Purpose Confirm that the appropriate ingress, transit, and egress routers are functioning by examining whether the packets have been received and transmitted with 0% packet loss.

Action To determine that the routers are connected, enter the following command from the ingress and transit routers:

```
user@host> ping host
```

Sample Output

```
user@R1> ping 10.0.0.3 count 3
PING 10.0.0.3 (10.0.0.3): 56 data bytes
64 bytes from 10.0.0.3: icmp_seq=0 ttl=254 time=0.859 ms
64 bytes from 10.0.0.3: icmp_seq=1 ttl=254 time=0.746 ms
64 bytes from 10.0.0.3: icmp_seq=2 ttl=254 time=0.776 ms

--- 10.0.0.3 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.746/0.794/0.859/0.048 ms

user@R3> ping 10.0.0.6 count 3
PING 10.0.0.6 (10.0.0.6): 56 data bytes
64 bytes from 10.0.0.6: icmp_seq=0 ttl=255 time=0.968 ms
64 bytes from 10.0.0.6: icmp_seq=1 ttl=255 time=3.221 ms
64 bytes from 10.0.0.6: icmp_seq=2 ttl=255 time=0.749 ms

--- 10.0.0.6 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.749/1.646/3.221/1.117 ms
```

Meaning The sample output shows that ingress router **R1** is receiving packets from transit router **R3**, and that the transit router is receiving packets from the egress router. Therefore, the routers in the LSP are connected.

Verify Interfaces

Purpose Confirm that the interfaces are configured correctly with the **family mpls** statement.

Action To determine that the relevant interfaces are up and configured correctly, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show interfaces terse
```

```
user@host> show configuration interfaces type-fpc/pic/port
```

Sample Output

```
user@R1> show interfaces so* terse
Interface           Admin Link Proto Local           Remote
so-0/0/0            up   up   inet  10.1.12.1/30
so-0/0/0.0          up   up   iso
                    mp1s
so-0/0/1            up   up   inet  10.1.15.1/30
so-0/0/1.0          up   up   iso
                    mp1s
so-0/0/2            up   up   inet  10.1.13.1/30
so-0/0/2.0          up   up   iso  <<< family mp1s is missing
so-0/0/3            up   down

user@R1> show configuration interfaces so-0/0/2
unit 0 {
    family inet {
        address 10.1.13.1/30;
    }
    family iso; <<< family mp1s is missing
}
```

Meaning The sample output shows that interface **so-0/0/2.0** on the ingress router does not have the **family mp1s** statement configured at the **[edit interfaces *type-fpc/pic/port*]** hierarchy level, indicating that the interface is incorrectly configured to support the LSP. The LSP is configured correctly at the **[edit protocols mp1s]** hierarchy level.

The output from the transit and egress routers (not shown) shows that the interfaces on those routers are configured correctly.

Take Appropriate Action

Problem **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the **family mp1s** statement, which was missing, is included in the configuration of ingress router **R1**.

Solution To correct the error in this example, enter the following commands:

```
[edit interfaces type-fpc/pic/port]
user@R1# set family mp1s
user@R1# show
user@R1# commit
```

Sample Output

```
[edit interfaces so-0/0/2 unit 0]
user@R1# set family mpls

[edit interfaces so-0/0/2 unit 0]
user@R1# show
family inet {
    address 10.1.13.1/30;
}
family iso;
family mpls;

[edit interfaces so-0/0/2 unit 0]
user@R1# commit
commit complete
```

Meaning The sample output from ingress router **R1** shows that the **family mpls** statement is configured correctly for interface **so-0/0/2.0**, and that the LSP is now functioning as originally configured.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the physical layer has been resolved.

Action To verify that the LSP is up and traversing the network as expected, enter the following command:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

label-switched-path R1-to-R6 {
    to 10.0.0.6;
}
interface fxp0.0 {
    disable;
}
inactive: interface so-0/0/0.0;
inactive: interface so-0/0/1.0;
interface so-0/0/2.0;

```

Meaning Sample Output 1 from ingress router **R1** shows that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Sample Output 2 from ingress router **R1** shows that the LSP is forced to take the intended path because MPLS is deactivated on **R1** interfaces **so-0/0/0.0** and **so-0/0/1.0**. If these interfaces were not deactivated, even though the configuration is now correct, the LSP would still traverse the network through the alternate path.

Checklist for Checking the Data Link Layer

Problem **Description:** This checklist provides the steps and commands for investigating a problem at the data link layer of the Multiprotocol Label Switching (MPLS) network. The checklist provides links to an overview of the data link layer and more detailed information about the commands used to investigate the problem.

Solution Table 34 on page 1026 provides commands for checking the data link layer.

Table 34: Checklist for Checking the Data Link Layer

Tasks	Command or Action
“Checking the Data Link Layer” on page 1026	
1. Verify the LSP on page 1028	<code>show mpls lsp extensive</code>
2. Verify Interfaces on page 1029	<code>show interfaces type-fpc/pic/port extensive</code> <code>show interfaces type-fpc/pic/port</code>
3. Take Appropriate Action on page 1032	The following sequence of commands addresses the specific problem described in this topic: <code>[edit interfaces type-fpc/pic/port]</code> <code>show</code> <code>delete encapsulation</code> <code>show</code> <code>commit</code>
4. Verify the LSP Again on page 1033	<code>show mpls lsp extensive</code>

Checking the Data Link Layer

Purpose After you have configured the label-switched path (LSP), issued the `show mpls lsp extensive` command, and determined that there is an error, you might find that the error is not in the physical layer. Continue investigating the problem at the data link layer of the network.

Figure 86 on page 1027 illustrates the data link layer of the layered MPLS model.

Figure 86: Checking the Data Link Layer

Data Link Layer	show interfaces extensive "JUNOS Interfaces Operations Guide"
Physical Layer	show interfaces show interfaces terse ping <i>host</i>

g015544

With this layer, you must check the encapsulation mode, for example, Point-to-Point Protocol (PPP) or Cisco High-Level Data Link Control (HDLC); PPP options, for example, header encapsulation; frame check sequence (FCS) size; and whether keepalive frames are enabled or disabled. Also, check the ingress, egress, and transit routers.

Figure 87 on page 1027 illustrates the MPLS network used in this topic.

Figure 87: MPLS Network Broken at the Data Link Layer

g015535

The network shown in [Figure 87 on page 1027](#) is a fully meshed configuration where every directly connected interface can receive and send packets to every other similar interface. The LSP in this network is configured to run from ingress router **R1**, through transit router **R3**, to egress router **R6**. In addition, a reverse LSP is configured to run from **R6** through **R3** to **R1**, creating bidirectional traffic.

However, in this example, the LSP is down without a path in either direction, from **R1** to **R6** or from **R6** to **R1**.

When you verify that the data link layer is not functioning correctly, you might find a mismatch with PPP or Cisco HDLC encapsulation, PPP options, or keepalive frames.

The cross shown in [Figure 87 on page 1027](#) indicates where the LSP is broken because of a configuration error on ingress router **R1** that prevents the LSP from traversing the network as expected.

To check the data link layer, follow these steps:

1. [Verify the LSP on page 1028](#)
2. [Verify Interfaces on page 1029](#)
3. [Take Appropriate Action on page 1032](#)
4. [Verify the LSP Again on page 1033](#)

Verify the LSP

Purpose Typically, you use the `show mpls lsp extensive` command to verify the LSP. However for quick verification of the LSP state, use the `show mpls lsp` command. If the LSP is down, use the `extensive` option (`show mpls lsp extensive`) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the `name` option (`show mpls lsp name name` or `show mpls lsp name name extensive`).

Action To determine whether the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From:10.0.0.1 , State: Dn, ActiveRoute: 0, LSPname: R1-to-R6

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

Meaning The sample output from ingress router **R1** shows the LSPs within which it participates. The ingress LSP is down, without a path from **R1** to **R6**. Because a reverse LSP is configured in the network shown in [Figure 87 on page 1027](#), we would expect an egress LSP session to be up. However, **R1** does not have any egress LSPs, indicating that the LSP from **R6** to **R1** is not functioning.

Verify Interfaces

Purpose From your network topology, determine the adjacent interfaces through which the LSP is meant to traverse, and examine the output for the encapsulation type, PPP options, FCS size, and whether keepalive frames are enabled or disabled

NOTE: Before you proceed with this step, check the physical layer to ensure that the problem is not in the physical layer.

Action To verify the functioning of adjacent interfaces, enter the following commands from the relevant routers:

```

user@host> show interfaces type-fpc/pic/port extensive
user@host> show interfaces type-fpc/pic/port

```

Sample Output 1

```

user@R6> show interfaces so-0/0/3 extensive

user@R3> show interfaces so-0/0/3
Physical interface: so-0/0/3, Enabled, Physical link is Up
  Interface index: 131, SNMP ifIndex: 24
    Link-level type: PPP , MTU: 4474, Clocking: Internal, SONET mode, Speed: OC3,
Loopback: None, FCS: 16 ,
Payload scrambler: Enabled
Device flags   : Present Running
Interface flags: Point-To-Point SNMP-Traps
Link flags    : Keepalives
Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
Keepalive: Input: 736827 (00:00:03 ago), Output: 736972 (00:00:05 ago)
LCP state: Opened
NCP state: inet: Opened, inet6: Not-configured, iso: Opened, mpls: Opened
CHAP state: Not-configured
CoS queues      : 4 supported
Last flapped    : 2004-07-21 16:08:01 PDT (10w5d 19:57 ago)
Input rate      : 40 bps (0 pps)
Output rate     : 48 bps (0 pps)
SONET alarms    : None
SONET defects   : None

Logical interface so-0/0/3.0 (Index 70) (SNMP ifIndex 51)
Flags: Point-To-Point SNMP-Traps Encapsulation: PPP
Protocol inet, MTU: 4470
  Flags: None
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 10.1.36.0/30, Local: 10.1.36.1, Broadcast: 10.1.36.3
Protocol iso, MTU: 4470
  Flags: None
Protocol mpls, MTU: 4458
  Flags: None
```

Meaning Sample Output 1 from egress router **R6** shows that there are no SONET alarms or defects (**none**), the states are all **OK**, and the path trace shows the distant end (**R3 so-0.0.0**), indicating that the physical link is up. However, the logical link is down, and the link-level type is Cisco HDLC.

Sample Output 2 from transit router **R3** shows that the link-level type is PPP, indicating that the encapsulation types are mismatched, resulting in the LSP going down.

Take Appropriate Action

Problem **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the encapsulation types are mismatched.

Solution To correct the error in this example, enter the following commands:

```
[edit interfaces so-0/0/3]
user@R1# show
user@R1# delete encapsulation
user@R1# show
user@R1# commit
```

Sample Output

```
[edit interfaces so-0/0/3]
user@R6# show
encapsulation cisco-hdlc;
unit 0 {
    family inet {
        address 10.1.36.2/30;
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/3]
user@R6# delete encapsulation

[edit interfaces so-0/0/3]
user@R6# show
unit 0 {
    family inet {
        address 10.1.36.2/30;
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/3]
user@R6# commit
commit complete
```

Meaning The sample output from egress router **R6** shows that the Cisco HDLC was incorrectly configured on interface **so-0/0/3** which prevented the LSP from using the intended path. The problem was corrected when the **encapsulation** statement was deleted and the configuration committed.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the data link layer has been resolved.

Action From the ingress, egress, and transit routers, verify that the LSP is up and traversing the network as expected:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions
```

10.0.0.6

```

Meaning Sample Outputs 1 and 2 from ingress router **R1** and egress router **R6**, respectively, show that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Sample Output 3 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**.

Sample Output 4 shows the interfaces that were deactivated on the ingress, egress, and transit routers, forcing the LSP to take the intended path. If these interfaces were not deactivated, even though the configuration is now correct, the LSP would still traverse the network through the alternate path.

Verify the LSP

Purpose Typically, you use the **show mpls lsp extensive** command to verify the LSP. However for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down, use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

Action To determine whether the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning The sample output from ingress router **R1** shows the LSPs within which it participates. The ingress LSP is down, without a path from **R1** to **R6**. Because a reverse LSP is configured in the network shown in [Figure 87 on page 1027](#), we would expect an egress LSP session

to be up. However, **R1** does not have any egress LSPs, indicating that the LSP from **R6** to **R1** is not functioning.

Verify Interfaces

Purpose From your network topology, determine the adjacent interfaces through which the LSP is meant to traverse, and examine the output for the encapsulation type, PPP options, FCS size, and whether keepalive frames are enabled or disabled

NOTE: Before you proceed with this step, check the physical layer to ensure that the problem is not in the physical layer.

Action To verify the functioning of adjacent interfaces, enter the following commands from the relevant routers:

```
user@host> show interfaces type-fpc/pic/port extensive
user@host> show interfaces type-fpc/pic/port
```

Sample Output 1

```
user@R6> show interfaces so-0/0/3 extensive

SONET defects : None
```

```
Logical interface so-0/0/3.0 (Index 70) (SNMP ifIndex 51)
Flags: Point-To-Point SNMP-Traps  Encapsulation: PPP
Protocol inet, MTU: 4470
  Flags: None
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 10.1.36.0/30, Local: 10.1.36.1, Broadcast: 10.1.36.3
Protocol iso, MTU: 4470
  Flags: None
Protocol mpls, MTU: 4458
  Flags: None
```

Meaning Sample Output 1 from egress router **R6** shows that there are no SONET alarms or defects (**none**), the states are all **OK**, and the path trace shows the distant end (**R3 so-0.0.0**), indicating that the physical link is up. However, the logical link is down, and the link-level type is Cisco HDLC.

Sample Output 2 from transit router **R3** shows that the link-level type is PPP, indicating that the encapsulation types are mismatched, resulting in the LSP going down.

Take Appropriate Action

Problem **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the encapsulation types are mismatched.

Solution To correct the error in this example, enter the following commands:

```
[edit interfaces so-0/0/3]
user@R1# show
user@R1# delete encapsulation
user@R1# show
user@R1# commit
```

Sample Output

```
[edit interfaces so-0/0/3]
user@R6# show
encapsulation cisco-hdlc;
unit 0 {
    family inet {
        address 10.1.36.2/30;
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/3]
user@R6# delete encapsulation

[edit interfaces so-0/0/3]
user@R6# show
unit 0 {
    family inet {
        address 10.1.36.2/30;
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/3]
user@R6# commit
commit complete
```

Meaning The sample output from egress router **R6** shows that the Cisco HDLC was incorrectly configured on interface **so-0/0/3** which prevented the LSP from using the intended path. The problem was corrected when the **encapsulation** statement was deleted and the configuration committed.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the data link layer has been resolved.

Action From the ingress, egress, and transit routers, verify that the LSP is up and traversing the network as expected:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

interface so-0/0/3.0;

```

Meaning Sample Outputs 1 and 2 from ingress router **R1** and egress router **R6**, respectively, show that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Sample Output 3 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**.

Sample Output 4 shows the interfaces that were deactivated on the ingress, egress, and transit routers, forcing the LSP to take the intended path. If these interfaces were not deactivated, even though the configuration is now correct, the LSP would still traverse the network through the alternate path.

Checklist for Verifying the IP and IGP Layers

Problem **Description:** This checklist provides the steps and commands for investigating a problem at the Internet Protocol (IP) and interior gateway protocol (IGP) layers of the layered Multiprotocol Label Switching (MPLS) model. The checklist provides links to an overview of the IP and IGP layers and more detailed information about the commands used to investigate the problem.

Solution Table 35 on page 1046 provides commands for verifying the IP and IGP layers.

Table 35: Checklist for Verifying the IP and IGP Layers

Tasks	Command or Action
“Verifying the IP and IGP Layers” on page 1047

Verifying the IP and IGP Layers

Problem **Description:** After you have configured the label-switched path (LSP), issued the `show mpls lsp extensive` command, and determined that there is an error, you might find that the error is not in the physical or data link layers. Continue investigating the problem at the IP and IGP layers of the network.

Figure 88 on page 1048 illustrates the IP and IGP layers of the layered MPLS model.

Figure 88: IP and IGP Layers

BGP Layer	tracertoute <i>host-name</i> show bgp summary show configuration protocols bgp show route <i>destination-prefix</i> detail show route receive protocol bgp <i>neighbor-address</i>
MPLS Layer	show mpls lsp show mpls lsp extensive show route table mpls.0 show route <i>address</i> tracertoute <i>address</i> ping mpls rsvp <i>lsp-name</i> detail
RSVP Layer	show rsvp session show rsvp neighbor show rsvp interface

IP Layer show ospf neighbor extensive show interfaces terse	IP Layer show isis adjacency extensive show interfaces terse
Data Link Layer	show interfaces extensive "JUNOS Interfaces Operations Guide"
Physical Layer	show interfaces show interfaces terse ping <i>host</i>

g015545

Solution At the IP and IGP layers, you must check the following:

- Interfaces have correct IP addressing, and the IGP neighbors or adjacencies are established.
- Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS) protocols are configured and running correctly.
 - If the OSPF protocol is configured, check the IP layer first, then the OSPF configuration, making sure that the protocol, interfaces, and traffic engineering are configured correctly.
 - If the IS-IS protocol is configured, it doesn't matter whether you check IS-IS or IP first because both protocols are independent of each other. Verify that IS-IS adjacencies are up, and that the interfaces and IS-IS protocol are configured correctly.

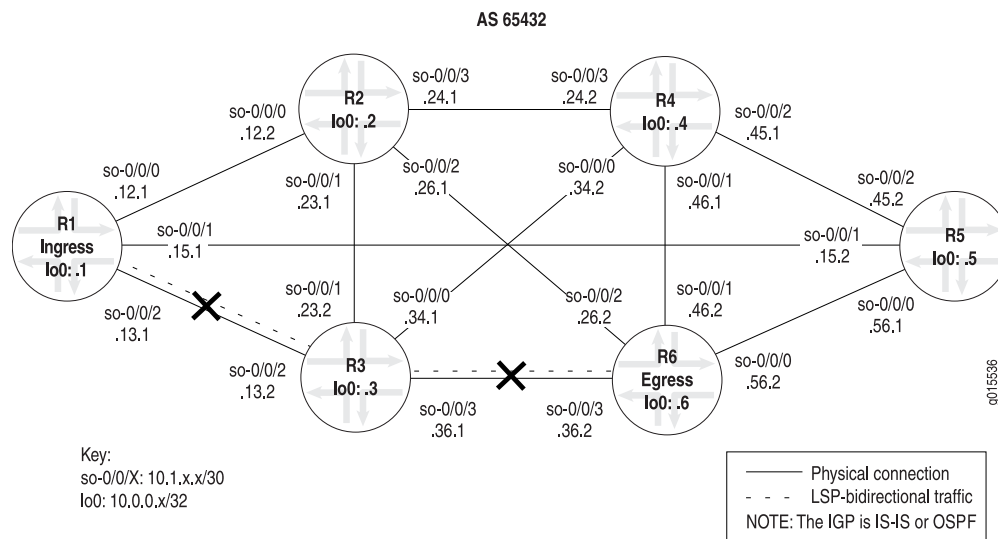

NOTE: The IS-IS protocol has traffic engineering enabled by default.

If the network is not functioning at the IP or IGP layers, the LSP does not work as configured.

Figure 89 on page 1049 illustrates the MPLS network used in this topic.

Figure 89: MPLS Network Broken at the IP and IGP Layers

The network shown in [Figure 89 on page 1049](#) is a fully meshed configuration where every directly connected interface can receive and send packets to every other similar interface. The LSP in this network is configured to run from ingress router **R1**, through transit router **R3**, to egress router **R6**. In addition, a reverse LSP is configured to run from **R6**, through **R3**, to **R1**, creating bidirectional traffic. The crosses in [Figure 89 on page 1049](#) indicate where the LSP is not working because of the following problems at the IP and IGP layer:

- An IP address is configured incorrectly on the ingress router (**R1**).
- The OSPF protocol is configured with a router ID (RID) but without the loopback (**lo0**) interface, and traffic engineering is missing from the transit router (**R3**).
- Levels in the IS-IS network are mismatched.

Related Documentation

To check the IP and IGP layers, follow these steps:

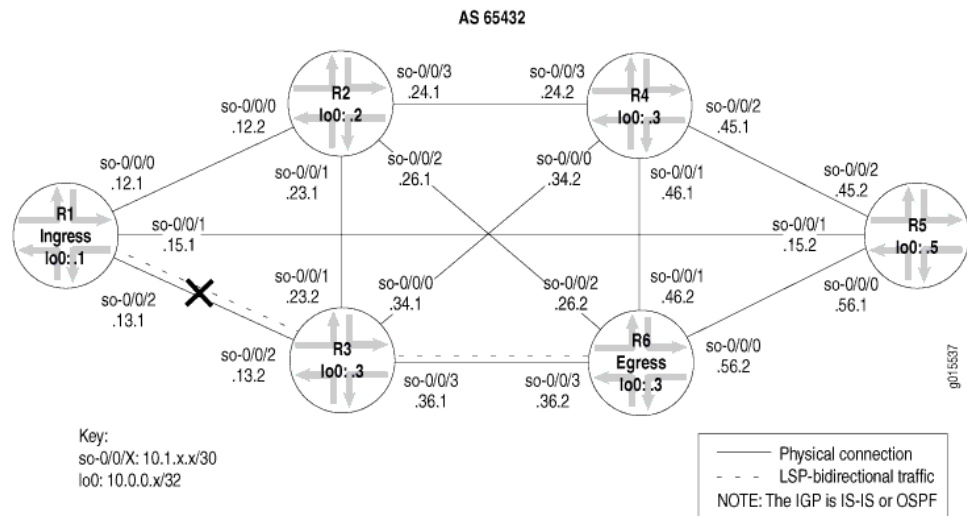

- [Verifying the IP Layer on page 1049](#)
- [Verifying the OSPF Protocol on page 1069](#)
- [Verifying the IS-IS Protocol](#)

Verifying the IP Layer

Purpose You can check the IP layer before or after you check the interior gateway protocol (IGP) layer, depending on whether you have OSPF or IS-IS configured as the IGP. If your MPLS network is configured with OSPF as the IGP, you must first verify the IP layer, checking that the interfaces have correct IP addressing and that the OSPF neighbors are established before you check the OSPF layer.

If you have IS-IS configured as the IGP in your MPLS network, you can verify either the IP layer or the IS-IS protocol layer first. The order in which you check the IP or IS-IS layer does not affect the results.

Figure 90: MPLS Network Broken at the IP Layer

The cross in Figure 90 on page 1050 indicates where the LSP is broken because of the incorrect configuration of an IP address on ingress router R1.

1. [Verify the LSP on page 1050](#)
2. [Verify IP Addressing on page 1051](#)
3. [Verify Neighbors or Adjacencies at the IP Layer on page 1052](#)
4. [Take Appropriate Action on page 1056](#)
5. [Verify the LSP Again on page 1057](#)

Verify the LSP

Purpose After configuring the LSP, you must verify that the LSP is up. LSPs can be ingress, transit, or egress. Use the **show mpls lsp** command for quick verification of the LSP state, with the **extensive** option (**show mpls lsp extensive**) as a follow-up if the LSP is down. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name name** or **show mpls lsp name name extensive**).

Action To verify that the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
```

```

```

Meaning The sample output from ingress router **R1** shows that an MPLS label allocation failure occurred and the Constrained Shortest Path First (CSPF) algorithm failed, resulting in no route to destination **10.0.0.6** on **R6**.

Verify IP Addressing

Purpose When you investigate the IP layer, you verify that interfaces have correct IP addressing, and that OSPF neighbors or IS-IS adjacencies are established. In this example, an IP address is configured incorrectly on the ingress router (**R1**).

Action To verify IP addressing, enter the following command from the ingress, transit, and egress routers:

```
user@host> show interfaces terse
```

Sample Output

```

user@R1> show interfaces terse
Interface      Admin Link Proto Local Remote

                        iso    49.0004.1000.0000.0006.00

```

Meaning The sample output shows that the IP addresses for interface **so-0/0/2.0** on **R1** and interface **so-0/0/2.0** on **R3** are identical. Interface IP addresses within a network must be unique for the interface to be identified correctly.

Verify Neighbors or Adjacencies at the IP Layer

Purpose If the IP addressing is configured incorrectly then the OSPF neighbors or IS-IS adjacencies both need to be checked to determine if one or both of them are established.

Action To verify neighbors (OSPF) or adjacencies (IS-IS), enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf neighbor extensive
user@host> show isis adjacency extensive
```

Sample Output 1

```
user@R1> show ospf neighbor extensive
Address      Interface      State      ID          Pri  Dead

```

Meaning Sample Output 1 from the ingress, transit, and egress routers shows that **R1** and **R3** are not established OSPF neighbors. Considering that the two interfaces **so-0/0/2.0** (**R1** and **R3**) are configured with identical IP addresses, you would expect this. The OSPF protocol routes IP packets based solely on the destination IP address contained in the IP packet header. Therefore, identical IP addresses in the autonomous system (AS) result in neighbors not establishing.

Sample Output 2 from the ingress, transit, and egress routers shows that **R1** and **R3** have established an IS-IS adjacency despite the identical IP addresses configured on interfaces **so-0/0/2.0** on **R1** and **R3**. The IS-IS protocol behaves differently from the OSPF protocol because it does not rely on IP to establish an adjacency. However, if the LSP is not up, it

is still useful to check the IP subnet addressing in case there is a mistake in that layer. Correcting the addressing error might bring the LSP back up.

Take Appropriate Action

Problem **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, the IP address of an interface on transit router **R2** is incorrectly configured.

Solution To correct the error in this example, enter the following commands:

```
[edit interfaces so-0/0/2]
user@R1# show
user@R1# rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30
user@R1# show
user@R1# commit
```

Sample Output

```
[edit interfaces so-0/0/2]
user@R1# show
unit 0 {
    family inet {
        address 10.1.13.2/30;   <<< Incorrect IP address
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/2]
user@R1# rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30

[edit interfaces so-0/0/2]
user@R1# show
unit 0 {
    family inet {
        address 10.1.13.1/30;   <<< Correct IP address.
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/2]
user@R1# commit
commit complete
```

Meaning The sample output shows that interface **so-0/0/2** on ingress router **R1** is now configured with the correct IP address. This correction results in unique subnet IP addresses for all interfaces in the MPLS network in [Figure 89 on page 1049](#), and the possibility that the LSP might come up.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the OSPF protocol has been resolved.

Action To verify the LSP again, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

```

Meaning Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up. The output shows that the egress LSP session **R6-to-R1** received and sent a recovery label.

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Verify the LSP

Purpose After configuring the LSP, you must verify that the LSP is up. LSPs can be ingress, transit, or egress. Use the **show mpls lsp** command for quick verification of the LSP state, with the **extensive** option (**show mpls lsp extensive**) as a follow-up if the LSP is down. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

Action To verify that the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6

Total 0 displayed , Up 0, Down 0

Transit LSP: 0 sessions
Total 0 displayed , Up 0, Down 0
```

Meaning The sample output from ingress router **R1** shows that an MPLS label allocation failure occurred and the Constrained Shortest Path First (CSPF) algorithm failed, resulting in no route to destination **10.0.0.6** on **R6**.

Verify IP Addressing

Purpose When you investigate the IP layer, you verify that interfaces have correct IP addressing, and that OSPF neighbors or IS-IS adjacencies are established. In this example, an IP address is configured incorrectly on the ingress router (**R1**).

Action To verify IP addressing, enter the following command from the ingress, transit, and egress routers:

```
user@host> show interfaces terse
```

Sample Output

```
user@R1> show interfaces terse
Interface          Admin Link Proto Local Remote
so-0/0/0           up    up
```

```

so-0/0/0.0          up    up    inet 10.1.12.1/30

Meaning The sample output shows that the IP addresses for interface **so-0/0/2.0** on **R1** and interface **so-0/0/2.0** on **R3** are identical. Interface IP addresses within a network must be unique for the interface to be identified correctly.

Verify Neighbors or Adjacencies at the IP Layer

Purpose If the IP addressing is configured incorrectly then the OSPF neighbors or IS-IS adjacencies both need to be checked to determine if one or both of them are established.

Action To verify neighbors (OSPF) or adjacencies (IS-IS), enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf neighbor extensive
user@host> show isis adjacency extensive
```

Sample Output 1

```
user@R1> show ospf neighbor extensive
Address          Interface          State      ID              Pri  Dead

Meaning Sample Output 1 from the ingress, transit, and egress routers shows that **R1** and **R3** are not established OSPF neighbors. Considering that the two interfaces **so-0/0/2.0** (**R1** and **R3**) are configured with identical IP addresses, you would expect this. The OSPF protocol routes IP packets based solely on the destination IP address contained in the IP packet header. Therefore, identical IP addresses in the autonomous system (AS) result in neighbors not establishing.

Sample Output 2 from the ingress, transit, and egress routers shows that **R1** and **R3** have established an IS-IS adjacency despite the identical IP addresses configured on interfaces **so-0/0/2.0** on **R1** and **R3**. The IS-IS protocol behaves differently from the OSPF protocol because it does not rely on IP to establish an adjacency. However, if the LSP is not up, it is still useful to check the IP subnet addressing in case there is a mistake in that layer. Correcting the addressing error might bring the LSP back up.

Take Appropriate Action

Problem **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, the IP address of an interface on transit router **R2** is incorrectly configured.

Solution To correct the error in this example, enter the following commands:

```
[edit interfaces so-0/0/2]  
user@R1# show  
user@R1# rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30  
user@R1# show  
user@R1# commit
```

Sample Output

```
[edit interfaces so-0/0/2]
user@R1# show
unit 0 {
    family inet {
        address 10.1.13.2/30; <<< Incorrect IP address
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/2]
user@R1# rename unit 0 family inet address 10.1.13.2/30 to address 10.1.13.1/30

[edit interfaces so-0/0/2]
user@R1# show
unit 0 {
    family inet {
        address 10.1.13.1/30; <<< Correct IP address.
    }
    family iso;
    family mpls;
}

[edit interfaces so-0/0/2]
user@R1# commit
commit complete
```

Meaning The sample output shows that interface **so-0/0/2** on ingress router **R1** is now configured with the correct IP address. This correction results in unique subnet IP addresses for all interfaces in the MPLS network in [Figure 89 on page 1049](#), and the possibility that the LSP might come up.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the OSPF protocol has been resolved.

Action To verify the LSP again, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

```

Meaning Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up. The output shows that the egress LSP session **R6-to-R1** received and sent a recovery label.

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Verifying the OSPF Protocol

Purpose After you have verified that the LSP is down, and the cause is not in the physical, datalink, or IP layer, verify the OSPF configuration. Check the routers in your network to ensure that the interfaces and the OSPF protocol are configured correctly, and that the neighbors are established.

Figure 91: MPLS Network Broken at the OSPF Protocol Layer

1. [Verify the LSP on page 1070](#)
2. [Verify OSPF Interfaces on page 1073](#)

3. [Verify OSPF Neighbors on page 1074](#)
4. [Verify the OSPF Protocol Configuration on page 1075](#)
5. [Take Appropriate Action on page 1076](#)
6. [Verify the LSP Again on page 1077](#)

Verify the LSP

Purpose Confirm that interfaces are configured for OSPF, the OSPF protocol is configured correctly and that neighbors are established.

Action To verify the LSP, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

Meaning Sample Outputs 1, 2, and 3 show that the LSP and the reverse LSP are down:

- Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** does not have a route towards the destination (**R6**).
- Sample Output 2 from transit router **R3** shows that there are no LSP sessions.
- Sample Output 3 from egress router **R6** also shows that reverse LSP **R6-to-R1** is down.

Sample Outputs 4, 5, and 6 show that the LSP is up and the reverse LSP is down:

- Sample Output 4 from ingress router **R1** shows that LSP **R1-to-R6** is up and there are no egress LSP sessions.
- Sample Output 5 from transit router **R3** shows that there is one ingress LSP session (**R1-to-R6**) and no egress LSP sessions.

- Sample Output 6 from egress router **R6** shows that LSP **R6-to-R1** is down due to an MPLS label allocation failure.

Verify OSPF Interfaces

Purpose After you have verified that the LSP is down, and the cause is not in the physical, data link, or IP layer, check the routers in your network to determine that all relevant OSPF interfaces are configured correctly.

Action To verify OSPF interfaces, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf interface
```

Sample Output 1

```
user@R1> show ospf interface
Interface      State      Area      DR ID      BDR ID      Nbrs

```

so-0/0/0.0	PtToPt	0.0.0.0	0.0.0.0	0.0.0.0	1
so-0/0/1.0	Down	0.0.0.0	0.0.0.0	0.0.0.0	0
so-0/0/2.0	PtToPt	0.0.0.0	0.0.0.0	0.0.0.0	1
so-0/0/3.0	PtToPt	0.0.0.0	0.0.0.0	0.0.0.0	1

Meaning Sample Output 1 shows that all interfaces on all routers are in the correct area (**0.0.0.0**), and the loopback (**lo0**) interface is missing from the list of interfaces on all routers. The missing loopback (**lo0**) interface is a problem in this configuration.

In an MPLS network configured with OSPF as the IGP, when you manually configure the RID, it is important to explicitly configure the loopback interface at the **[edit protocols ospf]** hierarchy level. If the RID is not manually configured, OSPF automatically advertises the loopback (**lo0**) interface. In the configuration of all the routers in this network, the RID is configured manually, therefore, the loopback (**lo0**) interface must be explicitly configured at the **[edit protocols ospf]** hierarchy level. In addition, the loopback (**lo0**) interface is configured with the **passive** statement to ensure that the protocols are not run over the loopback (**lo0**) interface and it is correctly advertised throughout the network.

Sample Output 2 shows that all the relevant interfaces on the ingress, transit, and egress routers, including the loopback (**lo0**) interface, are in the correct area (**0.0.0.0**). Because the configuration of the interfaces is correct, further investigation is required to determine the reason for the LSP problem.

Verify OSPF Neighbors

Purpose After you have checked OSPF interfaces, check your network topology to determine that all relevant neighbors are established.

Action To verify OSPF neighbors, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf neighbor
```

Sample Output

```
user@R1> show ospf neighbor
  Address      Interface      State      ID              Pri  Dead
10.1.12.2     so-0/0/0.0    Full      10.0.0.2       128  39
10.1.15.2     so-0/0/1.0    Full      10.0.0.5       128  39
10.1.13.2     so-0/0/2.0    Full      10.0.0.3       128  33

user@R3> show ospf neighbor
  Address      Interface      State      ID              Pri  Dead
10.1.34.2     so-0/0/0.0    Full      10.0.0.4       128  33
10.1.23.1     so-0/0/1.0    Full      10.0.0.2       128  33
10.1.13.1     so-0/0/2.0    Full      10.0.0.1       128  33
10.1.36.2     so-0/0/3.0    Full      10.0.0.6       128  33

user@R6> show ospf neighbor
  Address      Interface      State      ID              Pri  Dead
10.1.56.1     so-0/0/0.0    Full      10.0.0.5       128  30
10.1.46.1     so-0/0/1.0    Full      10.0.0.4       128  38
```

10.1.26.1	so-0/0/2.0	Full	10.0.0.2	128	34
10.1.36.1	so-0/0/3.0	Full	10.0.0.3	128	35

Meaning The sample output shows that all neighbors are fully adjacent, indicating that each router has exchanged a full copy of its link-state database with the other routers, passed through several neighbor states, and become fully adjacent. These adjacencies are created by router link and network link advertisements.

Verify the OSPF Protocol Configuration

Purpose After you have checked interfaces and neighbors, verify the OSPF protocol configuration.

Action To verify the OSPF protocol configuration, enter the following command from the ingress, transit, and egress routers:

```
user@host> show configuration protocols ospf
```

Sample Output 1

```
user@R1> show configuration protocols ospf
traffic-engineering;
area 0.0.0.0 {
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;    <<< The loopback interface (lo0) is missing
}
```

Sample Output 2

```
user@R3> show configuration protocols ospf
area 0.0.0.0 { <<< traffic engineering is missing
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;
    interface so-0/0/3.0;    <<< The loopback interface (lo0) is missing
}
```

Sample Output 3

```
user@R6> show configuration protocols ospf
traffic-engineering;
area 0.0.0.0 {
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;
    interface so-0/0/3.0;    <<< The loopback interface (lo0) is missing
}
```

Meaning All three sample outputs show that the loopback interface is not included on any of the routers. Including the loopback (**lo0**) interface is important when you have the RID manually configured.

In addition, Sample Output 2 from transit router **R3** shows that traffic engineering is not configured. Traffic engineering must be manually enabled when you configure OSPF for an MPLS network.

Because the loopback interface and traffic engineering are missing from the OSPF protocol configuration, the LSP does not work as expected.

Take Appropriate Action

Problem **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, the loopback (**lo0**) interface is missing from all routers, and traffic engineering is missing from the transit router (**R3**).

Solution To correct the errors in this example, follow these steps:

1. Include the loopback (**lo0**) interface on all routers that have the RID manually configured. Enter the following configuration mode commands:

```
[edit]
user@R3# edit protocols ospf area 0.0.0.0
[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0
user@R3# set interface lo0 passive
```

2. Move up one level of the configuration hierarchy:

```
[edit protocols ospf area 0.0.0.0]
user@R3# up
[edit protocols ospf]
user @R3#
```

3. Include traffic engineering on the transit router (**R3**). Enter the following configuration mode command:

```
[edit protocols ospf]
user@R3# set traffic-engineering
```

4. On all routers, verify and commit the configuration:

```
user@R3# show
user@R3# commit
```

Sample Output

```

user@R3> edit
Entering configuration mode

[edit]
user@R3# edit protocols ospf area 0.0.0.0

[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0

[edit protocols ospf area 0.0.0.0]
user@R3# set interface lo0 passive

[edit protocols ospf area 0.0.0.0]
user@R3# up

[edit protocols ospf]
user@R3# set traffic-engineering

[edit protocols ospf]
user@R3# show
traffic-engineering;
area 0.0.0.0 {
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;
    interface lo0.0; {
        passive
    }
}

[edit protocols ospf]
user@R3# commit
commit complete

```

Meaning The sample output shows that the loopback (**lo0**) interface and traffic engineering are now correctly configured on transit router **R3**. When traffic engineering is configured, OSPF advertises the traffic engineering capabilities of the links.

In the OSPF configuration, you must manually include the loopback (**lo0**) interface and set it to passive when you manually configure an RID. Setting the loopback (**lo0**) interface to passive ensures that protocols are not run over the loopback (**lo0**) interface and the loopback (**lo0**) interface is advertised correctly throughout the network.. If you do not manually configure an RID, there is no need to explicitly include the loopback interface because the OSPF protocol automatically includes the loopback (**lo0**) interface.

For more information about configuring LSPs and MPLS, see the *Junos MPLS Applications Configuration Guide*.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the IS-IS protocol has been resolved.

Action To verify that the LSP is up and traversing the network as expected, enter the following command from the ingress, egress, and transit routers:

```
user@host> show mpls lsp extensive
```

Sample Output

```
user@R1> show mpls lsp extensive

```

Meaning The sample output from ingress router **R1** and egress router **R6** shows that the LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**. In addition, the sample output from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6**, and the other from **R6** to **R1**.

Verify the LSP

Purpose Confirm that interfaces are configured for OSPF, the OSPF protocol is configured correctly and that neighbors are established.

Action To verify the LSP, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

```

Meaning Sample Outputs 1, 2, and 3 show that the LSP and the reverse LSP are down:

- Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** does not have a route towards the destination (**R6**).

- Sample Output 2 from transit router **R3** shows that there are no LSP sessions.
- Sample Output 3 from egress router **R6** also shows that reverse LSP **R6-to-R1** is down.

Sample Outputs 4, 5, and 6 show that the LSP is up and the reverse LSP is down:

- Sample Output 4 from ingress router **R1** shows that LSP **R1-to-R6** is up and there are no egress LSP sessions.
- Sample Output 5 from transit router **R3** shows that there is one ingress LSP session (**R1-to-R6**) and no egress LSP sessions.
- Sample Output 6 from egress router **R6** shows that LSP **R6-to-R1** is down due to an MPLS label allocation failure.

Verify OSPF Interfaces

Purpose After you have verified that the LSP is down, and the cause is not in the physical, data link, or IP layer, check the routers in your network to determine that all relevant OSPF interfaces are configured correctly.

Action To verify OSPF interfaces, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf interface
```

Sample Output 1

```
user@R1> show ospf interface
Interface      State      Area      DR ID      BDR ID      Nbrs
so-0/0/0.0     PtToPt    0.0.0.0   0.0.0.0    0.0.0.0     1
so-0/0/1.0     PtToPt    0.0.0.0   0.0.0.0    0.0.0.0     1

```

Interface	State	Area	DR ID	BDR ID	Nbrs
lo0.0	DR	0.0.0.0	10.0.0.6	0.0.0.0	0
so-0/0/0.0	PtToPt	0.0.0.0	0.0.0.0	0.0.0.0	1
so-0/0/1.0	Down	0.0.0.0	0.0.0.0	0.0.0.0	0
so-0/0/2.0	PtToPt	0.0.0.0	0.0.0.0	0.0.0.0	1
so-0/0/3.0	PtToPt	0.0.0.0	0.0.0.0	0.0.0.0	1

Meaning Sample Output 1 shows that all interfaces on all routers are in the correct area (0.0.0.0), and the loopback (lo0) interface is missing from the list of interfaces on all routers. The missing loopback (lo0) interface is a problem in this configuration.

In an MPLS network configured with OSPF as the IGP, when you manually configure the RID, it is important to explicitly configure the loopback interface at the [edit protocols ospf] hierarchy level. If the RID is not manually configured, OSPF automatically advertises the loopback (lo0) interface. In the configuration of all the routers in this network, the RID is configured manually, therefore, the loopback (lo0) interface must be explicitly configured at the [edit protocols ospf] hierarchy level. In addition, the loopback (lo0) interface is configured with the **passive** statement to ensure that the protocols are not run over the loopback (lo0) interface and it is correctly advertised throughout the network.

Sample Output 2 shows that all the relevant interfaces on the ingress, transit, and egress routers, including the loopback (lo0) interface, are in the correct area (0.0.0.0). Because the configuration of the interfaces is correct, further investigation is required to determine the reason for the LSP problem.

Verify OSPF Neighbors

Purpose After you have checked OSPF interfaces, check your network topology to determine that all relevant neighbors are established.

Action To verify OSPF neighbors, enter the following commands from the ingress, transit, and egress routers:

```
user@host> show ospf neighbor
```

Sample Output

```
user@R1> show ospf neighbor
```

Address	Interface	State	ID	Pri	Dead
10.1.12.2	so-0/0/0.0	Full	10.0.0.2	128	39
10.1.15.2	so-0/0/1.0	Full	10.0.0.5	128	39

```
10.1.13.2          so-0/0/2.0          Full    10.0.0.3          128    33
```

```
user@R3> show ospf neighbor
```

Address	Interface	State	ID	Pri	Dead
10.1.34.2	so-0/0/0.0	Full	10.0.0.4	128	33
10.1.23.1	so-0/0/1.0	Full	10.0.0.2	128	33
10.1.13.1	so-0/0/2.0	Full	10.0.0.1	128	33
10.1.36.2	so-0/0/3.0	Full	10.0.0.6	128	33

```
user@R6> show ospf neighbor
```

Address	Interface	State	ID	Pri	Dead
10.1.56.1	so-0/0/0.0	Full	10.0.0.5	128	30
10.1.46.1	so-0/0/1.0	Full	10.0.0.4	128	38
10.1.26.1	so-0/0/2.0	Full	10.0.0.2	128	34
10.1.36.1	so-0/0/3.0	Full	10.0.0.3	128	35

Meaning The sample output shows that all neighbors are fully adjacent, indicating that each router has exchanged a full copy of its link-state database with the other routers, passed through several neighbor states, and become fully adjacent. These adjacencies are created by router link and network link advertisements.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the IS-IS protocol has been resolved.

Action To verify that the LSP is up and traversing the network as expected, enter the following command from the ingress, egress, and transit routers:

```
user@host> show mpls lsp extensive
```

Sample Output

```
user@R1> show mpls lsp extensive

In addition, the sample output from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6**, and the other from **R6** to **R1**.

Verify the LSP

- Purpose** Confirm that interfaces are configured for IS-IS, that the IS-IS protocol is configured correctly, and that adjacencies are established.
- Action** To verify the label-switched path (LSP), enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn,  ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Meaning The sample output shows that LSP **R1-to-R6** and the reverse LSP **R6-to-R1** are down, and there are no LSP sessions on transit router R3.

Verify IS-IS Adjacencies and Interfaces

Purpose When you check the IS-IS layer, you verify that IS-IS adjacencies are up and that the IS-IS interfaces are included at the protocol level.

Action To verify the functioning of adjacent interfaces, enter the following commands from the relevant routers:

```
user@host> show isis adjacency
user@host> show isis interface
```

Sample Output 1

```
user@R1> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R2          2 Up         20
so-0/0/1.0     R5          2 Up         23
so-0/0/2.0     R3          2 Up         26
```

```
user@R3> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R4          2 Up         23
so-0/0/1.0     R2          2 Up         21
so-0/0/2.0     R1          2 Up         19
so-0/0/3.0     R6          2 Down       0
```

```
user@R6> show isis adjacency
IS-IS instance is not running
```

Sample Output 2

```
user@R1> show isis interface
IS-IS interface database:
Interface      L CirID Level 1 DR      Level 2 DR      L1/L2 Metric
lo0.0          0 0x1 Passive           Passive          0/0
so-0/0/0.0     2 0x1 Disabled         Point to Point   10/10
so-0/0/1.0     2 0x1 Disabled         Point to Point   10/10
so-0/0/2.0     2 0x1 Disabled         Point to Point   10/10
```

```
user@R3> show isis interface
IS-IS interface database:
Interface      L CirID Level 1 DR      Level 2 DR      L1/L2 Metric
lo0.0          0 0x1 Passive           Passive          0/0
```

```

so-0/0/0.0      2  0x1 Disabled      Point to Point      10/10
so-0/0/1.0      2  0x1 Disabled      Point to Point      10/10
so-0/0/2.0      2  0x1 Disabled      Point to Point      10/10
so-0/0/3.0      2  0x1 Disabled      Point to Point      10/10

```

```
user@R6> show isis interface
```

```
IS-IS interface database:
```

Interface	L	CirID	Level 1 DR	Level 2 DR	L1/L2 Metric
lo0.0	0	0x1	Passive	Passive	0/0
so-0/0/0.0	1	0x1	Point to Point	Disabled	10/10
so-0/0/1.0	1	0x1	Down	Disabled	10/10
so-0/0/2.0	1	0x1	Point to Point	Disabled	10/10
so-0/0/3.0	1	0x1	Point to Point	Disabled	10/10

Meaning Sample Output 1 shows that ingress router R1 has established adjacencies with the relevant routers. Transit router R3 does not have an adjacency with egress router R6, and egress router R6 has no adjacencies established in the network shown in [Figure 89 on page 1049](#), indicating that the problem might be at the IS-IS protocol level.

Sample Output 2 shows that R1 and R2 are Level 2 routers, in contrast to R6 which is a Level 1 router. When a router is configured explicitly as a Level 1 or Level 2 router, it does not communicate with routers configured at a different level. Level 1 routers communicate with other Level 1 routers within their area, while Level 2 routers communicate with other Level 2 routers, and toward other autonomous systems. Because all the routers in this network are configured for Level 2, they cannot form an adjacency with R6, which is incorrectly configured as a Level 1 router.

- Related Documentation**

Verify the IS-IS Configuration

Purpose When you have determined that the problem is probably at the IS-IS protocol level, check the IS-IS configuration of the routers in your network.

Action To verify the IS-IS configuration, enter the following command from the relevant routers:

```
user@host> show configuration protocols isis
```

Sample Output

```

user@R1> show configuration protocols isis
level 1 disable;
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface lo0.0; {
    passive

```

```

user@R3> show configuration protocols isis
level 1 disable;

```

```

interface all {
    level 2 metric 10;
}
interface fxp0.0 {
    disable;
}
interface lo0.0; {
    passive

user@R6> show configuration protocols isis
level 2 disable; <<< Incorrect level disabled
interface all {
    level 2 metric 10;
}
interface fxp0.0 {
    disable;
}
interface lo0.0; {
    passive

```

Meaning The sample output shows that R6 has Level 2 disabled, while R1 and R3 have Level 1 disabled. For IS-IS adjacencies to establish, routers need to be at the same level. Another common configuration error is to omit the loopback interface (lo0) from the configuration at the **[edit protocols isis]** hierarchy level. IS-IS does not function correctly if the loopback interface (lo0) is not configured at this level. In addition, including the **passive** statement ensures that protocols are not run over the loopback interface (lo0) and that the loopback interface (lo0) is advertised correctly throughout the network.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the label-switched path (LSP) needs to be checked again to confirm that the problem in the RSVP layer has been resolved.

