</i></li></ul>

## minimum-bandwidth-adjust-interval

<b>Syntax</b>	<code>minimum-bandwidth-adjust-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the duration (in seconds) for which minimum bandwidth is frozen.
<b>Options</b>	<b><i>seconds</i></b> —Minimum bandwidth reallocation interval, in seconds. <b>Range:</b> 300 through 31,536,000 seconds.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 425</a></li> </ul>

## minimum-bandwidth-adjust-threshold-change

<b>Syntax</b>	<code>minimum-bandwidth-adjust-threshold-change <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the percentage change in maximum average bandwidth to freeze the minimum bandwidth.
<b>Options</b>	<b><i>percentage</i></b> —Percentage change in maximum average bandwidth. <b>Range:</b> Range: 0 through 100 percent.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 425</a></li> </ul>

## minimum-bandwidth-adjust-threshold-value

---

<b>Syntax</b>	minimum-bandwidth-adjust-threshold-value <i>bps</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Specify the value in bits per second (bps) to freeze the minimum bandwidth if the maximum average bandwidth falls below this value.
<b>Options</b>	<i>bps</i> —Threshold value for minimum bandwidth if the maximum average bandwidth falls below the specified value.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 425</a></li></ul>

## metric (Protocols MPLS)

<b>Syntax</b>	<code>metric <i>metric</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.
<b>Description</b>	Compare against another LSP or against an IGP route. To disable dynamic metric tracking, assign a fixed metric value to an LSP. If no metric is assigned, the LSP metric is dynamic and automatically tracks underlying IGP metrics.
<b>Options</b>	<b>metric</b> —LSP metric value. <b>Default:</b> No metric assigned (dynamic) <b>Range:</b> 1 through 16,777,215
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Static LSP Metrics on page 404</a></li> </ul>

## minimum-bandwidth

---

<b>Syntax</b>	<code>minimum-bandwidth <i>bps</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Set the minimum bandwidth in bps for an LSP with automatic bandwidth allocation enabled.
<b>Options</b>	<i>bps</i> —Minimum bandwidth for the LSP.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 425</a></li></ul>

## monitor-bandwidth

---

<b>Syntax</b>	<code>monitor-bandwidth;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
<b>Description</b>	Do not automatically adjust bandwidth allocation. However, the maximum average bandwidth utilization is monitored on the LSP, and the information is recorded in the MPLS statistics file.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Passive Bandwidth Utilization Monitoring on page 429</a></li></ul>

## most-fill

## mpls-tp-mode

---

Syntax	<code>mpls-tp-mode;</code> <code>lsping-channel-type;</code>
Hierarchy Level	[edit protocols mpls label-switched-path <i>lsp-name</i> oam], [edit protocols mpls oam]
Release Information	Statement introduced in Junos OS Release 12.1. <code>lsping-channel-type</code> statement introduced in Junos OS Release 16.1.
Description	<p>Enable GAL or G-Ach OAM operation without IP encapsulation on a label-switched path (LSP).</p> <p>Include this statement at the <b>[edit protocols mpls oam]</b> hierarchy level to enable GAL or G-Ach OAM operation without IP encapsulation on all LSPs in the MPLS network. Include this statement at the <b>[edit protocols mpls label-switched-path <i>lsp-name</i> oam]</b> hierarchy level to enable GAL and G-Ach OAM operation without IP encapsulation on a specific LSP.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring the MPLS Transport Profile for OAM on page 964</a></li></ul>

## mtu-signaling

---

<b>Syntax</b>	mtu-signaling;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls path-mtu rsvp], [edit protocols mpls path-mtu rsvp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable MTU signaling in RSVP.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling MTU Signaling in RSVP on page 660</a></li></ul>

## neighbor (Protocols Layer 2 Circuit)

```
Syntax  neighbor address {
        interface interface-name {
            backup-neighbor address {
                community name;
                hot-standby;
                psn-tunnel-endpoint address;
                standby;
                virtual-circuit-id number;
            }
            bandwidth (bandwidth | ctnumber bandwidth);
            community community-name;
            (control-word | no-control-word);
            description text;
            egress-protection {
                protected-l2circuit {
                    egress-pe address;
                    ingress-pe address;
                    virtual-circuit-id identifier;
                }
                protector-interface interface-name;
                protector-pe address {
                    context-identifier identifier;
                    lsp lsp-name;
                }
            }
        }
        encapsulation-type type;
        ignore-encapsulation-mismatch;
        ignore-mtu-mismatch;
        mtu mtu-number;
        no-revert;
        protect-interface interface-name;
        pseudowire-status-tlv hot-standby-vc-on;
        psn-tunnel-endpoint address;
        revert-time seconds;
        static {
            incoming-label label;
            outgoing-label label;
            send-oam;
        }
        switchover-delay milliseconds;
        virtual-circuit-id identifier;
    }
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols l2circuit],  
[edit protocols l2circuit]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for EX Series switches.

<b>Description</b>	Each Layer 2 circuit is represented by the logical interface connecting the local provider edge (PE) router or switch to the local customer edge (CE) router or switch. All the Layer 2 circuits using a particular remote PE router or switch designated for remote CE routers or switches are listed under the <b>neighbor</b> statement (neighbor designates the PE router or switch). Each neighbor is identified by its IP address and is usually the end-point destination for the LSP tunnel (transporting the Layer 2 circuit).
<b>Options</b>	<b>address</b> —IP address of a neighboring router or switch.  The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Neighbor Interface for the Layer 2 Circuit</i></li></ul>

## next-hop (Protocols MPLS)

<b>Syntax</b>	<code>next-hop (address   interface-name   address/interface-name);</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> bypass],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>],</p> <p>[edit protocols mpls static-label-switched-path <i>lsp-name</i> bypass],</p> <p>[edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</p> <p>[edit protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for IPv6 addresses in static LSP configurations added in Junos OS Release 17.2R1.</p> <p>Support for IPv4 or IPv6 lookup after popping the label added in Junos OS Release 17.4R1.</p>
<b>Description</b>	<p>Location of the next hop to the destination, specified as the IPv4 or IPv6 address of the next hop, the interface name (for point-to-point interfaces only), or the <b>address/interface-name</b> to specify an IP address on an operational interface.</p>
<b>Options</b>	<b>address</b> —IPv4 or IPv6 address of the next-hop router.
<div>  <p><b>NOTE:</b> IPv6 static LSPs are not supported at the [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress] hierarchy level.</p> </div>	
<p><b>interface-name</b>—IP address of the outgoing interface. It must be a point-to-point interface. The name can be a simple or fully qualified domain name.</p>	
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Ingress Router for Static LSPs on page 468</a></li> </ul>

## no-bfd-triggered-local-repair

<b>Syntax</b>	no-bfd-triggered-local-repair;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options], [edit routing-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	<p>Disable Bidirectional Forwarding Detection (BFD) sessions to trigger fast reroute (FRR) using MPLS-FRR and loop-free alternates (LFAs). When this statement is configured, no BFD-triggered local repair is supported. However, logical interface down-based local repair is in force.</p> <p>When using this statement to disable local repair, you also must restart routing to ensure proper behavior. To restart routing, include the <b>graceful-restart</b> command for the interior gateway protocol (IGP) used in your configuration. For example, if your IGP is OSPF, include the <b>graceful-restart</b> statement at the [edit protocols ospf] hierarchy level.</p>
<b>Default</b>	BFD-triggered local repair is the default behavior. The loss of a neighbor results in BFD local repair for all next hops that derive themselves from the base next hop with which the BFD session is established.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">BFD-Triggered Local Repair for Rapid Convergence on page 81</a></li> <li>• <a href="#">graceful-restart (Enabling Globally) on page 2076</a></li> </ul>

## no-cspf

---

<b>Syntax</b>	no-cspf;
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path lsp-name</i> (<i>primary</i>   <i>secondary</i>) <i>path-name</i>], [edit protocols mpls], [edit protocols mpls <i>label-switched-path lsp-name</i>], [edit protocols mpls <i>label-switched-path lsp-name</i> (<i>primary</i>   <i>secondary</i>) <i>path-name</i>]</pre>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Disable constrained-path LSP computation.</p> <p>An explicit-path LSP is completely configured through operator action. Once configured, it is initiated only along the explicitly specified path.</p> <p>A constrained-path LSP relies on an ingress router to compute the complete path. The ingress router takes into account the following information during the computation:</p> <ul style="list-style-type: none"><li>• Interior gateway protocol (IGP) topology database</li><li>• Link utilization information from extensions in the IGP link-state database</li><li>• Administrative group information from extensions in the IGP link-state database</li><li>• LSP requirements, including bandwidth, hop count, and administrative group</li></ul> <p>Constrained-path LSPs can generally avoid link failures and congested links. They also permit recomputation (therefore, a new path) during topology changes or unsuccessful setup.</p>
<b>Default</b>	Constrained-path LSP computation enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Disabling Constrained-Path LSP Computation on page 376</a></li><li>• <a href="#">Configuring Explicit-Path LSPs on page 498</a></li></ul>

## no-decrement-ttl

<b>Syntax</b>	no-decrement-ttl;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls],  [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],  [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>],  [edit protocols mpls],  [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],  [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Disable normal time-to-live (TTL) decrementing, which decrements the TTL field in the IP header by 1. This statement decrements the IP TTL by 1 before encapsulating the IP packet within an MPLS packet. When the penultimate router pops off the top label, it does not use the standard write-back procedure of writing the MPLS TTL into the IP TTL field. Therefore, the IP packet is decremented by 1. The ultimate router then decrements the packet by one more for a total cloud appearance of 2, thus hiding the network topology.</p>
<b>Default</b>	<p>Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Disabling Normal TTL Decrementing on page 435</a></li> <li>• <a href="#">no-propagate-ttl on page 2081</a></li> </ul>

## graceful-restart (Enabling Globally)

---

<b>Syntax</b>	<pre>graceful-restart {   disable;   helper-disable;   maximum-helper-recovery-time <i>seconds</i>;   maximum-helper-restart-time <i>seconds</i>;   notify-duration <i>seconds</i>;   recovery-time <i>seconds</i>;   restart-duration <i>seconds</i>;   stale-routes-time <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> routing-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   routing-options], [edit routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	<p>You configure the graceful restart routing option globally to enable the feature, but not to enable graceful restart for all routing protocols in a routing instance. Because all routing protocols are not usually run on every routing instance, you must also configure graceful restart for individual routing protocols running on a routing instance, including the main routing instance. You can, optionally, modify the global settings at the individual protocol level.</p>
	<div> <b>NOTE:</b></div> <ul style="list-style-type: none"><li>• For VPNs, the <code>graceful-restart</code> statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.</li><li>• For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</li><li>• LDP sessions flap when <code>graceful-restart</code> configurations change.</li></ul>
<b>Default</b>	Graceful restart is disabled by default.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## helper-disable (Multiple Protocols)

**Syntax** helper-disable;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols (isis | ldp | ospf | ospf3 | rsvp) [graceful-restart](#)],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ldp | ospf | ospf3) [graceful-restart](#)],  
[edit protocols (isis | ldp | ospf | ospf3 | rsvp) [graceful-restart](#)],  
[edit routing-instances *routing-instance-name* protocols (ldp | ospf | ospf3) [graceful-restart](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Disable helper mode for graceful restart. When helper mode is disabled, a router or switch cannot help a neighboring router that is attempting to restart.

**Default** Helper mode is enabled by default for these supported protocols: IS-IS, LDP, OSPF/OSPFv3, and RSVP.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## no-install-to-address

---

<b>Syntax</b>	no-install-to-address;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> ], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Prevent the egress router address configured using the <b>to</b> statement from being installed into the inet.3 and inet.0 routing tables.
<b>Default</b>	The egress router address for an LSP is installed into the inet.3 and inet.0 routing tables.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Preventing the Addition of Egress Router Addresses to Routing Tables on page 393</a></li><li>• <a href="#">to on page 2156</a></li></ul>

---

## no-load-balance-label-capability

---

**Syntax** no-load-balance-label-capability;

**Hierarchy Level** [edit forwarding-options]

**Release Information** Statement introduced in Junos OS Release 14.1.

**Description** Disables advertisement of entropy label capability in LDP and RSVP.

**NOTE:** Although you can enable and disable the load-balance-label capability at the same time using the `load-balance-label-capability` and the `no-load-balance-label-capability` statements, respectively, at the [edit forwarding-options] hierarchy level, it is recommended that only one of the statements be configured at a given point in time. The `no-load-balance-label-capability` statement overrides the `load-balance-label-capability` statement when both the statements are configured together.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## no-mcast-replication

---

<b>Syntax</b>	no-mcast-replication;
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ], [edit chassis lcc <i>number</i> fpc <i>slot-number</i> pic <i>pic-number</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3.
<b>Description</b>	For point-to-multipoint LSPs configured on T Series routers, protect the Packet Forwarding Engine (PFE) from bandwidth saturation. When a PFE does not need to replicate traffic, the PFE's bandwidth is less likely to become saturated. When you include the <b>no-mcast-replication</b> statement, the PFE is forced to be a leaf node in the binary tree. Leaf nodes, unlike branch nodes, do not replicate traffic in the process of forwarding traffic. Because leaf nodes have no children, they do not need to replicate traffic, and thus are less likely to become saturated with traffic.
<b>Default</b>	If you omit the <b>no-mcast-replication</b> statement, the PFE can become a branch node or a leaf node. When the PFE becomes a branch node, the PFE must replicate traffic.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Point-to-Multipoint LSPs Overview on page 503</a></li></ul>

## no-propagate-ttl

---

<b>Syntax</b>	no-propagate-ttl;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Disable normal time-to-live (TTL) decrementing. You configure this statement once per router, and it affects all RSVP-signaled or LDP-signaled LSPs. When this router acts as an ingress router for an LSP, it pushes an MPLS header with a TTL value of 255, regardless of the IP packet TTL. When the router acts as the penultimate router, it pops the MPLS header without writing the MPLS TTL into the IP packet.</p> <p>When you add the <b>no-propagate-ttl</b> statement to the configuration or delete it from the configuration, the effect takes place immediately. There is no need to clear existing RSVP LSPs or LDP sessions.</p>
<b>Default</b>	Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Disabling Normal TTL Decrementing on page 435</a></li> <li>• <i>Example: Diagnosing Networking Problems Related to Layer 3 VPNs by Disabling TTL Decrementing</i> (on <i>Layer 3 VPNs Feature Guide for Routing Devices</i> or in the <i>Junos VPNs Configuration Guide</i>)</li> <li>• <a href="#">no-decrement-ttl on page 2075</a></li> </ul>

## no-transit-statistics

---

<b>Syntax</b>	no-transit-statistics;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">statistics</a> ], [edit protocols mpls <a href="#">statistics</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2 for PTX Series.
<b>Description</b>	(PTX Series only) Disables the collection of MPLS statistics for LSPs transiting the router.
<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MPLS to Gather Statistics on page 181</a></li><li>• <a href="#">statistics on page 2149</a></li></ul>

## no-trap

---

<b>Syntax</b>	no-trap { mpls-lsp-traps; rfc-3812-traps; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls log-updown], [edit protocols mpls log-updown]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. The <b>mpls-lsp-traps</b> and <b>rfc-3812-traps</b> options added in Junos OS Release 9.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Prevent the transmission of SNMP traps.
<b>Options</b>	<b>mpls-lsp-traps</b> —Block the MPLS LSP traps defined in the <b>rfc-3812-traps</b> , but allows the <b>rfc3812.mib</b> traps.  <b>rfc-3812-traps</b> —Block the traps defined in the <b>rfc3812.mib</b> , but allows the MPLS LSP traps defined in the <b>jnx-mpls.mib</b> .
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring System Log Messages and SNMP Traps for LSPs on page 98</a></li> <li>• <i>Network Management and Monitoring Guide</i></li> <li>• <a href="#">traceoptions (Protocols MPLS) on page 2157</a></li> </ul>

## node-protection (Static LSP)

---

<b>Syntax</b>	<code>node-protection bypass-name <i>name</i> next-next-label <i>label</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>],</code> <code>[edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</code> <code>[edit protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>]</code>
<b>Release Information</b>	Statement introduced in JUNOS Release 10.1.
<b>Description</b>	Enable node protection on the specified static bypass LSP. Node protection ensures that traffic from an LSP traversing a neighboring router can continue to reach its destination even if the neighboring router fails.
<b>Default</b>	Node protection is disabled.
<b>Options</b>	<code>bypass-name <i>name</i></code> —Bypass LSP name. <code>next-next-label <i>label</i></code> —Bypass LSP name.
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Static LSPs on page 468</a></li></ul>

## normalization

<b>Syntax</b>	<pre> normalization {     failover-normalization;     no-incremental-normalize;     normalization-retry-duration <i>seconds</i>;     normalization-retry-limits <i>number</i>;     normalize-interval <i>seconds</i>; } </pre>
<b>Hierarchy Level</b>	[edit protocols mpls container-label-switched-path <i>lsp-name</i> splitting-merging]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 14.2.</p> <p>Statement introduced in Junos OS Release 17.2R1 for QFX Series switches.</p>
<b>Description</b>	Perform normalization.
<b>Options</b>	<p><b>failover-normalization</b>—Enable the ingress router to pro-actively normalize or re-distribute traffic when a link or node failure happens on a member LSP. A member LSP can go down between two scheduled normalization events because of a link-failure or pre-emption.</p> <p><b>Default:</b> Disabled</p> <p><b>no-incremental-normalize</b>—Disables automatic switchover by the ingress router to a new instance of the container LSP until the desired demand is satisfied, although the given number of LSPs can be successfully signaled such that the new aggregate bandwidth value exceeds the old aggregate bandwidth value.</p> <p><b>Default:</b> False (disabled)</p> <p><b>normalization-retry-duration <i>seconds</i></b>—Specifies the duration before which the ingress router performs a normalization reattempt when the previous normalization has not been successful. Normalization is done until a sufficient number of LSPs come up with an aggregate bandwidth that is more than the current aggregate or desired bandwidth.</p> <p><b>Default:</b> 30 seconds</p> <p><b>normalization-retry-limits <i>number</i></b>—Specifies the maximum number of times the ingress router performs normalization reattempts until a sufficient number of LSPs come up successfully with new bandwidth values.</p> <p><b>Default:</b> 1</p> <p><b>normalize-interval <i>seconds</i></b>—Specifies the duration between two normalization events.</p> <p><b>Range:</b> 21600 seconds through 6 hours</p> <p><b>Default:</b> 21600 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## optimize-adaptive-teardown

---

<b>Syntax</b>	<pre>optimize-adaptive-teardown {   p2p: }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls]
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1R1.
<b>Description</b>	Make use of a new feedback mechanism from TAG library which relies on RPD infrastructure to decide when all the routes using the old LSP instance have fully shifted to the new LSP instance after MBB switchover. When this statement is configured, the <b>optimize-hold-dead-delay</b> statement, which delays the teardown of the old LSP instance after MBB switchover, is ignored.
<b>Options</b>	<b>p2p</b> —This is the only option. Only point-to-point LSPs configured in the system will be affected.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Optimizing Signaled LSPs on page 417</a></li><li>• <a href="#">Achieving a Make-Before-Break, Hitless Switchover for LSPs on page 414</a></li></ul>

## optimize-aggressive

---

<b>Syntax</b>	optimize-aggressive;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	If enabled, the LSP reoptimization is based solely on the IGP metric. The reoptimization process ignores the available bandwidth ratio calculations, the least-fill 10 percent congestion improvement rule, and the hop-counts rule. This statement makes reoptimization more aggressive than the default.
<b>Default</b>	Aggressive optimization is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Optimizing Signaled LSPs on page 417</a></li></ul>

## optimize-hold-dead-delay

<b>Syntax</b>	<code>optimized-hold-dead-delay <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switch-path <i>lsp-name</i> ], [edit protocols mpls], [edit protocols mpls label-switch-path <i>lsp-name</i> ]
<b>Description</b>	<p>Allows you to specify the amount of time to delay the tear down of old paths after the router has switched traffic to new optimized paths. This delay timer starts when the timer specified by the <b>optimize-switchover-delay</b> statement has elapsed, which is typically 30 seconds, and at the start of the next retry sequence (in other words, the delay is not an absolute countdown of the seconds configured here).</p> <p>You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that old paths are not torn down before all routes have been switched over to the new optimized paths.</p>
<b>Options</b>	<p><b>seconds</b>—Configure the time in seconds to wait before tearing down the old paths that were in use prior to the last LSP optimization.</p> <p><b>Default:</b> 60 to 90 seconds</p> <p><b>Range:</b> 0 through 65,535 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Optimizing Signaled LSPs on page 417</a></li> <li>• <a href="#">optimize-switchover-delay on page 2092</a></li> <li>• <a href="#">optimize-timer on page 2093</a></li> </ul>

## optimize-switchover-delay

---

<b>Syntax</b>	<code>optimize-switchover-delay seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1R1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Delays the switch over of LSPs to newly optimized paths. You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that the new optimized paths have been established before traffic is switched over from the old paths.
<b>Options</b>	<b>seconds</b> —Configure the time in seconds to wait before switching LSPs to newly optimized paths. <b>Default:</b> 1 second <b>Range:</b> 1 through 900 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Optimizing Signaled LSPs on page 417</a></li><li>• <a href="#">optimize-hold-dead-delay on page 2091</a></li><li>• <a href="#">optimize-timer on page 2093</a></li></ul>

## optimize-timer (Protocols MPLS)

<b>Syntax</b>	<code>optimize-timer <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls],          [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],          [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>],          [edit protocols mpls],          [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],          [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.</p>
<b>Description</b>	<p>Enable periodic reoptimization of an LSP that is already set up. If topology changes occur, an existing path might become suboptimal, and a subsequent recomputation might be able to determine a better path. This feature is useful only on LSPs for which constrained-path computation is enabled; that is, for which the <b>no-cspf</b> statement is not configured. Also, you only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers).</p> <p>To avoid extensive resource consumption that might result because of frequent path recomputations, or to avoid destabilizing the network as a result of constantly changing LSPs, we recommend that you either leave the timer value sufficiently large or disable the timer value.</p>
<b>Default</b>	The optimize timer is disabled.
<b>Options</b>	<p><b><i>seconds</i></b>—Length of the optimize timer, in seconds.</p> <p><b>Range:</b> 0 through 65,535 seconds</p> <p><b>Default:</b> 0 seconds (the optimize timer is disabled)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Optimizing Signaled LSPs on page 417</a></li> </ul>

## p2mp (Protocols MPLS)

---

<b>Syntax</b>	<code>p2mp p2mp-lsp-name;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.
<b>Description</b>	Specify an LSP as either a point-to-multipoint LSP or as a branch LSP of a point-to-multipoint LSP by specifying the point-to-multipoint LSP path name.
<b>Options</b>	<b>p2mp-lsp-name</b> —Name of the point-to-multipoint LSP path that identifies the sequence of nodes that form the point-to-multipoint LSP. The name can contain up to 32 characters and can include letters, digits, periods, and hyphens. To include other characters or use a longer name, enclose the name in quotation marks. The name must be unique within the ingress router.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Primary Point-to-Multipoint LSP on page 527</a></li></ul>

## p2mp-lsp-next-hop

<b>Syntax</b>	<pre>p2mp-lsp-next-hop {     metric <i>metric</i>;     preference <i>preference</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options static route <i>destination-prefix</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options static route <i>destination-prefix</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options static route <i>destination-prefix</i>],</p> <p>[edit routing-options static route <i>destination-prefix</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p>
<b>Description</b>	<p>Specify a point-to-multipoint LSP as the next hop for a static route, and configure an independent metric or preference on that next-hop LSP.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## path (Protocols MPLS)

---

<b>Syntax</b>	<pre>path <i>path-name</i> {     abstract-hop-name (abstract   loose   loose-link   strict);     (<i>address</i>   <i>hostname</i>) &lt;strict   loose&gt;; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric. <b>abstract-hop-name</b> option introduced in Junos OS Release 17.1 for all platforms.
<b>Description</b>	Create a named path and optionally specify the sequence of explicit routers that form the path.  You must include this statement when configuring explicit LSPs.
<b>Options</b>	<p><b>abstract-hop-name</b>—Name of the predefined abstract hop. The abstract hop can be used in combination with real IP next hops. An abstract hop is traversed by traversing the member nodes. This traversal can be done by either links that satisfy the logical combination of defined constituent attributes, or by any kind of link. This choice is controlled by the use of abstract hop qualifiers – abstract, loose, loose-link, and strict.</p> <p><b>abstract</b>—Indicate that the next hop configured in the <b>path</b> statement is an abstract hop..</p> <p><b>loose-link</b>—Indicate that the next hop in the <b>path</b> statement is a loose-link abstract hop. This means that the LSP cannot traverse other routers before reaching this router. In other words, the abstract hop of type loose-link is processed only if any of the viable routers is reached in constraint through a link of associated abstract hop membership.</p> <p><b>loose</b>—Indicate that the next hop in the <b>path</b> statement is a loose abstract hop. The path can traverse any real nodes that do not have abstract hop membership, before reaching a node with abstract hop membership, which is a feasible starting point for processing the next abstract hop.</p> <p><b>strict</b>—Indicate that the next hop in the <b>path</b> statement is a strict abstract hop. After the last processed hop in the constraint list, the path can traverse any real nodes that do not have abstract hop membership, before reaching a node with abstract hop membership, which is a feasible starting point for processing the next abstract hop.</p> <p><b>address</b>—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is <b>loose</b>. As an option, you can include the ingress and egress routers in the</p>

path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.

**Default:** If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.

**hostname**—See **address**.

**Default:** If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.

**loose**—(Optional) Indicate that the next address in the **path** statement is a loose link. This means that the LSP can traverse through other routers before reaching this router.

**Default:** **strict**

**path-name**—Name that identifies the sequence of nodes that form an LSP. The name can contain up to 32 characters and can include letters, digits, periods, and hyphens. To include other characters or use a longer name, enclose the name in quotation marks. The name must be unique within the ingress router.

**strict**—(Optional) Indicate that the LSP must go to the next address specified in the **path** statement without traversing other nodes. This is the default.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
---------------------------------	---

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Creating Named Paths on page 394</a></li><li>• <a href="#">abstract-hop on page 1959</a></li></ul>

## path

---

Syntax	<pre>path destination {     &lt;address   hostname&gt; &lt;strict   loose&gt; }</pre>
Hierarchy Level	[edit protocols <a href="#">mpls</a> ]
Release Information	Statement introduced in Junos OS Release 9.5 for EX Series switches.
Description	Configure path protection on your MPLS network.
Options	<p><b>destination</b> —Name of a label switched path (LSP). In addition to specifying the name of the configured LSP, you can include some other designation such as <b>primary-path</b>.</p> <p><b>address</b> —(Optional) IP address of each transit switch (or the IP address of the loopback interface on the switch) in the LSP. If you want to control exactly which switches are selected for the LSP, specify the address or hostname of each transit switch. Specify the addresses in order, starting with the first provider (transit) switch, and continuing sequentially along the path until reaching the egress provider edge switch.</p> <p><b>Default:</b> If you do not specify the addresses or hostnames of any switches, the LSP is calculated by the switch.</p> <p><b>hostname</b> —(Optional) See <b>address</b>.</p> <p><b>Default:</b> If you do not specify the addresses or hostnames of any switches, the LSP is calculated by the switch.</p> <p><b>loose</b>—(Optional) Indicates that the next address in the <b>path</b> statement is a loose link. This means that the LSP can traverse through other switches before reaching this switch.</p> <p><b>Default:</b> <b>strict</b></p> <p><b>strict</b>—(Optional) Indicates that the LSP must go to the next address specified in the <b>path</b> statement without traversing other switches. This is the default.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Path Protection in an MPLS Network (CLI Procedure) on page 107</a></li></ul>

## path-mtu

---

<b>Syntax</b>	<pre>path-mtu {     allow-fragmentation;     rsvp {         mtu-signaling;     } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Configure MTU options for MPLS paths, including packet fragmentation and MTU signaling.  The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MTU Signaling in RSVP on page 659</a></li></ul>

## per-prefix-label

<b>Syntax</b>	<code>per-prefix-label;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp family inet labeled-unicast],          [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> family inet labeled-unicast],          [edit protocols bgp family inet labeled-unicast],          [edit protocols bgp group <i>group-name</i> family inet labeled-unicast],          [edit routing-instances <i>instance-name</i> logical-systems <i>logical-system-name</i> protocols bgp family inet labeled-unicast],          [edit routing-instances <i>instance-name</i> logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> family inet labeled-unicast],          [edit routing-instances <i>instance-name</i> protocols bgp family inet labeled-unicast],          [edit routing-instances <i>instance-name</i> protocols bgp group <i>group-name</i> family inet labeled-unicast]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.</p> <p>Statement introduced in Junos OS Release 12.3 for M Series, T Series, and MX Series routers.</p>
<b>Description</b>	<p>Allocate a unique label for each prefix. The <b>per-prefix-label</b> statement helps minimize packet loss in most deployments.</p> <p>Although allocating a label for each prefix is not generally ideal for scaling, it is assumed that a small number of labels are used for BGP labeled-unicast. When labeled BGP is used to set up transport label-switched paths (LSPs), the common case is that each prefix has a unique next hop. Thus, the use of per-prefix labels does not have an adverse scaling impact. On the contrary, the use of per-prefix labels reduces churn in the network when multipath load balancing is enabled for IPv4 labeled-unicast, and a subset of the paths are withdrawn for some reason.</p> <p>The advantage of per-prefix labeling is that the advertised upstream label is more stable during network changes. That is, if the downstream label changes, the advertised upstream label remains the same under most scenarios. This way, the upstream router is isolated from the downstream network change, and the overall network is more stable. The greater stability of the advertised upstream label helps to reduce traffic loss during many different network change scenarios.</p>
<b>Default</b>	By default, label allocation is per next-hop router.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

Statement introduced in Junos OS Release 11.3 for the QFX Series.  
**route-target** option introduced in Junos OS Release 12.2.  
Statement introduced in Junos OS 14.1X53-D20 for the OCX Series.  
**protocol** and **traffic-engineering** options introduced in Junos OS Release 14.2.  
**no-entropy-label-capability** option introduced in Junos OS Release 15.1.

**priority** and **tag value** options introduced in Junos OS Release 17.1.

**as-path-unique-count** option introduced in Junos OS Release 17.2R1.

**prefix-segment** option introduced in Junos OS Release 17.2R1 for MX Series routers, PTX Series routers, QFX5100 switches, and QFX10000 switches.

**multipath-resolve** and **dynamic-tunnel-attributes** options introduced in Junos OS Release 17.3R1.

**aggregate-bandwidth** and **limit-bandwidth** *limit-bandwidth* options introduced in Junos OS Release 17.4R1 for MX Series, PTX Series, and QFX Series.

**Description** Define a routing policy, including subroutine policies.

A *term* is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of **accept** or **reject** is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either **accept** or **reject**) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the **[edit policy-options]** hierarchy level by **policy-statement** *policy-name* in alphabetical order, enter the **show policy-options** configuration command.

The statements are explained separately.

**Options** *actions*—(Optional) One or more actions to take if the conditions match. The actions are described in *Configuring Flow Control Actions*.

**family** *family-name*—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**. For traffic engineering, specify **traffic-engineering**.

**NOTE:** When family is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the *family* statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

**from**—(Optional) Match a route based on its source address.

**as-path-unique-count** *count (equal | orhigher | orlower)*—(Optional) Specify a number from 0 through 1024 to filter routes based on the number of unique autonomous systems (ASs) in the AS path. Specify the match condition for the unique AS path count.

**aggregate-bandwidth**—(Optional) Enable BGP to advertise aggregate outbound link bandwidth for load balancing.

**dynamic-tunnel-attributes** *dynamic-tunnel-attributes*—(Optional) Choose a set of defined dynamic tunnel attributes for forwarding traffic over V4oV6 tunnels.

**match-conditions**—(Optional in **from** statement; required in **to** statement) One or more conditions to use to make a match. The qualifiers are described in *Routing Policy Match Conditions*.

**multipath-resolve** *multipath-resolve*—(Optional) Enable the use of all paths for resolution over the specified prefix.

**limit-bandwidth** *limit-bandwidth*—(Optional) Specify the limit for advertised aggregate outbound link bandwidth for load balancing.

**Range:** 0 through 4,294,967,295 bytes

**no-entropy-label-capability**—(Optional) Disable the entropy label capability advertisement at egress or transit routes specified in the policy.

**priority** (*high | medium | low*)—(Optional) Configure the priority for an IS-IS route to change the default order in which the routes are installed in the routing table, in the event of a network topology change.

**policy** *subroutine-policy-name*—Use another policy as a match condition within this policy.

The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form `__.*-internal__`, as this form is reserved. For information about how to configure subroutines, see *Understanding Policy Subroutines in Routing Policy Match Conditions*.

**policy-name**—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

**prefix-list** *prefix-list-name*—Name of a list of IPv4 or IPv6 prefixes.

**prefix-list-filter** *prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match, and *actions* is the action to take if the prefixes match.

**protocol** *protocol-name*—Name of the protocol used to control traffic engineering database import at the originating point.

**route-filter** *destination-prefix match-type <actions>*—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see *Configuring Route Lists*), and *actions* is the action to take if the *destination-prefix* matches.

**source-address-filter** *source-prefix match-type <actions>*—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see *Configuring Route Lists*), and *actions* is the action to take if the *source-prefix* matches.

**tag value**—(Optional) A numeric value that identifies a route. You can tag certain routes to prioritize them over other routes. In the event of a network topology change, Junos OS updates these routes in the routing table before updating other routes with lower priority. You can also tag some routes to identify and reject them based on your requirement.

**term** *term-name*—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the **term** statement when defining match conditions and actions.

**to**—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

**then**—(Optional) Actions to take on matching routes. The actions are described in *Configuring Flow Control Actions* and *Configuring Actions That Manipulate Route Characteristics*.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## pop

**Syntax** pop;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols mpls static-label-switched-path *lsp-name* transit *incoming-label*],  
[edit protocols mpls static-label-switched-path *lsp-name* transit *incoming-label*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Remove the label from the top of the label stack. If there is another label in the stack, that label becomes the label at the top of the label stack. Otherwise, the packet is forwarded as a native protocol packet (typically, as an IP packet).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## pop-and-forward (Protocols MPLS)

---

<b>Syntax</b>	pop-and-forward;
<b>Hierarchy Level</b>	[edit logical-systems <i>name</i> protocols mpls <a href="#">label-switched-path</a> ], [edit logical-systems <i>name</i> routing-instances <i>name</i> protocols mpls <a href="#">label-switched-path</a> ], [edit protocols mpls <a href="#">label-switched-path</a> ], [edit routing-instances <i>name</i> protocols mpls <a href="#">label-switched-path</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 18.1R1 on MX Series routers, PTX Series routers, and vMX.
<b>Description</b>	Enable LSP as pop-and-forward with auto-delegation signaling enabled by default.  The LSP undergoes a make-before-break from a regular point-to-point LSP to a pop-and-forward LSP.
<b>Required Privilege Level</b>	routing
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RSVP-TE Pop-and-Forward LSP Tunnels Overview on page 613</a></li><li>• <a href="#">show rsvp pop-and-forward on page 2610</a></li><li>• <a href="#">pop-and-forward (Protocols RSVP) on page 2214</a></li></ul>

## preference (Protocols MPLS)

---

<b>Syntax</b>	<code>preference <i>preference</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i></code> <code>  (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls</code> <code>  static-label-switched-path <i>lsp-name</i> ingress],</code> <code>[edit protocols mpls],</code> <code>[edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],</code> <code>[edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>],</code> <code>[edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Preference for the route.</p> <p>You can optionally configure multiple LSPs between the same pair of ingress and egress routers. This is useful for balancing the load among the LSPs because all LSPs, by default, have the same preference level. To prefer one LSP over another, set different preference levels for individual LSPs. The LSP with the lowest preference value is used. The default preference for LSPs is lower (more preferred) than all learned routes except direct interface routes.</p>
<b>Options</b>	<p><b><i>preference</i></b>—Preference to assign to the route. A route with a lower preference value is preferred.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 5 for static MPLS LSPs, 7 for RSVP MPLS LSPs, 9 for LDP MPLS LSPs</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Preference Values for LSPs on page 413</a></li><li>• <a href="#">Configuring the Ingress Router for Static LSPs on page 468</a></li><li>• <a href="#">Configuring the Intermediate (Transit) and Egress Routers for Static LSPs on page 471</a></li></ul>

## primary (Protocols MPLS)

<b>Syntax</b>	<pre> primary <i>path-name</i> {   adaptive;   admin-group {     exclude [ <i>group-names</i> ];     include-all [ <i>group-names</i> ];     include-any [ <i>group-names</i> ];   }   bandwidth <i>bps</i>;   class-of-service <i>cos-value</i>;   hop-limit <i>number</i>;   no-cspf;   no-decrement-ttl;   optimize-timer <i>seconds</i>;   preference <i>preference</i>;   priority <i>setup-priority reservation-priority</i>;   (record   no-record);   select (manual   unconditional);   standby; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Specify the primary path to use for an LSP. You can configure only one primary path.</p> <p>You can optionally specify preference, CoS, and bandwidth values for the primary path, which override any equivalent values that you configure for the LSP (at the [edit mpls label-switched-path <i>lsp-name</i>] hierarchy level).</p>
<b>Options</b>	<p><i>path-name</i>—Name of a path that you created with the <b>path</b> statement.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Primary and Secondary LSPs on page 438</a></li> </ul>

## primary

---

<b>Syntax</b>	<code>primary <i>path-name</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mpls label-switched-path</a> <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Specify the primary path to use for a label switched path (LSP). You can configure only one primary path.
<b>Options</b>	<b><i>path-name</i></b> —Name of the primary path that you created with the <b>path</b> statement.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Path Protection in an MPLS Network (CLI Procedure) on page 107</a></li></ul>

## priority (Protocols MPLS)

<b>Syntax</b>	<code>priority setup-priority reservation-priority;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i></code> <code>  (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>],</code> <code>[edit protocols mpls],</code> <code>[edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i>],</code> <code>[edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (<a href="#">primary</a>   <a href="#">secondary</a>) <i>path-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the setup priority and reservation priority for an LSP. If insufficient link bandwidth is available during session establishment, the setup priority is compared with other setup priorities for established sessions on the link to determine whether some of them should be preempted to accommodate the new session. Sessions with lower hold priorities are preempted.
<b>Options</b>	<p><b><i>reservation-priority</i></b>—Reservation priority, used to keep a reservation after it has been set up. A smaller number has a higher priority. The priority must be greater than or equal to the setup priority to prevent preemption loops.</p> <p><b>Range:</b> 0 through 7, where 0 is the highest and 7 is the lowest priority.</p> <p><b>Default:</b> 0 (Once the session is set up, no other session can preempt it.)</p> <p><b><i>setup-priority</i></b>—Setup priority.</p> <p><b>Range:</b> 0 through 7, where 0 is the highest and 7 is the lowest priority.</p> <p><b>Default:</b> 7 (The session cannot preempt any existing sessions.)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Priority and Preemption for LSPs on page 408</a></li> </ul>

## protection-revert-time

---

<b>Syntax</b>	<code>protection-revert-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static], [edit protocols mpls interface <i>interface-name</i> static]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1.
<b>Description</b>	<p>Specify the amount of time (in seconds) that a static LSP must wait before traffic reverts from the bypass path to the original path.</p> <p>If you have configured a value of 0 seconds for the <b>protection-revert-time</b> statement and traffic is switched to the bypass path, the traffic remains on that path indefinitely. It is never switched back to the original path unless the bypass path is down or you intervene.</p>
<b>Options</b>	<p><b>seconds</b>—Time in seconds.</p> <p><b>Range:</b> 0 through 65,535 seconds</p> <p><b>Default:</b> 5 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Static LSPs on page 468</a></li></ul>

## push

---

<b>Syntax</b>	<code>push out-label;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> bypass], [edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit protocols mpls static-label-switched-path <i>lsp-name</i> bypass], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Add a new label to the top of the label stack. This statement is used to configure static LSPs at ingress routers and to configure bypass LSPs for static LSPs.
<b>Options</b>	<b>out-label</b> —Manually assigned outgoing label value. <b>Range:</b> 0 through 1,048,575.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">pop on page 2108</a></li> <li>• <a href="#">swap on page 2151</a></li> <li>• <a href="#">Configuring the Ingress Router for Static LSPs on page 468</a></li> </ul>

## random

---

<b>Syntax</b>	(random   least-fill   most-fill);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Configure the preferred path when several equal-cost candidate paths to a destination exist, and prefer the path with the highest available bandwidth (with the largest minimum available bandwidth ratio). The available bandwidth ratio of a link is the available bandwidth on a link divided by the maximum reservable bandwidth on the link.</p> <ul style="list-style-type: none"><li>• <b>least-fill</b>—Prefer the path with the most available bandwidth (with the largest available bandwidth ratio).</li><li>• <b>most-fill</b>—Prefer the path with the least available bandwidth (with the minimum available bandwidth ratio). The minimum available bandwidth ratio of a path is the smallest available bandwidth ratio belonging to any of the links in the path.</li><li>• <b>random</b>—Choose the path at random.</li></ul>
<b>Default</b>	random
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring CSPF Tie Breaking on page 375</a></li></ul>

## record

---

<b>Syntax</b>	(record   no-record);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> ( <a href="#">primary</a>   <a href="#">secondary</a> ) <i>path-name</i> ], [edit protocols mpls], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> ], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> ( <a href="#">primary</a>   <a href="#">secondary</a> ) <i>path-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify whether an LSP should actively record the routes in the path. Recording routes requires that all transit routers support the RSVP Record Route object. Recording routes can be useful for diagnostics and loop detection.
<b>Default</b>	Record routes.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Disabling Path Route Recording by LSPs on page 413</a></li> </ul>

## remote-interface-switch

---

<b>Syntax</b>	<pre>remote-interface-switch <i>connection-name</i> {     interface <i>interface-name.unit-number</i>;     receive-lsp <i>label-switched-path</i>;     transmit-lsp <i>label-switched-path</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols connections], [edit protocols <a href="#">connections (MPLS)</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Configure MPLS LSP tunnel cross-connects. This makes an association between a CCC interface and two LSPs, one for transmitting MPLS packets from the local provider edge switch to the remote provider edge switch and the other for receiving MPLS packets on the local provider edge switch from the remote provider edge switch.
<b>Options</b>	<p><b><i>connection-name</i></b>—Connection name.</p> <p><b><i>interface interface-name.unit-number</i></b>—Interface name. Include the logical portion of the name, which corresponds to the logical unit number of the CCC interface.</p> <p><b><i>receive-lsp label-switched-path</i></b>—Name of the LSP from the connection's source. This LSP name was specified by the <b>label-switched-path</b> statement on the remote provider edge switch in the <b>protocols mpls</b> stanza.</p> <p><b><i>transmit-lsp label-switched-path</i></b>—Name of the LSP to the connection's destination. This LSP name was specified by the <b>label-switched-path</b> statement on the local provider edge switch in the <b>protocols mpls</b> stanza.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MPLS LSP Tunnel Cross-Connects Using CCC on page 1320</a></li><li>• <a href="#">Example: Configuring MPLS on EX8200 and EX4500 Switches on page 42</a></li><li>• <a href="#">Configuring MPLS on Provider Edge EX8200 and EX4500 Switches Using Circuit Cross-Connect (CLI Procedure) on page 71</a></li><li>• <a href="#">Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure) on page 66</a></li><li>• <i>MPLS Applications Feature Guide</i></li></ul>

## remote-site-id

---

<b>Syntax</b>	<code>remote-site-id remote-site-ID;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn site <i>site-name</i> interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn site <i>site-name</i> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Control the remote interface to which the interface should connect. If you do not explicitly configure the remote site ID, the order of the interfaces configured for the site determines the default value. This statement is optional.
<b>Options</b>	<i>remote-site-ID</i> —Identifier specifying the interface on the remote PE router the Layer 2 VPN routing instance connects to.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Remote Site ID</a></li> <li>• <a href="#">Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 1159</a></li> </ul>

## retry-limit

---

<b>Syntax</b>	<code>retry-limit <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ],
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Maximum number of times the ingress router tries to establish the primary path. This counter is reset each time a primary path is created successfully. When the limit is exceeded, no more connection attempts are made. Intervention is then required to restart the connection.
<b>Options</b>	<b><i>number</i></b> —Maximum number of tries to establish the primary path. <b>Range:</b> 0 through 10,000 <b>Default:</b> 0 (The ingress node never stops trying to establish the primary path.)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Connection Between Ingress and Egress Routers on page 398</a></li></ul>

## retry-timer

---

<b>Syntax</b>	<code>retry-timer <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Amount of time the ingress router waits between attempts to establish the primary path.
<b>Options</b>	<b><i>seconds</i></b> —Amount of time between attempts to connect to the primary path. <b>Range:</b> 1 through 600 seconds <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Connection Between Ingress and Egress Routers on page 398</a></li></ul>

## revert-timer

---

<b>Syntax</b>	<code>revert-timer seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. BFD behavior modified in Junos OS Release 9.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Specify the amount of time (in seconds) that an LSP must wait before traffic reverts to a primary path. If during this time the primary path experiences any connectivity problem or stability problem, the timer is restarted.</p> <p>If you have configured BFD on the LSP, the Junos OS waits until the BFD session is restored before starting the revert timer counter.</p> <p>If you have configured a value of 0 seconds for the <b>revert-timer</b> statement and traffic is switched to the secondary path, the traffic remains on that path indefinitely. It is never switched back to the primary path unless you intervene.</p>
<b>Options</b>	<p><b>seconds</b>—Time in seconds.</p> <p><b>Range:</b> 0 through 65,535 seconds</p> <p><b>Default:</b> 60 seconds</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Revert Timer for LSPs on page 439</a></li></ul>

## revert-timer

---

<b>Syntax</b>	<code>revert-timer <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mpls</a> ], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	<p>Specify the amount of time that a label switched path (LSP) must wait before traffic reverts to a primary path. If during this time the primary path experiences any connectivity problem or stability problem, the timer is restarted.</p> <p>If you have configured a value of 0 seconds for the <b>revert-timer</b> statement and traffic is switched to the secondary path, the traffic remains on that path indefinitely. It is never switched back to the primary path unless you intervene.</p>
<b>Default</b>	60 seconds
<b>Options</b>	<p><b><i>seconds</i></b> —Value in seconds.</p> <p><b>Range:</b> 0 through 65,535 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Path Protection in an MPLS Network (CLI Procedure)</a> on page 107</li> </ul>

## responder (performance-monitoring)

---

**Syntax**

```
responder {  
    delay {  
        min-query-interval milliseconds;  
    }  
    loss {  
        min-query-interval milliseconds;  
    }  
}
```

**Hierarchy Level**

[edit protocols mpls [oam performance-monitoring](#)],  
[edit protocols mpls [label-switched-path](#) *lsp-name* [oam performance-monitoring](#)],  
[edit protocols mpls [label-switched-path](#) *lsp-name* primary *path-name* [oam performance-monitoring](#)],  
[edit protocols mpls [label-switched-path](#) *lsp-name* secondary *path-name* [oam performance-monitoring](#)]

**Release Information** Statement introduced in Junos OS Release 15.1.

**Description** Configure responder options.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## rpf-check-policy (Routing Options)

---

<b>Syntax</b>	<code>rpf-check-policy <i>policy</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options multicast], [edit routing-options multicast]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	Enable you to control whether a reverse path forwarding (RPF) check is performed for a source and group entry before installing a route in the multicast forwarding cache. This makes it possible to use point-to-multipoint LSPs to distribute multicast traffic to Protocol Independent Multicast (PIM) islands situated downstream from the egress routers of the point-to-multipoint LSPs.
<b>Options</b>	<i>policy</i> —Name of the RPF check routing policy.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a Multicast RPF Check Policy for Point-to-Multipoint LSPs on page 550</a></li></ul>

## rsvp-error-hold-time

---

<b>Syntax</b>	<code>rsvp-error-hold-time seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations. The more time you configure, the more time a source node (ingress of an RSVP LSP) can have to learn about the failures of its LSP by monitoring PathErr messages transmitted from downstream nodes.</p> <p>Information from the PathErr messages is incorporated into subsequent LSP computations, which can improve the accuracy and speed of LSP setup. Some PathErr messages are also used to update traffic engineering database bandwidth information, reducing inconsistencies between the database and the network.</p>
<b>Options</b>	<p><b>seconds</b>—Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations.</p> <p><b>Range:</b> 0 through 240 seconds</p> <p><b>Default:</b> 25 seconds</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Improving Traffic Engineering Database Accuracy with RSVP PathErr Messages on page 934</a></li></ul>

## sampling (Protocols MPLS)

<b>Syntax</b>	<pre>sampling {   cut-off-threshold <i>percentile</i>;   use-average-aggregate;   use-percentile <i>percentile</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls container-label-switched-path <i>lsp-name</i> splitting-merging]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 14.2.</p> <p>Statement introduced in Junos OS Release 17.2R1 for the QFX Series switches.</p>
<b>Description</b>	Configure traffic sampling.
<b>Options</b>	<p><b>cut-off-threshold <i>percentile</i></b>—Specify the percentile value to be used as a cut-off threshold in removing outlier bandwidth samples. All the aggregate bandwidth samples determined as outliers are used for computing aggregate bandwidth used at the time of normalization.</p> <p><b>Default:</b> 0 percentile (the ingress considers all aggregate bandwidth samples for normalization.)</p> <p><b>Range:</b> 0 through 100</p> <p><b>use-average-aggregate</b>—Specify the ingress router to take average of the aggregate samples for normalization.</p> <p>This option is mutually exclusive with the <b>use-percentile</b> configuration option.</p> <p><b>use-percentile <i>percentile</i></b>—Specify the ingress router to compute and use the <b>pth</b> percentile from all the bandwidth samples, and use that for normalization.</p> <p>This option is mutually exclusive with the <b>use-average-aggregate</b> configuration option.</p> <p><b>Range:</b> 0 through 100</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">splitting-merging on page 2142</a></li> </ul>

## secondary (Protocols MPLS)

<b>Syntax</b>	<pre> secondary <i>path-name</i> {     adaptive;     admin-group {         exclude [ <i>group-names</i> ];         include-all [ <i>group-names</i> ];         include-any [ <i>group-names</i> ];     }     bandwidth <i>bps</i>;     class-of-service <i>cos-value</i>;     hop-limit <i>number</i>;     no-cspf;     no-decrement-ttl;     optimize-timer <i>seconds</i>;     preference <i>preference</i>;     priority <i>setup-priority reservation-priority</i>;     (record   no-record);     retry-limit <i>number</i>;     retry-timer <i>seconds</i>;     select (manual   unconditional);     standby; } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Specify one or more secondary paths to use for the LSP. You can configure more than one secondary path. All secondary paths are equal, and the first one that is available is chosen.</p> <p>You can specify secondary paths even if you have not specified any primary paths.</p> <p>Optionally, you can specify preference, CoS, and bandwidth values for the secondary path, which override any equivalent values that you configure for the LSP (at the <b>[edit mpls label-switched-path]</b> hierarchy level).</p>
<b>Options</b>	<p><b><i>path-name</i></b>—Name of a path that you created with the <b>path</b> statement.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring Primary and Secondary LSPs on page 438</a></li> </ul>

## secondary

---

<b>Syntax</b>	<code>secondary <i>path-name</i> {     standby; }</code>
<b>Hierarchy Level</b>	[edit protocols <a href="#">mpls label-switched-path</a> <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Specify one or more secondary paths to use for the label switched path (LSP). You can configure more than one secondary path. All secondary paths are equal, and the first one that is available is chosen.
<b>Options</b>	<p><b><i>path-name</i></b> —Name of a secondary path that you created with the <b>path</b> statement.</p> <p>The remaining statement is explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Path Protection in an MPLS Network (CLI Procedure) on page 107</a></li> </ul>

## segment

---

<b>Syntax</b>	<pre>segment {     (pop   swap <i>swap</i>);     description <i>description</i>;     next-hop <i>next-hop</i>;     sid-label; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>name</i> protocols mpls <a href="#">static-label-switched-path</a> ], [edit logical-systems <i>name</i> routing-instances <i>name</i> protocols mpls <a href="#">static-label-switched-path</a> ], [edit protocols mpls <a href="#">static-label-switched-path</a> ], [edit routing-instances <i>name</i> protocols mpls <a href="#">static-label-switched-path</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release OS 18.1R1 for MX Series, PTX Series, and QFX Series.
<b>Description</b>	Static segment for segment routing. A static segment is identified by a unique name. This segment type is assigned a segment identifier (SID) which falls under a default range of 100000 through 1048575. The segment has label operation such as pop-and-forward for adjacency segment and swap-and-forward for prefix or node segment. For both types of label operation, the segment is assigned a next hop that specifies the remote IP address if the outgoing interface is a multi-access interface, or the name of the outgoing interface if the interface is a point-to-point interface. Static segment configuration is used to statically configure or provision the adjacency SIDs, node SIDs, and prefix SIDs on transit routers.
<b>Options</b>	<p><b>pop</b>—Pop the SID label</p> <p><b>swap</b>—Swap the SID label to this label</p> <p><b>description</b>—Text description of label-switched path</p> <p><b>next-hop</b>—IPv4 address or interface of next-hop router</p> <p><b>sid-label</b>—Segment identifier (SID) label</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	routing
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Static Segment Routing Label Switched Path on page 480</a></li><li>• <a href="#">segment-list on page 2131</a></li><li>• <a href="#">source-routing-path on page 2139</a></li></ul>

## segment-list

**Syntax**