Action To verify that the LSP is up and traversing the network as expected, enter the following command from the ingress, egress, and transit routers:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```

user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

Total 0 displayed, Up 0, Down 0

```

Meaning Sample Outputs 1 and 3 from ingress router R1 and egress router R6 show that the LSP is now traversing the network along the expected path, from R1 through R3 to R6, and the reverse LSP, from R6 through R3 to R1. In addition, Sample Output 2 from transit router R3 shows that there are two transit LSP sessions, one from R1 to R6, and the other from R6 to R1.

Checklist for Checking the RSVP Layer

Problem **Description:** This checklist provides the steps and commands for checking the Resource Reservation Protocol (RSVP) layer of the layered Multiprotocol Label Switching (MPLS) model. The checklist provides links to an overview of the RSVP layer and more detailed information about the commands used to investigate the problem.

Table 36 on page 1094 provides commands for checking the RSVP layer.

Table 36: Checking the RSVP Layer

Tasks	Command or Action
“Checking the RSVP Layer” on page 1094	
1. Verify the LSP on page 1097	<code>show mpls lsp extensive</code>
2. Verify RSVP Sessions on page 1098	<code>show rsvp session</code>
3. Verify RSVP Neighbors on page 1100	<code>show rsvp neighbor</code>
4. Verify RSVP Interfaces on page 1101	<code>show rsvp interface</code>
5. Verify the RSVP Protocol Configuration on page 1102	<code>show configuration protocols rsvp</code>
6. Take Appropriate Action on page 1103	<p>The following sequence of commands addresses the specific problem described in this topic:</p> <pre> [edit] edit protocols rsvp [edit protocols rsvp] show set interface type-fpc/pic/port show commit </pre>
7. Verify the LSP Again on page 1104	<code>show mpls lsp extensive</code>

Checking the RSVP Layer

Purpose After you have configured the label-switched path (LSP), issued the `show mpls lsp extensive` command, and determined that there is an error, you might find that the error

is not in the physical, data link, or Internet Protocol (IP) and interior gateway protocol (IGP) layers. Continue investigating the problem at the RSVP layer of the network.

Figure 92 on page 1095 illustrates the RSVP layer of the layered MPLS model.

Figure 92: Checking the RSVP Layer

BGP Layer	traceroute <i>host-name</i> show bgp summary show configuration protocols bgp show route <i>destination-prefix</i> detail show route receive protocol bgp <i>neighbor-address</i>
MPLS Layer	show mpls lsp show mpls lsp extensive show route table mpls.0 show route <i>address</i> traceroute <i>address</i> ping mpls rsvp <i>lsp-name</i> detail
RSVP Layer	show rsvp session show rsvp neighbor show rsvp interface
<div>↙ IGP and IP Layers Functioning ↘</div>	
OSPF Layer show ospf neighbor show configuration protocols ospf show ospf interface	IS-IS Layer show isis adjacency show configuration protocols isis show isis interface
IP Layer show ospf neighbor extensive show interfaces terse	IP Layer show isis adjacency extensive show interfaces terse
Data Link Layer	show interfaces extensive " <i>JUNOS Interfaces Operations Guide</i> "
Physical Layer	show interfaces show interfaces terse ping <i>host</i>

With this layer, you check that dynamic RSVP signaling is occurring as expected, neighbors are connected, and interfaces are configured correctly for RSVP. Check the ingress, egress, and transit routers.

If the network is not functioning at this layer, the LSP does not work as configured.

Figure 93 on page 1096 illustrates the MPLS network used in this topic.

Figure 93: MPLS Network Broken at the RSVP Layer

The network shown in [Figure 93 on page 1096](#) is a fully meshed configuration where every directly connected interface can receive and send packets to every other similar interface. The LSP in this network is configured to run from ingress router **R1**, through transit router **R3**, to egress router **R6**. In addition, a reverse LSP is configured to run from **R6** through **R3** to **R1**, creating bidirectional traffic.

However, in this example, the LSP is down without a path in either direction, from **R1** to **R6** or from **R6** to **R1**.

The crosses shown in [Figure 93 on page 1096](#) indicate where the LSP is broken. Some possible reasons the LSP is broken might include that dynamic RSVP signaling is not occurring as expected, neighbors are not connected, or interfaces are incorrectly configured for RSVP.

In the network in [Figure 93 on page 1096](#), a configuration error on transit router **R3** prevents the LSP from traversing the network as expected.

To check the RSVP layer, follow these steps:

1. [Verify the LSP on page 1097](#)
2. [Verify RSVP Sessions on page 1098](#)
3. [Verify RSVP Neighbors on page 1100](#)
4. [Verify RSVP Interfaces on page 1101](#)
5. [Verify the RSVP Protocol Configuration on page 1102](#)
6. [Take Appropriate Action on page 1103](#)
7. [Verify the LSP Again on page 1104](#)

Verify the LSP

Purpose Typically, you use the **show mpls lsp extensive** command to verify the LSP. However for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down, use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

Action To determine whether the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0,  LSPname: R1-to-R6
  ActivePath: (none)

  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn
    Will be enqueued for recomputation in 22 second(s).
    1 Oct 27 14:59:12  CSPF failed: no route toward 10.0.0.1 [4 times]
  Created: Wed Oct 27 14:57:44 2004
```

```
Total 1 displayed, Up 0, Down 1
```

```
Egress LSP: 0 sessions  
Total 0 displayed, Up 0, Down 0
```

```
Transit LSP: 0 sessions  
Total 0 displayed, Up 0, Down 0
```

Meaning The sample output shows that the LSP is down in both directions, from **R1** to **R6**, and from **R6** to **R1**. The output from **R1** shows that **R1** is using a no-cspf LSP since it tried to originate the call without being able to reach the destination. The output from **R6** shows that the Constrained Shortest Path First (CSPF) algorithm failed, resulting in no route to destination **10.0.0.1**.

Verify RSVP Sessions

Purpose When an RSVP session is successfully created, the LSP is set up along the paths created by the RSVP session. If the RSVP session is unsuccessful, the LSP does not work as configured.

Action To verify currently active RSVP sessions, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp session
```

Sample Output 1

```
user@R1> show rsvp session  
Ingress RSVP: 0 sessions  
Total 0 displayed, Up 0, Down 0
```

```
Egress RSVP: 0 sessions  
Total 0 displayed, Up 0, Down 0
```

```

Total 1 displayed, Up1 , Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning Sample Output 1 from all routers shows that no RSVP sessions were successfully created, even though the LSP **R6-to-R1** is configured. Continue investigating the problem in [“Verify RSVP Neighbors” on page 1100](#).

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the output from the ingress, transit, and egress routers when the RSVP configuration is correct, and the LSP is traversing the network as configured. **R1** and **R6** both show an ingress and egress RSVP session, with the LSP **R1-to-R6**, and the reverse LSP **R6-to-R1**. Transit router **R3** shows two transit RSVP sessions.

Verify RSVP Neighbors

Purpose Display a list of RSVP neighbors that were learned dynamically when exchanging RSVP packets. Once a neighbor is learned, it is never removed from the list of RSVP neighbors unless the RSVP configuration is removed from the router.

Action To verify RSVP neighbors, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp neighbor
```

Sample Output 1

```
user@R1> show rsvp neighbor
RSVP neighbor: 1 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.2    10  1/0    9:22      9    64/64    32

user@R3> show rsvp neighbor
RSVP neighbor: 2 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.1     0  1/0    28:20     9   190/190   41
10.1.36.2    16:50 1/1    15:37     9   105/78   38

user@R6> show rsvp neighbor
RSVP neighbor: 1 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.36.1    17:30 1/1    16:15     9   104/78   39
```

Sample Output 2

```
user@R3> show rsvp neighbor
RSVP neighbor: 2 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.1     5  1/0     9:14     9    63/63    33
10.1.36.2     5  1/0     9:05     9    62/62    32

user@R6> show rsvp neighbor
RSVP neighbor: 1 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.36.1     5  1/0     8:54     9    61/61    32
```

Meaning Sample Output 1 shows that **R1** and **R6** have one RSVP neighbor each, **R3**. However, the values in the **Up/Dn** field are different. **R1** has a value of **1/0** and **R6** has a value of **1/1**, indicating that **R1** is an active neighbor with **R3**, but **R6** is not. When the up count is one more than the down count, the neighbor is active; if the values are equal, the neighbor is down. The values for **R6** are equal, **1/1**, indicating that the neighbor **R3** is down.

Transit router **R3** knows about two neighbors, **R1** and **R6**. The **Up/Dn** field indicates that **R1** is an active neighbor and **R6** is down. At this point it is not possible to determine if the problem resides with **R3** or **R6**, because both neighbors are not active. Continue investigating the problem in [“Verify RSVP Interfaces” on page 1101](#).

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the correct neighbor relationship between transit router **R3** and egress router **R6**. The **Up/Dn** field shows the up count to be one more than the down count, **1/0**, indicating that the neighbors are active.

Verify RSVP Interfaces

Purpose Display the status of each interface on which RSVP is enabled to determine where the configuration error occurred.

Action To verify the status of RSVP interfaces, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp interface
```

Sample Output 1

```
user@R1> show rsvp interface
```

```
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R3> show rsvp interface
```

```
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
<<< Missing interface so-0/0/3.0
```

```
user@R6> show rsvp interface
```

```
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

Sample Output 2

```
user@R1> show rsvp interface
```

```
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R3> show rsvp interface
```

```
RSPV interface: 4 active
```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R6> show rsvp interface
```

```
RSPV interface: 4 active
```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

Meaning Sample Output 1 shows that even though each router has interfaces that are up and have RSVP active, there are no reservations (**Active resv**) on any of the routers. In this example, we would expect at least one reservation on the ingress and egress routers, and two reservations on the transit router.

In addition, interface **so-0/0/3** on transit router **R3** is not included in the configuration. The inclusion of this interface is critical to the success of the LSP.

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the relevant interfaces with active reservations.

Verify the RSVP Protocol Configuration

Purpose After you have checked RSVP sessions, interfaces, neighbors, and determined that there might be a configuration error, verify the RSVP protocol configuration.

Action To verify the RSVP configuration, enter the following command from the ingress, transit, and egress routers:

```
user@host> show configuration protocols rsvp
```

Sample Output

```
user@R1> show configuration protocols rsvp
```

```
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}
```

```
user@R3> show configuration protocols rsvp
```

```
interface so-0/0/0.0;
```

```

interface so-0/0/1.0;
interface so-0/0/2.0; <<< Missing interface so-0/0/3.0
interface fxp0.0 {
    disable;
}

user@R6> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface so-0/0/3.0;
interface fxp0.0 {
    disable;
}

```

Meaning The sample output shows that **R3** has interface **so-0/0/3.0** missing from the RSVP protocol configuration. This interface is critical for the correct functioning of the LSP.

Take Appropriate Action

Problem Description: Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, an interface is missing from the configuration of router R3.

Solution To correct the error in this example, follow these steps:

1. Include the missing interface in the configuration of transit router R3:

```

user@R3> edit
user@R3# edit protocols rsvp
[edit protocols rsvp]
user@R3# show
user@R3# set interface so-0/0/3.0

```

2. Verify and commit the configuration:

```

[edit protocols rsvp]
user@R3# show
user@R3# commit

```

Sample Output

```
user@R3> edit
Entering configuration mode

[edit]
user@R3# edit protocols rsvp

[edit protocols rsvp]
user@R3# show
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0; <<< Missing interface so-0/0/3.0
interface fxp0.0 {
    disable;
}
[edit protocols rsvp]
user@R3# set interface so-0/0/3.0

[edit protocols rsvp]
user@R3# show
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}
interface so-0/0/3.0; <<< Interface now included in the configuration

[edit protocols rsvp]
user@R3# commit
commit complete
```

Meaning The sample output shows that the missing interface **so-0/0/3.0** on transit router **R3** is now correctly included at the **[edit protocols rsvp]** hierarchy level. This results in the possibility that the LSP might come up.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the MPLS layer has been resolved.

Action To verify the LSP again, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

```

Meaning Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up.

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Verify the LSP

Purpose Typically, you use the **show mpls lsp extensive** command to verify the LSP. However for quick verification of the LSP state, use the **show mpls lsp** command. If the LSP is down, use the **extensive** option (**show mpls lsp extensive**) as a follow-up. If your network has numerous LSPs, you might consider specifying the name of the LSP, using the **name** option (**show mpls lsp name *name*** or **show mpls lsp name *name* extensive**).

Action To determine whether the LSP is up, enter the following command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0,  LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary          State: Dn
    2 Oct 27 15:06:05 10.1.13.2:  No Route toward dest [4 times]
    1 Oct 27 15:05:56 Originate Call

  From: 10.0.0.6, State: Dn, ActiveRoute: 0,  LSPname: R6-to-R1
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn
    Will be enqueued for recomputation in 22 second(s).
    1 Oct 27 14:59:12  CSPF failed: no route toward 10.0.0.1 [4 times]
  Created: Wed Oct 27 14:57:44 2004
Total 1 displayed, Up 0,  Down 1

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning The sample output shows that the LSP is down in both directions, from **R1** to **R6**, and from **R6** to **R1**. The output from **R1** shows that **R1** is using a no-cspf LSP since it tried to originate the call without being able to reach the destination. The output from **R6** shows that the Constrained Shortest Path First (CSPF) algorithm failed, resulting in no route to destination **10.0.0.1**.

Verify RSVP Sessions

Purpose When an RSVP session is successfully created, the LSP is set up along the paths created by the RSVP session. If the RSVP session is unsuccessful, the LSP does not work as configured.

Action To verify currently active RSVP sessions, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp session
```

Sample Output 1

```
user@R1> show rsvp session
Ingress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

```
Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

```
user@R3> show rsvp session
Ingress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

```
Egress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

```
Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

```
user@R6> show rsvp session
Ingress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

```
Egress RSVP: 0 sessions

Total 1 displayed, Up 1 , Down 0

```

```

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

Meaning Sample Output 1 from all routers shows that no RSVP sessions were successfully created, even though the LSP **R6-to-R1** is configured. Continue investigating the problem in [“Verify RSVP Neighbors” on page 1100](#).

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the output from the ingress, transit, and egress routers when the RSVP configuration is correct, and the LSP is traversing the network as configured. **R1** and **R6** both show an ingress and egress RSVP session, with the LSP **R1-to-R6**, and the reverse LSP **R6-to-R1**. Transit router **R3** shows two transit RSVP sessions.

Verify RSVP Neighbors

Purpose Display a list of RSVP neighbors that were learned dynamically when exchanging RSVP packets. Once a neighbor is learned, it is never removed from the list of RSVP neighbors unless the RSVP configuration is removed from the router.

Action To verify RSVP neighbors, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp neighbor
```

Sample Output 1

```

user@R1> show rsvp neighbor
RSVP neighbor: 1 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.2    10  1/0    9:22      9    64/64    32

user@R3> show rsvp neighbor
RSVP neighbor: 2 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.1    0   1/0    28:20     9    190/190   41
10.1.36.2    16:50 1/1    15:37     9    105/78   38

user@R6> show rsvp neighbor
RSVP neighbor: 1 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.36.1    17:30 1/1    16:15     9    104/78   39

```

Sample Output 2

```

user@R3> show rsvp neighbor
RSVP neighbor: 2 learned
Address      Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.13.1    5   1/0    9:14      9    63/63    33
10.1.36.2    5   1/0    9:05      9    62/62    32

```

```

user@R6> show rsvp neighbor
RSVP neighbor: 1 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx MsgRcvd
10.1.36.1         5   1/0      8:54         9    61/61    32

```

Meaning Sample Output 1 shows that **R1** and **R6** have one RSVP neighbor each, **R3**. However, the values in the **Up/Dn** field are different. **R1** has a value of **1/0** and **R6** has a value of **1/1**, indicating that **R1** is an active neighbor with **R3**, but **R6** is not. When the up count is one more than the down count, the neighbor is active; if the values are equal, the neighbor is down. The values for **R6** are equal, **1/1**, indicating that the neighbor **R3** is down.

Transit router **R3** knows about two neighbors, **R1** and **R6**. The **Up/Dn** field indicates that **R1** is an active neighbor and **R6** is down. At this point it is not possible to determine if the problem resides with **R3** or **R6**, because both neighbors are not active. Continue investigating the problem in “[Verify RSVP Interfaces](#)” on page 1101.

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the correct neighbor relationship between transit router **R3** and egress router **R6**. The **Up/Dn** field shows the up count to be one more than the down count, **1/0**, indicating that the neighbors are active.

Verify RSVP Interfaces

Purpose Display the status of each interface on which RSVP is enabled to determine where the configuration error occurred.

Action To verify the status of RSVP interfaces, enter the following command from the ingress, transit, and egress routers:

```
user@host> show rsvp interface
```

Sample Output 1

```

user@R1> show rsvp interface
RSVP interface: 3 active

```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```

user@R3> show rsvp interface
RSVP interface: 3 active

```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
<<< Missing interface so-0/0/3.0
```

```
user@R6> show rsvp interface
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

Sample Output 2

```
user@R1> show rsvp interface
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R3> show rsvp interface
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R6> show rsvp interface
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

Meaning Sample Output 1 shows that even though each router has interfaces that are up and have RSVP active, there are no reservations (**Active resv**) on any of the routers. In this example, we would expect at least one reservation on the ingress and egress routers, and two reservations on the transit router.

In addition, interface **so-0/0/3** on transit router **R3** is not included in the configuration. The inclusion of this interface is critical to the success of the LSP.

In contrast to Sample Output 1 and to illustrate correct output, Sample Output 2 shows the relevant interfaces with active reservations.

Verify the RSVP Protocol Configuration

Purpose After you have checked RSVP sessions, interfaces, neighbors, and determined that there might be a configuration error, verify the RSVP protocol configuration.

Action To verify the RSVP configuration, enter the following command from the ingress, transit, and egress routers:

```
user@host> show configuration protocols rsvp
```

Sample Output

```
user@R1> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}

user@R3> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0; <<< Missing interface so-0/0/3.0
interface fxp0.0 {
    disable;
}

user@R6> show configuration protocols rsvp
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface so-0/0/3.0;
interface fxp0.0 {
    disable;
}
```

Meaning The sample output shows that **R3** has interface **so-0/0/3.0** missing from the RSVP protocol configuration. This interface is critical for the correct functioning of the LSP.

Take Appropriate Action

Problem **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In this example, an interface is missing from the configuration of router R3.

Solution To correct the error in this example, follow these steps:

1. Include the missing interface in the configuration of transit router R3:

```
user@R3> edit
```

```
user@R3# edit protocols rsvp
[edit protocols rsvp]
user@R3# show
user@R3# set interface so-0/0/3.0
```

2. Verify and commit the configuration:

```
[edit protocols rsvp]
user@R3# show
user@R3# commit
```

Sample Output

```
user@R3> edit
Entering configuration mode

[edit]
user@R3# edit protocols rsvp

[edit protocols rsvp]
user@R3# show
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0; <<< Missing interface so-0/0/3.0
interface fxp0.0 {
    disable;
}
[edit protocols rsvp]
user@R3# set interface so-0/0/3.0

[edit protocols rsvp]
user@R3# show
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
    disable;
}
interface so-0/0/3.0; <<< Interface now included in the configuration

[edit protocols rsvp]
user@R3# commit
commit complete
```

Meaning The sample output shows that the missing interface **so-0/0/3.0** on transit router **R3** is now correctly included at the **[edit protocols rsvp]** hierarchy level. This results in the possibility that the LSP might come up.

Verify the LSP Again

Purpose After taking the appropriate action to correct the error, the LSP needs to be checked again to confirm that the problem in the MPLS layer has been resolved.

Action To verify the LSP again, enter the following command on the ingress, transit, and egress routers:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

Total 0 displayed, Up 0, Down 0

```

Meaning Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** has an active route to **R6** and the state is up.

Sample Output 2 from transit router **R3** shows that there are two transit LSP sessions, one from **R1** to **R6** and the other from **R6** to **R1**. Both LSPs are up.

Sample Output 3 from egress router **R6** shows that the LSP is up and the active route is the primary route. The LSP is now traversing the network along the expected path, from **R1** through **R3** to **R6**, and the reverse LSP, from **R6** through **R3** to **R1**.

Checklist for Determining LSP Status

Purpose This checklist provides the steps and commands to verify the state of a label-switched path (LSP) in an MPLS network. The checklist includes links to more detailed information about the commands to verify the LSP and supporting protocols. [Table 37 on page 1117](#) provides commands for determining the LSP state.

Table 37: Checklist for Determining the LSP State

Tasks	Command or Action
“Determining LSP Status” on page 1275	
1. Check the Status of the LSP on page 1275	show mpls lsp
2. Display Extensive Status About the LSP on page 1276	show mpls lsp extensive
“Determining LSP Statistics” on page 1117	
	show rsvp session detail

Determining LSP Statistics

Purpose Display detailed information about RSVP objects to assist the diagnosis of an LSP problem.

Action To verify RSVP objects, enter the following Junos OS CLI operational mode command:

```
user@host> show rsvp session detail
```

Sample Output

```
user@R1> show rsvp session detail
Ingress RSVP: 1 sessions

10.0.0.6

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning The sample output shows that there is one ingress and one egress RSVP session. The ingress session has a source address of **10.0.0.1 (R1)**, and the session is up, with one active route. The LSP name is **R1-to-R6** and it is the primary path for the LSP.

The recovery label (**100064**) is sent by a graceful restart router to its neighbor to recover a forwarding state. It is probably the old label that the router advertised before it went down.

This session is using the fixed filter (**FF**) reservation style (**Resv style**). Since this is an ingress router, there is no inbound label. The outbound label (provided by the next downstream router) is **100064**.

The **Time Left** field provides the number of seconds remaining in the RSVP session, and the **Tspec** object provides information about the controlled load rate (**rate**) and maximum burst size (**peak**), an infinite value (**Infbps**) for the guaranteed delivery option, and the indication that packets smaller than 20 bytes are treated as 20 bytes, while packets larger than 1500 bytes are treated as 1500 bytes.

The port number is the IPv4 tunnel ID, while the sender/receiver port number is the LSP ID. The IPv4 tunnel ID is unique for the life of the LSP, while the sender/receiver LSP ID can change, for example, with an SE style reservation.

The **PATH rcvfrom** field includes the source of the path message. Since this is the ingress router, the local client originated the path message.

The **PATH sentto** field includes the path message destination (**10.1.13.2**) and outgoing interface (**so-0/0/2.0**). The **RESV rcvfrom** field includes both the source of the Resv message received (**10.1.13.2**) and the incoming interface (**so-0/0/2.0**).

The RSVP explicit route and the route record values are identical: **10.1.13.2** and **10.1.36.2**. In most cases, the explicit route and the record route values are identical. Differences indicate that some path rerouting has occurred, typically during Fast-Reroute.

The **Total** fields indicate the total number of ingress, egress, and transit RSVP sessions, with the total being equal to the sum of the up and down sessions. In this example, there is one ingress session, one egress session, and no transit RSVP sessions.

Checklist for Verifying LSP Use

Purpose This checklist provides the steps and commands to verify the use of the LSP in an MPLS network. The checklist includes links to more detailed information about verifying the LSP on the ingress and transit routers in the network.

This checklist describes how to verify the availability and valid use of a label-switched path (LSP) in your network.

Table 38: Checklist for Verifying LSP Use

Tasks	Command or Action
“Verifying LSP Use in Your Network” on page 1120	
“Verifying an LSP on the Ingress Router” on page 1120	show route table inet.3
“Verifying an LSP on a Transit Router” on page 1122	show route table mpls.0

Table 38 on page 1119 provides commands for verifying LSP use.

Verifying LSP Use in Your Network

Purpose When you verify the valid use of an LSP on the ingress and transit routers in your network, you can determine if there is a problem with Multiprotocol Label Switching (MPLS) in your network. [Figure 94 on page 1120](#) describes the example network used in this topic.

Figure 94: MPLS Topology for Verifying LSP Use

The MPLS network in [Figure 94 on page 1120](#) illustrates a router-only network with SONET interfaces that consist of the following components:

- A full-mesh interior Border Gateway Protocol (IBGP) topology, using AS 65432
- MPLS and Resource Reservation Protocol (RSVP) enabled on all routers
- A **send-statics** policy on routers R1 and R6 that allows a new route to be advertised into the network
- An LSP between routers R1 and R6

The network shown in [Figure 94 on page 1120](#) is a Border Gateway Protocol (BGP) full-mesh network. Since route reflectors and confederations are not used to propagate BGP learned routes, each router must have a BGP session with every other router running BGP.

To verify LSP use in your network, follow these steps:

1. [Verifying an LSP on the Ingress Router on page 1120](#)
2. [Verifying an LSP on a Transit Router on page 1122](#)

Verifying an LSP on the Ingress Router

Purpose You can verify the availability of an LSP when it is up by examining the **inet.3** routing table on the ingress router. The **inet.3** routing table contains the host address of each LSP's

egress router. This routing table is used on ingress routers to route BGP packets to the destination egress router. BGP uses the **inet.3** routing table on the ingress router to help resolve next-hop addresses.

Action To verify an LSP on an ingress router, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show route table inet.3
```

Sample Output

```
user@R1> show route table inet.3
inet.3: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.6/32          *[RSVP/7] 4w0d 22:40:57, metric 20
                    > via so-0/0/2.0, label-switched-path R1-to-R6
```

Meaning The sample output shows the **inet.3** routing table. By default, only BGP and MPLS virtual private networks (VPNs) can use the **inet.3** route table to resolve next-hop information. One destination is listed in the route table, **10.0.0.6**. This destination (**10.0.0.6**) is signaled by RSVP, and is the current active path, as indicated by the asterisk (*). The protocol preference for this route is **7**, and the metric associated with it is **20**. The label-switched path is **R1-to-R6**, through interface **so-0/0/2.0**, which is the physical next-hop transit interface.

Typically, the penultimate router in the LSP either pops the packet's label or changes the label to a value of 0. If the penultimate router pops the top label and an IPv4 packet is underneath, the egress router routes the IPv4 packet, consulting the IP routing table **inet.0** to determine how to forward the packet. If another type of label (such as one created by Label Distribution Protocol (LDP) tunneling or VPNs, but not IPv4) is underneath the top label, the egress router does not examine the **inet.0** routing table. Instead, it examines the **mpls.0** routing table for forwarding decisions.

If the penultimate router changes the packet's label to a value of 0, the egress router strips off the 0 label, indicating that an IPv4 packet follows. The packet is examined by the **inet.0** routing table for forwarding decisions.

When a transit or egress router receives an MPLS packet, information in the MPLS forwarding table is used to determine the next transit router in the LSP or whether this router is the egress router.

When BGP resolves a next-hop prefix, it examines both the **inet.0** and **inet.3** routing tables, seeking the next hop with the lowest preference; for example, RSVP preference 7 is preferred over OSPF preference 10. The RSVP signaled LSP is used to reach the BGP next hop. This is the default when the BGP next hop equals the LSP egress address. Once the BGP next hop is resolved through an LSP, the BGP traffic uses the LSP to forward BGP transit traffic.

Verifying an LSP on a Transit Router

Purpose You can verify the availability of an LSP when it is up by examining the **mpls.0** routing table on a transit router. MPLS maintains the **mpls.0** routing table, which contains a list of the next label-switched router in each LSP. This routing table is used on transit routers to route packets to the next router along an LSP.

Action To verify an LSP on a transit router, enter the following Junos OS CLI operational mode command:

```
user@host> show route table mpls.0
```

Sample Output

```
user@R3> show route table mpls.0
mpls.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
1                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
2                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
100064            * [RSVP/7] 2w1d 04:17:36, metric 1
                  > via so-0/0/3.0, label-switched-path R1-to-R6
100064 (S=0)      * [RSVP/7] 2w1d 04:17:36, metric 1
                  > via so-0/0/3.0, label-switched-path R1-to-R6
```

Meaning The sample output from transit router **R3** shows route entries in the form of MPLS label entries, indicating that there is only one active route, even though there are five active entries.

The first three MPLS labels are reserved MPLS labels defined in RFC 3032. Packets received with these label values are sent to the Routing Engine for processing. Label 0 is the IPv4 explicit null label. Label 1 is the MPLS equivalent of the IP Router Alert label and Label 2 is the IPv6 explicit null label.

The two entries with the **100064** label are for the same LSP, **R1-to-R6**. There are two entries because the stack values in the MPLS header may be different. The second entry, **100064 (S=0)**, indicates that the stack depth is not 1 and additional label values are included in the packet. In contrast, the first entry of **100064** has an inferred S=1 which indicates a stack depth of 1 and makes it the last label in the packet. The dual entry indicates that this is the penultimate router. For more information on MPLS label stacking, see RFC 3032, *MPLS Label Stack Encoding*.

The incoming label is the MPLS header of the MPLS packet, and is assigned by RSVP to the upstream neighbor. Juniper Networks routers dynamically assign labels for RSVP traffic-engineered LSPs in the range from 100,000 through 1,048,575.

The router assigns labels starting at label 100,000, in increments of 16. The sequence of label assignments is 100,000, 100,016, 100,032, 100,048, and so on. At the end of the assigned labels, the label numbers start over at 100001, incrementing in units of 16. Juniper Networks reserves labels for various purposes. [Table 39 on page 1123](#) lists the various label range allocations for incoming labels.

Table 39: MPLS Label Range Allocations

Incoming Label	Status
0 through 15	Reserved by IETF
16 through 1023	Reserved for static LSP assignment
1024 through 9999	Reserved for internal use (for example, CCC labels)
10,000 through 99,999	Reserved for static LSP assignment
100,000 through 1,048,575	Reserved for dynamic label assignment

Verifying an LSP on the Ingress Router

Purpose You can verify the availability of an LSP when it is up by examining the **inet.3** routing table on the ingress router. The **inet.3** routing table contains the host address of each LSP's egress router. This routing table is used on ingress routers to route BGP packets to the destination egress router. BGP uses the **inet.3** routing table on the ingress router to help resolve next-hop addresses.

Action To verify an LSP on an ingress router, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show route table inet.3
```

Sample Output

```
user@R1> show route table inet.3
inet.3: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.6/32          *[RSVP/7] 4w0d 22:40:57, metric 20
                    > via so-0/0/2.0, label-switched-path R1-to-R6
```

Meaning The sample output shows the **inet.3** routing table. By default, only BGP and MPLS virtual private networks (VPNs) can use the **inet.3** route table to resolve next-hop information. One destination is listed in the route table, **10.0.0.6**. This destination (**10.0.0.6**) is signaled by RSVP, and is the current active path, as indicated by the asterisk (*). The protocol preference for this route is **7**, and the metric associated with it is **20**. The label-switched

path is **R1-to-R6**, through interface **so-0/0/2.0**, which is the physical next-hop transit interface.

Typically, the penultimate router in the LSP either pops the packet's label or changes the label to a value of 0. If the penultimate router pops the top label and an IPv4 packet is underneath, the egress router routes the IPv4 packet, consulting the IP routing table **inet.0** to determine how to forward the packet. If another type of label (such as one created by Label Distribution Protocol (LDP) tunneling or VPNs, but not IPv4) is underneath the top label, the egress router does not examine the **inet.0** routing table. Instead, it examines the **mpls.0** routing table for forwarding decisions.

If the penultimate router changes the packet's label to a value of 0, the egress router strips off the 0 label, indicating that an IPv4 packet follows. The packet is examined by the **inet.0** routing table for forwarding decisions.

When a transit or egress router receives an MPLS packet, information in the MPLS forwarding table is used to determine the next transit router in the LSP or whether this router is the egress router.

When BGP resolves a next-hop prefix, it examines both the **inet.0** and **inet.3** routing tables, seeking the next hop with the lowest preference; for example, RSVP preference 7 is preferred over OSPF preference 10. The RSVP signaled LSP is used to reach the BGP next hop. This is the default when the BGP next hop equals the LSP egress address. Once the BGP next hop is resolved through an LSP, the BGP traffic uses the LSP to forward BGP transit traffic.

Verifying an LSP on a Transit Router

Purpose You can verify the availability of an LSP when it is up by examining the **mpls.0** routing table on a transit router. MPLS maintains the **mpls.0** routing table, which contains a list of the next label-switched router in each LSP. This routing table is used on transit routers to route packets to the next router along an LSP.

Action To verify an LSP on a transit router, enter the following Junos OS CLI operational mode command:

```
user@host> show route table mpls.0
```

Sample Output

```
user@R3> show route table mpls.0
mpls.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
1                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
2                * [MPLS/0] 7w3d 22:20:56, metric 1
                  Receive
100064           * [RSVP/7] 2w1d 04:17:36, metric 1
                  > via so-0/0/3.0, label-switched-path R1-to-R6
```

```

100064 (S=0)          * [RSVP/7] 2w1d 04:17:36, metric 1
> via so-0/0/3.0, label-switched-path R1-to-R6

```

Meaning The sample output from transit router **R3** shows route entries in the form of MPLS label entries, indicating that there is only one active route, even though there are five active entries.

The first three MPLS labels are reserved MPLS labels defined in RFC 3032. Packets received with these label values are sent to the Routing Engine for processing. Label 0 is the IPv4 explicit null label. Label 1 is the MPLS equivalent of the IP Router Alert label and Label 2 is the IPv6 explicit null label.

The two entries with the **100064** label are for the same LSP, **R1-to-R6**. There are two entries because the stack values in the MPLS header may be different. The second entry, **100064 (S=0)**, indicates that the stack depth is not 1 and additional label values are included in the packet. In contrast, the first entry of **100064** has an inferred S=1 which indicates a stack depth of 1 and makes it the last label in the packet. The dual entry indicates that this is the penultimate router. For more information on MPLS label stacking, see RFC 3032, *MPLS Label Stack Encoding*.

The incoming label is the MPLS header of the MPLS packet, and is assigned by RSVP to the upstream neighbor. Juniper Networks routers dynamically assign labels for RSVP traffic-engineered LSPs in the range from 100,000 through 1,048,575.

The router assigns labels starting at label 100,000, in increments of 16. The sequence of label assignments is 100,000, 100,016, 100,032, 100,048, and so on. At the end of the assigned labels, the label numbers start over at 100001, incrementing in units of 16. Juniper Networks reserves labels for various purposes. [Table 39 on page 1123](#) lists the various label range allocations for incoming labels.

Table 40: MPLS Label Range Allocations

Incoming Label	Status
0 through 15	Reserved by IETF
16 through 1023	Reserved for static LSP assignment
1024 through 9999	Reserved for internal use (for example, CCC labels)
10,000 through 99,999	Reserved for static LSP assignment
100,000 through 1,048,575	Reserved for dynamic label assignment

Verify That Load Balancing Is Working

Purpose After configuring load balancing, check that traffic is load-balanced equally across paths. In this section, the command output reflects the load-balancing configuration of the

example network shown in [Figure 95 on page 1130](#). The **clear** commands are used to reset LSP and interface counters to zero so that the values reflect the operation of the load-balancing configuration.

Action To verify load balancing across interfaces and LSPs, use the following command on the ingress router:

```
user@host# show configuration
```

To verify load balancing across interfaces and LSPs, use the following commands on a transit router:

```
user@host# show route
user@host# show route forwarding-table
user@host# show mpls lsp statistics
user@host# monitor interface traffic
user@host# clear mpls lsp statistics
user@host# clear interface statistics
```

Sample Output

The following sample output is for the configuration on ingress router **R1**:

```
user@R1> show configuration | no-more
[...Output truncated...]
routing-options {
  [...Output truncated...]
  forwarding-table {
    export lbpp;
  }
}
[...Output truncated...]
policy-options {
  policy-statement lbpp {
    then {
      load-balance per-packet;
    }
  }
}
```

Meaning The sample output for the **show configuration** command on ingress router **R1** shows that load balancing is correctly configured with the **lbpp** policy statement. Also, the **lbpp** policy is exported into the forwarding table at the **[edit routing-options]** hierarchy level.

Sample Output The following sample output is from transit router R2:

```
user@R2> show route 192.168.0.1 terse

inet.0: 25 destinations, 27 routes (25 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
A Destination      P Prf  Metric 1   Metric 2   Next hop      AS path
* 192.168.0.1/32   0  10      3           so-0/0/1.0
                                >so-0/0/2.0

[...Output truncated...]
```

Meaning The sample output for the **show route** command issued on transit router **R2** shows the two equal-cost paths (**so-0/0/1** and **so-0/0/2**) through the network to the loopback address to **R0** (**192.168.0.1**). Even though the right angle bracket (**>**) usually indicates the active route, in this instance it does not, as shown in the following four sample outputs.

Sample Output The following sample output is from transit router R2:

```
user@R2> monitor interface traffic

R2                               Seconds: 65                               Time: 11:41:14

Interface  Link  Input packets      (pps)      Output packets      (pps)
so-0/0/0   Up    0                  (0)         0                  (0)
so-0/0/1   Up    126                (0)         164659             (2128)
so-0/0/2   Up    85219              (1004)      164598             (2128)
so-0/0/3   Up    0                  (0)         0                  (0)
fe-0/1/0   Up    328954             (4265)      85475              (1094)
fe-0/1/1   Up    0                  (0)         0                  (0)
fe-0/1/2   Up    0                  (0)         0                  (0)
fe-0/1/3   Up    0                  (0)         0                  (0)

[...Output truncated...]
```

Meaning The sample output for the **monitor interface traffic** command issued on transit router **R2** shows that output traffic is evenly distributed across the two interfaces **so-0/0/1** and **so-0/0/2**.

Sample Output The following sample output is from transit router R2:

```
user@R2> show mpls lsp statistics
Ingress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 5 sessions
To           From           State   Packets   Bytes  LSPname
192.168.0.1   192.168.1.1    Up      87997    17951388 lsp1
192.168.0.1   192.168.1.1    Up      87997    17951388 lsp2
192.168.0.1   192.168.1.1    Up      87997    17951388 lsp3
192.168.0.1   192.168.1.1    Up      87997    17951388 lsp4
192.168.6.1   192.168.0.1    Up        0          0 r0-r1
Total 5 displayed, Up 5, Down 0
```

Meaning The sample output for the **show mpls lsp statistics** command issued on transit router **R2** shows that output traffic is evenly distributed across the four LSPs configured on ingress router **R6**.

Sample Output The following sample output is from transit router R2:

```
user@R2> show route forwarding-table destination 10.0.90.14
Routing table: inet
Internet:
Destination      Type RtRef Next hop          Type Index NhRef Netif
10.0.90.12/30    user  0          ulst 262144 6
                  ucst 345 5 so-0/0/1.0
                  ucst 339 2 so-0/0/2.0
```

Meaning The sample output for the **show route forwarding-table destination** command issued on transit router **R2** shows **ulst** in the **Type** field, which indicates that load balancing is working. The two unicast (**ucst**) entries in the **Type** field are the two next hops for the LSPs.

Sample Output The following sample output is from transit router R2:

```
user@R2> show route forwarding-table | find mpls
Routing table: mpls
MPLS:
Destination      Type RtRef Next hop      Type Index NhRef Netif
default          perm  0
0                user  0              recv  37    3
1                user  0              recv  37    3
2                user  0              recv  37    3
100112           user  0              Swap 100032 so-0/0/1.0
100128           user  0              Swap 100048 so-0/0/1.0
100144           user  0 10.0.12.13      Swap 100096 fe-0/1/0.0
100160           user  0              Swap 100112 so-0/0/2.0
100176           user  0              Swap 100128 so-0/0/2.0
```

Meaning The sample output for the `show route forwarding-table | find mpls` command issued on transit router R2 shows the MPLS routing table that contains the labels received and used by this router to forward packets to the next-hop router. This routing table is used mostly on transit routers to route packets to the next router along an LSP. The first three labels in the **Destination** column (Label 0, Label 1, and Label 2) are automatically entered by MPLS when the protocol is enabled. These labels are reserved MPLS labels defined in RFC 3032. Label 0 is the IPv4 explicit null label. Label 1 is the MPLS equivalent of the IP Router Alert label, and Label 2 is the IPv6 explicit null label.

The remaining five labels in the **Destination** column are nonreserved labels that the router uses to forward traffic, and the last column **Netif**, shows the interfaces used to send the labeled traffic. For nonreserved labels, the second **Type** column shows the operation performed on matching packets. In this example, all non-reserved packets are swapped for outgoing packet labels. For example, packets with the label **100112** have their label swapped for **100032** before they are pushed out of interface **so-0/0/1.0**.

Example: Load-Balanced MPLS Network

When you configure several RSVP LSPs to the same egress router, the LSP with the lowest metric is selected and carries all traffic. If all of the LSPs have the same metric, one of the LSPs is selected at random and all traffic is forwarded over it. To distribute traffic equally across all LSPs, you can configure load balancing on the ingress or transit routers, depending on the type of load balancing configured.

Figure 95 on page 1130 illustrates an MPLS network with four LSPs configured to the same egress router (**RO**). Load balancing is configured on ingress router **R1**. The example network uses Open Shortest Path First (OSPF) as the interior gateway protocol (IGP) with OSPF area **0.0.0.0**. An IGP is required for the Constrained Shortest Path First (CSPF) LSP, which is the default for the Junos OS. In addition, the example network uses a policy to create BGP traffic.

Figure 95: Load-Balancing Network Topology

The network shown in [Figure 95 on page 1130](#) consists of the following components:

- A full-mesh interior BGP (IBGP) topology, using AS 65432
- MPLS and RSVP enabled on all routers
- A send-statics policy on routers **R1** and **R0** that allows a new route to be advertised into the network
- Four unidirectional LSPs between **R1** and **R0**, and one reverse direction LSP between **R0** and **R1**, which allows for bidirectional traffic
- Load balancing configured on ingress router **R1**

The network shown in [Figure 95 on page 1130](#) is a BGP full-mesh network. Since route reflectors and confederations are not used to propagate BGP learned routes, each router must have a BGP session with every other router running BGP.

For complete configurations for all routers in the example MPLS network, see [“Router Configurations for the Load-Balanced MPLS Network” on page 1130](#).

For a description of the situation before and after load balancing is configured in the network to use all four LSPs to forward traffic, see [“Traffic Flows Before Load Balancing” on page 1141](#).

Router Configurations for the Load-Balanced MPLS Network

Purpose The configurations in this topic are for the six routers in the example network illustrated in [Figure 95 on page 1130](#).

Action To display the configuration of a router, use the following Junos OS CLI operational mode command:

```
user@host> show configuration | no-more
```

Sample Output 1 The following configuration output is for edge router R6.

```

user@R6> show configuration | no-more

}

```

Meaning Sample Outputs 1 through 6 show the base interfaces, routing options, protocols, and policy options configurations for all six routers in the example network illustrated in [Figure 95 on page 1130](#).

All routers in the network have MPLS, RSVP, and BGP enabled. OSPF is configured as the IGP, and relevant interfaces have basic IP information and MPLS support.

In addition, all routers have the router ID (RID) configured manually at the **[edit routing-options]** hierarchy level to avoid duplicate RID problems. The **passive** statement is included in the OSPF configuration to ensure that protocols are not run over the loopback (**lo0**) interface and that the loopback (**lo0**) interface is advertised correctly throughout the network.

Sample Outputs 1, 3, 4, and 5 for **R6**, **R2**, **R4**, and **R9** show the base configuration for transit label-switched routers. The base configuration includes all interfaces enabled for MPLS, the RID manually configured, and the relevant protocols (RSVP, MPLS, BGP, and OSPF).

Sample Output 2 from ingress router **R1** shows the base configuration plus four LSPs (**lsp1** through **lsp4**) configured to **R0**. The four LSPs are configured with different primary paths that specify a loose hop through **R4** for **lsp1** and **lsp4**, and through **R2** for **lsp2** and **lsp3**.

To create traffic, **R1** has a static route (**100.100.1.0/24**) configured at the **[edit routing-options static route]** hierarchy level. The prefix is included in the send-statics policy at the **[edit policy-options send statics]** hierarchy level so the routes can become BGP routes.

In addition, on the ingress router **R1**, load balancing is configured using the **per-packet** option, and the policy is exported at the **[edit routing-options forwarding-table]** hierarchy level.

Sample Output 6 from egress router **R0** shows one LSP (**r0-r6**) to **R6** used to create bidirectional traffic. OSPF requires bidirectional LSP reachability before it will advertise the LSP into the IGP. Although the LSP is advertised into the IGP, no hello messages or routing updates occur over the LSP—only user traffic is sent over the LSP. The router uses its local copy of the IGP database to verify bidirectional reachability.

In addition, **R0** has a static route (**100.100.10.0/24**) configured at the **[edit routing-options static route]** hierarchy level. The prefix is included in the send-statics policy at the **[edit policy-options send statics]** hierarchy level so the routes can become BGP routes.

Traffic Flows Before Load Balancing

Purpose The following sample output illustrates the details to look for when you issue different **show** commands to check if traffic is balanced. The following output is before load balancing is configured and is taken from transit router **R2** in the network shown in [Figure 95 on page 1130](#).

Action To check the distribution of traffic across interfaces and LSPs, use the following CLI operational mode commands:

```
user@host> show route | find mpls
user@host> monitor interface traffic
user@host> show mpls lsp statistics
```

Sample Output 1 user@R2> show route | find mpls

```

mpls.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0                *[MPLS/0] 1d 00:12:08, metric 1
                  Receive
1                *[MPLS/0] 1d 00:12:08, metric 1
                  Receive
2                *[MPLS/0] 1d 00:12:08, metric 1
                  Receive
100112           *[RSVP/7] 13:10:36, metric 1
                  > via so-0/0/1.0, label-switched-path lsp1
100128           *[RSVP/7] 13:01:08, metric 1
                  > via so-0/0/1.0, label-switched-path lsp4
100144           *[RSVP/7] 00:26:49, metric 1
                  > to 10.0.12.13 via fe-0/1/0.0, label-switched-path r0-r6
100160           *[RSVP/7] 00:23:25, metric 1
                  > via so-0/0/2.0, label-switched-path lsp2
100176           *[RSVP/7] 00:23:25, metric 1
                  > via so-0/0/2.0, label-switched-path lsp3

```

Sample Output 2 user@R2> monitor interface traffic

```

R2                               Seconds: 89                Time: 14:33:09

Interface  Link  Input packets      (pps)  Output packets      (pps)
so-0/0/0   Up    0                  (0)    0                  (0)
so-0/0/1   Up    90 (1)  91 (1)            (0)
so-0/0/2   Up    118 (1) 100122 (0)
so-0/0/3   Up    0                  (0)    0                  (0)
fe-0/1/0   Up    100119            (0)    115                (0)
fe-0/1/1   Up    0                  (0)    0                  (0)
fe-0/1/2   Up    0                  (0)    0                  (0)
fe-0/1/3   Up    0                  (0)    0                  (0)
[...Output truncated...]

```

Sample Output 3 user@R2> show mpls lsp statistics

```

Ingress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 5 sessions
To          From          State  Packets  Bytes  LSPname
192.168.0.1 192.168.6.1  Up    0        0  lsp2
192.168.0.1 192.168.6.1  Up    112026  22853304  lsp1
192.168.0.1 192.168.6.1  Up    0        0  lsp3
192.168.0.1 192.168.6.1  Up    0        0  lsp4
192.168.6.1 192.168.0.1  Up    0        0  r0-r6
Total 5 displayed, Up 5, Down 0

```

Meaning Sample Outputs 1 through 3 from transit router **R2** show that traffic is not balanced across LSPs or interfaces.

Sample Output 1 for the **show route** command shows that all LSPs have the same metric (1) to the destination, even though they are traversing different interfaces. **lsp1** and **lsp4** are using **so-0/0/1**, while **lsp2** and **lsp3** are using **so-0/0/2**.

Sample Output 2 for the **monitor interface traffic** command shows that traffic is not evenly balanced across interfaces **so-0/0/1** and **so-0/0/2**. Almost all traffic is going out **so-0/0/2**.

Sample Output 3 for the **show mpls lsp statistics** command shows that traffic across LSPs is not balanced. All traffic is going over **lsp1**.

Verify the Operation of Uneven Bandwidth Load Balancing

Purpose When a router is performing unequal-cost load balancing between LSPs paths, the **show route detail** command displays a balance field associated with each next hop being used.

Action To verify that an RSVP LSP is unevenly load-balanced, use the following Junos OS CLI operational mode commands:

```
user@host> show route protocol rsvp detail
user@host> show mpls lsp statistics
```

Sample Output

```

user@R1> show route protocol rsvp detail

inet.0: 25 destinations, 25 routes (25 active, 0 holddown, 0 hidden)
10.0.90.14/32 (1 entry, 1 announced)

            AS path: I

user@R1> show mpls lsp statistics
Ingress LSP: 4 sessions

```

To	From	State	Packets	Bytes	LSPname
192.168.0.1	192.168.1.1	Up	10067	845628	lsp1
192.168.0.1	192.168.1.1	Up	20026	1682184	lsp2
192.168.0.1	192.168.1.1	Up	29796	2502864	lsp3
192.168.0.1	192.168.1.1	Up	40111	3369324	lsp4

Total 4 displayed, Up 4, Down 0

Egress LSP: 1 sessions

To	From	State	Packets	Bytes	LSPname
192.168.1.1	192.168.0.1	Up	NA	NA	r0-r1

Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions

Total 0 displayed, Up 0, Down 0

Meaning The sample output from ingress router **R1** shows that traffic is distributed according to the LSP bandwidth configuration, as indicated by the **Balance: xx%** field. For example, **lsp1** has 10 Mbps of bandwidth configured, as reflected in the **Balance: 10%** field.

Checklist for Collecting Crash Data

Problem **Description:** [Table 41 on page 1145](#) provides links commands for collection crash data.

Table 41: Checklist for Collecting Crash Data

Tasks	Command or Action
“Understand Crash Data Collection” on page 1146	
“Collect Crash Data for a Routing Engine Kernel” on page 1147	
1. Check the Routing Engine Core Files on page 1147	<code>file list detail /var/crash</code>
2. Clear the NVRAM Contents on page 1165	
a. List the Core Files on page 1148	<code>start shell</code> <code>su</code> <code>root password</code> <code>cd /var/crash</code> <code>ls -l</code>
b. Compress the vmcore File on page 1149	<code>gzip vmcore.number</code> To unzip the vmcore file: <code>gzip -d vmcore.number.gz</code>
c. Log Software Version Information on page 1152	<code>show version</code>
d. Open a Case with JTAC on page 1150	Send an e-mail to support@juniper.net .
“Collect Crash Data for Routing Engine Daemons” on page 1153	
1. Check for Daemon Core Files on page 1154	<code>file list detail /var/tmp</code>
2. Collect and Send Routing Engine Crash Data to JTAC on page 1157	

Table 41: Checklist for Collecting Crash Data (continued)

Tasks	Command or Action
a. List the Daemon Core Files on page 1155	<pre>start shell su root password cd /var/tmp ls -l</pre>
b. Compress the Daemon Core Files on page 1156	<code>gzip daemon-executable-name.core.number</code>
c. Log Software Version Information on page 1152	<code>show version</code>
d. Open a Case with JTAC on page 1150	Send an e-mail to support@juniper.net .
"Collect Crash Data for the Packet Forwarding Engine Microkernel" on page 1160	
1. Display the Crash Stack Traceback and Registration Information on page 1161	<pre>start shell su root password vty component-executable-name show nvram show syslog messages</pre>
2. Clear the NVRAM Contents on page 1165	<pre>start shell su root password vty component-executable-name clear nvram</pre>
3. Check Packet Forwarding Engine Microkernel Core Files on page 1165	<code>file list detail /var/crash</code>
4. Collect and Send Routing Engine Crash Data to JTAC on page 1157	
a. List the Core Files Generated by the Crash on page 1166	<pre>start shell su root password cd /var/crash ls -l</pre>
b. Compress the Core Files on page 1166	<code>gzip filename</code>
c. Log Software Version Information on page 1152	<code>show version</code>
d. Open a Case with JTAC on page 1150	Send an e-mail to support@juniper.net .