```
segment-list name {
    hop-name name {
        ip_address ip address;
        label label;
    }
}
```

**Hierarchy Level** [edit logical-systems *name* protocols source-packet-routing],  
[edit protocols source-packet-routing]

**Release Information** Statement introduced in Junos OS Release 17.4R1 for MX Series and PTX Series with FPC-PTX-P1-A.  
**ip-address** statement introduced in Junos OS Release 18.1R1 for MX Series.

**Description** Specify an explicit path for source routing label switched path (LSPs) to traverse through traffic engineering segments. The segment list is essentially a stack of segment identifiers. that

**NOTE:** The segment list enables BGP and static segment routing LSP to steer traffic based on segment routing policies. When a segment list is used by the protocol BGP, the BGP protocol validates these segment identifiers and selects valid segments for traffic engineering.

**Options** **name**—Specify a name to identify the segment routing list, which is used in traffic engineering policy.

**hop-name**—Specify the name of a hop from the segment list in the segment routing traffic engineering policy.

**ip-address**—Specify the IP address of the hop. For a segment-list to be used by a non-colored segment routing LSP, the first hop must specify an IP address..

**label**—Specify the SID label of the hop in a segment routing traffic engineering segment list. In static segment routing LSPs, the source routing path uses the segment list only if the second to Nth hop specifies segment identifiers (SID) labels.

**Range:** 0 through 1,048,576

**NOTE:** The range is applicable for protocol BGP and static segment routing LSPs.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>extended-nexthop-color</i></li><li>• <i>source-packet-routing</i></li><li>• <a href="#">source-routing-path on page 2139</a></li><li>• <i>sr-preference-override</i></li><li>• <i>Support for Segment Routing Traffic Engineering at BGP Ingress Peer Overview</i></li><li>• <a href="#">Static Segment Routing Label Switched Path on page 480</a></li></ul>

---

## select

<b>Syntax</b>	select (manual   unconditional);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (primary   secondary) <i>path-name</i> ], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> (primary   secondary) <i>path-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the conditions under which the path is selected to carry traffic. The <b>manual</b> and <b>unconditional</b> options are mutually exclusive.
<b>Options</b>	<b>manual</b> —The path is selected for carrying traffic if it is up and stable for at least the revert timer window (potentially before the revert timer has elapsed). Traffic is sent to other working paths if the current path is down or degraded (receiving errors).  <b>unconditional</b> —The path is always selected for carrying traffic, even if it is currently down or degraded (receiving errors).
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Specifying the Conditions for Path Selection on page 440</a></li></ul>

## signal-bandwidth

---

<b>Syntax</b>	<code>signal-bandwidth type;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> lsp-attributes], [edit protocols mpls label-switched-path <i>lsp-name</i> lsp-attributes]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the bandwidth encoding of the signal used for path computation and admission control.
<b>Options</b>	<b>type</b> —Configure the type of bandwidth encoding used on the LSP. It can be any of the following values: <b>10gigether</b> , <b>ds1</b> , <b>ds3</b> , <b>e1</b> , <b>e3</b> , <b>ethernet</b> , <b>fastether</b> , <b>gigether</b> , <b>stm-1</b> , <b>stm-4</b> , <b>stm-16</b> , <b>stm-64</b> , <b>stm-256</b> , <b>sts-1</b> , <b>vt1-5</b> , or <b>vt2</b> .
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Signal Bandwidth Type on page 1086</a></li> </ul>

## signaling

---

<b>Syntax</b>	signaling;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp family inet-mdt], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp family inet-mvpn], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family inet-mdt], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family inet-mvpn], [edit routing-instances <i>routing-instance-name</i> protocols bgp family inet-mdt], [edit routing-instances <i>routing-instance-name</i> protocols bgp family inet-mvpn], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family inet-mdt], [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family inet-mvpn]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Enable signaling in BGP. For multicast distribution tree (MDT) subaddress family identifier (SAFI) NLRI signaling, configure signaling under the <b>inet-mdt</b> family. For multiprotocol BGP (MBGP) intra-AS NLRI signaling, configure signaling under the <b>inet-mvpn</b> family.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Configuring Source-Specific Multicast for Draft-Rosen Multicast VPNs</i></li></ul>

## site (Layer 2 Circuits)

<b>Syntax</b>	<pre> site <i>site-name</i> {     hot-standby;     site-identifier <i>identifier</i>;     site-preference <i>preference-value</i> {         backup;         primary;     }     interface <i>interface-name</i> {         description <i>text</i>;         remote-site-id <i>remote-site-ID</i>;     } } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for EX Series switches. <b>hot-standby</b> option introduced in Junos OS Release 14.2 for MX Series routers.
<b>Description</b>	Specify the site name, site identifier, and interfaces connecting to the site. Allows you to configure a remote site ID for remote sites.
<b>Options</b>	<p><b>hot-standby</b>—Turn on the protector behavior for the site. This keeps backup pseudowire in continuous standby mode and ready for traffic forwarding.</p> <p><b>site-identifier <i>identifier</i></b>—Numerical identifier for the site used as a default reference for the remote site ID.</p> <p><b><i>site-name</i></b>—Name of the site.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Site</a></li> <li>• <a href="#">Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 1159</a></li> </ul>

## site-identifier (Layer 2 Circuits)

---

<b>Syntax</b>	<code>site-identifier <i>identifier</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn site <i>site-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn site <i>site-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Specify the numerical identifier for the local Layer 2 VPN site.
<b>Options</b>	<i>identifier</i> —The numerical identifier for the Layer 2 VPN site, which can be any number from 1 through 65,534.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Site</a></li><li>• <a href="#">Configuring an MPLS-Based Layer 2 VPN (CLI Procedure) on page 1159</a></li></ul>

## smart-optimize-timer

<b>Syntax</b>	<code>smart-optimize-timer <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Enable the smart optimization timer. When you enable the smart optimization timer on a router, the Junos OS operates on the assumption that the original LSP path is preferable to any alternate or secondary path. When you enable the smart optimization timer and an LSP fails and its traffic is switched to an alternate path, the smart optimization timer starts and waits 3 minutes (this time is configurable). After 3 minutes have passed, the LSP is switched back to the original path. If the original path fails again and the LSP is switched to an alternate path again, the router waits 1 hour before attempting to switch the LSP back to its original path.</p> <p>If you want to disable the smart optimizer, you can set it to zero. The <b>smart-optimize-timer</b> value in seconds indicates the time before which the LSP is switched back to its primary path in case the primary path becomes available. Otherwise, the time to wait is controlled by the <b>optimize-timer</b>, which is usually set to a high value. Some ISPs have the <b>optimize-timer</b> set to once a day. Sometimes after the smart optimizer causes the LSP to be placed back on its primary path, the primary path goes down again within 60 minutes. When this happens, the <b>smart-optimize-timer</b> is disabled automatically, and the <b>optimize-timer</b> (regular path optimization) goes into effect. This is to protect against a flapping link being used.</p>
<b>Default</b>	The smart optimization timer is enabled by default.
<b>Options</b>	<p><b>seconds</b>—(Optional) Specify the number of seconds to wait before switching an LSP back to its original path. If you do not specify the number of seconds, the default value is used.</p> <p><b>Range:</b> 0 through 65,535 seconds</p> <p><b>Default:</b> 180 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Smart Optimize Timer for LSPs on page 420</a></li> <li>• <a href="#">Optimizing Signaled LSPs on page 417</a></li> <li>• <a href="#">optimize-aggressive on page 2090</a></li> <li>• <a href="#">optimize-timer on page 2093</a></li> </ul>

## soft-preemption (Protocols MPLS)

---

<b>Syntax</b>	soft-preemption;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> ], [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Attempt to establish a new path for a preempted LSP before tearing it down.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MPLS Soft Preemption on page 407</a></li></ul>

## source-routing-path

<b>Syntax</b>	<pre> source-routing-path <i>name</i> {     binding-sid <i>binding-sid</i>;     color <i>color</i>;     metric <i>value</i>;     no-ingress;     preference <i>preference</i>;     primary <i>name</i> {         weight <i>weight</i>;     }     secondary <i>name</i> {         weight <i>weight</i>;     }     sr-preference <i>sr-preference</i>;     to <i>to</i>; } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>name</i> protocols source-packet-routing], [edit protocols source-packet-routing]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 17.4R1 for MX Series and PTX Series with FPC-PTX-P1-A.</p> <p>The <b>metric</b>, <b>no-ingress</b>, and <b>secondary</b> statements are introduced in Junos OS Release 18.1R1 for MX Series.</p>
<b>Description</b>	<p>Configure a source routing label switched path (LSP) for steering traffic at an ingress router. Specify a binding segment identifier from the static label range. Configure other parameters such as color, weight, preference, and segment routing preference for traffic engineering.</p> <p>Starting with Junos OS Release 18.1R1, non-colored static segment routing LSPs are supported in an MPLS network. Configure parameters such as destination address, binding SIDs, primary segment, secondary segment, metric, and preference. These segment routing LSPs do not have a color associated with them. If an ingress route is not required for a non-colored segment routing LSP then the ingress route installation in inet.3 table can be disabled.</p>
<b>Options</b>	<p><b>name</b>—Specify a name to identify a source routing path.</p> <p><b>binding-sid</b>—Specify the binding label to enable transit functionality for this tunnel. For a non-colored static segment routing LSP, a label route for the binding SID is installed in mpls.0 table, by default, with a preference of 8 and a metric of 1.</p>

**NOTE:** This is optional for MPLS networks.

**Range:** 16 through 1,048,576

**color**—Specify a color identifier for the tunnel end point.

**NOTE:** This is only for colored segment routing LSPs. For non-colored segment routing LSPs, you should not configure the color parameter. For colored segment routing LSP, the first hop in the segment list is a label whereas for non-colored segment routing LSP, the first hop is an IP address of the next hop.

**metric**—Specify metric for routes downloaded for the non-colored static segment routing tunnel.

**Range:** 1 through 16777215

**NOTE:** This range is for protocol BGP.

**no-ingress**—Disable installing the destination address of the segment routing LSP in the inet.3 table. This disables the ability to use the given non-colored static segment routing tunnel as ingress.

**preference**—Specify the preference for routes downloaded for this tunnel.

**primary**—Specify a primary segment list for the configured source routing path.

The non-colored static segment routing LSP can have a maximum of 8 primary paths. In case of multiple operational primary paths, the PFE distributes the traffic over the paths based on the weight configured on the paths. If none of the paths have weights configured then the weights default to 1 making it an ECMP path. The paths become weighted ECMP if the at least one of the paths have a non-zero weight. In both cases, when one or some of the paths fail, the PFE automatically re-balances the traffic over the remaining paths resulting in path protection.

**weight weight\_value**—Specify a percentage of the bandwidth with respect to the sum of weights of all paths for the primary segment list. If forwarding interfaces are also configured with weighted ECMP, then Junos OS applies hierarchical weighted ECMP. If the weight percentage is not configured, then only IGP weights are applied on the forwarding interfaces.

**secondary**—Specify a secondary path for the non-colored static segment routing LSP. In case, all the primary paths fail then the traffic gets switched to the secondary path.

**sr-preference**—Configure a preference for segment routing routes for traffic engineering. BGP chooses a higher preference over a lower preference value.

**Range:** 0 through 4,294,967,295

**to**—Specify the IP address of the tunnel end-point

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details..

## splitting-merging

---

<b>Syntax</b>	<pre>splitting-merging {     maximum-member-lsps <i>number</i>;     maximum-signaling-bandwidth <i>bps</i>;     merging-bandwidth <i>bps</i>;     minimum-member-lsps <i>number</i>;     minimum-signaling-bandwidth <i>bps</i>;     normalization;     sampling;     splitting-bandwidth <i>bps</i>;     splitting-merging-threshold <i>percent</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls container-label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2. Statement introduced for QFX Series switches in Junos OS Release 15.1X53-D30.
<b>Description</b>	Perform splitting and merging.
<b>Options</b>	<p><b>maximum-member-lsps <i>number</i></b>—Number of label-switched paths (LSPs) that a container LSP can have as member LSPs at maximum. <b>Default:</b> 1</p> <p><b>maximum-signaling-bandwidth <i>bandwidth</i></b>—Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at maximum after normalization. When <b>maximum-signaling-bandwidth</b> is not configured, the value is derived from the <b>splitting-bandwidth</b>.</p> <p>When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the <b>splitting-bandwidth</b>. <b>Default:</b> 1 bps</p> <p><b>merging-bandwidth <i>bandwidth</i></b>—Amount of bandwidth in bits per second (bps) that is used for merging during normalization. <b>Default:</b> 1 bps</p> <p><b>minimum-member-lsps <i>number</i></b>—Number of LSPd that a container LSP can have as member LSPs at minimum. <b>Default:</b> 64</p> <p><b>minimum-signaling-bandwidth <i>bandwidth</i></b>—Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at minimum after normalization. When <b>minimum-signaling-bandwidth</b> is not configured, the value is derived from the <b>merging-bandwidth</b>.</p>

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the **merging-bandwidth**.

**Default:** 1 bps

**splitting-bandwidth *bandwidth***—Amount of bandwidth in bits per second (bps) that can be used for splitting during normalization.

**Default:** 1 bps

**splitting-merging-threshold *percent***—Percentage changes in aggregate bandwidth relevant for splitting and merging.

**Default:** 0%

## statistics (Protocols MPLS)

<b>Syntax</b>	<pre>statistics {   auto-bandwidth (MPLS Statistics);   file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;   interval <i>seconds</i>;   no-transit-statistics;   traffic-class-statistics;   transit-statistics-polling; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p> <p><b>traffic-class-statistics</b> option introduced in Junos OS Release 14.2.</p> <p>Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.</p>
<b>Description</b>	Enable MPLS statistics collection and reporting.
<b>Options</b>	<p><b>file <i>filename</i></b>—(Optional) Name of the file to receive the output. We recommend that you place MPLS tracing output in the file <code>mpls-stat</code> in the <code>/var/log</code> directory.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <i>file</i> reaches its maximum size, it is renamed <i>file.0</i>, then <i>file.1</i>, and so on, until the maximum number of files is reached. Then, the oldest file is overwritten.</p> <p><b>Range:</b> 2 or more</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>interval <i>seconds</i></b>—Interval at which to periodically collect statistics.</p> <p><b>Range:</b> 1 through 65,535</p> <p><b>Default:</b> 300 seconds</p> <p><b>no-world-readable</b>—(Optional) Prevent users from reading the log file.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a file named <i>file</i> reaches this size, it is renamed <i>file.0</i>. When the <i>file</i> again reaches its maximum size, <i>file.0</i> is renamed <i>file.1</i> and <i>file</i> is renamed <i>file.0</i>. This renaming scheme continues until the maximum number of files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum file size, you also must specify a maximum number of files with the <b>files</b> option.</p> <p><b>world-readable</b>—(Optional) Enable users to read the log file.</p>

**Syntax:** Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**traffic-class-statistics**—(Optional) Create counters that maintain data traffic statistics per traffic class at the ingress of all types of LSPs and egress of ultimate hop popping (UHP) point-to-point LSPs. These counters are not created by default and are required to be configured to perform traffic-class-scoped loss measurement.

**transit-statistics-polling**—(Optional) Enable the polling and display of MPLS statistics for LSPs transiting the router. By default, RSVP does not periodically poll for transit LSP statistics. You cannot configure this statement and the **no-transit-statistics** statement at the same time.

The remaining statements are explained separately. See [CLI Explorer](#).

<b>Required Privilege</b>	routing and trace—To view this statement in the configuration.
<b>Level</b>	routing-control and trace-control—To add this statement to the configuration.

## swap

<b>Syntax</b>	<code>swap out-label;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i> ], [edit protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Remove the label at the top of the label stack and replace it with the specified label. Manually assigned incoming labels can have values from 1,000,000 through 1,048,575. This statement is used to configure static LSPs at transit routers.
<b>Options</b>	<b>out-label</b> —Manually assigned outgoing label value. <b>Range:</b> 0 through 1,048,575 <b>Default:</b> If you do not define the <b>out-label</b> option, the original label value remains unchanged.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">pop on page 2108</a></li> <li>• <a href="#">push on page 2115</a></li> <li>• <a href="#">Configuring the Intermediate (Transit) and Egress Routers for Static LSPs on page 471</a></li> </ul>

## switch-away-lsps

---

<b>Syntax</b>	switch-away-lsps;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-systems-name</i> protocols mpls interface <i>interface-name</i> ], [edit protocols mpls interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	<p>(MX Series routers only) Enable you to switch an LSP away from a network node using a bypass LSP. This feature could be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic. Configure this statement only after you have configured and committed the <b>always-mark-connection-protection-tlv</b> statement.</p> <p>The <b>always-mark-connection-protection-tlv</b> statement marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. When you configure the <b>switch-away-lsps</b> statement, traffic is switched to the bypass LSP.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Switching LSPs Away from a Network Node on page 654</a></li></ul>

---

## switching-type

---

<b>Syntax</b>	switching-type (fiber   lambda   psc-1   tdm);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> lsp-attributes], [edit protocols mpls label-switched-path <i>lsp-name</i> lsp-attributes]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the switching method for the LSP. The switching method can be one of the following values: <ul style="list-style-type: none"><li>• <b>fiber</b>—Fiber switching</li><li>• <b>lambda</b>—Lambda switching</li><li>• <b>psc-1</b>—Packet switching</li><li>• <b>tdm</b>—Time-division multiplexing (TDM) switching</li></ul>
<b>Default</b>	psc-1
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MPLS LSPs for GMPLS on page 1085</a></li></ul>

## sync-active-path-bandwidth

<b>Syntax</b>	<code>sync-active-path-bandwidth;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls],  [edit logical-systems <i>logical-system-name</i> protocols mpls <b>label-switched-path</b> <i>lsp-name</i>],  [edit logical-systems <i>logical-system-name</i> protocols mpls <b>label-switched-path</b> <i>lsp-name</i> <b>auto-bandwidth (MPLS Tunnel)</b>],  [edit logical-systems <i>logical-system-name</i> protocols mpls <b>label-switched-path</b> <i>lsp-name</i> (<b>primary</b>   <b>secondary</b>) <i>path-name</i>],  [edit protocols mpls],  [edit protocols mpls <b>label-switched-path</b> <i>lsp-name</i>],  [edit protocols mpls <b>label-switched-path</b> <i>lsp-name</i> <b>auto-bandwidth (MPLS Tunnel)</b>],  [edit protocols mpls <b>label-switched-path</b> <i>lsp-name</i> (<b>primary</b>   <b>secondary</b>) <i>path-name</i>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2.
<b>Description</b>	<p>When you have a primary and a secondary path configuration, specify that a path needs to be signaled with the active-path bandwidth when the auto-bandwidth adjustment happens and that the secondary path synchronizes the bandwidth reservations to that of the primary path.</p> <p>When a primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. If you include the <b>sync-active-path-bandwidth</b> statement, the secondary path releases the bandwidth it has reserved and adjusts its bandwidth after the primary path begins carrying traffic.</p> <p>For example, suppose the active path is a secondary path with a reserved bandwidth of 10 GB as a result of the automatic bandwidth adjustment. Then suppose there is a switchover from the secondary path to the primary path. After some time the primary path reserves 5 GB as a result of a new automatic adjustment. Without the <b>sync-active-path-bandwidth</b> statement, the secondary path does not release the 10 GB after a switchover occurs. That bandwidth is wasted. If the <b>sync-active-path-bandwidth</b> is included in the configuration, the secondary path adjusts its bandwidth to 5 GB along with the primary path.</p>
<b>Default</b>	When you have a primary and a secondary path configuration, and the primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. When the primary path comes back and the traffic switches over, the secondary path does not release its bandwidth reservations.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Disabling Constrained-Path LSP Computation on page 376</a></li> <li>• <a href="#">Configuring Explicit-Path LSPs on page 498</a></li> </ul>

## te-class-matrix

<b>Syntax</b>	<pre> te-class-matrix {     tenumber {         priority <i>priority</i>;         traffic-class {             ctnumber <i>priority priority</i>;         }     } } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls diffserv-te], [edit protocols mpls diffserv-te]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the traffic engineering class matrix for a multiclass LSP or a DiffServ-aware traffic engineering LSP.
<b>Default</b>	<p>The default traffic engineering class matrix is:</p> <pre> te-class-matrix {     te0 traffic-class ct0 priority 7;     te1 traffic-class ct1 priority 7;     te2 traffic-class ct2 priority 7;     te3 traffic-class ct3 priority 7;     te4 traffic-class ct0 priority 0;     te5 traffic-class ct1 priority 0;     te6 traffic-class ct2 priority 0;     te7 traffic-class ct3 priority 0; } </pre> <p>If you define any of the traffic engineering classes, all the default values are dropped.</p>
<b>Options</b>	<p><b>ctnumber</b>—Specify the number of the class type. It can be one of four values: <b>ct0</b>, <b>ct1</b>, <b>ct2</b>, or <b>ct3</b>.</p> <p><b>priority <i>priority</i></b>—Specify the priority of the class type. It can be one of eight values from 0 through 7.</p> <p><b>tenumber</b>—Specify the number of the traffic engineering class. It can be one of eight values: <b>te0</b>, <b>te1</b>, <b>te2</b>, <b>te3</b>, <b>te4</b>, <b>te5</b>, <b>te6</b>, or <b>te7</b>. You must configure the traffic engineering classes in order, starting with <b>te0</b>.</p> <p><b>traffic-class</b>—Specify the traffic class for the traffic engineering class.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

[edit protocols mpls static-label-switched-path *lsp-name* ingress]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  
Support for IPv6 addresses in static LSP configurations are provided in Junos OS Release 17.2R1.

**Description** Specify the egress router of a dynamic LSP.

**Options** *address*—IPv4 or IPv6 address of the egress router.

**NOTE:** IPv6 static LSPs are not supported at the [edit protocols mpls static-label-switched-path *lsp-name* ingress] hierarchy level.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** • [Configuring the Egress Router Address for LSPs on page 392](#)

## traceoptions (Protocols MPLS)

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls],          [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>],          [edit protocols mpls],          [edit protocols mpls label-switched-path <i>lsp-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.          Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  <b>ted-export</b> option introduced in Junos OS Release 14.2.  <b>ted-import</b> option introduced in Junos OS Release 14.2.  <b>lsp-history</b> option added in Junos OS Release 15.1.</p>
<b>Description</b>	<p>Configure MPLS tracing options at the protocol level or for a label-switched path.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>
<b>Default</b>	<p>The default MPLS protocol-level tracing options are inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.</p>
<b>Options</b>	<p><b>filename</b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <b>/var/log</b>. We recommend that you place MPLS tracing output in the file <b>mpls-log</b>.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>MPLS Tracing Flags</b></p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations</li> <li>• <b>autobw-state</b>—Automatic bandwidth events.</li> <li>• <b>connection</b>—All circuit cross-connect (CCC) activity</li> </ul>

- **connection-detail**—Detailed CCC activity
- **cspf**—CSPF computations
- **cspf-link**—Links visited during CSPF computations
- **cspf-node**—Nodes visited during CSPF computations
- **error**—MPLS error packets
- **graceful-restart**—Trace MPLS graceful restart events
- **lsp-history**—Trace LSP history events
- **lsping**—Trace lsping packets and return codes
- **nsr-synchronization**—Trace NSR synchronization events
- **nsr-synchronization-detail**—Trace NSR synchronization events in detail
- **state**—All LSP state transitions
- **static**—Trace static label-switched path
- **ted-export**—Trace leaking of entries from **lsdist.0** table into the traffic engineering database
- **ted-import**—Trace leaking traffic engineering database entries into the **lsdist.0** table
- **timer**—Timer usage

**no-world-readable**—(Optional) Allow only certain users to read the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Allow any user to read the log file.

<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.

## traffic-class (delay)

<b>Syntax</b>	<pre>traffic-class <i>tc-value</i> {     average-sample-size <i>sample size</i>;     padding-size <i>size</i>;     query-interval <i>milliseconds</i>;     rtt-delay-threshold <i>rtt threshold value</i>;     twcd-delay-threshold <i>twcd threshold value</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit protocols mpls <a href="#">oam performance-monitoring querier delay</a>],  [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> <a href="#">oam performance-monitoring querier delay</a>],  [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> <a href="#">primary path-name</a> <a href="#">oam performance-monitoring querier delay</a>],  [edit protocols mpls <a href="#">label-switched-path</a> <i>lsp-name</i> <a href="#">secondary path-name</a> <a href="#">oam performance-monitoring querier delay</a>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1.
<b>Description</b>	<p>Configure traffic class specific options.</p> <p>Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the <i>tc-all tc-0 tc-1 tc-2 tc-3 tc-4 tc-5 tc-6 tc-7 tc-none</i> traffic-class values. For each traffic class, you can configure the respective parameters.</p> <p>To enable traffic-class parameters, configure the <b>traffic-class-statistics</b> configuration statement under the <b>[edit protocol mpls statistic]</b> hierarchy level.</p>
<b>Options</b>	<p><b>average-sample-size</b> <i>sample size</i>—(Optional) Specify the number of samples used for calculating the average of various metrics.  <b>Default:</b> 5  <b>Range:</b> 1 through 30</p> <p><b>padding-size</b> <i>size</i>—(Optional) Specify the delay-measurement message length, which is used to calculate the delay experienced by messages of different sizes.  <b>Default:</b> 0  <b>Range:</b> 1 through 1500</p> <p><b>query-interval</b> <i>milliseconds</i>—Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.  <b>Default:</b> 10 seconds  <b>Range:</b> 1000 through 4294967295 milliseconds</p> <p><b>rtt-delay-threshold</b> <i>rtt threshold value</i>—Specify the round-trip delay threshold value.  <b>Range:</b> 1 through 4294967295 microseconds</p> <p><b>twcd-delay-threshold</b> <i>twcd threshold value</i>—Specify the two-way channel delay threshold value.</p>

**Range:** 1 through 4294967295 microseconds

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Pro-Active Loss and Delay Measurements on page 207</a></li><li>• <a href="#">On-Demand Packet Loss and Delay Measurement for UHP LSPs Overview on page 182</a></li><li>• <a href="#">performance-monitoring (Protocols MPLS) on page 2101</a></li></ul>
------------------------------	---

## traffic-class (loss)

<b>Syntax</b>	<pre>traffic-class <i>tc-value</i> {     average-sample-size <i>sample size</i>;     loss-threshold <i>loss threshold value</i>;     loss-threshold-window <i>number of samples for loss threshold</i>;     measurement-quantity <i>bytes packets</i>;     query-interval <i>milliseconds</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit protocols mpls <a href="#">oam performance-monitoring querier loss</a>],          [edit protocols mpls <a href="#">label-switched-path lsp-name oam performance-monitoring querier loss</a>],          [edit protocols mpls <a href="#">label-switched-path lsp-name primary path-name oam performance-monitoring querier loss</a>],          [edit protocols mpls <a href="#">label-switched-path lsp-name secondary path-name oam performance-monitoring querier loss</a>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1.
<b>Description</b>	<p>Configure traffic class specific options.</p> <p>Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the <i>tc-all tc-0 tc-1 tc-2 tc-3 tc-4 tc-5 tc-6 tc-7 tc-none</i> traffic-class values. For each traffic class, you can configure the respective parameters.</p> <p>To enable traffic-class parameters, configure the <b>traffic-class-statistics</b> configuration statement under the <b>[edit protocol mpls statistic]</b> hierarchy level.</p>
<b>Options</b>	<p><b>average-sample-size <i>sample size</i></b>—(Optional) Specify the number of samples used for calculating the average of various metrics.  <b>Default:</b> 5  <b>Range:</b> 1 through 30</p> <p><b>loss-threshold <i>loss threshold value</i></b>—Specify the threshold value that will be used with <b>loss-threshold-window</b> to calculate the loss within specified window size.  <b>Range:</b> 1 through 4294967295</p> <p><b>loss-threshold-window <i>number of samples for loss threshold</i></b>—Specify the number of samples used for loss threshold calculation.  <b>Range:</b> 1 through 30</p> <p><b>measurement-quantity <i>bytes packets</i></b>—(Optional) Specify whether packet or byte loss is being measured at the querier.  <b>Default:</b> packets</p> <p><b>query-interval <i>milliseconds</i></b>—Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.  <b>Default:</b> 10 seconds</p>

**Range:** 1000 through 4294967295 milliseconds

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Pro-Active Loss and Delay Measurements on page 207</a></li><li>• <a href="#">On-Demand Packet Loss and Delay Measurement for UHP LSPs Overview on page 182</a></li><li>• <a href="#">performance-monitoring (Protocols MPLS) on page 2101</a></li></ul>
------------------------------	---

## traffic-class (loss-delay)

<b>Syntax</b>	<pre> traffic-class <i>tc-value</i> {     average-sample-size <i>sample size</i>;     loss-threshold <i>loss threshold value</i>;     loss-threshold-window <i>number of samples for loss threshold</i>;     measurement-quantity <i>bytes packets</i>;     padding-size <i>size</i>;     query-interval <i>milliseconds</i>;     rtt-delay-threshold <i>rtt threshold value</i>;     twcd-delay-threshold <i>twcd threshold value</i>; } </pre>
<b>Hierarchy Level</b>	<p>[edit protocols mpls <a href="#">oam performance-monitoring querier loss-delay</a>],  [edit protocols mpls <a href="#">label-switched-path lsp-name oam performance-monitoring querier loss-delay</a>],  [edit protocols mpls <a href="#">label-switched-path lsp-name primary path-name oam performance-monitoring querier loss-delay</a>],  [edit protocols mpls <a href="#">label-switched-path lsp-name secondary path-name oam performance-monitoring querier loss-delay</a>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1.
<b>Description</b>	<p>Configure traffic class specific options.</p> <p>Specify the traffic classes for which loss measurement has to be performed. This parameter takes one of the <i>tc-all tc-0 tc-1 tc-2 tc-3 tc-4 tc-5 tc-6 tc-7 tc-none</i> traffic-class values. For each traffic class, you can configure the respective parameters.</p> <p>To enable traffic-class parameters, configure the <b>traffic-class-statistics</b> configuration statement under the [edit protocol mpls statistic] hierarchy level.</p>
<b>Options</b>	<p><b>average-sample-size <i>sample size</i></b>—(Optional) Specify the number of samples used for calculating the average of various metrics.  <b>Default:</b> 5  <b>Range:</b> 1 through 30</p> <p><b>loss-threshold <i>loss threshold value</i></b>—Specify the threshold value that will be used with <b>loss-threshold-window</b> to calculate loss within specified window size.  <b>Range:</b> 1 through 4294967295</p> <p><b>loss-threshold-window <i>number of samples for loss threshold</i></b>—Specify the number of samples used for loss threshold calculation.  <b>Range:</b> 1 through 30</p> <p><b>measurement-quantity <i>bytes packets</i></b>—(Optional) Specify whether packet or byte loss is being measured at the querier.  <b>Default:</b> packets</p>

**padding-size *size***—(Optional) Specify the delay-measurement message length, which is used to calculate the delay experienced by messages of different sizes.

**Default:** 0

**Range:** 1 through 1500

**query-interval *milliseconds***—Specify the minimum transmit interval, which signifies how often the loss measurement message is generated from the querier.

**Default:** 10 seconds

**Range:** 1000 through 4294967295 milliseconds

**rtt-delay-threshold *rtt threshold value***—Specify the round-trip delay threshold value.

**Range:** 1 through 4294967295 microseconds

**twcd-delay-threshold *twcd threshold value***—Specify the two-way channel delay threshold value.

**Range:** 1 through 4294967295 microseconds

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## traffic-engineering (Protocols MPLS)

<b>Syntax</b>	traffic-engineering (bgp   bgp-igp   bgp-igp-both-ribs   mpls-forwarding);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Select whether MPLS performs traffic engineering on BGP destinations only or on both BGP and IGP destinations. Affects only LSPs originating from this routing device, not transit or egress LSPs.
<b>Default</b>	bgp
<b>Options</b>	<p><b>bgp</b>—On BGP destinations only. Ingress routes are installed in the inet.3 routing table.</p> <p><b>bgp-igp</b>—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 routing table. If IGP shortcuts are enabled, the shortcut routes are automatically installed in the inet.0 routing table.</p> <p><b>bgp-igp-both-ribs</b>—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 and inet.3 routing tables. This option is used to support VPNs.</p> <p><b>mpls-forwarding</b>—On both BGP and IGP destinations. Use ingress routes for forwarding only, not for routing.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Traffic Engineering for LSPs on page 892</a></li> <li>• <a href="#">Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure) on page 66</a></li> </ul>

## traffic-engineering

---

<b>Syntax</b>	<pre>traffic-engineering {   disable; }</pre>
<b>Hierarchy Level</b>	[edit protocols ospf   isis]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Enable the traffic engineering features of the specified routing protocol.
<b>Default</b>	<p>Traffic engineering is disabled.</p> <p>Starting in Junos OS release 15.1, traffic engineering is enabled by default whenever the IS-IS protocol is enabled. You can disable it by including the <b>disable</b> statement at the <b>[edit protocols isis traffic-engineering]</b> hierarchy level. For the EX3300, EX4200, EX4500, EX4550, EX8200 and XRE200, you can disable traffic engineering starting in Junos OS release 15.1R7.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring MPLS on EX8200 and EX4500 Switches on page 42</a></li><li>• <a href="#">Configuring MPLS on Provider Edge EX8200 and EX4500 Switches Using Circuit Cross-Connect (CLI Procedure) on page 71</a></li><li>• <a href="#">Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure) on page 66</a></li><li>• <a href="#">Configuring MPLS on EX8200 and EX4500 Provider Switches (CLI Procedure) on page 75</a></li><li>• <a href="#">Configuring an OSPF Network (J-Web Procedure)</a></li><li>• <a href="#">MPLS Applications Feature Guide</a></li></ul>

## traffic-engineering (Protocols BGP)

<b>Syntax</b>	traffic-engineering { unicast; }
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp family],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> family],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> family],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp family],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> family],</p> <p>[edit protocols bgp family],</p> <p>[edit protocols bgp group <i>group-name</i> family],</p> <p>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i> family],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp family],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> family],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> family]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 14.2.</p> <p>Statement introduced on QFX5100 switches in Junos OS Release 15.1</p> <p>Statement introduced on QFX10000 switches in Junos OS Release 17.1.</p>
<b>Description</b>	<p>Enable traffic engineering address family. This generates a multiprotocol address family indicator (AFI) and a subsequent address family identifier (SAFI) to be negotiated with the BGP peers.</p> <p>The BGP network layer reachability information (NLRI) information is exchanged between the peers only when the traffic engineering AFI and SAFI are shared between them. If the peers do not agree on the use of the AFI and SAFI, the connection between the peers is terminated.</p>
<b>Options</b>	<b>unicast</b> —Include BGP-TE NLRI.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Link State Distribution Using BGP on page 914</a></li> </ul>

## transit-lsp-association

---

<b>Syntax</b>	<pre>transit-lsp-association <i>transit-association-lsp-group-name</i> {     from-1 <i>address-of-associated-lsp-1</i>;     from-2 <i>address-of-associated-lsp-2</i>;     lsp-name-1 <i>name-of-associated-lsp-1</i>;     lsp-name-2 <i>name-of-associated-lsp-2</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Associate two label-switched paths (LSPs) at a transit node to configure a path for sending and receiving GAL and G-Ach messages for MPLS-TP OAM.
<b>Options</b>	<p><i>transit-association-lsp-group-name</i>—Name of the transit association LSP group.</p> <p><i>from-1 address-of-associated-lsp-1</i>—Address of the first associated LSP.</p> <p><i>from-2 address-of-associated-lsp-2</i>—Address of the second associated LSP.</p> <p><i>lsp-name-1 name-of-associated-lsp-1</i>—Name of the first associated LSP.</p> <p><i>lsp-name-2 name-of-associated-lsp-1</i>—Name of the second associated LSP.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring the MPLS Transport Profile for OAM on page 964</a></li></ul>

## ultimate-hop-popping

<b>Syntax</b>	ultimate-hop-popping;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>label-switched-path-name</i> ], [edit protocols mpls], [edit protocols mpls label-switched-path <i>label-switched-path-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
<b>Description</b>	<p>Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.</p> <p>Be aware of the following platform requirements and restrictions:</p> <ul style="list-style-type: none"> <li>• UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.</li> <li>• UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.</li> <li>• UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.</li> <li>• UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.</li> <li>• UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the <i>no-tunnel-services</i> statement at the [edit routing-instances <i>routing-instance-name</i> protocols vpls] hierarchy level.</li> </ul>
<b>Default</b>	Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Ultimate-Hop Popping for LSPs on page 465</a></li> <li>• <a href="#">explicit-null on page 2012</a></li> </ul>

## vrf-table-label

<b>Syntax</b>	<pre>vrf-table-label {     source-class-usage;     static; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> ], [edit routing-instances <i>routing-instance-name</i> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for the <b>source-class-usage</b> statement added in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> <p>Statement introduced in Junos OS Release 15.1F5 and 16.1R2 for PTX5000 routers with third-generation FPCs installed.</p> <p>Statement introduced in Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers with third-generation FPCs.</p> <p>Statement introduced in Junos OS Release 16.1X65 and 17.2R1 for PTX1000 routers.</p> <p>Support for the <b>static</b> statement added in Junos OS Release 17.2.</p>
<b>Description</b>	<p>Map the inner label of a packet to a specific VPN routing and forwarding (VRF) instance. This allows the examination of the encapsulated IP header. The first lookup is done on the VPN label to determine which VRF instance to refer to, and the second lookup is done on the IP header to determine how to forward packets to the correct end hosts.</p> <p>When you include the <b>vrf-table-label</b> statement in the configuration of a VRF routing instance, a label-switched interface (LSI) logical interface label is created and mapped to the VRF routing table. Any routes in the VRF routing table are advertised with the LSI logical interface label allocated for the VRF routing table. When packets destined for the VRF routing instance arrive on a core-facing interface, they are treated as if the enclosed IP packet arrived on the LSI interface and are then forwarded and filtered based on the correct table.</p> <p>All routes in a VRF routing instance configured with this option are advertised with one label allocated per VRF.</p>

### NOTE:

- The **vrf-table-label** statement is supported on PTX5000 and PTX3000 routers only when third-generation FPCs are installed on the router and **enhanced-ip** command is configured on the chassis.
- Starting in Junos OS Release 17.2, you can configure the **enhanced-ip** command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability. The **vrf-table-label** space is increased to at least 16,000, if the platform can support the scale.

**Options** The remaining statements are explained separately.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

## admin-group

<b>Syntax</b>	<pre>admin-group {   exclude [ <i>group-names</i> ];   include-all [ <i>group-names</i> ];   include-any [ <i>group-names</i> ]; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>],</p> <p>[edit protocols rsvp interface <i>interface-name</i> link-protection],</p> <p>[edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	<p>Enable you to configure administrative groups for bypass label-switched paths (LSPs). You can configure administrative groups either globally for all bypass LSPs traversing an interface or for just a specific bypass LSP.</p>
<b>Options</b>	<p><b>exclude <i>group-names</i></b>—Specify the administrative groups to exclude for a bypass LSP.</p> <p><b>include-all <i>group-names</i></b>—Specify the administrative groups whose links the bypass LSP must traverse.</p> <p><b>include-any <i>group-names</i></b>—Specify the administrative groups whose links the bypass LSP can traverse.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Administrative Groups for Bypass LSPs on page 677</a></li> </ul>

## aggregate (Protocols RSVP)

---

<b>Syntax</b>	(aggregate   no-aggregate);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp peer-interface <i>peer-interface-name</i> ], [edit protocols rsvp peer-interface <i>peer-interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Control the use of RSVP aggregate messages on an interface or peer interface, as described below.</p> <p>Note that starting in Junos OS Release 15.2, this statement has been deprecated at the [edit protocols rsvp interface <i>interface-name</i>] and [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i>] hierarchy levels for MX Series and PTX Series routers.</p> <ul style="list-style-type: none"><li>• <b>aggregate</b>—Use RSVP aggregate messages.</li><li>• <b>no-aggregate</b>—Do not use RSVP aggregate messages.</li></ul> <p>Aggregate messages can pack multiple RSVP messages into a single transmission, thereby reducing network overhead and enhancing efficiency. The number of supportable sessions and processing overhead are significantly improved when aggregation is enabled.</p> <p>Not all routers connected to a subnet need to support aggregation simultaneously. Each RSVP router negotiates its intention to use aggregate messages on a per-neighbor basis. Only when both routers agree are aggregate messages sent.</p> <p>To have refresh reduction and reliable delivery, you must include the <b>aggregate</b> and <b>reliable</b> statements.</p>
<b>Default</b>	Aggregation is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RSVP Refresh Reduction on page 641</a></li><li>• <a href="#">reliable on page 2218</a></li></ul>

## authentication-key (Protocols RSVP)

<b>Syntax</b>	<code>authentication-key key;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rsvp peer-interface <i>peer-interface-name</i>],</code> <code>[edit protocols rsvp],</code> <code>[edit protocols rsvp interface <i>interface-name</i>],</code> <code>[edit protocols rsvp peer-interface <i>peer-interface-name</i>]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Authentication key (password). Neighboring routers use the password to verify the authenticity of packets sent from this interface or peer interface. To authenticate node hellos or remote messages between the Point of Local Repair (PLR) to the Merge Point (MP), enable <b>authentication-key</b> at the <b>[edit protocols rsvp]</b> hierarchy level.</p> <p>RSVP uses HMAC-MD5 authentication, which is defined in RFC 2104, <i>HMAC: Keyed-Hashing for Message Authentication</i>.</p> <p>All routers that are connected to the same IP subnet must use the same authentication scheme and password.</p>
<b>Options</b>	<p><b>key</b>—Authentication password. It can be 1 through 16 contiguous digits or letters. Separate decimal digits with periods. Separate hexadecimal digits with periods and precede the string with 0x. If you include spaces in the password, enclose the entire password in quotation marks (" ").</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RSVP Authentication on page 643</a></li> </ul>

## bandwidth (Protocols RSVP)

---

<b>Syntax</b>	<code>bandwidth <i>bps</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i></code> <code>link-protection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i></code> <code>link-protection bypass <i>bypass-name</i>],</code> <code>[edit protocols rsvp interface <i>interface-name</i>],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>For certain logical interfaces (such as Asynchronous Transfer Mode [ATM], Permanent Virtual Circuit [PVC], or Frame Relay), you cannot determine the correct bandwidth from the hardware. This statement enables you to specify the actual available bandwidth.</p> <p>This statement also enables you to specify the bandwidth for a bypass label switched path (LSP). If you have configured multiple bypasses, this statement is mandatory and is applied to all of the bypass LSPs.</p>
<b>Default</b>	The hardware raw bandwidth is used.
<b>Options</b>	<p><b><i>bps</i></b>—Bandwidth in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations <b>k</b> (for a thousand), <b>m</b> (for a million), or <b>g</b> (for a billion [also called a thousand million]).</p> <p><b>Range:</b> Any positive integer</p> <p><b>Default:</b> 0 (no bandwidth is reserved)</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Bandwidth for Bypass LSPs on page 677</a></li><li>• <a href="#">Configuring Link Protection on Interfaces Used by LSPs on page 675</a></li><li>• <a href="#">Configuring Bypass LSPs on page 676</a></li></ul>

## bypass (Signaled LSP)

<b>Syntax</b>	<pre> bypass <i>bypass-name</i> {   <b>bandwidth</b> <i>bps</i>;   <b>description</b> <i>text</i>;   <b>hop-limit</b> <i>number</i>;   <b>no-cspf</b>;   <b>path</b> <i>address</i> &lt;strict   loose&gt;;   <b>priority</b> <i>setup-priority reservation-priority</i>;   <b>to</b> <i>address</i>; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection],</p> <p>[edit protocols rsvp interface <i>interface-name</i> link-protection]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>The <b>description</b> option was added in Junos OS Release 10.4.</p>
<b>Description</b>	<p>Enables you to configure specific bandwidth and path constraints for a bypass LSP. It is possible to individually configure multiple bypass LSPs. If you do not configure the bypass LSPs individually, they all share the same path and bandwidth constraints.</p> <p>If you specify the <b>bandwidth</b>, <b>hop-limit</b>, and <b>path</b> statements for the bypass LSP, these values take precedence over the values configured at the [edit protocols rsvp interface <i>interface-name</i> link-protection] hierarchy level. The other attributes (<b>subscription</b>, <b>no-node-protection</b>, and <b>optimize-timer</b>) are inherited from the general constraints.</p>
<b>Options</b>	<p><b>bypass-name</b>—(Required) Specify a name for the bypass LSP. The name can be up to 64 characters.</p> <p><b>description</b>—Provides a textual description of the bypass LSP. Enclose any descriptive text that includes spaces in quotation marks (" "). Any descriptive text you include is displayed in the output of the <b>show mpls lsp bypass detail</b> command and has no effect on the operation of the bypass LSP. The description text can be no more than 80 characters in length.</p> <p><b>to address</b>—(Required) Specify the address for the interface of the immediate next-hop node (for link protection) or the next-next-hop node (for node-link protection). The address specified determines whether this is a link protection bypass or a node-link protection bypass. On multiaccess networks (for example, a LAN), this address is also used to specify which next-hop node is being protected.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

**Related Documentation** • [Configuring Bypass LSPs on page 676](#)

## **bypass (Static LSP)**

---

<b>Syntax</b>	<pre>bypass <i>bypass-name</i> {     bandwidth <i>bps</i>;     description <i>string</i>;     next-hop (<i>address</i>   <i>interface-name</i>   <i>address/interface-name</i>);     push <i>out-label</i>;     to <i>address</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 10.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Configure specific bandwidth and path constraints for a bypass ingress LSP. It is possible to configure multiple bypass LSPs individually. If you do not, they all share the same path and bandwidth constraints.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <a href="#">Configuring Static LSPs on page 468</a>

## chained-composite-next-hop

**Syntax** chained-composite-next-hop {  
     ingress;  
     transit;  
 }

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-options forwarding-table],  
 [edit routing-options forwarding-table]

**NOTE:** The [edit logical-systems] hierarchy level is not supported on the QFX10000 switches.

**Release Information** Statement introduced in Junos OS Release 12.1.  
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.  
 Statement introduced in Junos OS Release 15.1 for QFX10000 Series switches.

**Description** Allows you to configure the chained composite next hops for devices handling ingress or transit traffic in the network.

Chained composite next hops help to facilitate the handling of large volumes of transit traffic in the core of large networks by allowing the router to process much larger volumes of routes. A chained composite next hop allows the router to direct sets of routes sharing the same destination to a common forwarding next hop, rather than having each route also include the destination. In the event that a network destination is changed, rather than having to update all of the routes sharing that destination with the new information, just the shared forwarding next hop is updated with the new information. The chained composite next hops continue to point to this forwarding next hop which now contains the new destination.

On platforms containing only MPCs, such as PTX Series Packet Transport Routers, the MX80 router, the MX2020 router, and the QFX10000 switches, chained composite next hops are enabled by default. On MX Series 3D Universal Edge Routers containing both DPC and MPC FPCs and on T4000 Core Routers containing MPC and FPCs, chained composite next hops are disabled by default and need to be explicitly configured.

**NOTE:**

- Starting with Junos OS Release 13.3, for chained composite next hop feature to take effect for directly connected PE devices, the chassis must be configured to use the enhanced-ip option (in the case of MX Series 3D Universal Edge Routers containing both DPC and MPC FPCs) or the enhanced-mode option (in the case of T4000 Core Routers containing MPC and FPCs) in the network service mode, in addition to the l3vpn configuration.

For more information about configuring chassis network services, see the *Junos OS Administration Library*.

- On MX Series routers, removing the `chained-composite-next-hop` statement from a PE device configuration causes all IBGP sessions to be torn down and triggers the BGP session to flap as well. A similar change on a router configured as a route reflector does not have any effect, however.

The following is a sample system log message that is generated to record such an event:

```
Nov  6 15:16:21.670 host PE1: rpd[6947]: bgp_peer_mgmt_clear:5995:
NOTIFICATION sent to 10.0.100.2 (External AS 100): code 6 (Cease)
subcode 4 (Administratively Reset), Reason: Management session cleared
BGP neighbor
```

**NOTE:** Starting in Junos OS Release 14.1, the `transit l3vpn` statement is enabled by default on PTX Series Packet Transport Routers only.

The remaining statements are explained separately. See [CLI Explorer](#).

**Default** This statement is disabled by default.

**Options** `ingress`—Enable or disable composite chained next hop for ingress traffic.

`transit`—Enable or disable composite chained next hop for transit traffic.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** `routing`—To view this statement in the configuration.  
`routing-control`—To add this statement to the configuration.

## class-of-service (Protocols RSVP)

<b>Syntax</b>	<code>class-of-service <i>cos-value</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>],</p> <p>[edit protocols rsvp interface <i>interface-name</i> link-protection],</p> <p>[edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</p>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Class-of-service (CoS) value given to all packets in the bypass LSP. You can specify a single CoS value for all the bypass LSPs traversing an interface. You can also configure CoS values for specific bypass LSPs traversing an interface.</p> <p>The CoS value might affect the scheduling or queuing algorithm of traffic traveling along an LSP.</p>
<b>Options</b>	<p><b><i>cos-value</i></b>—CoS value. A higher value typically corresponds to a higher level of service.</p> <p><b>Range:</b> 0 through 7</p> <p><b>Default:</b> If you do not specify a CoS value, the IP precedence bits from the packet's IP header are used as the packet's CoS value.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Class of Service for Bypass LSPs on page 678</a></li> </ul>

## destination-networks

---

<b>Syntax</b>	<code>destination-networks <i>prefix</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options dynamic-tunnels <i>tunnel-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-options dynamic-tunnels <i>tunnel-name</i> rsvp-te <i>entry</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-options dynamic-tunnels <i>tunnel-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> routing-options dynamic-tunnels <i>tunnel-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> routing-options dynamic-tunnels <i>tunnel-name</i> rsvp-te <i>entry</i>],</code> <code>[edit routing-options dynamic-tunnels <i>tunnel-name</i>],</code> <code>[edit routing-options dynamic-tunnels <i>tunnel-name</i> rsvp-te <i>entry</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	Specify the IPv4 prefix range for the destination network. Only tunnels within the specified IPv4 prefix range can be created.
<b>Options</b>	<i>prefix</i> —Destination prefix of the network.
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring GRE Tunnels for Layer 3 VPNs</i></li><li>• <i>Configuring Dynamic Tunnels</i></li><li>• <a href="#">Configuring RSVP Automatic Mesh on page 657</a></li></ul>

## devices

---

<b>Syntax</b>	<code>devices <i>device-names</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1.
<b>Description</b>	Specifies one of the virtual tunnel (VT) interfaces to de-encapsulate the egress traffic for ultimate-hop popping on point-to-multipoint LSPs. If no device is specified, the selection process is performed automatically.
<b>Default</b>	The device selection process is performed automatically if no device is configured. Junos OS selects one of the available VT interfaces to de-encapsulate the egress traffic.
<b>Options</b>	<b><i>device-names</i></b> —Specify which VT interfaces are used to handle the RSVP traffic. <b>Range:</b> 0 to 8 devices
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling Ultimate-Hop Popping on Point-to-Multipoint LSPs on page 664</a></li> <li>• <a href="#">Understanding Redundant Virtual Tunnel Interfaces in MBGP MVPNs</a></li> </ul>

## disable (Protocols RSVP)

---

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit logical-systems <i>logical-system-name</i> protocols rsvp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit logical-systems <i>logical-system-name</i> protocols rsvp peer-interface <i>peer-interface-name</i> ], [edit protocols rsvp], [edit protocols rsvp graceful-restart], [edit protocols rsvp interface <i>interface-name</i> ], [edit protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp peer-interface <i>peer-interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Explicitly disable RSVP or RSVP graceful restart. Explicitly disable link protection on the specified interface.
<b>Default</b>	RSVP is enabled on interfaces and peer interfaces configured with the RSVP <b>interface</b> statement. RSVP graceful restart is enabled on the router. Link protection is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Minimum RSVP Configuration on page 639</a></li><li>• <a href="#">Configuring RSVP Graceful Restart on page 686</a></li><li>• <a href="#">Configuring Link Protection on Interfaces Used by LSPs on page 675</a></li></ul>

## dynamic-bidirectional-transport

---

<b>Syntax</b>	<code>dynamic-bidirectional-transport {     template <i>template</i>; }</code>
<b>Hierarchy Level</b>	[edit protocols rsvp peer-interface <i>peer-interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2.
<b>Description</b>	Enable the dynamic setup of associated bidirectional packet LSP for transporting non-packet Generalized Multiprotocol Label Switching (GMPLS) label-switched path (LSP).
<b>Options</b>	<b>template <i>template</i></b> —Name of the template for the dynamic bidirectional packet LSP.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## fast-reroute (Protocols RSVP)

---

<b>Syntax</b>	<code>fast-reroute optimize-timer <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement added in Junos OS Release 7.5. Statement introduced in Junos OS Release 14.1 for the QFX Series.
<b>Description</b>	Configure the optimize timer for fast reroute. The optimize timer triggers a periodic optimization process that recomputes the fast reroute detour LSPs to use network resources more efficiently.
<b>Options</b>	<b><i>seconds</i></b> —Specify the number of seconds between fast reroute detour LSP optimizations. <b>Range:</b> 0 through 65,535 seconds <b>Default:</b> 0 (disabled)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Optimization Interval for Fast Reroute Paths on page 370</a></li> </ul>

## graceful-deletion-timeout

---

<b>Syntax</b>	<code>graceful-deletion-timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the time, in seconds, before completing graceful deletion of signaling.
<b>Options</b>	<b><i>seconds</i></b> —Time before completing graceful deletion of signaling. <b>Range:</b> 1 through 300 seconds <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Graceful Deletion Timeout Interval on page 1088</a></li></ul>

## graceful-restart (Protocols RSVP)

<b>Syntax</b>	<pre> graceful-restart {   disable;   helper-disable;   maximum-helper-recovery-time <i>seconds</i>;   maximum-helper-restart-time <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options], [edit protocols rsvp], [edit routing-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure graceful restart on the router. You must configure the <b>graceful-restart</b> statement at the [edit routing-options] hierarchy level to enable graceful restart on the router.
<b>Options</b>	<p><b>disable</b>—Disable graceful restart on the router or for RSVP.</p> <p><b>helper-disable</b>—Disable RSVP graceful restart helper mode (this option is only available at the [edit protocols rsvp] hierarchy level).</p> <p><b>Default:</b> Helper mode is enabled by default.</p> <p><b>maximum-helper-recovery-time <i>seconds</i></b>—The maximum length of time the router stores the state of neighboring routers when they undergo a graceful restart. The value applies to all neighboring routers, so it should be based on the time that the slowest RSVP neighbor requires for restart.</p> <p><b>Default:</b> 180 seconds</p> <p><b>Range:</b> 1 through 3600 seconds</p> <p><b>maximum-helper-restart-time <i>seconds</i></b>—The maximum length of time the router waits between when it discovers that a neighboring router has gone down and when it declares the neighbor down. This value is applied to all neighboring routers, so it should be based on the time that the slowest RSVP neighbor requires for restart.</p> <p><b>Default:</b> 20 seconds</p> <p><b>Range:</b> 1 through 1800 seconds</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RSVP Graceful Restart on page 686</a></li> </ul>

## hello-acknowledgements

---

<b>Syntax</b>	hello-acknowledgements;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-systems-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable hello messages from nonsession neighbors to be acknowledged with a hello acknowledgment message. Once hello acknowledgments are enabled, the router continues to acknowledge hello messages from any nonsession RSVP neighbors unless the interface itself goes down or the configuration is changed by an administrator.
<b>Default</b>	Hello acknowledgments are disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Hello Acknowledgments for Nonsession RSVP Neighbors on page 654</a></li></ul>

---

## hello-interval (Protocols RSVP)

---

<b>Syntax</b>	hello-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols rsvp peer-interface <i>peer-interface-name</i> ], [edit protocols rsvp interface <i>interface-name</i> ], [edit protocols rsvp peer-interface <i>peer-interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable the sending of hello packets on the interface.
<b>Options</b>	<b><i>seconds</i></b> —Length of time between hello packets. A value of 0 disables the sending of hello packets on the interface. <b>Range:</b> 1 through 60 seconds <b>Default:</b> 9 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the RSVP Hello Interval on page 643</a></li></ul>

## hop-limit

<b>Syntax</b>	<code>hop-limit <i>number</i>;</code>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path lsp-name</i> <i>fast-reroute</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path lsp-name</i> (<i>primary</i>   <i>secondary</i>) <i>path-name</i>], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>], [edit protocols mpls], [edit protocols mpls <i>label-switched-path lsp-name</i>], [edit protocols mpls <i>label-switched-path lsp-name</i> <i>fast-reroute</i>], [edit protocols mpls <i>label-switched-path lsp-name</i> (<i>primary</i>   <i>secondary</i>) <i>path-name</i>], [edit protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Specify the maximum number of routers that an LSP can traverse. This limit can be applied to any of the following:</p> <ul style="list-style-type: none"> <li>LSPs—The configured hop limit includes the ingress and egress routers. You can specify a hop limit for an LSP and for both primary and secondary paths.</li> <li>Fast reroute detour—Specify the number of additional routers a fast reroute detour can traverse relative to the protected LSP. For example, if an LSP traverses 4 routers, any detour for the LSP can be no more than 10 router hops, including the ingress and egress routers.</li> <li>Link protection bypass—Specify the maximum number of routers that a link protection bypass can traverse.</li> </ul>
<b>Options</b>	<p><b><i>number</i></b>—Maximum number of hops.</p> <p><b>Range:</b> 2 through 255 (for an LSP or for a link protection bypass); 0 through 255 (for fast reroute)</p> <p><b>Default:</b> 255 (for an LSP or for a link protection bypass); 6 (for fast reroute)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## keep-multiplier

---

<b>Syntax</b>	<code>keep-multiplier <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Specify a value used by RSVP to calculate timer values for network outages, and declare that a reservation or a neighbor is down. It indicates the number of messages that can be lost before a particular state is declared stale and must be deleted. The keep multiplier directly affects the lifetime of an RSVP state.</p> <p>Starting in Junos OS Release 16.1, for MX Series routers and PTX Series routers, the default RSVP message refresh time, to which this multiplier is applied, has increased from 30 seconds to 20 minutes. The higher message refresh time provides support for RSVP Refresh Reduction Extensions, and improved scaling for MPLS traffic-engineered LSPs, as defined in RFC 2961. The changes are backward compatible so if any nodes in the two-hop neighborhood do not support the higher refresh time, the updated node will automatically fall back to the previous default refresh time to prevent error or tear down messages.</p>
<b>Options</b>	<p><i>number</i>—Multiplier value.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 3</p>
	<hr/> <div> <b>NOTE:</b> For MX Series routers and PTX Series routers (running Junos OS release 16.1 or later), this multiplier is applied to a default refresh time of 20 minutes. In earlier Junos OS releases, and for other platforms, the default refresh time remains 30 seconds.</div> <hr/>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Timers for RSVP Refresh Messages on page 658</a></li></ul>

## label-switched-path-template (Multicast)

<b>Syntax</b>	<pre>label-switched-path-template {   (default-template   <i>lsp-template-name</i>); }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> provider-tunnel rsvp-te],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> provider-tunnel ingress-replication label-switched-path],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> provider-tunnel selective group <i>address</i> source <i>source-address</i> rsvp-te],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options dynamic-tunnels <i>tunnel-name</i> rsvp-te <i>entry-name</i>],</p> <p>[edit protocols mvpn inter-region-segmented template <i>template-name</i> region <i>region-name</i> ingress-replication label-switched-path],</p> <p>[edit protocols mvpn inter-region-segmented template <i>template-name</i> region <i>region-name</i> rsvpe-te],</p> <p>[edit protocols mvpn inter-region-template template <i>template-name</i> all-regions ingress-replication label-switched-path],</p> <p>[edit protocols mvpn inter-region-template template <i>template-name</i> all-regions rsvp-te],</p> <p>[edit routing-instances <i>routing-instance-name</i> provider-tunnel ingress-replication label-switched-path],</p> <p>[edit routing-instances <i>routing-instance-name</i> provider-tunnel rsvp-te],</p> <p>[edit routing-instances <i>routing-instance-name</i> provider-tunnel selective group <i>address</i> source <i>source-address</i> rsvp-te],</p> <p>[edit routing-options dynamic-tunnels <i>tunnel-name</i> rsvp-te <i>entry-name</i>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	<p>Specify the LSP template. An LSP template is used as the basis for other dynamically generated LSPs. This feature can be used for a number of applications, including point-to-multipoint LSPs, flooding VPLS traffic, configuring ingress replication for IP multicast using MBGP MVPNs, and to enable RSVP automatic mesh. There is no default setting for the <b>label-switched-path-template</b> statement, so you must configure either the default-template using the <b>default-template</b> option, or you must specify the name of your preconfigured LSP template.</p>
<b>Options</b>	<p><b>default-template</b>—Specify that the default LSP template be used for the dynamically generated LSPs.</p> <p><b><i>lsp-template-name</i></b>—Specify the name of an LSP to be used as a template for the dynamically generated LSPs.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Ingress Replication for IP Multicast Using MBGP MVPNs</i></li> </ul>

## link-protection (RSVP)

```
Syntax  link-protection {
        disable;
        admin-group {
            exclude [ group-names ];
            include-all [ group-names ];
            include-any [ group-names ];
        }
        bandwidth bps;
        bypass bypass-name {
            bandwidth bps {
                ct0 bps;
                ct1 bps;
                ct2 bps;
                ct3 bps;
            }
            description text;
            class-of-service cos-value;
            hop-limit number;
            no-cspf;
            path address <strict | loose>;
            priority setup-priority reservation-priority;
            to address;
        }
        class-of-service cos-value;
        hop-limit number;
        max-bypasses number;
        no-cspf;
        no-node-protection;
        optimize-timer seconds;
        path address <strict | loose>;
        priority setup-priority reservation-priority;
        subscription percentage;
    }
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols rsvp interface *interface-name*],  
[edit protocols rsvp interface *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.

**Description** Enable link protection on the specified interface. Using link protection, you can configure a network to reroute traffic quickly around broken links. To fully enable link protection, you also need to configure the **link-protection** statement at the [edit protocols mpls label-switched-path *lsp-name*] hierarchy level. You can configure single or multiple bypasses for protected interface.

**Default** Link protection is disabled.

**Options**    **no-node-protection**—Disable node-link protection on the RSVP interface. Link protection remains active. When this option is configured, the router can only initiate a next-hop bypass, not a next-next-hop bypass.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring Link Protection on Interfaces Used by LSPs on page 675](#)  
   • [link-protection \(Dynamic LSPs\) on page 2046](#)

---

## load-balance (Protocols RSVP)

---

**Syntax**    load-balance {  
                 bandwidth;  
                 }

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols rsvp],  
                                 [edit protocols rsvp]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                                 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**    Load-balance traffic between RSVP LSPs.

**Options**    **bandwidth**—Load-balance traffic between RSVP LSPs based on the bandwidth configured for each LSP.

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring Load Balancing Across RSVP LSPs on page 656](#)

## max-bypasses

---

<b>Syntax</b>	<code>max-bypasses <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> ], [edit protocols rsvp interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Range modified in Junos OS Release 9.3.
<b>Description</b>	Specify the maximum number of dynamic bypass LSPs permitted for protecting this interface. When this option is configured, multiple bypasses for link protection are enabled. Call admission control (CAC) is also enabled. The limit on bypasses configured applies only to dynamically generated bypass LSPs. By default, this option is disabled and only one dynamic bypass LSP is enabled for each interface. If you configure <b>max-bypasses</b> , you must also configure the <b>bandwidth</b> statement.
<b>Options</b>	<p><b>number</b>—Configure the maximum number of bypass LSPs. If you configure a value of 0, no dynamic bypass LSPs are allowed to be established for the interface. Only static bypass LSPs can be configured.</p> <p><b>Range:</b> 0 through 99</p> <p><b>Default:</b> 1</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Maximum Number of Bypass LSPs on page 679</a></li> </ul>

## no-local-reversion

---

<b>Syntax</b>	local-reversion; no-local-reversion;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4.
<b>Description</b>	Disable RSVP local revertive mode as specified in RFC 4090, <i>Fast Reroute Extensions to RSVP-TE for LSP Tunnels</i> .

**NOTE:** For Junos OS Release 16.1 running on MX Series or PTX Series routers, **no-local-reversion** is enabled by default, that is, local reversion is not running, and the statement has been deprecated. To enable local reversion, use the **local-reversion** statement.

---

RSVP local revertive mode is supported on all Juniper Networks routers running Junos OS. It is the default behavior. If you include this statement, the Juniper Networks router uses global revertive mode instead. You might need to disable RSVP local revertive mode on Juniper Networks routers if your network includes equipment that does not support this mode.

The following information can also be found in RFC 4090. Refer to the RFC for additional information. When an LSP fails, the connection can be repaired locally using a traffic protection mechanism such as fast reroute. To restore the LSP to a full working path, RFC 4090 specifies the following strategies:

- Local revertive mode—Upon detecting that the path is restored, the point of local repair (PLR) resignals each of the LSPs that were formerly routed over the restored path. Every LSP successfully resignaled along the restored path is switched back.
- Global revertive mode—The ingress router of each tunnel is responsible for reoptimizing the LSPs that used the failed path. There are several potential reoptimization triggers: RSVP error messages, inspection of OSPF LSAs or IS-IS LSPs, and timers. This re-optimization process can proceed as soon as the failure is detected. It is not tied to the restoration of the failed path.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
---------------------------------	---

## node-hello

<b>Syntax</b>	(node-hello   no-node-hello);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Enable node-ID based RSVP hellos globally on all of the RSVP interfaces on the router to allow Juniper Networks routers to interoperate with the equipment of other vendors. By default, the Junos OS uses interface-based RSVP hellos; node-ID based RSVP hellos are disabled. If you have not enabled RSVP node IDs on the router, Junos OS does not accept any node-ID hello packets.</p> <p>.....</p> <p> <b>NOTE:</b> For Junos OS Release 16.1 running on MX Series or PTX Series routers, when using enhanced FRR, node-ID based hellos are enabled by default. Disabling the enhanced fast reroute (FRR) profile by using the <a href="#">no-enhanced-frr-bypass</a> command also disables the node-hello command. To re-enable node hellos after the enhanced FRR profile has been disabled, use the node-hello command.</p> <p>.....</p> <p> <b>NOTE:</b> If <a href="#">link-protection</a> is enabled, remote node hellos that are initiated by the Point of Local Repair (PLR) to Node Protecting Merge Point (NP-MP) are enabled automatically. Similarly, if <a href="#">no-enhanced-frr-profile</a> is enabled (that is, enhanced FRR is off), remote node hellos are automatically disabled. There is no command to explicitly enable or disable remote-node hellos.</p> <p>.....</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RSVP Node-ID Hellos on page 645</a></li> <li>• <a href="#">no-enhanced-frr-bypass on page 2209</a></li> </ul>

## no-adjacency-down-notification (Protocols IS-IS)

---

<b>Syntax</b>	no-adjacency-down-notification;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i> ], [edit protocols isis interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0.
<b>Description</b>	<p>Disable adjacency down notification for IS-IS to allow for migration from IS-IS to OSPF without disruption of the RSVP neighbors and associated RSVP-signaled label-switched paths (LSPs).</p> <p>Whenever IS-IS is deactivated, the IS-IS adjacencies are brought down. IS-IS signals to RSVP to bring down any RSVP neighbors associated with the IS-IS adjacencies, and this further causes the associated LSPs signaled by RSVP to go down as well.</p> <p>A similar process occurs whenever OSPF is deactivated. The OSPF neighbors are brought down. OSPF signals to RSVP to bring down any of the RSVP neighbors associated with the OSPF neighbors, and this further causes the associated LSPs signaled by RSVP to go down as well.</p> <p>If you need to migrate from IS-IS to OSPF or from OSPF to IS-IS, the internal gateway protocol (IGP) notification to RSVP for an adjacency or neighbor down event needs to be ignored. Using the <b>no-adjacency-down-notification</b> or <b>no-neighbor-down-notification</b> statements, you can disable IS-IS adjacency down notification or OSPF neighbor down notification, respectively, until the migration is complete. The network administrator is responsible for configuring the statements before the migration, and then removing them from the configuration afterward, so that IGP notification can function normally.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">no-neighbor-down-notification on page 2207</a></li></ul>

---

## no-cspf (Protocols RSVP)

---

<b>Syntax</b>	no-cspf;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i> ], [edit protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.5.
<b>Description</b>	Disable CSPF computation on all bypass LSPs or on a specific bypass LSP. You need to disable CSPF for link protection to function properly on interarea paths.
<b>Default</b>	CSPF is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Disabling CSPF for Bypass LSPs on page 679</a></li></ul>

## no-interface-hello

---

<b>Syntax</b>	no-interface-hello;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Explicitly disable RSVP interface hellos globally on the router.

**NOTE:** For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling RSVP interface hellos globally, the **no-interface-hello** command triggers a switch back to the previous profile for all label-switched paths (LSPs.)

---

This type of configuration might be necessary in networks where the Juniper Networks router has numerous RSVP connections with equipment from other vendors. However, if you disable RSVP interface hellos globally, you can also configure a hello interval on an RSVP interface using the **hello-interval** statement. This configuration disables RSVP interface hellos globally but enables RSVP interface hellos on the specified interface. This configuration might be necessary in a heterogeneous network where some devices support RSVP node-ID hellos and other devices support RSVP interface hellos.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RSVP Node-ID Hellos on page 645</a></li><li>• <a href="#">hello-interval (Protocols RSVP) on page 2191</a></li></ul>

## no-neighbor-down-notification

<b>Syntax</b>	no-neighbor-down-notification;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ospf area <i>area-id</i> interface <i>interface-name</i> ], [edit protocols ospf area <i>area-id</i> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0.
<b>Description</b>	Disable neighbor down notification for OSPF to allow for migration from OSPF to IS-IS without disruption of the RSVP neighbors and associated RSVP-signaled LSPs.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## no-node-id-subobject

<b>Syntax</b>	no-node-id-subobject;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Disable the record route object (RRO) node-ID subobject for compatibility with earlier versions of Junos OS.

**NOTE:** For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling the record route object (RRO) node ID sub-object, the **no-node-id-subobject** command triggers a switch back to the previous profile for all label-switched paths (LSPs).

To interoperate with other vendors' equipment, Junos OS supports the RRO node-ID subobject for use in inter-AS link and node protection configurations.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
---------------------------------	---

## no-p2mp-sublsp

---

<b>Syntax</b>	no-p2mp-sublsp;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Reject Resv messages that include the S2L_SUB_LSP object. By default, Resv messages that include the S2L_SUB_LSP object are accepted. However, in a network which includes Juniper Networks devices running both Junos OS Release 9.2 and later and Junos OS Release 9.1 and earlier, it is necessary to configure the <b>no-p2mp-sublsp</b> statement on devices running Junos OS Release 9.2 and later to ensure that point-to-multipoint LSPs function properly.
<b>Default</b>	Resv messages that include the S2L_SUB_LSP object are accepted.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Preserving Point-to-Multipoint LSP Functioning with Different Junos OS Releases on page 552</a></li></ul>

---

## no-enhanced-frr-bypass (Protocols RSVP)

---

<b>Syntax</b>	no-enhanced-frr-bypass;
<b>Hierarchy Level</b>	[edit protocols <a href="#">rsvp</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 15.2R1.
<b>Description</b>	<p>Enable <b>no-enhanced-frr-bypass</b> to turn off all Fast reroute (FRR) facility protection enhancements, which includes improved LSP scaling and enhanced RSVP message handling, and reduce the default refresh time to 30 seconds.</p> <p>FRR is enabled by default for MX Series and PTX Series routers starting in Junos OS Release 15.2R1.</p>
<b>Default</b>	This feature, <b>no-enhanced-frr-bypass</b> , is disabled by default. That is, enhanced FRR is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RSVP Refresh Reduction on page 635</a></li></ul>

## node-link-protection (Protocols MPLS)

---

<b>Syntax</b>	node-link-protection;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> ], [edit protocols mpls label-switched-path <i>lsp-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
<b>Description</b>	Enable node and link protection on the specified LSP. To fully enable node and link protection, you also need to include the <b>link-protection</b> statement at the [edit protocols <b>rsvp</b> interface <i>interface-name</i> ] hierarchy level.
<b>Default</b>	Node and link protection is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Node Protection or Link Protection for LSPs on page 682</a></li><li>• <a href="#">MPLS Feature Support on QFX Series and EX4600 Switches on page 18</a></li><li>• <a href="#">Understanding Interprovider and Carrier-of-Carriers VPNs on page 1305</a></li></ul>

## optimize-timer (Protocols RSVP)

---

<b>Syntax</b>	<code>optimize-timer <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp interface <i>interface-name</i> link-protection]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure an optimize timer for a bypass LSP. The optimize timer initiates a periodic optimization process that reshuffles data LSPs among bypass LSPs to achieve the most efficient use of network resources. The optimization process attempts to either minimize the number of bypasses currently in use, minimize the total amount of bandwidth reserved for all bypasses, or both.
<b>Options</b>	<b><i>seconds</i></b> —Specify the number of seconds between optimizations. <b>Range:</b> 0 through 65,535 seconds <b>Default:</b> 0 (disabled)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Optimization Interval for Bypass LSPs on page 680</a></li> </ul>

## path (Protocols RSVP)

---

<b>Syntax</b>	<code>path address &lt;strict   loose&gt;;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure an explicit path (a sequence of strict or loose routes) to control where and how a bypass LSP is established. If multiple bypasses are configured, they all will use the same explicit path.
<b>Default</b>	No path is configured. CSPF automatically calculates the path the bypass LSP takes.
<b>Options</b>	<p><b>address</b>—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is <b>loose</b>. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.</p> <p><b>Default:</b> If you do not specify any routers explicitly, no routing limitations are imposed on the bypass LSP.</p> <p><b>loose</b>—(Optional) The next address in the <b>path</b> statement is loose. The LSP can traverse other routers before reaching this router.</p> <p><b>Default:</b> <b>strict</b></p> <p><b>strict</b>—(Optional) The LSP must go to the next address specified in the <b>path</b> statement without traversing other nodes. This is the default.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring an Explicit Path for Bypass LSPs on page 681</a></li></ul>

## peer-interface (Protocols RSVP)

---

<b>Syntax</b>	<pre>peer-interface <i>peer-interface-name</i> {   disable;   (aggregate   no-aggregate);   authentication-key <i>key</i>;   dynamic-bidirectional-transport template <i>template</i>;   hello-interval <i>seconds</i>;   (reliable   no-reliable); }</pre>
<b>Hierarchy Level</b>	[edit protocols rsvp]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>dynamic-bidirectional-transport template <i>template</i></b> option introduced in Junos OS Release 14.2.</p>
<b>Description</b>	<p>Configure the name of the LMP peer device.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RSVP and OSPF for LMP Peer Interfaces on page 1082</a></li> </ul>

## pop-and-forward (Protocols RSVP)

---

<b>Syntax</b>	<pre>pop-and-forward {   application-label depth <i>depth</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>name</i> protocols rsvp], [edit logical-systems <i>name</i> routing-instances <i>name</i> protocols rsvp], [edit protocols rsvp], [edit routing-instances <i>name</i> protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 18.1R1 on MX Series routers, PTX Series routers, and vMX.
<b>Description</b>	Specify RSVP pop-and-forward LSP tunnel-specific global parameters. The application label depth (AppLD) value must be configured uniformly across the RSVP-TE network.
<b>Options</b>	<b>application-label depth <i>depth</i></b> —Specify the maximum number of service labels. <b>Range:</b> 0 through 3 <b>Default:</b> 1
<b>Required Privilege Level</b>	routing
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RSVP-TE Pop-and-Forward LSP Tunnels Overview on page 613</a></li><li>• <a href="#">show rsvp pop-and-forward on page 2610</a></li><li>• <a href="#">pop-and-forward (Protocols MPLS) on page 2109</a></li></ul>

## preemption

---

<b>Syntax</b>	<pre>preemption {   (aggressive   disabled   normal);   soft-preemption {     cleanup-timer <i>seconds</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Control RSVP session preemption.
<b>Default</b>	normal
<b>Options</b>	<p><b>aggressive</b>—Preempt RSVP sessions whenever bandwidth is insufficient to handle all sessions. A session is preempted whenever bandwidth is lowered or a new higher-priority session is established.</p> <p><b>disabled</b>—Do not preempt RSVP sessions.</p> <p><b>normal</b>—Preempt RSVP sessions to accommodate new higher-priority sessions when bandwidth is insufficient to handle all sessions.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Preempting RSVP Sessions on page 659</a></li> </ul>

## priority (Protocols RSVP)

---

<b>Syntax</b>	<code>priority setup-priority reservation-priority;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>],</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the setup priority and reservation priority for a bypass LSP. If insufficient link bandwidth is available during session establishment, the setup priority is compared with other setup priorities for established sessions on the link to determine whether some of them should be preempted to accommodate the new session. The session with the lower-hold priority is preempted.
<b>Options</b>	<p><b>reservation-priority</b>—Reservation priority, used to keep a reservation after it has been set up. A smaller number has a higher priority. The priority must be greater than or equal to the setup priority to prevent preemption loops.</p> <p><b>Range:</b> 0 through 7, where 0 is the highest and 7 is the lowest priority.</p> <p><b>Default:</b> 0 (Once the session is set up, no other session can preempt it.)</p> <p><b>setup-priority</b>—Setup priority.</p> <p><b>Range:</b> 0 through 7, where 0 is the highest and 7 is the lowest priority.</p> <p><b>Default:</b> 7 (The session cannot preempt any existing sessions.)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Priority and Preemption for Bypass LSPs on page 682</a></li><li>• <a href="#">Configuring Priority and Preemption for LSPs on page 408</a></li></ul>

## refresh-time

---

<b>Syntax</b>	refresh-time <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Set the refresh time.
<b>Options</b>	<i>seconds</i> —Refresh time. <b>Range:</b> 1 through 65,535 <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Timers for RSVP Refresh Messages on page 658</a></li></ul>

## reliable

---

<b>Syntax</b>	(reliable   no-reliable);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols rsvp peer-interface <i>peer-interface-name</i> ], [edit protocols rsvp interface <i>interface-name</i> ], [edit protocols rsvp peer-interface <i>peer-interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Enable reliable message delivery on the interface.</p> <p>To have both refresh reduction and reliable delivery, enable both the <b>aggregate</b> and <b>reliable</b> statements.</p> <div><b>NOTE:</b> For Junos OS Release 16.1 running on MX Series or PTX Series routers, setting <b>no-reliable</b> on an interface automatically disables the fast reroute (FRR) scalability enhancements, including refresh reduction, for all label-switched paths (LSPs) traversing the interface.</div>
<b>Default</b>	This option, <b>reliable</b> , is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RSVP Refresh Reduction on page 641</a></li><li>• <a href="#">aggregate on page 2176</a></li><li>• <a href="#">no-enhanced-frr-bypass on page 2209</a></li></ul>

## rsvp

---

<b>Syntax</b>	rsvp;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols], [edit protocols]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	<p>Enable Resource Reservation Protocol (RSVP) signaling.</p> <p>You must include the <b>rsvp</b> statement in the configuration to enable RSVP on the router.</p> <p>The primary purpose of RSVP in Junos OS for EX Series switches is to support dynamic signaling within label switched paths (LSPs).</p>
<b>Default</b>	RSVP is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Minimum RSVP Configuration on page 639</a></li> <li>• <a href="#">Example: Configuring MPLS on EX8200 and EX4500 Switches on page 42</a></li> <li>• <a href="#">Configuring MPLS on Provider Edge EX8200 and EX4500 Switches Using Circuit Cross-Connect (CLI Procedure) on page 71</a></li> <li>• <a href="#">Configuring MPLS on EX8200 and EX4500 Provider Switches (CLI Procedure) on page 75</a></li> </ul>

## rsvp-te (Routing Options)

---

<b>Syntax</b>	<pre>rsvp-te entry-name {   destination-networks network-prefix;   label-switched-path-template (Multicast) {     default-template;     template-name;   } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-options dynamic-tunnels <i>tunnel-name</i> ], [edit routing-options dynamic-tunnels <i>tunnel-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
<b>Description</b>	Enable RSVP to automatically establish LSPs for any new PE router added to a full mesh of LSPs. To enable this feature, you must configure the <b>rsvp-te</b> statement on all of the PE routers in the full mesh.
<b>Options</b>	<b>entry-name</b> —Specify the entry for the RSVP tunnel.  The other options are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring RSVP Automatic Mesh on page 657</a></li><li>• <a href="#">Configuring Dynamic Point-to-Multipoint Flooding LSPs</a></li></ul>

## setup-protection

---

<b>Syntax</b>	setup-protection;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Description</b>	The facility-backup fast reroute mechanism can provide setup protection for LSPs which are in the process of being signaled. Both point-to-point LSPs and point-to-multipoint LSPs are supported. You should configure the <b>setup-protection</b> statement on each of the routers along the LSP path on which you want to enable LSP setup protection. You should also configure IGP traffic engineering on all of the routers on the LSP path.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RSVP Setup Protection on page 655</a></li> </ul>

## soft-preemption (Protocols RSVP)

---

<b>Syntax</b>	soft-preemption { cleanup-timer <i>seconds</i> ; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp preemption], [edit protocols rsvp preemption]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable soft preemption to attempt to establish a new path for a preempted LSP before tearing it down.
<b>Options</b>	<b>cleanup-timer</b> —A value of 0 disables soft preemption. <b>Range:</b> 0 through 180 seconds <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MPLS Soft Preemption on page 407</a></li> </ul>

## static-label-switched-path

```
Syntax  static-label-switched-path lsp-name {
        bypass bypass-name {
            bandwidth bps;
            description string;
            next-hop (address | interface-name | address/interface-name);
            push out-label;
            to address;
        }
        ingress {
            bandwidth bps;
            class-of-service cos-value;
            description string;
            install {
                destination-prefix <active>;
            }
            link-protection bypass-name name;
            metric metric;
            next-hop (address | interface-name | address/interface-name);
            node-protection bypass-name name next-next-label label;
            no-install-to-address;
            policing {
                filter filter-name;
                no-auto-policing;
            }
            preference preference;
            push out-label;
            to address;
        }
        transit incoming-label {
            bandwidth bps;
            description string;
            link-protection bypass-name name;
            next-hop (address | interface-name | address/interface-name);
            node-protection bypass-name name next-next-label label;
            pop;
            swap out-label;
        }
    }
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols mpls],  
[edit protocols mpls]

**Release Information** Statement introduced in Junos OS Release 10.1.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Configure a static LSP.

**Options** *lsp-name*—Name of the path.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring Static LSPs on page 468](#)

## subscription

**Syntax**

```
subscription percentage {
    ct0 percentage;
    ct1 percentage;
    ct2 percentage;
    ct3 percentage;
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols rsvp interface *interface-name*],  
 [edit logical-systems *logical-system-name* protocols rsvp interface *interface-name* link-protection],  
 [edit protocols rsvp interface *interface-name*],  
 [edit protocols rsvp interface *interface-name* link-protection]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Configure the amount of bandwidth subscribed to a class type (when you have enabled Differentiated Services) or bypass LSP (when you have enabled link protection).  
**subscription** is the percentage of the link bandwidth that can be used for the RSVP reservation process.

**Options** ***ctnumber percentage***—Percentage of the class-type bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type. You can specify bandwidth subscriptions for class types 0 through 3. This option is not available for bypass LSPs.

**Range:** 0 through 65,000

**Default:** 100 percent

***percentage***—Percentage of the class-type or bypass LSP bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type or bypass LSP.

**Range:** 0 through 65,000

**Default:** 100 percent

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

**Related Documentation**

## traceoptions (Protocols RSVP)

---

Syntax	<pre>traceoptions {     enhanced-frr ;     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Enable RSVP-level trace options.
Default	The default RSVP-level trace options are those inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.
Options	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>enhanced-frr</b> —(Optional) Enable this option to trace internal events and state changes related to the FRR facility protection enhancements associated with the increased RSVP scaling introduced in Junos OS Release 16.1.</p> <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place RSVP tracing output in the file <b>rsvp-log</b>.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations</li><li>• <b>error</b>—All detected error conditions</li><li>• <b>event</b>—RSVP-related events</li></ul>

- **io-event [detail] [disable]** —Enable tracing of events that occur within the RSVP I/O task; can only be configured for the master routing instance. The trace output is generally independent of routing instance.
- **io-packets [detail] [disable] [receive] [send]** —Enable tracing of messages as they are received from the network or as they are sent out. This flag can be configured independently for each routing instance. Both bundled and individual messages are identified. Use *detail* to show all objects contained in the message. Use *send* and *receive* to limit tracing to outgoing or incoming packets.
- **lmp**—RSVP-LMP interactions
- **packets**—All RSVP packets
- **path**—All path messages
- **pathtear**—PathTear messages
- **resv**—Resv messages
- **resvtear**—ResvTear messages
- **route**—Routing information
- **state**—Session state transitions, including when RSVP-signaled LSPs come up and go down.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-world-readable**—(Optional) Enable only certain users to read the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable any user to read the log file.

<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
---------------------------------	---

## transit

<b>Syntax</b>	<pre>transit <i>incoming-label</i> {     bandwidth <i>bps</i>;     description <i>string</i>;     link-protection bypass-name <i>name</i>;     next-hop (<i>address</i>   <i>interface-name</i>   <i>address/interface-name</i>);     node-protection bypass-name <i>name</i> next-next-label <i>label</i>;     pop;     stitch {         bandwidth <i>bps</i>;         description <i>string</i>;         link-protection bypass-name <i>name</i>;         next-hop (<i>address</i>   <i>interface-name</i>   <i>address/interface-name</i>);         node-protection bypass-name <i>name</i> next-next-label <i>label</i>;     }     swap <i>out-label</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i>], [edit protocols mpls static-label-switched-path <i>lsp-name</i>]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.1.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p> <p>Statement updated to include switch option in Junos OS Release 14.1X53-D25</p>
<b>Description</b>	Configure a transit static LSP.

**NOTE:** When configuring transit static LSPs with label operation as stitch, the configured next-hop can only be a valid IP address and not an interface name.

The remaining statements are explained separately. See [CLI Explorer](#).

<b>Options</b>	<p><i>incoming-label</i>—Incoming label value.</p> <p><b>Range:</b> 1000000 through 1048575</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Static LSPs on page 468</a></li> </ul>

## tunnel-services (RSVP)

---

<b>Syntax</b>	tunnel-services { <b>devices</b> <i>device-names</i> ; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable ultimate-hop popping on point-to-multipoint LSPs. The Junos OS selects one of the available virtual tunnel (VT) interfaces to de-encapsulate the egress traffic. By default, the selection process is performed automatically.
<b>Default</b>	Ultimate-hop popping is disabled.
<b>Options</b>	<b>devices</b> <i>device-names</i> —Specify which VT interfaces are used to handle the RSVP traffic. <b>Range:</b> 0 to 8 devices
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling Ultimate-Hop Popping on Point-to-Multipoint LSPs on page 664</a></li> </ul>

## ultimate-hop-popping

---

<b>Syntax</b>	ultimate-hop-popping;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>label-switched-path-name</i> ], [edit protocols mpls], [edit protocols mpls label-switched-path <i>label-switched-path-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
<b>Description</b>	<p>Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.</p> <p>Be aware of the following platform requirements and restrictions:</p> <ul style="list-style-type: none"><li>• UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.</li><li>• UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.</li><li>• UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.</li><li>• UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.</li><li>• UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the <i>no-tunnel-services</i> statement at the [edit routing-instances <i>routing-instance-name</i> protocols vpls] hierarchy level.</li></ul>
<b>Default</b>	Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Ultimate-Hop Popping for LSPs on page 465</a></li><li>• <a href="#">explicit-null on page 2012</a></li></ul>

## update-threshold

---

<b>Syntax</b>	<code>update-threshold <i>threshold</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> ], [edit protocols rsvp interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Adjust the threshold at which a change in bandwidth triggers an interior gateway protocol (IGP) update.
<b>Options</b>	<b><i>threshold</i></b> —Specify the percentage change in bandwidth to trigger an IGP update. <b>Range:</b> 1 through 20 percent <b>Default:</b> 10 percent
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the RSVP Update Threshold on an Interface on page 644</a></li></ul>

## allow-subnet-mismatch

---

<b>Syntax</b>	allow-subnet-mismatch;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i> ], [edit protocols ldp interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Ignore the LDP subnet check. For Junos OS Release 8.4 and later releases, an LDP source address subnet check was added for the neighbor establishment procedure. The source address in the LDP link hello packet is matched against the interface address.
<b>Default</b>	The source address in the LDP link hello packet is matched against the interface address.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Ignoring the LDP Subnet Check on page 878</a></li></ul>

## authentication-algorithm

**Syntax** authentication-algorithm *algorithm*;

**Release Information** Statement introduced in Junos OS Release 7.6.  
 Statement introduced for BGP in Junos OS Release 8.0.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.3.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure an authentication algorithm type.

**NOTE:** Keep the following points in mind when you configure the authentication algorithm in an IPsec proposal:

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, an error occurs and the tunnel is not established in this scenario. For example, if one end of the tunnel contains router 1 configured with the authentication algorithm as hmac-sha-256-128 and the other end of the tunnel contains router 2 configured with the authentication algorithm as hmac-md5-96, the VPN tunnel is not established.

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, and when one end of the tunnel contains two IPsec proposals to check whether a less secure algorithm is selected or not, an error occurs and the tunnel is not established. For example, if you configure two authentication algorithms for an IPsec proposal as `hmac-sha-256-128` and `hmac-md5-96` on one end of the tunnel, router 1, and if you configure the algorithm for an IPsec proposal as `hmac-md5-96` on the other end of the tunnel, router 2, the tunnel is not established and the number of proposals mismatch.
  - When you configure two IPsec proposals at both ends of a tunnel, such as the `authentication-algorithm hmac-sha-256-128` and `authentication-algorithm hmac-md5-96` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 1 (with the algorithms in two successive statements to specify the order), and the `authentication-algorithm hmac-md5-96` and `authentication-algorithm hmac-sha-256-128` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 2 (with the algorithms in two successive statements to specify the order, which is the reverse order of router 1), the tunnel is established in this combination as expected because the number of proposals is the same on both ends and they contain the same set of algorithms. However, the authentication algorithm selected is `hmac-md5-96` and not the stronger algorithm of `hmac-sha-256-128`. This method of selection of the algorithm occurs because the first matching proposal is selected. Also, for a default proposal, regardless of whether the router supports the Advanced Encryption Standard (AES) encryption algorithm, the `3des-cbc` algorithm is chosen and not the `aes-cfb` algorithm, which is because of the first algorithm in the default proposal being selected. In the sample scenario described here, on router 2, if you reverse the order of the algorithm configuration in the proposal so that it is the same order as the one specified on router 1, `hmac-sha-256-128` is selected as the authentication method.
  - You must be aware of the order of proposals in an IPsec policy at the time of configuration if you want the matching of proposals to happen in a certain order of preference, such as the strongest algorithm to be considered first when a match is made when both policies from the two peers have a proposal.
-

- Options** *algorithm*—Specify one of the following types of authentication algorithms:
- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
  - **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
  - **md5**—Message digest 5.
- Default:** hmac-sha-1-96

**NOTE:** The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## authentication-key (Protocols LDP)

**Syntax** authentication-key *md5-authentication-key*;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp session address],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp session address],  
[edit protocols ldp session address],  
[edit routing-instances *routing-instance-name* protocols ldp session address]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Configure the MD5 authentication signature. The maximum length of the authentication signature is 69 characters.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring the TCP MD5 Signature for LDP Sessions on page 875](#)

## authentication-key-chain (Protocols LDP)

<b>Syntax</b>	<code>authentication-key-chain <i>key-chain</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>name</i> protocols ldp session <i>address</i> ], [edit logical-systems <i>name</i> routing-instances <i>instance-name</i> protocols ldp session <i>address</i> ], [edit protocols ldp session <i>address</i> ], [edit routing-instances <i>instance-name</i> protocols ldp session <i>address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Apply and enable an authentication keychain to the routing device. Note that the referenced key chain must be defined. When configuring the authentication key update mechanism for LDP, you cannot commit the <b>0.0.0.0/allow</b> statement with authentication keys or key chains. The CLI issues a warning and fails to commit such configurations.
<div>  <b>NOTE:</b> You must also configure an authentication algorithm using the <b>authentication-algorithm</b> statement. </div>	
<b>Options</b>	<b><i>key-chain</i></b> —Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Authentication Key Update Mechanism for BGP and LDP Routing Protocols</a></li> <li>• <a href="#">Configuring Miscellaneous LDP Properties on page 872</a></li> <li>• <a href="#">authentication-algorithm on page 2234</a></li> </ul>

## auto-targeted-session

---

<b>Syntax</b>	auto-targeted-session { maximum-sessions <i>seconds</i> ; teardown-delay <i>seconds</i> ; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2.
<b>Description</b>	Configure session parameters for LDP sessions established with the remote LFA node that are automatically targeted using the loopback addresses. Configure parameters of automatically targeted sessions for remote LFA only.
<b>Options</b>	<p><b>maximum-sessions <i>seconds</i></b> —Specify the maximum number of auto-targeted LDP sessions allowed. Include this statement to optimize the use of router memory. <b>Default:</b> 100 <b>Range:</b> 1 through 1000</p> <p><b>teardown-delay <i>seconds</i></b> —Specify the minimum time period for which the auto-targeted session must be alive before tearing down the auto-targeted LDP sessions to the remote LFA node. Include this statement to prevent rapid route-resolution in case of temporary change in IGP topology. <b>Default:</b> 90 seconds <b>Range:</b> 1 through 300 seconds</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>no-eligible-remote-backup</i></li><li>• <i>remote-backup-calculation</i></li></ul>

## bfd-liveness-detection (Protocols LDP)

<b>Syntax</b>	<pre> bfd-liveness-detection {   detection-time threshold <i>milliseconds</i>;   ecmp;   failure-action {     remove-nexthop;     remove-route;   }   holddown-interval <i>seconds</i>;   minimum-interval <i>milliseconds</i>;   minimum-receive-interval <i>milliseconds</i>;   minimum-transmit-interval <i>milliseconds</i>;   multiplier <i>detection-time-multiplier</i>;   no-adaptation;   transmit-interval {     minimum-interval <i>milliseconds</i>;     threshold <i>milliseconds</i>;   }   version (0   1   automatic); } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp <b>oam</b>],  [edit logical-systems <i>logical-system-name</i> protocols ldp oam <b>fec address</b>],  [edit protocols ldp <b>oam</b>],  [edit protocols ldp oam <b>fec address</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 7.6.</p> <p>Support for the <b>bfd-liveness-detection</b> statement at the [edit protocols ldp oam <b>fec address</b>] hierarchy level and the <b>ecmp</b> option added in Junos OS Release 9.0.</p> <p>Support for the <b>failure-action</b> statement with the <b>remove-nexthop</b> and <b>remove-route</b> options and the <b>holddown-interval</b> statement added in Junos OS Release 9.4.</p>
<b>Description</b>	<p>Enable Bidirectional Forwarding Detection (BFD) for all MPLS LSPs or for just a specific LSP.</p>
<b>Options</b>	<p><b>minimum-interval</b>—Minimum transmit and receive interval.  <b>Range:</b> 50 through 255,000 milliseconds  <b>Default:</b> 50</p> <p><b>minimum-receive-interval</b>—Minimum receive interval.  <b>Range:</b> 50 through 255,000 milliseconds  <b>Default:</b> 50</p> <p><b>minimum-transmit-interval</b>—Minimum transmit interval.  <b>Range:</b> 50 through 255,000 milliseconds  <b>Default:</b> 50</p> <p><b>multiplier</b>—Detection time multiplier.</p>

**Range:** 50 through 255

**Default:** 3

The other options are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring BFD for LDP LSPs on page 760](#)

---

## deaggregate

---

**Syntax** deaggregate | no-deaggregate;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],  
[edit protocols ldp],  
[edit routing-instances *routing-instance-name* protocols ldp]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Control forwarding equivalence class (FEC) deaggregation on the router. The use of the **deaggregate** statement in LDP is a standard practice that we recommend for LDP deployments.

**Default** Deaggregation is disabled on the router.

**Options** **deaggregate**—Deaggregate FECs.  
**no-deaggregate**—Aggregate FECs.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring FEC Deaggregation on page 758](#)

## disable (Protocols LDP)

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options graceful-restart], [edit protocols ldp graceful-restart], [edit protocols ldp interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> routing-options graceful-restart]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Explicitly disable LDP on an interface, or explicitly disable LDP graceful restart.
<b>Default</b>	LDP is enabled on interfaces configured with the LDP <b>interface</b> statement. LDP graceful restart is automatically enabled when graceful restart is enabled under the <b>[edit routing-options]</b> hierarchy level.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enabling and Disabling LDP on page 729</a></li> <li>• <a href="#">Configuring LDP Graceful Restart on page 750</a></li> </ul>

## dod-request-policy

---

<b>Syntax</b>	<code>dod-request-policy <i>dod-request-policy-name</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the name of the LDP downstream on demand request policy. LDP sends label request messages only for those FECs matching in the downstream on demand request policy.
<b>Options</b>	<i>dod-request-policy-name</i> —Specify the name of the downstream on demand request policy.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring LDP Downstream on Demand on page 820</a></li></ul>

## downstream-on-demand

---

<b>Syntax</b>	<code>downstream-on-demand;</code>
<b>Hierarchy Level</b>	[edit logical systems <i>logical-system-name</i> protocols ldp session <i>session-address</i> ], [edit protocols ldp session <i>session-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable LDP downstream on demand on the LDP session. LDP is widely deployed in downstream unsolicited advertisement mode. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between access and aggregation networks to minimize the workload for the access node (AN) control plane and to avoid the storage of tens of thousands of label bindings from upstream aggregation nodes.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring LDP Downstream on Demand on page 820</a></li></ul>

## ecmp

<b>Syntax</b>	<code>ecmp;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp oam bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>address</i> bfd-liveness-detection], [edit protocols ldp oam bfd-liveness-detection], [edit protocols ldp oam fec <i>address</i> bfd-liveness-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.
<b>Description</b>	Allows LDP to establish BFD sessions for all ECMP paths configured for the specified FEC. If you configure the <b>ecmp</b> statement, you must also configure the <b>periodic-traceroute</b> statement for the specified FEC. If you do not do so, the commit operation fails. You can configure the <b>periodic-traceroute</b> statement at the global hierarchy level ([edit protocols ldp oam]) while only configuring the <b>ecmp</b> statement for a specific FEC ([edit protocols ldp oam fec <i>address</i> bfd-liveness-detection]).
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring ECMP-Aware BFD for LDP LSPs on page 763</a></li> </ul>

## egress-policy

---

<b>Syntax</b>	<code>egress-policy [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Control the prefixes advertised into LDP.
<b>Default</b>	Only the loopback address is advertised.
<b>Options</b>	<i>policy-names</i> —Name of one or more routing policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Prefixes Advertised into LDP from the Routing Table on page 757</a></li></ul>

## explicit-null (Protocols LDP)

<b>Syntax</b>	explicit-null;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Advertise label 0 to the egress router of a label-switched path (LSP).
<b>Default</b>	If you do not include the <b>explicit-null</b> statement in the MPLS configuration, label 3 (implicit null) is advertised.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MPLS and LDP to Pop the Label on the Ultimate-Hop Router on page 873</a></li> </ul>

## export (Protocols LDP)

---

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Apply policy filters to outbound LDP label bindings. Filters are applied to all label bindings from all neighbors.
<b>Options</b>	<i>policy-names</i> —Name of one or more routing policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Filtering Outbound LDP Label Bindings on page 755</a></li></ul>

## failure-action (Protocols LDP)

<b>Syntax</b>	<pre>failure-action {     remove-nexthop;     remove-route; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp oam bfd-livenesss-detection],          [edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>address</i>              bfd-livenesss-detection],          [edit protocols ldp oam bfd-livenesss-detection],          [edit protocols ldp oam fec <i>address</i> bfd-livenesss-detection]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4.
<b>Description</b>	Configure route and next-hop properties in the event of a BFD session failure event on an LDP LSP. The failure event could be an existing BFD session that has gone down or could be a BFD session that never came up. LDP adds back the route or next hop when the relevant BFD session comes back up.
<b>Options</b>	<p><b>remove-nexthop</b>—Remove a route corresponding to a next hop of the LSP's route at the ingress node when a BFD session failure event is detected.</p> <p><b>remove-route</b>—Remove the route corresponding to an LSP from the appropriate routing tables when a BFD session failure event is detected. If the LSP is configured with ECMP and a BFD session corresponding to any path goes down, the route is removed.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a Failure Action for the BFD Session on an LDP LSP on page 764</a></li> </ul>

## fec

```

Syntax  fec fec-address {
        bfd-liveness-detection {
            detection-time threshold milliseconds;
            ecmp;
            failure-action {
                remove-nexthop;
                remove-route;
            }
            holddown-interval milliseconds;
            ingress-policy ingress-policy-name;
            minimum-interval milliseconds;
            minimum-receive-interval milliseconds;
            minimum-transmit-interval milliseconds;
            multiplier detection-time-multiplier;
            no-adaptation;
            transmit-interval {
                minimum-interval milliseconds;
                threshold milliseconds;
            }
            version (0 | 1 | automatic);
        }
        no-bfd-liveness-detection;
        periodic-traceroute {
            disable;
            exp exp-value;
            fanout fanout-value;
            frequency minutes;
            paths number-of-paths;
            retries retry-attempts;
            source address;
            ttl ttl-value;
            wait seconds;
        }
    }

```

**Hierarchy Level** [edit logical-systems *logical-systems-name* protocols ldp oam],  
[edit protocols ldp oam]

**Release Information** Statement introduced in Junos OS Release 8.5.  
Statement introduced in Junos OS Release 12.2 for EX Series switches.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Allows you to configure BFD for a specific LDP forwarding equivalence class (FEC).

**Options** *fec-address*—Specify the FEC address.  
  
The other statements are explained separately.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

**Related Documentation** • [Configuring BFD for LDP LSPs on page 760](#)

## graceful-restart (Protocols LDP)

**Syntax** graceful-restart {  
     disable;  
     helper-disable;  
     maximum-neighbor-recovery-time *value*;  
     reconnect-time *seconds*;  
     recovery-time *value*;  
 }

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ldp],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],  
 [edit protocols ldp],  
 [edit routing-instances *routing-instance-name* protocols ldp]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Configure LDP graceful restart on the LDP master protocol instance or for a specific routing instance.

**NOTE:** When you alter the graceful restart configuration at either the [edit routing-options graceful-restart] or [edit protocols ldp graceful-restart] hierarchy levels, any running LDP session is automatically restarted to apply the graceful restart configuration. This behavior mirrors the behavior of BGP when you alter its graceful restart configuration.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

**Related Documentation** • [Configuring LDP Graceful Restart on page 750](#)

## hello-interval (Protocols LDP)

---

<b>Syntax</b>	hello-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols ldp targeted-hello], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp targeted-hello], [edit protocols ldp interface <i>interface-name</i> ], [edit protocols ldp targeted-hello], [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols ldp targeted-hello]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Support for LDP targeted hellos added in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Control the LDP timer that regulates how often hello messages are sent. You can control the rate both link hello messages and targeted hello messages are sent depending on the hierarchy level at which you configure the <b>hello-interval</b> statement.
<b>Options</b>	<b>seconds</b> —Length of time between transmission of hello packets. <b>Range:</b> 1 through 65,535 seconds <b>Default:</b> 5 seconds for link hello messages, 15 seconds for targeted hello messages
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the LDP Timer for Hello Messages on page 729</a></li></ul>

## helper-disable (LDP)

---

<b>Syntax</b>	helper-disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Disable helper mode for LDP graceful restart. When helper mode is disabled, a router cannot help a neighboring router that is attempting to restart LDP.
<b>Default</b>	Helper mode is enabled by default on all routing protocols (including LDP) that support graceful restart.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LDP Graceful Restart on page 750</a></li> </ul>

## holddown-interval

---

<b>Syntax</b>	<code>holddown-interval <i>holddown-interval</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp oam bfd-livenesss-detection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>address</i></code> <code>    bfd-livenesss-detection],</code> <code>[edit protocols ldp oam bfd-livenesss-detection],</code> <code>[edit protocols ldp oam fec <i>address</i> bfd-livenesss-detection]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4.
<b>Description</b>	Specify how long the BFD session should be up before adding the route or next hop. Specifying a time of 0 seconds causes the route or next hop to be added as soon as the BFD session comes back up.
<b>Options</b>	<b><i>holddown-interval</i></b> —Number of seconds the BFD session should remain up before adding the route or next hop. <b>Default:</b> 0 seconds <b>Range:</b> 0 through 65,535 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Holddown Interval for the BFD Session on page 765</a></li></ul>

## hold-time (Protocols LDP)

<b>Syntax</b>	<code>hold-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols ldp targeted-hello],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>  ldp targeted-hello],</code> <code>[edit protocols ldp interface <i>interface-name</i>],</code> <code>[edit protocols ldp targeted-hello],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp targeted-hello]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for LDP targeted hellos added in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	Specify how long an LDP node should wait for a hello message before declaring a neighbor to be down. This value is sent as part of a hello message so that each LDP node tells its neighbors how long to wait. You can specify times for both link hello messages and targeted hello messages depending on the hierarchy level at which you configure the <b>hold-time</b> statement.
<b>Options</b>	<p><b><i>seconds</i></b>—Hold-time value.</p> <p><b>Range:</b> 1 through 65,535 seconds</p> <p><b>Default:</b> 15 seconds for link hello messages, 45 seconds for targeted hello messages</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Delay Before LDP Neighbors Are Considered Down on page 730</a></li> </ul>

## ignore-lsp-metrics

---

<b>Syntax</b>	ignore-lsp-metrics;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ospf traffic-engineering shortcuts], [edit protocols ospf traffic-engineering shortcuts]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	<p>Cause OSPF to ignore the RSVP LSP metric.</p> <p>Some other vendors use an OSPF metric of 1 for the loopback address. Juniper Networks routers use an OSPF metric of 0 for the loopback address. This can cause interoperability problems when you configure LDP tunneling over RSVP LSPs in heterogeneous networks.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling LDP over RSVP-Established LSPs in Heterogeneous Networks on page 874</a></li></ul>

## igp-synchronization

<b>Syntax</b>	<code>igp-synchronization holddown-interval <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp],</p> <p>[edit protocols ldp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ldp]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	Configure the time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational. For large networks with numerous FECs, you might need to configure a longer value to allow enough time for the LDP label databases to be exchanged.
<b>Options</b>	<p><b>holddown-interval <i>seconds</i></b>—Time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational.</p> <p><b>Default:</b> 10 seconds</p> <p><b>Range:</b> 10 through 60 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LDP Synchronization with the IGP on the Router on page 878</a></li> </ul>

## import (Protocols LDP)

---

<b>Syntax</b>	<code>import [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code>ldp],</code> <code>[edit protocols ldp],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Apply policy filters to received LDP label bindings. Filters are applied to all label bindings from all neighbors.
<b>Options</b>	<i>policy-names</i> —Name of one or more routing policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Filtering Inbound LDP Label Bindings on page 753</a></li></ul>

## ingress-policy

---

<b>Syntax</b>	<code>ingress-policy [ <i>ingress-policy-names</i> ];</code>
<b>Hierarchy Level</b>	[edit logical-system <i>logical-system-name</i> protocols ldp <a href="#">entropy-label</a> ], [edit logical-system <i>logical-system-name</i> protocols ldp <a href="#">oam</a> ], [edit protocols ldp <a href="#">entropy-label</a> ], [edit protocols ldp <a href="#">oam</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced at the <b>[edit protocols ldp entropy-label]</b> hierarchy level in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.
<b>Description</b>	Configure an LDP ingress policy for either the entropy label or Operation, Administration, and Management (OAM).  For OAM, configure the ingress policy to choose which forwarding equivalence classes (FECs) need to have OAM enabled. If the FEC passes through the policy or if the FEC is explicitly configured, OAM is enabled for a FEC. For FECs chosen using a policy, the BFD parameters configured under <b>[edit protocols ldp oam bfd-liveness-detection]</b> are applied.
<b>Options</b>	<i>ingress-policy-names</i> —Specify the names of the ingress policies.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring OAM Ingress Policies for LDP on page 976</a></li> <li>• <a href="#">Configuring the Entropy Label for LSPs on page 444</a></li> </ul>

## interface (Protocols LDP)

---

<b>Syntax</b>	<pre>interface <i>interface-name</i> {     disable;     hello-interval <i>seconds</i>;     hold-time <i>seconds</i>;     transport-address (interface   loopback); }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols     ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]</pre>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable LDP on one or more router interfaces.
<b>Default</b>	LDP is disabled on all interfaces.
<b>Options</b>	<p><i>interface-name</i>—Name of an interface. To configure all interfaces, specify <b>all</b>.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling and Disabling LDP on page 729</a></li></ul>

---

## keepalive-interval

---

<b>Syntax</b>	keepalive-interval <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Set the keepalive interval value.
<b>Options</b>	<b><i>seconds</i></b> —Keepalive value. <b>Range:</b> 1 through 65,535 <b>Default:</b> 10 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Interval for LDP Keepalive Messages on page 732</a></li></ul>

## keepalive-timeout

---

<b>Syntax</b>	<code>keepalive-timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Set the keepalive timeout value. The keepalive timeout defines the amount of time that the neighbor LDP node waits before determining that the session has failed.
<b>Options</b>	<b><i>seconds</i></b> —Keepalive timeout value. <b>Range:</b> 1 through 65,535 <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the LDP Keepalive Timeout on page 732</a></li></ul>

## l2-smart-policy

---

<b>Syntax</b>	l2-smart-policy;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Prevent LDP from exporting IPv4 FECs over sessions with Layer 2 neighbors only. IPv4 FECs received over such sessions are filtered out.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LDP IPv4 FEC Filtering on page 760</a></li></ul>

## label-withdrawal-delay

---

<b>Syntax</b>	label-withdrawal-delay <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Delay the withdrawal of labels to reduce router workload during IGP convergence.
<b>Options</b>	<b><i>seconds</i></b> —Configure the number of seconds to wait before withdrawing labels for the LDP LSPs. <b>Default:</b> 60 seconds <b>Range:</b> 0 through 300 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Label Withdrawal Timer on page 878</a></li></ul>

## ldp-synchronization

---

<b>Syntax</b>	<code>ldp-synchronization {     disable;     hold-time seconds; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ospf interface <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf interface <i>interface-name</i> ], [edit protocols ospf interface <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> protocols ospf interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Enable synchronization by advertising the maximum cost metric until LDP is operational on the link.
<b>Options</b>	The other statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <a href="#">Configuring LDP Synchronization with the IGP on LDP Links on page 877</a>

## log-updown (Protocols LDP)

---

<b>Syntax</b>	log-updown { trap disable; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Disable LDP traps on the router, logical system, or routing instance.
<b>Options</b>	<b>trap disable</b> —Disable LDP traps. <b>Default:</b> LDP traps are enabled on the router.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Disabling SNMP Traps for LDP on page 877</a></li> </ul>

## make-before-break (LDP)

---

<b>Syntax</b>	<pre>make-before-break {     timeout <i>seconds</i>;     switchover-delay <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3.
<b>Description</b>	Configures make before break (MBB) for multicast LDP (MLDP) link protection to ensure minimum packet loss when attempting to signal a new label-switched path (LSP) before tearing down the old LSP path.
<b>Options</b>	<p><b>timeout <i>seconds</i></b>—Specify a value to change a make -before-break timeout for point-to-multipoint LSPs. Even if an MBB acknowledgment is not received for a point-to-multipoint LSP before the specified timeout period expires, the label-switching router (LSR) performs an MBB switchover from the old LSR to the new upstream LSR.</p> <p><b>Range:</b> 1 through 300 seconds</p> <p><b>Default:</b> 30 seconds</p> <p><b>switchover-delay <i>seconds</i></b>—Specify a value to change switchover delay for a point-to-multipoint LSP from the old LSR to the new upstream LSR. If an MBB acknowledgment is received on a point of local repair (PLR) router, the PLR waits for the specified seconds to switch its upstream LSR from the old LSR to the new LSR.</p> <p><b>Range:</b> 1 through 300 seconds</p> <p><b>Default:</b> 30 seconds</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring LDP Link Protection on page 766</a></li></ul>

## maximum-neighbor-recovery-time

<b>Syntax</b>	<code>maximum-neighbor-recovery-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement changed from <b>maximum-recovery-time</b> to <b>maximum-neighbor-recovery-time</b> in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the maximum amount of time to wait before giving up an attempt to gracefully restart.
<b>Options</b>	<b><i>seconds</i></b> —Configure the maximum recovery time, in seconds. <b>Range:</b> 120 through 1800 seconds <b>Default:</b> 140 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Recovery Time and Maximum Recovery Time on page 752</a></li> <li>• <a href="#">Configuring Graceful Restart Options for LDP</a></li> <li>• <a href="#">no-strict-lsa-checking</a></li> <li>• <a href="#">recovery-time</a></li> </ul>

## mldp-inband-signalling (Protocols Multipoint LDP)

---

<b>Syntax</b>	mldp-inband-signalling { policy policy-name; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit protocols pim],
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2.
<b>Description</b>	<p>Multipoint LDP (M-LDP) in-band signaling enables you to carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.</p> <p>On the label-edge router (LER), enable PIM to use M-LDP in-band signaling for the upstream neighbors when the LER does not detect a PIM upstream neighbor. On the egress nodes, configure the MPLS LSP root in the PIM configuration, using the <b>policy</b> statement.</p> <p>The remaining statement is explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Multipoint LDP In-Band Signaling for Point-to-Multipoint LSPs on page 841</a></li></ul>

## mofrr-asm-starg (Multicast-Only Fast Reroute in a PIM Domain)

<b>Syntax</b>	<code>mofrr-asm-starg;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit logical-systems <i>logical-system-name</i> routing-options multicast stream-protection], [edit routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit routing-options multicast stream-protection]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.
<b>Description</b>	Enable <b>mofrr-asm-starg</b> to include any-source multicast (ASM) for (*,G) joins in the Multicast-only fast reroute (MoFRR).

**NOTE:** **mofrr-asm-starg** applies to IP-PIM only. When enabled for group G, \*,G will undergo MoFRR as long as there is no S#,G for Group G. In other words, \*,G MoFRR will cease and any old states will be torn down when S#,G is created. Note too, that **mofrr-asm-starg** is not supported for mLDP (since mLDP itself does not support \*,G).

In a PIM domain with MoFRR enabled, the default for **stream-protection** is S,G routes only.

Context: Multicast-only fast reroute (MoFRR) can be used to reduce traffic loss in a multicast distribution tree in the event of link down. To employ MoFRR, a downstream router is configured with an alternative path back towards the source, over which it receives a backup live stream of the same multicast traffic. That router propagates the same (S,G) join toward both upstream neighbors in order to create duplicate multicast trees. If a failure is detected on the primary tree, the router switches to the backup tree to prevent packet loss.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
---------------------------------	---

<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Multicast-Only Fast Reroute on page 794</a></li> <li>• <a href="#">Understanding Multicast-Only Fast Reroute on Switches</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain on Switches</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain on page 803</a></li> </ul>
------------------------------	---

## **mofrr-disjoint-upstream-only (Multicast-Only Fast Reroute in a PIM Domain)**

---

<b>Syntax</b>	<code>mofrr-disjoint-upstream-only;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-options multicast stream-protection],</code> <code>[edit routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection],</code> <code>[edit routing-options multicast stream-protection]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.
<b>Description</b>	<p>When you configure multicast-only fast reroute (MoFRR) in a PIM domain, allow only a disjoint RPF (an RPF on a separate plane) to be selected as the backup RPF path.</p> <p>In a multipoint LDP MoFRR domain, the same label is shared between parallel links to the same upstream neighbor. This is not the case in a PIM domain, where each link forms a neighbor. The <b>mofrr-disjoint-upstream-only</b> statement does not allow a backup RPF path to be selected if the path goes to the same upstream neighbor as that of the primary RPF path. This ensures that MoFRR is triggered only on a topology that has multiple RPF upstream neighbors.</p>
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Multicast-Only Fast Reroute on page 794</a></li><li>• <a href="#">Understanding Multicast-Only Fast Reroute on Switches</a></li><li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain</a></li><li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain on Switches</a></li><li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain on page 803</a></li></ul>

## mofrr-no-backup-join (Multicast-Only Fast Reroute in a PIM Domain)

<b>Syntax</b>	mofrr-no-backup-join;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit logical-systems <i>logical-system-name</i> routing-options multicast stream-protection], [edit routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit routing-options multicast stream-protection]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.
<b>Description</b>	When you configure multicast-only fast reroute (MoFRR) in a PIM domain, prevent sending join messages on the backup path, but retain all other MoFRR functionality.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Multicast-Only Fast Reroute on page 794</a></li> <li>• <a href="#">Understanding Multicast-Only Fast Reroute on Switches</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain on Switches</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain on page 803</a></li> </ul>

## mofrr-primary-path-selection-by-routing (Multicast-Only Fast Reroute)

<b>Syntax</b>	mofrr-primary-path-selection-by-routing;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit logical-systems <i>logical-system-name</i> routing-options multicast stream-protection], [edit routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit routing-options multicast stream-protection]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.
<b>Description</b>	<p>MoFRR is supported on both equal-cost multipath (ECMP) paths and non-ECMP paths. Unicast loop-free alternate (LFA) routes need to be enabled to support MoFRR on non-ECMP paths. LFA routes are enabled with the link-protection statement in the interior gateway protocol (IGP) configuration. When you enable link protection on an OSPF or IS-IS interface, Junos OS creates a backup LFA path to the primary next hop for all destination routes that traverse the protected interface.</p> <p>In the context load balancing, MoFRR prioritizes the disjoint backup in favor of load balancing the available paths.</p> <p>For Junos OS releases before 15.1R7, for both ECMP and Non-ECMP scenarios, the default MoFRR behavior was <i>sticky</i>, that is, if the Active link went down, the Active Path selection would give preference to Backup Path for the transition. The Active Path would not follow the unicast selected gateway</p> <p>Starting in Junos OS Release 15.1R7 however, the default behavior for non-EMCP scenarios is to be <i>nonsticky</i>, that is, the selection of Active Path strictly follows unicast selected gateway. MoFRR no longer chooses a unicast LFA path to become the MoFRR Active path; only a unicast LFA path can be selected to become MoFRR Backup.</p>
<b>Default</b>	By default, the backup path gets promoted to be the primary path when MoFRR is configured in a PIM domain.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Multicast-Only Fast Reroute on page 794</a></li><li>• <a href="#">Understanding Multicast-Only Fast Reroute on Switches</a></li><li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain</a></li><li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain on Switches</a></li><li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain on page 803</a></li></ul>

## no-forwarding

---

<b>Syntax</b>	no-forwarding;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Do not add ingress routes to the inet.0 routing table even if <a href="#">traffic-engineering bgp-igp</a> (configured at the <a href="#">[edit protocols mpls]</a> hierarchy level) is enabled.
<b>Default</b>	The <b>no-forwarding</b> statement is disabled. Ingress routes are added to the inet.0 routing table instead of the inet.3 routing table when <a href="#">traffic-engineering bgp-igp</a> is enabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Preventing Addition of Ingress Routes to the inet.0 Routing Table on page 873</a></li> <li>• <a href="#">Configuring a Routing Protocol Between the Service Provider Routers</a></li> </ul>

## oam (Protocols LDP)

---

```
Syntax  oam {  
        bfd-liveness-detection {  
            detection-time threshold milliseconds;

        }  
    }
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols *ldp*]  
[edit protocols *ldp*]

**Release Information** Statement introduced in Junos OS Release 7.6.  
***lsp-ping-interval*** option introduced in Junos OS Release 9.4.

**Description** Configure Operation, Administration, and Maintenance (OAM) and Bidirectional Forwarding Detection (BFD) protocol for LDP.

**Options** ***fec fec-address***—Specify the forwarding equivalence class (FEC) address. You must either specify a FEC address or configure an OAM ingress policy to ensure that the BFD session comes up.

**lsp-ping-interval *seconds***—Specify the duration of the LSP ping interval in seconds. To issue a ping on an LDP-signaled LSP, use the **ping mpls ldp** command.

**Default:** 60 seconds

**Range:** 30 through 3,600 seconds

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## p2mp-ldp-next-hop

---

<b>Syntax</b>	<pre>p2mp-ldp-next-hop {   root-address <i>root-address</i>{     lsp-id <i>id</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options static route <i>destination-prefix</i> ], [edit logical-systems <i>logical-system-name</i> routing-options static route <i>destination-prefix</i> ], [edit routing-instances <i>routing-instance-name</i> routing-options static route <i>destination-prefix</i> ]. [edit routing-options static route <i>destination-prefix</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.3.
<b>Description</b>	Specify a point-to-multipoint LDP label-switched path (LSP) as the next hop for a static route, and configure a root and provide an lsp-id on that LDP-signalled label-switched path.
<b>Options</b>	<b>root-address <i>root address</i></b> — Specify the root address of the point-to-multipoint LSP. <b>lsp-id <i>id</i></b> — Specify the generic LSP identifier. The range is 1 through 65535.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	

## periodic-traceroute

<b>Syntax</b>	<pre> periodic-traceroute {   disable;   exp <i>exp-value</i>;   fanout <i>fanout-value</i>;   frequency <i>minutes</i>;   paths <i>number-of-paths</i>;   retries <i>retry-attempts</i>;   source <i>address</i>;   ttl <i>ttl-value</i>;   wait <i>seconds</i>; } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp oam],  [edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>fec-address</i>],  [edit protocols ldp oam],  [edit protocols ldp oam fec <i>fec-address</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.4.  Support added at the [edit protocols ldp oam] and [edit logical-systems <i>logical-system-name</i> protocols ldp oam] hierarchy levels in Junos OS Release 9.0.  Statement introduced in Junos OS Release 12.2 for EX Series switches.</p>
<b>Description</b>	Enable tracing of forwarding equivalence classes (FECs) for LDP LSPs.
<b>Options</b>	<p><b>disable</b>—(Optional) Disable tracing for a specific FEC. This option is available at the [edit protocols ldp oam fec <i>fec-address</i> periodic-traceroute] and [edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>fec-address</i> periodic-traceroute] hierarchy levels only.</p> <p><b>exp <i>exp-value</i></b>—(Optional) Specify the class of service to use when sending probes.  <b>Default:</b> 7  <b>Range:</b> 0 through 7</p> <p><b>fanout <i>fanout-value</i></b>—(Optional) Specify the maximum number of next hops to search per node.  <b>Default:</b> 16  <b>Range:</b> 1 through 16</p> <p><b>frequency <i>minutes</i></b>—(Optional) Specify the interval between traceroute attempts.  <b>Default:</b> 60 minutes  <b>Range:</b> 15 through 120 minutes</p> <p><b>paths <i>number-of-paths</i></b>—(Optional) Specify the maximum number of paths to search.  <b>Default:</b> 3  <b>Range:</b> 1 through 255</p>

**retries** *retry-attempts*—(Optional) Specify the number of attempts to send a probe to a specific node before giving up.

**Default:** 3

**Range:** 1 through 9

**source address**—(Optional) Specify the IPv4 source address to use when sending probes.

**ttl value**—(Optional) Specify the maximum time-to-live value. Nodes that are beyond this value are not traced.

**Default:** 64

**Range:** 1 through 255

**wait seconds**—(Optional) Specify the wait interval before resending a probe packet.

**Default:** 10 seconds

**Range:** 5 though 15 seconds

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

## policing (Protocols LDP)

<b>Syntax</b>	<pre> policing {     fec <i>fec-address</i> {         ingress-traffic <i>filter-name</i>;         transit-traffic <i>filter-name</i>;     } } </pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp],</p> <p>[edit protocols ldp],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ldp]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	Enable policing of forwarding equivalence classes (FECs) for LDP.
<b>Options</b>	<p><b>fec <i>fec-address</i></b>—Specify the address for the FEC.</p> <p><b>ingress-traffic <i>filter-name</i></b>—Specify the name of the filter for policing ingress FEC traffic.</p> <p><b>transit-traffic <i>filter-name</i></b>—Specify the name of the filter for policing transit FEC traffic.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Policers for LDP FECs on page 759</a></li> </ul>

## policy (Multicast-Only Fast Reroute)

---

**Syntax**    `policy policy-name;`

**Hierarchy Level**    [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast stream-protection],  
[edit logical-systems *logical-system-name* routing-options multicast stream-protection],  
[edit routing-instances *routing-instance-name* routing-options multicast stream-protection],  
[edit routing-options multicast stream-protection]

**Release Information**    Statement introduced in Junos OS Release 14.1.  
Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.

**Description**    When you configure multicast-only fast reroute (MoFRR), apply a routing policy that filters for a restricted set of multicast streams to be affected by your MoFRR configuration. You can apply filters that are based on source or group addresses.

For example:

```
routing-options {
  multicast {
    stream-protection {
      policy mofrr-select;
    }
  }
}
policy-statement mofrr-select {
  term A {
    from {
      source-address-filter 225.1.1.1/32 exact;
    }
    then {
      accept;
    }
  }
  term B {
    from {
      source-address-filter 226.0.0.0/8 orlonger;
    }
    then {
      accept;
    }
  }
  term C {
    from {
      source-address-filter 227.1.1.0/24 orlonger;
      source-address-filter 227.4.1.0/24 orlonger;
      source-address-filter 227.16.1.0/24 orlonger;
    }
    then {
      accept;
    }
  }
}
```