Understand Crash Data Collection

A crash can occur in one of three areas in the Junos OS architecture (see Figure 96 on page 1147):

- Routing Engine kernel
- Routing Engine daemons (processes)
- Packet Forwarding Engine microkernel

Figure 96: Three Areas Where a Software Crash Can Occur

Software Architecture

Collect Crash Data for a Routing Engine Kernel

Purpose When a Routing Engine kernel crashes, the Routing Engine automatically reboots. By default, the Juniper Networks router does not attempt to dump a core if the Routing Engine kernel crashes. As a result, there is no crash data on the router to help investigate the crash. In addition, the system log messages are similar to those generated when the router is powered down and restarted, so you cannot tell if the Routing Engine restart was caused by a kernel crash or a normal power restart.

To collect crash data for a Routing Engine kernel crash, follow these steps:

1. [Check the Routing Engine Core Files on page 1147](#)
2. [List the Core Files on page 1148](#)
3. [Compress the vmcore File on page 1149](#)
4. [Log Software Version Information on page 1149](#)
5. [Open a Case with JTAC on page 1150](#)

Check the Routing Engine Core Files

Purpose If you observe disruption to the Routing Engine kernel, check the `/var/crash` directory for any core files created around the time of the crash.

Action To check the `/var/crash` directory, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> file list detail /var/crash
```

Sample Output

```
user@host> file list detail /var/crash
total 1577912
drwxr-x---  2 root  wheel           512 Sep  9 11:59 ./
drwxr-xr-x 22 root  wheel           512 Oct 29 2001 ../
-rw-r--r--  1 root  wheel              2 Jul 20 01:11 bounds
-rw-r--r--  1 root  wheel    2166913 Jul 20 01:11 kernel.0
-rw-r--r--  1 root  wheel              5 Feb 15 2002 minfree
-rw-----  1 root  wheel    805306368 Jul 20 01:11 vmcore.0
```

Meaning The sample output lists the contents of the `/var/crash/` directory. Check the date and timestamp for any kernel core files created around the time of the crash. In the example above, two core files are listed: `kernel.0` and `vmcore.0`.

List the Core Files

Purpose To list the core files, follow these steps:

Action 1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is % instead of >, for example:

```
% su
Password: ****
```

3. Change the directory to `/var/crash` and type **ls -l**, for example:

```
root@host% cd /var/crash
root@host% ls -l
```

4. Look for any core files created around the time of the crash.

Sample Output

```
user@host> start shell
% su
Password: ****
root@host% cd /var/crash
root@host% ls -l
total 1577908
-rw-r--r--  1 root  wheel              2 Jul 20 01:11 bounds
-rw-r--r--  1 root  wheel    2166913 Jul 20 01:11 kernel.0
-rw-r--r--  1 root  wheel              5 Feb 15 2002 minfree
-rw-----  1 root  wheel    805306368 Jul 20 01:11 vmcore.0
```

Meaning The sample output lists the contents of the `/var/crash` directory and shows the current core files `kernel.0` and `vm.core.0`.

Compress the vmcore File

Purpose The gzip compression utility is used to compress files. Compress the **vmcore** file if it is larger than 50 MB. Files created using the **gzip** command end with the file extension **.gz**.

NOTE: Use lowercase for the **gzip** command when you are in the shell.

Action To compress the **vmcore** file with gzip, use the following command from the shell:

```
root@host% gzip vmcore .number
```

To unzip the **vmcore** file with gzip, use the following command from the shell:

```
root@host% gzip -d vmcore .number.gz
```

Meaning The contents of the **vmcore** file are compressed into a single compressed file named **vmcore.number.gz**. The **gzip** command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

Log Software Version Information

Purpose To log the Junos OS version information.

Action To log the Junos OS version information, use the following Junos OS CLI operational mode command:

```
user@host> show version
```

Sample Output user@host> show version
Hostname: host
Model: m10
JUNOS Base OS boot [5.0R5]
JUNOS Base OS Software Suite [5.0R5]
JUNOS Kernel Software Suite [5.0R5]

Meaning The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

Open a Case with JTAC

Problem **Description:** To open a case with JTAC, call one of the Support phone numbers or create a case via [Case Manager](#).

Check the Routing Engine Core Files

Purpose If you observe disruption to the Routing Engine kernel, check the **/var/crash** directory for any core files created around the time of the crash.

Action To check the **/var/crash** directory, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> file list detail /var/crash
```

Sample Output

```
user@host> file list detail /var/crash
```

```

total 1577912
drwxr-x---  2 root  wheel      512 Sep  9 11:59 ./
drwxr-xr-x 22 root  wheel      512 Oct 29 2001 ../
-rw-r--r--  1 root  wheel        2 Jul 20 01:11 bounds
-rw-r--r--  1 root  wheel    2166913 Jul 20 01:11 kernel.0
-rw-r--r--  1 root  wheel        5 Feb 15 2002 minfree
-rw-----  1 root  wheel  805306368 Jul 20 01:11 vmcore.0

```

Meaning The sample output lists the contents of the `/var/crash/` directory. Check the date and timestamp for any kernel core files created around the time of the crash. In the example above, two core files are listed: `kernel.0` and `vmcore.0`.

List the Core Files

Purpose To list the core files, follow these steps:

Action 1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is % instead of >, for example:

```
% su
Password: ****
```

3. Change the directory to `/var/crash` and type **ls -l**, for example:

```
root@host% cd /var/crash
root@host% ls -l
```

4. Look for any core files created around the time of the crash.

Sample Output

```

user@host> start shell
% su
Password: ****
root@host% cd /var/crash
root@host% ls -l
total 1577908
-rw-r--r--  1 root  wheel        2 Jul 20 01:11 bounds
-rw-r--r--  1 root  wheel    2166913 Jul 20 01:11 kernel.0
-rw-r--r--  1 root  wheel        5 Feb 15 2002 minfree
-rw-----  1 root  wheel  805306368 Jul 20 01:11 vmcore.0

```

Meaning The sample output lists the contents of the `/var/crash` directory and shows the current core files `kernel.0` and `vmcore.0`.

Compress the vmcore File

Purpose The gzip compression utility is used to compress files. Compress the **vmcore** file if it is larger than 50 MB. Files created using the **gzip** command end with the file extension **.gz**.

NOTE: Use lowercase for the **gzip** command when you are in the shell.

Action To compress the **vmcore** file with gzip, use the following command from the shell:

```
root@host% gzip vmcore .number
```

To unzip the **vmcore** file with gzip, use the following command from the shell:

```
root@host% gzip -d vmcore .number.gz
```

Meaning The contents of the **vmcore** file are compressed into a single compressed file named **vmcore.number.gz**. The **gzip** command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

Log Software Version Information

Purpose To log the JUNOS software version information.

Action To log the JUNOS software version information, use the following JUNOS CLI operational mode command:

```
user@host> show version
```

Sample Output `user@host> show version`

```

Hostname: host
Model: m10

```

Meaning The sample output shows the hostname, router model, and the different JUNOS software packages, processes, and documents.

Open a Case with JTAC

Problem **Description:** To open a case with JTAC, call one of the Support phone numbers or create a case via [Case Manager](#).

Collect Crash Data for Routing Engine Daemons

To collect crash data for Routing Engine daemons, follow these steps:

1. [Check for Daemon Core Files on page 1154](#)
2. [List the Daemon Core Files on page 1155](#)
3. [Compress the Daemon Core Files on page 1156](#)
4. [Log Software Version Information on page 1156](#)
5. [Open a Case with JTAC on page 1157](#)

Check for Daemon Core Files

Purpose If you observe disruption to routing protocol operation, system log operation, Simple Network Management Protocol (SNMP) operation, or other operations handled by Routing Engine daemons, check the **/var/tmp** directory for any daemon core files created around the time of the crash.

Action To check the **/var/tmp** directory, use the following Junos OS CLI operational mode command:

```
user@host> file list detail /var/tmp
```

Sample Output

```
user@host> file list detail /var/tmp
total 1292622
drwxrwxrwt  3 root  field      512 Dec 31 06:48 ./
drwxr-xr-x 21 root  field      512 Mar  5 1999 ../
-rw-rw----  1 root  field 119713792 Nov 17 21:58 rpd.core.0
-rw-rw----  1 root  field 120782848 Nov 17 22:12 rpd.core.1
```

Meaning The sample output lists the contents of the **/var/tmp/** directory. Look for any daemon core files created around the time of the crash. In the example above, two core files are listed: **rpdc.core.0** and **rpdc.core.1**.

[Table 42 on page 1154](#) lists the major Routing Engine daemons supported by the Junos OS.

Table 42: Major Routing Engine Daemons

Executable Name	Definition	Description
rpdc	Routing protocol daemon	Provides routing protocol intelligence (Border Gateway Protocol [BGP], Intermediate System-to-Intermediate System [ISIS], Open Shortest Path First [OSPF], and so on).
dcd	Device control daemon	Manages all interface devices.
mgd	Management daemon	Provides user configuration access to the system. The CLI is a client of mgd .
snmpd	Simple Network Management Protocol daemon	Provides remote network management information to the network management system.
chassisd	Chassis daemon	Monitors and manages Flexible PIC Concentrator (FPC) slots and other environmental components.
alarmd	Alarm daemon	Manages system alarm notifications.
apsd	Automatic protection switching daemon	Provides SONET Automatic Protection Switching (APS) functionality.

Table 42: Major Routing Engine Daemons (continued)

Executable Name	Definition	Description
sampled	Traffic sampling daemon	Gathers traffic sampling information.
vrrpd	Virtual Router Redundancy Protocol daemon	Provides Virtual Router Redundancy Protocol (VRRP) functionality.
syslogd	System log daemon	Manages the router system logging operation.
mib2d	MIB2 daemon	Management Information Base (MIB) subagent for MIB2.

List the Daemon Core Files

Purpose To list the daemon core files.

Action To list the daemon core files, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Change the directory to **/var/tmp** and type **ls -l**, for example:

```
root@host% cd /var/tmp
root@host% ls -l
```

4. Look for any daemon core files created around the time of the crash.

Sample Output

```
user@host> start shell
% su
Password: ****
root@host% cd /var/tmp
root@host% ls -l
total 1292618
-rw-rw---- 1 root field 119713792 Nov 17 21:58 rpd.core.0
-rw-rw---- 1 root field 120782848 Nov 17 22:12 rpd.core.1
```

Meaning The sample output lists the contents of the **/var/tmp** directory and shows the current core file (**rpdc.core.1**) and one previous core file (**rpdc.core.0**) for the routing protocol daemon (**rpdc**). For each daemon, you can have a total of five core files in the **/var/tmp** directory:

the current core file and the four previous core files numbered 0 through 4 (from oldest to newest).

Compress the Daemon Core Files

Purpose The gzip compression utility is used to compress the files if they are large. Files created using the **gzip** command end with the file extension **.gz**. Compress the core file if it is over 50 MB.

NOTE: Use lowercase for the **gzip** command when you are in the shell.

You only need to compress the daemon core files when the tarball file is not created.

Action To compress the daemon core file with gzip, use the following command from the shell:

```
root@host% gzip daemon-executable-name.core.number
```

Sample Output

```
root@host% gzip rpd.core.0
gzip rpd.core.0
```

Meaning The contents of the daemon core file are compressed into a single compressed file named **daemon.number.gz**. The **gzip** command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

Log Software Version Information

Purpose To log the Junos OS version information.

Action To log the Junos OS version information, use the following Junos OS CLI operational mode command:

```
user@host> show version
```

Sample Output

```

user@host> show version
Hostname: host
Model: m10

```

Meaning The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

Open a Case with JTAC

Problem **Description:** To open a case with JTAC, call one of the Support phone numbers or create a case via [Case Manager](#).

Collect and Send Routing Engine Crash Data to JTAC

Problem **Description:** If a Routing Engine kernel crash occurs on your router, collect the following data for JTAC evaluation and instruction.

Solution To collect and send Routing Engine crash data to JTAC, follow these steps:

1. [List the Core Files on page 1148](#)
2. [Compress the vmcore File on page 1149](#)

3. [Log Software Version Information on page 1152](#)
4. [Open a Case with JTAC on page 1150](#)

- Related Documentation**
- [Understand Crash Data Collection on page 1146](#)
 - [Checklist for Collecting Crash Data on page 1145](#)

Check for Daemon Core Files

Purpose If you observe disruption to routing protocol operation, system log operation, Simple Network Management Protocol (SNMP) operation, or other operations handled by Routing Engine daemons, check the **/var/tmp** directory for any daemon core files created around the time of the crash.

Action To check the **/var/tmp** directory, use the following Junos OS CLI operational mode command:

```
user@host> file list detail /var/tmp
```

Sample Output

```
user@host> file list detail /var/tmp
total 1292622
drwxrwxrwt  3 root  field          512 Dec 31 06:48 ./
drwxr-xr-x 21 root  field          512 Mar  5 1999 ../
-rw-rw----  1 root  field 119713792 Nov 17 21:58 rpd.core.0
-rw-rw----  1 root  field 120782848 Nov 17 22:12 rpd.core.1
```

Meaning The sample output lists the contents of the **/var/tmp/** directory. Look for any daemon core files created around the time of the crash. In the example above, two core files are listed: **rpd.core.0** and **rpd.core.1**.

[Table 42 on page 1154](#) lists the major Routing Engine daemons supported by the Junos OS.

Table 43: Major Routing Engine Daemons

Executable Name	Definition	Description
rpd	Routing protocol daemon	Provides routing protocol intelligence (Border Gateway Protocol [BGP], Intermediate System-to-Intermediate System [ISIS], Open Shortest Path First [OSPF], and so on).
dcd	Device control daemon	Manages all interface devices.
mgd	Management daemon	Provides user configuration access to the system. The CLI is a client of mgd .
snmpd	Simple Network Management Protocol daemon	Provides remote network management information to the network management system.

Table 43: Major Routing Engine Daemons (continued)

Executable Name	Definition	Description
chassisd	Chassis daemon	Monitors and manages Flexible PIC Concentrator (FPC) slots and other environmental components.
alarmd	Alarm daemon	Manages system alarm notifications.
apsd	Automatic protection switching daemon	Provides SONET Automatic Protection Switching (APS) functionality.
sampled	Traffic sampling daemon	Gathers traffic sampling information.
vrpd	Virtual Router Redundancy Protocol daemon	Provides Virtual Router Redundancy Protocol (VRRP) functionality.
syslogd	System log daemon	Manages the router system logging operation.
mib2d	MIB2 daemon	Management Information Base (MIB) subagent for MIB2.

List the Daemon Core Files

Purpose To list the daemon core files.

Action To list the daemon core files, follow these steps:

- Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```
- Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```
- Change the directory to **/var/tmp** and type **ls -l**, for example:

```
root@host% cd /var/tmp
root@host% ls -l
```
- Look for any daemon core files created around the time of the crash.

Sample Output

```
user@host> start shell
% su
Password: ****
root@host% cd /var/tmp
root@host% ls -l
total 1292618
```

```
-rw-rw---- 1 root field 119713792 Nov 17 21:58 rpd.core.0
-rw-rw---- 1 root field 120782848 Nov 17 22:12 rpd.core.1
```

Meaning The sample output lists the contents of the `/var/tmp` directory and shows the current core file (`rpd.core.1`) and one previous core file (`rpd.core.0`) for the routing protocol daemon (`rpd`). For each daemon, you can have a total of five core files in the `/var/tmp` directory: the current core file and the four previous core files numbered 0 through 4 (from oldest to newest).

Compress the Daemon Core Files

Purpose The gzip compression utility is used to compress the files if they are large. Files created using the `gzip` command end with the file extension `.gz`. Compress the core file if it is over 50 MB.

NOTE: Use lowercase for the `gzip` command when you are in the shell.

You only need to compress the daemon core files when the tarball file is not created.

Action To compress the daemon core file with gzip, use the following command from the shell:

```
root@host% gzip daemon-executable-name.core.number
```

Sample Output

```
root@host% gzip rpd.core.0
gzip rpd.core.0
```

Meaning The contents of the daemon core file are compressed into a single compressed file named `daemon.number.gz`. The `gzip` command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

Collect Crash Data for the Packet Forwarding Engine Microkernel

Purpose Each of the following Packet Forwarding Engine components of a Juniper Networks router runs a microkernel:

- Flexible PIC Concentrator (FPC) on M-series platforms except for the M5 and M10 Internet routers
- Gibson Flexible PIC Concentrator (GFPC) on T640 and T320 Internet routing nodes
- Switched Printed Mezzanine Board (SPMB) on T640 and T320 Internet routing nodes
- Forwarding Engine Board (FEB) on M5 and M10 Internet routers

- System Switching Board (SSB) on an M20 Internet router
- System Control Board (SCB) on an M40 Internet router
- Switching and Forwarding Module (SFM) on M160 and M40e Internet routers

When a crash occurs, crash stack traceback and registration information is placed into nonvolatile random access memory (NVRAM) on the different components.

[Table 44 on page 1161](#) shows where the NVRAM is located for the components for each router.

Table 44: NVRAM Location on the Microkernel of the Packet Forwarding Engine Components

Router Type	NVRAM Location
M5 and M10	FEB
M20	SSB and crash stack traceback and register information for the FPC
M40	SCB and crash stack traceback and register information for the FPC
M40e	FPC SFM
M160	FPC SFM
T320	GFPC SPMB
T640	GFPC SPMB

To collect crash data for the Packet Forwarding Engine microkernel, follow these steps:

1. [Display the Crash Stack Traceback and Registration Information on page 1161](#)
2. [Clear the NVRAM Contents on page 1165](#)
3. [Check Packet Forwarding Engine Microkernel Core Files on page 1165](#)
4. [List the Core Files Generated by the Crash on page 1166](#)
5. [Compress the Core Files on page 1166](#)
6. [Log Software Version Information on page 1167](#)
7. [Open a Case with JTAC on page 1168](#)

Display the Crash Stack Traceback and Registration Information

Purpose To display the crash stack traceback and registration information.

Action To display the crash stack traceback and registration information, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Establish a vty session to the appropriate component. Use the **vtty** command followed by the executable name for the component; for example, **scb**, **ssb0**, **ssb1**, **fpc0**, or **fpc1**:

```
root@host% vty sfm0
```

NOTE: For the M40e and M160 routers, you can also create a **cty** session to the components if the components are not online.

4. Type the **show nvram** command to view the NVRAM information.
5. Type the **show syslog messages** command to view the system log messages.

Sample Output 1

```
user@host> start shell
% su
Password: ****
root@host% vty sfm0

FPC1(host vty)# show syslog messages
[0+00:00:00.780 LOG: Info] Version 4.0R5 by tlim on 2000-08-10 04:45:54 UTC
[0+00:00:00.780 LOG: Info] On-board NVRAM contains diagnostic information.
[0+00:00:03.175 LOG: Info] PFEMAN: Established connection to Master
[Jan 30 21:53:05.804 LOG: Info] SNTPD: Initial time of day set.

```

Meaning Sample output 1 and 2 show the stack trace from the microkernel crash. Save the output from the **show nvram** and **show syslog** commands so that you can send them to JTAC when you open a case.

Clear the NVRAM Contents

Purpose Currently the storage area for the logs on the NVRAM is limited to 4 KB. You need to delete old NVRAM logs to make room for new ones.

Action To clear the content of the NVRAM after you have captured the necessary information, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Establish a vty session to the appropriate component. Use the **vty** command followed by the abbreviation for the component, for example:

```
root@host% vty sfm0
SFM3(host vty)#
FPC1(host vty)#
```

4. Type the **clear nvram** command, for example:

```
SFM3(host vty)# clear nvram
FPC1(host vty)# clear nvram
```

Check Packet Forwarding Engine Microkernel Core Files

Purpose If you observe disruption to the Packet Forwarding Engine microkernel, check the **/var/crash** directory for any core files created around the time of the crash.

Action To check the **/var/crash** directory, use the following Junos OS CLI operational mode command:

```
user@host> file list detail /var/crash
```

Sample Output

```
user@host> file list detail /var/crash
var/crash:
total 456630
-rw-r--r--  1 root  wheel   6814720 Dec 18 08:03 core-FPC4.100111808032
-rw-r--r--  1 root  wheel   65613824 Dec 10 04:58 core-SCB.100111004570
-rw-r--r--  1 root  wheel   65613824 Dec 19 00:23 core-SCB.100111900221
-rw-r--r--  1 root  wheel   65545216 Feb  9 20:46 core-SCB.101010920452
```

Meaning The sample output lists the contents of the **/var/crash/** directory. Check the date and timestamp for any core files created around the time of the crash. In the example above, four core files are listed.

List the Core Files Generated by the Crash

Purpose To list the core files generated by the crash.

Action To list the core files, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Change the directory to **/var/crash** and type **ls -l**, for example:

```
root@host% cd /var/crash
root@host% ls -l
```

4. Look for any core files created around the time of the crash.

Sample Output

```
user@host> start shell
% su
Password: ****
root@host% cd /var/crash
root@host% ls -l
total 456630
-rw-r--r--  1 root  wheel   6814720 Dec 18 08:03 core-FPC4.100111808032
-rw-r--r--  1 root  wheel   65613824 Dec 10 04:58 core-SCB.100111004570
-rw-r--r--  1 root  wheel   65613824 Dec 19 00:23 core-SCB.100111900221
-rw-r--r--  1 root  wheel   65545216 Feb  9 20:46 core-SCB.101010920452
```

Meaning The sample output shows the current core files for the different components on the router; for example, **core-FPC4.100111808032** and **core-SCB.100111004570**.

Compress the Core Files

Purpose **gzip** is a compression utility used to compress the core files. Files created using the **gzip** command end with the file extension **.gz**. Compress the core files if they are larger than 50 MB.

Action To compress the core files with **gzip**, use the following command from the shell:

```
root@host% gzip filename
```

Sample Output `root@host% gzip core-SCB.101010920452`

Meaning The contents of the core file are compressed into a single compressed file named **core-SCB.10101092045.gz**. The **gzip** command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

Log Software Version Information

Purpose To log the Junos OS version information.

Action To log the Junos OS version information, use the following Junos OS CLI operational mode command:

`user@host> show version`

Sample Output `user@host> show version`
 Hostname: host
 Model: m10
 JUNOS Base OS boot [5.0R5]
 JUNOS Base OS Software Suite [5.0R5]
 JUNOS Kernel Software Suite [5.0R5]

 jdocs-dd release 5.0R5 built by builder on 2002-03-02 04:39:11 UTC

Meaning The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

Open a Case with JTAC

Problem **Description:** To open a case with JTAC, call one of the Support phone numbers or create a case via [Case Manager](#).

Display the Crash Stack Traceback and Registration Information

Purpose To display the crash stack traceback and registration information.

Action To display the crash stack traceback and registration information, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Establish a vty session to the appropriate component. Use the **vtty** command followed by the executable name for the component; for example, **scb**, **ssb0**, **ssb1**, **fpc0**, or **fpc1**:

```
root@host% vty sfm0
```

NOTE: For the M40e and M160 routers, you can also create a **cty** session to the components if the components are not online.

4. Type the **show nvram** command to view the NVRAM information.
5. Type the **show syslog messages** command to view the system log messages.

Sample Output 1

```
user@host> start shell
% su
Password: ****
root@host% vty sfm0
```

```

```

4. Type the **clear nvram** command, for example:

```
SFM3(host vty)# clear nvram
FPC1(host vty)# clear nvram
```

Check Packet Forwarding Engine Microkernel Core Files

Purpose If you observe disruption to the Packet Forwarding Engine microkernel, check the **/var/crash** directory for any core files created around the time of the crash.

Action To check the **/var/crash** directory, use the following Junos OS CLI operational mode command:

```
user@host> file list detail /var/crash
```

Sample Output

```
user@host> file list detail /var/crash
var/crash:
total 456630
-rw-r--r--  1 root  wheel   6814720 Dec 18 08:03 core-FPC4.100111808032
-rw-r--r--  1 root  wheel  65613824 Dec 10 04:58 core-SCB.100111004570
-rw-r--r--  1 root  wheel  65613824 Dec 19 00:23 core-SCB.100111900221
-rw-r--r--  1 root  wheel  65545216 Feb  9 20:46 core-SCB.101010920452
```

Meaning The sample output lists the contents of the `/var/crash/` directory. Check the date and timestamp for any core files created around the time of the crash. In the example above, four core files are listed.

List the Core Files Generated by the Crash

Purpose To list the core files generated by the crash.

Action To list the core files, follow these steps:

1. Exit from the CLI environment and create a UNIX-level shell by entering the **start shell** command:

```
user@host> start shell
```

2. Type **su** and the root password when prompted. You are now in the shell and the prompt is **%** instead of **>**, for example:

```
% su
Password: ****
```

3. Change the directory to `/var/crash` and type **ls -l**, for example:

```
root@host% cd /var/crash
root@host% ls -l
```

4. Look for any core files created around the time of the crash.

Sample Output user@host> start shell

```
% su
Password: ****
root@host% cd /var/crash
root@host% ls -l
total 456630
-rw-r--r--  1 root  wheel   6814720 Dec 18 08:03 core-FPC4.100111808032
-rw-r--r--  1 root  wheel  65613824 Dec 10 04:58 core-SCB.100111004570
-rw-r--r--  1 root  wheel  65613824 Dec 19 00:23 core-SCB.100111900221
-rw-r--r--  1 root  wheel  65545216 Feb  9 20:46 core-SCB.101010920452
```

Meaning The sample output shows the current core files for the different components on the router; for example, `core-FPC4.100111808032` and `core-SCB.100111004570`.

Compress the Core Files

Purpose gzip is a compression utility used to compress the core files. Files created using the **gzip** command end with the file extension **.gz**. Compress the core files if they are larger than 50 MB.

Action To compress the core files with gzip, use the following command from the shell:

```
root@host% gzip filename
```

Sample Output root@host% gzip core-SCB.101010920452

Meaning The contents of the core file are compressed into a single compressed file named **core-SCB.10101092045.gz**. The **gzip** command preserves the mode, ownership, and timestamps of files when compressing or decompressing them.

Configure a Primary Path

Action To configure a primary path with an ERO list, bandwidth, and priority, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols mpls
```

2. Configure the primary ERO list:

```
[edit protocols mpls]
user@host# set path path-name address strict
```

For example:

```
[edit protocols mpls]
user@R1# set path via-r2 10.0.12.14 strict
user@R1# set path via-r2 10.0.24.2 strict
```

3. Configure the LSP:

```
[edit protocols mpls]
user@host# set label-switched-path lsp-path-name to destination;
```

For example:

```
[edit protocols mpls]
user@R1# set label-switched-path r1-to-r5 to 192.168.5.1;
```

4. Configure the primary path:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@host# set primary primary-name
```

For example:

```
[edit protocols mpls label-switched-path r1-to-r5]
```

```
user@R1# set primary via-r2
```

5. Configure the bandwidth:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# set primary primary-name bandwidth bandwidth
```

For example:

```
[edit protocols mpls label-switched-path r1-to-r5]  
user@R1# set primary via-r2 bandwidth 35m
```

6. Configure the priority value:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# set primary primary-name priority reservation-priority setup-priority
```

For example:

```
[edit protocols mpls label-switched-path r1-to-r5]  
user@R1# set primary via-r2 priority 6 6
```

7. Verify and commit the configuration:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@host# show  
user@host# commit
```

Sample Output The sample output below illustrates the configuration of the primary path on ingress router R1.

```
[edit protocols mpls]  
user@R1# show  
label-switched-path r1-to-r5 {  
  to 192.168.5.1;  
  primary via-r2 { # Bandwidth and priority configured at the primary path  
  
    bandwidth 35m; # level of the hierarchy  
    priority 6 6; # Priority setup and hold values  
  }  
}  
path via-r2 { # Primary ERO list  
  10.0.12.14 strict;  
  10.0.24.2 strict;  
[...Output truncated...]  
  
[edit protocols mpls]  
user@R1# commit  
commit complete
```

Meaning The sample output shows a label-switched path (LSP) with bandwidth and priority applied to only one primary path. The same parameters specified one level up in the hierarchy, at the `[edit protocols mpls label-switched-path lsp-path-name]` hierarchy level, affect all paths.

The path, **via-r2**, specifies the complete strict path from the ingress to the egress routers through **10.0.12.14**, **10.0.24.2**, in that order. There cannot be any intermediate routers

except the ones specified. However, there can be intermediate routers between 10.0.24.2 and the egress router because the egress router is not specifically listed in the path statement. To prevent intermediate routers before egress, configure the egress router as the last router, with a strict type.

Ensuring That Secondary Paths Establish When Resources Are Diminished

The Junos OS does not require that a primary and secondary path share the same parameters. You may decide to configure your primary paths with strict resource requirements, and configure your secondary paths with less strict requirements, allowing your secondary paths to establish more readily during periods of diminished resources.

Action To ensure that secondary paths establish when resources are diminished, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit protocols mpls]
user@host# edit label-switched-path lsp-path-name
```

For example:

```
[edit protocols mpls]
user@R1# edit label-switched-path r1-to-r4
```

2. Configure the bandwidth for the primary path, and do not configure any bandwidth for the secondary path:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@host# set primary primary-name bandwidth bandwidth
```

For example:

```
[edit protocols mpls label-switched-path r1-to-r4]
user@R1# set primary via-r2 bandwidth 35m
```

3. Verify and commit the configuration:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@host# show
user@host# commit
```

Sample Output The sample output below illustrates a bandwidth configuration on ingress router R1.

```
[edit protocols mpls]
user@R1# show
label-switched-path r1-to-r4 {
  to 192.168.4.1;
  primary via-r2 {
    bandwidth 35m;
  }
  secondary via-r7 { # In this example, bandwidth is not configured for the
    secondary path.
      standby;      # However you could configure a bandwidth value different
    from           # that on the primary path.
  }
}
[...Output truncated...]
```

Meaning The sample output shows the primary path **via-r2** requires 35 Mbps of bandwidth, while secondary path **via-r7** has no constraints. The primary path is configured with strict resource requirements, while the secondary path is configured with no bandwidth requirements, allowing the secondary path to establish more readily during periods of diminished resources. One thing to keep in mind when configuring a secondary path without bandwidth requirements is that it can be subject to traffic loss due to congestion.

One-to-One Backup Overview

Fast reroute or one-to-one backup is a short-term solution to reduce packet loss associated with a particular LSP. One-to-one backup is appropriate under the following circumstances:

- Protection of a small number of LSPs relative to the total number of LSPs.
- Path selection criteria, such as bandwidth, priority, and link coloring for detour paths is critical.
- Control of individual LSPs is important.

In one-to-one backup, the ingress router adds the fast reroute object to the RSVP Path message requesting that downstream routers establish detours. Downstream routers generate Path messages and establish detours to avoid the downstream link or node. Detours are always calculated to avoid the immediate downstream link and node, providing against both link and node failure, as shown in [Figure 97 on page 1177](#).

Figure 97: One-to-One Backup Detours

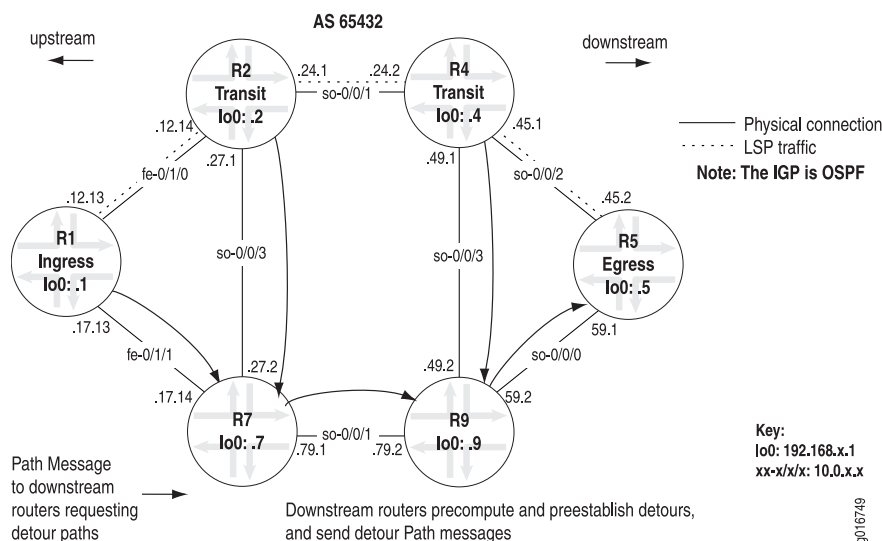

Figure 97 on page 1177 shows a network with one LSP configured from the ingress router R1 to the egress router R5, transiting R2 and R4. The following detours are established:

- R1 creates a detour to R5 via R7 and R9
- R2 creates a detour to R5 via R7 and R9
- R4 creates a detour to R5 via R9

Each detour is dedicated to a particular LSP traversing the router (one detour to one LSP). If the network topology has insufficient links and nodes, it may be impossible to establish a detour. Also, detour paths are not meant for long-term use because they may provide inadequate bandwidth and can result in congestion on the links. As soon as the ingress router calculates a new path avoiding the failure, traffic is redirected along the new path, detours are torn down, and new detours established.

Configure Link Protection

Purpose Configuring link protection is a two-part process. The first part involves configuring link protection on the RSVP interface, and the second part sets link protection for any LSPs traversing the protected link that require use of the bypass path.

Action To configure link protection, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit protocols rsvp interface type-fpc/pic/port
```

For example:

```
[edit]
user@R1# edit protocols rsvp interface fe-0/1/0
```

2. Configure link protection for the interface:

```
[edit protocols rsvp interface type-fpc/pic/port]
user@R1# set link-protection
```

3. Verify the link protection configuration for the interface:

```
[edit protocols rsvp interface type-fpc/pic/port]
user@R1# show
```

4. Configure link protection for LSPs requiring use of the bypass path:

```
[edit protocols rsvp interface fe-0/1/0.0]
user@R1# top
[edit]
user@R1# edit protocols mpls label-switched-path lsp-path-name
```

For example:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp2-r1-to-r5
```

5. Configure link protection for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# set link-protection
```

6. Verify and the link protection configuration for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# show
user@R1# commit
```

Sample Output The following sample output illustrates the configuration of the link protection on ingress router R1 in the network shown in [Figure 81 on page 982](#):

```
[edit protocols rsvp]
user@R1# show
interface fe-0/1/0.0 {
  link-protection; #Protection for the RSVP interface
}

[edit protocols mpls label-switched-path lsp2-r1-to-r5]
user@R1# up

[edit protocols mpls]
user@R1# show
label-switched-path lsp2-r1-to-r5 { #Path level of the hierarchy
  #to 192.168.5.1;
  link-protection;

[edit protocols mpls]
user@R1# commit
commit complete
```

Meaning The sample output shows link protection for a specific interface. After link protection is configured, a bypass path is signaled to avoid that link in case of a failure. Having a bypass path available does not in itself provide protection for LSPs that traverse the protected

link. You must configure link protection on the ingress router for each LSP that will benefit from the bypass path.

Configuring and Verifying Link Protection

The following sections describe the steps you must take to configure and verify link protection (many-to-one backup):

1. [Configure Link Protection on page 1179](#)
2. [Verify That Link Protection Is Up on page 1180](#)

Configure Link Protection

Purpose Configuring link protection is a two-part process. The first part involves configuring link protection on the RSVP interface, and the second part sets link protection for any LSPs traversing the protected link that require use of the bypass path.

Action To configure link protection, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit protocols rsvp interface type-fpc/pic/port
```

 For example:

```
[edit]
user@R1# edit protocols rsvp interface fe-0/1/0
```
2. Configure link protection for the interface:

```
[edit protocols rsvp interface type-fpc/pic/port]
user@R1# set link-protection
```
3. Verify the link protection configuration for the interface:

```
[edit protocols rsvp interface type-fpc/pic/port]
user@R1# show
```
4. Configure link protection for LSPs requiring use of the bypass path:

```
[edit protocols rsvp interface fe-0/1/0.0]
user@R1# top
[edit]
user@R1# edit protocols mpls label-switched-path lsp-path-name
```

 For example:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp2-r1-to-r5
```
5. Configure link protection for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# set link-protection
```
6. Verify the link protection configuration for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]  
user@R1# show  
user@R1# commit
```

Sample Output The following sample output illustrates the configuration of the link protection on ingress router R1 in the network shown in [Figure 81 on page 982](#):

```
[edit protocols rsvp]  
user@R1# show  
interface fe-0/1/0.0 {  
    link-protection; #Protection for the RSVP interface  
}  
  
[edit protocols mpls label-switched-path lsp2-r1-to-r5]  
user@R1# up  
  
[edit protocols mpls]  
user@R1# show  
label-switched-path lsp2-r1-to-r5 { #Path level of the hierarchy  
    #to 192.168.5.1;  
    link-protection;  
}  
  
[edit protocols mpls]  
user@R1# commit  
commit complete
```

Meaning The sample output shows link protection for a specific interface. After link protection is configured, a bypass path is signaled to avoid that link in case of a failure. Having a bypass path available does not in itself provide protection for LSPs that traverse the protected link. You must configure link protection on the ingress router for each LSP that will benefit from the bypass path.

Verify That Link Protection Is Up

Purpose When you verify link protection, you must check that the bypass LSP is up. You can also check the number of LSPs protected by the bypass. In the network shown in [Figure 81 on page 982](#), a bypass path should be up to protect the link between R1 and R2, or next-hop 10.0.12.14, and the two LSPs traversing the link, *lsp2-r1-to-r5* and *lsp1-r6-to-r0*.

Action To verify link protection (many-to-one backup), enter the following Junos OS CLI operational mode commands on the ingress router:

```
user@host> show mpls lsp extensive  
user@host> show rsvp session detail  
user@host> show rsvp interface
```

Sample Output

```
user@R1> show mpls lsp extensive | no-more  
Ingress LSP: 1 sessions
```

```

```

Meaning The sample output from ingress router **R1** shows the ingress, egress, and transit LSPs for **R1**. Some information is similar to that found in the **show mpls lsp** command. However, because link protection is an RSVP feature, information about bypass paths is provided. The bypass path appears as a separate RSVP ingress session for the protected interface, as indicated by the **Type** field.

The bypass path name is automatically generated. By default, the name appears as **Bypass > interface-address**, where the interface address is the next downstream router's interface (**10.0.12.14**). The explicit route **10.0.17.14 10.0.27.1** for the session shows **R7** as the transit node and **R2** as the egress node.

Within the ingress RSVP section of the output, the LSP originating at **R1** (**lsp2-r1-to-r5**) is shown requesting link protection. Since a bypass path is in place to protect the downstream link, **lsp2-r1-to-r5** is associated with the bypass, as indicated by the **Link protected LSP** field.

The egress section of the output shows the return LSP **r5-to-r1**, which is not protected.

The transit section of the output shows link protection requested by **lsp1-r6-to-r0**. Since a bypass path is in place to protect the downstream link, **lsp1-r6-to-r0** is associated with

the bypass, as indicated by the **Link protected LSP** field. Also included in the transit section of the output is the return LSP **r0-to-r6**, which is not protected.

Sample Output

```
user@R1> show rsvp interface
RSVP interface: 4 active
```

Interface	State	Active resv	Subscription	Static BW	Available BW	Reserved BW	Highwater mark
fe-0/1/0.0	Up	2	100%	100Mbps	100Mbps	0bps	35Mbps
fe-0/1/1.0	Up	1	100%	100Mbps	100Mbps	0bps	0bps
fe-0/1/2.0	Up	0	100%	100Mbps	100Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

Meaning The sample output from ingress router **R1** shows the number of LSPs going through the interfaces configured on **R1**. The **Active resv** field shows the number of LSPs for each interface. For example, interface **fe-0/1/0.0** between **R1** and **R2** has two active reservations, **lsp1-r6-to-r0** and **lsp2-r1-to-r5**; interface **fe-0/1/1.0** between **R1** and **R7** has one, the bypass (**10.0.12.14**); interface **fe-0/1/2.0** between **R6** and **R1** has no LSP reservations; and interface **so-0/0/3.0** between **R6** and **R1** has one LSP reservation, **lsp1-r6-to-r0**.

Configure Node-Link Protection

Configuring node-link protection is a two-part process. The first part involves configuring node-link protection for any LSPs traversing the protected node that require use of the bypass path, and the second part sets link protection on the outgoing RSVP interface on routers in the LSP.

Action To configure node-link protection, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp-path-name
```

For example:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp2-r1-to-r5
```
2. Configure node-link protection for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# set node-link-protection
```
3. Verify the node-link protection configuration for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# show
```
4. Configure link protection for the interface:

```
[edit protocols]
user@R1# edit protocols rsvp interface interface-name
```

For example:

```
[edit protocols]
user@R1# edit protocols rsvp interface fe-0/1/0
```

5. Configure link protection:

```
[edit protocols rsvp interface interface-name]
user@R1# set link-protection
```

6. Verify the link protection configuration for the interface, and commit both configurations:

```
[edit protocols rsvp interface interface-name]
user@R1# show
user@R1# commit
```

7. Repeat Step 1 through Step 3 on any other ingress routers that have LSPs requiring use of the bypass path.
8. Repeat Step 4 and Step 5 on routers with outgoing interfaces in the LSP.

Sample Output The following sample output shows the configuration of node-link protection on ingress router R1 in the network shown in [Figure 81 on page 982](#):

```
[edit protocols mpls label-switched-path lsp2-r1-to-r5]
user@R1# up

[edit protocols mpls]
user@R1# show
label-switched-path lsp2-r1-to-r5 { #Label-switched-path level of the hierarchy

    to 192.168.5.1;
    node-link-protection; #LSP node-link protection

[edit protocols rsvp]
user@R1# show
interface fe-0/1/0.0 {
    link-protection; #Link protection for the RSVP interface
}

[edit protocols rsvp]
user@R1# commit
commit complete
```

Meaning The sample output shows the configuration of node-link protection for an LSP. After node-link protection is configured, bypass paths are signaled to avoid the protected link or node in case of failure. Having bypass paths available does not in itself provide protection for LSPs that traverse the protected node. You must include the **node-link-protection** statement on the ingress router for each LSP that will benefit from the bypass path.

Configuring and Verifying Node-Link Protection

The following section describes the steps you must take to configure and verify many-to-one backup.

1. [Configure Node-Link Protection on page 1186](#)
2. [Verify That Node-Link Protection Is Up on page 1187](#)

Configure Node-Link Protection

Configuring node-link protection is a two-part process. The first part involves configuring node-link protection for any LSPs traversing the protected node that require use of the bypass path, and the second part sets link protection on the outgoing RSVP interface on routers in the LSP.

Action To configure node-link protection, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp-path-name
```

For example:

```
[edit]
user@R1# edit protocols mpls label-switched-path lsp2-r1-to-r5
```

2. Configure node-link protection for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# set node-link-protection
```

3. Verify the node-link protection configuration for the LSP:

```
[edit protocols mpls label-switched-path lsp-path-name]
user@R1# show
```

4. Configure link protection for the interface:

```
[edit protocols]
user@R1# edit protocols rsvp interface interface-name
```

For example:

```
[edit protocols]
user@R1# edit protocols rsvp interface fe-0/1/0
```

5. Configure link protection:

```
[edit protocols rsvp interface interface-name]
user@R1# set link-protection
```

6. Verify the link protection configuration for the interface, and commit both configurations:

```
[edit protocols rsvp interface interface-name]
user@R1# show
user@R1# commit
```

7. Repeat Step 1 through Step 3 on any other ingress routers that have LSPs requiring use of the bypass path.
8. Repeat Step 4 and Step 5 on routers with outgoing interfaces in the LSP.

Sample Output The following sample output shows the configuration of node-link protection on ingress router R1 in the network shown in [Figure 81 on page 982](#):

```
[edit protocols mpls label-switched-path lsp2-r1-to-r5]
user@R1# up

[edit protocols mpls]
user@R1# show
label-switched-path lsp2-r1-to-r5 { #Label-switched-path level of the hierarchy
    to 192.168.5.1;
    node-link-protection; #LSP node-link protection

[edit protocols rsvp]
user@R1# show
interface fe-0/1/0.0 {
    link-protection; #Link protection for the RSVP interface
}

[edit protocols rsvp]
user@R1# commit
commit complete
```

Meaning The sample output shows the configuration of node-link protection for an LSP. After node-link protection is configured, bypass paths are signaled to avoid the protected link or node in case of failure. Having bypass paths available does not in itself provide protection for LSPs that traverse the protected node. You must include the **node-link-protection** statement on the ingress router for each LSP that will benefit from the bypass path.

Verify That Node-Link Protection Is Up

Purpose After you configure node-link protection, you must check that bypass paths are up. You can also check the number of LSPs protected by the bypass paths. In the network shown in [Figure 5 on page 106](#), two bypass paths should be up: one next-hop bypass path protecting the link between R1 and R2 (or next-hop 10.0.12.14), and a next-next-hop bypass path avoiding R2.

Action To verify node-link protection (many-to-one backup), enter the following Junos OS CLI operational mode commands on the ingress router. You can also issue the commands on transit routers and other routers used in the bypass path for slightly different information.

```
show mpls lsp (See Sample Output on page ?)
show mpls lsp extensive (See Sample Output on page 973)
```

show rsvp interface (See [Sample Output on page 974](#))
 show rsvp interface extensive (See [Sample Output on page 975](#))
 show rsvp session detail (See [Sample Output on page 976](#))

Sample Output

```
user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPname

Total 2 displayed, Up 2, Down 0
```

Meaning Sample output from R1 for the **show mpls lsp** command shows a brief description of the state of configured and active LSPs for which R1 is the ingress, transit, and egress router. All LSPs are up. R1 is the ingress router for **lsp2-r1-to-r5**, and the egress router for return LSP **r5-to-r1**. Two LSPs transit R1, **lsp1-r6-to-r0** and the return LSP **r0-to-t6**. For more detailed information about the LSP, include the **extensive** option when you issue the **show mpls lsp** command.

```

Sample Output user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

```

Meaning Sample output from R1 for the **show mpls lsp extensive** command shows detailed information about all LSPs for which R1 is the ingress, egress, or transit router, including all past state history and the reason why an LSP failed. All LSPs are up. The main two LSPs **lsp2-r1-to-r5** and **lsp1-r6-to-r0** have node-link protection as indicated by the **Node/Link protection desired** field in the ingress and transit sections of the output. In the ingress section of the output, the **Link-protection Up** field shows that **lsp2-r1-to-r5** has link protection up. In the transit section of the output, the **Type: Node/Link protected LSP** field shows that **lsp1-r6-to-r0** has node-link protection up, and in case of failure will use the bypass **LSP Bypass->10.0.12.14->10.0.24.2**.

Sample Output

```

user@R1> show rsvp interface
RSVP interface: 4 active

```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
fe-0/1/0.0	Up	2	100%	100Mbps	100Mbps	0bps	0bps
fe-0/1/1.0	Up	1	100%	100Mbps	100Mbps	0bps	0bps
fe-0/1/2.0	Up	0	100%	100Mbps	100Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

Meaning Sample output from R1 for the **show rsvp interface** command shows four interfaces enabled with RSVP (**Up**). Interface **fe-0/1/0.0** has two active RSVP reservations (**Active resv**) that might indicate sessions for the two main LSPs, **lsp1-r6-to-r0** and **lsp2-r1-to-r5**. Interface **fe-0/1/0.0** is the connecting interface between R1 and R2, and both LSPs are configured with a strict path through **fe-0/1/0.0**. For more detailed information about what is happening on interface **fe-0/1/0.0**, issue the **show rsvp interface extensive** command.

Sample Output

```

user@R1> show rsvp interface extensive
RSVP interface: 3 active
fe-0/1/0.0 Index 67, State Ena/Up
  NoAuthentication, NoAggregate, NoReliable, LinkProtection

    2 Jul 14 14:50:04 CSPF: computation result accepted
    1 Jul 14 14:49:34 CSPF failed: no route toward 10.0.24.2
[...Output truncated...]

```

Meaning Sample output from R1 for the **show rsvp interface extensive** command shows more detailed information about the activity on all RSVP interfaces (3). However, only output for **fe-0/1/0.0** is shown. Protection is enabled (**Protection: On**), with two bypass paths (**Bypass: 2**) protecting two LSPs (**Protected LSP: 2**). All LSPs are protected, as indicated by the **Unprotected LSP: 0** field. The first bypass **Bypass->10.0.12.14** is a link protection bypass path (**Type: LP**), protecting the link between R1 and R2 **fe-0/1/0.0**. The second bypass path **10.0.12.14->10.0.24.2** is a node-link protected LSP, avoiding R2 in case of node failure.

```

```

Meaning Sample output from R1 shows detailed information about the RSVP sessions active on R1. All sessions are up, with two ingress sessions, one egress session, and two transit sessions.

Within the ingress section, the first session is a bypass path, as indicated by the **Type: Bypass LSP** field; and the second session is a protected LSP (**lsp2-r1-to-r5**) originating on R1, as indicated by the **Type: Node/Link protected LSP** field.

Conclusion Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection and node-link protection are facility-based methods used to reduce the amount of time needed to reroute LSP traffic. These protection methods are often compared to fast reroute—the other Junos OS LSP protection method.

While fast reroute protects LSPs on a one-to-one basis, link protection and node-link protection protect multiple LSPs by using a single, logical bypass LSP. Link protection provides robust backup support for a link, node-link protection bypasses a node or a link, and both types of protection are designed to interoperate with other vendor equipment.

Such functionality makes link protection and node-link protection excellent choices for scalability, redundancy, and performance in MPLS-enabled networks.

Configure IS-IS as the IGP

Before you can run MPLS on your network, you should have an IGP running on all specified routers and interfaces. The IGP can be either IS-IS or OSPF. For the steps to configure OSPF, see “Configure OSPF as the IGP” on page 1202.

Figure 98: IS-IS Network Topology

The IS-IS IGP in the MPLS network in Figure 98 on page 1194 consists of the following:

- All routers are configured for Level 2, therefore default CSPF LSPs can occur.
- All routers are in IS-IS area 49.0004. However, the routers in this network could be in any area because Level 2 adjacencies occur between all directly connected Level 2 routers regardless of which area they are in.
- Level 2 adjacencies between all directly connected Level 2 routers as follows:

- R1 is adjacent to R2, R3, and R5
- R2 is adjacent to R1, R3, R4, and R6
- R3 is adjacent to R1, R2, R4, and R6
- R4 is adjacent to R2, R3, R5, and R6
- R5 is adjacent to R1, R4, and R6
- R6 is adjacent to R2, R3, R4, and R5

When you configure IS-IS as the IGP, you must enable IS-IS on the router, configure International Organization for Standardization (ISO) addressing, and enable IS-IS on all router interfaces.