```

term D {
  from {
    source-address-filter 227.1.1.1/32 exact;
  }
  then {
    reject; #MoFRR disabled
  }
}
term E {
  from {
    route-filter 227.1.1.0/24 orlonger;
  }
  then accept;
}
...
}

```

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

## policy (Protocols Multipoint LDP)

---

<b>Syntax</b>	<code>policy <i>policy-name</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols pim mldp-inband-signalling], [edit protocols pim mldp-inband-signalling]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2.
<b>Description</b>	<p>Multipoint LDP (M-LDP) in-band signaling enables you to carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.</p> <p>On the egress nodes of the point-to-multipoint LSP, specify an M-LDP join translation filter policy where PIM messages are translated into M-LDP FEC bindings. The policy statement is needed when internal BGP (IBGP) is not available in the core site or to override IBGP-based LSP root detection.</p> <p>The filter policy is configured at the <b>[edit policy-options]</b> hierarchy level. The policy generally specifies one or more source-address filters and the point-to-multipoint LDP root IP address using the <b>p2mp-lsp-root</b> policy action.</p>
<b>Options</b>	<i>policy-name</i> —Name of a policy configured at the <b>[edit policy-options]</b> hierarchy level.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Multipoint LDP In-Band Signaling for Point-to-Multipoint LSPs on page 841</a></li></ul>

## preference (Protocols LDP)

<b>Syntax</b>	<code>preference <i>preference</i>;</code>
<b>Hierarchy Level</b>	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp],</code> <code>[edit protocols ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp],</code> <code>[edit protocols ldp],</code> <code>[edit protocols ldp interface <i>interface-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	Set the route preference level for LDP routes.
<b>Options</b>	<p><i>preference</i>—Preferred value.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 9</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LDP Route Preferences on page 749</a></li> </ul>

## reconnect-time

---

<b>Syntax</b>	<code>reconnect-time seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp <a href="#">graceful-restart</a> ], [edit protocols ldp <a href="#">graceful-restart</a> ], [edit routing-instances <i>routing-instance-name</i> protocols ldp <a href="#">graceful-restart</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the length of time required to reestablish a Label Distribution Protocol (LDP) session after graceful restart.
<b>Options</b>	<b>seconds</b> —Time required for reconnection. <b>Range:</b> 30 through 300 <b>Default:</b> 60 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LDP Graceful Restart on page 750</a> on <i>MPLS Applications Feature Guide</i></li><li>• <i>Configuring Graceful Restart Options for LDP</i></li></ul>

## recovery-time

---

<b>Syntax</b>	<code>recovery-time seconds;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the amount of time a router waits for LDP to restart gracefully.
<b>Options</b>	<b>seconds</b> —Configure the recovery time, in seconds. <b>Range:</b> 120 through 1800 seconds <b>Default:</b> 140 seconds
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Recovery Time and Maximum Recovery Time on page 752</a></li> </ul>

## session (Protocols LDP)

---

Syntax	<pre>session session-address {     authentication-algorithm (aes-128-cmac-96   hmac-sha-1-96   md5);     authentication-key authentication-key;     authentication-key-chain authentication-key-chain;     downstream-on-demand downstream-on-demand;     (mtu-discovery   no-mtu-discovery); }</pre>
Hierarchy Level	<pre>[edit logical-systems name protocols ldp], [edit logical-systems name routing-instances name protocols ldp], [edit protocols ldp], [edit routing-instances name protocols ldp]</pre>
Release Information	Statement introduced before Junos OS Release 7.4. <b>authentication-algorithm</b> statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Configure LDP session parameters by specifying the session destination address.
Options	<p><b>session-address</b>—Session destination address.</p> <p><b>authentication-algorithm</b>—Authentication algorithm name.</p> <p>Values:</p> <ul style="list-style-type: none"><li>• <b>aes-128-cmac-96</b>—Cipher-based Message Authentication Code (AES128) (96 bits).</li><li>• <b>hmac-sha-1-96</b>—Hash-based Message Authentication Code (SHA1) (96 bits).</li><li>• <b>md5</b>—Message Digest 5.</li></ul> <p><b>authentication-key</b>—MD5 authentication key.</p> <p><b>authentication-key-chain</b>—Key chain name.</p> <p><b>downstream-on-demand</b>—Configure downstream on demand label distribution mode.</p> <p><b>mtu-discovery</b>—Enable TCP path MTU discovery.</p> <p><b>no-mtu-discovery</b>—Disable TCP path MTU discovery.</p>
Required Privilege Level	routing
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring the TCP MD5 Signature for LDP Sessions on page 875</a></li></ul>

## session-group

---

<b>Syntax</b>	<pre>session-group <i>prefix-length</i> {   <i>authentication-key authentication-key</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols   ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 16.1.
<b>Description</b>	<p>Specify the group prefix address for the remote end of the LDP session.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<pre>routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.</pre>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the TCP MD5 Signature for LDP Sessions on page 875</a></li> </ul>

## session-protection

---

<b>Syntax</b>	<code>session-protection {     timeout <i>seconds</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Description</b>	Configure when an LDP session is torn down and resignaled after the router stops receiving hello messages from a neighboring router. You might want to modify this behavior to prevent an LDP session from being unnecessarily terminated and reestablished. The LDP session remains up for the duration specified as long as the routers maintain IP network connectivity.
<b>Options</b>	<b>timeout <i>seconds</i></b> —Time in seconds before the LDP session is torn down and resignaled. <b>Range:</b> 1 through 65,535 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LDP Session Protection on page 876</a></li></ul>

## stream-protection (Multicast-Only Fast Reroute)

<b>Syntax</b>	<pre>stream-protection {   mofrr-asm-starg;   mofrr-disjoint-upstream-only;   mofrr-no-backup-join;   mofrr-primary-path-selection-by-routing;   policy <i>policy-name</i>; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit routing-options multicast]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 14.1.</p> <p>Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.</p>
<b>Description</b>	<p>Enable multicast-only fast reroute (MoFRR) on a routing or switching device. MoFRR minimizes packet loss in a network when there is a link failure.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Multicast-Only Fast Reroute on page 794</a></li> <li>• <a href="#">Understanding Multicast-Only Fast Reroute on Switches</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a PIM Domain on Switches</a></li> <li>• <a href="#">Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain on page 803</a></li> </ul>

## strict-targeted-hellos

---

<b>Syntax</b>	strict-targeted-hellos;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Prevent LDP sessions from being established with remote neighbors that have not been specifically configured. LDP peers will not respond to targeted hellos coming from a source that is not one of the configured remote neighbors.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling Strict Targeted Hello Messages for LDP on page 731</a></li></ul>

## targeted-hello

---

<b>Syntax</b>	targeted-hello { hello-interval <i>seconds</i> ; hold-time <i>seconds</i> ; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify the LDP timer and LDP hold time for targeted hellos.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the LDP Timer for Hello Messages on page 729</a></li> <li>• <a href="#">Configuring the Delay Before LDP Neighbors Are Considered Down on page 730</a></li> </ul>

## traceoptions (Protocols LDP)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;<i>flag-modifier</i>&gt; &lt;disable&gt;; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. <b>match-on address</b> option for the <b>filter</b> flag modifier added in Junos OS Release 10.4. <b>nsr-synchronization</b> and <b>p2mp-nsr-synchronization</b> operations for <b>flag</b> statement introduced in Junos OS Release 13.3. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Specify LDP protocol-level trace options.
<b>Default</b>	The default LDP protocol-level trace options are inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>ldp-log</b>. We recommend that you place LDP tracing output in the file <b>ldp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>address</b>—Operation of address and address withdrawal messages</li><li>• <b>binding</b>—Label-binding operations</li></ul>

- **error**—Error conditions
- **event**—Protocol events
- **initialization**—Operation of initialization messages
- **label**—Operation of label request, label map, label withdrawal, and label release messages
- **notification**—Operation of notification messages
- **nsr-synchronization**—Nonstop active routing synchronization events
- **p2mp-nsr-synchronization**—Point-to-multipoint nonstop active routing synchronization events
- **packets**—Equivalent to setting **address**, **initialization**, **label**, **notification**, and **periodic** flags (see also the **filter** flag modifier)
- **path**—Label-switched path operations
- **periodic**—Operation of hello and keepalive messages
- **route**—Operation of route messages
- **state**—Protocol state transitions

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable this trace flag.
- **filter**—Filter to apply to this flag. The **filter** flag modifier can be applied only to the **route**, **path**, and **binding** flags. This flag modifier has the following options:
  - **match-on**—Match on argument specified. The **match-on** option has the following suboptions:
    - **address**—Filter based on the source and destination addresses of packets. Available for the **packets** flag option only.
    - **fec**—Filter based on the FEC associated with the traced object.
    - **policy policy-name**—Specify the filter policy.
  - **receive**—Packets being received.
  - **send**—Packets being transmitted.

**no-world-readable**—(Optional) Prevent all users from reading the log file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable any user to read the log file.

<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
---------------------------------	---

------------------------------	---

---

## track-igp-metric

---

<b>Syntax</b>	track-igp-metric;
---------------	-------------------

<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
------------------------	---

<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
----------------------------	---

<b>Description</b>	Cause the IGP route metric to be used for the LDP routes instead of the default LDP route metric (the default LDP route metric is 1).
--------------------	---

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
---------------------------------	---

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LDP to Use the IGP Route Metric on page 873</a></li></ul>
------------------------------	---

## traffic-statistics (Protocols LDP)

<b>Syntax</b>	<pre>traffic-statistics {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     interval <i>seconds</i>;     no-penultimate-hop; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp],          [edit protocols ldp],          [edit routing-instances <i>routing-instance-name</i> protocols ldp]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.          Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	LDP traffic statistics display the amount of traffic passed through a router for a particular FEC.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the LDP statistics operation.          Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of LDP statistics files. When a statistics file named <b>ldp-stat</b> reaches its maximum size, it is renamed <b>ldp-stat.0</b>, then <b>ldp-stat.1</b>, and so on, until the maximum number of LDP statistics files is reached. Then the oldest file is overwritten.</p> <p><b>Range:</b> 2 through 1000  <b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you also must include the <b>size</b> statement to specify the maximum file size.</p> <p><b>interval <i>seconds</i></b>—(Optional) Specify the interval at which the statistics are polled and written to the file.  <b>Default:</b> 300 seconds (5 minutes)</p> <p><b>no-penultimate-hop</b>—(Optional) Do not collect traffic statistics on the penultimate hop router.</p> <p><b>no-world-readable</b>—(Optional) Prevent all users from reading the log file.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each statistics file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a statistics file named <b>ldp-stat</b> reaches this size, it is renamed <b>ldp-stat.0</b>. When <b>ldp-stat</b> again reaches this size, <b>ldp-stat.0</b> is renamed <b>ldp-stat.1</b> and <b>ldp-stat</b> is renamed <b>ldp-stat.0</b>. This renaming scheme continues until the maximum number of statistics files is reached. Then the oldest statistics file is overwritten.</p> <p><b>Syntax:</b> <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB</p>

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you also must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable log file access for all users.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Collecting LDP Statistics on page 880</a></li></ul>
------------------------------	---

## transport-address

<b>Syntax</b>	<code>transport-address (interface   router-id);</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp],          [edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp],          [edit protocols ldp],          [edit protocols ldp interface <i>interface-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Enables you to configure the IP address used to specify the TCP session for the LDP session. Routers must first establish a TCP session between one another before they can establish an LDP session. The TCP session enables the routers to exchange the label advertisements needed for the LDP session. To establish the TCP session, each router must learn the other router's transport address. The transport address is an IP address used to identify the TCP session over which the LDP session will run.</p>
<b>Default</b>	<code>router-id</code>
<b>Options</b>	<p><b>interface</b>—The first IP address on the interface is used as the transport address for any LDP sessions to neighbors that can be reached over that interface. You cannot specify the <b>interface</b> option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the <b>router-id</b> option.</p> <p><b>router-id</b>—The router identifier is used as the transport address. Unless otherwise configured, the router identifier is the loopback address.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Specifying the Transport Address Used by LDP on page 757</a></li> </ul>

## version (BFD)

<b>Syntax</b>	version (0   1   automatic);
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp oam <a href="#">bfd-liveness-detection</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ldp oam fec address <a href="#">bfd-liveness-detection</a>],</p> <p>[edit system services dhcp-local-server liveness-detection method bfd],</p> <p>[edit system services dhcp-local-server dhcpv6 liveness-detection method bfd],</p> <p>[edit forwarding-options dhcp-relay liveness-detection method bfd],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method bfd],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method bfd],</p> <p>[edit protocols ldp oam <a href="#">bfd-liveness-detection</a>],</p> <p>[edit protocols ldp oam fec address <a href="#">bfd-liveness-detection</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Configure the BFD protocol version to detect.
<b>Options</b>	<p>0—Use BFD protocol version 0.</p> <p>1—Use BFD protocol version 1.</p> <p><b>automatic</b>—Autodetect the BFD protocol version.</p> <p><b>Default:</b> automatic</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## encapsulation (Logical Interface)

<b>Syntax</b>	encapsulation (atm-ccc-cell-relay   atm-ccc-vc-mux   atm-cisco-nlpid   atm-mlppp-llc   atm-nlpid   atm-ppp-llc   atm-ppp-vc-mux   atm-snap   atm-tcc-snap   atm-tcc-vc-mux   atm-vc-mux   ether-over-atm-llc   ether-vpls-over-atm-llc   ether-vpls-over-fr   ether-vpls-over-ppp   ethernet   ethernet-ccc   ethernet-vpls   ethernet-vpls-fr   frame-relay-ccc   frame-relay-ether-type   frame-relay-ether-type-tcc   frame-relay-ppp   frame-relay-tcc   gre-fragmentation   multilink-frame-relay-end-to-end   multilink-ppp   ppp-over-ether   ppp-over-ether-over-atm-llc   vlan-bridge   vlan-ccc   vlan-vci-ccc   vlan-tcc   vlan-vpls   vxlan);
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ], [edit interfaces rlsq <i>number</i> unit <i>logical-unit-number</i> ] [edit protocols evpn]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers ( <b>ethernet</b> , <b>vlan-ccc</b> , and <b>vlan-tcc</b> options only). Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers. Only the <b>atm-ccc-cell-relay</b> and <b>atm-ccc-vc-mux</b> options are supported on ACX Series routers. Statement introduced in Junos OS Release 17.3R1 for QFX10000 Series switches ( <b>ethernet-ccc</b> and <b>vlan-ccc</b> options only).
<b>Description</b>	Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.
<b>Options</b>	<p><b>atm-ccc-cell-relay</b>—Use ATM cell-relay encapsulation.</p> <p><b>atm-ccc-vc-mux</b>—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the <b>ccc</b> family only.</p> <p><b>atm-cisco-nlpid</b>—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-mlppp-llc</b>—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.</p> <p><b>atm-nlpid</b>—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-ppp-llc</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.</p> <p><b>atm-ppp-vc-mux</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.</p>

**atm-snap**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

**atm-tcc-snap**—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

**atm-tcc-vc-mux**—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**atm-vc-mux**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the **inet** family only.

**ether-over-atm-llc**—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

**ether-vpls-over-atm-llc**—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**ether-vpls-over-fr**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

**NOTE:** The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

---

**ether-vpls-over-ppp**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

**ethernet**—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

**ethernet-ccc**—Use Ethernet CCC encapsulation on Ethernet interfaces.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ppp**—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the **ppp** family only.

**frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**gre-fragmentation**—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet's size exceeds the tunnel's maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

**multilink-frame-relay-end-to-end**—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**multilink-ppp**—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

**ppp-over-ether**—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

**ppp-over-ether-over-atm-llc**—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

**vxlan**—Use VXLAN data plane encapsulation for EVPN.

<b>Required Privilege Level</b>	<b>interface</b> —To view this statement in the configuration. <b>interface-control</b> —To add this statement to the configuration.
---------------------------------	---

<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 11.1 for EX Series switches. Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers ( <b>flexible-ethernet-services</b> , <b>ethernet-ccc</b> , and <b>ethernet-tcc</b> options only).
<b>Description</b>	For M Series, MX Series, QFX Series, T Series, PTX Series, specify the physical link-layer encapsulation type.  For SRX Series, specify logical link layer encapsulation.
<div>  <b>NOTE:</b> Not all encapsulation types are supported on the switches. See the switch CLI. </div>	
<b>Default</b>	<b>ppp</b> —Use serial PPP encapsulation.

**Physical Interface  
Options and Logical  
Interface Options**

[Warning: element unresolved in stylesheets: <title> (in <config-options>). This is probably a new element that is not yet supported in the stylesheets.]

Physical Interface Options and Logical Interface Options

For physical interfaces:

**NOTE:** Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on EX Series switches.

---

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.
- **atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).
- **cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
  - CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.
  - TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.
- **cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.
- **ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.
- **ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDUs packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.
- **ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

- **ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.
- **ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.
- **ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.
- **ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.
- **extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the **ccc** family only.
- **extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.
- **extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.
- **extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.
- **extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the **ccc** family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.
- **extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

- **extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

- **flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.
- **flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.
- **frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.
- **frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.
- **frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

**NOTE:** When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

- **frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

- **frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the **ccc** family only.
- **frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.
- **multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.
- 
- **ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.
- **ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.
- **ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.
- **vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the **ccc** family only.

- **vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.
- **vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:**

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
  - Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure **family inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.
- 

For logical interfaces:

- **frame-relay**—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.
- **multilink-frame-relay-uni-nni**—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.
- **ppp**—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.
- **ppp-over-ether**—This encapsulation is used for underlying interfaces of pp0 interfaces.

<b>Required Privilege</b>	interface—To view this statement in the configuration.
<b>Level</b>	interface-control—To add this statement to the configuration.

## interface-switch

---

<b>Syntax</b>	<pre>interface-switch <i>connection-name</i> {     interface <i>interface-name.unit-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols connections], [edit protocols connections]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Configure Layer 2 switching cross-connects. The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first.</p> <p>For Layer 2 switching cross-connects to work, you must also configure MPLS.</p>
<b>Options</b>	<p><b><i>connection-name</i></b>—Connection name (up to 128 characters in Junos 12.3 and later).</p> <p><b><i>interface interface-name.unit-number</i></b>—Interface name. Include the logical portion of the name, which corresponds to the logical unit number.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the CCC Connection for Layer 2 Switching Cross-Connects on page 1317</a></li><li>• <i>Defining the Connection for Switching Cross-Connects</i></li><li>• <i>MPLS Applications Feature Guide</i></li></ul>

## **l2circuit-control-passthrough**

---

<b>Syntax</b>	<code>l2circuit-control-passthrough;</code>
<b>Hierarchy Level</b>	[edit forwarding-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 17.4R1.
<b>Description</b>	Configure the device to allow LACP, LLDP, OAM LFM, and OAM CFM packets to cross the Layer 2 circuit. If the <b>l2circuit-control-passthrough</b> statement is not configured, LACP, LLDP, OAM LFM, and OAM CFM packets are classified as control packets and are not transmitted across the Layer 2 circuit.
<b>Default</b>	By default, this statement is not configured.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>forwarding-options</i></li><li>• <a href="#">Configuring Layer 2 Switching Cross-Connects Using CCC on page 1312</a></li></ul>

## **lsp-switch**

---

<b>Syntax</b>	<code>lsp-switch <i>connection-name</i> {     transmit-lsp <i>label-switched-path</i>;     receive-lsp <i>label-switched-path</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols connections], [edit protocols connections]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure Layer 2 switching cross-connects.
<b>Options</b>	<i>connection-name</i> —Connection name.  <i>receive-lsp label-switched-path</i> —Name of the LSP from the connection's source.  <i>transmit-lsp label-switched-path</i> —Name of the LSP to the connection's destination.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Connection for Layer 2 Switching TCCs on page 1328</a></li></ul>

## **output-interface (CCC)**

---

<b>Syntax</b>	<code>output-interface [<i>interface-name 1 interface-name n</i>];</code>
<b>Hierarchy Level</b>	[edit protocols connections p2mp-transmit-switch <i>p2mp-transmit-switch-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3.
<b>Description</b>	Specify one or more output interfaces to switch traffic on an incoming CCC interface to one or more outgoing CCC interfaces.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring CCC Switching for Point-to-Multipoint LSPs on page 1333</a></li></ul>

## p2mp-receive-switch

---

<b>Syntax</b>	<code>p2mp-receive-switch <i>point-to-multipoint-switch-name</i> {     output-interface [ <i>interface-name.unit-number</i> ];     receive-p2mp-lsp <i>receiving-point-to-multipoint-lsp</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols connections], [edit protocols connections]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the CCC switch for a point-to-multipoint LSP on the egress PE router.
<b>Options</b>	<p><i>point-to-multipoint-switch-name</i>—Point-to-multipoint CCC receive switch name.</p> <p><i>output-interface interface-name.unit-number</i>—Name of the egress interfaces for the point-to-multipoint LSP traffic. You can configure multiple output interfaces.</p> <p><i>receive-p2mp-lsp receiving-point-to-multipoint-lsp</i>—Name of the point-to-multipoint LSP that is switched to the output interface.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Point-to-Multipoint LSP Switch on Egress PE Routers on page 1334</a></li> </ul>

## p2mp-transmit-switch

---

<b>Syntax</b>	<code>p2mp-transmit-switch <i>point-to-multipoint-transmit-switch-name</i> {     input-interface <i>interface-name.unit-number</i>;     transmit-p2mp-lsp <i>transmitting-point-to-multipoint-lsp</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols connections], [edit protocols connections]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the CCC switch for the point-to-multipoint LSP on the ingress PE router.
<b>Options</b>	<p><i>point-to-multipoint-transmit-switch-name</i>—Point-to-multipoint CCC transmit switch name.</p> <p><i>input-interface interface-name.unit-number</i>—Specify the name of the interface carrying incoming traffic to be switched to the point-to-multipoint LSP.</p> <p><i>transmit-p2mp-lsp transmitting-point-to-multipoint-lsp</i>—Specify the name of the point-to-multipoint LSP carrying traffic to the CCC switch on the egress PE router.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Point-to-Multipoint LSP Switch on Ingress PE Routers on page 1333</a></li></ul>

## remote-interface-switch

---

<b>Syntax</b>	<pre>remote-interface-switch <i>connection-name</i> {     interface <i>interface-name.unit-number</i>;     transmit-lsp <i>label-switched-path</i>;     receive-lsp <i>label-switched-path</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols connections], [edit protocols connections]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure MPLS LSP tunnel cross-connects.
<b>Options</b>	<p><b><i>connection-name</i></b>—Connection name.</p> <p><b><i>interface interface-name.unit-number</i></b>—Interface name. Include the logical portion of the name, which corresponds to the logical unit number.</p> <p><b><i>receive-lsp label-switched-path</i></b>—Name of the LSP from the connection's source.</p> <p><b><i>transmit-lsp label-switched-path</i></b>—Name of the LSP to the connection's destination.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring MPLS LSP Tunnel Cross-Connects Using CCC on page 1320</a></li> </ul>

---

## address (Peer)

---

<b>Syntax</b>	<code>address <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management peer <i>peer-name</i> ], [edit protocols link-management peer <i>peer-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Specify the ID of the peer.
<b>Default</b>	The loopback address is advertised.
<b>Options</b>	<i>ip-address</i> —IP address of the peer.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <a href="#">Configuring the ID for LMP Peers on page 1078</a>

---

## control-channel (Protocols Link Management Peer)

---

<b>Syntax</b>	<code>control-channel <i>control-channel-interface</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management peer <i>peer-name</i> ], [edit protocols link-management peer <i>peer-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Specify the control channel interface for the peer.
<b>Options</b>	<i>control-channel-interface</i> —Name of the control channel interface.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LMP Peers on page 1077</a></li></ul>

## dead-interval

<b>Syntax</b>	<code>dead-interval seconds;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ospf area <i>area-id</i> <b>peer-interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit protocols ospf area <i>area-id</i> <b>peer-interface</b> <i>interface-name</i>],</p> <p>[edit protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p>
<b>Description</b>	Specify how long OSPF waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor.
<b>Options</b>	<p><b>seconds</b>—Interval to wait.</p> <p><b>Range:</b> 1 through 65,535 seconds</p> <p><b>Default:</b> Four times the hello interval—40 seconds (broadcast and point-to-point networks); 120 seconds (nonbroadcast multiple access (NBMA) networks)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

---

## disable (GMPLS)

---

<b>Syntax</b>	disable;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management te-link <i>te-link-name</i> ], [edit protocols link-management te-link <i>te-link-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Disable a traffic engineering link.
<b>Default</b>	The configured object is enabled (operational) unless explicitly disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Disabling the Traffic Engineering Link for LMP Peers on page 1082</a></li></ul>

## disable (OSPF)

**Syntax**    disable;

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols (ospf | ospf3)],  
                           [edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* interface  
                           *interface-name*],  
                           [edit logical-systems *logical-system-name* protocols ospf area *area-id*  
                           *peer-interface* *interface-name*],  
                           [edit logical-systems *logical-system-name* protocols (ospf | ospf3) virtual-link],

                           ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                               Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                               Support for the **realm** statement introduced in Junos OS Release 9.2.  
                               Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series  
                               switches.  
                               Statement introduced in Junos OS Release 11.3 for the QFX Series.  
                               Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Disable OSPF, an OSPF interface, or an OSPF virtual link.

By default, control packets sent to the remote end of a virtual link must be forwarded using the default topology. In addition, the transit area path consists only of links that are in the default topology. You can disable a virtual link for a configured topology, but not for a default topology. Include the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id* topology *name*]** hierarchy level.

**NOTE:** If you disable the virtual link by including the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id*]** hierarchy level, you disable the virtual link for all topologies, including the default topology. You cannot disable the virtual link only in the default topology.

<b>Default</b>	The configured object is enabled (operational) unless explicitly disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding OSPF Configurations</a></li> <li>• <a href="#">Configuring RSVP and OSPF for LMP Peer Interfaces on page 1082</a></li> </ul>

## export (Protocols BGP)

<b>Syntax</b>	<code>export [ <i>policy-names</i> ];</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>],          [edit protocols bgp],          [edit protocols bgp group <i>group-name</i>],          [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp],          [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i>],          [edit routing-instances <i>routing-instance-name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	<p>Apply one or more policies to routes being exported from the routing table into BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p>
<b>Options</b>	<i>policy-names</i> —Name of one or more policies.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Routing Policies to Control BGP Route Advertisements</i></li> <li>• <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide</i></li> <li>• <a href="#">import on page 2333</a></li> </ul>

## hello-dead-interval

---

<b>Syntax</b>	hello-dead-interval <i>milliseconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management peer <i>peer-name</i> lmp-protocol], [edit protocols link-management peer <i>peer-name</i> lmp-protocol]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0.
<b>Description</b>	Specify how long the Link Management Protocol (LMP) waits before declaring the control channel to be dead. This is an interval during which the router receives no LMP hello packets from the neighbor on a control that is active or up.
<b>Options</b>	<i>milliseconds</i> —Interval to wait before declaring the control channel to be dead. <b>Range:</b> 500 through 300,000 <b>Default:</b> 500 milliseconds (three times the hello interval)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Hello Message Intervals for LMP Control Channels on page 1080</a></li> <li>• <a href="#">hello-interval (LMP) on page 2330</a></li> </ul>

## hello-interval (LMP)

---

<b>Syntax</b>	hello-interval <i>milliseconds</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management peer <i>peer-name</i> lmp-protocol], [edit protocols link-management peer <i>peer-name</i> lmp-protocol]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1.
<b>Description</b>	Specify how often the router sends Link Management Protocol (LMP) hello packets.
<b>Options</b>	<i>milliseconds</i> —Length of time between hello packets. <b>Range:</b> 150 through 300,000 <b>Default:</b> 150 milliseconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Hello Message Intervals for LMP Control Channels on page 1080</a></li><li>• <a href="#">hello-dead-interval on page 2329</a></li></ul>

## hello-interval (Protocols OSPF)

<b>Syntax</b>	<code>hello-interval seconds;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ospf area <i>area-id</i> <b>peer-interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit protocols ospf area <i>area-id</i> <b>peer-interface</b> <i>interface-name</i>],</p> <p>[edit protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p>
<b>Description</b>	Specify how often the routing device sends hello packets out the interface. The hello interval must be the same for all routing devices on a shared logical IP network.
<b>Options</b>	<p><b>seconds</b>—Time between hello packets, in seconds.</p> <p><b>Range:</b> 1 through 255 seconds</p> <p><b>Default:</b> 10 seconds (broadcast and point-to-point networks); 30 seconds (nonbroadcast multiple access [NBMA] networks)</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## import

**Syntax** `import [ policy-names ];`

**Hierarchy Level** `[edit logical-systems logical-system-name protocols bgp],`  
`[edit logical-systems logical-system-name protocols bgp group group-name],`  
`[edit logical-systems logical-system-name protocols bgp group group-name neighbor address],`  
`[edit logical-systems logical-system-name routing-instances routing-instance-name protocols`  
`bgp],`  
`[edit logical-systems logical-system-name routing-instances routing-instance-name protocols`  
`bgp group group-name],`  
`[edit logical-systems logical-system-name routing-instances routing-instance-name protocols`  
`bgp group group-name neighbor address],`  
`[edit protocols bgp],`  
`[edit protocols bgp group group-name],`  
`[edit protocols bgp group group-name neighbor address],`  
`[edit routing-instances routing-instance-name protocols bgp],`  
`[edit routing-instances routing-instance-name protocols bgp group group-name],`  
`[edit routing-instances routing-instance-name protocols bgp group group-name`  
`neighbor address]`

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of **metric 500** defined in the next policy.

It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.

Hidden routes can be viewed by using the **show route receive-protocol bgp neighbor-address hidden** command. The hidden routes can then be retained or dropped from the routing

table by configuring the **keep all | none** statement at the **[edit protocols bgp]** or **[edit protocols bgp group *group-name*]** hierarchy level.

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the **keep all** statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the **keep none** statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

**Options**    *policy-names*—Name of one or more policies.

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

## instance-type

<b>Syntax</b>	<code>instance-type type;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> ], [edit routing-instances <i>routing-instance-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. <b>virtual-switch</b> and <b>layer2-control</b> options introduced in Junos OS Release 8.4. Statement introduced in Junos OS Release 9.2 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 12.3 for ACX Series routers. <b>mpls-internet-multicast</b> option introduced in Junos OS Release 11.1 for the EX Series, M Series, MX Series, and T Series. <b>evpn</b> option introduced in Junos OS Release 13.2 for MX 3D Series routers. <b>evpn</b> option introduced in Junos OS Release 17.3 for the QFX Series. <b>forwarding</b> option introduced in Junos OS Release 14.2 for the PTX Series. <b>mpls-forwarding</b> option introduced in Junos OS Release 16.1 for the MX Series. <b>evpn-vpws</b> option introduced in Junos OS Release 17.1 for MX Series routers. Support for logical systems on MX Series routers added in Junos OS Release 17.4R1.
<b>Description</b>	Define the type of routing instance.

### Options

**NOTE:** On ACX Series routers, you can configure only the forwarding, virtual router, and VRF routing instances.

**type**—Can be one of the following:

- **evpn**—(MX 3D Series routers, QFX switches, and EX9200 switches)—Enable an Ethernet VPN (EVPN) on the routing instance.  
hierarchy level.
- **evpn-vpws**—Enable an Ethernet VPN (EVPN) Virtual Private Wire Service (VPWS) on the routing instance.
- **forwarding**—Provide support for filter-based forwarding, where interfaces are not associated with instances. All interfaces belong to the default instance. Other instances are used for populating RPD learned routes. For this instance type, there is no one-to-one mapping between an interface and a routing instance. All interfaces belong to the default instance inet.0.
- **l2backhaul-vpn**—Provide support for Layer 2 wholesale VLAN packets with no existing corresponding logical interface. When using this instance, the router learns both the outer tag and inner tag of the incoming packets, when the **instance-role** statement is defined as **access**, or the outer VLAN tag only, when the **instance-role** statement is defined as **nni**.

- **l2vpn**—Enable a Layer 2 VPN on the routing instance. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.
- **layer2-control**—(MX Series routers only) Provide support for RSTP or MSTP in customer edge interfaces of a VPLS routing instance. This instance type cannot be used if the customer edge interface is multihomed to two provider edge interfaces. If the customer edge interface is multihomed to two provider edge interfaces, use the default BPDU tunneling.
- **mpls-forwarding**—(MX Series routers only) Allow filtering and translation of route distinguisher (RD) values in IPv4 and IPv6 VPN address families on both routes received and routes sent for selected BGP sessions. In particular, for Inter-AS VPN Option-B networks, this option can prevent the malicious injection of VPN labels from one peer AS boundary router to another.
- **mpls-internet-multicast**—(EX Series, M Series, MX Series, and T Series routers only) Provide support for ingress replication provider tunnels to carry IP multicast data between routers through an MPLS cloud, using MBGP or next-generation MVPN.
- **no-forwarding**—This is the default routing instance. Do not create a corresponding forwarding instance. Use this routing instance type when a separation of routing table information is required. There is no corresponding forwarding table. All routes are installed into the default forwarding table. IS-IS instances are strictly nonforwarding instance types.
- **virtual-router**—Enable a virtual router routing instance. This instance type is similar to a VPN routing and forwarding instance type, but used for non-VPN-related applications. You must configure the **interface** statement for this type of routing instance. You do not need to configure the **route-distinguisher**, **vrf-import**, and **vrf-export** statements.
- **virtual-switch**—(MX Series routers, EX9200 switches, and QFX switches only) Provide support for Layer 2 bridging. Use this routing instance type to isolate a LAN segment with its Spanning Tree Protocol (STP) instance and to separate its VLAN identifier space.
- **vpls**—Enable VPLS on the routing instance. Use this routing instance type for point-to-multipoint LAN implementations between a set of sites in a VPN. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.
- **vrf**—VPN routing and forwarding (VRF) instance. Provides support for Layer 3 VPNs, where interface routes for each instance go into the corresponding forwarding table only. Required to create a Layer 3 VPN. Create a VRF table (**instance-name.inet.0**) that contains the routes originating from and destined for a particular Layer 3 VPN. For this instance type, there is a one-to-one mapping between an interface and a routing instance. Each VRF instance corresponds with a forwarding table. Routes on an interface go into the corresponding forwarding table. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## interface (Protocols Link Management)

**Syntax** `interface interface-name;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols link-management te-link *te-link-name*],  
[edit protocols link-management te-link *te-link-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the egress router interface.

**Options** *interface-name*—Name of the interface to the egress router.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## label-switched-path (Protocols Link Management)

---

<b>Syntax</b>	label-switched-path <i>lsp-name</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management te-link <i>te-link-name</i> ], [edit protocols link-management te-link <i>te-link-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4.
<b>Description</b>	Specify the label-switched path (LSP) to be used by the forwarding adjacency.
<b>Options</b>	<i>lsp-name</i> —Name of the LSP.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Forwarding Adjacencies</i></li></ul>

## link-management

<b>Syntax</b>	<pre> link-management {   peer <i>peer-name</i> {     address <i>ip-address</i>;     control-channel <i>control-channel-interface</i>;     lmp-control-channel <i>control-channel-interface</i> {       remote-address <i>ip-address</i>;     }     lmp-protocol {       hello-dead-interval <i>milliseconds</i>;       hello-interval <i>milliseconds</i>;       passive;       retransmission-interval <i>milliseconds</i>;       retry-limit <i>number</i>;     }     te-link <i>te-link-name</i>;   }   te-link <i>te-link-name</i> {     disable;     interface <i>interface-name</i> {       disable;       local-address <i>ip-address</i>;       remote-address <i>ip-address</i>;       remote-id <i>id-number</i>;     }     local-address <i>ip-address</i>;     remote-address <i>ip-address</i>;     remote-id <i>id-number</i>;   }   traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;;   } } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols], [edit protocols]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Enable Link Management Protocol (LMP) on the router.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">LMP Configuration Overview on page 1074</a></li> </ul>

## lmp-control-channel

---

<b>Syntax</b>	<code>lmp-control-channel <i>control-channel-interface</i> {     <i>remote-address</i> <i>ip-address</i>; }</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management peer <i>peer-name</i> ], [edit protocols link-management peer <i>peer-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1.
<b>Description</b>	Specify the Link Management Protocol (LMP) control channel interface for the peer.
<b>Options</b>	<i>control-channel-interface</i> —Name of the control channel interface.  The remaining statement is described separately in this chapter.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the LMP Control Channel Interface for the Peer on page 1079</a></li></ul>

---

## lmp-protocol

---

<b>Syntax</b>	<pre>lmp-protocol {     hello-dead-interval <i>milliseconds</i>;     hello-interval <i>milliseconds</i>;     passive;     retransmission-interval <i>milliseconds</i>;     retry-limit <i>number</i>; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management peer <i>peer-name</i> ], [edit protocols link-management peer <i>peer-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1.
<b>Description</b>	Configure attributes of Link Management Protocol (LMP) to establish and maintain the LMP control channel for the peer.
<b>Options</b>	The statements are described separately in this chapter.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring LMP Peers on page 1077</a></li></ul>

## local-address (Protocols Link Management)

---

<b>Syntax</b>	<code>local-address <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management te-link <i>te-link-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols link-management te-link <i>te-link-name</i> interface <i>interface-name</i> ], [edit protocols link-management te-link <i>te-link-name</i> ], [edit protocols link-management te-link <i>te-link-name</i> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Specify the local IP address associated with the traffic engineering link. If you configure the local IP address, you must also configure the <a href="#">remote-address</a> statement.
<b>Options</b>	<i>local-address</i> —Local IP address of the traffic engineering link.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Local IP Address for Traffic Engineering Links on page 1076</a></li><li>• <a href="#">Configuring the Local IP Address for Forwarding Adjacencies</a></li><li>• <a href="#">remote-address (for LMP Traffic Engineering) on page 2348</a></li></ul>

## l2circuit

<b>Syntax</b>	<pre> l2circuit {   auto-sensing{     password <i>password</i>;   }   local-switching {     interface <i>interface-name</i> {       description <i>text</i>;       end-interface {         interface <i>interface-name</i>;         protect-interface <i>interface-name</i>;       }       ignore-mtu-mismatch;       protect-interface <i>interface-name</i>;     }   }   neighbor <i>address</i> {     interface <i>interface-name</i> {       backup-neighbor <i>address</i>;       bandwidth (<i>bandwidth</i>   <i>ctnumber bandwidth</i>);       community <i>community-name</i>;       connection-protection;       (control-word   no-control-word);       description <i>text</i>;       egress-protection;       encapsulation-type <i>type</i>;       ignore-encapsulation-mismatch;       ignore-mtu-mismatch;       mtu <i>mtu-number</i>;       protect-interface <i>interface-name</i>;       pseudowire-status-tlv hot-standby-vc-on;       psn-tunnel-endpoint <i>address</i>;       virtual-circuit-id <i>identifier</i>;     }   }   traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;;   } } </pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols], [edit protocols]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
<b>Description</b>	Enables a Layer 2 circuit.

The remaining statements are explained separately. See [CLI Explorer](#).

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## remote-address (for LMP Control Channel)

---

<b>Syntax</b>	<code>remote-address <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management peer <i>peer-name</i> <code>lmp-control-channel <i>control-channel-interface</i></code> ], [edit protocols link-management peer <i>peer-name</i> <code>lmp-control-channel <i>control-channel-interface</i></code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1.
<b>Description</b>	Specify the remote IP address for the Link Management Protocol (LMP) control channel interface.
<b>Options</b>	<i>ip-address</i> —Remote IP address mapped to the LMP control channel interface.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Remote IP Address for LMP Control Channels on page 1079</a></li> </ul>

## remote-address (for LMP Traffic Engineering)

---

<b>Syntax</b>	<code>remote-address <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management te-link <i>te-link-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols link-management te-link <i>te-link-name</i> interface <i>interface-name</i> ], [edit protocols link-management te-link <i>te-link-name</i> ], [edit protocols link-management te-link <i>te-link-name</i> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Specify the remote IP address for the traffic engineering link. If you configure the remote IP address, you must also configure the <a href="#">local-address</a> statement.
<b>Options</b>	<i>ip-address</i> —Remote IP address mapped to the traffic engineering link.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Remote IP Address for Traffic Engineering Links on page 1076</a></li><li>• <a href="#">Configuring the Remote IP Address for Forwarding Adjacencies</a></li><li>• <a href="#">local-address (Protocols Link Management) on page 2342</a></li></ul>

## remote-id

---

<b>Syntax</b>	<code>remote-id <i>id-number</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management te-link <i>te-link-name</i> ], [edit logical-systems <i>logical-system-name</i> protocols link-management te-link <i>te-link-name</i> interface <i>interface-name</i> ], [edit protocols link-management te-link <i>te-link-name</i> ], [edit protocols link-management te-link <i>te-link-name</i> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Specify the ID assigned to a traffic engineering link or an interface (resource) on the peer node.
<b>Options</b>	<i>id-number</i> —ID number for the remote device.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Remote ID for Traffic Engineering Links on page 1077</a></li> </ul>

## retransmission-interval

---

<b>Syntax</b>	<code>retransmission-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management peer <i>peer-name</i> <code>lmp-protocol</code> ], [edit protocols link-management peer <i>peer-name</i> <code>lmp-protocol</code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1.
<b>Description</b>	Specify how often Link Management Protocol (LMP) sends Config and LinkSummary messages on the LMP control channel.
<b>Options</b>	<i>milliseconds</i> —Length of time between Config messages. <b>Range:</b> 500 through 300,000 <b>Default:</b> 500 milliseconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">retry-limit (Protocols Link Management) on page 2352</a></li><li>• <a href="#">Controlling Message Exchange for LMP Control Channels on page 1081</a></li></ul>

## retransmit-interval (OSPF)

**Syntax** `retransmit-interval seconds;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols ospf area *area-id* **peer-interface** *interface-name*],  
 [edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* interface *interface-name*],  
 [edit logical-systems *logical-system-name* protocols (ospf | ospf3) area *area-id* virtual-link],  
 [edit logical-systems *logical-system-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* interface *interface-name*],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* virtual-link],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*],  
 [edit protocols ospf area *area-id* **peer-interface** *interface-name*],  
 [edit protocols (ospf | ospf3) area *area-id* interface *interface-name*],  
 [edit protocols (ospf | ospf3) area *area-id* virtual-link],  
 [edit protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*],  
 [edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* interface *interface-name*],  
 [edit routing-instances *routing-instance-name* protocols (ospf | ospf3) area *area-id* virtual-link],  
 [edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for the **realm** statement introduced in Junos OS Release 9.2.  
 Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series switches.

**Description** Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements (LSAs) to an interface's neighbors.

**Options** **seconds**—Interval to wait.  
**Range:** 1 through 65,535 seconds  
**Default:** 5 seconds

**NOTE:** You must configure LSA retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because Junos OS delays LSA acknowledgments by up to 2 seconds.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring RSVP and OSPF for LMP Peer Interfaces on page 1082](#)

---

## retry-limit (Protocols Link Management)

---

**Syntax** `retry-limit number;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols link-management peer *peer-name* lmp-protocol],  
[edit protocols link-management peer *peer-name* lmp-protocol]

**Release Information** Statement introduced in Junos OS Release 8.1.

**Description** Specify how many times the Link Management Protocol (LMP) sends Config and LinkSummary messages on the LMP control channel without receiving an appropriate acknowledgment before it logs a message and restarts the LMP control channel configuration process.

**Options** *number*—Maximum number of times messages are sent without receiving an acknowledgment.  
**Range:** 3 through 1000  
**Default:** 3

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Controlling Message Exchange for LMP Control Channels on page 1081](#)

## route-distinguisher

<b>Syntax</b>	<code>route-distinguisher (as-number:id   ip-address:id);</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>],  [edit routing-instances <i>routing-instance-name</i>],  [edit routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>],  [edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Support at [edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>] hierarchy level introduced in Junos OS Release 11.2.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> <p>Support at [edit routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>] hierarchy level introduced in Junos OS Release 13.2.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for QFX Series switches.</p>
<b>Description</b>	<p>Specify an identifier attached to a route, enabling you to distinguish to which VPN or virtual private LAN service (VPLS) the route belongs. Each routing instance must have a unique route distinguisher (RD) associated with it. The RD is used to place bounds around a VPN so that the same IP address prefixes can be used in different VPNs without having them overlap. If the instance type is <b>vrf</b>, the <b>route-distinguisher</b> statement is required.</p> <p>For Layer 2 VPNs and VPLS, if you configure the <b>l2vpn-use-bgp-rules</b> statement, you must configure a unique RD for each PE router participating in the routing instance.</p> <p>For other types of VPNs, we recommend that you use a unique RD for each provider edge (PE) router participating in specific routing instance. Although you can use the same RD on all PE routers for the same VPN routing instance, if you use a unique RD, you can determine the customer edge (CE) router from which a route originated within the VPN.</p> <p>For Layer 2 VPNs and VPLSs, if you configure mesh groups, the RD in each mesh group must be unique.</p>

**CAUTION:** We strongly recommend that if you change an RD that has already been configured, make the change during a maintenance window, as follows:

1. Deactivate the routing instance.
2. Change the RD.
3. Activate the routing instance.

This is not required if you are configuring the RD for the first time.

**Options** *as-number:number*—*as-number* is an assigned AS number, and *number* is any 2-byte or 4-byte value. The AS number can be from 1 through 4,294,967,295. If the AS number is a 2-byte value, the administrative number is a 4-byte value. If the AS number is a 4-byte value, the administrative number is a 2-byte value. An RD consisting of a 4-byte AS number and a 2-byte administrative number is defined as a type 2 RD in RFC 4364 *BGP/MPLS IP VPNs*.

**NOTE:** In Junos OS Release 9.1 and later, the numeric range for AS numbers is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. All releases of Junos OS support 2-byte AS numbers. To configure an RD that includes a 4-byte AS number, append the letter “L” to the end of the AS number. For example, an RD with the 4-byte AS number 7,765,000 and an administrative number of 1,000 is represented as 77765000L:1000.

In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in the plain-number format is represented as 1.10 in AS dot notation format.

*ip-address:id*—IP address (*ip-address* is a 4-byte value) within your assigned prefix range and a 2-byte value for the *id*. The IP address can be any globally unique unicast address.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ ). If the router you are configuring is a BGP peer of a router that does not support 4-byte AS numbers, you need to configure a local AS number. For more information, see *Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview*.

**NOTE:** For Ethernet VPN (EVPN), an RD that includes zero as the *id* value is reserved for the default EVPN routing instance by default. Because the same RD cannot be assigned for two routing instances, using a *ip-address:id* RD for another routing instance (default-switch), where the *id* value is zero, throws a commit error.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

## te-link

<b>Syntax</b>	<pre>te-link te-link-name {     disable;     ethernet-vlan;     interface interface-name {         disable;         local-address ip-address;         remote-address ip-address;         remote-id id-number;     }     local-address ip-address;     remote-address ip-address;     remote-id id-number; }</pre>
<b>Hierarchy Level</b>	<pre>[edit protocols link-management], [edit protocols link-management peer peer-name]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>ethernet-vlan</b> option introduced in Junos OS Release 14.2.</p>
<b>Description</b>	<p>Represent a collection of physical ports or time slots. Assign a traffic engineering link to the specified network peer.</p>
<b>Options</b>	<p><b>te-link-name</b>—Name of the collection of physical ports or the name of the time slots.</p> <p><b>disable</b>—Disable the traffic engineering link or an interface to a traffic engineering link.</p> <p>The remaining statements are explained separately..</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LMP Traffic Engineering Links on page 1075</a></li> </ul>

## traceoptions (Protocols Link Management)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt;;     flag <i>flag</i> &lt;flag-modifier&gt; &lt;disable&gt;; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols link-management], [edit protocols link-management]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Support for <b>hello-packets</b> , <b>packets</b> , and <b>state</b> flags added in Junos OS Release 8.1.
<b>Description</b>	Trace options for the LMP protocol.
<b>Options</b>	<p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 2 files</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all available operations</li><li>• <b>hello-packets</b>—Trace hello packets on any LMP control channel</li><li>• <b>init</b>—Output from the initialization messages</li><li>• <b>packets</b>—Trace all packets other than hello packets on any LMP control channel</li><li>• <b>parse</b>—Operation of the parser</li><li>• <b>process</b>—Operation of the general configuration</li><li>• <b>route-socket</b>—Operation of route socket events</li><li>• <b>routing</b>—Operation of the routing protocols</li><li>• <b>server</b>—Server processing operations</li></ul>

- **show**—**show** command servicing operations
- **state**—Trace state transitions of the LMP control channels and traffic engineering links

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-world-readable**—(Optional) Prevent all users from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

**world-readable**—(Optional) Enable log file access for all users.

<b>Required Privilege Level</b>	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Tracing LMP Traffic on page 1084</a></li> <li>• <i>Network Management and Monitoring Guide</i></li> </ul>

## transit-delay (OSPF)

<b>Syntax</b>	<code>transit-delay seconds;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> protocols ospf area <i>area-id</i> <b>peer-interface</b> <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit logical-systems <i>logical-system-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf area <i>area-id</i> virtual-link],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit protocols ospf area <i>area-id</i> <b>peer-interface</b> <i>interface-name</i>],</p> <p>[edit protocols (ospf   ospf3) area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit protocols (ospf   ospf3) area <i>area-id</i> virtual-link],</p> <p>[edit protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast)] area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf area <i>area-id</i> interface <i>interface-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf area <i>area-id</i> virtual-link],</p> <p>[edit routing-instances <i>routing-instance-name</i> protocols ospf3 realm (ipv4-unicast   ipv4-multicast   ipv6-multicast) area <i>area-id</i> interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2.</p> <p>Support for the <b>realm</b> statement introduced in Junos OS Release 9.2 for EX Series switches.</p>
<b>Description</b>	<p>Set the estimated time required to transmit a link-state update on the interface. When calculating this time, make sure to account for transmission and propagation delays.</p> <p>You should never have to modify the transit delay time.</p>
<b>Options</b>	<p><b>seconds</b>—Estimated time, in seconds.</p> <p><b>Range:</b> 1 through 65,535 seconds</p> <p><b>Default:</b> 1 second</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring OSPF Timers</i></li> </ul>

- [Configuring RSVP and OSPF for LMP Peer Interfaces on page 1082](#)

## upstream-label

---

<b>Syntax</b>	<pre>upstream-label {   vlan-id <i>vlan-id</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols mpls label-switched-path <i>lsp-name</i> lsp-attributes]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2.
<b>Description</b>	Specify the upstream label for the bidirectional label-switched path (LSP).
<b>Options</b>	<b>vlan-id <i>vlan-id</i></b> —VLAN ID to be used for the Generalized MPLS (GMPLS) VLAN LSP at the ingress provider edge (PE) to customer edge (CE) link.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring MPLS LSPs for GMPLS on page 1085</a></li></ul>

## vrf-target

---

<b>Syntax</b>	<pre>vrf-target {     community;     auto     import community-name;     export community-name; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols evpn vni-options], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>], [edit switch-options]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for QFX Series switches. <b>auto option</b> was also added at this time.</p>
<b>Description</b>	<p>Specify a virtual routing and forwarding (VRF) target community. If you configure the <b>community</b> option only, default VRF import and export policies are generated that accept and tag routes with the specified target community. The purpose of the <b>vrf-target</b> statement is to simplify the configuration by allowing you to configure most statements at the [edit routing-instances] hierarchy level. In effect, this statement configures a single policy for import and a single policy for export to replace the per-VRF policies for every community.</p> <p>You can still create more complex policies by explicitly configuring VRF import and export policies using the <b>import</b> and <b>export</b> options.</p>
<b>Options</b>	<p><b>community</b>—Community name.</p> <p><b>auto</b>—Automatically derives the route target (RT) for QFX5100 switches.</p> <p><b>import community-name</b>—Allowed communities accepted from neighbors.</p> <p><b>export community-name</b>—Allowed communities sent to neighbors.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## delegation-cleanup-timeout

---

**Syntax**    `delegation-cleanup-timeout seconds;`

**Hierarchy Level**    `[edit protocols pcep pce pce-id]`

**Release Information**    Statement introduced in Junos OS Release 12.3.  
Support for PTX Series added in Junos OS Release 14.2.  
Support for QFX Series switches added in Junos OS Release 16.1R3.  
Support for ACX Series added in Junos OS Release 17.1R1.

**Description**    Specify the amount of time (in seconds) that a Path Computation Client (PCC) must wait before returning control of all LSPs to the routing protocol process after a PCEP session with the main active stateful Path Computation Element (PCE) is disconnected.

**NOTE:** In compliance with *draft-ietf-pce-stateful-pce-09*, revoking of PCE-initiated LSP delegations by a PCC happens in a make-before-break fashion before the LSPs are redelegated to an alternate PCE. Starting in Junos OS Release 18.1R1, the `lsp-cleanup-timer` must be greater than or equal to the `delegation-cleanup-timeout` for the PCC to revoke the LSP delegations. If not, the redelegation timeout interval for the PCC can be set to infinity, where the LSP delegations to that PCE remain intact until specific action is taken by the PCC to change the parameters set by the PCE.

**Options**    **seconds**—Time (in seconds) that a PCC must wait before returning control of all LSPs to the routing protocol process after a PCEP session with the main active stateful PCE is disconnected.

**Range:** 0 through 600 seconds

**Default:** 30 seconds

**Required Privilege Level**    routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**    • [pce on page 2375](#)

## delegation-priority

---

<b>Syntax</b>	<code>delegation-priority <i>priority-number</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pcep pce <i>pce-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series switches added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
<b>Description</b>	Specify the priority number of the active stateful Path Computation Element (PCE). This value is used by the Path Computation Client (PCC) to elect a PCE to delegate LSPs. No two PCEs can have the same delegation-priority value. The PCC elects the PCE with a lower priority as the main active stateful PCE to delegate LSPs.
<b>Options</b>	<i>priority-number</i> —Priority number of the active stateful PCE. <b>Range:</b> 1 through 65535 <b>Default:</b> 0 (no priority is set)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">pce on page 2375</a></li> </ul>

## destination-ipv4-address

---

<b>Syntax</b>	<code>destination-ipv4-address <i>ipv4-address</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pcep pce <i>pce-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series switches added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
<b>Description</b>	Specify the IPv4 address of the Path Computation Element (PCE) to which the Path Computation Client (PCC) should connect.
<b>Options</b>	<i>ipv4-address</i> —IPv4 address of the PCE.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pce on page 2375</a></li></ul>

## destination-port

---

<b>Syntax</b>	<code>destination-port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pcep pce <i>pce-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFXswitches added in Junos OS Release 16.1R3.
<b>Description</b>	Specify the TCP port number of the Path Computation Element (PCE) to which the Path Computation Client (PCC) should connect.
<b>Options</b>	<i>port-number</i> —Destination TCP port number. <b>Range:</b> 1 through 65535 <b>Default:</b> 4189
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pce on page 2375</a></li></ul>

## label-switched-path-template

---

<b>Syntax</b>	label-switched-path-template { (default-template   <i>lsp-template-name</i> ); }
<b>Hierarchy Level</b>	[edit protocols mpls lsp-external-controller <i>lsp-external-controller</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.3.
<b>Description</b>	Specify the LSP template with parameters for setting up the PCE-initiated LSPs when the PCE initiating the LSP does not provide the PCE-initiated parameters. When <b>label-switched-path-template</b> is not configured, the default LSP parameters are used.
<b>Options</b>	<p><b>default-template</b>—Specify that the default LSP template be used for the dynamically generated PCE-initiated LSPs.</p> <p><b><i>lsp-template-name</i></b>—Specify the name of the LSP template to be used for setting up PCE-initiated LSPs.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">pcep on page 2364</a></li> </ul>

## **lsp-cleanup-timer**

---

<b>Syntax</b>	<code>lsp-cleanup-timer <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols pcep pce <i>pce-id</i>]</code> <code>[edit protocols pcep pce-group <i>group-id</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 13.3.
<b>Description</b>	Specify the amount of time (in seconds) that the Path Computation Client (PCC) must wait before deleting any non-delegated Path Computation Element (PCE)-initiated LSPs from the failed PCE after a PCEP session terminates.
<div> <b>NOTE:</b> In compliance with <i>draft-ietf-pce-stateful-pce-09</i>, revoking of PCE-initiated LSP delegations by a PCC happens in a make-before-break fashion before the LSPs are redelegated to an alternate PCE. Starting in Junos OS Release 18.1R1, the <code>lsp-cleanup-timer</code> must be greater than or equal to the <code>delegation-cleanup-timeout</code> for the PCC to revoke the LSP delegations. If not, the redelegation timeout interval for the PCC can be set to infinity, where the LSP delegations to that PCE remain intact until specific action is taken by the PCC to change the parameters set by the PCE.</div>	
<b>Options</b>	<b><i>seconds</i></b> —Time (in seconds) that the PCC must wait before deleting any non-delegated PCE-initiated LSPs from the failed PCE after a PCEP session terminates. <b>Range:</b> 0 through 4294967294 seconds <b>Default:</b> 0 (Non-delegated PCE-initiated LSPs are deleted immediately)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pcep on page 2364</a></li></ul>

## **`lsp-external-controller`**

<b>Syntax</b>	<code>lsp-external-controller <i>controller-name</i>;</code>
<b>Hierarchy Level</b>	[edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i> ] [edit protocols spring-traffic-engineering]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 16.1R3 for QFX Series switches. Support for ACX Series added in Junos OS Release 17.1. Support at the <b>[edit protocols spring-traffic-engineering]</b> hierarchy level introduced in Junos OS Release 17.2.
<b>Description</b>	Enable external path computing capability for the device.
<b>Options</b>	<b><i>controller-name</i></b> —Name of the external path computing entity. By default, <i>pccd</i> is the only allowed LSP external controller. <b>Values:</b> <i>pccd</i>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">pcep on page 2364</a></li> <li>• <a href="#">Support of the Path Computation Element Protocol for RSVP-TE Overview on page 1347</a></li> <li>• <a href="#">Support of SPRING-TE for the Path Computation Element Protocol Overview on page 1407</a></li> <li>• <a href="#">Example: Configuring Path Computation Element Protocol for SPRING-TE LSPs on page 1411</a></li> </ul>

## max-unknown-messages

---

<b>Syntax</b>	max-unknown-messages <i>messages-per-minute</i> ;
<b>Hierarchy Level</b>	[edit protocols pcep pce <i>pce-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series switches added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
<b>Description</b>	Specify the number of unknown messages per minute that the Path Computation Client (PCC) can receive at maximum after which the PCEP session is closed.
<b>Options</b>	<b><i>messages-per-minute</i></b> —Number of unknown messages per minute that the PCC can receive at maximum after which the PCEP session is closed. Recommended value is 5. If the number of unknown messages received by the PCC is greater than or equal to the maximum number, the PCEP session is closed. <b>Range:</b> 1 through 16384 <b>Default:</b> 0 (disabled or no limit)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pce on page 2375</a></li></ul>

---

## max-unknown-requests

---

<b>Syntax</b>	<code>max-unknown-requests <i>requests-per-minute</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols pcep pce <i>pce-id</i>]</code> <code>[edit protocols pcep pce-group <i>group-id</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 13.3.
<b>Description</b>	Specifies the number of unknown requests per minute that the Path Computation Client (PCC) can receive at maximum after which the PCEP session is terminated.
<b>Options</b>	<b><i>requests-per-minute</i></b> —Number of unknown requests per minute that the PCC can receive at maximum after which the PCEP session is terminated. <b>Range:</b> 0 through 16384 (0 disables this statement) <b>Default:</b> 5
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pce on page 2375</a></li></ul>

## message-rate-limit

---

<b>Syntax</b>	<code>message-rate-limit <i>messages-per-minute</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pcep]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
<b>Description</b>	Specify the number of messages per minute that the Path Computation Client (PCC) can receive at maximum.
<b>Options</b>	<b><i>messages-per-minute</i></b> —Number of messages per minute that the PCC can receive at maximum. <b>Range:</b> 1 through 16384 <b>Default:</b> 0 (disabled or no limit)
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pcep on page 2364</a></li></ul>

## pce

**Syntax** `pce pce-id {`  
     `authentication-key key;`  
     `authentication-key-chain key-chain;`  
     `delegation-cleanup-timeout seconds;`  
     `delegation-priority priority-number;`  
     `destination-ipv4-address ipv4-address;`  
     `destination-port port-number;`  
     `local-address ip-address;`  
     `lsp-cleanup-timer seconds;`  
     `lsp-provisioning;`  
     `lsp-retry-delegation;`  
     `lsp-retry-delegation-timer seconds;`  
     `max-sid-depth max-sid-depth;`  
     `max-unknown-messages messages-per-minute;`  
     `max-unknown-requests requests-per-minute;`  
     `p2mp-lsp-report-capability;`  
     `pce-group pce-group-name;`  
     `pce-type ;`  
     `request-timer seconds;`  
     `request-priority priority;`  
     `spring-capability;`  
     `traceoptions ;`

**Hierarchy Level** [edit protocols pcep]

**Release Information** Statement introduced in Junos OS Release 12.3.  
 Support for PTX Series added in Junos OS Release 14.2.  
 Support for QFX10000 switches added in Junos OS Release 16.1R3.  
 Support for ACX Series added in Junos OS Release 17.1R1.  
**lsp-cleanup-timer** statement introduced in Junos OS Release 13.3.  
**lsp-provisioning** statement introduced in Junos OS Release 13.3.  
**max-unknown-requests** statement introduced in Junos OS Release 13.3.  
**request-timer** statement introduced in Junos OS Release 13.3.  
**request-priority** statement introduced in Junos OS Release 13.3.  
**authentication-key key**, **authentication-key-chain key-chain**, and **p2mp-lsp-report-capability** statements introduced in Junos OS Release 16.1.  
**max-sid-depth** and **spring-capability** statements introduced in Junos OS Release 17.2.

**Description** Configure per-Path Computation Element (PCE) parameters.

**Options** `pce-id`—IP address of the PCE.

**authentication-key key**—(Optional) Authentication password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

It is recommended to define and bind an authentication key for securing a PCEP session, as opposed to binding an authentication keychain.

**authentication-key-chain *key-chain***—(Optional) Authentication keychain password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

**local-address *ip-address***—(Optional) IP address of the local end of the PCEP session, the PCC.

**lsp-retry-delegation**—(Optional) Enable retry LSP delegation process.

**lsp-retry-delegation-timer**—(Optional) Specify the amount of time (in seconds) that the Path Computation Client (PCC) must wait before retrying delegation of Path Computation Element (PCE)-initiated LSPs in case of delegation failure or re-delegation.

**Default:** 3600 seconds

**Range:** 0 through 4294967294 seconds

**max-sid-depth**—(Optional) Specify the maximum value for service identifier (SID) depth.

**Default:** 5

**Range:** 1 through 5

**p2mp-lsp-report-capability**—(Optional) Capability to report point-to-multipoint RSVP-TE LSPs to a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable reporting of point-to-multipoint LSPs to a PCE.

**spring-capability**—(Optional) Enable SPRING-based provisioning for the PCE.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
---------------------------------	---

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pcep on page 2364</a></li><li>• <a href="#">Example: Configuring Path Computation Element Protocol for SPRING-TE LSPs on page 1411</a></li><li>• <a href="#">Support of the Path Computation Element Protocol for RSVP-TE Overview on page 1347</a></li></ul>
------------------------------	---

## pce-group (PCE)

---

<b>Syntax</b>	<code>pce-group <i>pce-group-name</i>;</code>
<b>Hierarchy Level</b>	[edit protocols pcep pce <i>pce-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series switches added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
<b>Description</b>	Specify the Path Computation Element (PCE) group to which the configured PCE belongs.
<b>Options</b>	<i>pce-group-name</i> —Name of the PCE group.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pce on page 2375</a></li></ul>

## pce-group (Protocols PCEP)

---

**Syntax**    `pce-group pce-group-id {  
                  delegation-cleanup-timeout seconds;  
                  max-unknown-messages messages-per-minute;  
                  pce-type {  
                    active stateful;  
                  }  
                  traceoptions {  
                    file filename <files number> <size size> <world-readable | no-world-readable>;  
                    flag (all | pcep);  
                    no-remote-trace;  
                  }  
                }`

**Hierarchy Level**    [edit protocols pcep]

**Release Information**    Statement introduced in Junos OS Release 12.3.  
Support for PTX Series added in Junos OS Release 14.2.  
Support for QFX Series switches added in Junos OS Release 16.1R3.  
Support for ACX Series added in Junos OS Release 17.1R1.

**Description**    Configure the Path Computation Element (PCE) group parameters. A maximum of 10 PCE groups can be configured at any given point in time.  
The remaining statements are explained separately.

**NOTE:** A PCE group can include PCEs that are either only stateful or only active stateful. A combination of stateful PCEs and active stateful PCEs in one PCE group is not supported.

---

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**    • [pcep on page 2364](#)

---

## pce-type

---

<b>Syntax</b>	<pre>pce-type {   active stateful; }</pre>
<b>Hierarchy Level</b>	[edit protocols pcep pce <i>pce-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series switches added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
<b>Description</b>	Configure the path computation element (PCE) type: <ul style="list-style-type: none"><li>• active—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegated control over their LSPs to the PCE.</li><li>• stateful—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update the LSP state. A PCC maintains synchronization with the PCE.</li></ul>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">pce on page 2375</a></li></ul>

## querier (performance-monitoring)

```
Syntax  querier {
        delay {
            traffic-class tc-value {
                average-sample-size sample size;
                padding-size size;
                query-interval milliseconds;
                rtt-delay-threshold rtt threshold value;
                twcd-delay-threshold twcd threshold value;
            }
        }
        loss {
            traffic-class tc-value {
                average-sample-size sample size;
                loss-threshold loss threshold value;
                loss-threshold-window number of samples for loss threshold;
                measurement-quantity bytes|packets;
                query-interval milliseconds;
            }
        }
        loss-delay {
            traffic-class tc-value {
                average-sample-size sample size;
                loss-threshold loss threshold value;
                loss-threshold-window number of samples for loss threshold;
                measurement-quantity bytes|packets;
                padding-size size;
                query-interval milliseconds;
                rtt-delay-threshold rtt threshold value;
                twcd-delay-threshold twcd threshold value;
            }
        }
    }
```

## traceoptions (PCE)

---

**Syntax**    `traceoptions {  
              file filename <files number> <size size> <world-readable | no-world-readable>;  
              flag (all | pcep);  
              no-remote-trace;  
          }`

**Hierarchy Level**    [edit protocols pcep pce *pce-id*]

**Description**        Configure the Path Computation Element Protocol (PCEP) tracing options.

**Options**        ***filename***—Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`.

***files number***—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Range:** 2 through 1000 files

**Default:** 2 files. If you specify a maximum number of files, you must also include the ***size*** statement to specify the maximum file size.

***flag***—Area of path computation client process (`pccd`) to enable debugging output.

- **all**—Trace all areas of PCD code.
- **pcep**—Trace Path Computation Element Protocol (PCEP) operations.

***no-remote-trace***—(Optional) Disable remote tracing options.

***no-world-readable***—(Optional) Allow only certain users to read the log file.

***size size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the trace-file again reaches this size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.

**Range:** 10 KB through the maximum file size supported on your system.

**Default:** 1 MB. If you specify a maximum file size, you must also include the ***files*** statement to specify the maximum number of files.

***world-readable***—(Optional) Allow any user to read the log file.

**Required Privilege** routing and trace—To view this statement in the configuration.  
**Level** routing-control and trace-control—To add this statement to the configuration.

**Related Documentation** • [pce on page 2375](#)

## traceoptions (Protocols PCEP)

---

**Syntax**    `traceoptions {  
              file filename <files number> <size size> <world-readable | no-world-readable>;  
              flag flag;  
              no-remote-trace;  
          }`

**Hierarchy Level**    [edit protocols pcep]

**Description**    Configure the Path Computation Element Protocol (PCEP) tracing options.

**Options**    *filename*—Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`.

*files number*—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Range:** 2 through 1000 files

**Default:** 2 files. If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

*flag*—Area of path computation client process (pccd) to enable debugging output.

### PCEP Tracing Flags

- *all*—Trace all areas of PCCD code
- *pccd-config*—All configuration parsing operations
- *pccd-core*—PCCD core operations
- *pccd-functions*—PCCD function entries and outs
- *pccd-main*—PCCD main module
- *pccd-rpd*—PCCD communication with RPD
- *pccd-ui*—PCCD user interface handling

*no-remote-trace*—(Optional) Disable remote tracing options.

*no-world-readable*—(Optional) Allow only certain users to read the log file.

*size size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the trace-file again reaches this size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.

**Range:** 10 KB through the maximum file size supported on your system.

**Default:** 1 MB. If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

***world-readable***—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

**Related Documentation** • [pcep on page 2364](#)

## update-rate-limit

**Syntax** update-rate-limit *updates-per-minute*;

**Hierarchy Level** [edit protocols pcep]

**Release Information** Statement introduced in Junos OS Release 12.3.  
Support for PTX Series added in Junos OS Release 14.2.  
Support for QFX Series switches added in Junos OS Release 16.1R3.  
Support for ACX Series added in Junos OS Release 17.1R1.

**Description** Specify the number of updates per minute that the Path Computation Client (PCC) can receive at maximum. Updates above this limit are ignored by the PCC.

**Options** *updates-per-minute*—Number of updates per minute that the PCC can receive at maximum.  
**Range:** 1 through 16384  
**Default:** 0 (disabled or no limit)

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** • [pcep on page 2364](#)

## clear mpls lsp

**List of Syntax**    [Syntax on page 2391](#)  
                          [Syntax \(EX and QFX Series Switches\) on page 2391](#)

**Syntax**    clear mpls lsp  
                  <all>  
                  <autobandwidth>  
                  <counters>  
                  <logical-system (all | *logical-system-name*)>  
                  <name *name*>  
                  <optimize | optimize-aggressive>  
                  <path *regular-expression*>  
                  <statistics>

**Syntax (EX and QFX Series Switches)**    clear mpls lsp  
                  <all>  
                  <autobandwidth>  
                  <name *name*>  
                  <optimize | optimize-aggressive>  
                  <path *regular-expression*>  
                  <statistics>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.5 for EX Series switches.  
                                  Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description**    Release the routes and states associated with MPLS label-switched paths (LSPs), and start new LSPs.

**CAUTION:** This command disconnects existing Resource Reservation Protocol (RSVP) sessions on the ingress routing device. If there is a time lag between the old path being torn down and the new path being set up, this command might impact traffic traveling along the LSPs.

**Options**    **all**—Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs.

**autobandwidth**—(Optional) Clear LSP autobandwidth counters.

**counters**—(Optional) Reset the flap and the MBB counters to zero.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name *name***—(Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the *Junos Network Interfaces Configuration Guide*.

**optimize | optimize-aggressive**—(Optional) Run nonpreemptive optimization or aggressive optimization computation now.

**path *regular-expression***—(Optional) Clear the specific LSP path matching the specified regular expression.

**statistics**—(Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (**name** and **path** options) on transit routers.

**Required Privilege Level** clear

**Related Documentation**

- [show mpls lsp on page 2480](#)
- [show rsvp session on page 2612](#)

**List of Sample Output** [clear mpls lsp all on page 2392](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

`clear mpls lsp all`

```
user@host> clear mpls lsp all
```

## clear mpls container-lsp

<b>Syntax</b>	<pre>clear mpls container-lsp &lt;autobandwidth&gt; &lt;history&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;member&gt; &lt;name <i>name</i>&gt; &lt;optimize   optimize-aggressive&gt; &lt;statistics&gt;</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 14.2.</p> <p>Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.</p>
<b>Description</b>	Release the routes and states associated with MPLS container label-switched paths (LSPs), and start new LSPs.
<b>Options</b>	<p><b>none</b>—Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs.</p> <p><b>autobandwidth</b>—(Optional) Clear LSP autobandwidth counters.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>name <i>name</i></b>—(Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the <i>Junos Network Interfaces Configuration Guide</i>.</p> <p><b>optimize   optimize-aggressive</b>—(Optional) Run nonpreemptive optimization or aggressive optimization computation now.</p> <p><b>statistics</b>—(Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (<b>name</b> and <b>path</b> options) on transit routers.</p>
<b>Required Privilege Level</b>	clear

<b>List of Sample Output</b>	<p><a href="#">clear mpls container-lsp on page 2394</a></p> <p><a href="#">clear mpls container-lsp name on page 2394</a></p> <p><a href="#">clear mpls container-lsp statistics on page 2394</a></p>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear mpls container-lsp

```
user@host> clear mpls container-lsp
```

### clear mpls container-lsp name

```
user@host> clear mpls container-lsp name name
```

### clear mpls container-lsp statistics

```
user@host> clear mpls container-lsp statistics
```

---

## clear performance-monitoring mpls lsp

---

<b>Syntax</b>	clear performance-monitoring mpls lsp <name <i>lsp-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Restart the performance monitoring statistics.
<b>Options</b>	<b>none</b> —Reset and restart all performance monitoring for all LSPs. <b>name <i>lsp-name</i></b> —(Optional) Reset and restart performance monitoring for the specified LSP.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">performance-monitoring (Protocols MPLS) on page 2101</a></li><li>• <a href="#">show performance-monitoring mpls lsp on page 2512</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear performance-monitoring mpls lsp on page 2395</a>
<b>Output Fields</b>	When you enter this command, performance monitoring is restarted.

### Sample Output

#### clear performance-monitoring mpls lsp

```
user@host> clear performance-monitoring mpls lsp
```

## monitor mpls delay rsvp

---

**Syntax**    `monitor mpls delay rsvp lsp-name`  
              `<detail>`  
              `<count count>`  
              `<interval seconds>`  
              `<padding-size padding-size>`  
              `<traffic-class traffic-class>`

**Release Information**    Command introduced in Junos OS Release 14.2.

**Description**    Perform an on-demand delay measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

**Options**    ***lsp-name***—Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.

***detail***—(Optional) Display detailed output of the LSP delay measurement.

***count count***—(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.

**Default:** 10

**Range:** 1 through 1000000

***interval seconds***—(Optional) Specify in seconds the interval between two successive query messages.

**Range:** 1 through 255 seconds

***padding-size padding-size***— (Optional) Specify the length of padding TLV to be included in the query message.

**Range:** 0 through 1500

***traffic-class traffic-class***—(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

**Range:** 0 though 7

**Required Privilege Level**    view

**List of Sample Output** [monitor mpls lsp delay rsvp count on page 2398](#)  
[monitor mpls lsp delay rsvp count detail on page 2398](#)

**Output Fields** [Table 79 on page 2397](#) describes the output fields for the **monitor mpls delay rsvp** command. Output fields are listed in the approximate order in which they appear.

*Table 79: monitor mpls delay rsvp Output Fields*

Field Name	Field Description	Level of Output
Current two-way channel delay	Sum of packet delays, excluding the processing time of the remote provider edge (PE) router.	All Levels
Current round-trip-time	Total time taken for completing round-trip of packet.	All Levels
Best two-way channel delay	Best available two-way channel delay count.	All Levels
Worst two-way channel delay	Worst available two-way channel delay count.	All Levels
Average two-way channel delay	Average of the available two-way channel delay counts.	All Levels
Best round-trip-time	Best available round-trip-time count.	All Levels
Worst round-trip-time	Worst available round-trip-time count.	All Levels
Average round-trip-time	Average of the available round-trip-time counts.	All Levels
Average forward delay variation	Average of the variation in forward delay.	All Levels
Average reverse delay variation	Average of the variation in reverse delay.	All Levels
DM queries sent	Number of queries sent for delay measurement.	All Levels
DM responses received	Number of responses received for delay measurement queries.	All Levels
DM queries timedout	Number of timed out queries sent for delay measurement.	All Levels
DM responses dropped due to errors	Number of loss measurement responses dropped due to errors.	All Levels
Response code	Status of the messages used for delay measurement. Response code can be one of the following: <ul style="list-style-type: none"> <li>• <b>Success</b>—Successful response code.</li> <li>• <b>Failed</b>—Failed response code.</li> </ul>	<b>detail</b>
Querier transmit timestamp	Timestamp on the query message when the message is sent out the ingress PE router (querier). This is done in the hardware before packet is sent out of an interface.	<b>detail</b>

Table 79: monitor mpls delay rsvp Output Fields (continued)

Field Name	Field Description	Level of Output
Responder receive timestamp	Timestamp on the response message when the message is received by the egress PE router (responder). This is done in the hardware before packet is received by an interface.	detail
Responder transmit timestamp	Timestamp on the query message when the message is sent out the egress PE router (responder). This is done in the hardware before packet is sent out of an interface.	detail
Querier receive timestamp	Timestamp on the response message when the message is received by the ingress PE router (querier). This is done in the hardware before packet is received by an interface.	detail

## Sample Output

### monitor mpls lsp delay rsvp count

```

user@host> monitor mpls lsp delay rsvp LSP-A count 2

(1)
Current two-way channel delay      : 44 usecs
Current round-trip-time            : 3243 usecs
(2)
Current two-way channel delay      : 45 usecs
Current round-trip-time            : 1752 usecs

Best two-way channel delay         : 44 usecs
Worst two-way channel delay        : 45 usecs
Average two-way channel delay      : 45 usecs
Best round-trip-time               : 1752 usecs
Worst round-trip-time              : 3243 usecs
Average round-trip-time            : 2498 usecs
Average forward delay variation    : 1 usecs
Average reverse delay variation    : 1 usecs

DM queries sent                    : 2
DM responses received              : 2
DM queries timedout                : 0
DM responses dropped due to errors : 0

```

### monitor mpls lsp delay rsvp count detail

```

user@host> monitor mpls lsp delay rsvp LSP-A count 2 detail

(1)
Response code                      : Success

## monitor mpls loss rsvp

---

**Syntax**    `monitor mpls loss rsvp lsp-name`  
              `<detail>`  
              `<bytes>`  
              `<count count>`  
              `<interval seconds>`  
              `<traffic-class traffic-class>`

**Release Information**    Command introduced in Junos OS Release 14.2.

**Description**    Perform an on-demand loss measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

**Options**    *lsp-name*—Name of the associated bidirectional MPLS UHP LSP for which the loss measurement is performed.

**detail**—(Optional) Display detailed output of the LSP loss measurement.

**bytes**—(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

**NOTE:** The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

---

**count *count***—(Optional) Specify the number of loss measurements to be carried out for the MPLS UHP LSP. For LSP loss measurement, the number of queries sent is the specified count number plus one additional query, because the LSP loss is measured using successive messages.