You can enable IS-IS throughout the rest of the network by repeating Step 1, “[Enable IS-IS on Routers in Your Network on page 1195](#)” through Step 3, “[Enable IS-IS on Router Interfaces on page 1199](#)” as appropriate on other routers until all routers and interfaces establish IS-IS adjacencies.

To configure IS-IS and establish IS-IS adjacencies, follow these steps:

1. [Enable IS-IS on Routers in Your Network on page 1195](#)
2. [Configure ISO Addressing on page 1197](#)
3. [Enable IS-IS on Router Interfaces on page 1199](#)
4. [Verify That IS-IS Adjacencies Are Established on page 1200](#)

Enable IS-IS on Routers in Your Network

Action To enable IS-IS on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols isis
```
2. Disable Level 1 if appropriate for your network:

```
[edit protocols isis]
user@host# set level 1 disable
```
3. Configure the interface:

```
[edit protocols isis]
user@host# edit interface type-fpc/pic/port level level-number metric metric
```
4. Disable the management interface if you have included the **interface all** statement, as shown in [Sample Output 2 on page 1196](#):

```
[edit protocols isis]
user@host# set interface fxp0.0 disable
```
5. Include the loopback interface (**lo0**) if you have listed all interfaces separately, as shown in [Sample Output 1 on page 1196](#):

```
[edit protocols isis]
user@host# set interface lo0.0
```

6. Set the loopback interface (lo0) to passive:

```
[edit protocols isis]
user@R1# set interface lo0 passive
```

7. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output 1

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit protocols isis

[edit protocols isis]
user@R1# set level 1 disable

[edit protocols isis]
user@host# edit interface all level 2 metric 10

[edit protocols isis]
user@host# set interface lo0.0

[edit protocols isis]
user@host# set interface lo0 passive

[edit protocols isis]
user@R1# show
level 1 disable;
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface lo0.0;
    passive;
}

[edit protocols isis]
user@R1# commit
commit complete
```

Sample Output 2

```
[edit protocols isis]
user@R6# show
level 1 disable;
interface all {
    level 2 metric 15;
}
interface fxp0.0 {
    disable;
}
interface lo0.0 {
    passive;
}
```

Meaning Sample Output 1 shows that IS-IS Level 1 is disabled, making this a Level 2 router. When all routers in the network are running at one IS-IS level (Level 2), default CSPF LSPs can occur.

Because **R1** in Sample Output 1 has all IS-IS enabled interfaces listed, including the loopback interface (**lo0**), you do not need to include the **disable** statement for the management interface (**fxp0**). All interfaces have unit number **0**, the default if a unit number is not specified. When you configure an interface at the **[edit protocols isis]** hierarchy level, and you do not include the logical unit, the default **0** is appended to the interface name, for example, **so-0/0/1.0**.

Sample Output 2 does not list the interfaces configured with IS-IS; instead, all interfaces are configured, including the loopback interface (**lo0**) and the management interface (**fxp0**). Therefore, you do not need to include a separate statement for the loopback (**lo0**) interface. However, in this instance, it is best practice to disable the management interface (**fxp0**) so that IS-IS packets are not sent over it. If you do not disable the management interface (**fxp0**) when you include the **interface-all** statement, the IS-IS protocol can form adjacencies over the management backbone, but traffic does not flow because transit traffic does not go out of the management interface.

Sample Output 2 also shows that all interfaces on **R6** are configured with a metric of **15**. A metric is not required to configure IS-IS on your interfaces. The default metric value is **10** (with the exception of the loopback [**lo0**] interface, which has a default metric of **0**). A metric is included to demonstrate that you can configure a metric for IS-IS if the default (**10**) is not appropriate for your network.

Both sample outputs show the **passive** statement included in the configuration of the loopback (**lo0**) interface. Including the **passive** statement is considered best practice and ensures the following:

- Protocols are not run over the loopback (**lo0**) interface
- When the router ID (RID) is configured manually, ensures that the loopback (**lo0**) interface is advertised to other networks.

NOTE: It is considered best practice to configure the RID manually to avoid duplicate RID problems.

Configure ISO Addressing

Purpose For a router to support IS-IS, you must configure an ISO network entity title (NET) address on one of the router's interfaces, preferably the loopback interface (**lo0**).

Action To configure ISO addressing, follow these steps:

1. In configuration mode, go to the following hierarchy level:
[edit]

```
user@host# edit interfaces
```

2. Include a NET address for the loopback interface:

```
[edit interfaces]
```

```
user@host# set lo0 unit number family iso address address
```

3. Verify and commit the configuration:

```
user@host# show
```

```
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit interfaces

[edit interfaces]
user@R1# set lo0 unit 0 family iso address 49.0004.1000.0000.0001.00

[edit interfaces]
user@R1# show
[...Output truncated...]
lo0 {
    unit 0 {
        family inet {
            address 10.0.0.1/32;
        }
        family iso {
            address 49.0004.1000.0000.0001.00;
        }
    }
}

[edit interfaces]
user@R1# commit
commit complete
```

Meaning The sample output shows that the loopback (**lo0**) interface is configured with the NET address **49.0004.1000.0000.0001.00**. The loopback interface (**lo0**) becomes a point of connection from the router to the IS-IS network. Every router in an IS-IS network must have at least one ISO NET address that identifies a point of connection to the IS-IS network. The NET address is generally configured on the loopback (**lo0**) interface. Routers that participate in multiple areas can have multiple NET addresses.

All the routers in the network share a Level 2 database containing identical information. A common Level 2 database occurs in this case because all adjacencies are Level 2, and all routers are within the same IS-IS area (**49.0004**). Level 2 LSP flooding reaches all routers in the network due to the presence of a single level. For more information on determining the NET address, see the *Junos Routing Protocols Configuration Guide*.

Enable IS-IS on Router Interfaces

Purpose Enable reception and transmission of ISO protocol data units (PDUs) on each router interface in the network with the **family** statement, which identifies which protocol packets are accepted into the interfaces. For example, valid IS-IS packets are dropped if the interface is not configured with the **family iso** statement.

Action To configure support for IS-IS on router interfaces in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit interfaces
```
2. Configure IS-IS:

```
[edit interfaces]
user@host# set type-fpc/pic/port unit number family iso
```
3. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit interfaces

[edit interfaces]
user@R1# set so-0/0/2 unit 0 family iso

[edit interfaces]
user@R1# show
[...Output truncated...]
so-0/0/2 {
  unit 0 {
    family inet {
      address 10.1.13.1/30;
    }
    family iso;
  }
}

[edit interfaces]
user@R1# commit
commit complete
```

Meaning The sample output shows that the interface **so-0/0/2** is configured with IS-IS.

Verify That IS-IS Adjacencies Are Established

Purpose After configuring IS-IS, you must verify that neighboring routers have formed adjacencies with each other.

Action To verify IS-IS adjacencies, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show isis adjacency
```

Sample Output

```
user@R1> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R2          2 Up         25
so-0/0/1.0     R5          2 Up         23
so-0/0/2.0     R3          2 Up         20
```

```
user@R3> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R4          2 Up         25
so-0/0/1.0     R2          2 Up         25
so-0/0/2.0     R1          2 Up         26
so-0/0/3.0     R6          2 Up         25
```

```
user@R6> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R5          2 Up         19
so-0/0/1.0     R4          2 Up         22
so-0/0/2.0     R2          2 Up         22
so-0/0/3.0     R3          2 Up         19
```

Sample Output

```
user@R1> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R2          2 Up         25
so-0/0/1.0     R5          2 Up         23
so-0/0/2.0     R3          2 Up         20
```

```
user@R3> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R4          2 Up         25
so-0/0/1.0     R2          2 Up         25
so-0/0/2.0     R1          2 Up         26
so-0/0/3.0     R6          2 Up         25
```

```
user@R6> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R5          2 Up         19
so-0/0/1.0     R4          2 Up         22
so-0/0/2.0     R2          2 Up         22
so-0/0/3.0     R3          2 Up         19
```

Meaning The sample output from the ingress, transit, and egress routers shows that all routers in the network have formed IS-IS adjacencies.

Verify That IS-IS Adjacencies Are Established

Purpose After configuring IS-IS, you must verify that neighboring routers have formed adjacencies with each other.

Action To verify IS-IS adjacencies, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show isis adjacency
```

Sample Output

```
user@R1> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R2          2 Up         25
so-0/0/1.0     R5          2 Up         23
so-0/0/2.0     R3          2 Up         20
```

```
user@R3> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R4          2 Up         25
so-0/0/1.0     R2          2 Up         25
so-0/0/2.0     R1          2 Up         26
so-0/0/3.0     R6          2 Up         25
```

```
user@R6> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R5          2 Up         19
so-0/0/1.0     R4          2 Up         22
so-0/0/2.0     R2          2 Up         22
so-0/0/3.0     R3          2 Up         19
```

Sample Output

```
user@R1> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R2          2 Up         25
so-0/0/1.0     R5          2 Up         23
so-0/0/2.0     R3          2 Up         20
```

```
user@R3> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R4          2 Up         25
so-0/0/1.0     R2          2 Up         25
so-0/0/2.0     R1          2 Up         26
so-0/0/3.0     R6          2 Up         25
```

```
user@R6> show isis adjacency
Interface      System      L State      Hold (secs) SNPA
so-0/0/0.0     R5          2 Up         19
so-0/0/1.0     R4          2 Up         22
so-0/0/2.0     R2          2 Up         22
so-0/0/3.0     R3          2 Up         19
```

Meaning The sample output from the ingress, transit, and egress routers shows that all routers in the network have formed IS-IS adjacencies.

Configure OSPF as the IGP

Before you can run MPLS on your network, you must have an IGP running on all specified routers and interfaces. The IGP can be either OSPF or IS-IS. For the steps to configure IS-IS, see “Configure IS-IS as the IGP” on page 1194.

Figure 99: OSPF Network Topology

The OSPF IGP in the MPLS network in Figure 98 on page 1194 consists of the following:

- All routers are configured for the backbone OSPF area 0.0.0.0.
- All routers have the RID manually configured to avoid possible problems when the OSPF RID changes; for example, when multiple loopback addresses are configured.
- All routers have traffic engineering enabled. When traffic engineering is enabled for OSPF, the SPF algorithm takes into account the various LSPs configured under MPLS and configures OSPF to generate link-state advertisements (LSAs) that carry traffic engineering parameters. These routes are installed into the primary routing table **inet.0**, but the LSPs are installed by default into the **inet.3** routing table.
- Adjacencies between all OSPF neighbors are as follows:
 - R1 is adjacent to R2, R3, and R5
 - R2 is adjacent to R1, R3, R4, and R6
 - R3 is adjacent to R1, R2, R4, and R6
 - R4 is adjacent to R2, R3, R5, and R6

- R5 is adjacent to R1, R4, and R6
- R6 is adjacent to R2, R3, R4, and R5

When you configure OSPF as the IGP, you must enable OSPF and traffic engineering on the router. We also recommend that you manually configure the RID and include the loopback interface (**lo0**) at the **[edit protocols ospf]** hierarchy level.

You can enable OSPF throughout the rest of the network by repeating this step as appropriate on other routers until all routers and interfaces establish OSPF neighbors.

To configure OSPF and establish OSPF neighbors, follow these steps:

1. [Enable OSPF on Routers in Your Network on page 1203](#)
2. [Verify That OSPF Neighbors Are Established on page 1205](#)

Enable OSPF on Routers in Your Network

Action To enable OSPF on routers in your MPLS network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols ospf
```
2. Configure the area and the interface:

```
[edit protocols ospf]
user@host# set area area-id interface type-fpc/pic/port
```
3. Disable the management interface if you have included the **interface all** statement in the previous step:

```
[edit protocols ospf]
user@host# set interface fxp0.0 disable
```
4. Include the loopback (**lo0**) interface if you intend to manually configure the RID:

```
[edit protocols ospf]
user@host# set area 0.0.0.0 interface lo0
```
5. Set the loopback interface (**lo0**) to passive:

```
[edit protocols ospf]
user@host# set area 0.0.0.0 interface lo0 passive
```
6. Configure traffic engineering:

```
[edit protocols ospf]
user@host# set traffic-engineering
```
7. Manually configure the RID at the **[routing-options]** hierarchy level:

```
[edit]
user@host# edit routing-options
[edit routing-options]
user@host# set router-id router-id
```
8. Verify and commit the entire configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R6> edit
Entering configuration mode

[edit]
user@R6# edit protocols ospf

[edit protocols ospf]
user@R6# set area 0.0.0.0 interface so-0/0/0.0

[edit protocols ospf]
user@R6# set area 0.0.0.0 interface lo0

[edit protocols ospf]
user@R6# set area 0.0.0.0 interface lo0 passive

[edit protocols ospf]
user@R6# set traffic-engineering

[edit protocols ospf]
user@R6# show
traffic-engineering;
area 0.0.0.0 {
    interface so-0/0/0.0;
    interface so-0/0/1.0;
    interface so-0/0/2.0;
    interface so-0/0/3.0;
    interface lo0.0 {
        passive;
    }
}

[edit protocols ospf]
user@R6# commit
commit complete

[edit]
user@R6# edit routing-options

[edit routing-options]
user@R6# set router-id 10.0.0.6

[edit routing-options]
user@R6# show
[...Output truncated...]
router-id 10.0.0.6;
autonomous-system 65432;

[edit routing-options]
user@R6# commit
commit complete
```

Meaning The sample output shows that OSPF, with traffic engineering, is enabled on the interfaces on egress router **R6**. In addition, the RID is configured manually to avoid possible problems when the OSPF RID changes; for example, when multiple loopback addresses are

configured. The RID uniquely identifies the router within the OSPF network. It is transmitted within the LSAs used to populate the link-state database and calculate the shortest-path tree. In a link-state network, it is important that two routers do not share the same RID value, otherwise IP routing problems may occur.

The sample outputs also shows the **passive** statement included in the configuration of the loopback (**lo0**) interface. Including the **passive** statement is considered best practice and ensures the following:

- Protocols are not run over the loopback (**lo0**) interface
- When the router ID (RID) is configured manually, ensures that the loopback (**lo0**) interface is advertised to other networks.

Verify That OSPF Neighbors Are Established

Purpose After configuring OSPF, you must verify that neighboring routers have formed adjacencies with each other.

Action To verify OSPF neighbors, enter the following Junos OS CLI operational mode command:

```
user@host> show ospf neighbor
```

Sample Output

```
user@R1> show ospf neighbor
```

Address	Interface	State	ID	Pri	Dead
10.1.12.2	so-0/0/0.0	Full	10.0.0.2	128	37
10.1.15.2	so-0/0/1.0	Full	10.0.0.5	128	35
10.1.13.2	so-0/0/2.0	Full	10.0.0.3	128	38

```
user@R3> show ospf neighbor
```

Address	Interface	State	ID	Pri	Dead
10.1.34.2	so-0/0/0.0	Full	10.0.0.4	128	38
10.1.23.1	so-0/0/1.0	Full	10.0.0.2	128	35
10.1.13.1	so-0/0/2.0	Full	10.0.0.1	128	37
10.1.36.2	so-0/0/3.0	Full	10.0.0.6	128	36

```
user@R6> show ospf neighbor
```

Address	Interface	State	ID	Pri	Dead
10.1.56.1	so-0/0/0.0	Full	10.0.0.5	128	39
10.1.46.1	so-0/0/1.0	Full	10.0.0.4	128	37
10.1.26.1	so-0/0/2.0	Full	10.0.0.2	128	36
10.1.36.1	so-0/0/3.0	Full	10.0.0.3	128	37

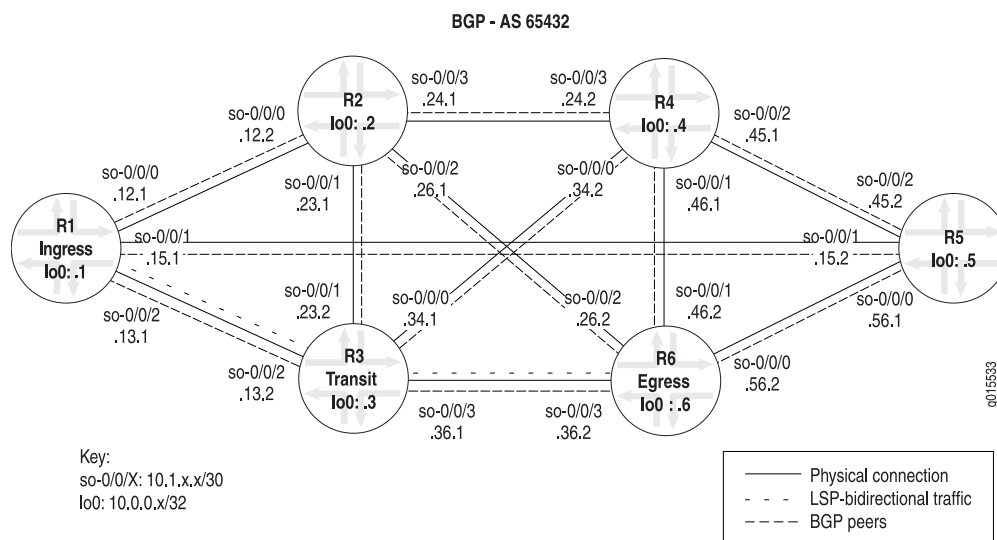

Meaning The sample output from the ingress, transit, and egress routers shows that all routers in the network have formed OSPF neighbor adjacencies.

Set Up BGP on Routers in Your Network

Before BGP can function in your MPLS network, you must define the autonomous system (AS) number on the routers in your network, and configure at least one group that includes at least one peer.

Optionally, you can configure a routing policy. The routing policy allows you to control the information shared with BGP neighbors and provides the opportunity to filter and modify the information you receive.

Figure 100: BGP Network Topology

The BGP configuration in the MPLS network in [Figure 100 on page 1206](#) consists of the following:

- A full-mesh IBGP topology, using AS 65432.
- All IBGP sessions peer between loopback addresses because significant stability advantages are gained.
- All routers are configured with one group, **group internal**.
- A **send-statics** policy on routers R1 and R6 allows a new route to be advertised into the network.

The example network uses IS-IS Level 2 and a policy to create routes that are reachable through the LSP. However, IS-IS Level 1 or an OSPF area can be used and the policy omitted if the network has existing BGP traffic.

You can set up BGP throughout the rest of the network by repeating Step 1, “[Define the Local Autonomous System](#)” on page 1207 through Step 3, “[Configure a Simple Routing Policy](#)” on page 1209 as appropriate on other routers until all routers are set up with BGP.

To set up BGP on routers in your network, follow these steps:

1. [Define the Local Autonomous System](#) on page 1207
2. [Configure BGP Neighbor Connections](#) on page 1208
3. [Configure a Simple Routing Policy](#) on page 1209
4. [Verify That BGP Sessions Are Up](#) on page 1211

Define the Local Autonomous System

Purpose Before BGP can function, you need to define a local AS number on the routers in your network. In the example network in [Figure 100 on page 1206](#), all routers are in AS 65432.

Action To define an AS number on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit routing-options
```

2. Configure all interfaces to a specific AS:

```
[edit routing-options]
user@host# set autonomous-system as-number
```

3. Verify the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit routing-options

[edit routing-options]
user@R1# set autonomous-system 65432

[edit routing-options]
user@R1# show
[...Output truncated...]
autonomous-system 65432;

[edit routing-options]
user@R6# commit
commit complete
```

Meaning The output shows that router **R1** resides in **AS 65432**. All other routers in the example network shown in [Figure 100 on page 1206](#) also reside in **AS 65432**.

Configure BGP Neighbor Connections

Purpose You must configure at least one group that includes at least one peer for BGP to run in your network. First determine which neighbors are internal or external to your local AS boundary. Internal neighbors are inside your local AS boundary. In the example network shown in [Figure 100 on page 1206](#), all the routers are in one AS and are therefore internal. In this example, all IBGP sessions peer between loopback addresses because significant stability advantages are gained. For more information about configuring BGP neighbor connections, see the *Junos Routing Protocols Configuration Guide*.

Action To configure BGP neighbor connections, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols bgp
```

2. Configure the group and peer's IP address:

```
[edit protocols bgp]
user@host# set group group-name type type neighbor neighbor-address
```

NOTE: For external neighbors, use the following form of the command that includes the peer's AS number:

```
user@host# set group group-name neighbor neighbor-address peer-as
peer-as-number
```

3. Configure the local address:

```
[edit protocols bgp]
user@host# set group group-name local-address local-address
```

4. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit protocols bgp

[edit protocols bgp]
user@R1# set group internal type internal neighbor 10.0.0.2

[edit protocols bgp]
```

```

users@R1# set group internal local-address 10.0.0.1

[edit protocols bgp]
user@R1# show
group internal {
    type internal;
    local-address 10.0.0.1;
    neighbor 10.0.0.2;
    neighbor 10.0.0.3;
    neighbor 10.0.0.5;
    neighbor 10.0.0.4;
    neighbor 10.0.0.6;
}

[edit protocols bgp]
user@R1# commit
commit complete

```

Meaning The sample output shows that router **R1** is in an internal group with five BGP neighbors. The **local-address** statement is included in this example configuration because IBGP is used. It is considered best practice to configure a local address when you use an IBGP. BGP messages are sourced from the loopback address because the **local-address** statement is included in the configuration. Generally, you would not configure a local address when external BGP is configured.

Configure a Simple Routing Policy

Purpose Routing policy allows you to control the information shared with BGP neighbors and provides the opportunity to filter and modify the information you receive. Typically, a network is injected into BGP using a policy. This may also be done through a static route. In the network in [Figure 100 on page 1206](#), a static route export policy is used to inject routes into BGP.

Action To configure a simple routing policy, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```

[edit]
user@host# edit routing-options

```

2. Configure a static route for redistribution to other autonomous systems:

```

[edit routing-options]
user@host# set static route destination/24 reject

```

3. Configure a routing policy that matches and accepts the configured static routes into BGP updates:

```

[edit]
user@host# edit policy-options
[edit policy-options]
user@host# set policy-statement policy-name term term-name from route-filter
address exact
user@host# set policy-statement policy-name term term-name then accept

```

4. Apply the policy created in Step 3 to all BGP neighbors:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# set export policy-name
```

5. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit routing-options

[edit routing-options]
user@R1# set static route 100.100.1.0/24 reject

[edit routing-options]
user@R1# show
[...Output truncated...]
    route 100.100.1.0/24 reject;
}
router-id 10.0.0.1;
autonomous-system 65432;

[edit routing-options]
user@R1# top

[edit]
user@R1# edit policy-options

[edit policy-options]
user@R1# set policy-statement send-statics term statics from route-filter 100.100.1.0/24 exact

[edit policy-options]
user@R1# set policy-statement send-statics term statics then accept

[edit policy-options]
user@R1# top

[edit]
user@R1# edit protocols bgp

[edit protocols bgp]
user@R1# set export send-statics

[edit protocols bgp]
user@R1# show
export send-statics;
group internal {
    type internal;
    local-address 10.0.0.1;
    neighbor 10.0.0.2;
    neighbor 10.0.0.3;
```

```

neighbor 10.0.0.5;
neighbor 10.0.0.4;
neighbor 10.0.0.6;
}

```

```

[edit protocols bgp]
user@R1# commit
commit complete

```

Meaning The sample output shows that routing policy **send-statics** is configured on the router. The routing policy matches and accepts the configured static routes into the routing table and injects the routes into BGP updates. Typically, a routing policy is applied at the group level, although it can be applied at the global level, as shown in this example.

Verify That BGP Sessions Are Up

Purpose After configuring BGP, you must verify that BGP peers are established and the sessions are up.

Action To verify BGP peers and sessions, enter the following Junos OS CLI operational mode command:

```
user@host> show bgp summary
```

Sample Output

```
user@R1> show bgp summary
```

```
Groups: 1 Peers: 5 Down peers: 0
```

Table	Tot Paths	Act Paths	Suppressed	History	Damp	State	Pending
inet.0	1	1	0	0	0	0	0
Peer	AS	InPkt	OutPkt	OutQ	Flaps	Last Up/Dwn	State #Active/Received/Damped...
10.0.0.2	65432	1369	1373	0	0	11:25:11	0/0/0 0/0/0
10.0.0.3	65432	1369	1372	0	0	11:24:55	0/0/0 0/0/0
10.0.0.4	65432	1369	1372	0	0	11:25:03	0/0/0 0/0/0
10.0.0.5	65432	1369	1372	0	0	11:25:07	0/0/0 0/0/0
10.0.0.6	65432	1343	1344	0	1	11:10:55	1/1/0 0/0/0

```
user@R3> show bgp summary
```

```
Groups: 1 Peers: 4 Down peers: 0
```

Table	Tot Paths	Act Paths	Suppressed	History	Damp	State	Pending
inet.0	2	2	0	0	0	0	0
Peer	AS	InPkt	OutPkt	OutQ	Flaps	Last Up/Dwn	State #Active/Received/Damped...
10.0.0.1	65432	1375	1375	0	6	11:26:57	1/1/0 0/0/0
10.0.0.2	65432	43016	43016	0	0	2w0d22h	0/0/0 0/0/0
10.0.0.4	65432	74460	74461	0	0	3w4d20h	0/0/0 0/0/0
10.0.0.6	65432	1347	1347	0	6	11:13:10	1/1/0 0/0/0

```
user@R6> show bgp summary
```

```
Groups: 1 Peers: 5 Down peers: 0
```

Table	Tot Paths	Act Paths	Suppressed	History	Damp	State	Pending
inet.0	1	1	0	0	0	0	0
Peer	AS	InPkt	OutPkt	OutQ	Flaps	Last Up/Dwn	State #Active/Received/Damped...
10.0.0.1	65432	1348	1350	0	0	11:13:46	1/1/0 0/0/0
10.0.0.2	65432	1347	1351	0	0	11:14:02	0/0/0 0/0/0
10.0.0.3	65432	1347	1350	0	0	11:13:58	0/0/0 0/0/0

10.0.0.4	65432	1347	1350	0	0	11:13:54 0/0/0	0/0/0
10.0.0.5	65432	1347	1350	0	0	11:13:50 0/0/0	0/0/0

Meaning The sample output from the ingress, transit, and egress routers shows that all routers in the network shown in [Figure 100 on page 1206](#) have BGP peers established and sessions up.

Define the Local Autonomous System

Purpose Before BGP can function, you need to define a local AS number on the routers in your network. In the example network in [Figure 100 on page 1206](#), all routers are in AS 65432.

Action To define an AS number on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit routing-options
```

2. Configure all interfaces to a specific AS:

```
[edit routing-options]
user@host# set autonomous-system as-number
```

3. Verify the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit routing-options

[edit routing-options]
user@R1# set autonomous-system 65432

[edit routing-options]
user@R1# show
[...Output truncated...]
autonomous-system 65432;

[edit routing-options]
user@R6# commit
commit complete
```

Meaning The output shows that router R1 resides in AS 65432. All other routers in the example network shown in [Figure 100 on page 1206](#) also reside in AS 65432.

Enable MPLS and RSVP

You can enable MPLS and RSVP throughout the rest of the network by repeating Step 1, “[Enable MPLS and RSVP on Routers](#)” on page 1213 and Step 2, “[Enable MPLS on Transit Router Interfaces](#)” on page 1214 as appropriate on other routers until all routers are enabled with MPLS and RSVP.

1. [Enable MPLS and RSVP on Routers](#) on page 1213
2. [Enable MPLS on Transit Router Interfaces](#) on page 1214

Enable MPLS and RSVP on Routers

Action To enable MPLS and RSVP on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols
```

2. Configure MPLS and RSVP:

```
[edit protocols]
user@host# set mpls interface all
user@host# set rsvp interface all
```

3. Disable the management interface for MPLS and RSVP:

```
[edit protocols mpls]
user@host# set interface fxp0.0 disable
[edit protocols rsvp]
user@host# set interface fxp0.0 disable
```

4. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit protocols

[edit protocols]
user@R1# set mpls interface all

[edit protocols]
user@R1# set rsdp interface all

[edit protocols]
user@R1# show
rsdp {
    interface all;
    interface fxp0.0 {
        disable;
    }
}
mpls {
    interface all;
    interface fxp0.0 {
        disable;
    }
}

[edit protocols]
user@R1# commit
commit complete
```

Meaning The sample output shows that router **R1** has MPLS and RSVP enabled on all interfaces, except for the management interface (**fxp0.0**), which is disabled. It is considered best practice to disable the management interlace (**fxp0.0**) for MPLS and RSVP to preempt any problems.

Typically every interface that you want to use is listed. For an example of a router configured with specific interfaces, see [“Enable IS-IS on Routers in Your Network” on page 1195](#).

Enable MPLS on Transit Router Interfaces

Purpose Even though transit interfaces are enabled with MPLS when you include the **family mpls** statement in the configuration, MPLS as a whole is not configured on your router or in your network. You must complete all five steps in this topic to have the MPLS protocol running on your network.

NOTE: The management interface (fxp0) and the loopback interface (lo0) are not transit interfaces.

Action To configure transit interfaces to support MPLS, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit interfaces
```
2. Configure MPLS:

```
[edit interfaces]
user@host# set type-fpc/pic/port unit number family mpls
```
3. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit interfaces

[edit interfaces]
user@R1# set so-0/0/2 unit 0 family mpls

[edit interfaces]
user@R1# show
so-0/0/2 {
  unit 0 {
    family inet {
      address 10.1.13.1/30;
    }
    family iso;
    family mpls;
  }
}

[edit interfaces]
user@R1# commit
commit complete
```

Meaning The sample output shows that the interface **so-0/0/2** is configured to support MPLS. The **family** statement identifies which protocol packets are accepted into the interfaces. For example, valid MPLS packets are dropped if the interface is not configured with the MPLS protocol.

Enable MPLS and RSVP on Routers

Action To enable MPLS and RSVP on routers in your network, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols
```

2. Configure MPLS and RSVP:

```
[edit protocols]
user@host# set mpls interface all
user@host# set rsvp interface all
```

3. Disable the management interface for MPLS and RSVP:

```
[edit protocols mpls]
user@host# set interface fxp0.0 disable
[edit protocols rsvp]
user@host# set interface fxp0.0 disable
```

4. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit protocols

[edit protocols]
user@R1# set mpls interface all

[edit protocols]
user@R1# set rsvp interface all

[edit protocols]
user@R1# show
rsvp {
  interface all;
  interface fxp0.0 {
    disable;
  }
}
mpls {
  interface all;
  interface fxp0.0 {
    disable;
  }
}

[edit protocols]
user@R1# commit
commit complete
```

Meaning The sample output shows that router **R1** has MPLS and RSVP enabled on all interfaces, except for the management interface (**fxp0.0**), which is disabled. It is considered best practice to disable the management interlace (**fxp0.0**) for MPLS and RSVP to preempt any problems.

Typically every interface that you want to use is listed. For an example of a router configured with specific interfaces, see [“Enable IS-IS on Routers in Your Network” on page 1195](#).

Enable MPLS on Transit Router Interfaces

Purpose Even though transit interfaces are enabled with MPLS when you include the **family mpls** statement in the configuration, MPLS as a whole is not configured on your router or in your network. You must complete all five steps in this topic to have the MPLS protocol running on your network.

NOTE: The management interface (fxp0) and the loopback interface (lo0) are not transit interfaces.

Action To configure transit interfaces to support MPLS, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]  
user@host# edit interfaces
```
2. Configure MPLS:

```
[edit interfaces]  
user@host# set type-fpc/pic/port unit number family mpls
```
3. Verify and commit the configuration:

```
user@host# show  
user@host# commit
```

Sample Output

```
user@R1> edit
Entering configuration mode

[edit]
user@R1# edit interfaces

[edit interfaces]
user@R1# set so-0/0/2 unit 0 family mpls

[edit interfaces]
user@R1# show
so-0/0/2 {
  unit 0 {
    family inet {
      address 10.1.13.1/30;
    }
    family iso;
    family mpls;
  }
}

[edit interfaces]
user@R1# commit
commit complete
```

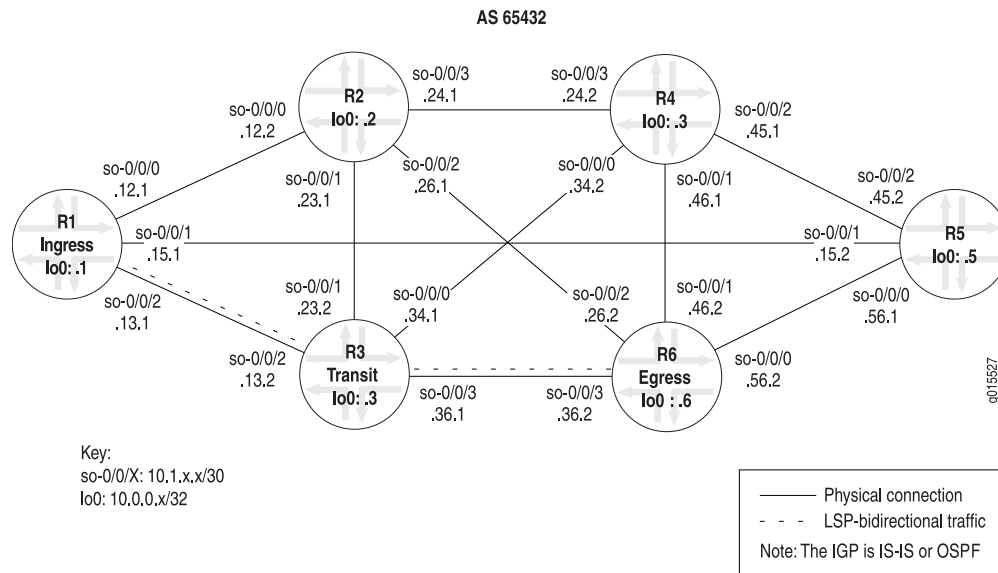

Meaning The sample output shows that the interface **so-0/0/2** is configured to support MPLS. The **family** statement identifies which protocol packets are accepted into the interfaces. For example, valid MPLS packets are dropped if the interface is not configured with the MPLS protocol.

Verifying the MPLS Configuration

After configuring MPLS on your network, you must verify the correct configuration of both the MPLS and RSVP protocols. Incorrect configuration of either protocol prevents successful LSP creation.

[Figure 101 on page 1219](#) illustrates the network with the example configurations used in this topic.

Figure 101: MPLS Network Topology

To verify the MPLS configuration, follow these steps:

1. [Verify MPLS Interfaces on page 1219](#)
2. [Verify the RSVP Protocol on page 1221](#)
3. [Verify RSVP Interfaces on page 1222](#)
4. [Verify Protocol Families on page 1224](#)

Verify MPLS Interfaces

Purpose If the MPLS protocol is not configured correctly on the routers in your network, the interfaces are not able to perform MPLS switching.

Action To verify MPLS interfaces, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show mpls interface
```

Sample Output 1

The following sample output is for all routers in the network shown in *MPLS Network Topology*.

```
user@R1> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0     Up         <none>
so-0/0/1.0     Up         <none>
so-0/0/2.0     Up         <none>
```

```
user@R2> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0     Up         <none>
so-0/0/1.0     Up         <none>
```

```
so-0/0/2.0      Up      <none>
so-0/0/3.0      Up      <none>

user@R3> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/2.0      Up      <none>
so-0/0/3.0      Up      <none>

user@R4> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/2.0      Up      <none>
so-0/0/3.0      Up      <none>

user@R5> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/2.0      Up      <none>

user@R6> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/2.0      Up      <none>
so-0/0/3.0      Up      <none>
```

Sample Output 2

```
user@R6> show mpls interface
Interface      State      Administrative groups
so-0/0/0.0      Up      <none>
so-0/0/1.0      Up      <none>
so-0/0/3.0      Up      <none>          # so-0/0/2.0 is missing
```

Sample Output 3

```
user@host> show mpls interface
MPLS not configured
```

Meaning Sample Output 1 shows that all MPLS interfaces on all routers in the network are enabled (**Up**) and can perform MPLS switching. If you fail to configure the correct interface at the **[edit protocols mpls]** hierarchy level or include the **family mpls** statement at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level, the interface cannot perform MPLS switching, and does not appear in the output for the **show mpls interface** command.

Administrative groups are not configured on any of the interfaces shown in the example network in *MPLS Network Topology*. However, if they were, the output would indicate which affinity class bits are enabled on the router.

Sample Output 2 shows that interface **so-0/0/2.0** is missing and therefore might be incorrectly configured. For example, the interface might not be included at the **[edit protocols mpls]** hierarchy level, or the **family mpls** statement might not be included at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level. If the interface is configured correctly, RSVP might not have signaled over this interface yet. For more information on determining which interface is incorrectly configured, see [“Verify Protocol Families” on page 1224](#).

Sample Output 3 shows that the MPLS protocol is not configured at the **[edit protocols mpls]** hierarchy level.

Verify the RSVP Protocol

Purpose If the RSVP protocol is not enabled on the routers in your network, the interface cannot signal LSPs.

Action To verify that the RSVP protocol is enabled, enter the following Junos OS CLI command:

```
user@host> show rsvp version
```

Sample Output

```
user@R1> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol           = Enabled
  R(refresh timer)        = 30 seconds
  K(keep multiplier)      = 3
  Preemption              = Normal
  Soft-preemption cleanup = 30 seconds
  Graceful restart        = Disabled
  Restart helper mode     = Enabled
  Restart time            = 0 msec
```

Meaning The sample output shows that the RSVP protocol is enabled on **R1**. The supported RSVP protocol is version 1, as defined in RFC 2205.

The RSVP refresh timer is set to 30 seconds, indicating that every 30 seconds, plus or minus 50 percent, the router will refresh the RSVP state with its directly connected neighbors by sending either a **Path** or a **Resv** message. The variable refresh time helps prevent harmonic oscillations in network traffic caused by periodic protocol updates.

The keepalive multiplier, **K(keep multiplier)**, is input to a formula that helps determine the lifetime of an RSVP session. The session lifetime is reset each time the state is updated. The lifetime represents the duration of an RSVP session that does not receive any state updates (**Path** or **Resv** messages). The formula is:

$$\text{RSVP session lifetime} = (\text{keep-multiplier} + 0.5) * 1.5 * \text{refresh-time}$$

The RSVP **preemption** state is currently configured for normal preemption, indicating that only an LSP with a stronger priority can preempt an existing session; that is, the setup value of the new LSP is lower than the hold value of the existing LSP. Other options

include **aggressive** preemption, which always preempts when there is insufficient bandwidth, and **disabled**, which prevents any preemption, regardless of LSP priority values.

Graceful restart is currently disabled and **Restart helper mode** is enabled. There are four combinations for **Graceful restart** and **restart helper mode**:

1. Both **Graceful restart** and **Restart helper mode** are enabled.
2. **Graceful restart** is enabled but **Restart helper mode** is disabled. An LSR with this configuration can restart gracefully but cannot help a neighbor with its restart and recovery procedures.
3. **Graceful restart** is disabled but **Restart helper mode** is enabled. An LSR with this configuration can only help a restarting neighbor. It cannot restart gracefully itself.
4. **Graceful restart** and **Restart helper mode** are both disabled. This configuration completely disables RSVP graceful restart (including restart and recovery procedures and helper mode). It is the same as an LSR that is not supported by RSVP graceful restart.

Restart time is the estimated time (in milliseconds) for an LSR to restart the RSVP traffic engineering component. In the example output, the restart time is 0 milliseconds, indicating that it is disabled.

The output is identical for all routers in the network shown in *MPLS Network Topology*.

Verify RSVP Interfaces

Purpose If the RSVP protocol is not configured correctly on the routers in your network, the interfaces cannot signal LSPs.

Action To verify RSVP interfaces, enter the following Junos OS CLI operational mode command:

```
user@host> show rsvp interface
```

Sample Output 1

```
user@R1> show rsvp interface
```

```
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	2	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R2> show rsvp interface
```

```
RSVP interface: 5 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R3> show rsvp interface
```

```
RSVP interface: 5 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R4> show rsvp interface
```

```
RSVP interface: 5 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R5> show rsvp interface
```

```
RSVP interface: 4 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
user@R6> show rsvp interface
```

```
RSVP interface: 5 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/3.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

Sample Output 2

```
user@R6> show rsvp interface
```

```
RSVP interface: 3 active
```

Interface	State	Active resv	Subscr- ption	Static BW	Available BW	Reserved BW	Highwater mark
so-0/0/0.0	Up	1	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/1.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps
so-0/0/2.0	Up	0	100%	155.52Mbps	155.52Mbps	0bps	0bps

```
#so-0/0/3.0 is missing
```

Sample Output 3

```
user@host# show rsvp interface
```

```
RSVP not configured
```

Meaning Sample Output 1 shows that all interfaces on all routers in the network are enabled with RSVP, including the management interface (**fxp0**). The output for all routers in the network includes similar information, so we will examine R6 in detail.

R6 has five interfaces enabled with RSVP (**Up**). Interface **so-0/1/1.0** has a single active RSVP reservation (**Active resv**) that did not change the default subscription percentage of 100 percent (**Subscription**). Interface **so-0/1/1.0** did not assign a static bandwidth (**Static BW**) to the logical unit and therefore inherited 100 percent of the physical interface rate as the bandwidth available (**Available BW**) for RSVP sessions. Interface **so-0/1/1.0** has no bandwidth assigned (**Reserved BW**), and no RSVP bandwidth allocation at any single instant in time (**Highwater mark**).

Sample Output 2 shows that interface **so-0/0/3.0** is missing. If you do not configure the correct interface at the **[edit protocols rsvp]** hierarchy level, the interface cannot signal LSPs, and does not appear in the output for the **show rsvp interface** command.

Sample Output 3 shows that the RSVP protocol is not configured at the **[edit protocols rsvp]** hierarchy level.

Verify Protocol Families

Purpose If a logical interface does not have MPLS enabled, it cannot perform MPLS switching. This step allows you to quickly determine which interfaces are configured with MPLS and other protocol families.

Action To verify the protocol families configured on the routers in your network, enter the following Junos OS CLI operational mode command:

```
user@host> show interfaces terse
```

Sample Output 1

```
user@R1> show interfaces terse
Interface      Admin Link Proto Local Remote
so-0/0/0       up   up
so-0/0/0.0     up   up   inet  10.1.12.1/30

               up    up    iso
               up    up    mpls

```

Meaning Sample Output 1 shows the interface, the administrative status of the link (**Admin**), the data link layer status of the link (**Link**), the protocol families configured on the interface (**Proto**), and the local and remote addresses on the interface.

All interfaces on all routes in the network shown in [Figure 101 on page 1219](#) are administratively enabled and functioning at the data link layer with MPLS and IS-IS, and have an **inet** address. All are configured with an IPv4 protocol family (**inet**), and have the IS-IS (**iso**) and MPLS (**mpls**) protocol families configured at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level.

Sample Output 2 shows that interface **so-0/0/2.0** on **R6** does not have the **mpls** statement included at the **[edit interfaces type-fpc/pic/port unit number]** hierarchy level.

Verify the RSVP Protocol

Purpose If the RSVP protocol is not enabled on the routers in your network, the interface cannot signal LSPs.

Action To verify that the RSVP protocol is enabled, enter the following Junos OS CLI command:

```
user@host> show rsvp version
```

Sample Output

```
user@R1> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol           = Enabled
  R(refresh timer)        = 30 seconds
  K(keep multiplier)      = 3
  Preemption              = Normal
  Soft-preemption cleanup = 30 seconds
  Graceful restart        = Disabled
  Restart helper mode     = Enabled
  Restart time            = 0 msec
```

Meaning The sample output shows that the RSVP protocol is enabled on **R1**. The supported RSVP protocol is version 1, as defined in RFC 2205.

The RSVP refresh timer is set to 30 seconds, indicating that every 30 seconds, plus or minus 50 percent, the router will refresh the RSVP state with its directly connected neighbors by sending either a **Path** or a **Resv** message. The variable refresh time helps prevent harmonic oscillations in network traffic caused by periodic protocol updates.

The keepalive multiplier, **K(keep multiplier)**, is input to a formula that helps determine the lifetime of an RSVP session. The session lifetime is reset each time the state is updated. The lifetime represents the duration of an RSVP session that does not receive any state updates (**Path** or **Resv** messages). The formula is:

$$\text{RSVP session lifetime} = (\text{keep-multiplier} + 0.5) * 1.5 * \text{refresh-time}$$

The RSVP **preemption** state is currently configured for normal preemption, indicating that only an LSP with a stronger priority can preempt an existing session; that is, the setup value of the new LSP is lower than the hold value of the existing LSP. Other options include **aggressive** preemption, which always preempts when there is insufficient bandwidth, and **disabled**, which prevents any preemption, regardless of LSP priority values.

Graceful restart is currently disabled and **Restart helper mode** is enabled. There are four combinations for **Graceful restart** and **restart helper mode**:

1. Both **Graceful restart** and **Restart helper mode** are enabled.
2. **Graceful restart** is enabled but **Restart helper mode** is disabled. An LSR with this configuration can restart gracefully but cannot help a neighbor with its restart and recovery procedures.
3. **Graceful restart** is disabled but **Restart helper mode** is enabled. An LSR with this configuration can only help a restarting neighbor. It cannot restart gracefully itself.
4. **Graceful restart** and **Restart helper mode** are both disabled. This configuration completely disables RSVP graceful restart (including restart and recovery procedures and helper mode). It is the same as an LSR that is not supported by RSVP graceful restart.

Restart time is the estimated time (in milliseconds) for an LSR to restart the RSVP traffic engineering component. In the example output, the restart time is 0 milliseconds, indicating that it is disabled.

The output is identical for all routers in the network shown in *MPLS Network Topology*.

Define a Load-Balancing Policy

Purpose On the ingress or transit router, you can include a policy statement that performs load balancing on all routes. For information on including a policy statement that performs load balancing on specific routes, see “Configuring Per-Packet Load Balancing” in the *Junos Routing Protocols Configuration Guide*.

Action On the ingress or transit router, to define a load-balancing policy for all routes, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit policy-options
```
2. Define the load-balance policy and action:

```
[edit policy-options]
user@host# set policy-statement policy-name then load-balance per-packet
```
3. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```

user@R6> edit
Entering configuration mode

[edit]
user@R6# edit policy-options

[edit policy-options]
user@R6# set policy-statement load-balance-traffic then load-balance per-packet

[edit policy-options]
user@R6# show
policy-statement load-balance-traffic {
    then {
        load-balance per-packet;
    }
}

[edit policy-options]
user@R6# commit
commit complete

```

Meaning The sample output from ingress router **R6** shows the process for configuring load balancing. On an Internet Processor I ASIC, packets with the same parameters are spread across multiple equal-cost next hops; while an Internet Processor II ASIC sends packets with the same parameters to the same next hop, since they are in the same flow. The Junos OS command to turn on load balancing uses the action **load-balance per-packet**, which is misnamed in relation to the Internet Processor II ASIC. On the Internet Processor II ASIC, this command actually enables per-flow load balancing.

Use the traceroute Command to Verify MPLS Labels

Purpose You can use the **traceroute** command to verify that packets are being sent over the LSP.

Action To verify MPLS labels, enter the following Junos OS CLI operational mode command, where **host-name** is the IP address or the name of the remote host:

```
user@host> traceroute host-name
```

Sample Output 1

```

user@R1> traceroute 100.100.6.1
traceroute to 100.100.6.1 (100.100.6.1), 30 hops max, 40 byte packets
 1  10.1.12.2 (10.1.12.2)  0.861 ms  0.718 ms  0.679 ms
    MPLS Label=100048 CoS=0 TTL=1 S=1
 2  10.1.24.2 (10.1.24.2)  0.822 ms  0.731 ms  0.708 ms
    MPLS Label=100016 CoS=0 TTL=1 S=1
 3  10.1.46.2 (10.1.46.2)  0.571 ms !N  0.547 ms !N  0.532 ms !N

```

Sample Output 2

```

user@R1> traceroute 10.0.0.6
traceroute to 10.0.0.6 (10.0.0.6), 30 hops max, 40 byte packets

```

```
1 10.1.13.2 (10.1.13.2) 0.605 ms 0.548 ms 0.503 ms
2 10.0.0.6 (10.0.0.6) 0.761 ms 0.676 ms 0.675 ms
```

Meaning Sample Output 1 shows that MPLS labels are used to forward packets through the network. Included in the output is a label value (**MPLS Label=100048**), the time-to-live value (**TTL=1**), and the stack bit value (**S=1**).

The **MPLS Label** field is used to identify the packet to a particular LSP. It is a 20-bit field, with a maximum value of $(2^{20}-1)$, or approximately 1,000,000.

The TTL value contains a limit on the number of hops that this MPLS packet can travel through the network (1). It is decremented at each hop, and if the TTL value drops below one, the packet is discarded.

The bottom of the stack bit value (**S=1**) indicates that is the last label in the stack and that this MPLS packet has one label associated with it. The MPLS implementation in the Junos OS supports a stacking depth of 3 on the M-series routers and up to 5 on the T-series platforms. For more information on MPLS label stacking, see RFC 3032, *MPLS Label Stack Encoding*.

MPLS labels appear in Sample Output 1 because the **traceroute** command is issued to a BGP destination where the BGP next hop for that route is the LSP egress address. The Junos OS default behavior uses LSPs for BGP traffic when the BGP next hop equals the LSP egress address.

Sample Output 2 shows that MPLS labels do not appear in the output for the **traceroute** command. If the BGP next hop does not equal the LSP egress address or the destination is an IGP route, the BGP traffic does not use the LSP. Instead of using the LSP, the BGP traffic is using the IGP (IS-IS, in this case) to reach the egress address (**R6**).

Apply the Load-Balancing Policy to the Forwarding Table

Purpose Apply the policy configured in Step 1 to routes exported from the routing table to the forwarding table.

Action To apply a load-balancing policy to the forwarding table, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit routing-options
```

2. Define a load-balance per packet action:

```
[edit routing-options]
user@host# set forwarding-table export policy-name
```

3. Verify and commit the configuration:

```
user@host# show
user@host# commit
```

Sample Output

```
[edit]
user@R6# edit routing-options

[edit routing-options]
user@R6# set forwarding-table export load-balance-traffic

[edit routing-options]
user@R6# show
static {
[...Output truncated...]
}
router-id 192.168.6.1;
autonomous-system 65432;
forwarding-table {
    export load-balance-traffic;
}

[edit routing-options]
user@R6# commit
commit complete
```

Meaning The sample output shows the process for applying a load-balancing policy to export routes from the routing table to the forwarding table.

Fast Reroute Problem Overview

Problem **Description:** Incorrect configuration is a common mistake when trying to establish protection for an MPLS LSP. Protection with either fast reroute or link protection requires a **per-packet load-balance policy** exported at the **[edit routing-options forwarding-table]** hierarchy level. Correctly configured protection for an MPLS LSP results in two next-hop forwarding table entries per destination, either an incoming MPLS label or an IP destination.

[Figure 102 on page 1232](#) illustrates a network topology with link protection and load balancing enabled to ensure that routes are correctly placed in to the forwarding table.

Figure 102: Fast Reroute Problem Network

The network shown in [Figure 102 on page 1232](#) illustrates an MPLS-based VPN with traffic protection and load balancing, consisting of the following:

- All physical interfaces addresses are from the 10.0.x.x/30 address space.
- All loopback addresses are from the 192.168.x.1/32 block.
- The IGP is a single-area (Area 0) OSPF.
- RSVP is deployed as the MPLS signaling protocol between PE routers.
- LSPs (r2-r4 and r4-r2) established between PE routers.
- MP-IBGP mesh between PE routers, loopback peering, and VPN-IPv4 NLRI.
- CE-PE link running EBGP.
- Full-mesh Layer 3 VPN between CE1 and CE2.
- Traffic protection for the link between the PE1 and P routers.
- Load balancing on PE1.

The overall goal of this network is to provide point-to-point connectivity between the two CE routers and traffic protection in the core of the network.

Symptom In the network shown in [Figure 102 on page 1232](#), the external symptom is that local repair is taking about one second to complete, which is slow. Use the **show route forwarding-table vpn vpn-a destination** command to check that the correct routes are included in the forwarding table. In the example output below, there is only one route installed in the forwarding table, when for fast local repair, there should be multiple next hops installed.

Sample Output user@R2-PE1> show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive

```
Routing table: vpn-a.inet [Index 2]
Internet:

Destination: 192.168.5.0/24
Route type: user
Route reference: 0                      Route interface-index: 0
Flags: sent to PFE, prefix load balance
Next-hop type: indirect                 Index: 262142   Reference: 2
Next-hop type: Push 100160
Next-hop interface: so-0/0/1.0 #Only one next hop in the forwarding table.
```

Cause Slow local repair is caused by the forwarding table not including the necessary next-hops to support local repair. The forwarding table shows only a single next-hop, when local repair requires additional next-hops for fast recovery.

Troubleshooting Commands The Junos OS includes commands that are useful when troubleshooting a problem. This topic provides a brief description of each command followed by sample output, and a discussion of the output in relation to the problem.

The following commands can be used when troubleshooting a fast reroute error in an MPLS-VPN network:

```
user@R2-PE1> show configuration routing-instances vpn-a
user@R2-PE1> show configuration routing-options
user@R2-PE1> show bgp summary instance vpn-a
user@R2-PE1> show configuration protocols mpls
user@R2-PE1> show mpls lsp ingress
user@R2-PE1> show rsvp session ingress
user@R2-PE1> show rsvp session ingress detail
user@R2-PE1> show route table vpn-a 192.168.5.1 detail
user@R2-PE1> show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive
```

Sample Output The `show configuration statement-path` command is used to display a specific configuration hierarchy; in this case, to verify the correct configuration of a specific routing instance named `vpn-a`.

```
user@R2-PE1> show configuration routing-instances vpn-a
instance-type vrf ;
interface so-0/0/0.0 ;
vrf-target {
    import target:65432:100;
    export target:65432:100;
}
protocols {
    bgp {
        group CE1 {
            type external;
            peer-as 65400;
            neighbor 10.0.12.1 ;
        }
    }
}
```

Meaning The sample output for the `show configuration` command shows the current running configuration of the specific routing instance named `vpn-a` configured on the ingress PE1 router. The `vpn-a` instance configuration has a VRF table that supports EBGp routing on the PE-CE link (`so-0/0/0.0`). This interface is the correct interface for the CE1-PE1 link in the network topology shown in [Figure 102 on page 1232](#).

The VRF instance is linked to a VFR target community configured at the [edit policy-options] hierarchy level, allowing advertising of L3 VPN routes between PE routers. (See the PE1 configuration in [“Router Configurations” on page 1241](#) for the policy options configuration.) The import statement places, into the `vpn-a.inet.0` table, all received L3 VPN MP-BGP routes tagged with the correct target community. The export statement advertises and tags all routes in the `vpn-a.inet.0` table with the listed target community to all MP-BGP peers.

The BGP protocols configuration within the routing instance applies the BGP import and export policies to the exchange of BGP routes on the PE-CE routing instance.

Sample Output The **show bgp summary** command is used to display summary information about BGP and its neighbors to determine if routes are received from peers in the autonomous system (AS). In this case, information for the specified instance **vpn-a** is displayed.

```
user@R2-PE1> show bgp summary instance vpn-a
Groups: 1 Peers: 1 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
vpn-a.inet.0 11 7 0 0 0 0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Damped...
10.0.12.1 65400 2471 2473 0 0 20:35:20 Establ
vpn-a.inet.0: 5/5/0
```

Meaning The sample output for the **show bgp summary instance vpn-a** command shows that the peering session between the CE1 and PE1 routers is established, indicating that the peers are exchanging update messages.

Sample Output The **show configuration statement-path** command is used to display a specific configuration hierarchy; in this case, the MPLS hierarchy.

```
user@R2-PE1> show configuration protocols mpls
label-switched-path r2-r4 {
    to 192.168.4.1;
    link-protection ;
    primary direct ;
}
path direct {
    10.0.24.2 strict;
}
interface all;
interface fxp0.0 {
    disable;
}
```

Meaning The sample output for the **show configuration protocols mpls** command shows the current running MPLS configuration on the ingress PE1 router. The configuration include the LSP **r2-r4**, link protection, and the strict primary path **direct**.

Sample Output The **show mpls lsp** command is used to display summarized information about the configured and active LSPs on a router; in this case, the command shows only the ingress LSPs on the ingress PE1 router.

```
user@R2-PE1> show mpls lsp ingress
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPname
192.168.4.1 192.168.2.1 Up    0 direct         *      r2-r4
Total 1 displayed, Up 1, Down 0
```

Meaning The sample output for the **show mpls lsp ingress** command shows that the ingress LSP **r2-r4** is up and following the configured path **direct**.

Sample Output The **show rsvp session** command is used to display summarized information about active RSVP sessions on a router; in this case, the command shows summarized information about ingress RSVP sessions on the PE1 router

```
user@R2-PE1> show rsvp session ingress
Ingress RSVP: 2 sessions
To          From          State Rt Style Labelin Labelout LSPname
192.168.4.1 192.168.2.1 Up    0 1 SE      -        3 r2-r4
192.168.4.1 192.168.2.1 Up    0 1 SE      -    100064
Bypass->10.0.24.2
Total 2 displayed, Up 2, Down 0
```

Meaning The sample output for the **show rsvp session ingress** command shows two RSVP sessions are up; the main LSP **r2-r4** and a bypass path protecting the main LSP. Both RSVP sessions are in the Shared Explicit (**SE**) style, creating a shared reservation among for the two paths.

Sample Output The `show rsvp session ingress detail` command is used to display more detailed information about the two ingress RSVP sessions on the PE1 router.

```

user@R2-PE1> show rsvp session ingress detail
Ingress RSVP: 2 sessions

192.168.4.1
  From: 192.168.2.1, LSPstate: Up , ActiveRoute: 0

  Path MTU: received 1500
  PATH sentto: 10.0.23.14 (fe-0/1/1.0) 2001 pkts
  RESV rcvfrom: 10.0.23.14 (fe-0/1/1.0) 1736 pkts
  Explct route: 10.0.23.14 10.0.34.14
  Record route: <self> 10.0.23.14 10.0.34.14
Total 2 displayed, Up 2, Down 0

```

Meaning The sample output for the `show rsvp session ingress detail` command shows the RSVP session for the ingress LSP and the bypass path, which appears as a separate RSVP ingress session for the protected interface **10.0.24.2**. The bypass path is automatically generated. By default, the name appears as **Bypass > interface-address**, where the interface address is the next downstream router's interface (**10.0.24.2**). The explicit route **10.0.23.14 10.0.34.14** for the session shows **R3** as the transit node and **R4** as the egress node.

Sample Output The **show route table *routing-table-name*** command is used to display information about a particular routing table. In this case, the **vpn-a.inet.0** routing table.

```
user@R2-PE1> show route table vpn-a 192.168.5.1 detail
vpn-a.inet.0: 9 destinations, 13 routes (9 active, 0 holddown, 0 hidden)
192.168.5.0/24 (1 entry, 1 announced)
  *BGP      Preference: 170/-101
             Route Distinguisher: 192.168.4.1:4
             Next-hop reference count: 11
             Source: 192.168.4.1
             Next hop: via so-0/0/1.0 weight 0x1, selected
             Label-switched-path r2-r4
             Label operation: Push 100160
             Next hop: 10.0.23.14 via fe-0/1/1.0 weight 0x8001
             Label-switched-path r2-r4
             Label operation: Push 100160, Push 100064(top)
             Protocol next hop: 192.168.4.1
             Push 100160
             Indirect next hop: 8791000 262142
             State: <Secondary Active Int Ext>
             Local AS: 65432 Peer AS: 65432
             Age: 1d 5:22:31      Metric2: 1
             Task: BGP_65432.192.168.4.1+2056
             Announcement bits (1): 0-KRT
             AS path: 65400 I
             Communities: target:65432:100
             VPN Label: 100160
             Localpref: 100
             Router ID: 192.168.4.1
             Primary Routing Table bgp.13vpn.0
```

Meaning The sample output for the **show route table vpn-a 192.168.5.1 detail** command shows routes associated with the remote PE-CE location as indicated by the loopback address of the PE2 router **192.168.5.1**. In this case, there are different next hops with unequal weights (**0x1** and **0x8001**) associated with the remote location. For correct traffic protection, those two routes must appear in the forwarding table.

Sample Output The **show route forwarding-table** command displays the route entries in the kernel's forwarding table. This is the version of the forwarding table in the Routing Engine. The Routing Engine copies this table to the Packet Forwarding Engine. In this case, the set of routes installed in the forwarding table to verify that the routing protocol process (rpd) has relayed the correct information to the forwarding table for the specified destination.

```
user@R2-PE1> show route forwarding-table vpn vpn-a destination 192.168.5.1
extensive
Routing table: vpn-a.inet [Index 2]
Internet:

Destination: 192.168.5.0/24
Route type: user
Route reference: 0                               Route interface-index: 0
Flags: sent to PFE, prefix load balance
Next-hop type: indirect                           Index: 262142   Reference: 2
Next-hop type: Push 100160
Next-hop interface: so-0/0/1.0
```

Meaning The sample output for the **show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive** command shows only one next hop **so-0/0/1.0** is installed in the forwarding table, indicating that the information in the forwarding table is not correct. We would expect to see the same paths installed in the forwarding table as appear in the routing table in the output for the **show route table vpn-a 192.168.5.1 detail**.

Solution The solution is to enable load-balancing and ensure that multiple next-hop forwarding table entries appear in the forwarding table for each destination. The forwarding-table entries can be an incoming MPLS label or an IP destination.

A load-balancing policy applied to the forwarding-table is the same mechanism required for ECMP (equal-cost multipath) load-balancing to install multiple next-hops into the forwarding-table. The extra paths installed for local repair are not used for load-balancing, because the paths are differently weighted, as demonstrated in the sample output for the **show routing table** and the **show route forwarding-table** commands.

NOTE: The load-balancing policy must be applied to all provider (P) and provider-edge (PE) routers that are required to support local repair.

The following sample output shows an example load-balancing configuration and the commands used to verify that the required two next-hop entries appear in the forwarding table.

Sample Output Use the following two **show configuration *statement-path*** commands to display a specific configuration hierarchy; in this case, policy-options and routing-options.

```
user@R2-PE1> show configuration policy-options
policy-statement lbpf {
    then {
        load-balance per-packet ;
    }
}
[...Output truncated...]

user@R2-PE1> show configuration routing-options
static {
    [...Output truncated...]
    route 100.100.1.0/24 reject;
}
router-id 192.168.2.1;
route-distinguisher-id 192.168.2.1;
autonomous-system 65432;
forwarding-table {
    export lbpf ;
}
```

Meaning The sample output for the **show configuration policy-options** and **show configuration routing-options** commands shows the two parts required to configure a load balancing policy. The **lbpf** policy includes the **load-balance per-packet** statement. The policy is then applied at the **[edit routing options forwarding-table]** hierarchy level with the **export lbpf** statement. Enabling load balancing results in the export of routes from the routing table to the forwarding table, and a solution to the problem.

NOTE: The **load-balance per-packet** statement is named *per-packet* for historical reasons. When the Packet Forwarding Engine was an IP Processor-1 (before Junos 4.0), Junos supported only per-packet load balancing. When the IP Processor-II was introduced the behavior was changed to per-flow load balancing without changing the statement.

Sample Output Use the **show route forwarding-table** command to display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. In this case, the option **vpn vpn** is used to display routing table entries for the specified VPN **vpn-a**.

```
user@R2-PE1> show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive
```

```
Routing table: vpn-a.inet [Index 2]
Internet:
```

```
Destination: 192.168.5.0/24
Route type: user
Route reference: 0                      Route interface-index: 0
Flags: sent to PFE
Next-hop type: indirect                 Index: 262142   Reference: 2
Next-hop type: unilist                  Index: 262146   Reference: 1
Next-hop type: Push 100160
Next-hop interface: so-0/0/1.0   Weight: 0x1
Nexthop: 10.0.23.14
Next-hop type: Push 100160, Push 100064(top)
Next-hop interface: fe-0/1/1.0   Weight: 0x8001
```

Meaning The sample output for the **show route forwarding-table vpn vpn-a destination 192.168.5.1 extensive** command shows the correct two routes were relayed from the routing table to the forwarding table.

Conclusion In conclusion, a load balancing policy is required for link protection to work effectively. The principles are the same for the configuration of the **fast reroute** and the **node-link protection** statements.

Router Configurations The following output shows the configurations of all routers in the network. The **no-more** option entered after the pipe (|) prevents the output from being paginated if the output is longer than the length of the terminal screen.

Sample Output The following sample output is for the customer edge (CE) 1 router:

```

user@R1-CE1> show configuration | no-more
[...Output truncated...]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        address 10.0.12.1/30;
      }
      family iso;
      family mpls;
    }
  }
  fxp0 {
    unit 0 {
      family inet {
        address 192.168.70.143/21;
      }
    }
  }

Problem Establishing a GRE Tunnel Checklist

Problem **Description:** This checklist provides the links and commands for troubleshooting a case study about a problem establishing a Generalized Multiprotocol Label Switching (GMPLS) label-switched path (LSP). Specifically, the configuration of the data channel is incorrect because the configuration includes different interface types at both ends of the tunnel. The principles and solution used in this case study also apply to control channel configuration.

The checklist includes the links to a brief summary of GRE tunnels within the context of GMPLS, an example network scenario, and more detailed information about the commands used to troubleshoot and resolve the problem.

The troubleshooting process described in this case study should not be followed rigidly; it is a basis from which you can develop your own process to suit your particular situation. (See [Table 45 on page 1253](#))

Table 45: Problem Establishing a GRE Tunnel Checklist

Tasks	Command or Action
"Troubleshooting GMPLS and GRE Tunnel" on page 1254	
"Symptom" on page 1256	<pre>show mpls lsp show rsvp session</pre>
"Cause" on page 1257	The cause of the problem with the GMPLS LSP is the configuration of different interface types at both ends of the GMPLS data channel.
"Troubleshooting Commands" on page 1257	<pre>show mpls lsp extensive show rsvp session detail show link-management peer show link-management te-link show configuration protocols mpls monitor start filename show log filename</pre>
"Solution" on page 1263	<p>Configure both ends of the data channel with the same switching type.</p> <pre>show configuration protocols link-management show mpls lsp show link-management te-link</pre>
"Conclusion" on page 1264	Both ends of a GMPLS data must be the same encapsulation or interface type.

Table 45: Problem Establishing a GRE Tunnel Checklist (continued)

"Router Configurations" on page 1264	show configuration no-more

Troubleshooting GMPLS and GRE Tunnel

Problem Description: The logical control channel for GMPLS must be a point-to-point link and must have some form of IP reachability. On broadcast interfaces or when there are multiple hops between control channel peers, use a GRE tunnel for the control channel. For more detailed information on GMPLS and GRE tunnels see the *Junos MPLS Applications Configuration Guide* and the *Junos Feature Guide*.

A tunnel PIC is *not* required to configure a GRE tunnel for the GMPLS control channel. Instead, use the software-based **gre** interface, rather than the hardware-based **gr-fpc/pic/port** interface.

CAUTION: Due to restrictions to the software-based **gre** interface, the GMPLS control channel is the only supported use of the software-based **gre** interface. Any other use is expressly unsupported and might cause an application failure.

The following example shows a basic **gre** interface configuration. In this case, the tunnel source is the loopback address of the local router and the destination address is the loopback destination of the remote router. Traffic that has a next hop of the tunnel destination will use the tunnel. The tunnel is not automatically used by all the traffic passing through the interface. Only traffic with the tunnel destination as the next hop uses the tunnel.

Sample Output

```

user@R1> show configuration interfaces
[...Output truncated...]
gre {
    unit 0 {
        tunnel {
            source 10.0.12.13;
            destination 10.0.12.14;
        }
        family inet {
            address 10.35.1.6/30;
        }
        family mpls;
    }
}

```

Sample Output The following sample output for the show interfaces command shows the encapsulation type and header, the maximum speed, packets through the logical interface, the destination, and logical address.

```

user@R1> show interfaces gre
Physical interface: gre, Enabled, Physical link is Up
Interface index: 10, SNMP ifIndex: 8
  Type: GRE, Link-level type: GRE, MTU: Unlimited, Speed: Unlimited
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps
Input packets : 0
Output packets: 0

Logical interface gre.0 (Index 70) (SNMP ifIndex 47)
Flags: Point-To-Point SNMP-Traps 0x4000
  IP-Header 10.0.12.14:10.0.12.13:47:df:64:0000000000000000
  Encapsulation: GRE-NULL
Input packets : 171734
Output packets: 194560
Protocol inet, MTU: 1476
  Flags: None
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 10.35.1.4/30, Local: 10.35.1.6, Broadcast: 10.35.1.7
Protocol mpls, MTU: 1464
  Flags: None

```

The following are various requirements when you configure a GMPLS LSP using a GRE tunnel:

- The data channel must start and end on the same type of interface.
- The control channel can be a GRE tunnel that starts and ends on the same or different interface type.
- The GRE tunnel must be configured indirectly with the **peer-interface peer-name** statement at the **[edit protocol ospf]** hierarchy level.
- The GRE interface must be disabled at the **[edit protocols ospf]** and **[edit protocols rsvp]** hierarchy levels.

- Data and control channels must be defined correctly in the LMP configuration .
- It is optional to disable Constrained Shortest Path First (CSPF) with the **no-cspf** statement.

This case focuses on the incorrect configuration of the endpoints of the GRE tunnel. However, you can use a similar process and commands to diagnose other GRE tunnel problems. [Figure 103 on page 1256](#) illustrates a network topology with MPLS tunneled through a GRE interface.

Figure 103: GMPLS Network Topology

The MPLS network topology in [Figure 103 on page 1256](#) shows Juniper Networks routers configured with a GRE tunnel that consists of the following components:

- A strict GMPLS LSP path from the ingress router to the egress router.
- On the ingress router, CSPF disabled with the **no-cspf** statement at the **[edit protocol mpls label-switched-path lsp-name]** hierarchy level.
- Traffic-engineering links and control channels within the **peer** statement at the **[edit protocols link-management]** hierarchy level on all routers.
- OSPF and OSPF traffic engineering configured on all routers.
- A reference to the **peer-interface** in both OSPF and RSVP on all routers.
- A switching-type problem between **R2** and **R3**.

Symptom The LSP in the network shown in [Figure 103 on page 1256](#) is down, as indicated by the output from the **show mpls lsp** and **show rsvp session** commands, which display very similar information. The **show mpls lsp** command shows all LSPs configured on the router, as well as all transit and egress LSPs. The **show rsvp session** command displays summary information about RSVP sessions. You can use either command to verify the state of the LSP. In this case, LSP **gmpls-r1-to-r3** is down (**Dn**).

Sample Output

```

user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPName
192.168.4.1 192.168.1.1 Dn    0 -      gmpls-r1-to-r3
Bidir
Total 1 displayed, Up 0, Down 1

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

user@R1> show rsvp session
Ingress RSVP: 1 sessions
To          From          State  Rt Style Labelin Labelout LSPName
192.168.4.1 192.168.1.1 Dn    0 0 -    -    - gmpls-r1-to-r3
Bidir
Total 1 displayed, Up 0, Down 1

Egress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

Cause The cause of the problem with the GMPLS LSP is the configuration of different interface types at both ends of the GMPLS data channel.

Troubleshooting Commands The Junos OS includes commands that are useful when troubleshooting a problem. This topic provides a brief description of each command, followed by sample output, and a discussion of the output in relation to the problem.

You can use the following commands when troubleshooting a GMPLS problem:

```

user@host> show mpls lsp extensive
user@host> show rsvp session detail
user@host> show link-management peer
user@host> show link-management te-link
user@host> show configuration protocols mpls
user@host> monitor start filename
user@host> show log filename

```

Sample Output Use the `show mpls lsp extensive` command on transit router R1 to display detailed information about all LSPs transiting, terminating, and configured on the router.

```

user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

192.168.4.1
  From: 192.168.1.1, State: Dn, ActiveRoute: 0, LSPName: gmpls-r1-to-r3
  Bidirectional
  ActivePath: (none)
  LoadBalance: Random

```

```
Encoding type: SDH/SONET, Switching type: PSC-1, GPID: IPv4
Primary    p1                State: Dn
SmartOptimizeTimer: 180
8 Dec 20 18:08:02 192.168.4.1: MPLS label allocation failure [3 times]
7 Dec 20 18:07:53 Originate Call
6 Dec 20 18:07:53 Clear Call
5 Dec 20 18:07:53 Deselected as active
4 Dec 20 18:06:13 Selected as active path
3 Dec 20 18:06:13 Record Route: 100.100.100.100 93.93.93.93
2 Dec 20 18:06:13 Up
1 Dec 20 18:06:13 Originate Call
Created: Wed Dec 20 18:06:12 2006
Total 1 displayed, Up 0, Down 1

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning The sample output for the `show mpls lsp extensive` command shows an error message (**MPLS label allocation failure**) in the log section of the output. This LSP event indicates that the MPLS protocol or the `family mpls` statement were not configured properly. When the LSP event is preceded by an IP address, the address is typically the router that has the MPLS configuration error. In this case, it appears that the router with the `lo0` address of **192.168.4.1 (R3)** has an MPLS configuration error.

Sample Output Use the `show rsvp session detail` command to display detailed information about RSVP sessions.

```
user@R1> show rsvp session detail
Ingress RSVP: 1 sessions

192.168.4.1
  From: 192.168.1.1, LSPstate: Dn, ActiveRoute: 0
  LSPname: gmpls-r1-to-r3, LSPpath: Primary
  Bidirectional, Upstream label in: 21253, Upstream label out: -
  Suggested label received: -, Suggested label sent: 21253
  Recovery label received: -, Recovery label sent: -
  Resvstyle: 0 - , Label in: -, Label out: -
  Time left: -, Since: Wed Dec 20 18:07:53 2006
  Tspec: rate 0bps size 0bps peak 155.52Mbps m 20 M 1500
  Port number: sender 2 receiver 46115 protocol 0
  PATH rcvfrom: localclient
  Adspec: sent MTU 1500
  Path MTU: received 0
  PATH sentto: 10.35.1.5 (tester2) 3 pkts
  Explct route: 100.100.100.100 93.93.93.93
  Record route: <self> ...incomplete
Total 1 displayed, Up 0, Down 1

Egress RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning The sample output for the `show rsvp session detail` command shows that LSP `gmpls-r1-to-r3` is down (`LSPstate: Dn`). The route record is incomplete, indicating a problem with the explicit route `100.100.100.100 93.93.93.93`. The address `100.100.100.100` is the data channel on `R2 so-0/0/0`, and the address `93.93.93.93` is the data channel on `R3`.

Sample Output Use the `show link-management peer` command to display MPLS peer link information.

```
user@R1> show link-management peer
Peer name: tester2, System identifier: 48428
State: Up, Control address: 10.35.1.5
Control-channel          State
gre.0                    Active
TE links:
tester2
```

```
user@R2> show link-management peer
Peer name: tester2, System identifier: 48428
State: Up, Control address: 10.35.1.6
Control-channel          State
gre.0                    Active
TE links:
te-tester2
```

```
Peer name: tester3 , System identifier: 48429
State: Up , Control address: 10.35.1.2
Control-channel          State
gre.1                    Active
TE links:
te-tester3
```

```
user@R3> show link-management peer
Peer name: tester3, System identifier: 48429
State: Up, Control address: 10.35.1.1
Control-channel          State
gre.0                    Active
TE links:
te-tester3
```

Meaning The sample output from all routers in the example network in [Figure 103 on page 1256](#) for the `show link-management peer` command shows that all control channels are up and active. A detailed analysis of the output shows the following information:

- Name of the peer, `tester2` or `tester3`, which is the same on neighboring routers for ease of troubleshooting.
- Internal identifier for the peer, `48428` for `tester2` and `48429` for `tester3`. The internal identifier is a range of values from 0 through 64,000.
- The state of the peer, which can be up or down. In this case, all peers are up.
- The address to which a control channel is established, for example, `10.35.1.5`.

- The state of the control channel, which can be up, down, or active.
- The traffic-engineered links that are managed by their peer, indicating that control channel **gre.0** is managed by **tester3**.

Sample Output Use the `show link-management te-link` command to display the resources used to set up Multiprotocol Label Switching (MPLS) traffic-engineered forwarding paths.

```
user@R1> show link-management te-link
TE link name:  tester2, State: Up
  Local identifier: 2005, Remote identifier: 21253, Local address: 90.90.90.90,
  Remote address: 100.100.100.100,
  Encoding: SDH/SONET, Switching: PSC-1, Minimum bandwidth: 155.52Mbps, Maximum
  bandwidth: 155.52Mbps, Total bandwidth: 155.52Mbps,
  Available bandwidth: 0bps
    Name      State Local ID Remote ID      Bandwidth Used  LSP-name
    so-0/0/0  Up    21253  21253      155.52Mbps Yes  gmpls-r1-to-r3

user@R2> show link-management te-link
TE link name:  te-tester2, State: Up
  Local identifier: 7002, Remote identifier: 22292, Local address: 100.100.100.100,
  Remote address: 90.90.90.90,
  Encoding: SDH/SONET, Switching: PSC-1, Minimum bandwidth: 155.52Mbps, Maximum
  bandwidth: 155.52Mbps, Total bandwidth: 155.52Mbps,
  Available bandwidth: 0bps
    Name      State Local ID Remote ID      Bandwidth Used  LSP-name
    so-0/0/0  Up    21253  21253      155.52Mbps Yes  gmpls-r1-to-r3
TE link name:  te-tester3, State: Up
  Local identifier: 7003, Remote identifier: 21254, Local address: 103.103.103.103,
  Remote address: 93.93.93.93,
  Encoding: SDH/SONET, Switching: PSC-1, Minimum bandwidth: 155.52Mbps, Maximum
  bandwidth: 155.52Mbps, Total bandwidth: 155.52Mbps,
  Available bandwidth: 0bps
    Name      State Local ID Remote ID      Bandwidth Used  LSP-name
    so-0/0/1  Up    21252  21252      155.52Mbps Yes  gmpls-r1-to-r3

user@R3> show link-management te-link
TE link name:  te-tester3, State: Up
  Local identifier: 7003, Remote identifier: 21254, Local address: 93.93.93.93,
  Remote address: 103.103.103.103,
  Encoding: SDH/SONET, Switching: PSC-1, Minimum bandwidth: 0bps, Maximum
  bandwidth: 0bps, Total bandwidth: 0bps,
  Available bandwidth: 0bps
    Name      State Local ID Remote ID      Bandwidth Used  LSP-name
    so-0/0/1  Dn    21252  21252      155.52Mbps No
```

Meaning The sample output for the `show link-management te-link` command issued on the three routers in the network in [Figure 103 on page 1256](#) shows the resources allocated to the traffic-engineered links **te-tester2** and **te-tester3**. The resources are the SONET interfaces **so-0/0/0** and **so-0/0/1**. On R1 and R2, the SONET interfaces are used for the LSP **gmpls-r1-to-r3**, as indicated by **Yes** in the **Used** field. However, the SONET interface **so-0/0/1** on R3 is down (**Dn**) and is not used for the LSP (**Used No**). Further investigation is required to discover why the SONET interface on R3 is down.

Sample Output Use the `show log filename` command to display the contents of the specified log file. In this case, the log file `rsvp.log` is configured at the `[edit protocols rsvp traceoptions]` hierarchy level. When the log file is configured, you must issue the `monitor start filename` command to begin logging messages to the file.

```
user@R1> show configuration protocols rsvp
traceoptions {
    file rsvp.log size 3m world-readable;
    flag state detail;
    flag error detail;
    flag packets detail;
}
```

```
user@R1> monitor start rsvp.log
```

NOTE: The `find Error` option entered after the pipe (`|`) searches the output for an instance of the term *Error*.

Sample Output

```
user@R3>
show log rsvp.log | find Error
Dec 28 17:23:32 Error Len 20 Session preempted flag 0 by 192.168.4.1 TE-link

```

Meaning The sample output from the egress router **R3** for the `show log rsvp.log` command is a snippet taken from the log file. The snippet shows a Link Management Protocol (LMP) resource request for the LSP `gmpls-r1-to-r3`. The request has problems with the encoding type (SDH/SONET), indicating a possible error with the SONET interface connecting **R2** and **R3**. Further investigation of the configuration of the LMP on **R2** and **R3** is required.

Sample Output Use the `show configuration statement-path` command to display a specific configuration hierarchy; in this instance, link-management.

```
user@R2> show configuration protocols link-management
te-link te-tester2 {
    local-address 100.100.100.100;
    remote-address 90.90.90.90;
    remote-id 22292;
    interface so-0/0/0 {
        local-address 100.100.100.100;
        remote-address 90.90.90.90;
        remote-id 21253;
    }
}
te-link te-tester3 {
    local-address 103.103.103.103;
    remote-address 93.93.93.93;
    remote-id 21254;
    interface so-0/0/1 {
        local-address 103.103.103.103;
        remote-address 93.93.93.93;
        remote-id 21252;
    }
}
peer tester2 {
    address 10.35.1.6;
    control-channel gre.0;
    te-link te-tester2;
}
peer tester3 {
    address 10.35.1.2;
    control-channel gre.1;
    te-link te-tester3;
}

user@R3> show configuration protocols link-management
te-link te-tester3 {
    local-address 93.93.93.93;
    remote-address 103.103.103.103;
    remote-id 21254;
}
interface at-0/3/1 {
    local-address 93.93.93.93;
    remote-address 103.103.103.103;
    remote-id 21252;
}
peer tester3 {
    address 10.35.1.1;
    control-channel gre.0;
    te-link te-tester3;
}
```

Meaning The sample output from transit router **R2** and ingress router **R3** for the `show configuration protocols link-management` command shows that the interface type on the two routers is different. The resource allocated to **te-tester3** on transit router **R2** is a SONET interface, while the resource allocated to **te-tester3** on egress router **R3** is an ATM interface. The

interface type on each end of the data or control channels must be of the same type. In this case, both ends should be SONET or ATM.

Solution The solution to the problem of different interface or encapsulation types at either end of the GMPLS LSP is to make sure that the interface type is the same at both ends. In this case, the ATM interface was deleted from the link-management configuration on **R3**, and a SONET interface was configured instead.

The following commands illustrate the correct configuration and commands to verify that the GMPLS LSP is up and using the data channel:

```
user@R3> show configuration protocols link-management
user@R3> show mpls lsp
user@R3> show link-management te-link
```

```

Sample Output user@R3> show configuration protocols link-management
te-link te-tester3 {
    local-address 93.93.93.93;
    remote-address 103.103.103.103;
    remote-id 21254;
    interface so-0/0/1 { # SONET interface replaces the incorrect ATM interface
        local-address 93.93.93.93;
        remote-address 103.103.103.103;
        remote-id 21252;
    }
}
peer tester3 {
    address 10.35.1.1;
    control-channel gre.0;
    te-link te-tester3;
}

user@R3> show mpls lsp
Ingress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
Egress LSP: 1 sessions
To          From          State    Rt Style Labelin Labelout LSPname
192.168.4.1 192.168.1.1 Up      0 1FF 21252 -gmpls-r1-to-r3
Bidir
Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

user@R3> show link-management te-link
TE link name: te-tester3, State: Up
Local identifier: 7003, Remote identifier: 21254, Local address: 93.93.93.93,
Remote address: 103.103.103.103,
Encoding: SDH/SONET, Switching: PSC-1, Minimum bandwidth: 155.52Mbps, Maximum
bandwidth: 155.52Mbps, Total bandwidth: 155.52Mbps,
Available bandwidth: 0bps
Name          State Local ID Remote ID    Bandwidth Used LSP-name
so-0/0/1 Up      21252 21252 155.52Mbps Yes gmpls-r1-to-r3

```

Meaning The sample output for the **show protocols link-management**, **show mpls lsp**, and **show link-management te-link** commands from ingress router **R3** show that the problem is solved. LMP is correctly configured, and the LSP **gmpls-r1-to-r3** is up and using the data channel **so-0/0/1**.

Conclusion In conclusion, both ends of a GMPLS data channel must be the same encapsulation or interface type. This case illustrates the correct configuration of the data channel. The principles are the same for the control channel.

Router Configurations Output that shows the configurations of the ingress router in the network. The **no-more** option entered after the pipe (|) prevents the output from being paginated if the output is longer than the length of the terminal screen.

Sample Output The following sample output is for ingress router R1:

```

user@R1> show configuration | no-more
[...Output truncated...]

```

Verify Protocol Families

Purpose If a logical interface does not have MPLS enabled, it cannot perform MPLS switching. This step allows you to quickly determine which interfaces are configured with MPLS and other protocol families.

Action To verify the protocol families configured on the routers in your network, enter the following Junos OS CLI operational mode command:

```
user@host> show interfaces terse
```

Sample Output 1

```

user@R1> show interfaces terse
Interface      Admin Link Proto Local Remote
so-0/0/0       up   up   up   10.1.12.1/30

```

Meaning Sample Output 1 shows the interface, the administrative status of the link (**Admin**), the data link layer status of the link (**Link**), the protocol families configured on the interface (**Proto**), and the local and remote addresses on the interface.

All interfaces on all routes in the network shown in [Figure 101 on page 1219](#) are administratively enabled and functioning at the data link layer with MPLS and IS-IS, and have an **inet** address. All are configured with an IPv4 protocol family (**inet**), and have the IS-IS (**iso**) and MPLS (**mpls**) protocol families configured at the `[edit interfaces type-fpc/pic/port unit number]` hierarchy level.

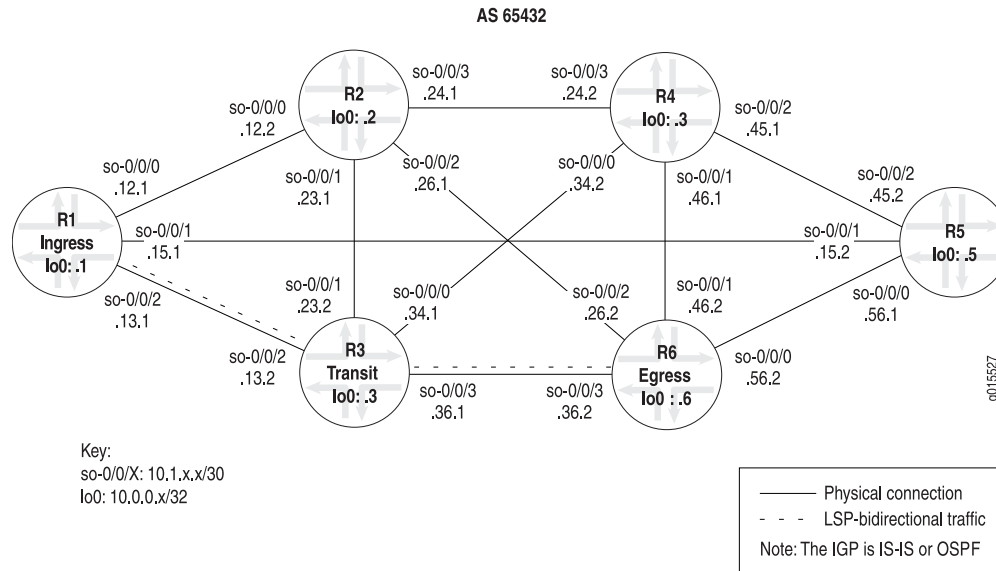

Sample Output 2 shows that interface **so-0/0/2.0** on **R6** does not have the **mpls** statement included at the `[edit interfaces type-fpc/pic/port unit number]` hierarchy level.

Determining LSP Status

Display detailed information about Resource Reservation Protocol (RSVP) objects and the label-switched path (LSP) history to pinpoint a problem with the LSP.

Figure 104 on page 1275 illustrates the network topology used in this topic.

Figure 104: MPLS Network Topology

To determine the LSP state, follow these steps:

1. [Check the Status of the LSP on page 1275](#)
2. [Display Extensive Status About the LSP on page 1276](#)

Check the Status of the LSP

Purpose Display the status of the label-switched path (LSP).

Action To determine the LSP status, on the ingress router, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show mpls lsp
```

Sample Output

```
user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P    LSPName
10.0.0.6    10.0.0.1    Up    1    *    R1-to-R6
Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions
To          From          State Rt Style  LabelIn LabelOut LSPName
10.0.0.1    10.0.0.6    Up    01 FF   3    -    R6-to-R1
```

```
Total 1 displayed, Up 1, Down 0
```

```
Transit LSP: 0 sessions
```

```
Total 0 displayed, Up 0, Down 0
```

Meaning The sample output is from the ingress router (**R1**), and shows ingress, egress, and transit LSP information. Ingress information is for the sessions that originate from this router, egress information is for sessions that terminate on this router, and transit information is for sessions that transit through this router.

There is one ingress route from **R1 (10.0.0.1)** to **R6 (10.0.0.6)**. This route is currently up, and is an active route installed in the routing table (**Rt**). The LSP **R1-to-R6** is the primary path (**P**) as opposed to the secondary path, and is indicated by an asterisk (*****). The route to **R6** does not contain a named path (**ActivePath**).

There is one egress LSP from **R6** to **R1**. The **State** is up, with no routes installed in the routing table. RSVP reservation style (**Style**) consists of two parts. The first is the number of active reservations (**1**). The second is the reservation style, which is **FF** (fixed filter). The reservation style can be **FF**, **SE** (shared explicit), or **WF** (wildcard filter). There are three incoming labels (**Labelin**) and no labels going out (**Labelout**) for this LSP.

There are no transit LSPs.

For more information on checking the LSP state, see [“Checklist for Working with the Layered MPLS Troubleshooting Model” on page 1005](#).

Display Extensive Status About the LSP

Purpose Display extensive information about LSPs, including all past state history and the reasons why an LSP might have failed.

Action To display extensive information about LSPs, on the ingress router, enter the following Junos OS CLI operational mode command:

```
user@host> show mpls lsp extensive
```

Sample Output

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Up , ActiveRoute: 1 , LSPname: R1-to-R6

Total 0 displayed, Up 0, Down 0
```

Meaning The sample output is from the ingress router (**R1**), and shows ingress, egress, and transit LSP information in detail, including all past state history and the reasons why an LSP failed. Ingress information is for sessions that originate from this router, egress information is for sessions that terminate on this router, and transit information is for sessions that transit through this router.

There is one ingress route from **R1 (10.0.0.1)** to **R6 (10.0.0.6)**. This route is currently up (**State**), with one route actively using the LSP, **R1-to-R6**. The LSP active path is the primary path. Even if the LSP does not contain a **primary** or **secondary** keyword, the router still treats the LSP as a primary LSP, indicating that if the LSP fails, the router will attempt to signal inactive LSPs at 30-second intervals, by default.

Load balancing is **Random**, which is the default, indicating that when selecting the physical path for an LSP, the router randomly selects among equal-cost paths that have an equal hop count. Other options that you can configure are **Least-fill** and **Most-fill**. **Least-fill** places the LSP over the least utilized link of the equal-cost paths with equal hop count. **Most-fill** places the LSP over the most utilized link of the equal-cost paths sharing an equal hop count. Utilization is based on the percentage of available bandwidth.

The **Encoding type** field shows Generalized MPLS (GMPLS) signaling parameters (**Packet**), indicating IPv4. The **Switching type** is **Packet**, and the Generalized Payload Identifier (**GPID**) is IPv4.

The primary path is the active path, as indicated by an asterisk (*). The state of the LSP is **Up**.

The Explicit Route Object (**ERO**) includes the Constrained Shortest Path First (CSPF) cost (**20**) for the physical path that the LSP follows. The presence of the CSPF metric indicates that this is a CSPF LSP. The absence of the CSPF metric indicates a no-CSPF LSP.

The field **10.1.13.2 S** indicates the actual ERO. The RSVP signaling messages went to **10.1.13.2** strictly (as a next hop) and finished at **10.1.36.2** strictly. All ERO addresses are strict hops when the LSP is a CSPF LSP. Loose hops can only display in a no-CSPF LSP.

The received Record Route Object (**RRO**) has the following protection flags:

- **0x01**—Local protection available. The link downstream of this node is protected by a local repair mechanism. This flag can only be set if the Local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding path message.
- **0x02**—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).
- **0x04**—Bandwidth protection. The downstream router has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.
- **0x08**—Node protection. The downstream router has a backup path providing protection against link and node failure on the corresponding path section. If the downstream router can set up only a link-protection backup path, the “Local protection available” bit is set but the “Node protection” bit is cleared.
- **0x10**—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engineered LSP. This indicates to the ingress label edge router (LER) of this LSP that it should be rerouted.

For more information on protection flags, see the *Junos Routing Protocols and Policies Command Reference*.

The field **10.1.13.2.10.1.36.2** is the actual received record route (**RRO**). Note that the addresses in the **RRO** field match those in the **ERO** field. This is the normal case for CSPF LSPs. If the RRO and ERO addresses do not match for a CSPF LSP, the LSP has to reroute or detour.

The lines numbered 91 through 42 contain the 49 most recent entries to the history log. Each line is time stamped. The most recent entries have the largest log history number and are at the top of the log, indicating that line 91 is the most recent history log entry. When you read the log, start with the oldest entry (**42**) to the most recent (**91**).

The history log was started on July 10, and displays the following sequence of activities: an LSP was selected as active, was found to be down, MPLS label allocation failed several times, was deleted several times, was preempted because of an ResvTear, was deselected as active, and was cleared. In the end, the router computed a CSPF ERO, signaled the call, the LSP came up with the listed RRO (line 90), and was listed as active.

For more information on error messages, see the *Junos MPLS Network Operations Guide Log Reference*.

The total number of ingress LSPs displayed is **1**, with **1** up and **0** down. The number in the **Up** field plus the number in the **Down** field should equal the total.

There is one egress LSP session from **R6** to **R1**. The **State** is up, with no routes installed in the routing table. RSVP reservation style (**Style**) consists of two parts. The first is the number of active reservations (**1**). The second is the reservation style, which is **FF** (fixed filter). The reservation style can be **FF**, **SE** (shared explicit), or **WF** (wildcard filter). There are three incoming labels (**Labelin**) and no labels going out (**Labelout**) for this LSP.

There are no transit LSPs.

For more information on checking the LSP state, see [“Checklist for Working with the Layered MPLS Troubleshooting Model” on page 1005](#).

Check the Status of the LSP

Purpose Display the status of the label-switched path (LSP).

Action To determine the LSP status, on the ingress router, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show mpls lsp
```

Sample Output

```
user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPname
10.0.0.6    10.0.0.1    Up 1      * R1-to-R6
Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions
To          From          State Rt Style  Labelin Labelout LSPname
10.0.0.1    10.0.0.6    Up 01 FF  3   - R6-to-R1
Total 1 displayed, Up 1, Down 0

Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning The sample output is from the ingress router (**R1**), and shows ingress, egress, and transit LSP information. Ingress information is for the sessions that originate from this router, egress information is for sessions that terminate on this router, and transit information is for sessions that transit through this router.

There is one ingress route from **R1** (**10.0.0.1**) to **R6** (**10.0.0.6**). This route is currently up, and is an active route installed in the routing table (**Rt**). The LSP **R1-to-R6** is the primary path (**P**) as opposed to the secondary path, and is indicated by an asterisk (*****). The route to **R6** does not contain a named path (**ActivePath**).

There is one egress LSP from **R6** to **R1**. The **State** is up, with no routes installed in the routing table. RSVP reservation style (**Style**) consists of two parts. The first is the number of active reservations (**1**). The second is the reservation style, which is **FF** (fixed filter). The reservation style can be **FF**, **SE** (shared explicit), or **WF** (wildcard filter). There are three incoming labels (**Labelin**) and no labels going out (**Labelout**) for this LSP.

There are no transit LSPs.

For more information on checking the LSP state, see [“Checklist for Working with the Layered MPLS Troubleshooting Model” on page 1005](#).

Display Extensive Status About the LSP

Purpose Display extensive information about LSPs, including all past state history and the reasons why an LSP might have failed.

Action To display extensive information about LSPs, on the ingress router, enter the following Junos OS CLI operational mode command:

```
user@host> show mpls lsp extensive
```

Sample Output

```
user@R1> show mpls lsp extensive

Meaning The sample output is from the ingress router (R1), and shows ingress, egress, and transit LSP information in detail, including all past state history and the reasons why an LSP failed. Ingress information is for sessions that originate from this router, egress information is for sessions that terminate on this router, and transit information is for sessions that transit through this router.

There is one ingress route from R1 (10.0.0.1) to R6 (10.0.0.6). This route is currently up (**State**), with one route actively using the LSP, **R1-to-R6**. The LSP active path is the primary path. Even if the LSP does not contain a **primary** or **secondary** keyword, the router still treats the LSP as a primary LSP, indicating that if the LSP fails, the router will attempt to signal inactive LSPs at 30-second intervals, by default.

Load balancing is **Random**, which is the default, indicating that when selecting the physical path for an LSP, the router randomly selects among equal-cost paths that have an equal hop count. Other options that you can configure are **Least-fill** and **Most-fill**. **Least-fill** places the LSP over the least utilized link of the equal-cost paths with equal hop count. **Most-fill** places the LSP over the most utilized link of the equal-cost paths sharing an equal hop count. Utilization is based on the percentage of available bandwidth.

The **Encoding type** field shows Generalized MPLS (GMPLS) signaling parameters (**Packet**), indicating IPv4. The **Switching type** is **Packet**, and the Generalized Payload Identifier (**GPID**) is IPv4.

The primary path is the active path, as indicated by an asterisk (*). The state of the LSP is **Up**.

The Explicit Route Object (**ERO**) includes the Constrained Shortest Path First (CSPF) cost (**20**) for the physical path that the LSP follows. The presence of the CSPF metric indicates that this is a CSPF LSP. The absence of the CSPF metric indicates a no-CSPF LSP.

The field **10.1.13.2 S** indicates the actual ERO. The RSVP signaling messages went to **10.1.13.2** strictly (as a next hop) and finished at **10.1.36.2** strictly. All ERO addresses are strict hops when the LSP is a CSPF LSP. Loose hops can only display in a no-CSPF LSP.

The received Record Route Object (**RRO**) has the following protection flags:

- **0x01**—Local protection available. The link downstream of this node is protected by a local repair mechanism. This flag can only be set if the Local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding path message.
- **0x02**—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously).
- **0x04**—Bandwidth protection. The downstream router has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section.
- **0x08**—Node protection. The downstream router has a backup path providing protection against link and node failure on the corresponding path section. If the downstream router can set up only a link-protection backup path, the “Local protection available” bit is set but the “Node protection” bit is cleared.
- **0x10**—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engineered LSP. This indicates to the ingress label edge router (LER) of this LSP that it should be rerouted.

For more information on protection flags, see the *Junos Routing Protocols and Policies Command Reference*.

The field **10.1.13.2.10.1.36.2** is the actual received record route (**RRO**). Note that the addresses in the **RRO** field match those in the **ERO** field. This is the normal case for CSPF LSPs. If the RRO and ERO addresses do not match for a CSPF LSP, the LSP has to reroute or detour.

The lines numbered 91 through 42 contain the 49 most recent entries to the history log. Each line is time stamped. The most recent entries have the largest log history number and are at the top of the log, indicating that line 91 is the most recent history log entry. When you read the log, start with the oldest entry (42) to the most recent (91).

The history log was started on July 10, and displays the following sequence of activities: an LSP was selected as active, was found to be down, MPLS label allocation failed several times, was deleted several times, was preempted because of an ResvTear, was deselected as active, and was cleared. In the end, the router computed a CSPF ERO, signaled the call, the LSP came up with the listed RRO (line 90), and was listed as active.

For more information on error messages, see the *Junos MPLS Network Operations Guide Log Reference*.

The total number of ingress LSPs displayed is 1, with 1 up and 0 down. The number in the **Up** field plus the number in the **Down** field should equal the total.

There is one egress LSP session from R6 to R1. The **State** is up, with no routes installed in the routing table. RSVP reservation style (**Style**) consists of two parts. The first is the number of active reservations (1). The second is the reservation style, which is **FF** (fixed filter). The reservation style can be **FF**, **SE** (shared explicit), or **WF** (wildcard filter). There are three incoming labels (**Labelin**) and no labels going out (**Labelout**) for this LSP.

There are no transit LSPs.

For more information on checking the LSP state, see “[Checklist for Working with the Layered MPLS Troubleshooting Model](#)” on page 1005.