**Default:** 10

**Range:** 1 through 1000000

**interval *seconds***—(Optional) Specify in seconds the interval between two successive query messages.

**Range:** 1 through 255 seconds

**traffic-class *traffic-class***—(Optional) Specify the traffic class and enable traffic-class-statistics for the LSP loss measurement.

**Range:** 0 though 7

**Required Privilege Level**    view

**Output Fields** [Table 79 on page 2397](#) describes the output fields for the **monitor mpls loss rsvp** command. Output fields are listed in the approximate order in which they appear.

*Table 80: monitor mpls loss rsvp Output Fields*

Field Name	Field Description	Level of Output
Current forward loss	Difference between the current forward transmit count and the current forward receive count.	All Levels
Current forward loss ratio	Total packet loss (current forward loss divided by current forward transmit count).	All Levels
Current forward throughput	Current forward transmit count divided by 1000.	All Levels
Current reverse loss	Difference between the current reverse transmit count and the current reverse receive count.	All Levels
Current reverse loss ratio	Total packet loss (current reverse loss divided by current reverse transmit count).	All Levels
Current reverse throughput	Current reverse transmit count divided by 1000.	All Levels
Cumulative forward transmit count	Cumulative forward transmit counter value at the time the loss measurement message was originated.	All Levels
Cumulative forward loss	Cumulative forward loss counter value at the time the loss measurement message was originated.	All Levels
Average forward loss ratio	Average packet loss (current forward loss divided by current forward transmit count).	All Levels
Average forward throughput	Average forward transmit count divided by 1000.	All Levels
Cumulative reverse transmit count	Cumulative reverse transmit counter value at the time the loss measurement message was originated.	All Levels
Cumulative reverse loss	Difference between the cumulative reverse transmit count and the cumulative reverse receive count.	All Levels
Average reverse loss ratio	Average packet loss (average reverse loss divided by average reverse transmit count).	All Levels
Average reverse throughput	Average reverse transmit count divided by 1000.	All Levels

Table 80: monitor mpls loss rsvp Output Fields (continued)

Field Name	Field Description	Level of Output
LM queries sent	Number of queries sent for loss measurement.	All Levels
LM responses received	Number of responses received for loss measurement queries.	All Levels
LM queries timedout	Number of timed out queries sent for loss measurement.	All Levels
LM responses dropped due to errors	Number of loss measurement responses dropped due to errors.	All Levels
Response code	Status of the messages used for loss measurement. Response code can be one of the following: <ul style="list-style-type: none"> <li>• <b>Success</b>—Successful response code.</li> <li>• <b>Failed</b>—Failed response code.</li> </ul>	<b>detail</b>
Origin timestamp	Time and date the loss measurement message is originated without any specific format (NTP and PTP).	<b>detail</b>
Forward transmit count	Forward transmit counter value at the time the loss measurement message was originated.	<b>detail</b>
Forward receive count	Forward receive counter value at the time the loss measurement message was originated.	<b>detail</b>
Reverse transmit count	Reverse transmit counter value at the time the loss measurement message was originated.	<b>detail</b>
Reverse receive count	Reverse receive counter value at the time the loss measurement message was originated.	<b>detail</b>
Current forward transmit count	Difference between the current forward transit count and the previous forward transit count.	<b>detail</b>
Current forward receive count	Difference between the current forward receive count and the previous forward receive count.	<b>detail</b>
Current reverse transmit count	Difference between the current reverse transit count and the previous reverse transit count.	<b>detail</b>
Current reverse receive count	Difference between the current reverse receive count and the previous reverse receive count.	<b>detail</b>

## monitor mpls loss-delay rsvp

**Syntax**    `monitor mpls loss-delay rsvp lsp-name`  
                   `<detail>`  
                   `<bytes>`  
                   `<count count>`  
                   `<interval seconds>`  
                   `<padding-size padding-size>`  
                   `<traffic-class traffic-class>`

**Release Information**    Command introduced in Junos OS Release 14.2.

**Description**    Perform a simultaneous on-demand loss and delay measurement using combined loss and delay messages, and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

**Options**    *lsp-name*—Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.

**detail**—(Optional) Display detailed output of the LSP delay measurement.

**bytes**—(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

**NOTE:** The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

**count *count***—(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.

**Default:** 10

**Range:** 1 through 1000000

**interval *seconds***—(Optional) Specify in seconds the interval between two successive query messages.

**Range:** 1 through 255 seconds

**padding-size *padding-size***—(Optional) Specify the length of padding TLV to be included in the query message.

**Range:** 0 through 1500

**traffic-class *traffic-class***—(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

**Range:** 0 though 7

**Required Privilege Level** view

## ping mpls bgp

**Syntax** ping mpls bgp *fec*  
 <bottom-label-ttl>  
 <count *count*>  
 <destination *address*>  
 <detail>  
 <exp *forwarding-class*>  
 <instance *routing-instance-name*>  
 <logical-system (all | *logical-system-name*)>  
 <size *bytes*>  
 <source *source-address*>  
 <sweep>

**Release Information** Command introduced in Junos OS Release 11.1.

**Description** Check the operability of MPLS BGP-signaled label-switched path (LSP) connections. Press Ctrl+c to interrupt a **ping mpls bgp** command.

**NOTE:** The **ping mpls bgp *fec*** command only supports single paths.

- Options**
- bottom-label-ttl**—(Optional) Time-to-live (TTL) value for the bottom label in the label stack. The range of values is 1 through 255. The default value is **255**.
  - count *count***—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.
  - destination *address***—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.
  - detail**—(Optional) Display detailed information about the echo requests sent and received.
  - exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.
  - fec***—Ping a BGP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.
  - instance *routing-instance-name***—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
  - logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.
  - size *bytes***—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller

than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only BGP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE:** In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

**Required Privilege Level** network

**List of Sample Output** [ping mpls bgp fec count on page 2410](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately. To display the error codes, use the **detail** option (for example, **ping mpls bgp 10.255.245.222 detail**).

## Sample Output

### ping mpls bgp fec count

```
user@host> ping mpls bgp 10.255.245.222 count 10
```

```
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,  
70% packet loss 4 packets received with error status, not counted as received.
```

## ping mpls lsp-end-point

---

**Syntax**    ping mpls lsp-end-point *prefix-name*  
              <count *count*>  
              <destination *address*>  
              <detail>  
              <exp *forwarding-class*>  
              <instance *routing-instance-name*>  
              <logical-system (all | *logical-system-name*)>  
              <size *bytes*>  
              <source *source-address*>  
              <sweep>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
                              The **instance** option was introduced in Junos OS Release 10.0.  
                              Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**    Check the operability of MPLS label-switched path (LSP) endpoint connections. Type Ctrl+c to interrupt a **ping mpls** command.

**Options**    **count *count***—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination *address***—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.

**instance *routing-instance-name***—(Optional) Ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP connection.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.

***prefix-name***—LDP forwarding equivalence class (FEC) prefix or RSVP LSP endpoint address.

**size *bytes***—(Optional) Size of the LSP ping request packet. If the endpoint is LDP-based, the minimum size of the packet is 88 bytes. If the endpoint is RSVP-based, the minimum size of the packet is 100 bytes. The maximum size in either case is 65468 bytes.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE:** In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

**Required Privilege Level** network

**List of Sample Output** [ping mpls lsp-end-point detail on page 2413](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls lsp-end-point detail

```
user@host> ping mpls lsp-end-point 10.255.245.119 detail
Route to end point address is via LDP FEC

--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## ping mpls l2circuit

**Syntax** ping mpls l2circuit (interface *interface-name* | virtual-circuit *virtual-circuit-id* neighbor *address*)  
 <count *count*>  
 <destination *address*>  
 <detail>  
 <exp *forwarding-class*>  
 <logical-system (all | *logical-system-name*)>  
 reply-mode (application-level-control-channel | ip-udp | no-reply)  
 <size *bytes*>  
 <source *source-address*>  
 <sweep>  
 <v1>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
 The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

**Description** Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a ping mpls l2circuit command.

**NOTE:** This command is not supported on EX4500 and EX4550 switches.

**Options** **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination** *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp** *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

**interface** *interface-name*—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.

**logical-system** (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

**reply-mode**—(Optional) Reply mode for the ping request. This option has the following suboptions:

**application-level-control-channel**—Reply using an application level control channel.

**ip-udp**—Reply using an IPv4 or IPv6 UDP packet.

**no-reply**—Do not reply to the ping request.

**NOTE:** The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

**size bytes**—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**vl**—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

**virtual-circuit virtual-circuit-id neighbor address**—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

**Additional Information** You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**Required Privilege Level** network

user@host> ping mpls l2circuit virtual-circuit 200 neighbor 10.255.245.122/32 detail
Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms
```

### ping mpls l2circuit interface <interface-name> reply-mode

```
user@host> ping mpls l2circuit interface lt-1/2/0.21 reply-mode application-level-control-channel
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## ping mpls l2vpn

---

**Syntax** ping mpls l2vpn (instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number* | interface *interface-name*)  
<bottom-label-ttl>  
<count *count*>  
<destination *address*>  
<detail>  
<exp *forwarding-class*>  
<logical-system (all | *logical-system-name*)>  
reply-mode (application-level-control-channel | ip-udp | no-reply)  
<size *bytes*>  
<source *source-address*>  
<sweep>

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

**Description** Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a **ping mpls l2vpn** command.

**Options** **bottom-label-ttl**—(Optional) Display the time-to-live value for the bottom label in the label stack.

**count *count***—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination *address***—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.

**instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number***—Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.

**interface *interface-name***—Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.

**reply-mode**—(Optional) Reply mode for the ping request. This option has the following suboptions:

**application-level-control-channel**—Reply using an application level control channel.

**ip-udp**—Reply using an IPv4 or IPv6 UDP packet.

**no-reply**—Do not reply to the ping request.

The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

**size bytes**—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

<b>Additional Information</b>	<p>You must configure MPLS at the <b>[edit protocols mpls]</b> hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.</p> <p>In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.</p>
<b>Required Privilege Level</b>	network
<b>List of Sample Output</b>	<p><a href="#">ping mpls l2vpn instance on page 2420</a>  <a href="#">ping mpls l2vpn instance detail on page 2420</a>  <a href="#">ping mpls l2vpn interface &lt;interface-name&gt; reply-mode on page 2420</a></p>
<b>Output Fields</b>	<p>When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code these packets are not counted in the received packets count. They are accounted for separately.</p>

## Sample Output

### ping mpls l2vpn instance

```
user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

### ping mpls l2vpn instance detail

```
user@host> ping mpls l2vpn instance vpn1 remote-site-id 1 local-site-id 2 detail
Request for seq 1, to interface 68, labels <800001, 100176>
Reply for seq 1, return code: Egress-ok
Request for seq 2, to interface 68, labels <800001, 100176>
Reply for seq 2, return code: Egress-ok
Request for seq 3, to interface 68, labels <800001, 100176>
Reply for seq 3, return code: Egress-ok
Request for seq 4, to interface 68, labels <800001, 100176>
Reply for seq 4, return code: Egress-ok
Request for seq 5, to interface 68, labels <800001, 100176>
Reply for seq 5, return code: Egress-ok

--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

### ping mpls l2vpn interface <interface-name> reply-mode

```
user@host> ping mpls l2vpn interface lt-1/2/0.21 reply-mode ip-udp
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## ping mpls l3vpn

**Syntax** ping mpls l3vpn prefix *prefix-name*  
 <*l3vpn-name*>  
 <bottom-label-ttl>  
 <count *count*>  
 <destination *address*>  
 <detail>  
 <exp *forwarding-class*>  
 <logical-system (all | *logical-system-name*)>  
 <size *bytes*>  
 <source *source-address*>  
 <sweep>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.

**Description** Check the operability of a MPLS Layer 3 virtual private network (VPN) connection. Type Ctrl+c to interrupt a **ping mpls l3vpn** command.

**Options** **bottom-label-ttl**—(Optional) Display the time-to-live value for the bottom label in the label stack.

**count *count***—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination *address***—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.

***l3vpn-name***—(Optional) Layer 3 VPN name.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.

**prefix *prefix-name***—Ping to test whether a prefix is present in a provider edge (PE) router's or switch's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix. This option does not test the connection between a PE router or switch and a customer edge (CE) router or switch.

**size *bytes***—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size

of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

If the Layer 3 VPN traffic transits a route reflector within the network, the **ping mpls l3vpn** command does not work.

**Required Privilege Level** network

**List of Sample Output** [ping mpls l3vpn on page 2422](#)  
[ping mpls l3vpn detail on page 2422](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code these packets are not counted in the received packets count. They are accounted for separately.

## Sample Output

Reply for seq 5, return code: Egress-ok
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

## request mpls container-lsp

---

<b>Syntax</b>	<code>request mpls container-lsp</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code> <code>&lt;name <i>lsp-name</i>&gt;</code> <code>&lt;adjust-autobandwidth&gt;</code> <code>&lt;normalization&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 14.2. Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.
<b>Description</b>	Manually trigger a bandwidth allocation adjustment for the container label-switched path (LSP).
<b>Options</b>	<b>none</b> —Manually trigger a bandwidth allocation adjustment for all active member LSP paths.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>name <i>lsp-name</i></b> —(Optional) Manually trigger a bandwidth allocation adjustment on the specified member LSP only.  <b>adjust-autobandwidth</b> —(Optional) Request LSP autobandwidth adjustment.  <b>normalization</b> —(Optional) Request container LSP normalization.
<b>Required Privilege Level</b>	clear, maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show mpls container-lsp on page 2454</a></li><li>• <a href="#">clear mpls container-lsp on page 2393</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request mpls container-lsp on page 2424</a> <a href="#">request mpls container-lsp on page 2424</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request mpls container-lsp

```
user@host> request mpls container-lsp lsp-name normalize
```

### request mpls container-lsp

```
user@host> request mpls container-lsp normalize bandwidth bps
```

## request mpls lsp adjust-autobandwidth

<b>List of Syntax</b>	<a href="#">Syntax on page 2425</a> <a href="#">Syntax (EX and QFX Series Switches) on page 2425</a>
<b>Syntax</b>	<pre>request mpls lsp adjust-autobandwidth &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;name <i>lsp-name</i>&gt;</pre>
<b>Syntax (EX and QFX Series Switches)</b>	<pre>request mpls lsp adjust-autobandwidth &lt;name <i>lsp-name</i>&gt;</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.</p>
<b>Description</b>	<p>Manually trigger a bandwidth allocation adjustment for active label-switched paths (LSPs).</p> <p>Without running this command, the bandwidth adjustment is recomputed at a configurable interval. The default interval is 5 minutes. If you do not want to wait for the periodic adjustment (for example, during a software demonstration), this command is useful.</p> <p>During bandwidth allocation adjustment, the LSP stays up to enable the bandwidth to be changed without dropping any traffic. This functionality is often referred to as <i>make-before-break</i>.</p>
<b>Options</b>	<p><b>none</b>—Manually trigger a bandwidth allocation adjustment for all active LSP paths.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>name <i>lsp-name</i></b>—(Optional) Manually trigger a bandwidth allocation adjustment on the specified LSP only.</p>
<b>Additional Information</b>	<p>For this command to work properly, the following conditions must exist:</p> <ul style="list-style-type: none"> <li>Automatic bandwidth allocation must be enabled on the LSP. The parameters for adjustment interval and maximum average bandwidth are not reset after you issue the <b>request mpls lsp adjust-autobandwidth</b> command.</li> <li>The difference between the adjusted bandwidth and the current LSP path bandwidth must be greater than the threshold limit.</li> </ul>
<b>Required Privilege Level</b>	clear, maintenance

## show link-management

<b>Syntax</b>	show link-management
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) peer and traffic engineering link information.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management peer on page 2434</a></li> <li>• <a href="#">show link-management routing on page 2436</a></li> <li>• <a href="#">show link-management statistics on page 2440</a></li> <li>• <a href="#">show link-management te-link on page 2442</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management on page 2433</a>
<b>Output Fields</b>	Table 82 on page 2430 describes the output fields for the <b>show link-management</b> command. Output fields are listed in the approximate order in which they appear.

Table 82: show link-management Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: <b>Up</b> or <b>Down</b> .
Control address	Address to which a control channel is established.
CC local ID	Identifier assigned to the control channel by the local peer. The range of values is 1 through 4,294,967,296.
CC remote ID	Identifier assigned to the control channel by the remote peer. The range of values is 1 through 4,294,967,296.
State	State of the control channel: <b>Up</b> or <b>Down</b> .
TxSeqNum	Sequence number of the hello message being sent to the peer. The range of values is 1 through 4,294,967,295.

Table 82: show link-management Output Fields (continued)

Field Name	Field Description
<b>RcvSeqNum</b>	Sequence number of the last hello message received from the peer. The range of values is 0 through 4,294,967,295.
<b>Flags</b>	Code that provides information about the control channel. Currently supports only code value <b>R</b> , which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts.
<b>TE links</b>	Traffic-engineered links that are managed by their peer.
<b>TE link name</b>	Name of the traffic-engineered link.
<b>State</b>	State of the traffic-engineered link: <b>Up</b> , <b>Down</b> , or <b>Init</b> .
<b>Local identifier</b>	Identifier of the local side of the link.
<b>Remote identifier</b>	Identifier of the remote side of the link.
<b>Local address</b>	Address of the local side of the link.
<b>Remote address</b>	Address of the remote side of the link.
<b>Encoding</b>	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , <b>Packet</b> , and <b>PDH</b> .
<b>Switching</b>	Type of switching that can be performed on the traffic-engineered link. Supported values are <b>PSC-1</b> and <b>Packet</b> .
<b>Minimum bandwidth</b>	Smallest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link (in bps).
<b>Maximum bandwidth</b>	Largest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).
<b>Total bandwidth</b>	Sum of the bandwidth, in bits per second (bps) and megabits per second (Mbps), of all interfaces that are members of the link.
<b>Available bandwidth</b>	Sum of the bandwidths of all interfaces that are members of the link and that are not yet allocated (in bps).
<b>Name</b>	Name of the interface.
<b>State</b>	State of the interface: <b>Up</b> or <b>Down</b> .
<b>Local ID</b>	Identifier of the local side of the interface.
<b>Remote ID</b>	Identifier of the remote side of the interface.
<b>Bandwidth</b>	Bandwidth, in bps or Mbps, of the member interface.

*Table 82: show link-management Output Fields (continued)*

Field Name	Field Description
<b>Used</b>	Whether the resource is allocated to an LSP: <b>Yes</b> or <b>No</b> .
<b>LSP-name</b>	LSP name.

## show link-management peer

<b>Syntax</b>	<code>show link-management peer</code> <code>&lt;name <i>peer-name</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) peer link information.
<b>Options</b>	<b>none</b> —Display all peer link information. <b>name <i>peer-name</i></b> —(Optional) Display information for the specified peer only.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management on page 2430</a></li> <li>• <a href="#">show link-management routing on page 2436</a></li> <li>• <a href="#">show link-management statistics on page 2440</a></li> <li>• <a href="#">show link-management te-link on page 2442</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management peer on page 2435</a>
<b>Output Fields</b>	Table 83 on page 2434 describes the output fields for the <b>show link-management peer</b> command. Output fields are listed in the approximate order in which they appear.

Table 83: show link-management peer Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: Up or Down.
Control address	Address to which a control channel is established.
Hello interval	How often the routing device sends Link Management Protocol (LMP) hello packets.
Hello dead interval	How long LMP waits before declaring the control channel to be dead. This is an interval during which the routing device receives no LMP hello packets from the neighbor on a control that is active or up.
CC local ID	Identifier assigned to the control channel by the local peer. The range of values is 1 through 4,294,967,296.

Table 83: show link-management peer Output Fields (continued)

Field Name	Field Description
CC remote ID	Identifier assigned to the control channel by the remote peer. The range of values is 1 through 4,294,967,296.
State	State of the control channel: <b>Up</b> or <b>Down</b> .
TxSeqNum	Sequence number of the hello message being sent to the peer. The range of values is 1 through 4,294,967,295.
RcvSeqNum	Sequence number of the last hello message received from the peer. The range of values is 0 through 4,294,967,295.
Flags	Code that provides information about the control channel. Currently supports only code value <b>R</b> , which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts.
TE links	Traffic-engineered links that are managed by their peer.

## Sample Output

### show link-management peer

```

user@host> show link-management peer
Peer name: sonet, System identifier: 41448
State: Up, Control address: 70.70.70.70
Hello interval: 10000, Hello dead interval: 30000
  CC local ID CC remote ID State      TxSeqNum  RcvSeqNum  Flags
      3265           0 ConfSnd         1         0 R
TE links:

```

## show link-management routing

<b>Syntax</b>	show link-management routing <peer <name <i>name</i> >   te-link <name <i>name</i> >> <resource <name <i>name</i> >>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) peer or traffic engineering link information from the routing process.
<b>Options</b>	<p><b>none</b>—Display all peer and traffic-engineered link information.</p> <p><b>peer &lt;name <i>name</i>&gt;</b>—(Optional) Display information for all peers or for the specified peer only.</p> <p><b>resource &lt;name <i>name</i>&gt;</b>—(Optional) Display information for all resources or for the specified resource only.</p> <p><b>te-link &lt;name <i>name</i>&gt;</b>—(Optional) Display information for all traffic-engineered forwarding paths or for the specified path only.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management on page 2430</a></li> <li>• <a href="#">show link-management peer on page 2434</a></li> <li>• <a href="#">show link-management statistics on page 2440</a></li> <li>• <a href="#">show link-management te-link on page 2442</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management routing on page 2439</a>
<b>Output Fields</b>	<a href="#">Table 84 on page 2436</a> describes the output fields for the <b>show link-management routing</b> command. Output fields are listed in the approximate order in which they appear.

Table 84: show link-management routing Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: Up or Down.

Table 84: show link-management routing Output Fields (continued)

Field Name	Field Description
<b>Control address</b>	Address to which a control channel is established.
<b>Control channel</b>	Interface over which control packets are sent.
<b>State</b>	State of the control channel.
<b>TE link name</b>	Traffic-engineered link name.
<b>State</b>	State of the traffic-engineered link: <b>Up</b> or <b>Down</b> .
<b>Local identifier</b>	Identifier of the local side of the link.
<b>Remote identifier</b>	Identifier of the remote side of the link.
<b>Local address</b>	Address of the local side of the link.
<b>Remote address</b>	Address of the remote side of the link.
<b>Encoding</b>	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , and <b>Packet</b> .
<b>Minimum bandwidth</b>	Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link.
<b>Maximum bandwidth</b>	Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).
<b>Total bandwidth</b>	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link.
<b>Available bandwidth</b>	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.
<b>Resource</b>	Forwarding adjacency LSP information.
<b>Type</b>	Type of resource. The type is always a forwarding adjacency LSP.
<b>State</b>	State of the LSP: <b>Up</b> or <b>Down</b> .
<b>System Identifier</b>	Internal identifier for the peer. The range of values is <b>0</b> through <b>64,000</b> .
<b>Total bandwidth</b>	Bandwidth resource, in bps or Mbps, on the TE-link learned from the routing process.

## show link-management statistics

<b>Syntax</b>	show link-management statistics <peer <name <i>name</i> >>
<b>Release Information</b>	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display statistical information for Link Management Protocol (LMP) packets.
<b>Options</b>	<b>none</b> —Display information for all peers.  <b>peer &lt;name <i>name</i>&gt;</b> —(Optional) Display information for all peers or for the specified peer only.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show link-management on page 2430</a></li> <li>• <a href="#">show link-management peer on page 2434</a></li> <li>• <a href="#">show link-management routing on page 2436</a></li> <li>• <a href="#">show link-management te-link on page 2442</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show link-management statistics on page 2441</a>
<b>Output Fields</b>	<a href="#">Table 85 on page 2440</a> describes the output fields for the <b>show link-management statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 85: show link-management statistics Output Fields*

Field Name	Field Description
Received packets	Number of received packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Received bad packets	Number of received bad packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Small packets	Number of packets that are too small.
Wrong protocol version	Number of packets specifying the wrong LMP version.
Messages for unknown peer	Number of packets destined for an unknown peer.
Messages for bad state	Number of packets indicating a state that does not match the recipient.

*Table 85: show link-management statistics Output Fields (continued)*

Field Name	Field Description
<b>Stale acknowledgments</b>	Number of <b>configAck</b> and <b>LinkSummaryAck</b> packets received that have a stale message ID.
<b>Stale negative acknowledgments</b>	Number of <b>configNack</b> and <b>LinkSummaryNack</b> packets received that have a stale message ID.
<b>Sent packets</b>	Number of sent packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
<b>Retransmitted packets</b>	Number of retransmitted packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
<b>Dropped packets</b>	Number of packets sent, by message type, that have been dropped by the receiver after the LMP retransmission interval has been exceeded. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.

## Sample Output

### show link-management statistics

```

user@host> show link-management statistics peer pro4-a
Statistics for peer pro4-a
  Received packets
    Config: 1
    Hello: 2572
  Small packets: 0
  Wrong protocol version: 0
  Messages for unknown peer: 0
  Messages for bad state: 0
  Stale acknowledgments: 0
  Stale negative acknowledgments: 0
  Sent packets
    Config: 2
    ConfigAck: 1
    Hello: 2572
  Retransmitted packets
    Config: 1

```

## show link-management te-link

<b>Syntax</b>	show link-management te-link <brief   detail> <name <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display the resources used to set up Multiprotocol Label Switching (MPLS) traffic-engineered forwarding paths.
<b>Options</b>	<b>none</b> —Display information for all traffic-engineered links.  <b>brief   detail</b> —(Optional) Display the specified level of output.  <b>name <i>name</i></b> —(Optional) Display information for the specified traffic-engineered link only.
<b>Required Privilege Level</b>	view

<b>Output Fields</b>	<a href="#">Table 86 on page 2442</a> describes the output fields for the <b>show link-management te-link</b> command. Output fields are listed in the approximate order in which they appear.

*Table 86: show link-management te-link Output Fields*

Field Name	Field Description
TE link name	Traffic-engineered link name.
State	State of the traffic-engineered link: <b>Up</b> or <b>Down</b> .
Local identifier	Identifier of the local side of the link.
Remote identifier	Identifier of the remote side of the link.
Local address	Address of the local side of the link.

Table 86: show link-management te-link Output Fields (continued)

Field Name	Field Description
Remote address	Address of the remote side of the link.
Encoding	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include <b>SDH/SONET</b> , <b>Ethernet</b> , <b>Packet</b> , and <b>PDH</b> .
Switching	Type of switching that can be performed on the traffic-engineered link. Supported values are <b>PSC-1</b> and <b>Packet</b> .
Minimum bandwidth	Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link.
Maximum bandwidth	Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link.
Total bandwidth	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link (in bps).
Available Bandwidth	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.
Name	Name of the interface.
State	State of the interface: <b>Up</b> or <b>Down</b> .
Local ID	Identifier of the local side of the interface.
Remote ID	Identifier of the remote side of the interface.
Bandwidth	Bandwidth, in bps or Mbps, of the member interface.
Used	Whether the resource is allocated to an LSP: <b>Yes</b> or <b>No</b> .
LSP-name	LSP name.

## Sample Output

### show link-management te-link

```

## show mpls association

<b>Syntax</b>	<code>show mpls association (iif <i>incoming-interface</i>   oif <i>outgoing-interface</i>) &lt;logical-system (all   <i>logical-system-name</i>)&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 16.1 for the M Series, MX Series, and T Series.
<b>Description</b>	Display the Multiprotocol Label Switching (MPLS) label-switched paths (LSPs) based on the association with an incoming or outgoing LSP interface. The command output displays the list of RSVP-TE LSPs carrying traffic in and out of the same interface.
<b>Options</b>	<p><b>iif <i>incoming-interface-name</i></b>—Display list of RSVP-TE LSPs that share the specified incoming interface to bring in traffic. This option works on transit label-switching routers (LSRs) and egress label edge routers (LERs).</p> <p><b>oif <i>outgoing-interface-name</i></b>—Display list of RSVP-TE LSPs that share the specified outgoing interface to carry out traffic. This option works on ingress LERs and transit LSRs.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view

## show mpls call-admission-control

<b>List of Syntax</b>	<a href="#">Syntax on page 2451</a> <a href="#">Syntax (EX Series Switches) on page 2451</a>
<b>Syntax</b>	<pre>show mpls call-admission-control &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;lsp-name&gt;</pre>
<b>Syntax (EX Series Switches)</b>	<pre>show mpls call-admission-control &lt;lsp-name&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p><b>instance <i>instance-name</i></b> option added in Junos OS Release 15.1.</p>
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) call admission control (CAC) information.
<b>Options</b>	<p><b>none</b>—Display CAC information for all LSPs.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display MPLS LSP CAC information for the specified instance. If <b><i>instance-name</i></b> is omitted, MPLS LSP CAC information for the master instance is displayed.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>lsp-name</i></b>—(Optional) Display CAC information for the specified LSP only.</p>
<b>Additional Information</b>	The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by any Layer 2 connection at that class type.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show mpls call-admission-control on page 2452</a>
<b>Output Fields</b>	<p><a href="#">Table 90 on page 2452</a> describes the output fields for the <b>show mpls call-admission-control</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 90: show mpls call-admission-control Output Fields*

Field Name	Field Description
<b>Available bandwidth</b>	Current available bandwidth on each LSP path. Depending on whether the LSP is an E-LSP or a regular LSP, either per-class bandwidth or a single bandwidth value (corresponding to best-effort bandwidth at <b>ct0</b> ) is displayed. The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by some Layer 2 connections at that class type.
<b>Layer2 connections</b>	Different Layer 2 connections that had some bandwidth requirement and were admitted into an LSP path.
<b>LSP name</b>	LSP pathname.
<b>Neighbor address</b>	Neighbor address from which CAC and bandwidth booking are configured for Layer 2 circuits.
<b>Circuit</b>	Interface name and circuit information.
<b>Primary</b>	LSP's primary standby path.
<b>Standby</b>	LSP's secondary standby path.
<b>VC bandwidth</b>	Bandwidth constraints associated with a Layer 2 circuit route.

## Sample Output

### show mpls call-admission-control

## show mpls container-lsp

---

**Syntax**    `show mpls container-lsp`  
              `<brief | detail | extensive | terse>`  
              `<count-active-routes>`  
              `<defaults>`  
              `<descriptions>`  
              `<down | up>`  
              `<egress>`  
              `<ingress>`  
              `<logical-system (all | logical-system-name)>`  
              `<name name>`  
              `<statistics>`  
              `<transit>`  
              `<unidirectional>`

**Release Information**    Command introduced in Junos OS Release 14.2.  
                              Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.

**Description**    Display information about configured and active Multiprotocol Label Switching (MPLS) container label-switched paths (LSPs).

**Options**    **none**—Display standard information about all configured and active member LSPs of the container LSP.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

**count-active-routes**—(Optional) Show active routes for the container LSP.

**defaults**—(Optional) Display the default settings of the container LSP.

**descriptions**—(Optional) Display the container LSP descriptions. To view this information, you must configure the description statement at the **[edit protocol mpls container-lsp]** hierarchy level. Only the LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**egress**—(Optional) Display the LSPs ending at this device.

**NOTE:** The **egress** option displays all the LSPs including regular LSPs, members of container LSPs, and transit LSPs. This is an expected behavior for all platforms.

---

**ingress**—(Optional) Display the member LSPs originating from this device.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name *name***—(Optional) Display information about the specified LSP or group of LSPs.

**statistics**—(Optional) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

**transit**—(Optional) Display LSPs transiting this routing device.

**unidirectional**—(Optional) Display unidirectional LSP information.

**Required Privilege Level** view

**List of Sample Output** [show mpls container-lsp on page 2459](#)  
[show mpls container-lsp extensive on page 2459](#)

**Output Fields** [Table 91 on page 2455](#) describes the output fields for the **show mpls container-lsp** command. Output fields are listed in the approximate order in which they appear.

*Table 91: show mpls container-lsp Output Fields*

Field Name	Field Description	Level of Output
<b>Ingress LSP</b>	Information about the member LSPs on the ingress routing device. Each LSP has one line of output.	All levels
<b>Container LSP name</b>	Name of the container LSP.	All levels
<b>Member LSP count</b>	Number of member LSPs in the container LSP.	All levels
<b>To</b>	Destination (egress routing device) of the session.	brief
<b>From</b>	Source (ingress routing device) of the session.	brief detail
<b>State</b>	State of the LSP handled by this RSVP session: <ul style="list-style-type: none"> <li>• Up</li> <li>• Dn (down)</li> <li>• Restart</li> </ul>	brief detail

Table 91: show mpls container-lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Rt</b>	Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0).	brief
<b>P</b>	Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.	brief
<b>ActivePath</b>	(Ingress LSP) Name of the active path: Primary or Secondary.	detail extensive
<b>LSPname</b>	Name of the member LSP.	brief detail
<b>Egress LSP</b>	Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output.	All levels
<b>Transit LSP</b>	Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
<b>Min LSPs</b>	Minimum number of member LSPs.  Default: 1	extensive
<b>Max LSPs</b>	Number of member LSPs that the container LSP can have at maximum.  Default: 64 (due to ECMP limit)	extensive
<b>Aggregate bandwidth</b>	Sum of the bandwidths of all member LSPs.	extensive
<b>NormalizeTimer</b>	Duration between two normalization events.  When not configured, 21600 seconds (6 hours) is set as the default value.	extensive
<b>NormalizeThreshold</b>	Change in aggregate LSP utilization to trigger splitting or merging expressed in percentage.	extensive
<b>Max Signaling BW</b>	Maximum bandwidth used to signal LSPs after a normalization event.  Default value is 0 bps. When not configured, the value is inherited from the splitting bandwidth configuration.  <b>NOTE:</b> Between two normalization events, when auto-bandwidth adjustment happens, the per-LSP auto-bandwidth configuration and thresholds are used, instead of the maximum signaling bandwidth threshold.	extensive

Table 91: show mpls container-lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Min Signaling BW</b>	<p>Minimum bandwidth used to signal LSPs after a normalization event.</p> <p>Default value is 0 bps. When not configured, the value is inherited from the merging bandwidth configuration.</p> <p><b>NOTE:</b> Between two normalization events, when auto-bandwidth adjustment happens, the per-LSP auto-bandwidth configuration and thresholds are used, instead of the minimum signaling bandwidth threshold.</p>	extensive
<b>Splitting BW</b>	<p>Bandwidth used for LSP splitting and merging.</p> <p>Default value is 0 bps. When not configured, the value is inherited from the auto-bandwidth maximum bandwidth configuration.</p>	extensive
<b>Merging BW</b>	<p>Bandwidth used for LSP splitting and merging.</p> <p>Default value is 0 bps. When not configured, the value is inherited from the auto-bandwidth minimum bandwidth configuration.</p>	extensive
<b>LSPtype</b>		extensive
<b>LoadBalance</b>		extensive
<b>MinBW</b>	Minimum LSP bandwidth in bps related to auto-bandwidth.	extensive
<b>AdjustTimer</b>	<p>Total amount of time in seconds allowed before LSP bandwidth adjustment take place.</p> <p>Range: 300 through 315360000 seconds</p>	extensive
<b>Max AvgBW util</b>	Current value of the actual maximum average bandwidth utilization in bps.	extensive
<b>Overflow limit</b>	Threshold overflow limit.	extensive
<b>Underflow limit</b>	Threshold underflow limit.	extensive
<b>Encoding type</b>		extensive
<b>Switching type</b>		extensive
<b>GPID</b>		extensive
<b>Priorities</b>	<p>Setup priority and hold priority values.</p> <p>For setup priority, 0 and 7 is the highest and lowest priority, respectively.</p> <p>When not explicitly configured, 7 and 0 are set as the default values for the setup priority and hold priority, respectively.</p>	extensive
<b>Bandwidth</b>		extensive

Table 91: show mpls container-lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>SmartOptimizeTimer</b>	Time in seconds allowed before path reoptimization.	extensive
<b>Computed ERO</b>	Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (S) or loose (L).	extensive
<b>Received RRO</b>	<p>Received record route.</p> <p>RRO is a series of hops, each with an address followed by a flag. In most cases, the received RRO is the same as the computed ERO. If the received RRO is different from the computed ERO, there is a topology change in the network, and the route is taking a detour.</p> <p>The following flags identify the protection capability and status of the downstream node:</p> <ul style="list-style-type: none"> <li>• <b>0x01</b>—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding path message.</li> <li>• <b>0x02</b>—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).</li> <li>• <b>0x03</b>—Combination of 0x01 and 0x02.</li> <li>• <b>0x04</b>—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.</li> <li>• <b>0x08</b>—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the local protection available bit is set but the node protection bit is cleared.</li> <li>• <b>0x09</b>—Detour is established. Combination of 0x01 and 0x08.</li> <li>• <b>0x10</b>—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.</li> <li>• <b>0x20</b>—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.</li> <li>• <b>0xb</b>—Detour is in use. Combination of 0x01, 0x02, and 0x08.</li> </ul>	extensive
<b>Make-before-break</b>		extensive
<b>Record Route</b>		extensive
<b>Automatic Autobw adjustment succeeded</b>		extensive
<b>CSPF</b>		extensive
<b>Created</b>	Date and time the LSP was created.	extensive

**List of Sample Output** [show mpls cspf on page 2466](#)

**Output Fields** [Table 94 on page 2465](#) describes the output fields for the **show mpls cspf** command. Output fields are listed in the approximate order in which they appear.

*Table 94: show mpls cspf Output Fields*

Field Name	Field Description
<b>Queue length</b>	Number of LSPs queued for automatic path computation.
<b>current</b>	Current queue length.
<b>maximum</b>	Maximum queue length (high-water mark).
<b>dequeued</b>	Number of aborted computation attempts.
<b>Paths</b>	Counters for label-switched path computations.

Table 94: show mpls cspf Output Fields (continued)

Field Name	Field Description
<b>total</b>	Sum of the next four fields.
<b>successful</b>	Number of path computations that were successfully completed.
<b>no route</b>	Number of path computations that failed because the destination is unreachable.
<b>Sys Error</b>	Number of path computations that failed because of lack of memory.
<b>CSPFs</b>	Total number of CSPF computations. A single path might require multiple CSPF computations.
<b>Time</b>	Time, in seconds, required to perform the label-switched path computation.
<b>Total</b>	Total amount of time consumed by the CSPF path computation algorithm.
<b>CSPFs</b>	Total number of CSPF computations.
<b>Avg per CSPF</b>	Average amount of time required for each CSPF computation.
<b>% of rpd</b>	Percentage of routing process CPU used in the CSPF computation.

## Sample Output

### show mpls cspf

## show mpls diffserv-te

<b>List of Syntax</b>	<a href="#">Syntax on page 2467</a> <a href="#">Syntax (EX Series Switches) on page 2467</a>
<b>Syntax</b>	<pre>show mpls diffserve-te &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Syntax (EX Series Switches)</b>	show mpls diffserve-te
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p><b>instance <i>instance-name</i></b> option added in Junos OS Release 15.1.</p>
<b>Description</b>	Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) Differentiated Services (DiffServ) class and preemption priority information.
<b>Options</b>	<p><b>none</b>—Display DiffServ classes and priorities used by MPLS LSPs.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display DiffServ classes and priorities used by MPLS LSPs for the specified instance. If <b>instance-name</b> is omitted, DiffServ information for the master instance is displayed.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show mpls diffserv-te on page 2468</a>
<b>Output Fields</b>	<p><a href="#">Table 95 on page 2467</a> describes the output fields for the <b>show mpls diffserv-te</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 95: show mpls diffserv-te Output Fields*

Field Name	Field Description
<b>Bandwidth model</b>	Bandwidth constraint model supported. The maximum allocation model (MAM) for EXP-inferred LSPs (E-LSPs) is currently supported.
<b>TE class</b>	DiffServ traffic engineering class.

*Table 95: show mpls diffserv-te Output Fields (continued)*

Field Name	Field Description
<b>Traffic class</b>	MPLS class type that corresponds to the DiffServ traffic engineering class: <ul style="list-style-type: none"><li>• <b>ct0</b>—Best effort</li><li>• <b>ct1</b>—Assured forwarding</li><li>• <b>ct2</b>—Expedited forwarding</li><li>• <b>ct3</b>—Network control</li></ul>
<b>Priority</b>	MPLS preemption priority for this class type, a value from 0 through 7. Interior gateway protocols (IGPs) distribute information about the available bandwidth for each traffic engineering class.

## Sample Output

### show mpls diffserv-te

```
user@host> show mpls diffserv-te
Bandwidth model: Maximum Allocation Model with support for E-LSPs.
TE class    Traffic class    Priority
te0         ct0              3
te1         ct1              2
```

## show mpls interface

**Syntax** `show mpls interface`

**Release Information** Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description** Display information about MPLS-enabled interfaces. MPLS is enabled on an interface when the interface is configured with both the `set protocols mpls interface interface-name` and `set interfaces interface-name unit 0 family mpls` commands.

**Required Privilege Level** view

**Related Documentation**

- [Example: Configuring MPLS on EX8200 and EX4500 Switches on page 42](#)
- [Configuring CoS on an MPLS Provider Edge Switch Using IP Over MPLS \(CLI Procedure\) on page 1037](#)
- [Configuring CoS on an MPLS Provider Edge Switch Using Circuit Cross-Connect \(CLI Procedure\) on page 1040](#)
- [Configuring MPLS on EX8200 and EX4500 Provider Switches \(CLI Procedure\) on page 75](#)

**List of Sample Output** [show mpls interface on page 2469](#)

**Output Fields** [Table 96 on page 2469](#) describes the output fields for the `show mpls interface` command. Output fields are listed in the approximate order in which they appear.

*Table 96: show mpls interface Output Fields*

Field Name	Field Description
<b>Interface</b>	Name of the interface.
<b>State</b>	State of the interface: <b>Up</b> or <b>Dn</b> (down).
<b>Administrative groups</b>	Administratively assigned colors of the link.

## Sample Output

### show mpls interface

```
user@switch> show mpls interface
Interface  State      Administrative groups
so-1/0/0.0  Up         Blue Yellow Red
```

## show mpls egress-protection

**Syntax** show mpls egress-protection  
 <brief | detail>  
 <logical-system (all | *logical-system-name*)>

**Release Information** Command introduced in Junos OS Release 11.4R3.

**Description** Display information about egress protection.

**NOTE:** Use this command on the device configured as the protector PE router to display information about egress protection. If you use this command on the device configured as the primary PE router, no output is displayed.

**Options** **none**—Display standard information about egress protection.

**brief | detail**—(Optional) Display the specified level of output.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**Related Documentation**

- *Example: Configuring Layer 3 VPN Egress Protection with RSVP and LDP*

**List of Sample Output** [show mpls egress-protection detail \(Centralized Protector\) on page 2471](#)  
[show mpls egress-protection detail \(Collocated Protector\) on page 2471](#)

**Output Fields** [Table 92 on page 2461](#) describes the output fields for the **show mpls egress-protection detail** command. Output fields are listed in the approximate order in which they appear.

*Table 97: show mpls lsp Output Fields*

Field Name	Field Description
Instance	Indicates egress instance name
Type	Indicates type of the VRF. It can be either local-vrf or remote-vrf
RIB	Indicates the edge-protection created routing table
Context-Id	Indicates the context-ID associated with the RIB.

Table 97: show mpls lsp Output Fields (continued)

Field Name	Field Description
<del>Interface</del> / <del>EnhancedLookup</del>	Show VT interfaces associated with the backup RIB.  Shows <b>Enhanced-lookup</b> for MX Series 3D Universal Edge Routers with the Enhanced IP Network Services mode configured using the <b>network-services enhanced-ip</b> statement at the <b>[edit chassis]</b> hierarchy level.

## Sample Output

### show mpls egress-protection detail (Centralized Protector)

```
user@host> show mpls egress-protection detail

Instance          Type      Protection-Type
rsite1            remote-vrf Protector
  RIB __99.99.1.4-rsite1__.inet.0, Context-Id 99.99.1.4, Enhanced-lookup
  Route Target 1:1
rsite24           remote-vrf Protector
  RIB __99.99.1.4-rsite24__.inet.0, Context-Id 99.99.1.4, Enhanced-lookup
  Route Target 100:1023
```

## Sample Output

### show mpls egress-protection detail (Collocated Protector)

```
user@host> show mpls egress-protection detail

Instance          Type      Protection-Type
site2             local-vrf  Protector
  RIB __66.6.6.6-site2__.inet.0, Context-Id 66.6.6.6, Interface vt-1/3/0.87031809

  Route Target 100:251

  Route Target 100:250
  Route Target 100:251

site2             local-vrf  Protector
  RIB __66.6.6.6-site2__.inet.0, Context-Id 66.6.6.6, Interface vt-1/3/0.87031809

  Route Target 100:251
```

## show mpls interface

<b>List of Syntax</b>	<a href="#">Syntax on page 2472</a> <a href="#">Syntax (EX Series Switches) on page 2472</a>
<b>Syntax</b>	<pre>show mpls interface &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Syntax (EX Series Switches)</b>	show mpls interface
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p><b>instance <i>instance-name</i></b> option added in Junos OS Release 15.1.</p>
<b>Description</b>	Display information about Multiprotocol Label Switching (MPLS)-enabled interfaces.
<b>Options</b>	<p><b>none</b>—Display information about MPLS-enabled interfaces.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about MPLS-enabled interfaces for the specified routing instance. If <b><i>instance-name</i></b> is omitted, information about MPLS-enabled interfaces is displayed for the master instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Additional Information</b>	MPLS is enabled on an interface when the interface is configured with both the <b>set protocol mpls interface <i>interface-name</i></b> and <b>set interface <i>interface-name</i> unit 0 family mpls</b> statements.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show mpls interface on page 2473</a>
<b>Output Fields</b>	<p><a href="#">Table 98 on page 2472</a> describes the output fields for the <b>show mpls interface</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 98: show mpls interface Output Fields*

Field Name	Field Description
<b>Interface</b>	Name of the interface.
<b>State</b>	State of the interface: <b>Up</b> or <b>Dn</b> (down).
<b>Administrative groups</b>	Administratively assigned colors of the link.

Table 98: show mpls interface Output Fields (continued)

Field Name	Field Description
Maximum labels	Maximum number of MPLS labels upon which MPLS can operate on a logical interface. This is configured using the <b>maximum-labels</b> statement at the [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls] or the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls] hierarchy levels.
Static protection revert time	Time (in seconds) that a static LSP must wait before traffic reverts from the bypass path to the original path. This is configured using the <b>protection-revert-time</b> statement at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels.
Always mark connection protection tlv	Enabled or Disabled: Enabled indicates that the <b>always-mark-connection-protection-tlv</b> statement is configured at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels. When this statement is configured, it marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, the <b>switch-away-lsps</b> statement must be configured.
Switch away lsps	Enabled or Disabled: Enabled indicates that the <b>switch-away-lsps</b> statement is configured at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels. This enables you to switch an LSP away from a network node using a bypass LSP. This feature can be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic.

## Sample Output

### show mpls interface

```

user@host> show mpls interface

Interface: ge-0/2/1.57
State: Up
Administrative group: <none>
Maximum labels: 5
Static protection revert time: 5 seconds
Always mark connection protection tlv: Disabled
Switch away lsps : Disabled

```

## show mpls label usage

---

<b>Syntax</b>	<pre>show mpls label usage &lt;label <i>label value</i>&gt; &lt;label-range <i>range-start range-end</i>&gt; &lt;logical-system (<i>all</i>   <i>logical-system-name</i>)&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 15.1.</p> <p>Support for the <b>label</b> statement added in Junos OS Release 17.2.</p> <p>Support for the <b>label-range</b> statement added in Junos OS Release 17.2.</p>
<b>Description</b>	<p>Show the available label space resource in RPD and also the applications that use the label space in RPD. There are four different label spaces currently used in MPLS—namely LSI, dynamic, block, and static. Each label space has a fixed number and cannot grow beyond the fixed value. Using this command, the administrator can monitor the available labels in each label space and the applications that are using the labels. Based on the availability of labels, the administrator can decide to stop any service and free some labels or use other service where the labels are available.</p> <p>Starting in Junos OS Release 17.2, you can configure the <b>enhanced-ip</b> command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability.</p> <p>When you set each member router's network services to <b>enhanced-ip</b>, only MPC or Modular Interface Cards (MICs) modules and Multiservices Dense Port Concentrator (MS-DPC) modules are powered on in the chassis. Non-service DPCs do not work with enhanced IP network services.</p>
<b>Options</b>	<p><b>none</b>— Display the available labels in each label space and the applications using the labels.</p> <p><b>label <i>label value</i></b>—(Optional) Display the information about which <i>label value</i> is used by which protocol, if any.</p> <p><b>label-range <i>range-start range-end</i></b> —(Optional) Display the complete information about the <b>label-range</b> specified. With the <b>enhanced-ip</b> command enabled on the supported device, effective ranges and configured ranges along with details of different label spaces such as LSI, dynamic, block, and static types are displayed.</p> <p><b>logical-system (<i>all</i>   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Additional Information</b>	<p>Once the label space crosses the threshold, a new syslog message is added.</p> <p>&lt;label-space-name&gt; label space usage crossed threshold limit of 90%.</p> <p>For instance, LSI label space usage crossed threshold limit of 90%.</p>

**Required Privilege Level** view

**List of Sample Output** [show mpls label usage on page 2475](#)

**Output Fields** [Table 99 on page 2475](#) describes the output fields for the **show mpls label usage** command. Output fields are listed in the order in which they appear.

*Table 99: show mpls label usage Fields*

Field Name	Field Description
<b>Label Space</b>	Indicates the different types of labels currently used in MPLS.
<b>Total</b>	Indicates the total label space available.
<b>Available</b>	Indicates the number of freely available labels and also the percentage of the label space available.
<b>Applications</b>	Indicates the applications that use the MPLS label spaces.
<b>Effective Ranges</b>	Indicates actual ranges in use, which can be different from configured ranges, if conflicting with label already allocated.
<b>Configured Ranges</b>	Indicates the currently configured range assigned to different label spaces on the device.

## Sample Output

### show mpls label usage

```
user@host> show mpls label usage
Label space Total Available Applications
LSI 999984 999971 (100.00%) BGP/LDP VPLS with no-tunnel-services, BGP
L3VPN with vrf-table-label
Block 999984 999971 (100.00%) BGP/LDP VPLS with tunnel-services, BGP L2VPN
Dynamic 999984 999971 (100.00%) RSVP, LDP, PW, L3VPN, RSVP-P2MP, LDP-P2MP,
MVPN, EVPN, BGP
Static 48576 48576 (100.00%) Static LSP, Static PW
```

With **enhanced-ip** enabled on the supported device, you get the following additional output.

```
user@host> show mpls label usage
Label space Total Available Applications
LSI 101 99 (98.02% ) BGP/LDP VPLS with no-tunnel-services, BGP
L3VPN with vrf-table-label
Block 101 101 (100.00%) BGP/LDP VPLS with tunnel-services, BGP L2VPN
Dynamic 101 98 (97.03% ) RSVP, LDP, PW, L3VPN, RSVP-P2MP, LDP-P2MP,
MVPN, EVPN, BGP
Static 48576 48576 (100.00%) Static LSP, Static PW
Effective Ranges
Range name Shared with Start End
LSI 300 400
Block 500 600
```

```
Dynamic      100      200
Static      1000000 1048575
Configured Ranges
Range name  Shared with Start  End
LSI         300      400
Block       500      600
Dynamic     100      200
Static      1000000 1048575

user@host> show mpls label usage label 101
Label 101 is used by protocol BGP

user@host> show mpls label usage label 102
Label 102 is used by protocol LDP

user@host> show mpls label usage label 103
Label 103 is not allocated to any protocol
```

## show mpls label usage label-range

**Syntax**    `show mpls label usage label-range`  
               `<block-label-range range-start range-end>`  
               `<dynamic-label-range range-start range-end>`  
               `<label-limit label-limit value>`  
               `<lsi-label-range range-start range-end>`  
               `<static-label-range range-start range-end>`

**Release Information**    Command introduced in Junos OS Release 17.2.

**Description**    There are four different label spaces currently used in MPLS—namely LSI, dynamic, block, and static. Each label space has a fixed number and cannot grow beyond the fixed value. Using **show mpls label usage label-range** command, the administrator can monitor the available labels in each label space and the applications that are using the labels. Based on the availability of labels, the administrator can decide to stop any service and free some labels or use other service where the labels are available.

Starting in Junos OS Release 17.2, you can configure the **enhanced-ip** command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability.

When you set each member router's network services to **enhanced-ip**, only MPC or Modular Interface Cards (MICs) modules and Multiservices Dense Port Concentrator (MS-DPC) modules are powered on in the chassis. Non-service DPCs do not work with enhanced IP network services.

**Options**    **block-label-range range-start range-end**—Display the details of block label type.

**dynamic-label-range range-start range-end** —Display the details of dynamic label type.

**label-limit label-limit value**—Limit for the number of concurrent active labels.

**lsi-label-range range-start range-end**—Display the details of LSI label type.

**static-label-range range-start range-end**—Display the details of static label type.

**Required Privilege Level**    view

**Related Documentation**    • [show mpls label usage on page 2474](#)

**Output Fields**    [Table 100 on page 2478](#) describes the output fields for the **show mpls label usage label-range** command. Output fields are listed in the order in which they appear.

Table 100: show mpls label usage label-range Fields

Field Name	Field Description
<b>Label Space</b>	Indicates the different types of labels currently used in MPLS.
<b>Total</b>	Indicates the total label space available.
<b>Available</b>	Indicates the number of freely available labels and also the percentage of the label space available.
<b>Applications</b>	Indicates the applications that use the MPLS label spaces.
<b>Effective Ranges</b>	Indicates actual ranges in use, which can be different from configured ranges, if conflicting with label already allocated.
<b>Configured Ranges</b>	Indicates the currently configured range assigned to different label spaces on the device.
<b>Total</b>	Indicates the currently used labels with label type and application type details.

## Sample Output

With the **enhanced-ip** command enabled on the supported device, you get the following output.

```

user@host> show mpls label usage label-range 16 600
Label space Total Available Applications
LSI 101 99 (98.02% ) BGP/LDP VPLS with no-tunnel-services, BGP
L3VPN with vrf-table-label
Block 101 101 (100.00%) BGP/LDP VPLS with tunnel-services, BGP L2VPN
Dynamic 101 98 (97.03% ) RSVP, LDP, PW, L3VPN, RSVP-P2MP, LDP-P2MP,
MVPN, EVPN, BGP

                 <lsp-type>  
                 <name *name*>  
                 <p2mp>  
                 <statistics>  
                 <transit>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              **defaults** option added in Junos OS Release 8.5.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.  
                              **autobandwidth** option added in Junos OS Release 11.4.  
                              **externally-controlled** option added in Junos OS Release 12.3.  
                              **externally-provisioned** option added in Junos OS Release 13.3.  
                              Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.  
                              **instance *instance-name*** option added in Junos OS Release 15.1.

**Description**    Display information about configured and active dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

**Options**    **none**—Display standard information about all configured and active dynamic MPLS LSPs.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

**autobandwidth**—(Optional) Display automatic bandwidth information. This option is explained separately (see [show mpls lsp autobandwidth](#)).

**bidirectional | unidirectional**—(Optional) Display bidirectional or unidirectional LSP information, respectively.

**bypass**—(Optional) Display LSPs used for protecting other LSPs.

**count-active-routes**—(Optional) Display active routes for LSPs.

**defaults**—(Optional) Display the MPLS LSP default settings.

**descriptions**—(Optional) Display the MPLS label-switched path (LSP) descriptions. To view this information, you must configure the description statement at the **[edit protocol mpls lsp]** hierarchy level. Only LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**externally-controlled**—(Optional) Display the LSPs that are under the control of an external Path Computation Element (PCE).

**externally-provisioned**—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

**instance *instance-name***—(Optional) Display MPLS LSP information for the specified instance. If *instance-name* is omitted, MPLS LSP information is displayed for the master instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

**name *name***—(Optional) Display information about the specified LSP or group of LSPs.

**p2mp**—(Optional) Display information about point-to-multipoint LSPs.

**statistics**—(Optional) (Ingress and transit routers only) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet

arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

**NOTE:** If a bypass LSP is configured for the primary static LSP, display cumulative statistics of packets traversing through the protected LSP and bypass LSP when traffic is re-optimized when the protected LSP link is restored. (Bypass LSPs are not supported on QFX Series switches.)

When used with the `bypass` option (`show mpls lsp bypass statistics`), display statistics for the traffic that flows only through the bypass LSP.