Checking That RSVP Path Messages Are Sent and Received

Purpose The presence or absence of various RSVP messages can help determine if there is a problem with Multiprotocol Label Switching (MPLS) in your network. For example, if path messages occur in the output without Resv messages, it might indicate that label-switched paths (LSPs) are not being created.

Action To check that RSVP Path messages are sent and received, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show rsvp statistics
```

Sample Output

```
user@R1> show rsvp statistics
  PacketType      Sent      Received      Last 5 seconds
  Path      114523      80185      1      0      Sent      Received
  PathErr      5      10      0      0      0
  PathTear      12      6      0      0      0
  Resv FF      80515      111476      0      0      0
  Resv WF      0      0      0      0      0
  Resv SE      0      0      0      0      0
  ResvErr      0      0      0      0      0
```

ResvTear	0	5	0	0	
ResvConf		0	0	0	0
Ack		0	0	0	0
SRefresh		0	0	0	0
Hello	915851	915881	0	0	
EndtoEnd RSVP		0	0	0	0
			Total	Last 5 seconds

No TE-link to recv Hop			0		0

Meaning The sample output shows RSVP messages sent and received. The total number of RSVP Path messages is 11,4532 sent and 80,185 received. Within the last 5 seconds, no messages have been sent or received.

A total of 5 **PathErr** messages were sent and 10 received. When path errors occur (usually because of parameter problems in a path message), the router sends a unicast PathErr message to the sender that issued the path message. In this case, **R1** sent at least 10 path messages with an error, as indicated by the 10 PathErr messages that **R1** has received. The downstream router sent **R1** five path messages with an error, as indicated by the five PathErr messages that **R1** has sent. PathErr messages transmit in the opposite direction to path messages.

A total of 12 **PathTear** messages were sent and 6 received, none in the last 5 seconds. In contrast to PathErr messages, PathTear messages travel in the same direction as path messages. Since path messages are both sent and received, PathTear messages are also sent and received. However, if only path messages are sent, then only the PathTear messages that are sent appear in the output.

A total of 80,515 reservation (**Resv**) messages with the fixed filter (**FF**) reservation style were sent and 111,476 received, none in the last 5 seconds. An **FF** reservation style indicates that within each session, each receiver establishes its own reservation with each upstream sender, and that all selected senders are listed. No messages for the wildcard filter (**WF**) or shared explicit (**SE**) reservation styles are sent or received. For more information on RSVP reservation styles, see the *Junos MPLS Applications Configuration Guide*.

Other RSVP message types are not sent or received. For information on the ResvErr, ResvTear, and Resvconf message types, see the *Junos MPLS Applications Configuration Guide*.

Ack and summary refresh (SRefresh) messages do not appear in the output. Ack and summary refresh messages are defined in RFC 2961 and are part of the RSVP extensions. Ack messages are used to reduce the amount of RSVP control traffic in the network.

A total of 915,851 hello messages were sent and 915,881 received, with none transmitted or received in the last 5 seconds. The RSVP hello interval is 9 seconds. If more than one hello message is sent or received in the last 5 seconds, it implies that more than one interface supports RSVP.

EndtoEnd RSVP messages are legacy RSVP messages that are not used for RSVP traffic engineering. These counters increment only when RSVP forwards legacy RSVP messages issued by a virtual private network (VPN) customer for transit across the backbone to the other site(s) in the VPN. They are called end-to-end messages because they are intended for the opposite side of the network and only have meaning at the two ends of the provider network.

The **Errors** section of the output shows statistics about RSVP packets with errors. A total of 15 **PathErr to client** packets were sent to the Routing Engine. The total combines the sent and received **PathErr** packets. For more information about error statistics and packets, see the *Junos System Basics and Services Command Reference*.

Determining the Current RSVP Neighbor State

Purpose Display a list of RSVP neighbors that were learned dynamically when exchanging RSVP packets. Once a neighbor is learned, it is never removed from the list of RSVP neighbors.

Action To determine the current RSVP neighbor state, enter the following Junos OS CLI operational mode command:

```
user@host> show rsvp neighbor
```

Sample Output

```
user@R6> show rsvp neighbor
RSVP neighbor: 2 learned
Address  Idle Up/Dn LastChange  HelloInt  HelloTx/Rx  MsgRcvd
10.1.36.1   5  1/0  1w5d 6:30:50    9      116734/116734  23558
10.1.56.1  10  1/0  2w2d 23:44:15    9      161600/161600  23570
```

Meaning The sample output shows that **R6** has learned about two different RSVP neighbors. Each neighbor has one line of output that includes the neighbor RSVP address, the length of time the interface was idle, the current interface up/down counter, the time of the last interface state change, the current RSVP hello interval, the total number of RSVP hello messages transmitted and received, and the total number of RSVP messages received on the interface.

The **show rsvp neighbor** command only indicates a neighbor after a session is established. Once an interface is displayed in this command output, it always appears, even if the RSVP neighbor state is down.

The RSVP neighbor **10.1.36.1** was idle for 5 seconds, came up once and has not gone down, indicating that the interface is currently in an **Up** state. As long as the up counter is one greater than the down counter, the RSVP interface is up. If the up/down counters are equal, the interface is down.

The last state change occurred 6 hours and 30 minutes ago. The current hello interval is 9 seconds. A total of 116,734 hello messages were transmitted and received on this interface, and a total of 23,558 RSVP Path/Resv messages were processed.

The RSVP neighbor **10.1.56.1** was idle for 10 seconds, came up once and has not gone down, indicating that the interface is currently in an **Up** state. The last state change occurred 23 hours and 44 minutes ago. The current Hello interval is 9 seconds. A total of 161,600 hello messages were transmitted and received on this interface, and a total of 23,570 RSVP Path/Resv messages were processed.

Take Appropriate Action

Problem **Description:** Depending on the error you encountered in your investigation, you must take the appropriate action to correct the problem. In the example below, the routers are configured to function at different levels of the IS-IS protocol.

Solution To correct the error in this example, enter the following commands:

Sample Output

```
[edit protocols isis]
user@R6# show
level 2 disable;
interface all {
    level 2 metric 10;
}
interface fxp0.0 {
    disable;
}
interface lo0.0; {
passive

[edit protocols isis]
user@R6# delete level 2

[edit protocols isis]
user@R6# set level 1 disable

[edit protocols isis]
user@R6# show
level 1 disable;
interface all {
    level 2 metric 10;
}
```

```
interface fxp0.0 {
    disable;
}
interface lo0.0; {
    passive

[edit protocols isis]
user@R6# commit
commit complete

[edit protocols isis]
user@R6# run show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
so-0/0/0.0	R5	2 Up	22	
so-0/0/1.0	R4	2 Up	22	
so-0/0/2.0	R2	2 Up	22	
so-0/0/3.0	R3	2 Up	22	

Meaning

The sample output shows that the configuration error on egress router R6 has been corrected, and IS-IS adjacencies are now established.

Examine BGP Routes

Purpose You can examine the BGP path selection process to determine the single, active path when BGP receives multiple routes to the same destination. In this step, we examine the reverse LSP **R6-to-R1**, making **R6** the ingress router for that LSP.

Action To examine BGP routes and route selection, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix detail
```

Sample Output 1

```
user@R6> show route 100.100.1.1 detail
inet.0: 30 destinations, 46 routes (29 active, 0 holddown, 1 hidden)
100.100.1.0/24 (1 entry, 1 announced)
  *BGP      Preference: 170/-101
            Source: 10.1.13.1
            Next hop: via so-0/0/3.0, selected
              Protocol next hop: 10.1.13.1  Indirect next hop: 8671594 304
            State: <Active Int Ext>
            Local AS: 65432 Peer AS: 65432
            Age: 4d 5:15:39      Metric2: 2
            Task: BGP_65432.10.1.13.1+3048
            Announcement bits (2): 0-KRT 4-Resolve inet.0
            AS path: I
            Localpref: 100
            Router ID: 10.0.0.1
```

Sample Output 2

```

user@R6> show route 100.100.1.1 detail
inet.0: 30 destinations, 46 routes (29 active, 0 holddown, 1 hidden)
100.100.1.0/24 (1 entry, 1 announced)
  *BGP      Preference: 170/-101
             Source: 10.0.0.1
             Next hop: via so-0/0/3.0 weight 1, selected
             Label-switched-path R6-to-R1
             Label operation: Push 100000
             Protocol next hop: 10.0.0.1 Indirect next hop: 8671330 301
             State: <Active Int Ext>
             Local AS: 65432 Peer AS: 65432
             Age: 24:35      Metric2: 2
             Task: BGP_65432.10.0.0.1+179
             Announcement bits (2): 0-KRT 4-Resolve inet.0
             AS path: I
             Localpref: 100
             Router ID: 10.0.0.1

```

Meaning Sample Output 1 shows that the BGP next hop (10.1.13.1) does not equal the LSP destination address (10.0.0.1) in the **to** statement at the **[edit protocols mpls label-switched-path label-switched-path-name]** hierarchy level when the BGP configuration of R6 and R1 is incorrect.

Sample Output 2, taken after the configurations on R1 and R6 are corrected, shows that the BGP next hop (10.0.0.1) and the LSP destination address (10.0.0.1) are the same, indicating that BGP can use the LSP to forward BGP traffic.

CLI Operational Mode Top-Level Commands

In operational mode, you enter commands to monitor and diagnose the software, network connectivity, and the router. When you log in to the router and the CLI starts, you are at the top level of the CLI operational mode. At this level, there are several broad groups of CLI commands. [Table 46 on page 1289](#) lists the top-level CLI operational mode commands and describes the options available for each command. The commands are listed in alphabetical order.

Table 46: CLI Operational Mode Top-Level Commands

Command	Description
clear	Clear statistics and protocol database information. Syntax: clear (arp bgp firewall helper igmp ike ilmi interfaces ipsec ipv6 isis ldp log mpls msdp multicast ospf pim rip ripng route rsvp snmp system vrrp)
configure	Enter CLI configuration mode. Alternative commands: configure <exclusive> <private>

Table 46: CLI Operational Mode Top-Level Commands (continued)

Command	Description
file	<p>Perform file manipulation operations, such as copy, delete, list, rename, and show.</p> <p>Syntax: file (compare copy delete list rename show)</p>
help	<p>Provide help information.</p> <p>Syntax: help (reference syslog topic)</p>
monitor	<p>Monitor a log file or interface traffic in real time.</p> <p>Syntax: monitor (interface list start stop traffic)</p>
mtrace	<p>Display trace information about a multicast path from a source to a receiver.</p> <p>Syntax: mtrace (from-source monitor to-gateway)</p>
ping	<p>Verify IP connectivity to another IP host or Asynchronous Transfer Mode (ATM) connectivity (ping ATM) using Operation Administration and Maintenance (OAM) cells to an ATM endstation.</p> <p>Syntax: ping host <interface <i>source-interface</i>> <bypass-routing> <count <i>requests</i>> <do-not-fragment> <interval <i>seconds</i>> <pattern <i>string</i>> <record-route> <routing-instance <i>routing-instance-name</i>> <size <i>bytes</i>> <strict> <tos <i>type-of-service</i>> <ttl <i>value</i>> <via <i>route</i>> <rapid detail></p> <p>Syntax: ping atm interface <i>interface</i> <count <i>count</i>> <end-to-end segment> <interval <i>interval</i>> <sequence-number <i>sequence-number</i>> <vci <i>vci</i>> <brief></p> <p>Syntax: ping vpn-interface <i>vpn-interface</i> host <local <i>echo-address</i>></p>
pipe	<p>Filter the output of an operational mode or configuration mode command.</p> <p>Syntax: (compare count display <detail inheritance xml> except <i>pattern</i> find <i>pattern</i> last <i>lines</i> match <i>pattern</i> no-more resolve <<i>file-names</i>> save <i>filename</i> trim <i>columns</i>)</p>
quit	<p>Log out from the CLI process.</p> <p>Syntax: quit</p>
request	<p>Make system-level requests, such as halt or reboot the router, load software packages, and back up the router's file systems.</p> <p>Syntax: request system (halt reboot snapshot software)</p>
restart	<p>Restart the router hardware or software processes.</p> <p>Syntax: restart (fpc class-of-service gracefully immediately interface-control mib-process network-access-service remote-operations routing sampling sfm snmp soft)</p>
set	<p>Set CLI properties, the router's date and time, and the craft interface display text.</p> <p>Syntax: set (chassis cli date)</p>

Table 46: CLI Operational Mode Top-Level Commands (continued)

Command	Description
show	<p>Show information about all aspects of the software, including interfaces and routing protocols.</p> <p>Syntax: show (accounting aps arp as-path bgp chassis cli configuration connections dvmrp firewall helper host igmp ike ilmi interfaces ipsec ipv6 isis l2circuit l2vpn ldp link-management log mpls msdp multicast ntp ospf pfe pim policer policy rip ripng route rsvp sap snmp system task ted version vrrp)</p>
ssh	<p>Open a secure shell to another host.</p> <p>Syntax: ssh <i>host</i> <bypass-routing> <routing-instance <i>routing-instance-name</i>> <source address> <vpn-interface <i>vpn-interface</i>> <v1 v2></p>
start	<p>Start a software process.</p> <p>Syntax: start <i>shell</i></p>
telnet	<p>Start a telnet session to another host.</p> <p>Syntax: telnet <i>host</i> <8bit> <bypass-routing> <inet inet6> <noresolve> <port <i>port</i>> <interface <i>interface-name</i>> <routing-instance <i>routing-instance-name</i>> <source address> <vpn-interface <i>vpn-interface</i>></p>
test	<p>Run various diagnostic debugging commands.</p> <p>Syntax: test (configuration interface msdp policy)</p>
tracroute	<p>Trace the route to a remote host.</p> <p>Syntax: tracroute <i>host</i> <as-number-lookup> <bypass-routing> <gateway address> <inet inet6> <noresolve> <routing-instance <i>routing-instance-name</i>> <source address> <tos value> <ttl value> <vpn-interface <i>vpn-interface</i>> <wait seconds></p>

CLI Keyboard Shortcuts

In the CLI, you can use keyboard sequences to move around and edit a command line. You can also use keyboard sequences to scroll through a list of recently executed commands.

Table 15 on page 23 lists some of the CLI keyboard sequences.

Table 47: CLI Keyboard Shortcuts

Keyboard sequence	Action
Ctrl+b	Move the cursor back one character.
Esc+b or Alt+b	Move the cursor back one word.
Ctrl+f	Move the cursor forward one character.
Esc+f or Alt+f	Move the cursor forward one word.

Table 47: CLI Keyboard Shortcuts (continued)

Keyboard sequence	Action
Ctrl+a	Move the cursor to the beginning of the command line.
Ctrl+e	Move the cursor to the end of the command line.
Ctrl+h, Delete, or Backspace	Delete the character before the cursor.
Ctrl+d	Delete the character at the cursor.
Ctrl+k	Delete the all characters from the cursor to the end of the command line.
Ctrl+u or Ctrl+x	Delete the all characters from the command line.
Ctrl+w, Esc+Backspace, or Alt+Backspace	Delete the word before the cursor.
Esc+d or Alt+d	Delete the word after the cursor.
Ctrl+y	Insert the most recently deleted text at the cursor.
Ctrl+l	Redraw the current line.
Ctrl+p	Scroll backward through the list of recently executed commands.
Ctrl+n	Scroll forward through the list of recently executed commands.
Ctrl+r	Search the CLI history incrementally in reverse order for lines matching the search string.
Esc+/ or Alt+/	Search the CLI history for words for which the current word is a prefix.
Esc-1 through Esc-9 or Alt-1 through Alt-9	Specify the number of times to execute a keyboard sequence.

Manage Output at the ---(more)--- Prompt

If the output is longer than the screen length, it appears one screen at a time with the UNIX ---(more)-- prompt at the end of the screen. The ---(more)--- prompt indicates that more output is available. The following table lists the keyboard sequences you can use at the --(more)--- prompt.

Table 48: Keyboard Shortcuts at the ---(more)--- Prompt

Keyboard Shortcut	Action
Enter, Return, k, Ctrl+m, Ctrl+n, or down arrow	Scroll down one line.
Tab, d, Ctrl+d, or Ctrl+x	Scroll down one-half screen.
Space or Ctrl+f	Scroll down one whole screen.

Table 48: Keyboard Shortcuts at the ---(more)--- Prompt (continued)

Keyboard Shortcut	Action
Ctrl+e or g	Scroll down to the bottom of the output.
n (or no-more)	Display the output all at once instead of one screen at a time.
j , Ctrl-h , Ctrl-p , or up arrow	Scroll up one line.
u or Ctrl-u	Scroll up one-half screen.
b or Ctrl-b	Scroll up one whole screen.
Ctrl-a or g	Scroll up to the bottom of the output.
/string	Search forward for a string.
?string	Search backward for a string.
n	Repeat previous search for a string.
m or M (or match string)	Find a text string. You are prompted for the string to match
e or E (or except string)	Find, ignoring a text string. You are prompted for the string to ignore.
Ctrl-C , q , Q , or Ctrl-k	Interrupt the display of output.
H (Same as specifying hold)	Hold the CLI at the —more— prompt after displaying all output.
c or C	Clear any match conditions and display the complete output.
Ctrl-l	Redraw the output on the screen.
s or S (or save filename)	Save the command output to a file. You are prompted for a filename.

Working with Problems on Your Network

Problem **Description:** This checklist provides links to troubleshooting basics, an example network, and includes a summary of the commands you might use to diagnose problems with the router and network.

Table 49: Checklist for Working with Problems on Your Network

Tasks	Command or Action
“Isolating a Broken Network Connection” on page 1294	

Table 49: Checklist for Working with Problems on Your Network (continued)

Tasks	Command or Action
1. <i>Identifying the Symptoms of a Broken Network Connection</i>	<code>ping (ip-address hostname)</code> <code>show route (ip-address hostname)</code> <code>traceroute (ip-address hostname)</code>
2. <i>Isolating the Causes of a Network Problem</i>	<code>show < configuration interfaces protocols route ></code>
3. <i>Taking Appropriate Action for Resolving the Network Problem</i>	<code>[edit]</code> <code>delete routing options static route destination-prefix</code> <code>commit and-quit</code> <code>show route destination-prefix</code>
4. <i>Evaluating the Solution to Check Whether the Network Problem Is Resolved</i>	<code>show route (ip-address hostname)</code> <code>ping (ip-address hostname) count 3</code> <code>traceroute (ip-address hostname)</code>

Isolating a Broken Network Connection

By applying the standard four-step process illustrated in [Figure 105 on page 1294](#), you can isolate a failed node in the network. Note that the functionality described in this section is not supported in versions 15.1X49, 15.1X49-D30, or 15.1X49-D40.

Figure 105: Process for Diagnosing Problems in Your Network

Before you embark on the four-step process, however, it is important that you are prepared for the inevitable problems that occur on all networks. While you might find a solution to a problem by simply trying a variety of actions, you can reach an appropriate solution more quickly if you are systematic in your approach to the maintenance and monitoring of your network. To prepare for problems on your network, understand how the network functions under normal conditions, have records of baseline network activity, and carefully observe the behavior of your network during a problem situation.

[Figure 106 on page 1295](#) shows the network topology used in this topic to illustrate the process of diagnosing problems in a network.

Figure 106: Network with a Problem

The network in [Figure 106 on page 1295](#) consists of two autonomous systems (ASs). AS 65001 includes two routers, and AS 65002 includes three routers. The border router (R1) in AS 65001 announces aggregated prefixes **100.100/24** to the AS 65002 network. The problem in this network is that R6 does not have access to R5 because of a loop between R2 and R6.

To isolate a failed connection in your network, follow the steps in these topics:

- *Identifying the Symptoms of a Broken Network Connection*
- *Isolating the Causes of a Network Problem*
- *Taking Appropriate Action for Resolving the Network Problem*
- *Taking Appropriate Action for Resolving the Network Problem*
- *Evaluating the Solution to Check Whether the Network Problem Is Resolved*

Display Junos OS Information

Purpose Display Junos OS information and status to determine if the version of Junos OS that you are running supports particular features or hardware. You can also determine whether particular software bugs will affect your version of Junos OS.

Action To display Junos OS information, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show version
```

Sample Output `user@host> show version`
Hostname: my-router.net
Model: m160
JUNOS Base OS boot [5.5R2.3]
JUNOS Base OS Software Suite [5.5R2.3]
JUNOS Kernel Software Suite [5.5R2.3]
JUNOS Packet Forwarding Engine Support [5.5R2.3]
JUNOS Routing Software Suite [5.5R2.3]
JUNOS Online Documentation [5.5R2.3]
JUNOS Crypto Software Suite [5.5R2.3]
KERNEL 5.5R2.3 #0 built by builder on 2002-11-21 22:56:20 UTC
MGD release 5.5R2.3 built by builder on 2002-11-21 22:36:05 UTC
CLI release 5.5R2.3 built by builder on 2002-11-21 22:33:44 UTC

SMARTD release 5.5R2.3 built by builder on 2002-11-21 22:47:50 UTC
jkernel-dd release 5.5R2.3 built by builder on 2002-11-21 22:27:20 UTC
jroute-dd release 5.5R2.3 built by builder on 2002-11-21 22:27:34 UTC
jcrypto-dd release 5.5R2.3 built by builder on 2002-11-21 22:27:46 UTC

Meaning The sample output shows the hostname, the version information for the Junos OS packages installed on the machine, and the version information for each software process.

Display Version Information for Junos OS Packages

Purpose Display version information for Junos OS packages to determine if they support particular features or hardware. You can also determine whether particular software bugs will affect your version of Junos OS.

Action To display brief information and status for the kernel and Packet Forwarding Engine, use the following CLI operational mode command:

`user@host> show version brief`

The following sample output is for worldwide nonencrypted Junos OS:

Sample Output

```
user@host> show version brief
  Hostname: my-router.net
  Model: m10
  JUNOS Base OS boot [5.5R2.3]
  JUNOS Base OS Software Suite [5.5R2.3]
  JUNOS Kernel Software Suite [5.5R2.3]
  JUNOS Packet Forwarding Engine Support [5.5R2.3]
  JUNOS Routing Software Suite [5.5R2.3]
  JUNOS Online Documentation [5.5R2.3]
```

The following sample output is for Canada and USA encrypted Junos OS:

```
user@host> show version brief
  Hostname: my-router.net
  Model: m10
  JUNOS Base OS boot [5.5R2.3]
  JUNOS Base OS Software Suite [5.5R2.3]
  JUNOS Kernel Software Suite [5.5R2.3]
  JUNOS Packet Forwarding Engine Support [5.5R2.3]
  JUNOS Routing Software Suite [5.5R2.3]
  JUNOS Online Documentation [5.5R2.3]
  JUNOS Crypto Software Suite [5.5R2.3]
```

Meaning The sample output shows version information for the Junos OS packages installed on the router. If the **Junos Crypto Software Suite** is listed, the router has Canada and USA encrypted Junos OS. If the **Junos Crypto Software Suite** is not listed, the router is running worldwide nonencrypted Junos OS.

Display the Current Active Router Configuration

Purpose Examine the current active router configuration.

Action To display the current, active router configuration, use the following command-line interface (CLI) operational mode command:

```
user@host> show configuration
```

Sample Output

```
user@host> show configuration
version "10.4R2";
groups {
  global {
    system {
      host-name potter;
      domain-name harry.potter.net;
      domain-search [ harry.potter.net potter.net hryprr.net ];
      backup-router 10.110.12.254;

```

Meaning The sample output shows the current, active configuration for the router. When displaying the configuration, the CLI indents each subordinate hierarchy level, inserts braces to indicate the beginning and end of each hierarchy level, and places semicolons at the end of statements that are at the lowest level of the hierarchy.

The configuration statements appear in a fixed order. Interfaces appear alphabetically by type, and then in numerical order by slot number, Physical Interface Card (PIC) number, and port number.

Copy Junos OS to the Router

Action Copy the software packages from the server to the router. We recommend that you copy them to the `/var/tmp` directory, which is on the rotating medium (hard disk) and is a large file system. Use the following CLI command:

```

user@host> file copy ftp://username: prompt@ftp.hostname.
net/jinstall-package-name/var/tmp/jinstall-package-name

```

Add New Software

Action To add new software packages, use the following Junos OS CLI operational mode command:

```

user@host> request system software add /var/tmp/jinstall-package--name

```

package-name is the full URL to the file and **release-number** is the major software release number; for example, 4.2R1. Before the new software is added, the existing software is automatically deleted.

NOTE: Even though you are adding the new software, the changes do not take effect until the router has completed rebooting.

Sample Output

```
user@host> request system software add /var/tmp/jinstall-5.2R2.3-domestic.tgz
Installing package '/var/tmp/jinstall-5.2R2.3-domestic.tgz
Auto-deleting old jroute...
Auto-deleting old jdocs...
Auto-deleting old jpfe...
Auto-deleting old jkernel...
Adding JUNOS base software 5.2R2.3
Adding jkernel...
Adding jpfe...
Adding jdocs...
Adding jroute...
NOTICE: uncommitted changes have been saved in
/var/db/config/juniper.conf.pre-install
Saving package file in /var/sw/pkg/jinstall-5.2R2.3-domestic.tgz
```

Compare Information Logged Before and After the Upgrade

Purpose Compare the operation of the system before and after the upgrade to ensure that everything is working as expected.

Action To obtain system information, use the following Junos OS CLI operational mode commands:

```
user@host> show version
user@host> show chassis hardware
user@host> show configuration
user@host> show interface terse
user@host> show bgp summary
user@host> show isis adjacency brief
user@host> show ospf neighbor brief
user@host> show system storage
```

Compare the information from these commands with the information you logged before the upgrade.

Displaying LSP Status Events

Purpose Display extensive information about LSPs, including the 50 most recent history events and the reasons why an LSP might have failed.

Action To examine status messages, enter the following Junos OS command-line interface (CLI) operational mode command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1# run show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
```

[...Output truncated...]

```

Meaning Sample Output 1 from ingress router R1 shows extensive ingress LSP information, including LSP events that led to an LSP failure and the 50 most recent state events.

LSP events in bold are described in this topic. Descriptions include sample output of the LSP event, an explanation of what the event means, the possible cause of the event, and any possible actions that you can take.

For completeness, events not included in this example output are also described in this topic to show LSP events that did not occur in the example network configuration, but might occur in your network. The LSP events are organized alphabetically.

Sample Output 2 shows the state of the route received in the Received Record Route (**Received RRO**) created by fast reroute configurations in the network. The **Received RRO** indicates a series of hops. Each hop has an address followed by a flag. For more information on flags, see the *Junos MPLS Network Operations Guide*. In most cases, the **Received RRO** is the same as the computed Explicit Route Object (ERO).

Sample Output 3 shows a **Computed ERO** and a **Received RRO**. In this instance they are the same. However, if **Received RRO** is different from the **Computed ERO**, there is a topology change in the network, and the route is taking a detour.

Call Was Cleared by RSVP Event

LSP Event Call was cleared by RSVP

Sample Output user@R1> show mpls lsp extensive
 [...Output truncated...]
 10.0.0.6
 From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
 ActivePath: (none)
 LoadBalance: Random
 Encoding type: Packet, Switching type: Packet, GPID: IPv4
 Primary State: Dn
 Will be enqueued for recomputation in 10 second(s).
 11 Jan 26 14:58:32 CSPF failed: no route toward 10.0.0.6
 10 Jan 26 14:58:25 Deselected as active
 9 Jan 26 14:58:25 CSPF failed: no route toward 10.0.0.6
 8 Jan 26 14:58:25 **Call was cleared by RSVP**
 7 Jan 26 14:58:25 Session preempted
 6 Jan 26 14:58:25 Down
 [...Output truncated...]

Meaning This LSP event indicates that the Resource Reservation Protocol (RSVP) session corresponding to the LSP path was preempted and the corresponding RSVP state deleted.

Cause This LSP event is occurs when you issue the **clear rsvp session** command or trigger preemption of an RSVP session at the ingress router. Depending on the timer value, Constrained Shortest Path First (CSPF) recomputes the path and the LSP comes up again.

Action Not applicable.

Change in Active Path Event

LSP Event Change in active path

Sample Output	<pre>user@R1> show mpls lsp extensive [...Output truncated...] 13 Sep 19 00:02:20 Deselected as active 12 Sep 19 00:02:20 ResvTear received 11 Sep 19 00:02:20 Down 10 Sep 19 00:02:20 Change in active path 9 Sep 19 00:02:20 8 Sep 19 00:02:20 10.222.28.2: Explicit Route: bad strict routeChange in active path 7 Sep 19 00:02:20 CSPF failed: no route toward 192.168.32.1 6 Sep 19 00:02:20 10.222.28.2: No Route toward dest 5 Sep 19 00:00:54 Selected as active path 4 Sep 19 00:00:54 Record Route: 10.222.28.2 10.222.4.2 10.222.44.2 3 Sep 19 00:00:54 Up 2 Sep 19 00:00:54 Originate Call 1 Sep 19 00:00:54 CSPF: computation result accepted [...Output truncated...]</pre>
Meaning	This LSP event indicates that even though the active physical path has changed, the LSP stays up. Because this network configuration has an alternate (fast-reroute) path available, the event is a Change in active path rather than a Session preempted event.
Cause	The active path might have failed.
Action	Not applicable.

Clear Call Event

LSP Event	Clear call
Sample Output	<pre>user@R1> show mpls lsp extensive [...Output truncated...] 65 Jan 5 09:58:33 Clear Call 64 Jan 5 09:58:33 Session preempted 63 Jan 5 09:58:33 Down [...Output truncated...]</pre>
Meaning	This LSP event indicates that the LSP was disconnected and restarted.
Cause	The clear mpls lsp command was issued on the ingress router to disconnect existing RSVP sessions, release the routes and states associated with the LSP, and then start a new LSP. Issuing this command might impact traffic travelling along the LSP, because a time lag might occur between tearing down the old path and setting up a new path.
Action	Not applicable.

Deselected as Active Event

LSP Event Deselected as active

Sample Output user@R1> show mpls lsp extensive
[...Output truncated...]
Will be enqueued for recomputation in 18 second(s).
53 Jan 4 18:11:28 CSPF failed: no route toward 10.0.0.6[2 times]
52 Jan 4 18:10:44 **Deselected as active**
51 Jan 4 18:10:44 CSPF failed: no route toward 10.0.0.6
50 Jan 4 18:10:44 CSPF: link down/deleted
[...Output truncated...]

Meaning This LSP event indicates that the LSP is no longer the active path.

Cause Typically, other events, similar to those in lines 50 and 51, indicate the reason that the LSP is no longer the active path.

Action Refer to events on either side of this event to determine the appropriate action.

Link Protection Down Event

LSP Event Link protection down

Sample Output 1

```

user@R1> show configuration protocols mpls
label-switched-path R1-to-R6 {
    to 10.0.0.6;
    link-protection;
}
interface fxp0.0 {
    disable;

  49 Feb 10 10:56:35 10.1.56.2: MPLS label allocation failure[2 times]
  48 Feb 10 10:48:32 Link-protection Up
  47 Feb 10 10:48:32 Selected as active path
[...Output truncated...]
```

Meaning Sample Output 1 shows the MPLS link-protection configuration on R1 for the LSP R1-to-R6.

Sample Output 2 shows that link protection came up and down several times. Link protection comes up when the LSP signals. Line 60 shows the result when RSVP is disabled on all alternate paths out of R6. Lines 68 to 70 are the result when the **clear mpls lsp** command is issued.

Cause This LSP event is caused by a failure or configuration change that deletes or resignals the bypass LSP. For example, you clear the LSP using the **clear mpls lsp** command, or you disable RSVP on all alternate paths for the LSP. The bypass LSP does not use the primary path, instead it looks for an alternate path.

Action Include the **family mpls** statement for all alternate paths for the LSP at the [edit interfaces type-fpc/pic/port.unit] hierarchy level.

Originate Call Event

LSP Event Originate call

Sample Output

```
user@R1> show mpls lsp extensive
[...Output truncated...]
 43 Jan  4 18:06:09 Record Route: 10.1.13.2 10.1.36.2
 42 Jan  4 18:06:09 Up
 41 Jan  4 18:06:09 Originate Call
 40 Jan  4 18:06:09 CSPF: computation result accepted
 39 Jan  4 18:05:40 CSPF failed: no route toward 10.0.0.6[2 times]
[...Output truncated...]
```

Meaning This LSP event indicates that the router is issuing an RSVP Path message.

Cause A Path message is transmitted by the ingress router toward the egress router to establish an LSP.

Action To analyze the contents of the Path message, enable RSVP tracing. To configure RSVP tracing, include the **traceoptions** statement at the [edit protocols rsvp] hierarchy level. Use the **file** statement to specify the name of the file that receives the output of the tracing operation. All files are placed in the directory **/var/log**. We recommend that you place RSVP tracing output in the file **rsvp-log**. To examine the contents of the **rsvp-log** file, issue the **file show /var/log/rsvp-log** command.

ResvTear Received Event

LSP Event ResvTear received

Sample Output user@R1> show mpls lsp extensive
[...Output truncated...]
23 Dec 28 13:46:39 CSPF failed: no route toward 10.0.0.6
22 Dec 28 13:46:39 Clear Call
21 Dec 28 13:46:39 **ResvTear received**
20 Dec 28 13:46:39 Down
19 Dec 28 13:46:39 10.1.13.2: Session preempted
18 Dec 28 13:42:07 Selected as active path
[...Output truncated...]

Meaning This LSP event indicates that an RSVP ResvTear message was received. ResvTear messages remove RSVP reservation states along a path. These messages travel upstream toward senders of the session. This message usually appears in the middle of a run of messages that tear the LSP down.

Cause In some cases, an ResvTear event is received because a router's reservation state times out. In other cases, when the downstream link fails, the upstream node must eliminate all RSVP states and initiates a ResvTear event. If you are running Fast ReRoute, the upstream node initiates a PathErr message, not a ResvTear message. It is beyond the scope of this document to include all possible reasons for an ResvTear event.

Action Analyze the status to determine if this is the required behavior. If this is not the required behavior, verify the surrounding LSP events to identify the cause of the problem.

Session Preempted Event

LSP Event Session preempted

Sample Output 1 user@R1> show mpls lsp extensive
 [...Output truncated...]
 21 Dec 28 13:46:39 ResvTear received
 20 Dec 28 13:46:39 Down
 19 Dec 28 13:46:39 10.1.13.2: **Session preempted**
 18 Dec 28 13:42:07 Selected as active path
 17 Dec 28 13:42:07 Record Route: 10.1.13.2 10.1.36.2
 [...Output truncated...]

Sample Output 2 user@R1> show mpls lsp extensive
 [...Output truncated...]
 66 Jan 5 09:58:33 CSPF failed: no route toward 10.0.0.6
 65 Jan 5 09:58:33 Clear Call
 64 Jan 5 09:58:33 **Session preempted**
 63 Jan 5 09:58:33 Down
 62 Jan 5 09:58:32 **CSPF failed**
 : no route toward 10.0.0.6[2 times]
 61 Jan 5 09:57:55 10.1.36.2: Explicit Route: wrong delivery
 60 Jan 5 09:57:34 CSPF failed: no route toward 10.0.0.6[2 times]
 59 Jan 5 09:57:28 CSPF: link down/deleted
 10.1.36.1(R3.00/10.0.0.3)->10.1.36.2(R6.00/10.0.0.6)
 [...Output truncated...]

Meaning This LSP event indicates that the LSP session was taken over. Sample Output 1 shows the IP address (10.1.13.2) included with the event, indicating the IP address of the router that sent the message. Sample Output 2 does not include an IP address, indicating that the message originated on the ingress router.

Cause The state of the network might have changed, as shown in Sample Output 1, or an LSP with a higher priority might be using the bandwidth of the LSP.

Action Refer to the events preceding this event in the history log for more information on what might have caused the preemption. For example, in line 62, the **CSPF failed** message may indicate that you specified a disable constrained-path (**no-cspf**) LSP and an explicit route address that is strict and not directly connected. Additionally, the egress router might have changed its configuration, making the destination address unreachable.

Displaying General LSP Error Events

Purpose Display extensive information about LSPs, including the 50 most recent history events and the possible reasons why an LSP failed.

Action To examine error messages, enter the following Junos OS command-line interface (CLI) operational mode command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output

```
user@R1# run show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn, No-decrement-ttl
    Bandwidth: 100Mbps
    14 Jan 21 15:43:39 Requested bandwidth unavailable[3 times]
    13 Jan 21 15:43:21 Deselected as active
    12 Jan 21 15:43:21 Requested bandwidth unavailable
    11 Jan 21 15:43:21 Clear Call
    10 Jan 21 15:42:32 Selected as active path
    9 Jan 21 15:42:32 Record Route: 10.1.12.2 10.1.26.2
    8 Jan 21 15:42:32 Up
[...Output truncated...]
```

Meaning The sample output from ingress router R1 is a section from the complete output. Typically, the output includes LSP events that led to an LSP failure and the 50 most recent state events. Only one example of a general LSP error event is displayed because it is impossible to provide all of the events described in this topic in one sequence of log history.

For completeness, events not generated by the example network used throughout this book are described to show LSP events that might occur in your network. The output for these events includes the prompt **user@host** rather than the usual **user@R1** prompt.

Admission Control Failure Event

LSP Event Admission control failure

Sample Output Not available.

Meaning This LSP error event indicates that a Resource Reservation Protocol (RSVP) Admission control failure occurred along the LSP path. This event is logged because of an error notification (PathErr message) received from RSVP for the label-switched path.

Cause This LSP event is caused by inadequate bandwidth on a link along the LSP path. The available bandwidth could not satisfy the requested traffic parameters and no other sessions were pre-empted to accommodate this request.

Action This error event is not generated by Juniper Networks routers. However, when this event is received by a Juniper Networks router, it appears in the log output of the **show mpls lsp extensive** command.

Explicit Route: Bad Loose Route Event

LSP Event Explicit Route: bad loose route

Sample Output 1 user@R1# run show mpls lsp extensive

```
Ingress LSP: 1 sessions

10.0.0.6
From: 10.0.0.1, State: up, ActiveRoute: 0, LSPname: R1-R6-3

path R6-3-1 {  
10.1.12.2;  
}  
interface fxp0.0 {  
disable;  
}  
interface all;
```

Meaning This LSP error event indicates that there is an error in the loose hop specified in the Explicit Route Object (ERO) of a Path message received by a label-switched router (LSR) along the LSP path, indicating an LSP setup failure.

Cause This LSP error event is caused by control plane unreachability or data plane incompatibility.

Action Check the LSP configuration at the `[edit protocols mpls]` hierarchy level.

Explicit Route: Bad Strict Route Event

LSP Event Explicit route: bad strict route

Sample Output 1 user@R1> show mpls lsp extensive
[...Output truncated...]

[20 times]
16 Jun 27 00:39:49 204.70.192.26: Routing loop detected [3370 times]
[...Output truncated...]

Meaning This LSP event indicates that a poorly formed ERO was generated. Sample Outputs 1 and 2 show that this LSP event was caused by different situations described below.

Cause This LSP event can be caused by several factors:

- A strict hop address specified for an LSP on a link that does not have RSVP enabled.
- The **no-cspf** statement included in the LSP configuration.
- An error with the configuration of constraints on a Constrained Shortest Path First (CSPF) LSP generates the **CSPF: No route towards dest** message, followed by the **Explicit Route: bad strict route** event.
- An ERO that causes a routing loop. See Sample Output 2.

Action Examine the strict hop address, remove the **no-cspf** statement, or examine the path and verify that RSVP is enabled on each interface.

Explicit Route: Format Error Event

LSP Event Explicit route: format error

Sample Output

```
user@R1> show mpls lsp extensive
[...Output truncated...]
10.0.0.6
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary to-R6 State: Dn, No-decrement-ttl
    5 Jan 21 14:37:06 10.1.34.2: Explicit Route: format error [2 times]
    4 Jan 21 14:37:03 Originate Call
    3 Jan 21 14:37:03 Clear Call
[...Output truncated...]
```

Meaning This LSP event indicates an LSP setup failure in which a Path message error in the the ERO was received by a router along the LSP path.

Cause This LSP event can be caused by several factors:

- An incorrectly formed ERO in the RSVP Path message.
- A strict hop address specified in the middle of an ERO that is not contiguous.
- An unsupported subobject in the ERO of a router along the LSP path.
- The hop indicated by the RSVP hop object does not match the hop indicated by the ERO.

Action Examine the strict hop address configuration and make any necessary changes.

Explicit Route: Wrong Delivery Event

LSP Event Explicit route: wrong delivery

Sample Output 1 user@host> show mpls lsp extensive
[...Output truncated...]
Primary use-TOKYO State: Dn, No-decrement-ttl
3 Sep 19 00:25:45 10.222.45.2: Explicit Route: wrong delivery
2 Sep 19 00:25:34 No Route[8 times]

[...Output truncated...]
10.0.0.6
From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
ActivePath: (none)
LoadBalance: Random
Encoding type: Packet, Switching type: Packet, GPID: IPv4
Primary to-R6 State: Dn
40 Jan 26 16:35:26 10.1.36.2: Explicit Route: wrong delivery [2 times]
39 Jan 26 16:35:23 Originate Call
38 Jan 26 16:35:23 Clear Call
[...Output truncated...]

Sample Output 3 user@R1> show configuration protocols mpls
label-switched-path R1-to-R6 {
to 10.0.0.6;
no-cspf;
primary to-R6;
}
path to-R6 {
10.1.13.2 strict;
10.1.56.1 strict; <<< IP address not directly connected to 10.1.13.2
10.1.26.1 strict;

Meaning This LSP event indicates that a RSVP message with an ERO arrived at the wrong router, even though a strict route was specified. The receiving router determines that the address is inconsistent with the ERO, and generates the error message. Note that the IP address of the sending router precedes the error event; for example, **10.222.45.2** in Sample Output 1, and **10.1.36.2** in Sample Output 2.

Cause This LSP event can be caused by several factors:

- The loopback (**lo0**) interface on the ingress router is not configured at the **[edit protocols isis]** hierarchy level. After the loopback (**lo0**) interface is included in the Intermediate System-to-Intermediate System (IS-IS) configuration, and while IS-IS is forming adjacencies, an RSVP packet is forwarded to an incorrect destination, **10.222.45.2**, as shown in Sample Output 1.
- A strict path is configured to a directly connected router, then another strict path is configured to an IP address that is not directly connected. For example, Sample Output

3 shows that the path **to-R6** includes three IP addresses, one of which (**10.1.56.1**) is not directly connected to the other IP addresses in the path.

Action Take appropriate action. On the ingress router, include the loopback (**lo0**) interface at the **[edit protocols isis]** hierarchy level, change the definition of the strict path at the **[edit protocols mpls path path-name]** hierarchy level, or verify the validity of all IP addresses listed in the named path referenced by the LSP hop by hop.

Invalid Destination Address Event

LSP Event Invalid Dest addr

Sample Output

```
user@R1> show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.1
  From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Metric: 100
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary                               State: Dn
    4 Apr 22 10:22:15 Invalid Dest Addr
    3 Apr 22 10:22:15 Originate Call
    2 Apr 22 10:22:15 Invalid Dest Addr
    1 Apr 22 10:22:15 Originate Call
  Created: Fri Apr 22 10:22:16 2005
  Total 1 displayed, Up 0, Down 1
```

Meaning This LSP event indicates that the **to** address configured at the **[edit protocols mpls labeled-switched-path name]** hierarchy level is invalid.

Cause This LSP event is caused when the **to** address of the LSP is the loopback address of the ingress router. A contributing factor may be that the **no-cspf** statement is included in the LSP configuration.

Action Verify that the LSP destination address is not the local router's loopback address, and check that the addresses on the local router are correctly configured.

Invalid Filter for Policing Event

LSP Event Invalid filter for policing

Sample Output Not available. This LSP event indicates an abnormal condition and is difficult to recreate.

Meaning	Although a policer was configured on the LSP, the corresponding firewall filter index was not found, indicating a failure in the routing protocol process (rpd) or the firewall process (dfwd).
Cause	A possible cause is that the routing protocol process (rpd) or the firewall process (dfwd) were restarted in a situation in which the LSP was established.
Action	Not applicable.

MPLS Graceful Restart: Recovery Failed Event

LSP Event	MPLS graceful restart: recovery failed
Sample Output	Not available.
Meaning	This LSP event indicates unsuccessful recovery of an LSP path after graceful restart, resulting in potential traffic loss.
Cause	<p>This LSP event is caused by several factors:</p> <ul style="list-style-type: none">• MPLS graceful restart procedures may have been aborted by this LSR.• MPLS graceful restart is disabled, by configuration, during the recovery period.• An MPLS LSP path is disabled either due to a configuration change or due to an error during the recovery period.• CSPF computation failed for the restarted LSP path with parameters and constraints preserved across the restart.• A signaling failure occurred and an RSVP PathErr was received on the LSP path signaled after a restart.• A network failure occurred on some hop that the LSP was traversing during the recovery period.
Action	Check the MPLS logs for more details about the failure.

MPLS Label Allocation Failure Event

LSP Event	MPLS label allocation failure
------------------	-------------------------------

Sample Output user@R1> show mpls lsp extensive
 [...Output truncated...]
 24 Jan 20 09:25:35 CSPF failed: no route toward 10.0.0.6
 23 Jan 20 09:25:35 Clear Call
 22 Jan 20 09:25:35 Deselected as active
 21 Jan 20 09:25:35 10.1.13.1: MPLS label allocation failure
 20 Jan 20 09:25:34 MPLS label allocation failure
 19 Jan 20 09:25:34 Down
 [...Output truncated...]

Meaning This LSP event indicates that the MPLS protocol or the **family mpls** statement were not configured properly. When the LSP event is preceded by an IP address, the address is typically the router that has the MPLS configuration error.

Cause This LSP event is caused by the omission of interfaces at the [edit protocols mpls] hierarchy level or failure to configure the **family mpls** statement at the [edit interfaces *type-fpc/pic/port*] hierarchy level. The **family mpls** statement specifies to the interface ASICs to permit protocol code 0x8847 (unicast MPLS) into the router.

Action Include interfaces at the [edit protocols mpls] hierarchy level, or include the **family mpls** statement at the [edit interfaces *type-fpc/pic/port*] hierarchy level. You must configure the **family mpls** statement, in the same way that you must configure the **family iso** statement for IS-IS.

NOTE: Do not configure the **family mpls** statement on the loopback (lo0) interface.

Non-RSVP Capable Router Detected Event

LSP Event Non-RSVP capable router detected

 6 Oct 25 16:29:27 Down
 [...Output truncated...]

Meaning This LSP event indicates that the router at address **10.1.36.1** in Sample Output 1 does not have a route to the specified destination. Sample Output 2 shows that the local router, ingress router **10.0.0.1**, does not have a route to the specified destination.

Cause This LSP event is caused by different factors. The egress interface of a transit router might not have RSVP enabled, or IP reachability to the destination (either the egress router or the next address in the ERO) does not exist.

Action Enable RSVP on the transit router's egress interface, or examine the IP configuration of the relevant router.

Unsupported Traffic Class Event

LSP Event Unsupported traffic class

Sample Output Not available. This LSP event indicates an abnormal condition and is difficult to recreate.

Meaning This LSP error event is a Juniper Networks proprietary error, indicating that a DiffServ-traffic engineering (TE) LSP was signaled with one or more traffic classes with values greater than the four traffic classes currently supported.

Cause Not available.

Action Not available.

CSPF: Computation Result Accepted Event

LSP Event CSPF: computation result accepted

Sample Output

```
user@R1> show mpls lsp extensive
[...Output truncated...]
 57 Jan  5 09:54:37 Record Route: 10.1.13.2 10.1.36.2
 56 Jan  5 09:54:37 Up
 55 Jan  5 09:54:37 Originate Call
 54 Jan  5 09:54:37  CSPF: computation result accepted
[...Output truncated...]
```

Meaning This LSP event indicates that CSPF pruned the traffic engineering database of noncompliant links and found a shortest path. CSPF generated an ERO, which was then passed to the RSVP.

Cause Not applicable.

Action Not applicable

CSPF: Reroute Due to Re-Optimization Event

LSP Event CSPF: Reroute due to re-optimization

Sample Output user@host> show mpls lsp extensive
[...Output truncated...]
9 Dec 11 17:32:35 Up
 8 Dec 11 17:32:35 Clear Call
 7 Dec 11 17:32:35 CSPF: computation result accepted
 6 Dec 11 17:32:35 **CSPF: Reroute due to re-optimization**
 5 Dec 11 17:28:29 CSPF: computation result ignored
 4 Dec 11 17:24:23 Record Route: 10.35.38.2 S 192.168.135.29 S
10.35.39.1 S 10.35.40.2 S 10.35.41.1 S
 3 Dec 11 17:24:23 Up
[...Output truncated...]

Meaning This LSP event indicates that CSPF found an optimal path for LSP traffic, and switched over to the new path.

Cause This is a periodic or one-time reoptimization event.

Action Not applicable.

Retry Limit Exceeded Event

LSP Event Retry limit exceeded

Sample Output 1 user@R1> show mpls lsp extensive
[...Output truncated...]
10.0.0.6
From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
ActivePath: (none)
LoadBalance: Random
Encoding type: Packet, Switching type: Packet, GPID: IPv4
Primary State: Dn
RetryCount: 13
RetryLimit: 1
12 Jan 14 15:39:30 Clear Call
11 Jan 14 15:39:30 Retry limit exceeded
10 Jan 14 15:39:10 10.1.12.1: MPLS label allocation failure[11 times]
[...Output truncated...]

Sample Output 2 user@R1> show mpls lsp extensive
[...Output truncated...]
10.0.0.6
From: 10.0.0.1, State: Dn, ActiveRoute: 0, LSPname: R1-to-R6
ActivePath: (none)
LoadBalance: Random
Encoding type: Packet, Switching type: Packet, GPID: IPv4
Primary State: Dn
14 Jan 14 15:44:07 10.1.12.1: MPLS label allocation failure[3 times]
13 Jan 14 15:43:58 Originate Call
12 Jan 14 15:39:30 Clear Call
11 Jan 14 15:39:30 Retry limit exceeded
10 Jan 14 15:39:10 10.1.12.1: MPLS label allocation failure[11 times]
[...Output truncated...]

Meaning This LSP event indicates that the number of CSPF path computations for a particular path exceeded a configured retry limit. After this point, the path is not recomputed or signaled, unless the user intervenes.