**transit**—(Optional) Display LSPs transiting this routing device.

*Table 101: show mpls lsp Output Fields*

Field Name	Field Description	Level of Output
Ingress LSP	Information about LSPs on the ingress routing device. Each session has one line of output.	All levels

Table 101: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Egress LSP</b>	Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output.	All levels
<b>Transit LSP</b>	Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
<b>P2MP name</b>	Name of the point-to-multipoint LSP. Dynamically generated P2MP LSPs used for VPLS flooding use dynamically generated P2MP LSP names. The name uses the format <i>identifier:vpls:router-id:routing-instance-name</i> . The <i>identifier</i> is automatically generated by Junos OS.	All levels
<b>P2MP branch count</b>	Number of destination LSPs the point-to-multipoint LSP is transmitting to.	All levels
<b>P</b>	An asterisk (*) under this heading indicates that the LSP is a primary path.	All levels
<b>address</b>	( <b>detail</b> and <b>extensive</b> ) Destination (egress routing device) of the LSP.	<b>detail extensive</b>
<b>To</b>	Destination (egress routing device) of the session.	<b>brief</b>
<b>From</b>	Source (ingress routing device) of the session.	<b>brief detail</b>
<b>State</b>	State of the LSP handled by this RSVP session: <b>Up</b> , <b>Dn</b> (down), or <b>Restart</b> .	<b>brief detail</b>
<b>Active Route</b>	Number of active routes (prefixes) installed in the forwarding table. For ingress LSPs, the forwarding table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table ( <b>mpls.0</b> ).	<b>detail extensive</b>
<b>Rt</b>	Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ).	<b>brief</b>
<b>P</b>	Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.	<b>brief</b>
<b>ActivePath</b>	(Ingress LSP) Name of the active path: <b>Primary</b> or <b>Secondary</b> .	<b>detail extensive</b>
<b>LSPname</b>	Name of the LSP.	<b>brief detail</b>
<b>Statistics</b>	Displays the number of packets and the number of bytes transmitted over the LSP. These counters are reset to zero whenever the LSP path is optimized (for example, during an automatic bandwidth allocation).	<b>extensive</b>
<b>Aggregate statistics</b>	Displays the number of packets and the number of bytes transmitted over the LSP. These counters continue to iterate even if the LSP path is optimized. You can reset these counters to zero using the <b>clear mpls lsp statistics</b> command.	<b>extensive</b>
<b>Packets</b>	Displays the number of packets transmitted over the LSP.	<b>brief extensive</b>

Table 101: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Bytes</b>	Displays the number of bytes transmitted over the LSP.	<b>brief extensive</b>
<b>DiffServInfo</b>	Type of LSP: multiclass LSP ( <b>multiclass diffServ-TE LSP</b> ) or Differentiated-Services-aware traffic engineering LSP ( <b>diffServ-TE LSP</b> ).	<b>detail</b>
<b>LSPtype</b>	Type of LSP: <ul style="list-style-type: none"> <li>• <b>Static configured</b>—Static</li> <li>• <b>Dynamic configured</b>—Dynamic</li> <li>• <b>Externally controlled</b>—External path computing entity</li> </ul> Also indicates if the LSP is a <b>Penultimate hop popping</b> LSP or an <b>Ultimate hop popping</b> LSP.	<b>detail extensive</b>
<b>Bypass</b>	(Bypass LSP) Destination address (egress routing device) for the bypass LSP.	All levels
<b>LSPpath</b>	Indicates whether the RSVP session is for the primary or secondary LSP path. <b>LSPpath</b> can be either <b>primary</b> or <b>secondary</b> and can be displayed on the ingress, egress, and transit routing devices.	<b>detail</b>
<b>Bidir</b>	(GMPLS) The LSP allows data to travel in both directions between GMPLS devices.	All levels
<b>Bidirectional</b>	(GMPLS) The LSP allows data to travel both ways between GMPLS devices.	All levels
<b>FastReroute desired</b>	Fast reroute has been requested by the ingress routing device.	<b>detail</b>
<b>Link protection desired</b>	<b>detail</b>	
<b>Node/Link protection desired</b>	Link protection has been requested by the ingress routing device.	<b>detail</b>
<b>LSP Control Status</b>	(Ingress LSP) LSP control mode: <ul style="list-style-type: none"> <li>• <b>External</b>—By default, all PCE-controlled LSPs are under external control. When an LSP is under external control, the PCC uses the PCE-provided parameters to set up the LSP.</li> <li>• <b>Local</b>—A PCE-controlled LSP can come under local control. When the LSP switches from external control to local control, path computation is done using the CLI-configured parameters and constraint-based routing. Such a switchover happens only when there is a trigger to re-signal the LSP. Until then, the PCC uses the PCE-provided parameters to signal the PCE-controlled LSP, although the LSP remains under local control.</li> </ul> A PCE-controlled LSP switches to local control from its default external control mode in cases such as no connectivity to a PCE or when a PCE returns delegation of LSPs back to the PCC.	<b>extensive</b>

Table 101: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>External Path CSPF status</b>	(PCE-controlled LSPs) Status of the PCE-controlled LSP with per path attributes: <ul style="list-style-type: none"> <li>Local</li> <li>External</li> </ul>	<b>extensive</b>
<b>Externally Computed ERO</b>	(PCE-controlled LSPs) Externally computed explicit route when the route object is not null or empty. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict ( <b>S</b> ) or loose ( <b>L</b> ).	<b>extensive</b>
<b>EXTCTRL_LSP</b>	(PCE-controlled LSPs) Display path history including the bandwidth, priority, and metric values received from the external controller.	<b>extensive</b>
<b>LoadBalance</b>	(Ingress LSP) CSPF load-balancing rule that was configured to select the LSP's path among equal-cost paths: <b>Most-fill</b> , <b>Least-fill</b> , or <b>Random</b> .	<b>detail extensive</b>
<b>Signal type</b>	Signal type for GMPLS LSPs. The signal type determines the peak data rate for the LSP: <b>DS0</b> , <b>DS3</b> , <b>STS-1</b> , <b>STM-1</b> , or <b>STM-4</b> .	All levels
<b>Encoding type</b>	LSP encoding type: <b>Packet</b> , <b>Ethernet</b> , <b>PDH</b> , <b>SDH/SONET</b> , <b>Lambda</b> , or <b>Fiber</b> .	All levels
<b>Switching type</b>	Type of switching on the links needed for the LSP: <b>Fiber</b> , <b>Lambda</b> , <b>Packet</b> , <b>TDM</b> , or <b>PSC-1</b> .	All levels
<b>GPID</b>	Generalized Payload Identifier (identifier of the payload carried by an LSP): <b>HDLCL</b> , <b>Ethernet</b> , <b>IPv4</b> , <b>PPP</b> , or <b>Unknown</b> .	All levels
<b>Protection</b>	Configured protection capability desired for the LSP: <b>Extra</b> , <b>Enhanced</b> , <b>none</b> , <b>One plus one</b> , <b>One to one</b> , or <b>Shared</b> .	All levels
<b>Upstream label in</b>	(Bidirectional LSPs) Incoming label for reverse direction traffic for this LSP.	All levels
<b>Upstream label out</b>	(Bidirectional LSPs) Outgoing label for reverse direction traffic for this LSP.	All levels
<b>Suggested label received</b>	(Bidirectional LSPs) Label the upstream node suggests to use in the Resv message that is sent.	All levels
<b>Suggested label sent</b>	(Bidirectional LSPs) Label the downstream node suggests to use in the Resv message that is returned.	All levels
<b>Autobandwidth</b>	(Ingress LSP) The LSP is performing autobandwidth allocation.	<b>detail extensive</b>
<b>MinBW</b>	(Ingress LSP) Configured minimum value of the LSP, in bps.	<b>detail extensive</b>
<b>MaxBW</b>	(Ingress LSP) Configured maximum value of the LSP, in bps.	<b>detail extensive</b>
<b>Dynamic MinBW</b>	(Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps.	<b>detail extensive</b>

Table 101: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Dynamic MinBW</b>	(Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps.	<b>detail extensive</b>
<b>AdjustTimer</b>	(Ingress LSP) Configured value for the <b>adjust-timer</b> statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.	<b>detail extensive</b>
<b>Adjustment Threshold</b>	(Ingress LSP) Configured value for the <b>adjust-threshold</b> statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization.	<b>detail extensive</b>
<b>Time for Next Adjustment</b>	(Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.	<b>detail extensive</b>
<b>Time of Last Adjustment</b>	(Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.	<b>detail extensive</b>
<b>MaxAvgBW util</b>	(Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.	<b>detail extensive</b>
<b>Overflow limit</b>	(Ingress LSP) Configured value of the threshold overflow limit.	<b>detail extensive</b>
<b>Overflow sample count</b>	(Ingress LSP) Current value for the overflow sample count.	<b>detail extensive</b>
<b>Bandwidth Adjustment in <i>nnn</i> second(s)</b>	(Ingress LSP) Current value of the bandwidth adjustment timer, indicating the amount of time remaining until the bandwidth adjustment will take place, in seconds.	<b>detail extensive</b>
<b>Underflow limit</b>	(Ingress LSP) Configured value of the threshold underflow limit.	<b>detail extensive</b>
<b>Underflow sample count</b>	(Ingress LSP) Current value for the underflow sample count.	<b>detail extensive</b>
<b>Underflow Max AvgBW</b>	(Ingress LSP) The highest sample bandwidth among the underflow samples recorded currently. This is the signaling bandwidth if an adjustment occurs because of an underflow.	<b>detail extensive</b>
<b>Active path indicator</b>	(Ingress LSP) A value of * indicates that the path is active. The absence of * indicates that the path is not active. In the following example, "long" is the active path.  *Primary long Standby short	<b>detail extensive</b>
<b>Primary</b>	(Ingress LSP) Name of the primary path.	<b>detail extensive</b>
<b>Secondary</b>	(Ingress LSP) Name of the secondary path.	<b>detail extensive</b>
<b>Standby</b>	(Ingress LSP) Name of the path in standby mode.	<b>detail extensive</b>

Table 101: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	(Ingress LSP) State of the path: <b>Up</b> or <b>Dn</b> (down).	<b>detail extensive</b>
<b>COS</b>	(Ingress LSP) Class-of-service value.	<b>detail extensive</b>
<b>Bandwidth per class</b>	(Ingress LSP) Active bandwidth for the LSP path for each MPLS class type, in bps.	<b>detail extensive</b>
<b>Priorities</b>	(Ingress LSP) Configured value of the setup priority and the hold priority respectively (the setup priority is displayed first), where 0 is the highest priority and 7 is the lowest priority. If you have not explicitly configured these values, the default values are displayed (7 for the setup priority and 0 for the hold priority).	<b>detail extensive</b>
<b>OptimizeTimer</b>	(Ingress LSP) Configured value of the optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.	<b>detail extensive</b>
<b>SmartOptimizeTimer</b>	(Ingress LSP) Configured value of the smart optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.	<b>detail extensive</b>
<b>Flap Count</b>	Number of times an LSP flaps down and up.  Syslog messages are logged when an LSP goes down – <b>RPD_MPLS_(PATH LSP)_DOWN</b> , and when an LSP goes up – <b>RPD_MPLS_(PATH LSP)_UP</b> .	<b>detail extensive</b>
<b>MBB Count</b>	Number of times an LSP incurs a make before break (MBB).  A syslog message is logged when a make-before-break completes for an LSP.	<b>detail extensive</b>
<b>Reoptimization in xxx seconds</b>	(Ingress LSP) Current value of the optimize timer, indicating the amount of time remaining until the path will be reoptimized, in seconds.	<b>detail extensive</b>
<b>Computed ERO (S [L] denotes strict [loose] hops)</b>	(Ingress LSP) Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict ( <b>S</b> ) or loose ( <b>L</b> ).	<b>detail extensive</b>
<b>CSPF metric</b>	(Ingress LSP) Constrained Shortest Path First metric for this path.	<b>detail extensive</b>

Table 101: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Received RRO</b>	<p>(Ingress LSP) Received record route. A series of hops, each with an address followed by a flag. (In most cases, the received record route is the same as the computed explicit route. If <b>Received RRO</b> is different from <b>Computed ERO</b>, there is a topology change in the network, and the route is taking a detour.) The following flags identify the protection capability and status of the downstream node:</p> <ul style="list-style-type: none"> <li>• <b>0x01</b>—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the Local protection flag was set in the <b>SESSION_ATTRIBUTE</b> object of the corresponding Path message.</li> <li>• <b>0x02</b>—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).</li> <li>• <b>0x03</b>—Combination of <b>0x01</b> and <b>0x02</b>.</li> <li>• <b>0x04</b>—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.</li> <li>• <b>0x08</b>—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the <b>Local protection available</b> bit is set but the <b>Node protection</b> bit is cleared.</li> <li>• <b>0x09</b>—Detour is established. Combination of <b>0x01</b> and <b>0x08</b>.</li> <li>• <b>0x10</b>—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted.</li> <li>• <b>0x20</b>—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently.</li> <li>• <b>0xb</b>—Detour is in use. Combination of <b>0x01</b>, <b>0x02</b>, and <b>0x08</b>.</li> </ul>	<b>detail extensive</b>
<b>Index number</b>	(Ingress LSP) Log entry number of each LSP path event. The numbers are in chronological descending order, with a maximum of 50 index numbers displayed.	<b>extensive</b>
<b>Date</b>	(Ingress LSP) Date of the LSP event.	<b>extensive</b>
<b>Time</b>	(Ingress LSP) Time of the LSP event.	<b>extensive</b>
<b>Event</b>	(Ingress LSP) Description of the LSP event.	<b>extensive</b>
<b>Created</b>	(Ingress LSP) Date and time the LSP was created.	<b>extensive</b>
<b>Resv style</b>	(Bypass) RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter).	<b>brief detail extensive</b>
<b>Labelin</b>	Incoming label for this LSP.	<b>brief detail</b>
<b>Labelout</b>	Outgoing label for this LSP.	<b>brief detail</b>

Table 101: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>LSPname</b>	Name of the LSP.	<b>brief detail</b>
<b>Time left</b>	Number of seconds remaining in the lifetime of the reservation.	<b>detail</b>
<b>Since</b>	Date and time when the RSVP session was initiated.	<b>detail</b>
<b>Tspec</b>	Sender's traffic specification, which describes the sender's traffic parameters.	<b>detail</b>
<b>Port number</b>	Protocol ID and sender or receiver port used in this RSVP session.	<b>detail</b>
<b>PATH rcvfrom</b>	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this router, and number of packets received from the upstream neighbor.	<b>detail</b>
<b>PATH sentto</b>	Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor, and number of packets sent to the downstream routing device.	<b>detail</b>
<b>RESV rcvfrom</b>	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor. The output in this field, which is consistent with that in the <b>PATH rcvfrom</b> field, indicates that the RSVP negotiation is complete.	<b>detail</b>
<b>Record route</b>	Recorded route for the session, taken from the record route object.	<b>detail</b>
<b>Soft preempt</b>	Number of soft preemptions that occurred on a path and when the last soft preemption occurred. Only successful soft preemptions are counted (those that actually resulted in a new path being used).	<b>detail</b>
<b>Soft preemption pending</b>	Path is in the process of being soft preempted. This display is removed once the ingress router has calculated a new path.	<b>detail</b>
<b>MPLS-TE LSP Defaults</b>	Default settings for MPLS traffic engineered LSPs: <ul style="list-style-type: none"> <li>• <b>LSP Holding Priority</b>—Determines the degree to which an LSP holds on to its session reservation after the LSP has been set up successfully.</li> <li>• <b>LSP Setup Priority</b>—Determines whether a new LSP that preempts an existing LSP can be established.</li> <li>• <b>Hop Limit</b>—Specifies the maximum number of routers the LSP can traverse (including the ingress and egress).</li> <li>• <b>Bandwidth</b>—Specifies the bandwidth in bits per second for the LSP.</li> <li>• <b>LSP Retry Timer</b>—Length of time in seconds that the ingress router waits between attempts to establish the primary path.</li> </ul>	<b>defaults</b>

The XML tag name of the **bandwidth** tag under the **auto-bandwidth** tag has been updated to **maximum-average-bandwidth**. You can see the new tag when you issue the **show mpls lsp extensive** command with the **| display xml** pipe option. If you have any scripts that use the **bandwidth** tag, ensure that they are updated to **maximum-average-bandwidth**.

## Sample Output

### show mpls lsp defaults

```
user@host> show mpls lsp defaults

## show mpls lsp abstract-computation

<b>Syntax</b>	show mpls lsp abstract-computation <brief   detail   extensive>; <logical-system (all   <i>logical-system-name</i> )>; <name <i>lsp-name</i> >;
<b>Release Information</b>	Command introduced in Junos OS Release 17.1 for all platforms.
<b>Description</b>	Display the ingress to egress abstract hop computation used by the constrained shortest path in the preprocessing for LSPs. The command output displays the various computation passes involved per LSP, and the qualifying exit devices for each pass. It also displays the affinity per pass, and the current start device chosen for the pass.
<b>Options</b>	<p><b>brief   detail   extensive</b>—(Optional) Display the desired level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Display the abstract computation for abstract hop constraints on all logical systems or on a particular logical system.</p> <p><b><i>lsp-name</i></b>—(Optional) Name of the LSP for which the abstract hop computation is displayed.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Abstract Hops for MPLS LSPs on page 339</a></li> <li>• <a href="#">abstract-hop on page 1959</a></li> <li>• <a href="#">constituent-list on page 1987</a></li> <li>• <a href="#">show mpls abstract-hop-membership on page 2445</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show mpls lsp abstract-computation on page 2500</a>
<b>Output Fields</b>	<a href="#">Table 102 on page 2499</a> describes the output fields for the <b>show mpls lsp abstract-computation</b> command. Output fields are listed in the approximate order in which they appear.

Table 102: show mpls lsp abstract-computation Output Fields

Field Name	Field Description
Path computation using abstract hops for LSP	Name of the LSP for which the abstract hop computation is performed.
Path type	The type of the path can be primary or secondary.
Path name	Name of the path.

Table 102: show mpls lsp abstract-computation Output Fields (continued)

Field Name	Field Description
Credibility	Credibility value associated with the interior gateway protocol in use.
Total no of CSPF passes	Number of constrained shortest path passes for the abstract hop.
CSPF pass no	Constrained shortest path pass number for the abstract hop computation.
Start address of the pass	IP address where the pass starts.
Affinity	Name of the abstract hop.
Destination	Destination IP address for a node in the pass.
State	State of the backtracking: <ul style="list-style-type: none"> <li>Valid</li> <li>Disqualified</li> </ul>

## Sample Output

### show mpls lsp abstract-computation

```

## show mpls lsp autobandwidth

<b>Syntax</b>	show mpls lsp autobandwidth <brief   detail   extensive> <logical-system (all   <i>logical-system-name</i> )> <name <i>lsp-name</i> >
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 15.1X54-D60 for the ACX5000 Series. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches. <b>name <i>lsp-name</i></b> option introduced in Junos OS Release 18.1R1 for all platforms.
<b>Description</b>	Display automatic bandwidth information for the LSP(s).  After a Routing Engine switchover, the output of the <b>show mpls autobandwidth</b> command might not be up-to-date, as the automatic bandwidth information for the LSP(s) is gathered by the new master Routing Engine during the first adjustment interval.
<b>Options</b>	<b>brief   detail   extensive</b> —(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.  <b>name <i>lsp-name</i></b> —(Optional) Specify name of the LSP for which the automatic bandwidth information should be displayed.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show mpls lsp on page 2480</a></li> <li>• <a href="#">Achieving a Make-Before-Break, Hitless Switchover for LSPs on page 414</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show mpls lsp autobandwidth on page 2503</a>
<b>Output Fields</b>	<a href="#">Table 103 on page 2501</a> describes the output fields for the <b>show mpls lsp autobandwidth</b> command. Output fields are listed in the approximate order in which they appear.

*Table 103: show mpls lsp autobandwidth Output Fields*

Field Name	Field Description	Level of Output
To	Destination (egress routing device) of the session.	All Levels
From	Source (ingress routing device) of the session.	All Levels

Table 103: show mpls lsp autobandwidth Output Fields (continued)

Field Name	Field Description	Level of Output
<b>LSPname</b>	Name of the LSP.	All Levels
<b>Min BW</b>	(Ingress LSP) Configured minimum value of the LSP, in bps.	detail extensive
<b>Max BW</b>	(Ingress LSP) Configured maximum value of the LSP, in bps.	detail extensive
<b>Max AvgBW util</b>	(Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.  <b>NOTE:</b> In calculating this value, the sample collected during make before break (MBB) is ignored to prevent inaccurate results. The first sample after a bandwidth adjustment, or after a change in the LSP ID (regardless of path change), is also ignored.	detail extensive
<b>Overflow limit</b>	(Ingress LSP) Configured value of the threshold overflow limit.	detail extensive
<b>Overflow sample count</b>	(Ingress LSP) Current value for the overflow sample count.	detail extensive
<b>Underflow limit</b>	(Ingress LSP) Configured value of the threshold underflow limit.	detail extensive
<b>Underflow sample count</b>	(Ingress LSP) Current value for the underflow sample count.	detail extensive
<b>Adjustment Timer</b>	(Ingress LSP) Configured value for the adjust-timer statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.	detail extensive
<b>Adjustment Threshold</b>	(Ingress LSP) Configured value for the adjust-threshold statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization.	detail extensive
<b>Time for Next Adjustment</b>	(Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.	detail extensive
<b>Time of Last Adjustment</b>	(Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.	detail extensive
<b>Last BW</b>	Previous active bandwidth of the LSP.	detail extensive
<b>Last Requested BW</b>	Bandwidth requested in the previous automatic bandwidth adjustment.	detail extensive
<b>Last Signaled BW</b>	Bandwidth signaled in the previous automatic bandwidth adjustment.	detail extensive
<b>Highest Watermark BW</b>	Maximum bandwidth used by the LSP.	detail extensive
<b>Total AutoBW Adjustments</b>	Total number of attempts to adjust automatic bandwidth including failed and successful adjustments.	detail extensive

Table 103: show mpls lsp autobandwidth Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Successful Adjustments</b>	Number of successful automatic bandwidth adjustments.	<b>detail extensive</b>
<b>Failed Adjustments</b>	Number of failed automatic bandwidth adjustments.	<b>detail extensive</b>

## show mpls path

**List of Syntax** [Syntax on page 2504](#)  
[Syntax \(EX Series Switches\) on page 2504](#)

**Syntax** `show mpls path`  
`<instance instance-name>`  
`<logical-system (all | logical-system-name)>`  
`<path-name>`

**Syntax (EX Series Switches)** `show mpls path`  
`<path-name>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.5 for EX Series switches.  
**instance *instance-name*** option added in Junos OS Release 15.1.

**Description** Display dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

**Options** **none**—Display standard information about all MPLS LSPs.

**instance *instance-name***—(Optional) Display the dynamic MPLS LSP for the specified instance. If ***instance-name*** is omitted, dynamic MPLS LSP for the master instance is displayed.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***path-name***—(Optional) Display information about the specified LSP only.

**Required Privilege Level** view

**List of Sample Output** [show mpls path on page 2505](#)

**Output Fields** [Table 104 on page 2504](#) describes the output fields for the **show mpls path** command. Output fields are listed in the approximate order in which they appear.

*Table 104: show mpls path Output Fields*

Field Name	Field Description
Path name	Information about ingress LSPs. Each path has one line of output.
Address	Addresses of the routing devices that form the LSP.
Strict/loose address	Whether the address is configured as a strict or loose address.

## Sample Output

### show mpls path

```
user@host> show mpls path
Path name      Address          Strict/loose address
p1             123.456.55.6    Strict
               123.456.1.6     Loose
p2             191.456.1.4     Strict
```

## show mpls srlg

**Syntax** `show mpls srlg`  
`<logical-systems (all | logical-system-name)>`

**Release Information** Command introduced before Junos OS Release 11.4.

**Description** Display Shared Risk Link Group (SRLG) cost and value configuration information.

**NOTE:** If an SRLG is associated with a link that is used by an ingress LSP in the router, then on deleting the SRLG configuration from that router, the SRLG gets removed from the SRLG table only on the next reoptimization of the LSP. Until then, the output of the run `show mpls srlg` command displays `Unknown-XXX` instead of the SRLG name and a non zero `srlg-cost` for that SRLG.

**Options** `logical-system (all | logical-system-name)`—(Optional) View SRLG configuration information for all logical systems or a particular logical system.

**Required Privilege Level** view

**Related Documentation**

- [Example: Configuring SRLG on page 210](#)

**Output Fields** [Table 105 on page 2506](#) lists the output fields for the `show mpls srlg` command. Output fields are listed in the approximate order in which they appear.

*Table 105: show mpls srlg Output Fields*

Field Name	Field Description
SRLG	Name of the SRLG.
Value	A group ID for the SRLG ranging from 1 through 4294967295.
Cost	A cost for the Shared Risk Link Group (SRLG) ranging from 1 through 65535.

## Sample Output

```
user@host> show mpls srlg
```

SRLG	Value	Cost
srlg-a	101	10

## show mpls static-lsp

---

**Syntax**    show mpls static-lsp  
             <brief | detail | extensive | terse>  
             <bypass>  
             <descriptions>  
             <down | up>  
             <ingress>  
             <instance *instance-name*>  
             <logical-system (all | *logical-system-name*)>  
             <lsp-type>  
             <name *name*>  
             <statistics>  
             <transit>

**Release Information**    Command introduced in Junos OS Release 10.1.  
                             Command updated in Junos OS Release 14.1X53-D25 to accommodate the stitching feature of MPLS.  
                             Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.  
                             Statement introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.

**Description**    Display information about configured and active static Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

**Options**    **none**—Display standard information about all configured and active static MPLS LSPs.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output. The **extensive** option displays the same information as the **detail** option, but covers the most recent 50 events.

**bypass**—(Optional) Display LSPs used for protecting other static LSPs.

**descriptions**—(Optional) Display the MPLS static LSP descriptions. To view this information, you must configure the description statement at the **[edit protocols mpls static-label-switched-path *path-name* bypass]**, **[edit protocols mpls static-label-switched-path *path-name* ingress]**, or **[edit protocols mpls static-label-switched-path *path-name* transit *incoming-label*]** hierarchy levels. Only static LSPs with a description are displayed.

**down | up**—(Optional) Display only static LSPs that are inactive or active, respectively.

**instance *instance-name***—(Optional) Display information about all configured and active static MPLS LSPs for the specified routing instance. If ***instance-name*** is omitted, information about all configured and active static MPLS LSPs for the master instance is displayed.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

**name *name***—(Optional) Display information about the specified static LSP or group of LSPs.

**statistics**—(Optional) Display accounting information about static LSPs.

**transit**—(Optional) Display static LSPs transiting this routing device.

**Required Privilege Level** view

**List of Sample Output** [show mpls static-lsp extensive on page 2510](#)  
[show mpls static-lsp statistics ingress on page 2510](#)  
[show mpls static-lsp \(when MPLS stitching is used\) on page 2510](#)

**Output Fields** [Table 91 on page 2455](#) describes the output fields for the **show mpls static-lsp** command. Output fields are listed in the approximate order in which they appear.

*Table 106: show mpls static-lsp Output Fields*

Field Name	Field Description	Level of Output
<b>Ingress LSPs</b>	Information about the static LSPs on the ingress routing device. Each session has one line of output.	All levels
<b>Transit LSPs</b>	Number of static LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
<b>Bypass LSPs</b>	Information about the bypass LSPs configured on the routing device. Each session has one line of output.	All levels
<b>LSPname</b>	Name of the static LSP.	All levels
<b>To</b>	Destination (egress routing device) of the session.	All levels
<b>State</b>	State of the static LSP handled by this RSVP session: <b>Up</b> , <b>Dn</b> (down), or <b>Restart</b> .	All levels
<b>Packets</b>	Number of packet transiting the static LSP ( <b>statistics</b> option only).	All levels
<b>Bytes</b>	Number of bytes transiting the static LSP ( <b>statistics</b> option only).	All levels
<b>Nexthop</b>	IP address for the next-hop router for the static LSP.	<b>detail, extensive</b>
<b>Bypass</b>	(Bypass LSP) Destination address (egress routing device) for the bypass LSP.	All levels

Table 106: show mpls static-lsp Output Fields (continued)

Field Name	Field Description	Level of Output
Link protection desired	Link protection has been requested by the ingress routing device.	detail, extensive
LabelOperation	Label operation to perform: Push, Pop, Swap.	detail, extensive
Outgoing-label	Outgoing label to use for the MPLS packet in either push or swap label operations.	detail, extensive
Created	(Ingress LSP) Date and time the static LSP was created.	extensive
Bandwidth	Bandwidth configured for the static LSP.	detail, extensive
Resv style	(Bypass) RSVP reservation style. This field consists of two parts: the number of active reservations and the reservation style, which can be FF (fixed filter), SE (shared explicit), or WF (wildcard filter).	All levels

## Sample Output

### show mpls static-lsp extensive

```

user@host> show mpls static-lsp extensive
Ingress LSPs:
LSPname: alpha-to-beta, To: 192.168.14.1
State: Dn
Nexthop: 192.168.10.1
LabelOperation: Push, Outgoing-label: 1000001
Created: Thu Jan 14 16:44:43 2010
Bandwidth: 0 bps
Total 1, displayed 1, Up 0, Down 1

Transit LSPs:
Total 0, displayed 0, Up 0, Down 0

Bypass LSPs:
Total 0, displayed 0, Up 0, Down 0

```

### show mpls static-lsp statistics ingress

```

user@host> show mpls static-lsp statistics ingress
Ingress LSPs:
LSPname                To           State   Packets   Bytes
alpha-to-beta          192.168.14.1 Dn      NA        NA
Total 1, displayed 1, Up 0, Down 1

```

### show mpls static-lsp (when MPLS stitching is used)

The show mpls static-lsp command was extended in Junos release 14.1X53-D25 to accommodate the stitching feature of MPLS. This example shows the LSP state as 'InProgress' because the LSP is waiting for protocol next-hop resolution. For more information, see

```
user@host> show mpls static-lsp
Ingress LSPs:
Total 0, displayed 0, Up 0, Down 0
Transit LSPs: LSPname
to-165
```

Incoming-label	State
1000000	InProgress

## show performance-monitoring mpls lsp

---

**Syntax**    `show performance-monitoring mpls lsp`  
              `<brief | detail | extensive>`  
              `<name lsp name>`

**Release Information**    Command introduced in Junos OS Release 15.1.

**Description**    Display the following performance monitoring data:

- Packet loss measurement
- Packet throughput measurement
- Two-way channel delay
- Round-trip delay
- Inter-packet delay variation (IPDV)

**Options**    **none**—Display standard information performance monitoring data.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**NOTE:** The extensive option displays the same information as the detail option.

---

**name lsp name**—(Optional) Display information about the specified LSP.

**Required Privilege Level**

View

**Output Fields**

Table 107 on page 2513 describes the output fields for the **show performance-monitoring mpls lsp** command. Output fields are listed in the approximate order in which they appear.

Table 107: show performance-monitoring mpls lsp Output Fields

Field Name	Display Data		Field Description	Level of Output
Session	Total		Total number of performance monitoring sessions created.	All Levels
	Up		Number of performance monitoring sessions that are up and running.	All Levels
	Down		Number of performance monitoring sessions that are down.	All Levels
LSP name			Name of the LSP.	All Levels
Loss measurement Data	Traffic-class		Traffic class for which loss measurement is performed.	All Levels
	Queries sent		Total number of queries sent for loss measurement.	All Levels
	Responses received		Total number of responses received for loss measurement queries.	All Levels
	Responses dropped due to errors		Total number of loss measurement responses dropped due to errors.	All Levels
	Queries timeout		Number of timed out queries sent for loss measurement.	All Levels
	Forward loss measurement	Average packet loss	Average packet loss (total loss of packets divided by the total number of samples used since the session is up).	All Levels
		Average packet throughput	Total number of packets sent divided by the time considered for measurement.	All Levels
	Reverse loss measurement	Average packet loss	Average packet loss (total loss of packets divided by the total number of samples used since the session is up).	All Levels
		Average packet throughput	Total number of packets sent divided by the time considered for measurement.	All Levels

Table 107: show performance-monitoring mpls lsp Output Fields (continued)

Field Name	Display Data	Field Description	Level of Output
Delay measurement Data	Traffic-class	Traffic class for which delay measurement is performed.	All Levels
	Queries sent	Total number of queries sent for delay measurement.	All Levels
	Responses received	Total number of responses received for delay measurement queries.	All Levels
	Responses dropped due to errors	Total number of delay measurement responses dropped due to errors.	All Levels
	Queries timeout	Number of timed out queries sent for delay measurement.	All Levels
	Best 2-way channel delay	Best available two-way channel delay.	All Levels
	Worst 2-way channel delay	Worst available two-way channel delay.	All Levels
	Best round trip time	Best available round-trip time.	All Levels
	Worst round trip time	Worst available round-trip time.	All Levels
	Avg absolute fw delay variation	Average of the variation in forward delay.	All Levels
	Avg absolute rv delay variation	Average of the variation in reverse delay.	All Levels
	Two-way channel delay	Sum of packet delays, excluding the processing time of the remote provider edge (PE) router.	<b>detail, extensive</b>
	Two-way round trip delay	Total time taken for completing round-trip of packet.	<b>detail, extensive</b>

## Sample Output

### show performance-monitoring mpls lsp

## show route forwarding-table

---

<b>Syntax</b>	<code>show route forwarding-table</code> <code>&lt;detail   extensive   summary&gt;</code> <code>&lt;ccc ccc-interface-name&gt;</code> <code>&lt;destination&gt;</code> <code>&lt;family family-name&gt;</code> <code>&lt;label label&gt;</code> <code>&lt;matching ip_prefix&gt;</code> <code>&lt;multicast&gt;</code> <code>&lt;vpn vpn&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.
<b>Description</b>	Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.
<b>Options</b>	<b>none</b> —Display the routes in the forwarding table.  <b>detail   extensive   summary</b> —(Optional) Display the specified level of output.  <b>ccc</b> —(Optional) Display the specified circuit cross-connect interface name for entries to match.  <b>destination</b> —(Optional) Display the destination prefix.  <b>family family-name</b> —(Optional) Display routing table entries for the specified family: <code>ethernet-switching</code> , <code>inet</code> , <code>inet6</code> , <code>iso</code> , <code>mpls</code> , <code>vlan classification</code> .  <b>label label</b> —(Optional) Display route entries for the specified label name.  <b>matching ip_prefix</b> —(Optional) Display route entries for the specified IP prefix.  <b>multicast</b> —(Optional) Display route entries for multicast routes.  <b>vpn vpn</b> —(Optional) Display route entries for the specified VPN.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring MPLS on EX8200 and EX4500 Switches on page 42</a></li><li>• <a href="#">Configuring MPLS on EX8200 and EX4500 Provider Switches (CLI Procedure) on page 75</a></li></ul>

**Output Fields** Table 108 on page 2519 lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the **detail** keyword is used instead of the **extensive** keyword.

*Table 108: show route forwarding-table Output Fields*

Field Name	Field Description	Level of Output
<b>Routing table</b>	Name of the routing table (for example, <b>inet</b> , <b>inet6</b> , <b>mpls</b> ).	All levels
<b>Address family</b>	Address family (for example, <b>IP</b> , <b>IPv6</b> , <b>ISO</b> , <b>MPLS</b> ).	All levels
<b>Destination</b>	Destination of the route.	<b>detail</b> , <b>extensive</b>
<b>Route Type (Type)</b>	How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses): <ul style="list-style-type: none"> <li><b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li><b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li><b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li><b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li><b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li><b>ignore (ignr)</b>—Ignore this route.</li> <li><b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li><b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li><b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul>	All levels
<b>Route reference (RtRef)</b>	Number of routes to reference.	<b>detail</b> , <b>extensive</b>

Table 108: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Flags</b>	Route type flags: <ul style="list-style-type: none"> <li><b>none</b>—No flags are enabled.</li> <li><b>accounting</b>—Route has accounting enabled.</li> <li><b>cached</b>—Cache route.</li> <li><b>incoming-iface <i>interface-number</i></b>—Check against incoming interface.</li> <li><b>prefix load balance</b>—Load balancing is enabled for this prefix.</li> <li><b>sent to PFE</b>—Route has been sent to the Packet Forwarding Engine.</li> <li><b>static</b>—Static route.</li> </ul>	<b>extensive</b>
<b>Nexthop</b>	IP address of the next hop to the destination.	<b>detail, extensive</b>
<b>Next hop type (Type)</b>	Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses): <ul style="list-style-type: none"> <li><b>broadcast (bcst)</b>—Broadcast.</li> <li><b>deny</b>—Deny.</li> <li><b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li><b>indexed (idxd)</b>—Indexed next hop.</li> <li><b>indirect (indr)</b>—Indirect next hop.</li> <li><b>local (locl)</b>—Local address on an interface.</li> <li><b>routed multicast (mcrt)</b>—Regular multicast next hop</li> <li><b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li><b>multicast discard (mdsc)</b>—Multicast discard.</li> <li><b>multicast group (mgrp)</b>—Multicast group member.</li> <li><b>receive (rcv)</b>—Receive.</li> <li><b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li><b>resolve (rslv)</b>—Resolving the next hop.</li> <li><b>unicast (ucst)</b>—Unicast.</li> <li><b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul>	<b>detail, extensive</b>
<b>Index</b>	Software index of the next hop that is used to route the traffic for a given prefix.	<b>detail, extensive none</b>
<b>Route interface-index</b>	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	<b>extensive</b>
<b>Reference (NhRef)</b>	Number of routes that refer to this next hop.	<b>none detail, extensive</b>
<b>Next-hop interface (Netif)</b>	Interface used to reach the next hop.	<b>none detail, extensive</b>
<b>Alternate forward nh index</b>	Index number of the alternate next hop interface. Seen with <b>multicast</b> option only.	<b>extensive</b>

Table 108: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Next-hop L3 Interface	The next hop layer 3 interface. This option can be expressed as a VLAN name and is only seen with the <b>multicast</b> option.	extensive
Next-hop L2 Interfaces	The next hop layer 2 interfaces. Seen with <b>multicast</b> option only.	extensive

## Sample Output

### show route forwarding-table

```
user@switch> show route forwarding-table
```

```

**Output Fields** [Table 109 on page 2527](#) describes the output fields for the **show route table** command. Output fields are listed in the approximate order in which they appear.

*Table 109: show route table Output Fields*

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
Restart complete	<p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> <li>• <b>Pending:</b><i>protocol-name</i>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>• <b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> <p>For example, if the output shows-</p> <ul style="list-style-type: none"> <li>• LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden) Restart Pending: OSPF LDP VPN</li> </ul> <p>This indicates that <b>OSPF</b>, <b>LDP</b>, and <b>VPN</b> protocols did not restart for the <b>LDP.inet.0</b> routing table.</p> <ul style="list-style-type: none"> <li>• vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden) Restart Complete</li> </ul> <p>This indicates that all protocols have restarted for the <b>vpls_1.l2vpn.0</b> routing table.</p>
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 109: show route table Output Fields (continued)

Field Name	Field Description
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>
<i>route-destination</i> (entry, announced)	<p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> <li>• <b>inclusive multicast Ethernet tag route</b>—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> <li>• <b>route distinguisher</b>—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</li> <li>• <b>Ethernet tag ID</b>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</li> <li>• <b>IP address length</b>—(1 octet) Length of IP address in bits.</li> <li>• <b>originating router's IP address</b>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</li> </ul> </li> </ul>
<i>label stacking</i>	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>

Table 109: show route table Output Fields (continued)

Field Name	Field Description
[ <i>protocol, preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop. For a description of possible values for this field, see <a href="#">Table 110 on page 2533</a> .
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
Label-switched-path <i>lsp-path-name</i>	Name of the LSP used to reach the next hop.

Table 109: show route table Output Fields (continued)

Field Name	Field Description
Label operation	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See <a href="#">Table 111 on page 2534</a> .
Local AS	AS number of the local routing devices.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.
Task	Name of the protocol that has added the route.
Announcement bits	<p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, <b>n-Resolve inet</b> indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <li>• <b>n</b>—An index used by Juniper Networks customer support only.</li> </ul>

Table 109: show route table Output Fields (continued)

Field Name	Field Description
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
FECs bound to route	Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.

Table 109: show route table Output Fields (continued)

Field Name	Field Description
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See <a href="#">Table 112 on page 2536</a> for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: <b>none</b> or <b>Site Down</b> .
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.
Accepted LongLivedStaleImport	<p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p>
ImportAccepted LongLivedStaleImport	<p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.

**Table 109: show route table Output Fields (continued)**

Field Name	Field Description
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

[Table 110 on page 2533](#) describes all possible values for the Next-hop Types output field.

**Table 110: Next-hop Types Output Field Values**

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.
Deny	Deny next hop.
Discard	Discard next hop.
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.
Reject (rjct)	Discard. An ICMP unreachable message was sent.

*Table 110: Next-hop Types Output Field Values (continued)*

Next-Hop Type	Description
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrtr)	Regular multicast next hop.
Router	<p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as a next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul>
Table	Routing table next hop.
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

[Table 111 on page 2534](#) describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

*Table 111: State Output Field Values*

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.

*Table 111: State Output Field Values (continued)*

Value	Description
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGp path is available.
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.

*Table 111: State Output Field Values (continued)*

Value	Description
Pending	Route pending because of a hold-down configured on another route.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available.
Router ID	Path through a neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul>
Update source	Last tiebreaker is the lowest IP address value.

[Table 112 on page 2536](#) describes the possible values for the Communities output field.

*Table 112: Communities Output Field Values*

Value	Description
<i>area-number</i>	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is <b>0</b> . A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
<b>bandwidth: local AS</b> <b>number:link-bandwidth-number</b>	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
<b>domain-id</b>	Unique configurable number that identifies the OSPF domain.
<b>domain-id-vendor</b>	Unique configurable number that further identifies the OSPF domain.
<i>link-bandwidth-number</i>	Link-bandwidth number: from <b>0</b> through <b>4,294,967,295</b> (bytes per second).
<i>local AS number</i>	Local AS number: from <b>1</b> through <b>65,535</b> .

Table 112: Communities Output Field Values (continued)

Value	Description
<i>options</i>	1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.
<i>origin</i>	(Used with VPNs) Identifies where the route came from.
<i>ospf-route-type</i>	1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses.
<i>route-type-vendor</i>	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <i>area-number:ospf-route-type:options</i> .
<i>rte-type</i>	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <i>area-number:ospf-route-type:options</i> .
<i>target</i>	Defines which VPN the route participates in; <b>target</b> has the format <i>32-bit IP address:16-bit number</i> . For example, 10.19.0.0:100.
<i>unknown IANA</i>	Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.
<i>unknown OSPF vendor community</i>	Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.

## Sample Output

### show route table bgp.l2vpn

```

user@host> show route table bgp.l2vpn
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.24.1:1:4:1/96
    *[BGP/170] 01:08:58, localpref 100, from 192.168.24.1
    AS path: I
    > to 10.0.16.2 via fe-0/0/1.0, label-switched-path am

```

### show route table bgp.l3vpn.0

```

user@host> show route table bgp.l3vpn.0
bgp.l3vpn.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

## show ted database

---

<b>List of Syntax</b>	<a href="#">Syntax on page 2564</a> <a href="#">Syntax (EX Series Switches) on page 2564</a>
<b>Syntax</b>	<pre>show ted database &lt;brief   detail   extensive&gt; &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;<i>system-name</i>&gt; &lt;topology-id <i>topology</i>&gt;</pre>
<b>Syntax (EX Series Switches)</b>	<pre>show ted database &lt;brief   detail   extensive&gt; &lt;<i>system-name</i>&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches. <b>instance <i>instance-name</i></b> option added in Junos OS Release 15.1. <b>topology-id <i>topology</i></b> option added in Junos OS Release 17.4R1 for MX Series and PTX Series.
<b>Description</b>	Display the entries in the Multiprotocol Label Switching (MPLS) traffic engineering database.
<b>Options</b>	<p><b>none</b>—Display standard information about all entries in the traffic engineering database.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display routing instance information for the specified instance. If <b><i>instance-name</i></b> is omitted, information is displayed for the master instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>system-name</i></b>—(Optional) Display traffic engineering database information for a particular system.</p> <p><b>topology-id <i>topology</i></b>— Display the topology information. By default, traffic engineering topology information is displayed.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ted database brief on page 2567</a> <a href="#">show ted database detail on page 2568</a> <a href="#">show ted database extensive on page 2569</a> <a href="#">show ted database topology-id igp on page 2571</a>

**Output Fields** Table 113 on page 2565 describes the output fields for the **show ted database** command. Output fields are listed in the approximate order in which they appear.

*Table 113: show ted database Output Fields*

Field Name	Field Description	Level of Output
TED database	Number of nodes and pseudonodes participating in IS-IS and OSPF domain routing.	All levels
ID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode. If the node contains a router ID, it is displayed in parentheses.	brief
NodeID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	extensive
Type	Type of node. It can be either <b>Rtr</b> (router) or <b>Net</b> (pseudonode).	All levels
Age(s)	How long since the node was last refreshed, in seconds.	All levels
LnkIn	Number of nodes pointing toward this node.	All levels
LnkOut	Number of nodes to which this node points.	All levels
Protocol	Protocol that reported the node information: <ul style="list-style-type: none"> <li>IS-IS(1)—IS-IS Level 1.</li> <li>IS-IS(2)—IS-IS Level 2.</li> <li>OSPF (area-number)—OSPF from the specified area.</li> </ul>	All levels
To	Address on the far end of a link.	detail extensive
Local	Address of the local interface being used to reach the remote node.	detail extensive
Remote	Address of the interface on the remote node.	detail extensive
Local interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail extensive
Remote interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail extensive
Metric	Configured traffic engineering metric.	extensive
IGP metric	Configured interior gateway protocol metric.	extensive
Static BW	Total interface bandwidth in bps.	extensive

Table 113: *show ted database Output Fields (continued)*

Field Name	Field Description	Level of Output
Reservable bandwidth	Subscription factor for the interface, which is the percentage of the link bandwidth that can be used for the RSVP reservation process. You configure this by including the <b>subscription</b> statement when configuring RSVP.	extensive
Available BW [priority]	(Must include <b>diffserv-te</b> statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each priority level. The bandwidth shown is for the entire interface, not for each individual LSP.	extensive
Diffserv-TE BW Model	Bandwidth constraint model used by the LSPs.	extensive
Available BW [TE-class]	(Must include the <b>diffserv-te</b> statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each traffic engineering class.	extensive
Static BW [CT-class]	Total interface bandwidth used by an MPLS traffic class, in bps.	extensive

Table 113: show ted database Output Fields (continued)

Field Name	Field Description	Level of Output
Interface Switching Capability Descriptor ( <i>n</i> )	<p>Information about the interface switching capability descriptor, which is a subtype length value (TLV) of the link TLV. <i>n</i> is the index number.</p> <ul style="list-style-type: none"> <li>• <b>Switching type</b>—Type of switching to be performed on a particular link: <ul style="list-style-type: none"> <li>• PSC-1—Packet switch-capable 1</li> <li>• PSC-2—Packet switch-capable 2</li> <li>• PSC-3—Packet switch-capable 3</li> <li>• PSC-4—Packet switch-capable 4</li> <li>• L2SC—Layer-2-switch-capable</li> <li>• TDM—Time-division-multiplexing-capable</li> <li>• LSC—Lambda switch-capable</li> <li>• FSC—Fiber switch-capable</li> </ul> </li> <li>• <b>Encoding type</b>—Encoding of the LSP being requested: <ul style="list-style-type: none"> <li>• Packet</li> <li>• Ethernet</li> <li>• ANSI/ETSI PDH</li> <li>• Reserved</li> <li>• SDH /SONET</li> <li>• Digital Wrapper</li> <li>• Lambda (photonic)</li> <li>• Fiber</li> <li>• FiberSDH/SONET</li> </ul> </li> <li>• <b>Maximum LSP BW [priority] bps</b>—Maximum LSP bandwidth information. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface. <ul style="list-style-type: none"> <li>• [<i>n</i>]—Priority level. The range is from 0 (high) through 7 (low).</li> <li>• <i>n</i> Mbps—Amount of the maximum bandwidth.</li> </ul> </li> <li>• <b>Minimum LSP BW</b>—Minimum LSP bandwidth in Mbps. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface. <b>Minimum LSP BW</b> is displayed only when <b>switching type</b> is PSC-1 or TDM.</li> <li>• <b>Interface MTU</b>—Displayed only when <b>switching type</b> is TDM.</li> <li>• <b>Interface supports standard SONET/SDH</b>—Displayed only when <b>switching type</b> is TDM.</li> </ul>	extensive

## show ted link

**List of Syntax**    [Syntax on page 2573](#)  
                          [Syntax \(EX Series Switches\) on page 2573](#)

**Syntax**    show ted link  
                  <brief | detail>  
                  <instance *instance-name*>  
                  <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)**    show ted link  
                  <brief | detail>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.5 for EX Series switches.  
                                  **instance *instance-name*** option added in Junos OS Release 15.1.

**Description**    Display Multiprotocol Label Switching (MPLS) traffic engineering database link information.

**Options**    **none**—Display standard information about traffic engineering database link information.  
                  **brief | detail**—(Optional) Display the specified level of output.  
                  **instance *instance-name***—(Optional) Display routing instance information for the specified instance. If ***instance-name*** is omitted, information is displayed for the master instance.  
                  **logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**    view

**List of Sample Output**    [show ted link brief on page 2574](#)  
                                  [show ted link detail on page 2574](#)

**Output Fields**    [Table 114 on page 2573](#) describes the output fields for the **show ted link** command. Output fields are listed in the approximate order in which they appear.

*Table 114: show ted link Output Fields*

Field Name	Field Description	Level of Output
ID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	<b>brief</b>
-->ID	Hostname and address of the node that the link is going to. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	<b>brief</b>

Table 114: show ted link Output Fields (continued)

Field Name	Field Description	Level of Output
hostname	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	detail
hostname	Hostname and address of the node that the link is going to. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	detail
Local Path	Number of paths CSPF on the local routing device has placed on the link.	All levels
Metric	Configured traffic engineering metric.	extensive
IGP metric	Configured interior gateway protocol metric.	detail
Local BW	Amount of bandwidth the local routing device has placed on the link.	All levels
Local	Address of the local interface being used to reach the remote node.	detail extensive
Remote	Address of the interface on the remote node.	detail extensive
Local interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail
Remote interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail

## show ted protocol

**List of Syntax** [Syntax on page 2576](#)  
[Syntax \(EX Series Switches\) on page 2576](#)

**Syntax** show ted protocol  
 <brief | detail>  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show ted protocol  
 <brief | detail>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.5 for EX Series switches.  
**instance *instance-name*** option added in Junos OS Release 15.1.

**Description** Display information about the protocols from which the Multiprotocol Label Switching (MPLS) traffic engineering database learned about its nodes.

**Options** **none**—Display standard information about the protocols from which the traffic engineering database learned about its nodes.

**brief | detail**—(Optional) Display the specified level of output.

**instance *instance-name***—(Optional) Display routing instance information for the specified instance. If ***instance-name*** is omitted, information is displayed for the master instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show ted protocol on page 2577](#)

**Output Fields** [Table 115 on page 2576](#) describes the output fields for the **show ted protocol** command. Output fields are listed in the approximate order in which they appear.

*Table 115: show ted protocol Output Fields*

Field Name	Field Description
<b>Protocol name</b>	Protocol that reported the node information: <ul style="list-style-type: none"> <li><b>IS-IS(1)</b>—IS-IS Level 1.</li> <li><b>IS-IS(2)</b>—IS-IS Level 2.</li> <li><b>OSPF (<i>area-number</i>)</b>—OSPF from the specified area.</li> </ul>

*Table 115: show ted protocol Output Fields (continued)*

Field Name	Field Description
<b>Credibility</b>	If the protocols provide conflicting information about a node, the protocol with the highest credibility value is the one that the traffic engineering database uses.
<b>Self node</b>	Address the protocol uses as the local address.

## Sample Output

### show ted protocol

```
user@host> show ted protocol
Protocol name      Credibility Self node
IS-IS(2)           2  (highest) corriedale.00(123.456.1.11)
IS-IS(1)           1                corriedale.00(123.456.1.11)
```

## traceroute mpls bgp

---

**Syntax**    `traceroute mpls bgp fec`  
              `<destination destination-address>`  
              `<detail>`  
              `<exp exp>`  
              `<fanout fanout-number>`  
              `<logical-system logical system-name>`  
              `<no-resolve>`  
              `<paths paths-number>`  
              `<pipe-mode>`  
              `<retries retries-number>`  
              `<routing-instance routing-instance-name>`  
              `<source source-address>`  
              `<ttl value>`  
              `<wait seconds>`

**Release Information**    Command introduced in Junos OS Release 14.2.

**Description**    Trace route to a remote host for an MPLS label-switched path (LSP) signaled by the Border Gateway Protocol (BGP). Use **traceroute mpls bgp** as a debugging tool to locate MPLS BGP forwarding issues in a network. (Currently supported for IPv4 packets only.)

**NOTE:** The **traceroute mpls bgp fec** command only supports single paths.

---

**Options**    **fec**—Specify the IP address and optional prefix of the forwarding equivalence class (FEC). Suppose you are at PE1, you would want to use the IP address of PE2 to trace the BGP path to that router.

**destination destination-address**—(Optional) Specify the destination address to use when sending probes.

**detail**—(Optional) Display detailed output.

**exp exp**—(Optional) Specify the class of service to use when sending probes.

**Range:** 0 through 7

**Default:** 7

**fanout fanout-number**—(Optional) Specify the maximum number of next hops to search per node.

**Range:** 1 through 16

**Default:** 16

**logical-system logical-system-name**—(Optional) Specify the name of the logical system for the traceroute attempt.

**no-resolve**—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

**paths *paths-number***—(Optional) Specify the number of paths to search.

**Range:** 1 through 255

**Default:** 16

**pipe-mode**—(Optional) Specify to trace only the outermost FEC.

**retries *retries-number***—(Optional) Specify the number of times to resend probe values.

**Range:** 1 through 9

**Default:** 3

**routing-instance *routing-instance-name***—(Optional) Specify the name of the routing instance for the trace route attempt.

**source *source-address***—(Optional) Specify the source address of the outgoing traceroute packets.

**ttl *value***—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

**Range:** 1 through 125

**Default:** 64

**wait *seconds***—(Optional) Specify the number of seconds to wait before resending a probe.

**Range:** 5 though 15

**Default:** 10

**Required Privilege Level** network

**List of Sample Output** [traceroute mpls bgp on page 2580](#)  
[traceroute mpls bgp detail on page 2581](#)

**Output Fields** [Table 116 on page 2579](#) describes the output fields for the **traceroute mpls bgp fec** command and the **traceroute mpls bgp fec detail** command. Output fields are listed in the approximate order in which they appear.

*Table 116: traceroute mpls bgp Output Fields*

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the <b>traceroute mpls bgp fec</b> command.	All levels

Table 116: traceroute mpls bgp Output Fields (continued)

Field Name	Field Description	Level of Output
ttl	Time to live value of the labeled packet.	None
Label	Outgoing label used for forwarding the packet along the label-switched paths.	None
Protocol	Signaling protocol used. For this command, it is BGP.	None
Address	Address of the next hop.	None
Previous Hop	Address of the previous hop. Previous hop address of the first hop is <b>null</b> .	None
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	None
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	<b>detail</b>
Parent	Address of the previous hop. Parent value for the first hop is <b>null</b> .	<b>detail</b>
Return Code	Return code for reporting the result of processing the echo request by the receiver.	<b>detail</b>
Response time	Time for the echo request to reach the receiver.	<b>detail</b>
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is <b>none</b> .	<b>detail</b>
Label Stack	Label stack used to forward the packet.	<b>detail</b>

## Sample Output

### traceroute mpls bgp

## transit (Chained Composite Next Hops)

**Syntax** transit {  
 (all | no-all);  
 (l2vpn | no-l2vpn);  
 (l3vpn | no-l3vpn);  
 (labeled-bgp | no-labeled-bgp);  
 (ldp | no-ldp);  
 (ldp-p2mp | no-ldp-p2mp);  
 lsp-statistics-from-route;  
 (rsvp | no-rsvp);  
 (rsvp-p2mp | no-rsvp-p2mp);  
 (static | no-static);  
 }

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-options forwarding-table  
 chained-composite-next-hop],  
 [edit routing-options forwarding-table chained-composite-next-hop]

**NOTE:** The [edit logical-systems] hierarchy level is not supported on the QFX10000 switches.

**Release Information** Statement introduced in Junos OS Release 12.1.  
 Statement introduced in Junos OS Release 15.1 for QFX10000 Series switches.

**Description** Allows you to configure the chained composite next hops transit configuration options for devices handling transit traffic in the network. This statement and the associated functionality is available on PTX Packet Transport Routers and QFX10000 switches.

**Default** All of the **transit** statement options are enabled on PTX transport routers and QFX10000 switches. However, you can disable any of the statements with a **no** option.

**Options** **all | no-all**—Enable or disable chained composite next-hops for all of the possible packet transit protocols and applications. The **all | no-all** statements do not apply to the **lsp-statistics-from-route** statement.

**l2vpn | no-l2vpn**—Enable or disable chained composite next-hops for Layer 2 VPNs.

**l3vpn | no-l3vpn**—Enable or disable chained composite next-hops for Layer 3 VPNs.

**labeled-bgp | no-labeled-bgp**—Enable or disable chained composite next-hops for labeled BGP.

**ldp | no-ldp**—Enable or disable chained composite next-hops for LDP.

**ldp-p2mp | no-ldp-p2mp**—Enable or disable chained composite next-hops for LDP-signaled P2MP LSPs.

**NOTE:** On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `rsvp-p2mp` and `ldp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current master logical system to fail at the time of a Routing Engine switchover.

**`lsp-statistics-from-route`**—Enable LSP statistics collection from the route.

**`rsvp` | `no-rsvp`**—Enable or disable chained composite next-hops for RSVP.

**`rsvp-p2mp` | `no-rsvp-p2mp`**—Enable or disable chained composite next-hops for RSVP-signaled P2MP LSPs.

**NOTE:** On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `rsvp-p2mp` and `ldp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current master logical system to fail at the time of a Routing Engine switchover.

**`static` | `no-static`**—Chained composite next hops are enabled for transit static LSPs by default. You can also disable this functionality for transit static LSPs.

**Required Privilege Level**

<code>routing</code>	—To view this statement in the configuration.
<code>routing-control</code>	—To add this statement to the configuration.

## clear rsvp session

---

**List of Syntax**    [Syntax on page 2586](#)  
                          [Syntax \(EX and QFX Series Switches\) on page 2586](#)

**Syntax**    clear rsvp session  
              <all>  
              <connection-destination *address*>  
              <connection-source *address*>  
              <gracefully>  
              <logical-system (all | *logical-system-name*)>  
              <lsp-id *identifier*>  
              <name *name*>  
              <optimize-fast-reroute>  
              <tunnel-id *identifier*>

**Syntax (EX and QFX Series Switches)**    clear rsvp session  
  <connection-destination *address*>  
  <connection-source *address*>  
  <gracefully>  
  <lsp-id *identifier*>  
  <name *name*>  
  <optimize-fast-reroute>  
  <tunnel-id *identifier*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description**    Reset and restart Resource Reservation Protocol (RSVP) sessions.

**Options**    **all**—Clear all RSVP sessions for which this routing device is the ingress, transit, or egress routing device.

**connection-source *address***—(Optional) Source address for GMPLS and MPLS LSPs from the RSVP sender template.

**connection-destination *address***—(Optional) Destination address for GMPLS and MPLS LSPs from the RSVP sender template.

**gracefully**—(Optional) Gracefully reset an RSVP session for a nonpacket LSP in two passes. In the first pass, the Admin-Status object is signaled along the path to the other endpoint of the RSVP session. In the second pass, the path used by the RSVP session is torn down. This option can only be used on the ingress or egress routing device of the RSVP session and is only valid for nonpacket LSPs.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsp-id *identifier***—(Optional) LSP identifier (source port) for the RSVP sender template.

**name** *name*—(Optional) Reset and restart the specified RSVP session.

**optimize-fast-reroute**—(Optional) Begin fast reroute optimization.

**tunnel-id** *identifier*—(Optional) Tunnel identifier (destination port) for the RSVP session.

```

## monitor label-switched-path

**Syntax** `monitor label-switched-path lsp-name`  
`<logical-system (logical-system-name)>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Logical system support introduced in Junos OS Release 9.4.  
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description** Display the real-time status of the specified RSVP label-switched path (LSP). You can also use this command to monitor LSPs configured within logical systems.

**Options** `logical-system ( logical-system-name )`—(Optional) Perform this operation on all logical systems or on a particular logical system.

*lsp-name*—Name of the LSP.

**Additional Information** You can track the amount of traffic traversing an RSVP LSP and observe its essential parameters, such as uptime, ingress and egress addresses, labels, routes, and ports. Values are typically sampled every second. The display also allows you to scroll to other currently running LSPs. You cannot use this command to display information about static LSPs or LDP-signaled LSPs.

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the `c` key. To control the output of the `monitor label-switched-path` command while it is running, use the keys listed in [Table 117 on page 2589](#). The keys are not case-sensitive.

**Table 117: Output Control Keys for the monitor label-switched-path Command**

Key	Action
c	Clears the screen and refreshes the display for this LSP.
f	Freezes the display, preventing new information from being displayed.
l	Monitors a different LSP. After you type <code>l</code> , you can type the new LSP name.
n	Displays information about the next LSP (whose name is alphabetically higher than the current LSP name) configured on the router.
p	Goes to the previous LSP (whose name is alphabetically lower than the current LSP name) configured on the router.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws, or restarts, the data display for this LSP.

**Required Privilege Level** trace

**List of Sample Output** [monitor label-switched-path on page 2591](#)

**Output Fields** [Table 118 on page 2590](#) describes the output fields for the **monitor label-switched-path** command. Output fields are listed in the approximate order in which they appear.

*Table 118: monitor label-switched-path Output Fields*

Field Name	Field Description
(1)	Displays the following information: <ul style="list-style-type: none"> <li>• <b>hostname</b>—Name of the router.</li> <li>• <b>Seconds</b>—Time elapsed since this display was started.</li> <li>• <b>Time</b>—Current local time.</li> </ul>
(2)	<b>Delay</b> —Length of the time delay, in milliseconds, required to obtain the information in the monitor display. The first number shows the current sampling delay. The second number shows the shortest delay recorded to date. The third number shows the worst delay recorded to date. This delay can vary substantially depending on the system load.
(3)	Displays the following: <ul style="list-style-type: none"> <li>• <b>To</b>—Destination address of the LSP.</li> <li>• <b>From</b>—Originating address of the LSP.</li> <li>• <b>State</b>—Current state of the LSP: <b>Up</b> or <b>Down</b>.</li> </ul>
(4)	Displays the following: <ul style="list-style-type: none"> <li>• <b>LSPName</b>—Name of the LSP.</li> <li>• <b>Type</b>—Type of LSP: <b>Ingress</b>, <b>Egress</b>, or <b>Transit</b>.</li> </ul>
(5)	Displays the following: <ul style="list-style-type: none"> <li>• <b>Label in</b>—Incoming label of the LSP.</li> <li>• <b>Label out</b>—Outgoing label of the LSP.</li> </ul>
(6)	<b>Port number</b> —Port number for the sending router, the port number for the receiving router, and the protocol ID. For MPLS traffic engineering applications, the protocol ID is always <b>0</b> .
(7/8)	<b>Record route</b> —All intermediate and egress router addresses for this LSP.
(9/10/11)	Displays traffic statistics: <ul style="list-style-type: none"> <li>• <b>Output packets</b>—Number of packets that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.</li> <li>• <b>Output bytes</b>—Number of bytes that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.</li> </ul>
(12)	Displays any errors the router encountered while attempting to retrieve information on the LSP.
(13)	Lists the keyboard commands you can use to navigate to other LSPs. For a description of the keyboard commands, see <a href="#">Table 117 on page 2589</a> .

## Sample Output

### monitor label-switched-path

```
user@host> monitor label-switched-path
(1) host                               Seconds: 112           Time: 15:32:22

    LSP='l'
```

## ping mpls rsvp

---

**Syntax**    ping mpls rsvp  
             <lsp-name>  
             <count count>  
             <destination address>  
             <detail>  
             <dynamic-bypass>  
             <egress egress-address>  
             <exp forwarding-class>  
             <interface interface-name>  
             <logical-system (all | logical-system-name)>  
             <manual-bypass>  
             <multipoint>  
             <size bytes>  
             <source source-address>  
             <standby standby-path-name>  
             <sweep>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                             The **egress** and **multipoint** options were introduced in Junos OS Release 9.2.  
                             The **size** and **sweep** options were introduced in Junos OS Release 9.6.  
                             The **dynamic-bypass** and **manual-bypass** options were introduced in Junos OS Release 10.2.  
                             Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description**    Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections.  
                     Type Ctrl+c to interrupt a **ping mpls** command.

**Options**    **count count**—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

**destination address**—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

**detail**—(Optional) Display detailed information about the echo requests sent and received.

**NOTE:** When using the **detail** option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the **detail** option (even when synchronized using NTP).

---

**dynamic-bypass**—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

**egress *egress-address***—(Optional) Only the specified egress router or switch responds to the ping request.

**exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.

**interface**—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the **manual-bypass** option.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.

***lsp-name***—Ping an RSVP-signaled LSP using an LSP name.

**manual-bypass**—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the **interface** option.

**multipoint**—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the **egress** option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

**size *bytes***—(Optional) Size of the LSP ping request packet (100 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

**standby *standby-path-name***—(Optional) Name of the standby path.

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE:** In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

<b>Required Privilege Level</b>	network
<b>List of Sample Output</b>	<a href="#">ping mpls rsvp (Echo Reply Received) on page 2594</a> <a href="#">ping mpls rsvp (Echo Reply with Error Code) on page 2594</a> <a href="#">ping mpls rsvp detail on page 2594</a> <a href="#">ping mpls rsvp multipoint egress detail count on page 2595</a> <a href="#">ping mpls rsvp multipoint detail count on page 2595</a> <a href="#">ping mpls rsvp destination detail count size on page 2595</a> <a href="#">ping mpls rsvp destination detail sweep size on page 2596</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls rsvp (Echo Reply Received)

```
user@host> ping mpls rsvp test1
!!!!!--- lsping statistics ---5 packets transmitted, 5 packets received, 0% packet
loss
```

## show rsvp interface

**List of Syntax**    [Syntax on page 2597](#)  
                          [Syntax \(EX Series Switches\) on page 2597](#)

**Syntax**    show rsvp interface  
                  <brief | detail | extensive>  
                  <instance *instance-name*>  
                  <link-management>  
                  <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)**    show rsvp interface  
                  <brief | detail | extensive>  
                  <link-management>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.5 for EX Series switches.  
                                  **instance** option added in Junos OS Release 15.1 for the MX Series.

**Description**    Display the status of Resource Reservation Protocol (RSVP)-enabled interfaces and packet statistics. The RSVP input/input module collects statistics for certain events on a per-interface basis. Most of these events were tracked on a routing-instance basis in Junos OS releases earlier than Release 17.2. The "show rsvp interface detail" command displays these event counters under the Events section of the output only when the values of these fields are higher than zero. These statistics are also maintained at the global level (per routing-instance) and are also displayed in the output of the "show rsvp statistics" command.

**Options**    **none**—Display standard information about the status of RSVP-enabled interfaces and packet statistics.

**brief | detail | extensive | link-management**—(Optional) Display the specified level of output.

**instance *instance-name***—(Optional) Display RSVP status information for the specified instance. If **instance-name** is omitted, RSVP status information is displayed for the master instance.

**link-management**—(Optional) Use the link-management option to display the control peers and corresponding TE-link information created by the Link Management Protocol (LMP).

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level**    view

**List of Sample Output** [show rsvp interface brief on page 2600](#)  
[show rsvp interface detail on page 2600](#)  
[show rsvp interface extensive on page 2601](#)  
[show rsvp interface link-management on page 2601](#)  
[show rsvp interface detail RSVP interface: 9 active on page 2602](#)

**Output Fields** [Table 119 on page 2598](#) lists the output fields for the **show rsvp interface** command. Output fields are listed in the approximate order in which they appear.

*Table 119: show rsvp interface Output Fields*

Field Name	Field Description	Level of Output
<b>RSVP interface</b>	Number of interfaces on which RSVP is active. Each interface has one line of output.	All levels
<b>Interface</b>	Name of the interface.	All levels
<b>Index</b>	Index of the interface.	<b>detail</b>
<b>State</b>	State of the interface. <ul style="list-style-type: none"> <li>• <b>Disabled</b>—No traffic engineering information is displayed.</li> <li>• <b>Down</b>—Interface is not operational.</li> <li>• <b>Enabled</b>—Displays traffic engineering information.</li> <li>• <b>Up</b>—Interface is operational.</li> </ul>	All levels
<b>NoAuthentication</b>	Interface does not support RSVP authentication.	<b>detail</b>
<b>NoAggregate</b>	Interface does not support refresh reduction.	<b>detail</b>
<b>NoReliable</b>	Interface does not support refresh reduction message ID extension.	<b>detail</b>
<b>NoLinkProtection</b>	Interface does not support link protection.	<b>detail</b>
<b>HelloInterval</b>	Frequency at which RSVP hellos are sent on this interface (in seconds).	<b>detail</b>
<b>Address</b>	IP address of the local interface.	<b>detail</b>
<b>Active control channel</b>	Next-hop link address to transmit messages.	None specified
<b>TElink</b>	Traffic-engineered links that are managed by the peer they are associated with.	None specified
<b>Active resv</b>	Number of reservations that are actively reserving bandwidth on the interface.	All levels
<b>PreemptionCnt</b>	Number of times an RSVP session was preempted on this interface.	<b>detail</b>
<b>Update threshold</b>	Percentage change in reserved bandwidth to trigger an IGP update.	<b>detail</b>
<b>Subscription</b>	User-configured subscription factor.	All levels

Table 119: *show rsvp interface Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Actual</b>	Available RSVP bandwidth that is recalculated after considering SPRING bandwidth utilization.	<b>extensive</b>
<b>bc number</b>	Bandwidth allocated for the specified bandwidth constraint.	<b>extensive</b>
<b>ct number</b>	Bandwidth allocated for the specified class type.	<b>extensive</b>
<b>Static BW</b>	Total interface bandwidth, in bps.	All levels
<b>Available BW</b>	Amount of bandwidth that RSVP is allowed to reserve, in bps. It is equal to (static bandwidth * subscription factor).	all levels
<b>Reserved BW</b>	Currently reserved bandwidth, in bps.	All levels
<b>SoftPreemptionCnt</b>	Number of times a soft preemption occurred on this interface. This number is not included in the <b>PreemptionCnt</b> value.	<b>detail</b>
<b>Overbooked BW</b>	Currently overbooked bandwidth, in bps, by class type ( <b>ct0</b> through <b>ct3</b> ).	<b>detail</b>
<b>Highwater mark</b>	Highest bandwidth that has ever been reserved on this interface, in bps.	<b>brief</b>
<b>PacketType</b>	Type of RSVP packet.	<b>detail</b>
<b>Total Sent</b>	Total number of packets sent.	<b>detail</b>
<b>Total Received</b>	Total number of packets received since RSVP was enabled.	<b>detail</b>
<b>Last 5 seconds Sent</b>	Number of packets sent in the last 5 seconds.	<b>detail</b>
<b>Last 5 seconds Received</b>	Number of packets received in the last 5 seconds.	<b>detail</b>
<b>Path</b>	Statistics about Path messages, which are sent from the RSVP sender along the data paths and store path state information in each node along the path.	<b>detail</b>
<b>PathErr</b>	Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.	<b>detail</b>
<b>PathTear</b>	Statistics about PathTear messages, which remove path states and dependent reservation states in any routers along a path.	<b>detail</b>
<b>Resv</b>	Statistics about Resv messages, which are sent from the RSVP receiver along the data paths and store reservation state information in each node along the path.	<b>detail</b>
<b>ResvErr</b>	Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.	<b>detail</b>

Table 119: show rsvp interface Output Fields (continued)

Field Name	Field Description	Level of Output
<b>ResvTear</b>	Statistics about ResvTear messages, which remove reservation states along a path.	<b>detail</b>
<b>Hello</b>	Number of RSVP hello packets that have been sent to and received from the neighbor.	<b>detail</b>
<b>Ack</b>	Acknowledge message for refresh reductions.	<b>detail</b>
<b>Srefresh</b>	Summary refresh messages.	<b>detail</b>
<b>EndtoEnd RSVP</b>	Statistics for the number of end-to-end RSVP messages sent.	<b>detail</b>
<b>Queue</b>	CoS transmit queue number and its associated forwarding class designation.	<b>extensive</b>
<b>TxRate</b>	Configured bandwidth in Mbps and configured bandwidth as a percentage of the specified queue.	<b>extensive</b>
<b>Priority</b>	Weight of the queue relative to other configured queues, in percentage.	<b>extensive</b>
<b>queue-priority-value</b>	<b>Low, High, None, or Exact.</b> <b>None</b> indicates no rate limiting. <b>Exact</b> indicates the queue transmits at the configured rate only.	<b>extensive</b>

## Sample Output

### show rsvp interface brief

```

user@host> show rsvp interface brief
RSVP interface: 1 active

```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
de0.0	Up	1	23%	10Mbps	989.992kbps	1.31Mbps	1.31Mbps

### show rsvp interface detail

Starting in Junos OS Release 15.2, this command also shows conditional PathTear statistics and Node Hellos.

```

## show rsvp neighbor

**List of Syntax** [Syntax on page 2603](#)  
[Syntax \(EX Series Switches\) on page 2603](#)

**Syntax** show rsvp neighbor  
 <brief | detail | extensive>  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show rsvp neighbor  
 <brief | detail>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.5 for EX Series switches.  
**instance** option added in Junos OS Release 15.1 for the MX Series.

**Description** Display Resource Reservation Protocol (RSVP) neighbors that were discovered dynamically during the exchange of RSVP packets.

**Options** **none**—Display standard information about RSVP neighbors.

**brief | detail**—(Optional) Display the specified level of output.

**instance *instance-name***—(Optional) Display the RSVP neighbor information for the specified instance. If **instance-name** is omitted, RSVP neighbor information is displayed for the master instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show rsvp neighbor on page 2607](#)  
[show rsvp neighbor detail on page 2607](#)

**Output Fields** [Table 120 on page 2603](#) lists the output fields for the **show rsvp neighbor** command. Output fields are listed in the approximate order in which they appear.

*Table 120: show rsvp neighbor Output Fields*

Field Name	Field Description	Level of Output
RSVP neighbor	Number of neighbors that the routing device has learned of. Each neighbor has one line of output.	All levels

Table 120: *show rsvp neighbor* Output Fields (continued)

Field Name	Field Description	Level of Output
<b>via</b>	Name of the interface where the neighbor has been detected. In the case of generalized MPLS (GMPLS) LSPs, the name of the peer where the neighbor has been detected.	<b>detail</b>
<b>Address</b>	Address of a learned neighbor.	All levels
<b>Idle</b>	Length of time the neighbor has been idle, in seconds.  <b>NOTE:</b> Until Junos OS Release 15.1, in the output of the <i>show rsvp neighbor</i> command, the value under the <i>Idle</i> field immediately reflects the changed idle time when a link in the neighboring router is brought down. Starting with Junos OS Release 15.2, a router does not declare a neighbor as idle when a hello adjacency exists and has not timed out. When an interface is brought down, RSVP brings down the neighbor because of the notification it receives from IGP. The reason for considering the IGP-down notification is to support BFD-triggered fast reroute (FRR) and RSVP-TE is not directly a client for BFD notifications. When RSVP brings down the neighbor, the input/output process is not impacted. As a result, the idle time in the output of the <i>show</i> command is not immediately updated.	All levels
<b>Up/Dn</b>	Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.	All levels
<b>Up cnt and Down cnt</b>	Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.	<b>detail</b>
<b>status</b>	State of the RSVP neighbor:  <ul style="list-style-type: none"> <li>• <b>Up</b>—Routing device can detect RSVP Hello messages from the neighbor.</li> <li>• <b>Down</b>—Routing device has received one of the following indications: <ul style="list-style-type: none"> <li>• Communication failure from the neighbor.</li> <li>• Communication from IGP that the neighbor is unavailable.</li> <li>• Change in the sequence numbers in the RSVP Hello messages sent by the neighbor.</li> </ul> </li> <li>• <b>Restarting</b>—RSVP neighbor is unavailable and might be restarting. The neighbor remains in this state until it has restarted or is declared dead. This state is possible only when graceful restart is enabled.</li> <li>• <b>Restarted</b>—RSVP neighbor has restarted and is undergoing state recovery (graceful restart) procedures.</li> <li>• <b>Dead</b>—Routing device has lost all communication with the RSVP neighbor. Any RSVP sessions with that neighbor are torn down.</li> </ul>	<b>detail</b>
<b>LastChange</b>	Time elapsed since the neighbor state changed either from up to down or from down to up. The format is <i>hh:mm:ss</i> .	All levels

Table 120: *show rsvp neighbor* Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Last changed time</b>	Time elapsed since the neighbor state changed either from up to down or from down to up.	<b>detail</b>
<b>HelloInt</b>	Frequency at which RSVP hellos are sent on this interface (in seconds).	All levels
<b>HelloTx/Rx</b>	Number of hello packets sent to and received from the neighbor.	All levels
<b>Hello</b>	Number of RSVP hello packets that have been sent to and received from the neighbor.	<b>detail</b>
<b>Message received</b>	Number of Path and Resv messages that this routing device has received from the neighbor.	<b>detail</b>
<b>Remote Instance</b>	Identification provided by the remote routing device during Hello message exchange.	<b>detail</b>
<b>Local Instance</b>	Identification sent to the remote routing device during Hello message exchange.	<b>detail</b>
<b>Refresh reduction</b>	<p>Measure of processing overhead requests of refresh messages. Refresh reduction extensions improve routing device performance by reducing the process overhead, thus increasing the number of LSPs a routing device can support. <b>Refresh reduction</b> can have the following values:</p> <ul style="list-style-type: none"> <li>• <b>operational</b>—All four RSVP refresh reduction extensions—message ack, bundling, summary refresh, and staged refresh timer—are functional between the two neighboring routing devices. For a detailed explanation of these extensions, see RFC 2961.</li> <li>• <b>incomplete</b>—Some RSVP refresh reduction extensions are functional between the two neighboring routing devices.</li> <li>• <b>not operational</b>—Either the refresh reduction feature has been turned off, or the remote routing device cannot support the refresh reduction extensions.</li> </ul>	<b>detail</b>
<b>Remote end</b>	<p>Neighboring routing device's status with regard to refresh reduction:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Remote routing device has requested refresh reduction during RSVP message exchanges.</li> <li>• <b>disabled</b>—Remote routing device does not require refresh reduction.</li> </ul>	<b>detail</b>
<b>Pop label</b>	Pop labels of the RSVP-TE pop-and-forward LSP tunnels.	<b>detail</b>
<b>Ack-extension</b>	<p>An RSVP refresh reduction extension:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Both local and remote routing devices support the ack-extension (RFC 2961).</li> <li>• <b>disabled</b>—Remote routing device does not support the ack-extension.</li> </ul>	<b>detail</b>
<b>Link protection</b>	<p>Status of the MPLS fast reroute mechanism that protects traffic from link failure:</p> <ul style="list-style-type: none"> <li>• <b>enabled</b>—Link protection feature has been turned on, protecting the neighbor with a bypass LSP.</li> <li>• <b>disabled</b>—No link protection feature has been enabled for this neighbor.</li> </ul>	<b>detail</b>

Table 120: *show rsvp neighbor Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>LSP name</b>	Name of the bypass LSP.	<b>detail</b>
<b>Bypass LSP</b>	Status of the bypass LSP. It can have the following values: <ul style="list-style-type: none"> <li>• <b>does not exist</b>—Bypass LSP is not available.</li> <li>• <b>connecting</b>—Routing device is in the process of establishing a bypass LSP, and the LSP is not available for link protection at the moment.</li> <li>• <b>operational</b>—Bypass LSP is up and running.</li> <li>• <b>down</b>—Bypass LSP has gone down, with the most probable cause a node or a link failure on the bypass path.</li> </ul>	<b>detail</b>
<b>Backup routes</b>	Number of user LSPs (or routes) that are being protected by a bypass LSP (before link failure).	<b>detail</b>
<b>Backup LSPs</b>	Number of LSPs that have been temporarily established to maintain traffic by refreshing the downstream LSPs during link failure (not a one-to-one correspondence).	<b>detail</b>
<b>Bypass explicit route</b>	Explicit route object's (ERO) path that is taken by the bypass LSP.	<b>detail</b>
<b>Restart time</b>	Length of time a neighbor waits to receive a Hello from the restarting node before declaring the node dead and deleting the states (in milliseconds).	<b>detail</b>
<b>Recovery time</b>	Length of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds). Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.	<b>detail</b>

## Sample Output

### show rsvp neighbor

```
user@host> show rsvp neighbor
RSVP neighbor: 2 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx
192.168.207.203   0 3/2    13:01      3   366/349
192.168.207.207   0 1/0    22:49      3   448/448
```

### show rsvp neighbor detail

Starting in Junos OS Release 16.1, this command also shows whether enhanced FRR procurers are enabled on the neighbor. Neighbors with Point of Local Repair (PLR) or Node Protecting Merge Point (NP-MP) also show the Hellos sent /received count.

```
user@host> show rsvp neighbor detail
RSVP neighbor: 2 learned
Address: 192.168.207.203 via: ecstasy1 status: Up
  Last changed time: 28:47, Idle: 0 sec, Up cnt: 3, Down cnt: 2
  Message received: 632
  Hello: sent 673, received 656, interval 3 sec
  Remote instance: 0x6432838a, Local instance: 0x74b72e36
  Refresh reduction: operational
    Remote end: enabled, Ack-extension: enabled
  Enhanced FRR local protection: enabled
    LSPs (total 76): Phop 0, PPhop 0, Nhop 76, NNhop 0
  Pop Label: 299808(unprotected) 299840(link-protected)
Link protection: enabled
  LSP name: Bypass_to_192.168.207.203
  Bypass LSP: operational, Backup routes: 1, Backup LSPs: 0
  Bypass explicit route: 192.168.207.207 192.168.207.224
Restart time: 60000 msec, Recovery time: 0 msec
```

## show rsvp route-session-id

**Syntax** `show rsvp route-session-id`

**Release Information** Command introduced in Junos OS Release 16.1 for the MX Series.

**Description** Display the session ID and the version information associated with the ingress route added by the Resource Reservation Protocol (RSVP) in the inet.3 table.

Session ID is a pre-populated identifier used for indirect next hops in BGP Prefix Independent Convergence (PIC) enabled router. Session ID is used to identify the session or path.

**Options** **none**—Validate and display RSVP route session details.

**Required Privilege Level** view

**List of Sample Output** [show rsvp route-session-id on page 2608](#)

**Output Fields** [Table 121 on page 2608](#) describes the output fields for the **show rsvp route-session-id** command. Output fields are listed in the approximate order in which they appear.

*Table 121: show rsvp route-session-id Output Fields*

Field Name	Field Description
Ingress Route Destination	Destination (egress routing device) of the session.
Ingress Route Preference	RSVP preference value of the ingress session.
Ingress Route Metric 1	Metric 1 associated with the RSVP ingress route.
Ingress Route Metric 2	Metric 2 associated with the RSVP ingress route.
Ingress Route Session ID	Session ID associated with the RSVP ingress route.
Version	Version number associated with the RSVP ingress route.

## Sample Output

### show rsvp route-session-id

```
user@host> show rsvp route-session-id
```

```
RSVP Ingress Route Session ID Database:
```

```
=====
```

```
Ingress Route Destination: 1.1.1.5/32
Ingress Route Preference: 7
```

Ingress Route Metric 1: 20, Metric 2: 0  
Ingress Route Session ID: 0x146, Version: 0

## show rsvp pop-and-forward

---

<b>Syntax</b>	<pre>show rsvp pop-and-forward &lt;brief   detail   extensive&gt; &lt;instance <i>routing-instance-name</i>&gt; &lt;label <i>label</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 18.1R1 on MX Series routers, PTX Series routers, and vMX series routers.
<b>Description</b>	Display RSVP-TE pop-and-forward LSP tunnel information. This information includes the set of in-labels (one-hop pop label or a delegation label), the number of session using each label and the next segment-label (if there is another delegation hop downstream), and whether the in-label is used for unprotected or protected LSPs.
<b>Options</b>	<p><b>none</b>—Display the standard level of information for the RSVP-TE pop-and-forward LSP tunnels.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the desired level of output. The brief option is the default level of output.</p> <p>The detail option provides more information about the hops in a delegation segment (whether its one-hop or multi-hop).</p> <p>The extensive option lists the set of LSPs that are using a given pop or delegation label.</p> <p><b>instance <i>routing-instance-name</i></b>—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for the specified routing instance.</p> <p><b>label <i>label</i></b>—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for the specified label.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for all or the specified logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">RSVP-TE Pop-and-Forward LSP Tunnels Overview on page 613</a></li><li>• <a href="#">pop-and-forward (Protocols RSVP) on page 2214</a></li><li>• <a href="#">pop-and-forward (Protocols MPLS) on page 2109</a></li></ul>

**Syntax (EX and QFX Series Switches)**    show rsvp session  
  <brief | detail | extensive | terse>  
  <bidirectional | unidirectional>  
  <bypass>  
  <down | up>  
  <externally-provisioned>  
  <interface *interface-name*>  
  <lsp-type>  
  <name *session-name*>  
  <p2mp>  
  <session-type>  
  <statistics>  
  <te-link *te-link*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.  
                              **externally-provisioned** option added in Junos OS Release 13.3.  
                              Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.  
                              **instance** option added in Junos OS Release 15.1 for the MX Series.

**Description**    Display information about Resource Reservation Protocol (RSVP) sessions.

**Options**    **none**—Display standard information about all RSVP sessions.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**bidirectional | unidirectional**—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.

**bypass**—(Optional) Display RSVP sessions for bypass LSPs.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**externally-provisioned**—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

**instance *instance-name***—(Optional) Display RSVP sessions for the specified instance. If *instance-name* is omitted, RSVP session information is displayed for the master instance.

**interface *interface-name***—(Optional) Display RSVP sessions for the specified interface only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***lsp-type***—(Optional) Display information about RSVP sessions with regard to LSPs:

- **bypass**—Sessions used for bypass LSPs.
- **lsp**—Sessions used to set up LSPs.
- **nolsp**—Sessions not used to set up LSPs.

**name *session-name***—(Optional) Display information about the named session.

**p2mp**—(Optional) Display point-to-multipoint information.

***session-type***—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that transit through this routing device.

**statistics**—(Optional) Display packet statistics.

**te-link *te-link***—(Optional) Display sessions with reservations on the specified TE link.

**Required Privilege Level**

**Output Fields** Table 122 on page 2614 describes the output fields for the **show rsvp session** command. Output fields are listed in the approximate order in which they appear.

*Table 122: show rsvp session Output Fields*

Field Name	Field Description	Level of Output
<b>Ingress RSVP</b>	Information about ingress RSVP sessions.	<b>detail</b>
<b>Ingress RSVP</b>	Information about ingress RSVP sessions. Each session has one line of output.	All levels
<b>Egress RSVP</b>	Information about egress RSVP sessions.	All levels
<b>Transit RSVP</b>	Information about the transit RSVP sessions.	All levels
<b>P2MP name</b>	(Appears only when the <b>p2mp</b> option is specified). Name of the point-to-multipoint LSP path.	All levels
<b>P2MP branch count</b>	(Appears only when the <b>p2mp</b> option is specified). Number of LSPs receiving packets from the point-to-multipoint LSP.	All levels
<b>To</b>	Destination (egress routing device) of the session.	All levels
<b>From</b>	Source (ingress routing device) of the session.	All levels
<b>State</b>	State of the path: <b>Up</b> , <b>Down</b> , or <b>AdminDn</b> . <b>AdminDn</b> indicates that the LSP is being taken down gracefully.	All levels
<b>Address</b>	Destination (egress routing device) of the LSP.	<b>detail</b>
<b>From</b>	Source (ingress routing device) of the session.	<b>detail</b>
<b>LSPstate</b>	State of the LSP that is being handled by this RSVP session. It can be either <b>Up</b> , <b>Dn</b> (down), or <b>AdminDn</b> . <b>AdminDn</b> indicates that the LSP is being taken down gracefully.	<b>brief detail</b>
<b>Rt</b>	Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ).	<b>brief</b>
<b>Active Route</b>	Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table ( <b>mpls.0</b> ).	<b>detail</b>
<b>LSPname</b>	Name of the LSP.	<b>brief detail</b>

Table 122: *show rsvp session Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>LSPpath</b>	Indicates whether the RSVP session is for the primary or secondary LSP path. <b>LSPpath</b> can be either <b>primary</b> or <b>secondary</b> and can be displayed on the ingress, egress, and transit routing devices. <b>LSPpath</b> can also indicate when a graceful LSP deletion has been triggered.	<b>detail</b>
<b>Bypass</b>	(Egress routing device) Destination address for the bypass LSP.	<b>detail</b>
<b>Bidir</b>	(When LSP is bidirectional) LSP will allow data to travel in both directions between GMPLS devices.	<b>detail</b>
<b>Bidirectional</b>	(When LSP is bidirectional) LSP will allow data to travel both ways between GMPLS devices.	<b>detail</b>
<b>Upstream label in</b>	(When LSP is bidirectional) Incoming label for reverse direction traffic for this LSP.	<b>detail</b>
<b>Upstream label out</b>	(When LSP is bidirectional) Outgoing label for reverse direction traffic for this LSP.	<b>detail</b>
<b>Recovery label received</b>	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	<b>detail</b>
<b>Recovery label sent</b>	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned.	<b>detail</b>
<b>Suggested label received</b>	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	<b>detail</b>
<b>Suggested label sent</b>	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned.	<b>detail</b>
<b>Resv style or Style</b>	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter).	<b>brief detail</b>
<b>Label in</b>	Incoming label for this LSP.	<b>brief detail</b>
<b>Label out</b>	Outgoing label for this LSP.	<b>brief detail</b>
<b>Time left</b>	Number of seconds remaining in the lifetime of the reservation.	<b>brief detail</b>
<b>Since</b>	Date and time when the RSVP session was initiated.	<b>detail</b>
<b>Tspec</b>	Sender's traffic specification, which describes the sender's traffic parameters.	<b>detail</b>
<b>DiffServ info</b>	Indicates whether the LSP is a multiclass LSP ( <b>multiclass diffServ-TE LSP</b> ) or a Differentiated-Services-aware traffic engineering LSP ( <b>diffServ-TE LSP</b> ).	<b>detail</b>
<b>bandwidth</b>	Bandwidth for each class type ( <b>ct0</b> , <b>ct1</b> , <b>ct2</b> , or <b>ct3</b> ).	<b>detail</b>

Table 122: *show rsvp session Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Port number</b>	Protocol ID and sender/receiver port used in this RSVP session.	<b>detail</b>
<b>Attrib flags</b>	<b>Non-PHP</b> indicates that ultimate hop popping has been requested by the LSP using this RSVP session	extensive
<b>FastReroute desired</b>	Fast reroute has been requested by the ingress routing device.	<b>detail</b>
<b>Soft preemption desired</b>	Soft preemption has been requested by the ingress routing device.	<b>detail</b>
<b>FastReroute desired</b>	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Fast reroute (one-to-one backup) has been requested by the ingress routing device.	<b>detail extensive</b>
<b>Link protection desired</b>	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Link protection (many-to-one backup) has been requested by the ingress routing device.	<b>detail extensive</b>
<b>Node/Link protection desired</b>	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Node and link protection (many-to-one backup) has been requested by the ingress routing device.	<b>detail extensive</b>
<b>Type</b>	LSP type: <ul style="list-style-type: none"> <li>• <b>Link protected LSP</b>—LSP has been protected by link protection at the outgoing interface. The name of the bypass used is also listed here (<b>extensive</b>).</li> <li>• <b>Node/Link protected LSP</b>—LSP has been protected by node and link protection at the outgoing interface. The name of the bypass used is also listed here (<b>extensive</b>).</li> <li>• <b>Protection down</b>—LSP is not currently protected.</li> <li>• <b>Bypass LSP</b>—LSP that is used to protect one or more user LSPs in case of link failure.</li> <li>• <b>Backup LSP at Point-of-Local-Repair (PLR)</b>—LSP that has been temporarily established to protect a user LSP at the ingress of a failed link.</li> <li>• <b>Backup LSP at Merge Point (MP)</b>—LSP that has been temporarily established to protect a user LSP at the egress of a failed link.</li> </ul>	<b>detail extensive</b>
<b>New bypass</b>	New bypass (the bypass name is also displayed) has been activated to protect the LSP.	<b>extensive</b>
<b>Link protection up, using bypass-name</b>	Link protection (the bypass name is also displayed) has been activated for the LSP.	<b>extensive</b>
<b>Creating backup LSP, link down</b>	A <b>link down</b> event occurred, and traffic is being switched over to the bypass LSP.	<b>extensive</b>
<b>Deleting backup LSP, protected LSP restored</b>	Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted.	<b>extensive</b>

Table 122: *show rsvp session* Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Path mtu</b>	Displays the value of the path MTU received from the network (through signaling) and the value used for forwarding. This value is only displayed on ingress routing devices with the <b>allow-fragmentation</b> statement configured at the <b>[edit protocols mpls path-mtu]</b> hierarchy level. If there is a detour LSP, the path MTU for the detour is also displayed.	<b>detail</b>
<b>Egress protection PLR as protector</b>	RSVP state on the Protector or the point-of-local-repair (PLR) routing device: <ul style="list-style-type: none"> <li>• <b>Active</b>— Egress protection is available at the Protector or the PLR routing device.</li> <li>• <b>In Use</b>— Local repair has been completed.</li> </ul>	<b>detail</b>
<b>PATH rcvfrom</b>	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor.	<b>detail</b>
<b>Adspec</b>	MTU signaled from the ingress routing device to the egress routing device by means of the adspec object.	<b>detail</b>
<b>PATH sentto</b>	Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor (or peer-name in the GMPLS LSP case), and number of packets sent to the downstream routing device.	<b>detail</b>
<b>Explct route</b>	Explicit route for the session. Normally this value will be the same as that of record route. Differences indicate that path rerouting has occurred, typically during fast reroute.	<b>detail</b>
<b>Record route</b>	Recorded route for the session, taken from the record route object. Normally this value will be the same as that of explct route. Differences indicate that path rerouting has occurred, typically during fast reroute.	<b>detail</b>

## show rsvp session

**Syntax** show rsvp session  
 <brief | detail | extensive | terse>  
 <bidirectional | unidirectional>  
 <down | up>  
 <interface *interface-name*>  
 <lsp-type>  
 <name *session-name*>  
 <session-type>  
 <statistics>  
 <te-link *te-link*>

**Release Information** Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description** Display information about Resource Reservation Protocol (RSVP) sessions.

**Options** **none**—Display standard information about all RSVP sessions.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**bidirectional | unidirectional**—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.

**down | up**—(Optional) Display only LSPs that are inactive or active, respectively.

**interface *interface-name***—(Optional) Display RSVP sessions for the specified interface only.

***lsp-type*** —(Optional) Display information about RSVP sessions with regard to LSPs:

- **bypass**—Sessions used for bypass LSPs.
- **lsp**—Sessions used to set up LSPs.
- **nolsp**—Sessions not used to set up LSPs.

**name *session-name***—(Optional) Display information about the named session.

***session-type***—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this switch.
- **ingress**—Sessions that originate from this switch.
- **transit**—Sessions that transit through this switch.

**statistics**—(Optional) Display packet statistics.

**te-link *te-link***—(Optional) Display sessions with reservations on the specified traffic-engineered link name.

**Required Privilege Level** view

[show rsvp session extensive on page 2626](#)

**Output Fields** [Table 123 on page 2624](#) describes the output fields for the **show rsvp session** command. Output fields are listed in the approximate order in which they appear.

*Table 123: show rsvp session Output Fields*

Field Name	Field Description	Level of Output
Ingress RSVP	Information about ingress RSVP sessions.	<b>detail</b>
Ingress RSVP	Information about ingress RSVP sessions. Each session has one line of output.	All levels
Egress RSVP	Information about egress RSVP sessions.	All levels
Transit RSVP	Information about the transit RSVP sessions.	All levels
To	Destination (egress switch) of the session.	All levels
From	Source (ingress switch) of the session.	All levels
State	State of the path: <b>Up</b> , <b>Down</b> , or <b>AdminDn</b> . <b>AdminDn</b> indicates that the LSP is being taken down gracefully.	All levels
Address	Destination (egress switch) of the LSP.	<b>detail</b>
LSPstate	State of the LSP that is being handled by this RSVP session. It can be either <b>Up</b> , <b>Dn</b> (down), or <b>AdminDn</b> . <b>AdminDn</b> indicates that the LSP is being taken down gracefully.	<b>brief, detail</b>
Rt	Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the routing table is the primary MPLS table ( <b>mpls.0</b> ).	<b>brief</b>

Table 123: *show rsvp session Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>ActiveRoute</b>	Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table ( <b>inet.0</b> ). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table ( <b>mpls.0</b> ).	<b>detail</b>
<b>LSPname</b>	Name of the LSP.	<b>brief, detail</b>
<b>LSPpath</b>	Indicates whether the RSVP session is for the primary or secondary LSP path. <b>LSPpath</b> can be either <b>primary</b> or <b>secondary</b> and can be displayed on the ingress, egress, and transit switches. <b>LSPpath</b> can also indicate when a graceful LSP deletion has been triggered.	<b>detail</b>
<b>Recovery label received</b>	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	<b>detail</b>
<b>Recovery label sent</b>	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned.	<b>detail</b>
<b>Suggested label received</b>	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	<b>detail</b>
<b>Suggested label sent</b>	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned.	<b>detail</b>
<b>Resv style or Style</b>	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be <b>FF</b> (fixed filter), <b>SE</b> (shared explicit), or <b>WF</b> (wildcard filter).	<b>brief detail</b>
<b>Label in</b>	Incoming label for this LSP.	<b>brief, detail</b>
<b>Label out</b>	Outgoing label for this LSP.	<b>brief, detail</b>
<b>Time left</b>	Number of seconds remaining in the lifetime of the reservation.	<b>brief, detail</b>
<b>Since</b>	Date and time when the RSVP session was initiated.	<b>detail</b>
<b>Tspec</b>	Sender's traffic specification, which describes the sender's traffic parameters.	<b>detail</b>
<b>Port number</b>	Protocol ID and sender/receiver port used in this RSVP session.	<b>detail</b>
<b>Creating backup LSP, link down</b>	A <b>link down</b> event occurred, and traffic is being switched over to the bypass LSP.	<b>extensive</b>
<b>Deleting backup LSP, protected LSP restored</b>	Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted.	<b>extensive</b>
<b>PATH rcvfrom</b>	Address of the previous-hop (upstream) switch or client, interface the neighbor used to reach this switch, and number of packets received from the upstream neighbor.	<b>detail</b>

## show rsvp statistics

---

List of Syntax	<a href="#">Syntax on page 2628</a> <a href="#">Syntax (EX Series Switches) on page 2628</a>
Syntax	<code>show rsvp statistics</code> <code>&lt;instance <i>instance-name</i>&gt;</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code>
Syntax (EX Series Switches)	<code>show rsvp statistics</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches. <b>instance</b> option added in Junos OS Release 15.1 for the MX Series.
Description	Display Resource Reservation Protocol (RSVP) packet and error statistics. The RSVP input/input module collects statistics for certain events on a per-interface basis. Most of these events were tracked on a routing-instance basis in Junos OS releases earlier than Release 17.2. The "show rsvp interface detail" command displays these event counters under the Events section of the output only when the values of these fields are higher than zero. These statistics are also maintained at the global level (per routing-instance) and are also displayed in the output of the "show rsvp statistics" command.
Options	<b>none</b> —Display RSVP packet and error statistics.  <b>instance <i>instance-name</i></b> —(Optional) Display RSVP packet and error statistics for the specified instance. If <b>instance-name</b> is omitted, RSVP statistics are displayed for the master instance.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view

List of Sample Output	<a href="#">show rsvp statistics on page 2631</a> <a href="#">show rsvp statistics on page 2632</a>
Output Fields	<a href="#">Table 124 on page 2629</a> describes the output fields for the <b>show rsvp statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 124: show rsvp statistics Output Fields

Field Name	Field Description
<b>Packet Type</b>	Statistics about different RSVP messages.
<b>Total Sent</b>	Total number of packets sent since RSVP was enabled.
<b>Total Received</b>	Total number of packets received since RSVP was enabled.
<b>Last 5 seconds Sent</b>	Total number of packets sent in the last 5 seconds.
<b>Last 5 seconds Received</b>	Number of packets received in the last 5 seconds.
<b>Path</b>	Statistics about Path messages, which are sent from the RSVP sender along the data paths and which store path state information in each node along the path.
<b>PathErr</b>	Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.
<b>PathTear</b>	Statistics about PathTear messages, which remove path states and dependent reservation states in any routing devices along a path.
<b>Resv FF</b>	Statistics about fixed-filter reservation style messages, which consist of distinct reservations among explicit senders.
<b>Resv WF</b>	Statistics about wildcard-filter reservation style messages, which consist of shared reservations among wildcard senders.
<b>Res SE</b>	Statistics about shared-explicit reservation style messages, which consist of shared reservations among explicit senders.
<b>ResvErr</b>	Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.
<b>ResvTear</b>	Statistics about ResvTear messages, which remove reservation states along a path.
<b>ResvConf</b>	Statistics about ResvConfirm messages, which are responses to confirm a reservation request.
<b>Ack</b>	Acknowledge message for refresh reductions.
<b>SRefresh</b>	Summary refresh messages.
<b>Hello</b>	Number of RSVP hello packets that have been sent to and received from the neighbor.
<b>EndtoEnd RSVP</b>	Statistics for the number of End-to-end RSVP messages.
<b>Errors</b>	Statistics about errored RSVP packets.
<b>Rcv pkt bad length</b>	The packet was not processed because its length is inappropriate.

Table 124: show rsvp statistics Output Fields (continued)

Field Name	Field Description
Rcv pkt unknown type	The packet is not one of the well-known RSVP types, as defined in RFC 2205, <i>Resource ReSerVation Protocol (RSVP)</i> .
Rcv pkt bad version	The packet is not an RSVP version 1 packet.
Rcv pkt auth fail	The packet failed authentication checks.
Rcv pkt bad checksum	The RSVP checksum check failed.
Rcv pkt bad format	General packet processing failed because the packet was badly formed.
Memory allocation fail	An internal resource failure occurred.
No path information	A reservation was received, but no sender is active.
Resv style conflict	The same session contains inconsistent reservation styles.
Port conflict	There were inconsistent port numbers for the same session.
Resv no interface	An interface for the receive reservation packets cannot be located.
PathErr to client	Number of PathErr packets delivered to the local client.
ResvErr to client	Number of ResvErr packets delivered to the local client.
Path timeout	Number of times the sender timed out because the path was removed.
Resv timeout	Number of times the receiver timed out because the reservation was removed.
Message out-of-order	Records the number of RSVP incoming messages that are considered out of order. This is detected from the message ID object's sequence number.
Unknown ack msg	A neighboring routing device replies with an ACK object that contains an unknown message ID. This can indicate a message ID handshake problem. For example, a router receives an ACK for message IDs 1, 2, and 3. However, it only has state for message IDs 1 and 3. The router increments the unknown ack counter by 1.
Recv nack	If a neighboring router receives an unknown message ID in an RSVP refresh message, the router sends a Resv nack message back to the sender. This can happen if that neighbor has been rebooted. For this case, the router sends a regular RSVP refresh message to recover the state and start the message-ID handshake process again.
Recv duplicated msg-id	Number of times the same message ID is used by two different RSVP messages. This duplication is usually caused when a neighboring routing device restarts.
No TE-link to rcv Hop	Counter of packets discarded because a TE link was not found.
Rcv pkt disabled interface	Number of RSVP packets received on an interface that is not enabled for RSVP.

Table 124: show rsvp statistics Output Fields (continued)

Field Name	Field Description
<b>Transmit buffer full</b>	Number of times the buffer for assembling an outgoing RSVP message was not large enough.
<b>Transmit failure</b>	Number of times the RSVP task failed to send out a packet.
<b>Receive failure</b>	Number of times the RSVP task failed to read an incoming packet.
<b>P2MP RESV discarded by appl</b>	Number of Resv messages discarded because the MPLS label is not valid for the P2MP LSP application.
<b>Rate limit</b>	Number of RSVP packets dropped due to rate limiting.
<b>Err msg loop detected</b>	Number of RSVP error messages that have looped back to their originator. This is detected by checking the error node address in the ERROR_SPEC object.

## Sample Output

### show rsvp statistics

Starting in Junos OS Release 16.1, this command also shows conditional PathTear statistics and the number of times an LSP state has been retained because of Link Protecting Merge Point (LP-MP) or Node Protecting Merge Point (NP-MP) determination.

```

user@host> show rsvp statistics

## show rsvp version

<b>List of Syntax</b>	<a href="#">Syntax on page 2634</a> <a href="#">Syntax (EX Series Switches) on page 2634</a>
<b>Syntax</b>	show rsvp version <logical-system (all   <i>logical-system-name</i> )>
<b>Syntax (EX Series Switches)</b>	show rsvp version
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display information about the Resource Reservation Protocol (RSVP) protocol settings, such as the version of the RSVP software, the refresh timer and keep multiplier, and local RSVP graceful restart capabilities on a routing device.
<b>Options</b>	<b>none</b> —Display RSVP protocol settings.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show rsvp version on page 2636</a>
<b>Output Fields</b>	<a href="#">Table 125 on page 2634</a> describes the output fields for the <b>show rsvp version</b> command. Output fields are listed in the approximate order in which they appear.

Table 125: show rsvp version Output Fields

Field Name	Field Description
Resource ReSerVation Protocol, version	RSVP software version.
RSVP protocol	Status of RSVP: <b>Enabled</b> or <b>Disabled</b> .
R(refresh timer)	Configured time interval used to generate periodic RSVP messages.
K(keep multiplier)	Number of RSVP messages that can be lost before an RSVP state is declared stale.
Preemption	Currently configured preemption capability: <b>Aggressive</b> , <b>Disabled</b> , or <b>Normal</b> . The default is <b>Normal</b> .
Soft-preemption cleanup	Time, in seconds, that an LSP is kept after it has been soft preempted. This is a global property of the RSVP protocol.

Table 125: show rsvp version Output Fields (continued)

Field Name	Field Description
Graceful deleting timeout	Currently configured value for the <b>graceful-deletion-timeout</b> statement. The router that initiates the graceful deletion procedure for an RSVP session waits for the graceful deletion timeout interval to ensure that all routers along the path (especially the ingress and egress routers) have prepared for the LSP to be taken down.
NSR Mode	Status of the nonstop active routing feature for RSVP on the restarting device: <b>Disabled</b> , <b>Enabled/Master</b> , or <b>Enabled/Standby</b> .
NSR State	State of the nonstop active routing feature for RSVP on the restarting device.  Possible values are: <ul style="list-style-type: none"> <li>• <b>Idle</b></li> <li>• <b>TE-link sync complete</b></li> <li>• <b>Neighbor sync complete</b></li> <li>• <b>Path state sync complete</b></li> <li>• <b>Resv state sync complete</b></li> <li>• <b>Bypass sync complete</b></li> <li>• <b>Init sync complete</b></li> </ul>
Setup protection	Status of point-to-point and point-to-multipoint LSP setup protection configuration on the device: <b>Enabled</b> or <b>Disabled</b> .
Route Session-Id count	Total count of session IDs associated with the combination of all the RSVP ingress routes.  <b>NOTE:</b> Starting in Junos OS Release 16.1, the <b>show rsvp version</b> command output displays the <b>Route Session-Id count</b> output field by default, irrespective of the presence of associated session IDs.  When there are no session IDs associated with any RSVP ingress route, the <i>Route Session-Id count</i> value is zero (0).
Graceful restart	Status of the graceful restart feature for RSVP on the restarting routing device: <b>Enabled</b> or <b>Disabled</b> .
Restart helper mode	Status of the helper mode feature: <b>Enabled</b> or <b>Disabled</b> . When this feature is enabled, the restarting routing device can help the neighbor with its RSVP restart procedures.
Maximum helper restart time	Number of milliseconds (ms) configured for the maximum helper restart time. The maximum helper restart time is the length of time the routing device waits before declaring that an RSVP neighbor attempting to restart gracefully is down.
Maximum helper recovery time	Number of milliseconds configured for the maximum helper recovery time. The maximum helper recovery time is the amount of time the routing device maintains the state of an RSVP neighbor attempting to restart gracefully.
Restart time	Number of milliseconds that a neighbor waits to receive a Hello message from the restarting node before declaring the node dead and deleting the states.
Recovery time	Number of milliseconds during which the restarting node attempts to recover its lost states with help from its neighbors. Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.

Table 125: show rsvp version Output Fields (continued)

Field Name	Field Description
<b>P2p transit LSP nexthop mode</b>	Point-to-point transit LSP next-hop mode on PTX Series devices. The possible values are <b>Chained</b> or <b>Unchained</b> .
<b>P2mp transit LSP nexthop mode</b>	Point-to-multipoint transit LSP next-hop mode on PTX Series devices. The possible values are <b>Chained</b> or <b>Unchained</b> .

## Sample Output

### show rsvp version

Starting with Junos OS Release 16.1, this command also shows whether enhanced FRR procurers are enabled on the router.

```

user@host> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol:           Enabled
  R(refresh timer):        30 seconds
  K(keep multiplier):      3
  Preemption:             Normal
  Soft-preemption cleanup:  30 seconds
  Graceful deletion timeout: 30 seconds
  NSR mode:               Enabled/Master
  NSR state:              Init sync complete
  Setup protection:        Disabled
  Route Session-Id count:  1
  Graceful restart:        Disabled
  Restart helper mode:     Enabled
  Maximum helper restart time: 20000 msec
  Maximum helper recovery time: 180000 msec
  Restart time:            0 msec
  P2p transit LSP nexthop mode: Unchained
  P2mp transit LSP nexthop mode: Unchained
  Enhanced FRR local protection: Enabled

```

## traceroute mpls rsvp

<b>Syntax</b>	<pre>traceroute mpls &lt;rsvp&gt; <i>lsp-name</i> &lt;detail&gt; &lt;egress&gt; &lt;exp&gt; &lt;logical-system&gt; &lt;multipoint&gt; &lt;no-resolve&gt; &lt;retries&gt; &lt;source <i>source-address</i>&gt; &lt;ttl&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.2.</p> <p><b>egress</b>, <b>multipoint</b>, and <b>ttl</b> options added in Junos OS Release 11.2.</p>
<b>Description</b>	<p>Trace route to a remote host for an MPLS LSP signaled by RSVP. Use <b>traceroute mpls rsvp</b> as a debugging tool to locate MPLS label-switched path (LSP) forwarding issues in a network. (Currently supported for IPv4 packets only.)</p>
<b>Options</b>	<p><b><i>lsp-name</i></b>—Specify the name of the LSP to be traced.</p> <p><b>detail</b>—(Optional) Display detailed output.</p> <p><b>egress</b>—(Optional) Request that a specific point-to-multipoint egress node reply to the trace route. The trace route would follow the associated sub-LSP to the egress node.</p> <p><b>exp</b>—(Optional) Specify the class of service to use when sending probes. The range of values is 0 through 7. The default value is 7.</p> <p><b>logical-system</b>—(Optional) Specify the name of the logical system for the traceroute attempt.</p> <p><b>multipoint</b>—(Optional) Perform a trace route on a point-to-multipoint LSP.</p> <p><b>no-resolve</b>—(Optional) Specify not to resolve the hostname that corresponds to the IP address.</p> <p><b>retries</b>—(Optional) Specify the number of times to resend probe. The range of values is 1 through 9. The default value is 3.</p> <p><b>source <i>source-address</i></b>—(Optional) Specify the source address of the outgoing traceroute packets.</p> <p><b>ttl</b>—(Optional) Specify the number of hops to follow before forcing the trace route to quit.</p>
<b>Required Privilege Level</b>	network

**List of Sample Output** [traceroute mpls rsvp on page 2639](#)  
[traceroute mpls rsvp detail on page 2639](#)  
[traceroute mpls rsvp multipoint \(branch node for sub-LSPs\) on page 2640](#)  
[traceroute mpls rsvp multipoint \(single-hop sub-LSPs\) on page 2640](#)

**Output Fields** [Table 126 on page 2638](#) describes the output fields for the **traceroute mpls rsvp *lsp-name*** and **traceroute mpls rsvp *lsp-name* detail** commands. Output fields are listed in the approximate order in which they appear.

*Table 126: traceroute mpls rsvp Output Fields*

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the <b>traceroute mpls rsvp <i>lsp-name</i></b> command.	all levels
ttl	Time-to-live value of the labeled packet.	none specified
Label	MPLS label used to forward the packets along the LSP.	none specified
Protocol	Signaling protocol used. For this command, it is RSVP-TE.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is null.	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). Displays <b>Success</b> if the trace to a hop is successful or <b>Egress</b> if the trace has reached the last router on the path.	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	<b>detail</b>
Parent	Address of the previous hop. Parent value for the first hop is null.	<b>detail</b>
Return Code	Return code for reporting the result of processing the echo request by the receiver.	<b>detail</b>
Sender timestamp	Displays the timestamp when the MPLS echo request is sent to the next hop.	<b>detail</b>
Receiver timestamp	Timestamp when the echo request from the previous hop is received and acknowledged with an echo response by the next hop.	<b>detail</b>
Response time	Time for the echo request to reach the receiver.	<b>detail</b>

Table 126: *traceroute mpls rsvp* Output Fields (continued)

Field Name	Field Description	Level of Output
MTU	Size of the largest packet that includes the label stack forwarded to the next hop.	<b>detail</b>
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none.	<b>detail</b>
Label stack	Label stack used to forward the packet.	<b>detail</b>
Path	Displays the sub-lsp path number for this traceroute, the interface used, and the destination address.	all levels

## CHAPTER 42

# LDP Operational Commands

- `clear ldp neighbor`
- `clear ldp session`
- `clear ldp statistics`
- `ping mpls ldp`
- `show ldp database`
- `show ldp fec-filters`
- `show ldp interface`
- `show ldp neighbor`
- `show ldp overview`
- `show ldp p2mp tunnel`
- `show ldp path`
- `show ldp route`
- `show ldp session`
- `show ldp statistics`
- `show ldp traffic-statistics`
- `show security keychain`
- `traceroute mpls ldp`

## clear ldp neighbor

---

<b>Syntax</b>	<code>clear ldp neighbor</code> <code>&lt;instance <i>instance-name</i>&gt;</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code> <code>&lt;neighbor&gt;</code>
<b>Description</b>	Tear down Label Distribution Protocol (LDP) neighbor connections.
<b>Options</b>	<p><b>none</b>—Tear down connections with all LDP neighbors for all routing instances.</p> <p><b>instance <i>instance name</i></b>—(Optional) Clear the LDP session for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>neighbor</b>—(Optional) Clear an LDP session for the specified neighbor (IP address) only.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show ldp neighbor on page 2660</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear ldp neighbor on page 2642</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ldp neighbor

```
user@host> clear ldp neighbor
```

## clear ldp session

---

<b>Syntax</b>	clear ldp session <all> <destination> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Clear Label Distribution Protocol (LDP) sessions.
<b>Options</b>	<p><b>all</b>—Clear LDP sessions for all destinations for all routing instances.</p> <p><b>destination</b>—(Optional) Clear an LDP session for the specified destination (IP address).</p> <p><b>instance <i>instance-name</i></b>—(Optional) Clear the LDP session for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ldp session on page 2677</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear ldp session on page 2643</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ldp session

```
user@host> clear ldp session all
```

## clear ldp statistics

---

<b>Syntax</b>	<code>clear ldp statistics</code> <code>&lt;instance <i>instance-name</i>&gt;</code> <code>&lt;logical-system (all   <i>logical-system-name</i>)&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Set all Label Distribution Protocol (LDP) statistics to zero.
<b>Options</b>	<b>none</b> —Set all LDP statistics to zero for all routing instances.  <b>instance <i>instance-name</i></b> —(Optional) Clear the LDP session for the specified routing instance only.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show ldp statistics on page 2684</a></li><li>• <a href="#">show ldp traffic-statistics on page 2688</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear ldp statistics on page 2644</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ldp statistics

```
user@host> clear ldp statistics
```

## ping mpls ldp

<b>Syntax</b>	<pre>ping mpls ldp fec &lt;count count&gt; &lt;destination address&gt; &lt;detail&gt; &lt;exp forwarding-class&gt; &lt;instance routing-instance-name&gt; &lt;logical-system (all   logical-system-name)&gt; &lt;p2mp root-addr ip-address lsp-id identifier&gt; &lt;size bytes&gt; &lt;source source-address&gt; &lt;sweep&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>size</b> and <b>sweep</b> options introduced in Junos OS Release 9.6.</p> <p><b>instance</b> option introduced in Junos OS Release 10.0.</p> <p><b>p2mp</b>, <b>root-address</b>, and <b>lsp-id</b> options introduced in Junos OS Release 11.2.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Check the operability of MPLS LDP-signaled label-switched path (LSP) connections.</p> <p>Type Ctrl+c to interrupt a <b>ping mpls</b> command.</p>
<b>Options</b>	<p><b>count count</b>—(Optional) Number of ping requests to send. If <b>count</b> is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p><b>destination address</b>—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p><b>detail</b>—(Optional) Display detailed information about the echo requests sent and received.</p> <p><b>exp forwarding-class</b>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p><b>fec</b>—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.</p> <p><b>instance routing-instance-name</b>—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p><b>p2mp root-addr ip-address lsp-id identifier</b>—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.</p> <p><b>size bytes</b>—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the</p>

router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

**source source-address**—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

**sweep**—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

**Additional Information** If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. For more information, see the *MPLS Applications Feature Guide*.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

**NOTE:** In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

---

**Required Privilege Level** network

**List of Sample Output** [ping mpls ldp fec count on page 2647](#)  
[ping mpls ldp p2mp root-addr lsp-id on page 2647](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

## Sample Output

### ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.
```

### ping mpls ldp p2mp root-addr lsp-id

```
user@host> ping mpls ldp p2mp root-addr 10.1.1.1/32 lsp-id 1 count 1
Request for seq 1, to interface 71, no label stack.

[show ldp database \(Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs\) on page 2656](#)

[show ldp database summary on page 2656](#)

**Output Fields** [Table 127 on page 2649](#) describes the output fields for the **show ldp database** command. Output fields are listed in the approximate order in which they appear.

*Table 127: show ldp database Output Fields*

Field Name	Field Description	Level of Output
<b>Input label database</b>	Label received from the other router.	All levels
<b>Output label database</b>	Label advertised to the other router.	All levels
<b><i>session-identifier</i></b>	Session identifier, which includes the local and remote label space identifiers.	All levels
<b>Labels received</b>	Number of labels received from the other router.	All levels
<b>Labels advertised</b>	Number of labels advertised to the other router.	All levels.
<b>Label</b>	Label binding to a route prefix.	All levels

Table 127: show ldp database Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Prefix</b>	<p>Route prefix.</p> <p>It can be one of the following values:</p> <ul style="list-style-type: none"> <li>• IP prefix.</li> <li>• Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.</li> <li>• Layer 2 encapsulation type.</li> </ul> <p>Layer 2 encapsulation types are displayed in the format <b>L2CKT control word status encapsulation-type vc-number</b>, for example, <b>L2CKT CtrlWord FRAME RELAY VC 2</b></p> <ul style="list-style-type: none"> <li>• <b>control-word-status</b>—Displays whether the use of the control word has been negotiated for this virtual circuit: <ul style="list-style-type: none"> <li>• <b>NoCtrlWord</b></li> <li>• <b>CtrlWord</b></li> </ul> </li> <li>• <b>encapsulation-type</b>—Encapsulation type: <ul style="list-style-type: none"> <li>• <b>FRAME RELAY</b></li> <li>• <b>ATM AAL5</b></li> <li>• <b>ATM CELL</b></li> <li>• <b>VLAN</b></li> <li>• <b>ETHERNET</b></li> <li>• <b>CISCO_HDLC</b></li> <li>• <b>PPP</b></li> </ul> </li> <li>• <b>VC number</b>—Virtual circuit number. It can have any numeric value.</li> <li>• <b>(Stale)</b>—When you display the LDP database for the neighbor of a restarting router, the bindings learned from the restarting neighbor are displayed as (Stale). Stale bindings are deleted if they are not refreshed within the recovery time.</li> </ul>	All levels
<b>MTU</b>	MTU of the Layer 2 circuit. MTU is displayed for all encapsulation types except ATM cell encapsulations.	<b>detail</b>
<b>VCCV Control Channel types</b>	<p>Virtual Circuit Connection Verification (VCCV) control channel types.</p> <ul style="list-style-type: none"> <li>• <b>MPLS router alert label</b></li> <li>• <b>MPLS PW label with TTL=1</b></li> </ul>	<b>extensive</b>
<b>VCCV Control Verification types</b>	The only valid VCCV control verification type is <b>LSP ping</b> .	<b>extensive</b>
<b>TDM payload size</b>	Size of the Time Division Multiplex (TDM) payload.	All levels
<b>TDM bitrate</b>	Bit rate for the TDM traffic.	All levels
<b>Requested VLAN ID</b>	(VLANs) VLAN identifier of the Layer 2 circuit.	<b>detail</b>
<b>Cell bundle size</b>	(ATM cell encapsulations) Maximum number of cells that the Layer 2 circuit can receive in a packet.	<b>detail</b>

Table 127: show ldp database Output Fields (continued)

Field Name	Field Description	Level of Output
State	State of the label binding: <ul style="list-style-type: none"> <li>• <b>Active</b>—Label binding has been installed and distributed appropriately. A label binding is almost always in this state.</li> <li>• <b>New</b>—New label that has not yet been distributed.               <ul style="list-style-type: none"> <li>• <b>MapRcv</b>—Waiting to receive a label mapping message.</li> <li>• <b>MapSend</b>—Waiting to send a label mapping message.</li> <li>• <b>RelRcv</b>—Waiting to receive a label release message.</li> <li>• <b>RelRsnd</b>—Waiting to receive a label release message before resending label mapping message.</li> <li>• <b>RelSend</b>—Waiting to send a label release message.</li> <li>• <b>ReqSend</b>—Waiting to send a label request message.</li> <li>• <b>W/dSend</b>—Waiting to send a label withdrawal message.</li> </ul> </li> </ul>	detail
Age	Time elapsed since the binding was created.	detail

## show ldp fec-filters

<b>Syntax</b>	show ldp fec-filters <fec> <instance <i>instance-name</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display information about configured Label Distribution Protocol (LDP) forwarding equivalence class (FEC) filters.
<b>Options</b>	<b>fec</b> —(Optional) Display FEC filter information for the specified FEC.  <b>instance <i>instance-name</i></b> —(Optional) Display FEC filter information for the specified instance.  <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ldp fec-filters on page 2657</a>
<b>Output Fields</b>	<a href="#">Table 128 on page 2657</a> lists the output fields for the <b>show ldp fec-filters</b> command. Output fields are listed in the approximate order in which they appear.

*Table 128: show ldp fec-filters Output Fields*

Field Name	Field Description
Ingress	Names of the FEC filters on the ingress routers.
Transit	Names of the FEC filters on the transit routers.

## Sample Output

### show ldp fec-filters

```
user@host> show ldp fec-filters 10/8
10.22.1.2/32
  Ingress: f1-10.22.1.2/32 (index: 3)
  Transit: (null) (index: 0)
```

## show ldp interface

<b>Syntax</b>	<pre>show ldp interface &lt;brief   detail   extensive&gt; &lt;interface-name&gt; &lt;instance instance-name&gt; &lt;logical-system (all   logical-system-name)&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	Display the status of Label Distribution Protocol (LDP)-enabled interfaces.
<b>Options</b>	<p><b>none</b>—Display standard status information about all LDP-enabled interface for all routing instances.</p> <p><b>interface-name</b>—(Optional) Display information for the specified interface.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>instance instance-name</b>—(Optional) Display information for the specified routing instance.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show ldp interface extensive on page 2659</a>
<b>Output Fields</b>	<p><a href="#">Table 129 on page 2658</a> describes the output fields for the <b>show ldp interface</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 129: show ldp interface Output Fields

Field Name	Field Description	Level of Output
Interface	Interface name.	All levels
Label space ID	Label space identifier that the router is advertising on the interface.	All levels
Nbr count	Number of neighbors on the interface.	All levels
Next hello	How long until the next hello packet is sent on this interface, in seconds.	All levels

Table 129: show ldp interface Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Hello interval</b>	One-third of the negotiated hold time (in seconds). If the user-configured value for the hello interval is smaller than the computed value, the user-configured value is used.	<b>detail extensive</b>
<b>Hold time</b>	Configured hold time, in seconds.	<b>detail extensive</b>
<b>Transport address</b>	Address to which the neighbor wants the local route to establish the LDP session.	<b>extensive</b>
<b>Local hello interval</b>	Locally configured hello interval.	<b>extensive</b>

## Sample Output

### show ldp interface extensive

```

user@host> show ldp interface extensive
Interface          Label space ID      Nbr count  Next hello
fe-0/0/3.0         10.255.245.6:0      2          0
  Hello interval: 1, Hold time: 15, Transport address: 10.255.245.6
  Local hello interval: 2, Index: 69

```

## show ldp neighbor

<b>Syntax</b>	<pre>show ldp neighbor &lt;brief   detail   extensive&gt; &lt;auto-targeted&gt; &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;neighbor-address&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>neighbor-address</b> option added in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p> <p><b>auto-targeted</b> option added in Junos OS Release 14.2.</p>
<b>Description</b>	Display Label Distribution Protocol (LDP) neighbor information.
<b>Options</b>	<p><b>none</b>—Display standard information about LDP neighbors for all routing instances.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>auto-targeted</b>—(Optional) Display information about LDP neighbors that are automatically targeted using the loopback addresses.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information for the specified routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>neighbor-address</b>—(Optional) Display information about the specified LDP neighbor.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear ldp neighbor on page 2642</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show ldp neighbor extensive on page 2661</a></p> <p><a href="#">show ldp neighbor auto-targeted extensive on page 2661</a></p>
<b>Output Fields</b>	<p><a href="#">Table 130 on page 2660</a> describes the output fields for the <b>show ldp neighbor</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 130: show ldp neighbor Output Fields

Field Name	Field Description	Level of Output
Address	IP address of the neighbor.	All levels

Table 130: show ldp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
Interface	Interface over which the neighbor was discovered.	All levels
Label space ID	Label space identifier advertised by the neighbor.	All levels
Hold time	Remaining hold time before the neighbor expires, in seconds.	All levels
Transport address	Address to which the neighbor wants the local route to establish the LDP session.	<b>detail</b>
Configuration sequence	Counter that increments whenever the neighbor changes its configuration.	<b>detail</b>
Up for	Length of time the LDP neighbor has been in operation.	<b>detail extensive</b>
Reference count	Reference count for the LDP neighbor.	<b>extensive</b>
Hold time	Displays the neighbor's hold time. The hold time is the proposed hold times for the local and peer routers.	<b>extensive</b>
Proposed local/peer	Hold time value proposed by the local router and the peer router.	<b>extensive</b>

## Sample Output

### show ldp neighbor extensive

```

user@host> show ldp neighbor extensive
Address          Interface      Label space ID  Hold Time
192.168.37.23    so-1/0/0.0    10.255.245.5:0  44
Transport address: 10.255.245.5, Configuration sequence: 6
Up for 00:03:37
Reference count: 1
Hold time: 45, Proposed local/peer: 15/45

```

### show ldp neighbor auto-targeted extensive