Cause The number of CSPF path computations for an LSP path exceeded the configured non-zero retry limit. Sample Output 1 shows that a configured retry limit of 1 was exceeded by the retry count of 13.

Action Enter the **clear mpls lsp** command to disconnect and restart the LSP. Sample Output 2 shows that events 13 and 14 were generated after the **clear mpls lsp** command was issued. This operation disconnects existing RSVP sessions on the ingress router, releases the routes and states associated with the LSPs, and starts a new LSP. Issuing this command might impact traffic travelling along the LSP, because of a time lag that can occur between the old path being torn down and the new path being set up.

Log the Software Version Information

Purpose The purpose of this action is to log the Junos OS version information.

Action Use the following Junos OS CLI operational mode command:

```
user@host> show version | save filename
```

Sample Output

```
user@host> show version | save test
Wrote 39 lines of output to 'test'

user@host> show version
Hostname: my-router.net
Model: m10

```

Meaning The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

Related Documentation •

Log the Hardware Version Information

Purpose You should log hardware version information in the rare event that a router cannot successfully reboot and you cannot obtain the Routing Engine serial number. The Routing Engine serial number is necessary for Juniper Networks Technical Assistance Center (JTAC) to issue a return to manufacturing authorization (RMA). Without the Routing Engine serial number, an onsite technician must be dispatched to issue the RMA.

Action To log the router chassis hardware version information, use the following Junos OS CLI operational mode command:

```
user@host> show chassis hardware | save filename
```

Sample Output The output for the M-series routers varies depending on the chassis components of each router. All routers have a chassis, midplanes or backplanes, power supplies, and Flexible PIC Concentrators (FPCs). Refer to the hardware guides for information about the different chassis components.

```
user@host> show chassis hardware | save test
Wrote 43 lines of output to 'test'
```

```
user@host> show chassis hardware
```

Item	Version	Part number	Serial number	Description

PIC 0	REV 01			1x OC-192 SM SR-2

Meaning The sample output shows the hardware inventory for an M160 router with a chassis serial number of 101. For each component, the output shows the version number, part number, serial number, and description.

Log the System Boot-Message Information

Action To log the system boot-message information, use the following Junos OS CLI operational mode command:

```
user@host> show system boot-messages | save filename
```

```

Sample Output user@host> show system boot-messages | save test
Wrote 80 lines of output to 'test'

user@host> show system boot-messages

```

Meaning The sample output shows the initial messages generated by the system kernel upon boot. This is the content of the `/var/run/dmesg.boot` file.

Log the BGP, IS-IS, and OSPF Adjacency Information

Purpose The following commands log useful information about Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Open Shortest Path First (OSPF) protocols. If you have other protocols installed, such as Multiprotocol Label Switching (MPLS), Resource Reservation Protocol (RSVP), or Protocol Independent Multicast (PIM), you also might log summary information for them.

Action To log the protocol peer information, use the following Junos OS CLI operational mode commands:

```
user@host> show bgp summary | save filename
user@host> show isis adjacency brief | save filename
user@host> show ospf neighbor brief | save filename
```

Sample Output 1 user@host> show bgp summary | save test
Wrote 45 lines of output to 'test'

```
user@host> show bgp summary
Groups: 1 Peers: 1 Down peers: 0
Table          Tot Paths  Act Paths Suppressed  History Damp State   Pending
inet.0         4          4          0          0        0      0

```

Sample Output 3 user@host> show ospf neighbor brief | save test
Wrote 10 lines of output to 'test'

```
user@host> show ospf neighbor brief
Address      Intf      State      ID          Pri  Dead
10.168.254.225 fxp3.0    2Way      10.250.240.32 128 36
10.168.254.230 fxp3.0    Full      10.250.240.8 128 38
10.168.254.229 fxp3.0    Full      10.250.240.35 128 33
10.1.1.129      fxp2.0    Full      10.250.240.12 128 37
10.1.1.131      fxp2.0    Full      10.250.240.11 128 38
10.1.2.1        fxp1.0    Full      10.250.240.9 128 32
10.1.2.81       fxp0.0    Full      10.250.240.10 128 33
```

Meaning Sample output 1 displays summary information about BGP and its neighbors. Sample output 2 displays information about IS-IS neighbors. Sample output 3 displays information about all OSPF neighbors.

Back Up the Currently Running and Active File System

Action To back up the currently running and active file system so that you can recover to a known, stable environment in case there is a problem during the reinstall, use the following Junos OS CLI operational mode command:

```
user@host> request system snapshot
```

Sample Output

```
user@host> request system snapshot
umount: /altroot: not currently mounted
Copying / to /altroot.. (this may take a few minutes)
umount: /altconfig: not currently mounted
Copying /config to /altconfig.. (this may take a few minutes)
The following filesystems were archived: / /config
```

Meaning The root file system is backed up to **/altroot**, and **/config** is backed up to **/altconfig**. The root and **/config** file systems are on the router's internal flash drive, and the **/altroot** and **/altconfig** file systems are on the router's hard drive.

NOTE: After you issue the **request system snapshot** command, you cannot return to the previous version of the software because the running and backup copies of the software are identical.

Reinstall Junos OS

Action To reinstall Junos OS, follow these steps:

1. Insert the removable medium (boot floppy) into the router.
2. Reboot the router, either by power-cycling it or by issuing the **request system reboot** command from the CLI.
3. At the following prompt, type **y**:

```
WARNING: The installation will erase the contents of your disk. Do you wish
to continue (y/n)?
```

The router copies the software from the removable medium onto your system, occasionally displaying status messages. This can take up to 10 minutes.

4. Remove the removable medium when prompted.

The router reboots from the primary boot device on which the software is installed. When the reboot is complete, the router displays the login prompt.

Reconfigure Junos OS

After you have reinstalled the software, you must copy the router's configuration files back to the router. (You also can configure the router from scratch, as described in *Junos System Basics Configuration Guide*.) However, before you can copy the configuration files, you must establish network connectivity.

To reconfigure the software, follow these steps:

1. [Configure Host Names, Domain Names, and IP Addresses on page 1333](#)
2. [Protecting Network Security by Configuring the Root Password on page 1334](#)
3. [Check Network Connectivity on page 1336](#)
4. [Copy Backup Configurations to the Router on page 1336](#)

Configure Host Names, Domain Names, and IP Addresses

To configure the machine name, domain name, and various addresses, follow these steps:

1. Log in as **root**. There is no password.
2. Start the CLI:

```
root# cli
root@>
```
3. Enter configuration mode:

```
cli> configure
[edit]
root@#
```
4. Configure the name of the machine. If the name includes spaces, enclose the entire name in quotation marks (" "):

```
[edit]
root@# set system host-name host-name
```
5. Configure the machine's domain name:

```
[edit]
root@# set system domain-name domain-name
```
6. Configure the IP address and prefix length for the router's management Ethernet interface:

```
[edit]
root@# set interfaces fxp0 unit 0 family inet address address / prefix-length
```
7. Configure the IP address of a default router. This system is called the backup router because it is used only while the routing protocol process is not running.

```
[edit]
root@# set system backup-router address
```
8. Configure the IP address of a Domain Name Server (DNS) server:

```
[edit]
root@# set system name-server address
```

Protecting Network Security by Configuring the Root Password

Configuring the root password on your Junos OS-enabled router helps prevent unauthorized users from making changes to your network. The root user (also referred to as superuser) has unrestricted access and full permissions within the system, so it is crucial to protect these functions by setting a strong password when setting up a new router.

After a new router is initially powered on, you log in as the user **root** with no password. Junos OS requires configuration of the root password before it accepts a commit operation. On a new device, the root password must always be a part of the configuration submitted with your initial commit.

To set the root password, you have a few options as shown in Step 1 of the following procedure.

- Enter a plain-text password that Junos OS encrypts.
- Enter a password that is already encrypted.
- Enter a secure shell (ssh) public key string.

The most secure options of these three are using an already encrypted password or an ssh public key string. Pre-encrypting your password or using a ssh public key string means the plain-text version of your password will never be transferred over the internet, protecting it from being intercepted by a man-in-the-middle attack.

BEST PRACTICE: Optionally, instead of configuring the root password at the **[edit system]** hierarchy level, you can use a configuration group to strengthen security, as shown in Step 2 of this procedure. This step uses a group called **global** as an example.

To set the root password:

1. Use one of these methods to configure the root password:

- To enter a plain-text password that the system encrypts for you:

```
[edit groups global system]
root@# set root-authentication plain-text-password
New Password: type password here
Retype new password: retry password here
```

If you use a plain-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see it. As you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt the password as in some other systems. Plain-text passwords are hidden and marked as **## SECRET-DATA** in the configuration.

- To enter a password that is already encrypted:

CAUTION: Do not use the `encrypted-password` option unless the password is *already* encrypted, and you are entering the encrypted version of the password.

If you accidentally configure the `encrypted-password` option with a plain-text password or with blank quotation marks (" "), you will not be able to log in to the device as root, and you will need to complete the root password recovery process.

```
[edit groups global system]
root@# set root-authentication encrypted-password password
```

- To enter an ssh public key string:

```
[edit groups global system]
root@# set root-authentication (ssh-dsa | ssh-eccdsa | ssh-rsa key)
```

2. (Optional) Strengthen security by only allowing root access from the console port.

```
[edit groups global system]
root@# set services ssh root-login deny
```

3. If you used a configuration group in Step 2, apply the configuration group, substituting **global** with the appropriate group name.

```
[edit]
user@host# set apply-groups global
```

4. Commit the changes.

```
root@# commit
```

Check Network Connectivity

Purpose Establish that the router has network connectivity.

Action To check that the router has network connectivity, issue a **ping** command to a system on the network:

```
root@> ping address
```

If there is no response, verify that there is a route to the **address** using the **show route** command. If the address is outside your **fxp0** subnet, add a static route. Once the backup configuration is loaded and committed, the static route is no longer needed and should be deleted.

Copy Backup Configurations to the Router

To copy backup configurations to the router, follow these steps:

1. To copy the existing configuration and any backup configurations back onto the router, use the **file copy** command. Place the files in the **/var/tmp** directory.

```
user@host> file copy var/tmp/filename
```

2. Load and activate the desired configuration:

```
root@> configure
[edit]
root@# load merge/config/filename or load replace/config/filename
[edit]
root@# commit
```

Configure Host Names, Domain Names, and IP Addresses

To configure the machine name, domain name, and various addresses, follow these steps:

1. Log in as **root**. There is no password.
2. Start the CLI:

```
root# cli
root@>
```

3. Enter configuration mode:

```
cli> configure
[edit]
root@#
```

4. Configure the name of the machine. If the name includes spaces, enclose the entire name in quotation marks (" "):

```
[edit]
root@# set system host-name host-name
```

5. Configure the machine's domain name:

```
[edit]  
root@# set system domain-name domain-name
```

6. Configure the IP address and prefix length for the router's management Ethernet interface:

```
[edit]  
root@# set interfaces fxp0 unit 0 family inet address address / prefix-length
```

7. Configure the IP address of a default router. This system is called the backup router because it is used only while the routing protocol process is not running.

```
[edit]  
root@# set system backup-router address
```

8. Configure the IP address of a Domain Name Server (DNS) server:

```
[edit]  
root@# set system name-server address
```

Check Network Connectivity

Purpose Establish that the router has network connectivity.

Action To check that the router has network connectivity, issue a **ping** command to a system on the network:

```
root@> ping address
```

If there is no response, verify that there is a route to the **address** using the **show route** command. If the address is outside your **fxp0** subnet, add a static route. Once the backup configuration is loaded and committed, the static route is no longer needed and should be deleted.

Automatic Autobandwidth Adjustment Failed Event

LSP Event Autobw adjustment failed

Sample Output 1

```

user@R1> show configuration protocols mpls
statistics {
    file auto-bw.log;
    interval 5;
    auto-bandwidth;
}
label-switched-path R1-to-R6 {
    to 10.0.0.6;
    auto-bandwidth {
        adjust-interval 300;
        adjust-threshold 10;
        minimum-bandwidth 5m;
        maximum-bandwidth 80m;
    }
}
label-switched-path R1-to-R3 {
    to 10.0.0.3;
    auto-bandwidth {
        adjust-interval 300;
        adjust-threshold 10;
        minimum-bandwidth 155m;
        maximum-bandwidth 155m;
    }
}

```

Sample Output 2

```

user@R1> show mpls lsp extensive

```

Meaning This LSP event indicates that a periodic (timer-based) autobandwidth adjustment for

the LSP is triggered at the end of the adjust interval. The adjustment fails, and the LSP stays up on the existing path with its current bandwidth.

Cause Adjustment failure may be due to a path CSPF computation failure with the adjust bandwidth or a signaling failure on the new path.

At the end of the time interval specified at the **[edit protocols mpls label-switched-path auto-bandwidth]** hierarchy level, the current maximum average bandwidth usage is compared to the allocated bandwidth for the LSP. If the LSP needs more bandwidth, an attempt is made to set up a new path where bandwidth is equal to the current maximum average usage. If the attempt is successful, the LSP's traffic is routed through the new path and the old path is removed. If the attempt fails, the LSP continues to use its current path.

Action Take action appropriate to the situation:

- Verify the MPLS and RSVP configuration on all available paths to the LSP endpoint.
- Check available bandwidth on alternate paths using the **show rsvp interface** command. If not enough bandwidth is available on any available paths, adjust the minimum-bandwidth parameter for the LSP in order to establish or adjust the priority to allow the LSP to preempt another LSP of lesser priority. For an LSP to be preempted, its hold priority must be lower than the LSP you are trying to establish.

Configuring Automatic Bandwidth Allocation for LSPs

Automatic bandwidth allocation allows an MPLS tunnel to automatically adjust its bandwidth allocation based on the volume of traffic flowing through the tunnel. You can configure an LSP with minimal bandwidth, and this feature can dynamically adjust the LSP's bandwidth allocation based on current traffic patterns. The bandwidth adjustments do not interrupt traffic flow through the tunnel.

At the end of the automatic bandwidth allocation time interval, the current maximum average bandwidth usage is compared with the allocated bandwidth for the LSP. If the LSP needs more bandwidth, an attempt is made to set up a new path where bandwidth is equal to the current maximum average usage. If the attempt is successful, the LSP's traffic is routed through the new path and the old path is removed. If the attempt fails, the LSP continues to use its current path.

NOTE: In calculating the value for **Max AvgBW** (relative to the ingress LSP), the sample collected during make before break (MBB) is ignored to prevent inaccurate results. The first sample after a bandwidth adjustment, or after a change in the LSP ID (regardless of path change), is also ignored.

If you have configured link and node protection for the LSP and traffic has been switched to the bypass LSP, the automatic bandwidth allocation feature continues to operate and take bandwidth samples from the bypass LSP. For the first bandwidth adjustment cycle,

the maximum average bandwidth usage taken from the original link and node-protected LSP is used to resignal the bypass LSP if more bandwidth is needed. (Link and node protection are not supported on QFX Series switches.)

If you have configured fast-reroute for the LSP, you might not be able to use this feature to adjust the bandwidth. Because the LSPs use a fixed filter (FF) reservation style, when a new path is signaled, the bandwidth might be double-counted. Double-counting can prevent a fast-reroute LSP from ever adjusting its bandwidth when automatic bandwidth allocation is enabled. (Fast reroute is not supported on QFX Series switches.)

To configure automatic bandwidth allocation, complete the steps in the following sections:

- [Configuring Automatic Bandwidth Allocation on LSPs on page 1340](#)
- [Requesting Automatic Bandwidth Allocation Adjustment on page 1345](#)

NOTE: On the QFX10000 switches, you can only configure automatic bandwidth allocation at the `edit protocols mpls` hierarchy level. Logical systems are not supported.

Configuring Automatic Bandwidth Allocation on LSPs

To enable automatic bandwidth allocation on an LSP, include the **auto-bandwidth** statement:

```
auto-bandwidth (MPLS Tunnel) {  
  adjust-interval seconds;  
  adjust-threshold percent;  
  adjust-threshold-overflow-limit number;  
  adjust-threshold-underflow-limit number;  
  maximum-bandwidth bps;  
  minimum-bandwidth bps;  
  minimum-bandwidth-adjust-interval  
  minimum-bandwidth-adjust-threshold-change  
  minimum-bandwidth-adjust-threshold-value  
  monitor-bandwidth;  
}
```

You can include this statement at the following hierarchy levels:

- `[edit protocols mpls label-switched-path lsp-name]`
- `[edit logical-systems logical-system-name protocols mpls label-switched-path lsp-name]`

If an LSP has an automatic bandwidth configuration, you can disable automatic bandwidth adjustments on a particular path (either primary or secondary) by configuring a static bandwidth value and by disabling the CSPF computation (using the **no-cspf** statement).

For example:

```
user@host> show protocols mpls  
label-switched-path primary-path {  
  to 192.168.0.1;
```

```

ldp-tunneling;
optimize-timer 3571;
least-fill;
link-protection;
adaptive;
auto-bandwidth {
    adjust-interval 7177;
    adjust-threshold 5;
    minimum-bandwidth 1m;
    maximum-bandwidth 2500000000;
    adjust-threshold-overflow-limit 2;
    resignal-minimum-bandwidth;
}
primary primary-path;
secondary secondary-path {
    bandwidth 0;
    no-cspf;
    priority 0 0;
}
}

```

The statements configured at the **[edit protocols mpls label-switched-path *label-switched-path-name* auto-bandwidth]** hierarchy level are optional and explained in the following sections:

- [Configuring the Automatic Bandwidth Allocation Interval on page 1341](#)
- [Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 1342](#)
- [Configuring the Automatic Bandwidth Adjustment Threshold on page 1342](#)
- [Configuring a Limit on Bandwidth Overflow and Underflow Samples on page 1343](#)
- [Configuring Passive Bandwidth Utilization Monitoring on page 1345](#)

Configuring the Automatic Bandwidth Allocation Interval

At the end of the automatic bandwidth allocation interval, the automatic bandwidth computation and new path setup process is triggered.

NOTE: To prevent unnecessary resignaling of LSPs, it is best to configure an LSP adjustment interval that is at least three times longer than the MPLS automatic bandwidth statistics interval. For example, if you configure a value of 30 seconds for the MPLS automatic bandwidth statistics interval (interval statement at the **[edit protocols mpls statistics]** hierarchy level), you should configure a value of at least 90 seconds for the LSP adjustment interval (adjust-interval statement at the **[edit protocols mpls label-switched-path *label-switched-path-name* auto-bandwidth]** hierarchy level). See also [“Configuring Reporting of Automatic Bandwidth Allocation Statistics for LSPs” on page 430](#).

To specify the bandwidth reallocation interval in seconds for a specific LSP, include the **adjust-interval** statement:

```
adjust-interval seconds;
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls label-switched-path *lsp-name* auto-bandwidth (MPLS Tunnel)]
- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* auto-bandwidth (MPLS Tunnel)]

Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth

You can maintain the LSP's bandwidth between minimum and maximum bounds by specifying values for the **minimum-bandwidth** and **maximum-bandwidth** statements.

To specify the minimum amount of bandwidth allocated for a specific LSP, include the **minimum-bandwidth** statement:

```
minimum-bandwidth bps;
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls label-switched-path *lsp-name* auto-bandwidth (MPLS Tunnel)]
- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* auto-bandwidth (MPLS Tunnel)]

To specify the maximum amount of bandwidth allocated for a specific LSP, include the **maximum-bandwidth** statement:

```
maximum-bandwidth bps;
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls label-switched-path *lsp-name* auto-bandwidth (MPLS Tunnel)]
- [edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* auto-bandwidth (MPLS Tunnel)]

Configuring the Automatic Bandwidth Adjustment Threshold

Use the **adjust-threshold** statement to specify the sensitivity of the automatic bandwidth adjustment of an LSP to changes in bandwidth utilization. You can set the threshold for when to trigger automatic bandwidth adjustments. When configured, bandwidth demand for the current interval is determined and compared to the LSP's current bandwidth allocation. If the percentage difference in bandwidth is greater than or equal to the specified **adjust-threshold** percentage, the LSP's bandwidth is adjusted to the current bandwidth demand.

For example, assume that the current bandwidth allocation is 100 megabits per second (Mbps) and that the percentage configured for the **adjust-threshold** statement is 15 percent. If the bandwidth demand increases to 110 Mbps, the bandwidth allocation is not adjusted. However, if the bandwidth demand increases to 120 Mbps (20 percent over the current allocation) or decreases to 80 Mbps (20 percent under the current allocation), the bandwidth allocation is increased to 120 Mbps or decreased to 80 Mbps, respectively.

To configure the threshold for automatic bandwidth adjustment, include the **adjust-threshold** statement:

```
adjust-threshold percent;
```

You can include this statement at the following hierarchy levels:

- [edit protocols mpls **label-switched-path** *lsp-name* **auto-bandwidth** (MPLS Tunnel)]
- [edit logical-systems *logical-system-name* protocols mpls **label-switched-path** *lsp-name* **auto-bandwidth** (MPLS Tunnel)]

Configuring a Limit on Bandwidth Overflow and Underflow Samples

The automatic bandwidth adjustment timer is a periodic timer which is triggered every adjust interval to determine whether any bandwidth adjustments are required on the LSP's active path. This interval is typically configured as a long period of time, usually hours. If, at the end of adjust interval, the change in bandwidth is above a certain adjust threshold, the LSP is resigaled with the new bandwidth.

During the automatic bandwidth adjustment interval, the router might receive a steady increase in traffic (increasing bandwidth utilization) on an LSP, potentially causing congestion or packet loss. To prevent this, you can define a second trigger to prematurely expire the automatic bandwidth adjustment timer before the end of the current adjustment interval.

Every statistics interval, the router samples the average bandwidth utilization of an LSP and if this has exceeded the current maximum average bandwidth utilization, the maximum average bandwidth utilization is updated.

During each sample period, the following conditions are also checked:

- Is the current average bandwidth utilization above the active bandwidth of the path?
- Has the difference between the average bandwidth utilization and the active bandwidth exceeded the adjust threshold (bandwidth utilization has changed significantly)?

If these conditions are true, it is considered to be one bandwidth overflow sample. Using the **adjust-threshold-overflow-limit** statement, you can define a limit on the number of bandwidth overflow samples such that when the limit is reached, the current automatic bandwidth adjustment timer is expired and a bandwidth adjustment is triggered. Once this adjustment is complete, the normal automatic bandwidth adjustment timer is reset to expire after the periodic adjustment interval.

To specify a limit on the number of bandwidth overflow samples before triggering an automatic bandwidth allocation adjustment, configure the **adjust-threshold-overflow-limit** statement:

```
adjust-threshold-overflow-limit number;
```

Similarly, if the current average bandwidth utilization is below the active bandwidth of the path by the configured adjusted threshold (meaning that bandwidth utilization has gone down significantly), the sample is considered to be an underflow sample. The adjusted (new signaling) bandwidth after an adjustment due to underflow is the maximum

average bandwidth among the underflow samples. Starting in Junos OS Release 14.1R9, 15.1R7, 16.1R5, 16.1X2, 16.2R3, and 17.2R2, all zero value bandwidth samples are considered as underflow samples, except for the zero value samples that arrive after an LSP comes up for the first time, and the zero value samples that arrive first after a Routing Engine switchover.

You can specify a limit on the number of bandwidth underflow samples before triggering an automatic bandwidth allocation adjustment by configuring the **adjust threshold-underflow-limit** statement:

adjust-threshold-underflow-limit *number*;

These statements can be configured at the following hierarchy levels:

- [edit protocols mpls **label-switched-path** *lsp-name* **auto-bandwidth** (MPLS Tunnel)]
- [edit logical-systems *logical-system-name* protocols mpls **label-switched-path** *lsp-name* **auto-bandwidth** (MPLS Tunnel)]

You must configure the **adjust-threshold** and **minimum-bandwidth** statements whenever you configure the **adjust-threshold-underflow-limit** statement. You must configure the **adjust-threshold** and **maximum-bandwidth** statements whenever you configure the **adjust-threshold-overflow-limit** statement.

- You must configure a nonzero value for the **adjust-threshold** statement if you configure the **adjust-threshold-overflow-limit** or **adjust-threshold-underflow-limit** statement.
- Any bandwidth increase or decrease below the value configured for the **adjust-threshold** statement does not constitute an overflow or underflow condition.
- To prevent unlimited increases in LSP bandwidth (to limit overflow beyond a certain bandwidth), you must also configure the **maximum-bandwidth** statement when you configure the **adjust-threshold-overflow-limit** statement.

The following describes the other aspects of the **adjust-threshold-overflow-limit** statement:

- It only applies to bandwidth overflows. If the bandwidth is decreasing, the normal automatic bandwidth adjustment interval is used.
- It does not affect manually triggered automatic bandwidth adjustment.
- It applies to single-class DiffServ-TE LSPs.
- Because the **adjust-threshold-overflow-limit** statement can trigger a bandwidth adjustment, it cannot be enabled at the same time as the **monitor-bandwidth** statement (for information about that statement, see [“Configuring Passive Bandwidth Utilization Monitoring” on page 429](#)).
- You cannot configure automatic bandwidth adjustments to occur more often than every 300 seconds. The **adjust-threshold-overflow-limit** statement is subject to the same minimum value with regard to the minimum frequency of adjustment allowed. Overflow condition based adjustments can occur no sooner than 300 seconds from the start of the overflow condition. Therefore it is required that:

sample interval x adjust-threshold-overflow-limit >= 300s

These values are checked during the commit operation. An error is returned if the value is less than 300 seconds.

- If you change the value of the **adjust-threshold-overflow-limit** statement on a working router, you can expect the following behavior:
 - If you increase the current value of the **adjust-threshold-overflow-limit** statement, the old value is replaced with the new one.
 - If you decrease the current value of the **adjust-threshold-overflow-limit** statement and the current bandwidth overflow count is less than the new value, the old value is replaced with the new one.
 - If you decrease the current value of the **adjust-threshold-overflow-limit** statement and the current bandwidth overflow count is greater than the new value, the adjustment timer is immediately expired and a bandwidth adjustment is initiated.

Configuring Passive Bandwidth Utilization Monitoring

Use the **monitor-bandwidth** statement to switch to a passive bandwidth utilization monitoring mode. In this mode, no automatic bandwidth adjustments are made, but the maximum average bandwidth utilization is continuously monitored and recorded.

To configure passive bandwidth utilization monitoring, include the **monitor-bandwidth** statement:

```
monitor-bandwidth;
```

You can include this statement at the following hierarchy levels:

- **[edit protocols mpls label-switched-path *lsp-name* auto-bandwidth (MPLS Tunnel)]**
- **[edit logical-systems *logical-system-name* protocols mpls label-switched-path *lsp-name* auto-bandwidth (MPLS Tunnel)]**

If you have configured an LSP with primary and secondary paths, the automatic bandwidth allocation statistics are carried over to the secondary path if the primary path fails. For example, consider a primary path whose adjustment interval is half complete and whose maximum average bandwidth usage is currently calculated as 50 Mbps. If the primary path suddenly fails, the time remaining for the next adjustment and the maximum average bandwidth usage are carried over to the secondary path.

Requesting Automatic Bandwidth Allocation Adjustment

For MPLS LSP automatic bandwidth allocation adjustment, the minimum value for the adjustment interval is 5 minutes (300 seconds). You might find it necessary to trigger a bandwidth allocation adjustment manually, for example in the following circumstances:

- When you are testing automatic bandwidth allocation in a network lab.
- When the LSP is configured for automatic bandwidth allocation in monitor mode (the **monitor-bandwidth** statement is included in the configuration as described in

[“Configuring Passive Bandwidth Utilization Monitoring” on page 429](#)), and want to initiate an immediate bandwidth adjustment.

To use the **request mpls lsp adjust-autobandwidth** command, the following must be true:

- Automatic bandwidth allocation must be enabled on the LSP.
- The criteria required to trigger a bandwidth adjustment have been met (the difference between the adjust bandwidth and the current LSP path bandwidth is greater than the threshold limit).

A manually triggered bandwidth adjustment operates only on the active LSP path. Also, if you have enabled periodic automatic bandwidth adjustment, the periodic automatic bandwidth adjustment parameters (the adjustment interval and the maximum average bandwidth) are not reset after a manual adjustment.

For example, suppose the periodic adjust interval is 10 hours and there are currently 5 hours remaining before an automatic bandwidth adjustment is triggered. If you initiate a manual adjustment with the **request mpls lsp adjust-autobandwidth** command, the adjust timer is not reset and still has 5 hours remaining.

To manually trigger a bandwidth allocation adjustment, you need to use the **request mpls lsp adjust-autobandwidth** command. You can trigger the command for all affected LSPs on the router, or you can specify a particular LSP:

```
user@host> request mpls lsp adjust-autobandwidth
```

Once you execute this command, the automatic bandwidth adjustment validation process is triggered. If all the criteria for adjustment are met, the LSP's active path bandwidth is adjusted to the adjusted bandwidth value determined during the validation process.

Release History Table

Release	Description
14.1R9	Starting in Junos OS Release 14.1R9, 15.1R7, 16.1R5, 16.1X2, 16.2R3, and 17.2R2, all zero value bandwidth samples are considered as underflow samples, except for the zero value samples that arrive after an LSP comes up for the first time, and the zero value samples that arrive first after a Routing Engine switchover.

Displaying DiffServ-Aware Traffic-Engineered LSP Events

Purpose A DiffServ-aware traffic-engineered LSP is configured with a bandwidth reservation for a specific class type, and carries traffic for a single class type. On the packets, the class

type is specified by the experimental (EXP) bits (also known as the class-of-service bits) and the per-hop behavior (PHB) associated with the EXP bits. The mapping between the EXP bits and the PHB is static, instead of being signaled in Resource Reservation Protocol (RSVP).

The class type must be configured consistently across the DiffServ domain, and must be consistent from router to router in the network. You can unambiguously map a class type to a queue. On each node router, the class-of-service queue configuration for an interface translates to the available bandwidth for a particular class type on that link. For more information about forwarding classes and class of service, see the Junos Class of Service Configuration Guide. For more information about differentiated services, see RFC 3270, *MPLS Applications Feature Guide Support of Differentiated Services*.

When the configuration of a DiffServ-aware traffic-engineered LSP is incorrect, an even or error message might occur in the output of the **show mpls lsp extensive** command.

Action To display LSP events that can occur with a DiffServ-aware LSP, enter the following Junos OS command-line interface (CLI) operational mode command from the ingress router:

```
user@host> show mpls lsp extensive
```

Sample Output

Not available.

Unsupported Traffic Class Event

LSP Event Unsupported traffic class

Sample Output Not available.

Meaning This LSP error event is a Juniper Networks proprietary error indicating that a Diffserv traffic engineering LSP was signaled with one or more traffic classes with values greater than the four traffic classes currently supported by the Junos OS.

Cause Not available.

Action Not available.

Traffic Class Value Out of Allowed Range Event

LSP Event Traffic class value out of allowed range

Sample Output Not available.

Meaning This LSP error event is a Juniper Networks proprietary error indicating that a single class, IETF-style DiffServ traffic engineering LSP was signaled with a traffic class value of zero, which is invalid.

Cause Not available.

Action Not available.

The Combination of Setup Priority and Traffic Class Is Not One of the Configured TE Classes Event

LSP Event The combination of setup-priority and traffic class is not one of the configured TE-classes

Sample Output Not available.

Meaning This LSP error event is a Juniper Networks proprietary error that indicates the setup priority signaled in the Path message for the LSP does not match the supported Diffserv traffic engineering classes configured on a label-switching router (LSR) along the LSP path.

Cause This LSP error event is caused by incorrect configuration of the LSP setup priority on the ingress LSR, or the incorrect configuration of a DiffServ traffic engineering class on an LSR along the LSP path.

Action Correct the configuration depending on the supported traffic engineering classes.

RSVP Error, Subcode 7, Signal Type Does Not Match Link Encoding Event

LSP Event RSVP error, subcode 7, signal-type does not match link encoding

Sample Output Not available

Meaning This LSP error event is a Juniper Networks proprietary error reported for GMPLS LSPs when the configured signal bandwidth does not match the encoding type of the traffic engineering link selected on the first hop.

Cause An incorrect Sender Tspec is used with a particular LSP switching or encoding type.

Action Not available.

Unacceptable Label Value Event

LSP Event Unacceptable label value event

Sample Output Not available.

Meaning This LSP error event indicates that the label value signaled in either the Path or Resv message was unacceptable to a label-switched router (LSR) along the LSP path.

Cause For GMPLS LSPs, this LSP error event is generated by incorrect label mapping configured on one of the LSRs, or by deletion of a resource that was being used by an LSP.

Action Not available.

Unsupported Switching Type Event

LSP Event Unsupported switching type

Sample Output Not available.

Meaning This LSP error event indicates that the switching type requested in the generalized label request for a GMPLS LSP is unsupported on the corresponding selected traffic engineering link.

Cause Not available.

Action Not available.

Gather Component Alarm Information

Purpose When you obtain information about component alarms and error messages, you determine when a problem with a component first appeared and the details of the situation.

To gather component alarm information, follow these steps:

1. [Display the Current Router Alarms on page 1350](#)
2. [Display Error Messages in the Messages Log File on page 1350](#)
3. [Display Error Messages in the Chassis Process Log File on page 1351](#)

Display the Current Router Alarms

Purpose To determine the details of the alarms and when they first appeared in the component.

Action To display the current router component alarms, use the following CLI command:

```
user@host> show chassis alarms
```

The command output displays the number of alarms currently active, the time when the alarm began, the severity level, and an alarm description. Note the date and time of an alarm so that you can correlate it with error messages in the **messages** system log file.

For examples of sample output, see the *Junos System Basics and Services Command Reference*.

Display Error Messages in the Messages Log File

Purpose To determine the details of the error messages in the Messages Log File.

Action To display router component error messages in the **messages** system log file, use the following CLI command:

```
user@host> show log messages
```

The **messages** system log file records the time the failure or event occurred, the severity level, a code, and a message description. Error messages in the **messages** system log file are logged at least 5 minutes before and after the alarm event.

To search for specific information in the log file, use the **| match component-name** command; for example, use **show log messages | match fpc**. If there is a space in the component name, enclose the component name in quotation marks; for example, **| match "power supply"**.

To search for multiple items in the log file, use the **| match** command followed by the multiple items, separated by the **|** (pipe), and enclosed in quotation marks; for example, **| match "fpc | sfm | kernel | tnp"**.

To monitor the **messages** file in real time, use the **monitor start messages** CLI command. This command displays the new entries in the file until you stop monitoring by using the **monitor stop messages** CLI command.

For more information about system log messages, see the *Junos System Log Messages Reference*.

Display Error Messages in the Chassis Process Log File

Purpose To determine the details of the error messages in the Chassis Process Log File.

Action To display router component errors in the chassis process (**chassisd**) system log file, use the following CLI command:

```
user@host> show log chassisd
```

The chassis process (**chassisd**) log file tracks the state of each chassis component. For examples of sample output, see the *Junos System Basics and Services Command Reference*.

To search for specific information in the log file, use the **| match component-name** command; for example, **show log messages | match fpc**. If there is a space in the component name, enclose the component name in quotation marks; for example, **| match "power supply"**.

To search for multiple items in the log file, use the **| match** command followed by the multiple items, separated by the **|** (pipe), and enclosed in quotation marks; for example, **| match "fpc | sfm | kernel | tnp"**.

To monitor the **chassisd** file in real time, use the **monitor start chassisd** CLI command. This command displays the new entries in the file until you stop monitoring by using the **monitor stop chassisd** CLI command.

Case Study for a CSPF Failure

Purpose This case study presents a Multiprotocol Label Switching (MPLS) network topology and CSPF failure scenario designed to demonstrate techniques and commands that are particularly useful when addressing CSPF problems in your network. The focus of the study is the incorrect association of user-provided constraints, specifically administrative groups (also known as link coloring).

When calculating a path, the CSPF algorithm factors in user-provided constraints. The ingress router determines the physical path for each LSP by applying a CSPF algorithm to the information in the traffic engineering database. CSPF is a shortest-path-first (SPF) algorithm that has been modified to take into account constraints when calculating the shortest path across the network. Links that do not comply with the restrictions are removed from the tree and cannot be factored into the resulting SPF calculations.

CSPF integrates topology link-state information that is learned from interior gateway protocol (IGP) traffic engineering extensions and is maintained in the traffic engineering database. The information stored in the traffic engineering database includes attributes associated with the state of network resources.

The network topology shown in [Figure 107 on page 1352](#) illustrates a network in which the LSP is constrained by administrative group coloring (also known as link coloring), and CSPF tracing is configured on the ingress router **R1**. In this example, the LSP is forced to transit **R5** in accordance with the restrictions imposed.

Figure 107: CSPF Topology with Administrative Group Coloring

The network shown in [Figure 107 on page 1352](#) is an MPLS router-only network with SONET interfaces.

The MPLS network shown in [Figure 107 on page 1352](#) is configured with administrative group coloring as follows:

- The LSP **R1-to-R6** is established with **R1** as the ingress router and **R6** as the egress router.
- The required path to **R6** transits **R5** on the redlinks. The inclusion of red coloring is not strictly necessary. To force the LSP to transit **R5**, you could color the links on **R3** and **R2** blue and then exclude the blue links.
- Both red and blue colors are used with the **include** and **exclude** statements to ensure that the LSP always transits **R5**. For information on configuring administrative group coloring, see the *MPLS Applications Feature Guide*.

To check that the network is configured correctly and the LSP is established, follow these steps:

1. [Verify That the LSP Is Established on page 1352](#)
2. [Check the Administrative Group Configuration on page 1354](#)

Verify That the LSP Is Established

Purpose Check that the LSP shown in [Figure 107 on page 1352](#) is established and traversing the path from **R1** to **R6** through the red links.

Action To verify that the LSP is established, enter the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show mpls lsp extensive
```

```
user@host> show mpls lsp
```

Sample Output

```
user@R1> show mpls lsp extensive | no-more
Ingress LSP: 1 sessions

10.0.0.6
  From: 10.0.0.1, State: Up, ActiveRoute: 1, LSPname: R1-to-R6

```

Meaning Sample Output 1 from ingress router **R1** shows that LSP **R1-to-R6** is successfully established as indicated by the Explicit Route Object (ERO) **10.1.15.2 S 10.1.56.2 S**, the log message **CSPF: computation result accepted**, and **State: Up**. Also, the LSP is routing packets correctly over the red links, avoiding the blue links or the links without any coloring.

Sample Output 2 from transit router **R5** shows that LSP **R1-to-R6** is transiting **R5** as expected.

Check the Administrative Group Configuration

Purpose Check that the administrative group coloring is correct and the relevant interfaces are associated with each administrative group correctly

Action To check the administrative group configuration, enter the following Junos OS CLI operational mode commands, or issue the **show** command at the **[edit protocols mpls]** hierarchy level, as shown in the example below:

```
user@host> show configuration protocols mpls
user@host> show mpls interface
user@host> show ted database extensive nodeID
```

Sample Output 1

```
[edit protocols mpls]
user@R1# show

```

Meaning Sample Output 1 shows that administrative group coloring is correctly configured on all relevant routers. Administrative groups red and blue are configured at the `[edit protocols mpls]` hierarchy level, and relevant interfaces are associated with each administrative group correctly.

R3 is configured with blue coloring and the **include** and **exclude** statements are included in the configuration of **R1** to ensure that LSP **R1-to-R6** always transits **R5**. The inclusion of red coloring is not strictly necessary. To force the LSP to transit **R5**, you could color the links on **R2** and **R3** blue and then exclude the blue links. Red coloring is included in this example to demonstrate the fact that the CSPF algorithm excludes links that do not have a color configured, when the **include** statement is configured at the `[edit protocols mpls]` hierarchy level.

In addition, ingress router **R1** has CSPF tracing configured in preparation for gathering information when the CSPF algorithm fails later in this example.

Sample Output 2 shows that the correct interfaces are associated with the red and blue administration groups on **R1**, **R3**, **R5**, and **R6**.

Sample Output 3 confirms that link coloring is correctly reported in the traffic engineering database for **R1**. Not shown is the traffic engineering database output for the remaining routers, which is similar to the **R1** output, and correct.

Examining a CSPF Failure

When a local CSPF failure indicates that no path meets the constraints configured for the LSP, you must perform CSPF-based tracing and be familiar with the contents of the traffic engineering database to resolve the problem. See [“Examine the Traffic Engineering Database” on page 1361](#) for an analysis of the traffic engineering database.

NOTE: If an LSP does not establish immediately, wait at least a minute or so before taking diagnostic or corrective action. This is because the RSVP retry timer is set to a 30-second default, resulting in a slight delay before the correct state of the LSP is available.

To examine a CSPF failure, follow these steps:

1. [Verify the CSPF Failure on page 1358](#)
2. [Examine the CSPF Log File on page 1359](#)
3. [Examine the Traffic Engineering Database on page 1361](#)
4. [Check the Administrative Group Configuration on R5 on page 1363](#)

Verify the CSPF Failure

Purpose To simulate a configuration error on the network, router **R5** has the administrative group coloring removed from interface **so-0/0/0**. The result is a CSPF failure at **R5** because there is no longer a path between **R1** and **R6** that includes the red color.

Action To confirm that the LSP is down and verify the configuration on routers **R1** and **R5**, enter the following Junos OS CLI operational mode commands:

```
user@host> clear mpls lsp
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> clear mpls lsp
[edit protocols mpls]
user@R1# run show mpls lsp extensive
Ingress LSP: 1 sessions

, Down 0

Meaning Sample Output 1 from ingress router **R1** shows that the **clear mpls lsp** command was issued to confirm that **R1** cannot reestablish LSP **R1-to-R6**. The sample output from the **show mpls lsp extensive** command shows that LSP **R1-to-R6** is down, **State: Dn** and **ActivePath: (None)**; and that the CSPF has failed, **CSPF failed: no route toward 10.0.0.6**.

Sample Output 2 from transit router **R5** shows that LSP **R1-to-R6** is not included in the output, indicating that the LSP is not transiting **R5**.

Most network problems appear as a local CSPF failure, as shown in the sample output. The CSPF failure indicates that no path meeting the constraints for the LSP can be found in the router's traffic engineering database. To resolve these problems effectively, use CSPF tracing on the ingress router, and analyze the traffic engineering database to locate the node that should meet the constraints.

Examine the CSPF Log File

Purpose After you have confirmed that the LSP is down, obtain more information about the possible cause of the failure.

NOTE: To obtain useful information from the CSPF log file, make sure that CSPF tracing is configured on the ingress router.

Action To examine the CSPF log file, enter the following Junos OS CLI operational mode commands:

```
user@host> monitor start filename
user@host> show log filename
```

NOTE: To stop monitoring CSPF, issue the **monitor stop** command.

Sample Output

```
user@R1> monitor start cspf

[edit protocols mpls]
user@R1# run show log cspf-failed3

May 27 10:22:29 CSPF for R1-to-R6 done!
monitor stop

```

Meaning The sample output shows that the **monitor start cspf** command was issued to start displaying entries in the **cspf** log file in real time. The **cspf** log file is generated by the routing protocol process after the file is configured with the **traceoptions** statement at the **[edit protocols mpls]** hierarchy level. In this example, the **cspf** log file is configured with the **cspf**, **cspf-node**, and **cspf-link** flags to provide the most granular information about the steps taken by the CSPF algorithm.

The only link that passes the color constraint is between **R1** and **R5**, **10.1.15.0/32**. The CSPF algorithm is a locally run algorithm, which makes its calculations on a given router. When the CSPF algorithm runs on **R5**, it prunes **10.1.15.2** and selects **10.1.56.1** to send the message to **R6**. The link between **R5** and **R6** **10.1.56.0/32** does not pass the color

constraints, indicating a problem with **R5**. At this stage, it is useful to examine the traffic engineering database to determine which link on **R5** should be associated with the red color.

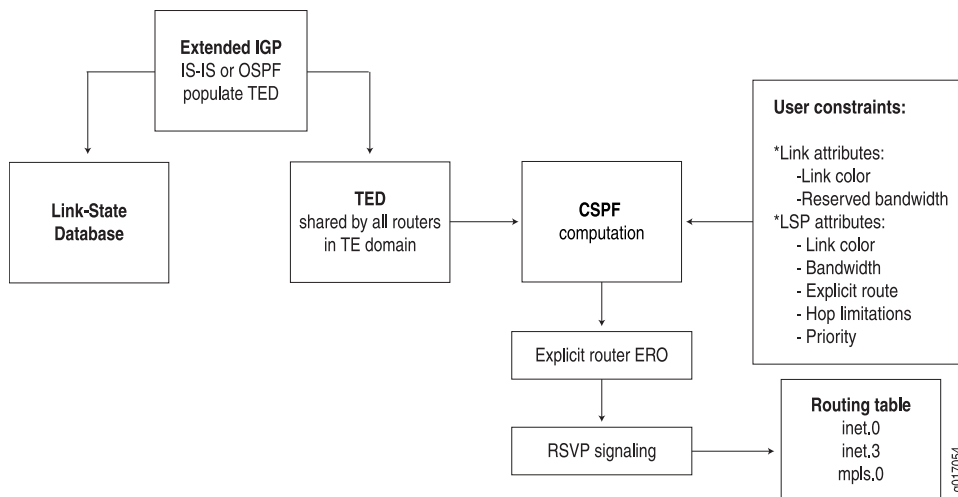

Examine the Traffic Engineering Database

Purpose Examining the traffic engineering database is another way to locate the node that should meet the constraints but does not. Once identified, you can concentrate your troubleshooting efforts on why that node is not being represented accurately in the database.

The contents of the traffic engineering database are consistent among all routers within a given traffic engineering domain. Therefore, you can issue the **show ted database** command from any router in the same traffic engineering domain to obtain more granular information about the CSPF failure.

CSPF integrates topology link-state information that is learned from the IGP traffic engineering extensions and maintained in the traffic engineering database. The information stored in the traffic engineering database includes attributes associated with the state of the network resources (such as total link bandwidth, reserved link bandwidth, available link bandwidth, and link color). When calculating a path, the CSPF algorithm factors in user-provided information such as bandwidth requirements, maximum allowed hop count, and administrative groups, all of which are obtained from user configuration. (See [Figure 108 on page 1361](#)).

Figure 108: User-Provided Constraints

Action To examine the traffic engineering database, enter the following Junos OS CLI operational mode commands:

```

user@host> show ted database extensive
user@host> show ted database extensive NodeID | match "(NodeID|To:|Color)"

```

Sample Output 1

```
[edit protocols mpls]
user@R1# run show ted database extensive
TED database: 6 ISIS nodes 6 INET nodes
[...Output truncated...]
NodeID: R5.00(10.0.0.5)
  Type: Rtr , Age: 103 secs, LinkIn: 3, LinkOut: 3
  Protocol: IS-IS(2)

To: R6.00(10.0.0.6), Local: 10.1.56.1, Remote: 10.1.56.2
Color: 0 <none>

```

Meaning Sample Output 1 from ingress router **R1** shows a wealth of information on each node in the network, although only a portion is included in this example. The output shows the total number of IS-IS and INET nodes in the traffic engineering domain. The portion of the traffic engineering database shown represents a node (**R5**), and the **Type** field indicates **Rtr** (router). The **Type** field could also indicate **Net** (network) if the node were a pseudo node. The node (**R5**) has three input and output links that are running IS-IS Level 2, **Protocol: IS-IS(2)**. The links lead to nodes **R1**, **R4**, and **R6**. The local address and remote address for each link is specified. The information on each node includes administrative groups (**Color:**), metrics, static bandwidth, reservable bandwidth, and available bandwidth priority level. The information contained in the traffic engineering database should be the same across all routers in the same traffic engineering domain. For a detailed description of the fields in the output of the **show ted database extensive** command, see the *Junos Routing Protocols and Policies Command Reference*.

Sample Output 2 shows filtered output that allows you to focus on exactly what is missing or incorrect.

Both outputs confirm that the link between **R1** and **R5**, **10.1.15.0/32**, is associated with the red color, while the link between **R5** and **R6**, **10.1.56.0/32**, is not associated with a color. In the network shown in [Figure 107 on page 1352](#), for the LSP to establish correctly, link **10.1.56.1** must be associated with the red color.

Check the Administrative Group Configuration on R5

Purpose Focus on R5 to determine which interfaces are associated with the red color, and make any necessary corrections.

Action To check the administrative group configuration on R5 and make any necessary corrections, enter the following Junos OS CLI commands:

```

user@R5> edit
[edit protocols mpls]
user@R5# show
user@R5# delete interface so-0/0/1 admin-group
user@R5# set interface so-0/0/0 admin-group red
user@R5# show
user@R5# commit

```

Sample Output 1

```
user@R5> edit
Entering configuration mode

[edit protocols mpls]
user@R5# show
admin-groups {
    red 8;
}
interface fxp0.0 {
    disable;
}
interface so-0/0/0.0;
interface so-0/0/1.0 { <<<incorrect interface configured with admin-group
    admin-group red;
}
interface so-0/0/2.0;
```

Sample Output 2

```
[edit protocols mpls]
user@R5# delete interface so-0/0/1 admin-group

[edit protocols mpls]
user@R5# set interface so-0/0/0 admin-group red

[edit protocols mpls]
user@R5# show
admin-groups {
    red 8;
    blue 4;
}
interface fxp0.0 {
    disable;
}
interface so-0/0/0.0 { <<<correct interface configured with admin-group
    admin-group red;
}
interface so-0/0/1.0;
interface so-0/0/2.0;

[edit protocols mpls]
user@R5# commit
commit complete
```

Sample Output 3

```
user@R1> show mpls lsp
Ingress LSP: 1 sessions
To          From          State Rt ActivePath      P      LSPname
10.0.0.6    10.0.0.1    Up 1      *   R1-to-R6
Total 1 displayed, Up 1, Down 0

Egress LSP: 1 sessions
To          From          State Rt Style Labelin Labelout LSPname
10.0.0.1    10.0.0.6    Up    0  1 FF      3      - R6-to-R1
Total 1 displayed, Up 1, Down 0
```