```

user@host> show ldp neighbor auto-targeted extensive
Address          Interface      Label space ID  Hold time
10.255.107.236   lo0.0         10.255.107.236:0  41
Transport address: 10.255.107.236, Configuration sequence: 14
Up for 00:10:53
Reference count: 2
Hold time: 45, Proposed local/peer: 45/45
Hello interval: 15
Hello flags: targeted
Neighbor types: Auto-targeted

```

## show ldp overview

Syntax	<pre>show ldp overview &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
Syntax (EX Series Switch and QFX Series)	<pre>show ldp overview &lt;instance <i>instance-name</i>&gt;</pre>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display LDP overview information.
Options	<p><b>none</b>— Display standard overview information about LDP for all routing instances.</p> <p><b>instance <i>instance-name</i></b>— (Optional) Display LDP overview information for the specified routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>— (Optional) Display LDP information from systems or a particular logical system on the devices.</p>
Required Privilege Level	view
List of Sample Output	<a href="#">show ldp overview on page 2665</a>
Output Fields	<a href="#">Table 131 on page 2662</a> lists the output fields for the <b>show ldp overview</b> command. Output fields are listed in the approximate order in which they appear.

Table 131: show ldp overview Output Fields

Field Name	Field description	Level of Output
Instance	LDP routing instance.	All Levels
Router ID	Router ID of the routing device.	All Levels
Message ID	Unique identifier of message.	All Levels
Configuration sequence	Value of configuration sequence.	All Levels
Deaggregate	Status of control forwarding equivalence class (FEC) deaggregation on the router. By default it is <b>disabled</b> on the router.	All Levels
Explicit null	<p>Advertise label 0 to the egress routing device of an LSP. Explicit null: <b>enabled</b> or <b>disabled</b>.</p> <p><b>NOTE:</b> If you do not include the explicit-null statement in the configuration, label 3 (implicit null) is advertised.</p>	All Levels

Table 131: show ldp overview Output Fields (continued)

Field Name	Field description	Level of Output
IPv6 tunneling	Internet Protocol version 6 tunneling: <b>enabled</b> or <b>disabled</b> .	All Levels
Strict targeted hellos	Prevent LDP sessions from being established with remote neighbors that have not been specifically configured. Strict targeted hellos: <b>enabled</b> or <b>disabled</b> .  <i>NOTE:</i> LDP peers will not respond to targeted hellos coming from a source that is not one of the configured remote neighbors.	All Levels
Loopback if added	Loopback interface is added: <b>yes</b> or <b>no</b> .	All Levels
Route preference	Default preference value (also known as an administrative distance) assigned to each route that the routing table receives. LDP preference is: <b>9</b>	All Levels
Unicast transit LSP chaining	Unicast transit LSP chaining: <b>enabled</b> or <b>disabled</b> .	All Levels
P2MP transit LSP chaining	P2MP transit LSP chaining: <b>enabled</b> or <b>disabled</b> .	All Levels
Transit LSP statistics based on route statistics	Transit LSP statistics based on route statistics: <b>enabled</b> or <b>disabled</b> .	All Levels
Longest match	Longest match for label mapping: <b>enabled</b> or <b>disabled</b> .	All Levels
Capabilities enabled	Enabled capabilities: <b>none</b>	All Levels
Timers	<ul style="list-style-type: none"> <li><b>Keepalive interval:</b> Keepalive interval value.</li> <li><b>Keepalive timeout:</b> Time interval for which the neighbor LDP node waits before determining session failure.</li> <li><b>Link hello interval:</b> Specify how often the router sends Link Management Protocol (LMP) hello packets.</li> <li><b>Link hello hold time:</b> Time interval for which an LDP node waits for a hello message before declaring a neighbor is down.</li> <li><b>Targeted hello interval:</b> Specify how often LDP sends targeted hello messages.</li> <li><b>Targeted hello hold time:</b> Time interval for which a sending LSR maintains a record of targeted hello messages from the receiving LSR without receipt of another targeted hello message from that LSR.</li> <li><b>Label withdraw delay:</b> Time interval for withdrawing labels to reduce router workload during IGP convergence.</li> </ul>	All Levels

Table 131: show ldp overview Output Fields (continued)

Field Name	Field description	Level of Output
Graceful restart	Graceful restart attributes. <ul style="list-style-type: none"> <li>• <b>Restart</b>— Graceful restart capability: <b>enabled</b> or <b>disabled</b>.</li> <li>• <b>Helper</b>— Standard graceful restart helper capability: <b>enabled</b> or <b>disabled</b>.</li> <li>• <b>Restart in process</b>— Graceful restart in process.</li> <li>• <b>Reconnect time</b>— Period of time that a restarting LSR (label switched router) designates to LDP neighbors to wait until the former reestablishes the session after restarting.</li> <li>• <b>Max neighbor reconnect time</b>— Maximum reconnect time.</li> <li>• <b>Recovery time</b>— Period of time that an LSR preserves its state across the restart.</li> <li>• <b>Max neighbor recovery time</b>— Maximum recovery time designated to LDP neighbors by a restarting LSR.</li> </ul>	All Levels
Traffic Engineering	<ul style="list-style-type: none"> <li>• <b>Bgp igp</b>— BGP and IGP destinations: <b>enabled</b> or <b>disabled</b>. When enabled, IGP uses MPLS paths for forwarding traffic.</li> <li>• <b>Both ribs</b>— BGP and IGP destinations with routes in both RIBs: <b>enabled</b> or <b>disabled</b>.</li> <li>• <b>Mpls forwarding</b>— MPLS routes used for forwarding: <b>enabled</b> or <b>disabled</b>.</li> </ul>	All Levels
IGP	<ul style="list-style-type: none"> <li>• <b>Tracking igp metric</b>— Cause the IGP route metric to be used for the LDP routes instead of the default LDP route metric (the default LDP route metric is 1).</li> <li>• <b>Sync session up delay</b>— Time interval to synchronize LDP session.</li> </ul>	All Levels
Session protection	<ul style="list-style-type: none"> <li>• <b>Session protection</b>— Remote neighbor added to LDP configuration which enables protection for all sessions in the corresponding LDP instance: <b>enabled</b> or <b>disabled</b>.</li> <li>• <b>Session protection timeout</b>— Period of time until which the remote neighbor is connected to LSR in the absence of link neighbors.</li> </ul>	All Levels
Interface addresses advertising	Advertises interface address.	All Levels
Label allocation	Label accounting information. <ul style="list-style-type: none"> <li>• <b>Current number of LDP labels allocated</b>— Number of labels currently in use.</li> <li>• <b>Total number of LDP labels allocated</b>— Cumulative number of labels being allocated.</li> <li>• <b>Total number of LDP labels freed</b>— Cumulative number of labels being freed.</li> <li>• <b>Total number of LDP label allocation failures</b>— Cumulative number of failures for allocating a label.</li> <li>• <b>Current number of labels allocated by all protocols</b>— Number of labels currently being used by routing protocols.</li> </ul>	All Levels

## Sample Output

### show ldp overview

```

user@host> show ldp overview
Instance: master
  Router ID: 192.168.2.1
  Message id: 0
  Configuration sequence: 1
  Deaggregate: disabled

    Current number of labels allocated by all protocols: 3

```

## show ldp p2mp tunnel

---

**Syntax**    `show ldp p2mp tunnel`  
             `<brief | detail | extensive>`  
             `<instance instance-name>`  
             `<logical-system (all | logical-system-name)>`

**Release Information**    Command introduced in Junos OS Release 13.3.

**Description**    Display LDP point-to-multipoint tunnel table information.

**Options**    **brief | detail | extensive**—(Optional) Display the specified level of output.

**instance *instance-name***—(Optional) Display routing instance information for the specified instance only.

**logical-system (all | *logical-system-name*)**—(Optional) Display LDP point-to-multipoint tunnel table information of all logical systems or a particular logical system.

**Required Privilege Level**    View

## Sample Output

`show ldp p2mp tunnel`

```
user@host> show ldp p2mp tunnel extensive

Instance   Tunnel type      Tunnel name
0          Name            10.254.1.1:1:ldp-p2mp:mvpn:vpn-1
P2MP root-addr 10.255.107.232, lsp-id 16777217
Self id 805306372
Reference count 2
```

## show ldp path

**Syntax** `show ldp path`  
`<brief | detail | extensive>`  
`<destination>`  
`<instance instance-name>`  
`<logical-system (all | logical-system-name)>`

**Release Information** Command introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Display Label Distribution Protocol (LDP) label-switched paths (LSPs).

**Options** **none**—Display standard information about all LDP LSPs for all routing instances.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**destination**—(Optional) Restrict the output to entries that match the specified destination prefix.

**instance instance-name**—(Optional) Display information for the specified routing instance only.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show ldp path extensive on page 2668](#)

**Output Fields** [Table 132 on page 2667](#) describes the output fields for the **show ldp path** command. Output fields are listed in the approximate order in which they appear.

*Table 132: show ldp path Output Fields*

Field Name	Field Description
<b>Output Session (label)</b>	Session ID and labels that this system has sent using LDP. These correspond to MPLS packets received.
<b>Input Session (label)</b>	Session ID and labels that this system has received using LDP. These correspond to MPLS packets transmitted.
<b>route</b>	MPLS route.
<b>Attached route</b>	Route corresponding to the LSP.
<b>Ingress route</b>	The router acts as the ingress for the LSP.

*Table 132: show ldp path Output Fields (continued)*

Field Name	Field Description
Reference count	Reference count for the LDP neighbor.
Transit route	Names of the forwarding equivalence class (FEC) filters on the transit routers.
Global label	MPLS label that is used globally.

## Sample Output

### show ldp path extensive

```
user@host> show ldp path extensive
Output Session (label)      Input Session (label)
10.255.14.220:0(3)         ( )
  Attached route: 10.255.14.221/32
  Reference count: 3, Global label: 3
10.255.14.220:0(100000)     10.255.14.220:0(3)
  Attached route: 10.255.14.220/32, Ingress route
  Reference count: 2, Transit route, Global label: 100000
10.255.14.220:0(100001)     10.255.14.220:0(100001)
  Attached route: 10.255.14.214/32, Ingress route
  Reference count: 2, Transit route, Global label: 100001
```

## show ldp route

<b>Syntax</b>	<pre>show ldp route &lt;brief   detail   extensive&gt; &lt;destination&gt; &lt;fec-and-route&gt; &lt;fec-only&gt; &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
<b>Description</b>	<p>Display the entries in the Label Distribution Protocol (LDP) internal topology table. The internal topology table contains routes from inet.0 and inet.3 and is used when binding a label to a forwarding equivalence class (FEC).</p>
<b>Options</b>	<p><b>none</b>—Display standard information about all entries in the LDP internal topology table for all routing instances.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>destination</b>—(Optional) Restrict the output to entries that are longer than the specified destination prefix and prefix length.</p> <p><b>fec-and-route</b>—Display the show routes and the FECs.</p> <p><b>fec-only</b>—Display only LDP FECs.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display entries for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show ldp route detail on page 2671</a></p> <p><a href="#">show ldp route extensive on page 2671</a></p> <p><a href="#">show ldp route fec-and-route on page 2672</a></p> <p><a href="#">show ldp route fec-and-route on page 2673</a></p> <p><a href="#">show ldp route fec-only on page 2675</a></p> <p><a href="#">show ldp route fec-only detail on page 2676</a></p>
<b>Output Fields</b>	<p><a href="#">Table 133 on page 2670</a> describes the output fields for the <b>show ldp route</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 133: show ldp route Output Fields*

Field Name	Field Description
<b>Destination</b>	Destination prefix.
<b>Next-hop intf/lsp/table</b>	Interface that is the next hop to the destination prefix.
<b>Next-hop address</b>	IP address of the next hop.
<b>Session ID</b>	LDP session ID.
<b>Route flags</b>	Information about the route. For example, the <b>Ingress TTL propagate</b> flag indicates that the time-to-live (TTL) value is being propagated with the route.
<b>Bound to outgoing label</b>	The route has been bound to LSPs with the label being distributed for that LSP.
<b>Topology entry</b>	The topology that the route is bound to.
<b>Ingress route status</b>	Status of the ingress route. For example, it could be <b>Active</b> or <b>Inactive</b> .
<b>Last modified</b>	The length of time since the ingress route status last changed.
<b>Last event(s)</b>	The last event that occurred.

## Sample Output

### show ldp route detail

```

user@host> show ldp route 10.255.8.5 detail

## show ldp session

<b>Syntax</b>	<pre>show ldp session &lt;brief   detail   extensive&gt; &lt;auto-targeted&gt; &lt;destination&gt; &lt;instance instance-name&gt; &lt;logical-system (all   logical-system-name)&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p> <p><b>auto-targeted</b> option added in Junos OS Release 14.2.</p>
<b>Description</b>	Display information about Label Distribution Protocol (LDP) sessions.
<b>Options</b>	<p><b>none</b>—Display standard information about all LDP sessions for all routing instances.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>auto-targeted</b>—(Optional) Display information about LDP sessions that are automatically targeted using loopback addresses.</p> <p><b>destination</b>—(Optional) Restrict LDP session display to the specified address.</p> <p><b>instance instance-name</b>—(Optional) Display routing instance information for the specified instance. If <b>instance-name</b> is omitted, information is displayed for the master instance.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear ldp session on page 2643</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show ldp session brief on page 2681</a></p> <p><a href="#">show ldp session detail on page 2681</a></p> <p><a href="#">show ldp session extensive on page 2682</a></p> <p><a href="#">show ldp session auto-targeted detail on page 2682</a></p>
<b>Output Fields</b>	<p><a href="#">Table 134 on page 2677</a> describes the output fields for the <b>show ldp session</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 134: show ldp session Output Fields

Field Name	Field Description	Level of Output
Address	Transport address of the session.	any

Table 134: show ldp session Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	State of the session: <b>Nonexistent</b> , <b>Connecting</b> , <b>Initialized</b> , <b>OpenRec</b> , <b>OpenSent</b> , <b>Operational</b> , or <b>Closing</b> . The states correspond to the state diagram specified in Internet Draft LDP Specification draft-ietf-mpls-rfc3036bis-01.txt.	any
<b>Connection</b>	TCP connection state: <b>Closed</b> , <b>Opening</b> , or <b>Open</b> .	any
<b>Hold time</b>	Time remaining until the session will be closed, in seconds.	any
<b>Session ID</b>	LDP identifiers of the peers of this session.	detail extensive
<b>Next keepalive</b>	Time until next keepalive is sent, in seconds.	<b>detail extensive</b>
<b>Active</b>	Whether the local router is playing the active role in the session and during session establishment.	<b>detail extensive</b>
<b>Passive</b>	Whether the local router is playing the passive role in the session and during session establishment.	<b>detail extensive</b>
<b>Maximum PDU</b>	Maximum protocol data unit (PDU) size (packet size) for the session.	<b>detail extensive</b>
<b>Hold time</b>	Time remaining until the session will be closed, in seconds. This value corresponds to the one configured using the <b>keepalive-timeout</b> statement configured at the <b>[edit protocols ldp]</b> hierarchy level.	<b>detail extensive</b>
<b>Neighbor count</b>	Number of neighbors that are contributing to the session.	<b>detail extensive</b>
<b>Neighbor types</b>	Category of LDP session: <b>discovered</b> or <b>auto-targeted</b> .	any
<b>Keepalive interval</b>	Keepalive interval, in seconds.	<b>detail extensive</b>
<b>Connect retry interval</b>	TCP connection retry interval, in seconds.	<b>detail extensive</b>
<b>Local address</b>	Local transport address.	<b>detail extensive</b>
<b>Remote address</b>	Remote transport address.	<b>detail extensive</b>
<b>Up for</b>	Time that this session has been up.	<b>detail extensive</b>
<b>Last down</b>	Time since the session last went down.	<b>detail extensive</b>

Table 134: *show ldp session* Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Reason</b>	Reason the session went down: <ul style="list-style-type: none"> <li>• Aborted graceful restart</li> <li>• Authentication key was changed</li> <li>• Bad type length value (TLV)</li> <li>• Bad protocol data unit (PDU) packets</li> <li>• Command-line interface (CLI) command</li> <li>• Connect time expired</li> <li>• Connection error</li> <li>• Connection reset</li> <li>• Error during initialization</li> <li>• Hold time expired</li> <li>• No adjacency or all adjacencies down</li> <li>• Notification received</li> <li>• Received notification from peer</li> <li>• Unexpected End of File (EOF)</li> <li>• Unknown reason</li> </ul>	detail extensive
<b>Number of session flaps</b>	Number of times the session changes from up to down.	detail extensive
<b>Restarting</b>	LDP is in the process of gracefully restarting.	detail extensive
<b>Capabilities advertised</b>	LDP capabilities advertised to a peer.	detail extensive
<b>Capabilities received</b>	LDP capabilities received from a peer.	detail extensive
<b>Protection</b>	Information about the status of MPLS LDP session protection.	detail extensive
<b>restart complete in nnn msec</b>	Amount of time (in milliseconds) remaining until graceful restart is declared complete.	detail extensive
<b>Authentication type</b>	Shows the longest match MD5 authentication	detail extensive

Table 134: show ldp session Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Local</b>	<p>Information about graceful restart for the local end of an LDP session. Graceful restart and helper mode are independent.</p> <ul style="list-style-type: none"> <li>• <b>Restart</b>—Status of the graceful restart feature at the local end of the LDP session: <b>enabled</b> or <b>disabled</b>.</li> <li>• <b>Helper mode</b>—Status of the helper mode feature at the local end of the LDP session: <b>enabled</b> or <b>disabled</b>. When this feature is enabled, the local end of the LDP session can help the restarting router with its LDP restart procedures.</li> <li>• <b>Reconnect time</b>—Amount of time to wait from when a restart is initiated until the router can exchange LDP messages with its neighbors. The default is <b>60000 msec</b> and is not configurable. (<b>Reconnect timeout</b> refers to "FT Reconnect timeout" in draft-ietf-mpls-ldp-restart-06, <i>Internet Draft Graceful Restart Mechanism for LDP</i>.)</li> </ul>	<b>detail extensive</b>
<b>Remote</b>	<p>Information about graceful restart at the remote end of an LDP session. Graceful restart and helper mode are independent.</p> <ul style="list-style-type: none"> <li>• <b>Restart</b>—Status of the graceful restart feature at the remote end of the LDP session: <b>enabled</b> or <b>disabled</b>.</li> <li>• <b>Helper mode</b>—Status of the helper mode feature at the remote end of the LDP session: <b>enabled</b> or <b>disabled</b>. When this feature is enabled, the remote end of the LDP session can help the restarting router with its LDP restart procedures.</li> <li>• <b>Reconnect time</b>—Amount of time in milliseconds from when a restart is initiated until the remote router can exchange LDP messages with its neighbors.</li> </ul>	<b>detail extensive</b>
<b>Local maximum recovery time</b>	Amount of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds).	<b>detail extensive</b>
<b>Next-hop addresses received</b>	Next-hop addresses received on the session.	<b>detail extensive</b>
<b>Queue depth</b>	Number of messages that are queued for sending to the peers in the group.	<b>extensive</b>

Table 134: show ldp session Output Fields (continued)

Field Name	Field Description	Level of Output
Message type	<p>Type of message being sent:</p> <ul style="list-style-type: none"> <li>• <b>Initialization</b>—Session initialization negotiation messages sent by an LSR to an LDP peer when the transport connection is established.</li> <li>• <b>Keepalive</b>—Keepalive timer messages sent by an LSR to an LDP peer to keep the session active when there is no information or PDU exchanged between them.</li> <li>• <b>Notification</b>—Notification messages (such as state of the LDP session) or error information (such as bad PDU length) sent by an LSR to an LDP peer.</li> <li>• <b>Address</b>—Message sent by an LSR to an LDP peer to advertise interface addresses.</li> <li>• <b>Address withdraw</b>—Message sent by an LSR to an LDP peer to withdraw a previously advertised interface address.</li> <li>• <b>Label mapping</b>—Message sent by an LSR to an LDP peer to advertise label mapping for a forwarding equivalence class (FEC).</li> <li>• <b>Label request</b>—Message sent by an LSR to an LDP peer to request a label mapping for an FEC.</li> <li>• <b>Label withdraw</b>—Message sent by an LSR to an LDP peer to withdraw a previously advertised FEC-label mapping.</li> <li>• <b>Label release</b>—Message sent by an LSR to an LDP peer to notify the peer that a specific FEC-label mapping has been released.</li> <li>• <b>Label abort</b>—Message sent by an LSR to an LDP peer to abort a label request message.</li> <li>• <b>Total</b>—Messages sent and received during the lifetime of the session.</li> <li>• <b>Last 5 seconds</b>—Messages sent and received during the current session.</li> </ul>	extensive

## Sample Output

<b>List of Sample Output</b>	<a href="#">show ldp statistics on page 2687</a>
<b>Output Fields</b>	<a href="#">Table 135 on page 2684</a> lists the output fields for the <b>show ldp statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 135: show ldp statistics Output Fields*

Field Name	Field Description
Total Sent, Received	Total number of each message type sent and received.
Last 5 seconds Sent, Received	Number of each message type sent and received in the last 5 seconds.

Table 135: show ldp statistics Output Fields (continued)

Field Name	Field Description
<b>Message type</b>	<p>LDP message types:</p> <ul style="list-style-type: none"> <li>• <b>Hello</b>—Messages that enable LDP nodes to discover one another and to detect the failure of a neighbor or of the link to the neighbor.</li> <li>• <b>Initialization</b>—Messages that indicate an LDP session has started.</li> <li>• <b>Keepalive</b>—Messages that ensure that the keepalive timeout is not exceeded.</li> <li>• <b>Notification</b>—Advisory information and signal error information.</li> <li>• <b>Address</b>—Messages with address information.</li> <li>• <b>Address withdrawal</b>—Messages regarding address withdrawal.</li> <li>• <b>Label mapping</b>—Messages with label mapping information.</li> <li>• <b>Label request</b>—Request for a label mapping from a neighboring router.</li> <li>• <b>Label withdrawal</b>—Withdrawal message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.</li> <li>• <b>Label release</b>—Message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use.</li> <li>• <b>Label abort</b>—Messages about label interruptions.</li> <li>• <b>All UDP</b>—All hello messages sent by LSRs to the well-known UDP port, 646.</li> <li>• <b>All TCP</b>—All LDP session messages.</li> </ul>

Table 135: show ldp statistics Output Fields (continued)

Field Name	Field Description
Event type	<p>LDP events and errors:</p> <ul style="list-style-type: none"> <li>• <b>Sessions opened</b>—Number of LDP sessions that have been opened.</li> <li>• <b>Sessions closed</b>—Number of LDP sessions that have been closed.</li> <li>• <b>Topology changes</b>—Number of changes to the known LDP topology.</li> <li>• <b>No interface</b>—Number of missing interface address messages. When a new LDP session is initialized and before sending label lapping or label request messages, the LSR advertises its interface addresses with one or more address messages.</li> <li>• <b>No session</b>—Number of missing session messages. Session messages are used to establish, maintain, and terminate sessions between LDP peers.</li> <li>• <b>No adjacency</b>—The exchange of hello adjacency messages results in the creation of an adjacency. The LDP identifier, together with the sender's LDP identifier in the PDU header, enables the receiver to match the initialization message with one of its hello adjacencies. If there is no matching hello adjacency, the LSR sends a session the initialization message is rejected.</li> <li>• <b>Unknown version</b>—The LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.</li> <li>• <b>Malformed PDU</b>—An LDP PDU received on a TCP connection for an LDP session is malformed if the LDP identifier in the PDU header is unknown to the receiver, or if it is known but is not the LDP identifier associated by the receiver with the LDP peer for this LDP session.  An LDP PDU is considered to be malformed if the LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment.  An LDP PDU is considered malformed if the PDU length field is too small (less than 14) or too large (greater than maximum PDU length).</li> <li>• <b>Malformed message</b>—Malformed LDP messages that are part of the LDP discovery mechanism are handled by silently discarding them.  An LDP message is malformed if the message type is unknown. If the message type is less than 0x8000 (high order bit = 0), it is an error signaled by the unknown message type status code.  An LDP message is considered to be malformed if the message length is too large, meaning that the message extends beyond the end of the containing LDP PDU.  The LDP message is considered to be malformed if the message length is too small, meaning that it is smaller than the smallest possible value component.  The LDP message is considered to be malformed if the message is missing one or more mandatory parameters.</li> <li>• <b>Unknown message type</b>—If the message type is less than 0x8000 (high order bit = 0) or greater than or equal to 0x8000 (high order bit = 1) it is considered to be an unknown message.</li> <li>• <b>Inappropriate message</b>—The message is not of the type that the receiver expects to receive.</li> <li>• <b>Malformed TLV</b>—The TLV Length is too large or the receiver cannot decode the TLV value. This can indicate an issue in either the sending or receiving LSR.</li> <li>• <b>Bad TLV value</b>—The TLV Length is too large.</li> <li>• <b>Missing TLV</b>—The TLV is missing one or more mandatory parameters.</li> <li>• <b>PDU too large</b>—The PDF is greater than the maximum PDU length. Section "Initialization Message" in RFC 5036 describes how the maximum PDU length for a session is determined.</li> </ul>
Total	Total number of each event or error.
Last 5 seconds	Number of each event or error in the last 5 seconds.

## Sample Output

### show ldp statistics

```

user@host> show ldp statistics
Message type          Total
                      Sent      Received
Hello                 265        263
Initialization        2          2

```

## show ldp traffic-statistics

---

Syntax	<pre>show ldp traffic-statistics &lt;instance <i>instance-name</i>&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt; &lt;p2mp&gt;</pre>
Release Information	Command introduced before Junos OS Release 7.4. <b>p2mp</b> option added in Junos OS Release 11.2. Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Description	Display Label Distribution Protocol (LDP) traffic statistics.
<div> <b>NOTE:</b> If nonstop active routing features is configured, <b>show ldp traffic-statistics</b> command is not supported on backup Routing Engines.</div>	
Options	<p><b>none</b>—Display LDP traffic statistics for all routing instances.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display LDP traffic statistics for the specified routing instance only.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>p2mp</b>—(Optional) Display only the data traffic statistics for a point-to-multipoint LSP.</p>
Additional Information	To collect output from this command on a periodic basis, configure the <a href="#">traffic-statistics</a> statement for the LDP protocol. For more information, see the <i>Junos MPLS Applications Configuration Guide</i> .
Required Privilege Level	view

### [show ldp traffic-statistics p2mp \(Multipoint LDP with Multicast-Only Fast Reroute\) on page 2691](#)

**Output Fields** [Table 136 on page 2689](#) lists the output fields for the **show ldp traffic-statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 136: show ldp traffic-statistics Output Fields*

Field Name	Field Description
<b>Message type</b>	LDP message types.
<b>FEC</b>	Forwarding equivalence class (FEC) for which LDP traffic statistics are collected.  For P2MP LSPs, FEC appears as a combination of root address and the LSP ID ( <b>root_addr:lsp_id</b> ).  For M-LDP P2MP LSPs, FEC appears as a combination of root address multicast source address, and multicast group address ( <b>root_addr:lsp_id/grp,src</b> ).
<b>Type</b>	Type of traffic originating from a router, either <b>Ingress</b> (originating from this router) or <b>Transit</b> (forwarded through this router).
<b>Packets</b>	Number of packets passed by the FEC since its LSP came up.
<b>Bytes</b>	Number of bytes of data passed by the FEC since its LSP came up.
<b>Shared</b>	Whether a label is shared by prefixes: <b>Yes</b> or <b>No</b> . A <b>Yes</b> value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such.
<b>Nexthop</b>	The next hop address for P2MP LSPs. (This is the downstream LDP Session ID.)
<b>Label</b>	For multipoint LDP with multicast-only fast reroute (MoFRR), the multipoint LDP node selects two separate upstream peers and sends two separate labels, one to each upstream peer. The same algorithm described in RFC 6388 is used to select the primary upstream path. The backup upstream path selection again uses the same algorithm but excludes the primary upstream LSR as a candidate. Two streams of MPLS traffic are sent to the egress node from the two different upstream peers. The MPLS traffic from only one of the upstream neighbors is selected as the primary path to accept the traffic, and the other becomes the backup path. The traffic on the backup path is dropped. When the primary upstream path fails, the traffic from the backup path is then accepted. The multipoint LDP node selects the two upstream paths based on the interior gateway protocol (IGP) root node next hop.  Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
<b>Backup route</b>	For multipoint LDP with MoFRR, the route that is used if the primary route becomes unavailable.

## show security keychain

<b>Syntax</b>	show security keychain <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
<b>Description</b>	Display information about authentication keychains configured for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, the Bidirectional Forwarding Detection (BFD) protocol, and the Intermediate System-to-Intermediate System (IS-IS) protocol.
<b>Options</b>	<b>none</b> —Display information about authentication keychains.  <b>brief   detail</b> —(Optional) Display the specified level of output.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show security keychain brief on page 2694</a> <a href="#">show security keychain detail on page 2694</a>
<b>Output Fields</b>	<a href="#">Table 137 on page 2692</a> describes the output fields for the <b>show security keychain</b> command. Output fields are listed in the approximate order in which they appear.

*Table 137: show security keychain Output Fields*

Field Name	Field Description	Level of Output
keychain	The name of the keychain in operation.	All levels
Active-ID Send	Number of routing protocols packets sent with the active key.	All levels
Active-ID Receive	Number of routing protocols packets received with the active key.	All levels
Next-ID Send	Number of routing protocols packets sent with the next key.	All levels
Next-ID Receive	Number of routing protocols packets received with the next key.	All levels
Transition	Amount of time until the current key will be replaced with the next key in the keychain.	All levels
Tolerance	Configured clock-skew tolerance, in seconds, for accepting keys for a key chain.	All levels
Id	Identification number configured for the current key.	<b>detail</b>
Algorithm	Authentication algorithm configured for the current key.	<b>detail</b>

Table 137: show security keychain Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	<p>State of the current key.</p> <p>The value can be:</p> <ul style="list-style-type: none"> <li>• <b>receive</b></li> <li>• <b>send</b></li> <li>• <b>send-receive</b></li> </ul> <p>For the active key, the <b>State</b> can be <b>send-receive</b>, <b>send</b>, or <b>receive</b>. For keys that have a future start time, the <b>State</b> is <b>inactive</b>. Compare the <b>State</b> field to the <b>Mode</b> field.</p>	<b>detail</b>
<b>Option</b>	<p>For IS-IS only, the option determines how Junos OS encodes the message authentication code in routing protocol packets.</p> <p>The values can be:</p> <ul style="list-style-type: none"> <li>• <b>basic</b>—Based on RFC 5304.</li> <li>• <b>isis-enhanced</b>—Based on RFC 5310.</li> </ul> <p>The default value is <b>basic</b>. When you configure the <b>isis-enhanced</b> option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.</p> <p>When you configure <b>basic</b> (or do not include the <b>options</b> statement in the key configuration) Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.</p> <p>Because this setting is for IS-IS only, the TCP and the BFD protocol ignore the encoding option configured in the key.</p>	<b>detail</b>
<b>Start-time</b>	Time that the current key became active.	<b>detail</b>
<b>Mode</b>	<p>Mode of each key (Informational only.)</p> <p>The value can be</p> <ul style="list-style-type: none"> <li>• <b>receive</b></li> <li>• <b>send</b></li> <li>• <b>send-receive</b></li> </ul> <p>The mode of the key is based on the configuration. Suppose you configure two keys, one with a start-time of today and the other with a start-time of next week. For both keys, the <b>Mode</b> can be <b>send-receive</b>, <b>send</b>, or <b>receive</b>, regardless of the configured start-time. Compare the <b>Mode</b> field to the <b>State</b> field.</p>	<b>detail</b>

## traceroute mpls ldp

**Syntax** `traceroute mpls <ldp> fec`  
`<destination ip-address>`  
`<detail>`  
`<exp exp>`  
`<fanout fanout-number>`  
`<logical-system logical-system-name>`  
`<no-resolve>`  
`<paths maximum-paths>`  
`<pipe-mode>`  
`<retries retries-number>`  
`<routing-instance routing-instance-name>`  
`<source ip-address>`  
`<ttl value>`  
`<update>`  
`<wait seconds>`

**Release Information** Command introduced in Junos OS Release 8.4.  
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

**Description** Trace route to a remote host for an MPLS label-switched path signaled by the LDP. Use **traceroute mpls ldp** as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

**Options** *fec*—Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

**destination *ip-address***—(Optional) Specify the destination address to use when sending probes.  
**Values:** The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets.

**detail**—(Optional) Display detailed output.

**exp *exp***—(Optional) Specify the class-of-service to use when sending probes.  
**Range:** 0 through 7  
**Default:** 7

**fanout *fanout-number***—(Optional) Specify the maximum number of nexthops to search per node.  
**Range:** 1 through 16  
**Default:** 16

**logical-system**—(Optional) Specify the name of the logical system for the traceroute attempt.

**no-resolve**—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

**paths *maximum-paths***—(Optional) Specify the maximum number of paths to search.

**Range:** 1 through 255

**Default:** 16

**pipe-mode**—(Optional) Specify to trace only nodes that understand LDP FEC.

In an interoperation with other vendor devices or devices running Junos OS Release that do not support tracing of hierarchical LSPs as described in RFC 6424, continuous non-complaint probe status is displayed in the **traceroute mpls ldp** command output. To avoid this LDP loop creation, use the **pipe-mode** option with the **traceroute mpls ldp fec** command.

**NOTE:** Even after using the **traceroute mpls ldp fec pipe-mode** command, one or more intermediate transit nodes that do not understand LDP FEC can return non-complaint probe status in the command output.

**retries *retries-number***—(Optional) Specify the number of times to resend probe values.

**Range:** 1 through 9

**Default:** 3

**routing-instance *routing-instance-name***—(Optional) Specify the name of the routing instance for the traceroute attempt.

**source *source-address***—(Optional) Specify the source address of the outgoing traceroute packets.

**ttl *value***—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

**Range:** 1 through 125

**Default:** 64

**update**—(Optional) Update database contents with traceroute results.

**wait *seconds***—(Optional) Specify the number of seconds to wait before resending a probe.

**Range:** 5 through 15

**Default:** 10

**Required Privilege Level** network

**List of Sample Output** [traceroute mpls ldp on page 2697](#)  
[traceroute mpls ldp detail on page 2698](#)

**Output Fields** [Table 116 on page 2579](#) describes the output fields for the **traceroute mpls ldp fec** command and the **traceroute mpls ldp fec detail** commands. Output fields are listed in the approximate order in which they appear.

Table 138: *traceroute mpls ldp* Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the <b>traceroute mpls ldp fec</b> command.	all levels
ttl	Time to live value of the labeled packet.	none specified
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is LDP.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is <b>null</b> .	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	<b>detail</b>
Parent	Address of the previous hop. Parent value for the first hop is <b>null</b> .	<b>detail</b>
Return Code	Return code for reporting the result of processing the echo request by the receiver.	<b>detail</b>
Response time	Time for the echo request to reach the receiver.	<b>detail</b>
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is <b>none</b> .	<b>detail</b>
Label Stack	Label stack used to forward the packet.	<b>detail</b>

## Sample Output

### traceroute mpls ldp

```
user@router> traceroute mpls ldp 4.4.4.4
```

```
Probe options: ttl 64, retries 3, wait 10, paths 16, exp 7, fanout 16
ttl  Label  Protocol  Address          Previous Hop      Probe Status
 1   100016  LDP        24.24.24.1       (null)           Success
 2   100000  LDP        20.20.20.2       24.24.24.1       Success
 3           3  LDP        22.22.22.4       20.20.20.2       Egress
```

```
Path 1 via fe-0/3/3.101 destination 127.0.0.64
```

### traceroute mpls ldp detail

```
user@router> traceroute mpls ldp 4.4.4.4 detail

Probe Options: ttl 64, retries 3, wait 10, paths 3, exp 7
Hop 24.24.24.1 Depth 1
  Parent (null)
  Return code: Label switched at stack-depth 1
  Response time 165.93 msec
  Multipath type: IP bitmask
    Address Range 1: 127.0.0.0 ~ 127.0.3.255
  Label Stack:
    Label 1 Value 100032 Protocol LDP

Hop 20.20.20.2 Depth 2
  Parent 24.24.24.1
  Return code: Upstream interface index unknown label-switched at stack-depth
1
  Response time 19.05 msec
  Multipath type: IP bitmask
    Address Range 1: 127.0.0.0 ~ 127.0.3.255
  Label Stack:
    Label 1 Value 100000 Protocol LDP

Hop 22.22.22.4 Depth 3
  Parent 20.20.20.2
  Return code: Egress-ok at stack-depth 1
  Response time 0.79 msec
  Multipath type: None
  Label Stack:
    Label 1 Value 3 Protocol LDP
```

## CHAPTER 43

# CCC and TCC Operational Commands

- `show connections`
- `show route ccc`
- `show route forwarding-table`

## show connections

---

**List of Syntax**    [Syntax on page 2700](#)  
                          [Syntax \(EX Series Switches\) on page 2700](#)

**Syntax**    show connections  
              <brief | extensive>  
              <all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch |  
              remote-interface-switch>  
              <down | up | up-down>  
              <history>  
              <labels>  
              <logical-system (all | *logical-system-name*)>  
              <*name*>  
              <status>

**Syntax (EX Series Switches)**    show connections  
  <brief | extensive>  
  <all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch |  
  remote-interface-switch>  
  <down | up | up-down>  
  <history>  
  <labels>  
  <*name*>  
  <status>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description**    Display information about the configured circuit cross-connect (CCC) connections.

**Options**    **none**—Display the standard level of output for all configured CCC connections.

**all**—(Optional) Display all connections.

**brief | extensive**—(Optional) Display the specified level of output. Use history to display information about connection history. Use labels to display labels used for transmit and receive LSPs. Use status to display information about the connection and interface status.

**interface-switch**—(Optional) Display interface switch connections only.

**lsp-switch**—(Optional) Display LSP switch connections only.

**p2mp-receive-switch**—(Optional) Display point-to-multipoint LSP to local interfaces switch connections only.

**p2mp-transmit-switch**—(Optional) Display local interface to point-to-multipoint LSP switch connections only.

**remote-interface-switch**—(Optional) Display remote interface switch connections only.

**down | up | up-down**—(Optional) Display nonoperational, operational, or both kinds of connections.

**history**—(Optional) Display information about connection history.

**labels**—(Optional) Display labels used for transmit and receive.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**name**—(Optional) Display information about the specified connection only.

**status**—(Optional) Display information about the connection and interface status.

**Required Privilege Level** view

**Output Fields** [Table 81 on page 2428](#) describes the output fields for the **show connections** command. Output fields are listed in the approximate order in which they appear.

*Table 139: show connections Output Fields*

Field Name	Field Description
CCC and TCC connections [Link Monitoring On   Off]	Whether link monitoring is enabled: <b>On</b> or <b>Off</b> .
<b>Legend for Status (St)</b>	Connection or circuit status. See the output's legend for an explanation of the status field values.
<b>Legend for connection types</b>	Type of connection: <ul style="list-style-type: none"> <li>• <b>if-sw</b>—Layer 2 switching cross-connect.</li> <li>• <b>rmt-if</b>—Remote interface switch. While graceful restart is in progress, <b>rmt-if</b> will display a state (<b>St</b>) of <b>Restart</b>.</li> <li>• <b>lsp-sw</b>—LSP stitching cross-connect. While graceful restart is in progress, <b>lsp-sw</b> will display a state (<b>St</b>) of <b>Restart</b>.</li> </ul>
<b>Legend for circuit types</b>	Type of circuits: <ul style="list-style-type: none"> <li>• <b>intf</b>—Interface circuit.</li> <li>• <b>tlsp</b>—Transmit LSP circuit.</li> <li>• <b>rlsp</b>—Receive LSP circuit.</li> </ul>
<b>Connection/Circuit</b>	Name of the configured CCC connection.
<b>Type</b>	Type of connection.
<b>St</b>	State of the connection.
<b>Time last up</b>	Time that the connection or circuit last transitioned to the <b>Up</b> (operational) state.

Table 139: show connections Output Fields (continued)

Field Name	Field Description
# Up trans	Number of times that the connection or circuit has transitioned to the Up (operational) state.

## Sample Output

### show connections

```

user@switch> show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)
UN -- uninitialized
NP -- not present
WE -- wrong encapsulation
DS -- disabled
Dn -- down
-> -- only outbound conn is up
<- -- only inbound conn is up
Up -- operational
RmtDn -- remote CCC down
Restart -- restarting

Legend for connection types
if-sw: interface switching
rmt-if: remote interface switching
lsp-sw: LSP switching

Legend for circuit types
intf -- interface
tlsp -- transmit LSP
rlsp -- receive LSP

CCC Graceful restart : Restarting

Connection/Circuit      Type  St    Time last up    # Up trans
IFSW-ed
  so-1/0/2.0             intf  Up    Aug  5 15:39:15      1
  t1-0/1/2.0             intf  Up
SW-db
  so-1/0/3.0             rmt-if Restart      0

```

## show route ccc

<b>Syntax</b>	<pre>show route ccc ccc &lt;brief   detail   extensive   terse&gt; &lt;logical-system (all   <i>logical-system-name</i>)&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display circuit cross-connect (CCC) entries in the Multiprotocol Link Switching (MPLS) routing table.
<b>Options</b>	<p><b>ccc</b>—Name of an entry with a circuit cross-connect interface.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show connections on page 2427</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show route ccc extensive on page 2703</a>
<b>Output Fields</b>	For information about output fields, see the output field tables for the <i>show route</i> command, the <i>show route detail</i> command, the <i>show route extensive</i> command, or the <i>show route terse</i> command.

## Sample Output

### show route ccc extensive

```
user@host> show route ccc fe-0/1/0.600 extensive
mpls.0: 19 destinations, 19 routes (19 active, 0 holddown, 0 hidden)
fe-0/1/2.600 (1 entry, 1 announced)
TSI:
KRT in-kernel fe-0/1/2.600.0      /16 -> {0.0.0.0}
      *CCC      Preference: 7
                Next-hop reference count: 2
                Next hop: via so-0/0/3.0 weight 0x1, selected
                Label operation: Push 101424
                State: <Active Int>
                Local AS: 100
                Age: 28:13 Metric: 3
                Task: MPLS

                 <multicast>  
                 <table *routing-instance-name*>  
                 <vpn *vpn*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Option **bridge-domain** introduced in Junos OS Release 7.5

Option **learning-vlan-id** introduced in Junos OS Release 8.4

Options **all** and **vlan** introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **bridge** (ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn), **ethernet-switching**, **evpn**, **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mcsnoop-inet**, **mcsnoop-inet6**, **mpls**, **satellite-inet**, **satellite-inet6**, **satellite-vpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers,

display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** —(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the **show route instance** command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege Level**

view

**Output Fields** [Table 108 on page 2519](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

*Table 140: show route forwarding-table Output Fields*

Field Name	Field Description	Level of Output
Logical system	Name of the logical system. This field is displayed if you specify the <b>table logical-system-name/routing-instance-name</b> option on a device that is configured for and supports logical systems.	All levels
Routing table	Name of the routing table (for example, inet, inet6, mpls).	All levels

Table 140: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Enabled protocols	<p>The features and protocols that have been enabled for a given routing table. This field can contain the following values:</p> <ul style="list-style-type: none"> <li>• BUM hashing—BUM hashing is enabled.</li> <li>• MAC Stats—Mac Statistics is enabled.</li> <li>• Bridging—Routing instance is a normal layer 2 bridge.</li> <li>• No VLAN—No VLANs are associated with the bridge domain.</li> <li>• All VLANs—The <b>vlan-id all</b> statement has been enabled for this bridge domain.</li> <li>• Single VLAN—Single VLAN ID is associated with the bridge domain.</li> <li>• MAC action drop—New MACs will be dropped when the MAC address limit is reached.</li> <li>• Dual VLAN—Dual VLAN tags are associated with the bridge domain</li> <li>• No local switching—No local switching is enabled for this routing instance..</li> <li>• Learning disabled—Layer 2 learning is disabled for this routing instance.</li> <li>• MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached.</li> <li>• VPLS—The VPLS protocol is enabled.</li> <li>• No IRB I2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance.</li> <li>• ACKed by all peers—All peers have acknowledged this routing instance.</li> <li>• BUM Pruning—BUM pruning is enabled on the VPLS instance.</li> <li>• Def BD VXLAN—VXLAN is enabled for the default bridge domain.</li> <li>• EVPN—EVPN protocol is enabled for this routing instance.</li> <li>• Def BD OVSDb—Open vSwitch Database (OVSDb) is enabled on the default bridge domain.</li> <li>• Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain.</li> <li>• L2 backhaul—Layer 2 backhaul is enabled.</li> <li>• FRR optimize—Fast reroute optimization</li> <li>• MAC pinning—MAC pinning is enabled for this bridge domain.</li> <li>• MAC Aging Timer—The MAC table aging time is set per routing instance.</li> <li>• EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation.</li> <li>• PBBN—This routing instance is configured as a provider backbone bridged network.</li> <li>• PBN—This routing instance is configured as a provider bridge network.</li> <li>• ETREE—The ETREE protocol is enabled on this EVPN routing instance.</li> <li>• ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance.</li> <li>• Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain.</li> <li>• MPLS control word—Control word is enabled for this MPLS routing instance.</li> </ul>	All levels
Address family	Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).	All levels
Destination	Destination of the route.	detail extensive

Table 140: *show route forwarding-table Output Fields (continued)*

Field Name	Field Description	Level of Output
Route Type (Type)	<p>How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li>• <b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li>• <b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li>• <b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li>• <b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li>• <b>ignore (ignr)</b>—Ignore this route.</li> <li>• <b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li>• <b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li>• <b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul>	All levels
Route Reference (RtRef)	Number of routes to reference.	<b>detail extensive</b>
Flags	<p>Route type flags:</p> <ul style="list-style-type: none"> <li>• <b>none</b>—No flags are enabled.</li> <li>• <b>accounting</b>—Route has accounting enabled.</li> <li>• <b>cached</b>—Cache route.</li> <li>• <b>incoming-iface interface-number</b>—Check against incoming interface.</li> <li>• <b>prefix load balance</b>—Load balancing is enabled for this prefix.</li> <li>• <b>rt nh decoupled</b>—Route has been decoupled from the next hop to the destination.</li> <li>• <b>sent to PFE</b>—Route has been sent to the Packet Forwarding Engine.</li> <li>• <b>static</b>—Static route.</li> </ul>	<b>extensive</b>
Next hop	IP address of the next hop to the destination.	<b>detail extensive</b>

Table 140: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Next hop Type (Type)	<p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b> —Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrt)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul>	<b>detail extensive</b>
Index	Software index of the next hop that is used to route the traffic for a given prefix.	<b>detail extensive none</b>
Route interface-index	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	<b>extensive</b>
Reference (NhRef)	Number of routes that refer to this next hop.	<b>detail extensive none</b>
Next-hop interface (Netif)	Interface used to reach the next hop.	<b>detail extensive none</b>
Weight	Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).	<b>extensive</b>
Balance	Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.	<b>extensive</b>
RPF interface	List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.	<b>extensive</b>

## Sample Output

### show route forwarding-table

```

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```

so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;
      address 192.0.2.2/30;
    }
  }
}

user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
Destination: 192.0.2.3/32

```

```

Route type: destination
Route reference: 0
Flags: sent to PFE
Nexthop: 192.0.2.3
Next-hop type: broadcast
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0
Route interface-index: 67
Index: 328      Reference: 1

```

### show route forwarding-table (dynamic list next hop)

The **show route forwarding table** output shows the two next hop elements for a multihomed EVPN destination.

```

user@host> show route forwarding-table label 299952 extensive
MPLS:

Destination: 299952
Route type: user
Route reference: 0
Multicast RPF nh index: 0
P2mpidx: 0
Flags: sent to PFE, rt nh decoupled
Next-hop type: indirect
Nexthop:
Next-hop type: composite
Next-hop type: indirect
Nexthop: 1.0.0.4
Next-hop type: Push 301632, Push 299776(top) Index: 600 Reference: 2
Load Balance Label: None
Next-hop interface: ge-0/0/1.0
Next-hop type: indirect
Nexthop: 1.0.0.4
Next-hop type: Push 301344, Push 299792(top) Index: 619 Reference: 2
Load Balance Label: None
Next-hop interface: ge-0/0/1.0
Route interface-index: 0
Index: 1048575 Reference: 2
Index: 601      Reference: 2
Index: 1048574 Reference: 3
Index: 1048577 Reference: 3
Index: 619 Reference: 2

```

After one of the PE router has been disabled in the EVPN multihomed network, the same **show route forwarding table** output command shows one next hop element and one empty next hop element.

```

user@host> show route forwarding-table label 299952 extensive
Routing table: default.mpls [Index 0]
MPLS:

## CHAPTER 44

# PCEP Operational Commands

- `clear path-computation-client statistics`
- `request path-computation-client active-pce`
- `show path-computation-client active-pce`
- `show path-computation-client lsp`
- `show path-computation-client statistics`
- `show spring-traffic-engineering`

## clear path-computation-client statistics

---

<b>Syntax</b>	<code>clear path-computation-client statistics</code> <code>&lt;pce-id   all&gt;</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 16.1R3 for QFX Series switches. Command introduced in Junos OS Release 17.1R1 for ACX Series routers.
<b>Description</b>	Clear Path Computation Element (PCE) statistics.
<b>Options</b>	<b>pce-id</b> —(Optional) Clear statistics of the specified PCE.  <b>all</b> —(Optional) Clear statistics of all available PCEs configured on the path computation client (PCC).
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show path-computation-client statistics on page 2732</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear path-computation-client statistics pce-id on page 2724</a> <a href="#">clear path-computation-client statistics all on page 2724</a>
<b>Output Fields</b>	When you enter this command, you are not provided feedback on the status of your request.

## Sample Output

### clear path-computation-client statistics pce-id

```
user@host> clear path-computation-client statistics pce1
```

### clear path-computation-client statistics all

```
user@host> clear path-computation-client statistics all
```

## request path-computation-client active-pce

---

<b>Syntax</b>	request path-computation-client active-pce <i>pce-id</i>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3. Command introduced in Junos OS Release 16.1R3 for QFX Series switches. Command introduced in Junos OS Release 17.1R1 for ACX Series routers.
<b>Description</b>	Request a new active Path Computation Element (PCE).
<b>Options</b>	<i>pce-id</i> —Unique user defined ID for this PCE.
<b>Required Privilege Level</b>	request
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show path-computation-client active-pce on page 2726</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request path-computation-client active-pce pce-id on page 2725</a>

### Sample Output

request path-computation-client active-pce pce-id

```
user@host> request path-computation-client active-pce pce1
```

## show path-computation-client active-pce

<b>Syntax</b>	show path-computation-client active-pce <brief   detail>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3. Command introduced in Junos OS Release 16.1R3 for QFX Series switches. Command introduced in Junos OS Release 17.1R1 for ACX Series routers.
<b>Description</b>	Displays information about the current active Path Computation Element (PCE).
<b>Options</b>	<b>none</b> —Display brief information about the current active PCE. <b>brief   detail</b> —(Optional) Display the specific level of output.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">request path-computation-client active-pce on page 2725</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show path-computation-client active-pce on page 2728</a> <a href="#">show path-computation-client active-pce detail on page 2729</a>
<b>Output Fields</b>	<a href="#">Table 141 on page 2726</a> describes the output fields for the <b>show path-computation-client active-pce</b> command. Output fields are listed in the approximate order in which they appear.

*Table 141: show path-computation-client active-pce Output Fields*

Field Name	Field Description	Level of Output
IP address	IP address of the current active PCE.	All levels
Priority	Active PCE priority.	All levels
PCE status	Active PCE state: <ul style="list-style-type: none"> <li>PCE_STATE_NEW—Initial PCEP session state.</li> <li>PCE_STATE_RECONNECT—Trying to re-establish TCP connection with the PCEP peer.</li> <li>PCE_STATE_CONNECTING—Establishing TCP connection with the PCEP peer.</li> <li>PCE_STATE_CONNECTED—TCP connection established with the PCEP peer.</li> <li>PCE_STATE_SYNC—Open messages exchanged with the PCEP peer and entering SYNC state.</li> <li>PCE_STATE_UP—PCEP session established.</li> </ul>	All levels

Table 141: show path-computation-client active-pce Output Fields (continued)

Field Name	Field Description	Level of Output
Session type	Active PCE type: <ul style="list-style-type: none"> <li>PCE_TYPE_STATELESS—Does not learn LSP state information from PCC.</li> <li>PCE_TYPE_STATEFUL—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update LSP state. A PCC maintains synchronization with the PCE.</li> <li>PCE_TYPE_STATEFULACTIVE—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegate control of their LSPs to the PCE.</li> </ul>	All levels
PCE-mastership	PCE mastership state: <ul style="list-style-type: none"> <li>main—Current active PCE.</li> <li>backup—Backup PCE.</li> </ul>	All levels
PCRpts	Number of PC report (PCRpt) messages sent by PCC to a stateful PCE to report current state of LSP(s).	All levels
PCUpdates	Number of PC update (PCUpd) messages sent by a PCE to a PCC to update LSP parameters.	All levels
Local Keepalive timer	Keepalive timer used by or for the PCC.	All levels
Local Dead timer	Dead timer used by or for the PCC.	All levels
Remote Keepalive timer	Keepalive timer used by or for the PCE.	All levels
Remote Dead timer	Dead timer used by or for the PCE.	All levels
PCErr-recv	Information about type, value, and number of PC Error messages received.	All levels
Max unknown messages	Maximum number of unknown messages received for a PCEP session. Recommended value is 5. If the number of unknown messages received by a PCC or PCE is greater than or equal to the maximum number, the PCEP session is closed.	detail
Keepalives received	Number of Keepalive messages received by a PCC from a PCE.	detail
Keepalives sent	Number of Keepalive messages sent by a PCC to a PCE.	detail
Dead timer	Dead timer used by the current active PCE.	detail
Elapsed as main current	Time (in seconds) the PCE is in the main mastership state.	detail
Elapsed as main total	Time (in seconds) the PCE became main from the last PCCD restart.	detail

Table 141: show path-computation-client active-pce Output Fields (continued)

Field Name	Field Description	Level of Output
Unknown msgs/min rate	Number of unknown messages received per minute.	detail
Session failures	Number of PCEP session failures with the PCE.	detail
Delegation timeout in	Time (in seconds) left for LSP delegation to timeout.	detail
Delegation failures	Number of LSP delegation failures.	detail
Connection down	Time (in seconds) since the PCEP session is down.	detail
PCErr-sent	Information about type, value, and number of PC Error messages sent.	All levels

## Sample Output

## show path-computation-client lsp

**Syntax**    `show path-computation-client lsp`

**Release Information**    Command introduced in Junos OS Release 17.2R1 on MX Series routers.

**Description**    Display the state of label-switched paths (LSPs) known to the Path Computation Client (PCC).

**Required Privilege Level**    view

**Related Documentation**

- [show path-computation-client active-pce on page 2726](#)
- [show path-computation-client statistics on page 2732](#)

**List of Sample Output**    [show path-computation-client lsp on page 2731](#)

**Output Fields**    [Table 142 on page 2730](#) describes the output fields for the **show path-computation-client lsp** command. Output fields are listed in the approximate order in which they appear.

*Table 142: show path-computation-client lsp Output Fields*

Field Name	Field Description
Name	Name of the LSP.
Status	LSP status: <ul style="list-style-type: none"><li>• Up</li><li>• Down</li></ul>
PLSP-Id	PCEP-specific unique identifier for each LSP. The ID is created by the PCC for the lifetime of a PCEP session.
LSP-Type	Type of LSP: <ul style="list-style-type: none"><li>• External provisioned</li><li>• Local</li></ul>
Controller	Name of the external path computing entity.
Path-Setup-Type	Protocol used to set up the LSP: <ul style="list-style-type: none"><li>• RSVP-TE</li><li>• SPRING-TE</li></ul>
Template	Name of template used.

Sample Output

show path-computation-client lsp

```
user@host> show path-computation-client lsp
```

Name	Path-Setup-Type	Status	PLSP-Id	LSP-Type
Controller		Template		
Adj_LSP_R0_to_R3		(Up)	1	ext-provided
ns1	spring-te			
Node_LSP_R0_to_R3		(Up)	2	ext-provided
ns1	spring-te			

## show path-computation-client statistics

<b>Syntax</b>	<code>show path-computation-client statistics</code> <code>&lt;brief   detail&gt;</code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3. Command introduced in Junos OS Release 16.1R3 for QFX Series switches. Command introduced in Junos OS Release 17.1R1 for ACX Series routers.
<b>Description</b>	Display statistics about the Path Computation Element (PCE).
<b>Options</b>	<b>none</b> —Display statistics about the primary PCE.  <b>brief   detail</b> —(Optional) Display the specific level of output.  <b>all</b> —(Optional) Display the statistics about all PCEs configured on the PCC.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">clear path-computation-client statistics on page 2724</a></li></ul>
<b>List of Sample Output</b>	<a href="#">show path-computation-client statistics all on page 2734</a> <a href="#">show path-computation-client statistics detail on page 2735</a>
<b>Output Fields</b>	<a href="#">Table 143 on page 2732</a> describes the output fields for the <b>show path-computation-client statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 143: show path-computation-client statistics Output Fields*

Field Name	Field Description	Level of Output
IP address	IP address of the PCE.	All levels
Priority	PCE priority.	All levels

Table 143: *show path-computation-client statistics Output Fields (continued)*

Field Name	Field Description	Level of Output
PCE status	PCE state: <ul style="list-style-type: none"> <li>• PCE_STATE_NEW—Initial PCEP session state.</li> <li>• PCE_STATE_RECONNECT—Trying to re-establish TCP connection with the PCEP peer.</li> <li>• PCE_STATE_CONNECTING—Establishing TCP connection with the PCEP peer.</li> <li>• PCE_STATE_CONNECTED—TCP connection established with the PCEP peer.</li> <li>• PCE_STATE_SYNC—Open messages exchanged with the PCEP peer and entering SYNC state.</li> <li>• PCE_STATE_UP—PCEP session established.</li> </ul>	All levels
Session type	Active PCE type: <ul style="list-style-type: none"> <li>• PCE_TYPE_STATELESS—Does not learn LSP state information from PCC.</li> <li>• PCE_TYPE_STATEFUL—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update LSP state. A PCC maintains synchronization with the PCE.</li> <li>• PCE_TYPE_STATEFULACTIVE—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegate control of their LSPs to the PCE.</li> </ul>	All levels
PCE-mastership	PCE mastership state: <ul style="list-style-type: none"> <li>• main</li> <li>• primary</li> <li>• backup</li> </ul>	All levels
PCRpts	Number of PC report (PCRpt) messages sent by PCC to a stateful PCE to report current state of LSP(s).	All levels
PCUpdates	Number of PC update (PCUpd) messages sent by a PCE to a PCC to update LSP parameters.	All levels
Local Keepalive timer	Keepalive timer used by or for the PCC.	All levels
Local Dead timer	Dead timer used by or for the PCC.	All levels
Remote Keepalive timer	Keepalive timer used by or for the PCE.	All levels
Remote Dead timer	Dead timer used by or for the PCE.	All levels

**Table 143: show path-computation-client statistics Output Fields (continued)**

Field Name	Field Description	Level of Output
PCErr-recv	Information about type, value, and number of PC Error messages received.	All levels
PCErr-sent	Information about type, value, and number of PC Error messages sent.	All levels
Max unknown messages	Maximum number of unknown messages received for a PCEP session. Recommended value is 5. If the number of unknown messages received by a PCC or PCE is greater than or equal to the maximum number, the PCEP session is closed.	detail
Keepalives received	Number of Keepalive messages received by a PCC from a PCE.	detail
Keepalives sent	Number of Keepalive messages sent by a PCC to a PCE.	detail
Elapsed as main current	Time (in seconds) the PCE is in the main mastership state.	detail
Elapsed as main total	Time (in seconds) the PCE became main from the last PCCD restart.	detail
Unknown msgs/min rate	Number of unknown messages received per minute.	detail
Session failures	Number of PCEP session failures with the PCE.	detail
Delegation timeout in	Time (in seconds) left for LSP delegation to timeout.	detail
Delegation failures	Number of LSP delegation failures.	detail
Connection down	Time (in seconds) since the PCEP session is down.	detail

## Sample Output

## show spring-traffic-engineering

<b>Syntax</b>	show spring-traffic-engineering (lsp   overview) <brief   detail> <logical-system (all   <i>logical-system-name</i> )> <name <i>lsp-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 17.2 on MX Series routers.
<b>Description</b>	Display ingress details of SPRING traffic engineering.
<b>Options</b>	<p><b>lsp</b>—Display details of SPRING traffic engineered LSPs on the ingress router or the Path Computation Client (PCC).</p> <p><b>overview</b>—Display overview of SPRING traffic engineered LSPs on the ingress router, or the PCC.</p> <p><b>brief   detail</b>—(Optional) Display the specific level of output.</p> <p><b>name <i>lsp-name</i></b>—(Optional) Regular expression for LSP names to match for displaying SPRING traffic engineering details.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Support of SPRING-TE for the Path Computation Element Protocol Overview on page 1407</a></li> <li>• <a href="#">Example: Configuring Path Computation Element Protocol for SPRING-TE LSPs on page 1411</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show spring-traffic-engineering lsp name on page 2738</a> <a href="#">show spring-traffic-engineering lsp detail on page 2738</a> <a href="#">show spring-traffic-engineering overview on page 2738</a>
<b>Output Fields</b>	<a href="#">Table 144 on page 2737</a> describes the output fields for the <b>show spring-traffic-engineering</b> command. Output fields are listed in the approximate order in which they appear.

*Table 144: show spring-traffic-engineering Output Fields*

Field Name	Field Description
To	IP address of the SPRING-TE LSP destination.
State	State of the SPRING-TE LSP: <ul style="list-style-type: none"> <li>• Up</li> <li>• Down</li> </ul>

Table 144: *show spring-traffic-engineering Output Fields (continued)*

Field Name	Field Description
LSP Name	Name of the SPRING-TE LSP.
S-ERO	Source Explicit Route Object (ERO), or LSP path.
Bandwidth	Bandwidth allocated for the SPRING-TE LSP.
Route preference	Route preference of the SPRING-TE LSP.
Number of LSPs	Statistics of the total number of SPRING-TE LSPs and the LSP state.
External controllers	Name of the LSP external controller. By default the only supported external controller is <b>pccd</b> .

## Sample Output

### show spring-traffic-engineering lsp name

```

user@host> show spring-traffic-engineering lsp name lsp-name
To           State      LSP Name
10.1.1.7     Up          to-R1

```

### show spring-traffic-engineering lsp detail

```

user@host> show spring-traffic-engineering lsp detail
10.1.1.7
  State: Up
  S-ERO: 24.1.1.1(80001) 10.1.1.3(4509) 11.2.1.2(9875)
  Bandwidth: 100M
  The above line is in IP address(label) format.

```

### show spring-traffic-engineering overview

```

user@host> show spring-traffic-engineering overview
Overview of SPRING-TE:
  Route preference: 8
  Number of LSPs: 0 (Up: 0, Down: 0)
  External controllers:
    pccd

```