```
Transit LSP: 0 sessions
Total 0 displayed, Up 0, Down 0
```

Meaning Sample Output 1 from transit router **R5** shows that at the `[edit protocols mpls]` hierarchy level, interface **so-0/0/1** is incorrectly configured with the **admin-group red** statement. The **so-0/0/0** interface should be configured with the **admin-group red** statement.

Sample Output 2 shows the steps taken to correct the configuration. The administration group has been deleted from **so-0/0/1** and **so-0/0/0** is now associated with the red color.

Sample Output 3 shows that LSP **R1-to-R6** is established.

Verify the CSPF Failure

Purpose To simulate a configuration error on the network, router **R5** has the administrative group coloring removed from interface **so-0/0/0**. The result is a CSPF failure at **R5** because there is no longer a path between **R1** and **R6** that includes the red color.

Action To confirm that the LSP is down and verify the configuration on routers **R1** and **R5**, enter the following Junos OS CLI operational mode commands:

```
user@host> clear mpls lsp
user@host> show mpls lsp extensive
```

Sample Output 1

```
user@R1> clear mpls lsp
[edit protocols mpls]
user@R1# run show mpls lsp extensive
Ingress LSP: 1 sessions

10.0.0.6
  From: 0.0.0.0, State: Dn
  , ActiveRoute: 0, LSPname: R1-to-R6
  ActivePath: (none)
  LoadBalance: Random
  Metric: 100
  Encoding type: Packet, Switching type: Packet, GPID: IPv4
  Primary State: Dn
    Include: red Exclude: blue
  Will be enqueued for recomputation in 24 second(s).
  9 May 11 20:12:28 CSPF failed: no route toward 10.0.0.6
  8 May 11 20:12:28 Clear Call
  7 May 11 20:12:28 Deselected as active
  6 May 11 19:31:42 Selected as active path
  5 May 11 19:31:42 Record Route: 10.1.15.2 10.1.56.2
  4 May 11 19:31:42 Up
  3 May 11 19:31:42 Originate Call
  2 May 11 19:31:42 CSPF: computation result accepted
  1 May 11 19:31:12 CSPF failed: no route toward 10.0.0.6[5 times]
  Created: Wed May 11 19:29:17 2005
  Total 1 displayed, Up 0, Down 1
  [...Output truncated...]
```

Sample Output 2

```
[edit protocols mpls]
user@R5# run show mpls lsp
Ingress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Egress LSP: 0 sessions
Total 0 displayed, Up 0, Down 0

Transit LSP: 1 sessions
To          From          State  Rt  Style Labelin Labelout LSPname
10.0.0.1    10.0.0.6    Up     1   1 FF  100352      3 R6-to-R1
Total 1 displayed, Up 1
, Down 0
```

Meaning Sample Output 1 from ingress router **R1** shows that the **clear mpls lsp** command was issued to confirm that **R1** cannot reestablish LSP **R1-to-R6**. The sample output from the **show mpls lsp extensive** command shows that LSP **R1-to-R6** is down, **State: Dn** and **ActivePath: (None)**; and that the CSPF has failed, **CSPF failed: no route toward 10.0.0.6**.

Sample Output 2 from transit router **R5** shows that LSP **R1-to-R6** is not included in the output, indicating that the LSP is not transiting **R5**.

Most network problems appear as a local CSPF failure, as shown in the sample output. The CSPF failure indicates that no path meeting the constraints for the LSP can be found in the router's traffic engineering database. To resolve these problems effectively, use CSPF tracing on the ingress router, and analyze the traffic engineering database to locate the node that should meet the constraints.

Examining the Hello Message

Purpose RSVP monitors the status of the interior gateway protocol (IGP) (Intermediate System-to-Intermediate System [ISIS] or Open Shortest Path First [OSPF]) neighbors and relies on the IGP protocols to detect when a node fails. If an IGP protocol declares a neighbor down (because Hello messages are no longer being received), RSVP also brings down that neighbor. However, the IGP protocols and RSVP still act independently when bringing a neighbor up.

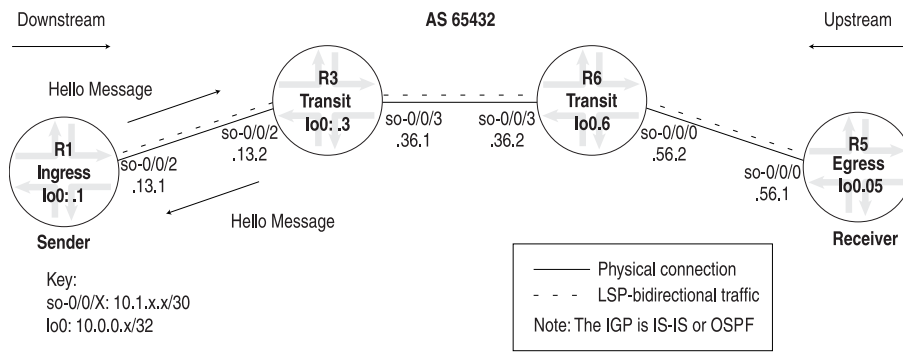

RSVP Hello messages are exchanged between neighbors. The destination address is the neighbor node. RSVP Hello messages are used to determine loss of interface more quickly than determined by the RSVP state timeout.

NOTE: RSVP Hello messages are required to establish the protocol or to maintain adjacency information. RSVP Hello messages do not establish state.

Figure 109 on page 1367 shows two RSVP Hello messages exchanged between routers **R1** and **R3**.

Figure 109: RSVP Hello Message

To ensure that Hello messages are displayed in the output, include the **packets** flag at the `[edit protocols rsvp traceoptions]` hierarchy level.

Action To examine the Hello message, enter the following Junos OS CLI command:

```
user@R1> monitor start filename
```

Sample Output 1

```
[edit protocols rsvp]
user@R1# show
traceoptions {
  file rsvp-log;
  flag packets detail;
}
interface so-0/0/2.0;
interface fxp0.0 {
  disable;
}
```

Sample Output 2

```
user@R1> clear log rsvp-log

user@R1> monitor start rsvp-log
```

```
user@R1>
*** rsvp-log ***
[...Output truncated...]
Jun 29 15:48:59  RSVP send Hello New 10.1.13.1->10.1.13.2 Len=32 so-0/0/2.0
Jun 29 15:48:59  HelloReq Len 12
Jun 29 15:48:59  RestartCap Len 12 restart time 0, recovery time 0
Jun 29 15:48:59  RSVP rcv Hello New 10.1.13.2->10.1.13.1 Len=32 so-0/0/2.0
Jun 29 15:48:59  HelloRply Len 12
Jun 29 15:48:59  RestartCap Len 12 restart time 0, recovery time 0
monitor stop
```

Meaning Sample Output 1 shows the configuration of RSVP tracing on ingress router **R1**. The **packets** flag is included at the `[edit protocols rsvp traceoptions]` hierarchy level to provide information about RSVP traffic. The **detail** option is included to show granular details about the configured flag.

Sample Output 2 shows **clear** commands, the output for the **rsvp-log** file, and that monitoring was started and then stopped. The **rsvp-log** output shows two RSVP Hello messages exchanged between **R1** and **R3**.

The first Hello message in the **rsvp-log** output is a request sent from **R1 (10.1.13.1)** to **R3 (10.1.13.2)**. The outgoing interface is **so-0/0/2.0** on **R1**. The second Hello message was a reply sent from **R3** to **R1**, also through the outgoing interface **so-0/0/2.0** on **R3**.

The next two lines of output indicate object values for the two Hello messages, and are indented in the output. To facilitate this discussion, each line of output for each object is displayed before the corresponding explanation.

- **HelloReq Len 12**

The Hello request (**HelloReq**) object indicates that this is a Hello request. RFC 3209 defines the RSVP Hello message. An RSVP Hello message can either be a request or a reply. Every request should generate a reply.

- **RestartCap Len 12 restart time 0, recovery time 0**

The restart object (**RestartCap**) indicates the graceful restart capability of the sender node. The restart time of 0 milliseconds is the length of time that this node takes to restart its RSVP traffic engineering functionality. At the end of this time, the node can send and receive RSVP messages again. The recovery time of 0 milliseconds indicates the length of time the LSR retains MPLS forwarding information. A recovery time of 0 in this case indicates that no forwarding state was preserved across a restart. Because both values are set to 0, graceful restart was not enabled for this RSVP session.

- **HelloRply Len 12**

The Hello reply (**HelloRply**) object indicates that this is an RSVP Hello message sent from **R3** to **R1** out of interface **so-0/0/2.0**.

In standard RSVP, node failure detection occurs as a consequence of the RSVP soft-state timeout model. However, detection typically requires several minutes to time out the soft state. Hello packets allow the detection of the neighboring node state changes more quickly.

In Junos OS, RSVP Hello messages are optional and are backward-compatible with RSVP implementations that do not support Hello messages. For neighboring routers that do not support Hello messages or on which RSVP Hello is disabled, RSVP uses the soft-state timeout for loss detection and cannot benefit from fast IGP Hello detection.

Configuring a short time for the IS-IS or OSPF Hello timers allows these protocols to detect node failures more quickly. RSVP also benefits from early detection by the IGP protocols. It is not necessary to explicitly configure a short RSVP Hello timer. If you do configure the RSVP Hello timer, you can configure a longer value and can still expect the failure of a neighboring router to be quickly detected by IGP.

Between Hello-capable neighbors, Hello messages are sent unicast toward each other. A loss of $(2 \times \text{keep-multiplier} + 1)$ consecutive Hello messages causes the neighbor's state to go down, and all RSVP sessions to and from that neighbor are declared to be down.

By default, RSVP sends Hello messages every 9 seconds.

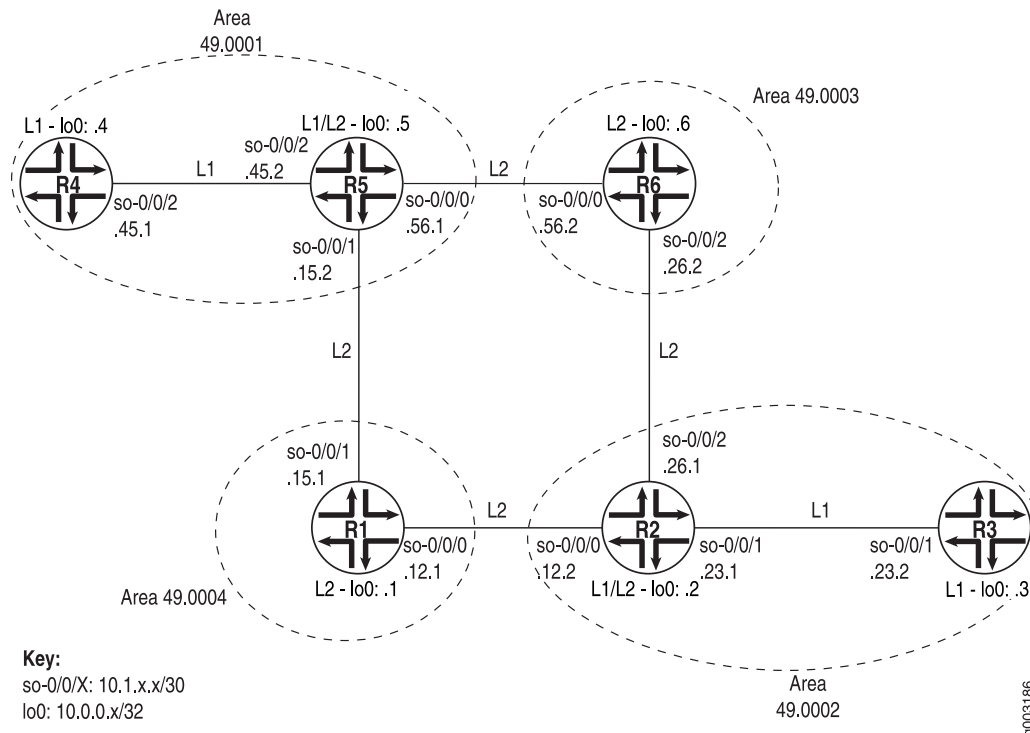

Displaying the Status of IS-IS Adjacencies

Purpose

Assuming that all the routers are correctly configured for IS-IS, you can verify which neighbors are adjacent and able to exchange IS-IS data. In addition, you can examine the set of routes installed in the forwarding table to verify that the routing protocol process (rpd) has relayed the correct information into the forwarding table.

Figure 110 on page 1369 illustrates the example IS-IS topology used for the procedures in this topic.

Figure 110: IS-IS Network Topology

The network consists of Level 1 and Level 2 adjacencies. Level 1 adjacencies are within areas 49.0001 and 49.0002. Level 2 adjacencies occur between all directly connected Level 2 routers regardless of which area they are in. For example, R5 is in area 49.0001, R6 is in area 49.0003, R1 is in area 49.0004, and R2 is in area 49.0002. The network in Figure 110 on page 1369 should have the following adjacencies:

- Level 2 adjacencies between all directly connected Level 2 routers (R1, R2, R5, and R6).
- Level 1 adjacencies between routers in area 49.0001 (R4 and R5) and between routers in area 49.0002 (R2 and R3).

To verify that routers are adjacent and able to exchange IS-IS data, follow these steps:

1. [Verifying Adjacent Routers on page 1370](#)
2. [Examine the Forwarding Table on page 1371](#)

Verifying Adjacent Routers

Purpose Verify that routers are adjacent and able to exchange IS-IS data.

Action To verify that routers are adjacent and able to exchange IS-IS data, enter the following CLI operational mode command:

```
user@host> show isis adjacency
```

The following sample output shows the adjacencies that formed for all routers shown in [“Displaying the Status of IS-IS Adjacencies” on page 1369](#).

Sample Output

```
user@R1> show isis adjacency
Interface          System    L State    Hold (secs) SNPA
so-0/0/0.0         R2        2 Up       19
so-0/0/1.0         R5        2 Up       18

user@R2> show isis adjacency
Interface          System    L State    Hold (secs) SNPA
so-0/0/0.0         R1        2 Up       19
so-0/0/1.0         R3        1 Up       26
so-0/0/2.0         R6        2 Up       21

user@R3> show isis adjacency
Interface          System    L State    Hold (secs) SNPA
so-0/0/1.0         R2        1 Up       24

user@R4> show isis adjacency
Interface          System    L State    Hold (secs) SNPA
so-0/0/2.0         R5        1 Up       23

user@R5> show isis adjacency
Interface          System    L State    Hold (secs) SNPA
so-0/0/0.0         R6        2 Up       22
so-0/0/1.0         R1        2 Up       20
so-0/0/2.0         R4        1 Up       20

user@R6> show isis adjacency
Interface          System    L State    Hold (secs) SNPA
so-0/0/0.0         R5        2 Up       21
so-0/0/2.0         R2        2 Up       20
```

Meaning The sample output shows the adjacencies that formed in the network illustrated in [“Displaying the Status of IS-IS Adjacencies” on page 1369](#). The Level 1/Level 2 routers (R2 and R5) formed Level 1 adjacencies with Level 1 routers (R3 and R4), and Level 2 adjacencies with the Level 2 routers (R1 and R6). To view the status of the adjacency, examine the State column. In this example, all adjacencies in the network are up.

If the state is not **Up** for a particular neighbor, you must first examine the IS-IS configuration for the particular interface. Make sure that the NET address is correct and that the loopback interface (lo0) is configured. Use the **show isis interface** or **show isis interface detail** command to display the IS-IS parameters for all interfaces configured with IS-IS. With these two commands, you can see which interfaces are configured for IS-IS, whether they are configured for Level 1 or Level 2, the IS-IS metric, and other IS-IS information.

See Also • *Example: Configuring a Multi-Level IS-IS Topology to Control Interarea Flooding*

Examine the Forwarding Table

Purpose You can display the set of routes installed in the forwarding table to verify that the routing protocol process (rpd) has relayed the correct information into the forwarding table. This is especially important when there are network problems, such as connectivity. In this procedure, you verify that the routes displayed in Step 2 appear in the forwarding table for Router R5.

Action To examine the forwarding table for a router, enter the following CLI command:

```
user@host> show route forwarding-table destination destination-prefix
```

Sample Output

```
user@R5> show route forwarding-table destination 10.0.0.3
Routing table: inet
Internet:
Destination      Type RtRef Next hop          Type Index NhRef Netif
10.0.0.3/32      user  0 10.1.15.0          ucst  285   7  so-0/0/1.0
user@R5> show route forwarding-table destination 10.0.0.3
Routing table: inet
Internet:
Destination      Type RtRef Next hop          Type Index NhRef Netif
10.0.0.3/32      user  0 10.1.56.0          ucst  281   9  so-0/0/0.0
```

Meaning The sample output shows the selected next hop between Routers R5 and R3 sent from the inet routing table and installed into the forwarding table. The first instance shows the route through Router R1, and the second instance shows the route through Router R6. In both instances, the preferred route displayed in Step 2 is installed in the forwarding table.

In general, the sample output includes the destination address and destination type, the next-hop address and next-hop type, the number of references to the next hop, an index number into an internal next-hop database, and the interface used to reach the next hop.

Check OSPF on a Stub Router

Purpose To verify the OSPF configuration on a stub router.

Action To verify the OSPF configuration on a stub router in your network, enter the following commands:

```
user@host> show configuration
user@host> show ospf interface
```

The following sample output is for an OSPF configuration on **R5**, a stub router:

Sample Output

```
user@R5> show configuration
[...Output truncated...]
interfaces {
    so-0/0/2 {
        unit 0 {
            family inet {
                address 10.1.45.2/30;
            }
        }
    }
    lo0 {
        unit 0 {
            family inet {
                address 10.0.0.5/32;
            }
        }
    }
}
routing-options {
    router-id 10.0.0.5;
}
protocols {
    ospf {
        area 0.0.0.2 {
            stub;
            interface so-0/0/2.0;
            interface lo0.0 {
                passive;
            }
        }
    }
}
```

```
user@R5> show ospf interface
```

Interface	State	Area	DR ID	BDR ID	Nbrs
lo0.0	DRother	0.0.0.2	0.0.0.0	0.0.0.0	0
so-0/0/2.0	PtToPt	0.0.0.2	0.0.0.0	0.0.0.0	1

Meaning The sample output shows a basic OSPF configuration at the `[edit protocols ospf]` and `[edit interfaces]` hierarchy levels on **R5**, a stub router.

R5 has two interfaces included at the `[edit protocols ospf]` hierarchy level, and those interfaces have the **family inet** statement included at the `[edit interfaces]` hierarchy level. Both interfaces, **so-0/0/2.0** and the loopback interface (**lo0**), are in the stub area (**0.0.0.2**).

R5 has the router ID configured manually to avoid possible problems when the OSPF router ID (RID) changes; for example, when multiple loopback addresses are configured. The RID uniquely identifies the router within the OSPF network. It is transmitted within the LSAs used to populate the link-state database and calculate the shortest-path tree. In a link-state network, it is important that two routers do not share the same RID value, otherwise IP routing problems may occur.

A stub area does not allow AS external advertisements to flood within that area. **R5** relies on a default route (**0.0.0.0/0**) to reach destinations outside the AS. The default route can be statically configured on **R5** or advertised by an ABR (**R4**). In this network, the default LSA is advertised by **R4**.

A stub area is useful if you want to reduce the size of the topological database and therefore the amount of memory required from the routers in the stub area. However, some restrictions apply to a stub area. You cannot create a virtual link through a stub area, and a stub area cannot contain an ASBR.

Checklist for Verifying the BGP Protocol and Peers

Purpose [Table 50 on page 1373](#) provides links and commands for verifying whether the Border Gateway Protocol (BGP) is configured correctly on a Juniper Networks router in your network, the internal Border Gateway Protocol (IBGP) and exterior Border Gateway Protocol (EBGP) sessions are properly established, the external routes are advertised and received correctly, and the BGP path selection process is working properly.

Action

Table 50: Checklist for Verifying the BGP Protocol and Peers

Tasks	Command or Action
<i>Verify the BGP Protocol</i>	
1. Verify BGP on an Internal Router on page 1376	<code>show configuration</code>
2. Verify BGP on a Border Router on page 1378	<code>show configuration</code>
<i>“Verify BGP Peers” on page 1374</i>	
1. Check BGP Sessions	<code>show bgp summary</code>
2. Verify Advertised BGP Routes on page 1381	<code>show route advertising-protocol bgp neighbor-address</code>

Table 50: Checklist for Verifying the BGP Protocol and Peers (continued)

Tasks	Command or Action
3. Verify That a Particular BGP Route Is Received on Your Router on page 1382	<code>show route receive-protocol bgp <i>neighbor-address</i></code>

2. Examine the Multiple Exit Discriminator Route Selection on page 1387	<code>show route <i>destination-prefix</i> < detail ></code>
3. Examine the EBGp over IBGP Selection on page 1383	<code>show route <i>destination-prefix</i> < detail ></code>
4. Examine the IGP Cost Selection on page 1389	<code>show route <i>destination-prefix</i> < detail ></code>
“Examine Routes in the Forwarding Table” on page 1394	<code>show route forwarding-table</code>

Verify BGP Peers

Purpose

Assuming that all the routers are correctly configured for BGP, you can verify if IBGP and EBGp sessions are properly established, external routes are advertised and received correctly, and the BGP path selection process is working properly.

Figure 111 on page 1375 illustrates an example BGP network topology used in this topic.

Figure 111: BGP Network Topology

The network consists of two directly connected ASs consisting of external and internal peers. The external peers are directly connected through a shared interface and are running EBGP. The internal peers are connected through their loopback (lo0) interfaces through IBGP. AS 65001 is running OSPF and AS 65002 is running IS-IS as its underlying IGP. IBGP routers do not have to be directly connected, the underlying IGP allows neighbors to reach one another.

The two routers in AS 65001 each contain one EBGP link to AS 65002 (R2 and R4) over which they announce aggregated prefixes: 100.100.1.0, 100.100.2.0, 100.100.3.0, and 100.100.4.0. Also, R1 and R5 are injecting multiple exit discriminator (MED) values of 5 and 10, respectively, for some routes.

The internal routers in both ASs are using a full mesh IBGP topology. A full mesh is required because the networks are not using confederations or route reflectors, so any routes learned through IBGP are not distributed to other internal neighbors. For example, when R3 learns a route from R2, R3 does not distribute that route to R6 because the route is learned through IBGP, so R6 must have a direct BGP connection to R2 to learn the route.

In a full mesh topology, only the border router receiving external BGP information distributes that information to other routers within its AS. The receiving router does not redistribute that information to other IBGP routers in its own AS.

From the point of view of AS 65002, the following sessions should be up:

- The four routers in AS 65002 should have IBGP sessions established with each other.
- R2 should have an EBGP session established with R1.
- R4 should have an EBGP session established with R5.

To verify BGP peers, follow these steps:

1. [Verify BGP on an Internal Router on page 1376](#)
2. [Verify BGP on a Border Router on page 1378](#)
3. [Verify Advertised BGP Routes on page 1381](#)
4. [Verify That a Particular BGP Route Is Received on Your Router on page 1382](#)
5. [Examine the EBGP over IBGP Selection on page 1383](#)

Verify BGP on an Internal Router

Purpose To verify the BGP configuration of an internal router.

Action To verify the BGP configuration of an internal router, enter the following Junos OS command-line interface (CLI) command:

```
user@host> show configuration
```

The following sample output is for a BGP configuration on R3, as shown in *Verify the BGP Protocol*:

Sample Output

```
user@R3> show configuration
[...Output truncated...]
interfaces {
  so-0/0/1 {
    unit 0 {
      family inet {
        address 10.1.23.2/30;
      }
      family iso;
    }
  }
  so-0/0/3 {
    unit 0 {
      family inet {
        address 10.1.36.1/30;

      local-address 10.0.0.6;
      neighbor 10.0.0.2;
      neighbor 10.0.0.3;
      neighbor 10.0.0.4;
    }
  }
  isis {
    level 1 disable;
    interface all {
      level 2 metric 10;
    }
    interface lo0.0;
  }
}
```

Meaning The sample output shows a basic BGP configuration on routers **R3** and **R6**. The local AS (65002) and one group (**internal**) are configured on both routers. **R3** has three internal peers—**10.0.0.2**, **10.0.0.4**, and **10.0.0.6**—included at the [**protocols bgp group group**] hierarchy level. **R6** also has three internal peers: **10.0.0.2**, **10.0.0.3**, and **10.0.0.4**. The underlying IGP protocol is Intermediate System-to-Intermediate System (IS-IS), and relevant interfaces are configured to run IS-IS.

Note that in this configuration the router ID is manually configured to avoid any duplicate router ID problems.

Verify BGP on a Border Router

Purpose To verify the BGP configuration of a border router.

Action To verify the BGP configuration of a border router, enter the following Junos OS CLI operational mode command:

```
user@host> show configuration
```

Sample Output

The following sample output is for a BGP configuration on two border routers from AS 65002 (R2 and R4 as shown in *Verify the BGP Protocol*):

```
user@R2> show configuration
[...Output truncated...]
interfaces {
  so-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.12.2/30;
      }
      family iso;
    }
  }
}
```

```

so-0/0/1 {
    unit 0 {
        family inet {
            address 10.1.23.1/30;
        }
        family iso;
    }
}
so-0/0/3 {
    unit 0 {
        family inet {
            address 10.1.24.1/30;
        }
        family iso;
    }
}
lo0 {
    unit 0 {
        family inet {
            address 10.0.0.2/32;
        }
        family iso {

        }
    }
    so-0/0/3 {
        unit 0 {
            family inet {
                address 10.1.24.2/30;
            }
            family iso;
        }
    }
    lo0 {
        unit 0 {
            family inet {
                address 10.0.0.4/32;
            }
            family iso {
                address 49.0001.1000.0000.0004.00;
            }
        }
    }
}
routing-options {
    [...Output truncated...]
    router-id 10.0.0.4;
    autonomous-system 65002;
}
protocols {
    bgp {
        group internal {

```

```

        type internal;
        local-address 10.0.0.4;
        export next-hop-self;
        neighbor 10.0.0.2;
        neighbor 10.0.0.3;
        neighbor 10.0.0.6;
    }
    group toR5 {
        type external;
        peer-as 65001;
        neighbor 10.1.45.2;
    }
}
isis {
    level 1 disable;
    interface all {
        level 2 metric 10;
    }
    interface lo0.0;
}
}
policy-options {
    policy-statement next-hop-self {
        term change-next-hop {
            from neighbor 10.1.45.2;
            then {
                next-hop self;
            }
        }
    }
}

```

Meaning The sample output shows a basic BGP configuration on border routers **R2** and **R4**. Both routers have the AS (65002) included at the **[routing-options]** hierarchy level. Each router has two groups included at the **[protocols bgp group group]** hierarchy level. External peers are included in the external group, either *toR1* or *toR5*, depending on the router. Internal peers are included in the **internal** group. The underlying IGP protocol is IS-IS on both routers, and relevant interfaces are configured to run IS-IS.

Note that in the configuration on both routers, the router ID is manually configured to avoid duplicate router ID problems, and the **next-hop-self** statement is included to avoid any BGP next-hop reachability problems.

Verify Advertised BGP Routes

Purpose You can determine if a particular route that you have configured is being advertised to a neighbor.

Action To verify the routing information as it has been prepared for advertisement to the specified BGP neighbor, enter the following Junos OS CLI operational mode command:

```
user@host> show route advertising-protocol bgp neighbor-address
```

Sample Output

```
user@R2> show route advertising-protocol bgp 10.0.0.4\
inet.0: 20 destinations, 22 routes (20 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
* 100.100.1.0/24        Self            5         200        65001 I
* 100.100.2.0/24        Self            5         100        65001 I
* 100.100.3.0/24        Self            100       65001 I
* 100.100.4.0/24        Self            100       65001 I
```

Meaning The sample output shows the BGP routes advertised from **R2** to its neighbor, **10.0.0.4** (**R4**). Out of 22 total routes in the **inet.0** routing table, 20 are active destinations. No routes are **hidden** or in the **hold-down** state. Routes reside in the **hold-down** state prior to being declared active, and routes rejected by a routing policy can be placed into the **hidden** state. The information displayed reflects the routes that the routing table exported to the BGP routing protocol.

Verify That a Particular BGP Route Is Received on Your Router

Purpose Display the routing information as it is received through a particular BGP neighbor and advertised by the local router to the neighbor.

Action To verify that a particular BGP route is received on your router, enter the following Junos OS CLI operational mode command:

```
user@host> show route receive-protocol bgp neighbor-address
```

Sample Output

```
user@R6> show route receive-protocol bgp 10.0.0.2
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
*100.100.1.0/24    10.0.0.2      5    200    65001 I
*100.100.2.0/24    10.0.0.2      5    100    65001 I
  100.100.3.0/24    10.0.0.2      100   65001 I
  100.100.4.0/24    10.0.0.2      100   65001 I
iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

user@R6> show route receive-protocol bgp 10.0.0.4
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
*100.100.3.0/24    10.0.0.4      100   65001 I
*100.100.4.0/24    10.0.0.4      100   65001 I
iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
```

Meaning The sample output shows four BGP routes from **R2** and two from **R4**. Of the four routes from **R2**, only two are active in the routing table, as indicated by the asterisk (*), while both routes received from **R4** are active in the routing table. All BGP routes came through AS 65001.

Examine the EBGp over IBGP Selection

Purpose To examine a route to determine if EBGp is selected over IBGP as the selection criteria for the single, active path.

Action To examine a route to determine if EBGp is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R4> show route 100.100.3.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.3.0/24 (2 entries, 1 announced)
    *BGP      Preference: 170/-101
        Source: 10.1.45.2
        Next hop: 10.1.45.2 via so-0/0/2.0, selected
        State: <Active Ext>
        Local AS: 65002 Peer AS: 65001
        Age: 5d 0:31:25
        Task: BGP_65001.10.1.45.2+179
        Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

        AS path: 65001 I
        Localpref: 100
        Router ID: 10.0.0.5
    BGP      Preference: 170/-101
        Source: 10.0.0.2
        Next hop: 10.1.24.1 via so-0/0/3.0, selected
        Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277
        State: <NotBest Int Ext>
        Inactive reason: Interior > Exterior > Exterior via Interior
        Local AS: 65002 Peer AS: 65002
        Age: 2:48:18 Metric2: 10
        Task: BGP_65002.10.0.0.2+179
        AS path: 65001 I
        Localpref: 100
        Router ID: 10.0.0.2
```

Meaning The sample output shows that R4 received two instances of the 100.100.3.0 route: one from 10.1.45.2 (R5) and one from 10.0.0.2 (R2). R4 selected the path from R5 as its active path, as indicated by the asterisk (*). The selection is based on a preference for routes learned from an EBGp peer over routes learned from an IBGP. R5 is an EBGp peer.

You can determine if a path is received from an EBGp or IBGP peer by examining the **Local As** and **Peer As** fields. For example, the route from R5 shows the local AS is 65002 and the peer AS is 65001, indicating that the route is received from an EBGp peer. The route from R2 shows that both the local and peer AS is 65002, indicating that it is received from an IBGP peer.

The reason that the inactive path is not selected is displayed in the **Inactive reason** field, in this case, **Interior > Exterior > Exterior via Interior**. The wording of this reason shows the

order of preferences applied when the same route is received from two routers. The route received from a strictly internal source (IGP) is preferred first, the route received from an external source (EBGP) is preferred next, and any route which comes from an external source and is received internally (IBGP) is preferred last.

Examine BGP Routes and Route Selection

Purpose

You can examine the BGP path selection process to determine the single, active path when BGP receives multiple routes to the same destination prefix.

Figure 112: BGP Network Topology

The network in [Figure 112 on page 1384](#) shows that **R1** and **R5** announce the same aggregate routes to **R2** and **R4**, which results in **R2** and **R4** receiving two routes to the same destination prefix. The route selection process on **R2** and **R4** determines which of the two BGP routes received is active and advertised to the other internal routers (**R3** and **R6**).

Before the router installs a BGP route, it must make sure that the BGP **next-hop** attribute is reachable. If the BGP next hop cannot be resolved, the route is not installed. When a BGP route is installed in the routing table, it must go through a path selection process if

multiple routes exist to the same destination prefix. The BGP path selection process proceeds in the following order:

1. Route preference in the routing table is compared. For example, if an OSPF and a BGP route exist for a particular destination, the OSPF route is selected as the active route because the OSPF route has a default preference of 110, while the BGP route has a default preference of 170.
2. Routes are compared for local preference. The route with the highest local preference is preferred. For example, see [“Examine the Local Preference Selection” on page 1386](#).
3. The AS path attribute is evaluated. The shorter AS path is preferred.
4. The origin code is evaluated. The lowest origin code is preferred (I (IGP) < E (EGP) < ? (Incomplete)).
5. The MED value is evaluated. By default, if any of the routes are advertised from the same neighboring AS, the lowest MED value is preferred. The absence of a MED value is interpreted as a MED of 0. For an example, see [“Examine the Multiple Exit Discriminator Route Selection” on page 1387](#).
6. The route is evaluated as to whether it is learned through EBGP or IBGP. EBGP learned routes are preferred to IBGP learned routes. For an example, see [“Examine the EBGP over IBGP Selection” on page 1383](#).
7. If the route is learned from IBGP, the route with the lowest IGP cost is preferred. For an example, see [“Examine the IGP Cost Selection” on page 1389](#). The physical next hop to the IBGP peer is installed according to the following three rules:
 - a. After BGP examines the **inet.0** and **inet.3** routing tables, the physical next hop of the route with the lowest preference is used.
 - b. If the preference values in the **inet.0** and the **inet.3** routing tables are a tie, the physical next hop of the route in the **inet.3** routing table is used.
 - c. When a preference tie exists in the same routing table, the physical next hop of the route with more paths is installed.
8. The route reflection cluster list attribute is evaluated. The shortest length cluster list is preferred. Routes without a cluster list are considered to have a cluster list length of 0.
9. The router ID is evaluated. The route from the peer with the lowest router ID is preferred (usually the loopback address).
10. The peer address value is examined. The peer with the lowest peer IP address is preferred.

To determine the single, active path when BGP receives multiple routes to the same destination prefix, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

The following steps illustrate the inactive reason displayed when BGP receives multiple routes to the same destination prefix and one route is selected as the single, active path:

1. [Examine the Local Preference Selection on page 1386](#)
2. [Examine the Multiple Exit Discriminator Route Selection on page 1387](#)
3. [Examine the EBGP over IBGP Selection on page 1388](#)
4. [Examine the IGP Cost Selection on page 1389](#)

Examine the Local Preference Selection

Purpose To examine a route to determine if local preference is the selection criteria for the single, active path.

Action To examine a route to determine if local preference is the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R4> show route 100.100.1.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.1.0/24 (2 entries, 1 announced)
    *BGP      Preference: 170/-201
        Source: 10.0.0.2
        Next hop: 10.1.24.1 via so-0/0/3.0, selected
        Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277
        State: <Active Int Ext>
        Local AS: 65002 Peer AS: 65002
        Age: 2:22:34 Metric: 5 Metric2: 10
        Task: BGP_65002.10.0.0.2+179
        Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

        AS path: 65001 |
        Localpref: 200
        Router ID: 10.0.0.2
    BGP      Preference: 170/-101
        Source: 10.1.45.2
        Next hop: 10.1.45.2 via so-0/0/2.0, selected
        State: <Ext>
        Inactive reason: Local Preference
        Local AS: 65002 Peer AS: 65001
        Age: 2w0d 1:28:31 Metric: 10
        Task: BGP_65001.10.1.45.2+179
        AS path: 65001 |
        Localpref: 100
        Router ID: 10.0.0.5
```

Meaning The sample output shows that R4 received two instances of the 100.100.1.0 route: one from 10.0.0.2 (R2) and one from 10.1.45.2 (R5). R4 selected the path from R2 as its active path, as indicated by the asterisk (*). The selection is based on the local preference value contained in the **Localpref** field. The path with the *highest* local preference is preferred. In the example, the path with the higher local preference value is the path from R2, 200.

The reason that the route from **R5** is not selected is in the **Inactive reason** field, in this case, **Local Preference**.

Note that the two paths are from the same neighboring network: AS 65001.

Examine the Multiple Exit Discriminator Route Selection

Purpose To examine a route to determine if the MED is the selection criteria for the single, active path.

Action To examine a route to determine if the MED is the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R4> show route 100.100.2.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.2.0/24 (2 entries, 1 announced)
    *BGP          Preference: 170/-101
        Source: 10.0.0.2
        Next hop: 10.1.24.1 via so-0/0/3.0, selected
        Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277
        State: <Active Int Ext>
        Local AS: 65002 Peer AS: 65002
        Age: 2:32:01      Metric: 5      Metric2: 10
        Task: BGP_65002.10.0.0.2+179
        Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

        AS path: 65001|
        Localpref: 100
        Router ID: 10.0.0.2
    BGP          Preference: 170/-101
        Source: 10.1.45.2
        Next hop: 10.1.45.2 via so-0/0/2.0, selected
        State: <NotBest Ext>
        Inactive reason: Not Best in its group
        Local AS: 65002 Peer AS: 65001
        Age: 2w0d 1:37:58      Metric: 10
        Task: BGP_65001.10.1.45.2+179
        AS path: 65001|
        Localpref: 100
        Router ID: 10.0.0.5
```

Meaning The sample output shows that **R4** received two instances of the **100.100.2.0** route: one from **10.0.0.2 (R2)**, and one from **10.1.45.2 (R5)**. **R4** selected the path from **R2** as its active route, as indicated by the asterisk (*). The selection is based on the MED value contained in the **Metric:** field. The path with the lowest MED value is preferred. In the example, the path with the lowest MED value (5) is the path from **R2**. Note that the two paths are from the same neighboring network: AS 65001.

The reason that the inactive path is not selected is displayed in the **Inactive reason:** field, in this case, **Not Best in its group**. The wording is used because the Junos OS uses the process of deterministic MED selection, by default.

Examine the EBGp over IBGP Selection

Purpose To examine a route to determine if EBGp is selected over IBGP as the selection criteria for the single, active path.

Action To examine a route to determine if EBGp is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R4> show route 100.100.3.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.3.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-101
    Source: 10.1.45.2
    Next hop: 10.1.45.2 via so-0/0/2.0, selected
    State: <Active Ext>
    Local AS: 65002 Peer AS: 65001
    Age: 5d 0:31:25
    Task: BGP_65001.10.1.45.2+179
    Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

    AS path: 65001 I
    Localpref: 100
    Router ID: 10.0.0.5
  BGP      Preference: 170/-101
    Source: 10.0.0.2
    Next hop: 10.1.24.1 via so-0/0/3.0, selected
    Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277
    State: <NotBest Int Ext>
    Inactive reason: Interior > Exterior > Exterior via Interior
    Local AS: 65002 Peer AS: 65002
    Age: 2:48:18 Metric2: 10
    Task: BGP_65002.10.0.0.2+179
    AS path: 65001 I
    Localpref: 100
    Router ID: 10.0.0.2
```

Meaning The sample output shows that R4 received two instances of the 100.100.3.0 route: one from 10.1.45.2 (R5) and one from 10.0.0.2 (R2). R4 selected the path from R5 as its active path, as indicated by the asterisk (*). The selection is based on a preference for routes learned from an EBGp peer over routes learned from an IBGP. R5 is an EBGp peer.

You can determine if a path is received from an EBGp or IBGP peer by examining the **Local As** and **Peer As** fields. For example, the route from R5 shows the local AS is 65002 and the peer AS is 65001, indicating that the route is received from an EBGp peer. The

route from **R2** shows that both the local and peer AS is 65002, indicating that it is received from an IBGP peer.

The reason that the inactive path is not selected is displayed in the **Inactive reason** field, in this case, **Interior > Exterior > Exterior via Interior**. The wording of this reason shows the order of preferences applied when the same route is received from two routers. The route received from a strictly internal source (IGP) is preferred first, the route received from an external source (EBGP) is preferred next, and any route which comes from an external source and is received internally (IBGP) is preferred last.

Examine the IGP Cost Selection

Purpose To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path.

Action To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R6> show route 100.100.4.0 detail
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)
100.100.4.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-101
             Source: 10.0.0.4
             Next hop: 10.1.46.1 via so-0/0/1.0, selected
             Protocol next hop: 10.0.0.4 Indirect next hop: 864c000 276
             State: <Active Int Ext>
             Local AS: 65002 Peer AS: 65002
             Age: 2:16:11      Metric2: 10
             Task: BGP_65002.10.0.0.4+4120
             Announcement bits (2): 0-KRT 4-Resolve inet.0
             AS path: 65001
             Localpref: 100
             Router ID: 10.0.0.4
  BGP      Preference: 170/-101
             Source: 10.0.0.2
             Next hop: 10.1.46.1 via so-0/0/1.0, selected
             Next hop: 10.1.36.1 via so-0/0/3.0
             Protocol next hop: 10.0.0.2 Indirect next hop: 864c0b0 278
             State: <NotBest Int Ext>
             Inactive reason: IGP metric
             Local AS: 65002 Peer AS: 65002
             Age: 2:16:03      Metric2: 20
             Task: BGP_65002.10.0.0.2+179
             AS path: 65001
             Localpref: 100
             Router ID: 10.0.0.2
```

Meaning The sample output shows that **R6** received two instances of the **100.100.4.0** route: one from **10.0.0.4 (R4)** and one from **10.0.0.2 (R2)**. **R6** selected the path from **R4** as its active

route, as indicated by the asterisk (*). The selection is based on the IGP metric, displayed in the **Metric2** field. The route with the lowest IGP metric is preferred. In the example, the path with the lowest IGP metric value is the path from **R4**, with an IGP metric value of 10, while the path from **R2** has an IGP metric of 20. Note that the two paths are from the same neighboring network: AS 65001.

The reason that the inactive path was not selected is displayed in the **Inactive reason** field, in this case, **IGP metric**.

Examine the Local Preference Selection

Purpose To examine a route to determine if local preference is the selection criteria for the single, active path.

Action To examine a route to determine if local preference is the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R4> show route 100.100.1.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.1.0/24 (2 entries, 1 announced)
  *BGP    Preference: 170/-201
    Source: 10.0.0.2
    Next hop: 10.1.24.1 via so-0/0/3.0, selected
    Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277
    State: <Active Int Ext>
    Local AS: 65002 Peer AS: 65002
    Age: 2:22:34 Metric: 5 Metric2: 10
    Task: BGP_65002.10.0.0.2+179
    Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

    AS path: 65001|
    Localpref: 200
    Router ID: 10.0.0.2
  BGP    Preference: 170/-101
    Source: 10.1.45.2
    Next hop: 10.1.45.2 via so-0/0/2.0, selected
    State: <Ext>
    Inactive reason: Local Preference
    Local AS: 65002 Peer AS: 65001
    Age: 2w0d 1:28:31 Metric: 10
    Task: BGP_65001.10.1.45.2+179
    AS path: 65001|
    Localpref: 100
    Router ID: 10.0.0.5
```

Meaning The sample output shows that **R4** received two instances of the **100.100.1.0** route: one from **10.0.0.2 (R2)** and one from **10.1.45.2 (R5)**. **R4** selected the path from **R2** as its active path, as indicated by the asterisk (*). The selection is based on the local preference value

contained in the **Localpref** field. The path with the *highest* local preference is preferred. In the example, the path with the higher local preference value is the path from **R2**, 200.

The reason that the route from **R5** is not selected is in the **Inactive reason** field, in this case, **Local Preference**.

Note that the two paths are from the same neighboring network: AS 65001.

Examine the Multiple Exit Discriminator Route Selection

Purpose To examine a route to determine if the MED is the selection criteria for the single, active path.

Action To examine a route to determine if the MED is the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R4> show route 100.100.2.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.2.0/24 (2 entries, 1 announced)
    *BGP      Preference: 170/-101
        Source: 10.0.0.2
        Next hop: 10.1.24.1 via so-0/0/3.0, selected
        Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277

        Local AS: 65002 Peer AS: 65001
        Age: 2w0d 1:37:58      Metric: 10
        Task: BGP_65001.10.1.45.2+179
        AS path: 65001|
        Localpref: 100
        Router ID: 10.0.0.5
```

Meaning The sample output shows that **R4** received two instances of the **100.100.2.0** route: one from **10.0.0.2** (**R2**), and one from **10.1.45.2** (**R5**). **R4** selected the path from **R2** as its active route, as indicated by the asterisk (*). The selection is based on the MED value contained in the **Metric** field. The path with the lowest MED value is preferred. In the example, the

path with the lowest MED value (5) is the path from **R2**. Note that the two paths are from the same neighboring network: AS 65001.

The reason that the inactive path is not selected is displayed in the **Inactive reason:** field, in this case, **Not Best in its group**. The wording is used because the Junos OS uses the process of deterministic MED selection, by default.

Examine the EBGp over IBGP Selection

Purpose To examine a route to determine if EBGp is selected over IBGP as the selection criteria for the single, active path.

Action To examine a route to determine if EBGp is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R4> show route 100.100.3.0 detail
inet.0: 20 destinations, 24 routes (20 active, 0 holddown, 0 hidden)
100.100.3.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-101
    Source: 10.1.45.2
    Next hop: 10.1.45.2 via so-0/0/2.0, selected
    State: <Active Ext>
    Local AS: 65002 Peer AS: 65001
    Age: 5d 0:31:25
    Task: BGP_65001.10.1.45.2+179
    Announcement bits (3): 0-KRT 3-BGP.0.0.0.0+179 4-Resolve inet.0

    AS path: 65001 I
    Localpref: 100
    Router ID: 10.0.0.5
  BGP      Preference: 170/-101
    Source: 10.0.0.2
    Next hop: 10.1.24.1 via so-0/0/3.0, selected
    Protocol next hop: 10.0.0.2 Indirect next hop: 8644000 277

    Age: 2:48:18 Metric2: 10
    Task: BGP_65002.10.0.0.2+179
    AS path: 65001 I
    Localpref: 100
    Router ID: 10.0.0.2
```

Meaning The sample output shows that **R4** received two instances of the **100.100.3.0** route: one from **10.1.45.2 (R5)** and one from **10.0.0.2 (R2)**. **R4** selected the path from **R5** as its active path, as indicated by the asterisk (*). The selection is based on a preference for routes learned from an EBGp peer over routes learned from an IBGP. **R5** is an EBGp peer.

You can determine if a path is received from an EBGP or IBGP peer by examining the **Local As** and **Peer As** fields. For example, the route from **R5** shows the local AS is 65002 and the peer AS is 65001, indicating that the route is received from an EBGP peer. The route from **R2** shows that both the local and peer AS is 65002, indicating that it is received from an IBGP peer.

The reason that the inactive path is not selected is displayed in the **Inactive reason** field, in this case, **Interior > Exterior > Exterior via Interior**. The wording of this reason shows the order of preferences applied when the same route is received from two routers. The route received from a strictly internal source (IGP) is preferred first, the route received from an external source (EBGP) is preferred next, and any route which comes from an external source and is received internally (IBGP) is preferred last.

Examine the IGP Cost Selection

- Purpose** To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path.
- Action** To examine a route to determine if EBGP is selected over IBGP as the selection criteria for the single, active path, enter the following Junos OS CLI operational mode command:

```
user@host> show route destination-prefix < detail >
```

Sample Output

```
user@R6> show route 100.100.4.0 detail
inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)
100.100.4.0/24 (2 entries, 1 announced)
  *BGP      Preference: 170/-101
    Source: 10.0.0.4
    Next hop: 10.1.46.1 via so-0/0/1.0, selected
    Protocol next hop: 10.0.0.4 Indirect next hop: 864c000 276
    State: <Active Int Ext>
    Local AS: 65002 Peer AS: 65002
    Age: 2:16:11    Metric2: 10
    Task: BGP_65002.10.0.0.4+4120
    Announcement bits (2): 0-KRT 4-Resolve inet.0
    AS path: 65001|
    Localpref: 100
    Router ID: 10.0.0.4
  BGP      Preference: 170/-101
    Source: 10.0.0.2
    Next hop: 10.1.46.1 via so-0/0/1.0, selected
    Next hop: 10.1.36.1 via so-0/0/3.0
    Protocol next hop: 10.0.0.2 Indirect next hop: 864c0b0 278
    State: <NotBest Int Ext>
    Inactive reason: IGP metric
    Local AS: 65002 Peer AS: 65002
    Age: 2:16:03    Metric2: 20
    Task: BGP_65002.10.0.0.2+179
    AS path: 65001|
    Localpref: 100
    Router ID: 10.0.0.2
```

Meaning The sample output shows that **R6** received two instances of the **100.100.4.0** route: one from **10.0.0.4 (R4)** and one from **10.0.0.2 (R2)**. **R6** selected the path from **R4** as its active route, as indicated by the asterisk (*). The selection is based on the IGP metric, displayed in the **Metric2** field. The route with the lowest IGP metric is preferred. In the example, the path with the lowest IGP metric value is the path from **R4**, with an IGP metric value of 10, while the path from **R2** has an IGP metric of 20. Note that the two paths are from the same neighboring network: AS 65001.

The reason that the inactive path was not selected is displayed in the **Inactive reason** field, in this case, **IGP metric**.

Examine Routes in the Forwarding Table

Purpose When you run into problems, such as connectivity problems, you may need to examine routes in the forwarding table to verify that the routing protocol process has relayed the correct information into the forwarding table.

Action To display the set of routes installed in the forwarding table, enter the following Junos OS CLI operational mode command:

```
user@host> show route forwarding-table
```

Sample Output

```
user@R2> show route forwarding-table
```

```
Routing table: inet
```

```
Internet:
```

Destination	Type	RtRef	Next hop	Type	Index	NhRef	Netif
default	perm	0		rjct	10	1	
10.0.0.2/32	intf	0	10.0.0.2	loc1	256	1	
10.0.0.3/32	user	1	10.1.23.0	ucst	282	4 so-0/0/1.0	
10.0.0.4/32	user	1	10.1.24.0	ucst	290	7 so-0/0/3.0

100.100.4.0/24	user	0	10.1.12.0	ucst	278	6 so-0/0/0.0	

[...Output truncated...]

Meaning The sample output shows the network-layer prefixes and their next hops installed in the forwarding table. The output includes the same next-hop information as in the **show route detail** command (the next-hop address and interface name). Additional information includes the destination type, the next-hop type, the number of references to this next hop, and an index into an internal next-hop database. (The internal database contains additional information used by the Packet Forwarding Engine to ensure proper encapsulation of packets sent out an interface. This database is not accessible to the user.

For detailed information about the meanings of the various flags and types fields, see the *Routing Policies, Firewall Filters, and Traffic Policers*.

Ping the Egress Router

Purpose Ping the egress router to confirm that communication over the network is operational.

Action To ping the egress router, enter the following Junos OS CLI operational mode command:

```
user@host> ping ip-address-interface
```

Sample Output

```
[edit protocols mpls]
user@R1# run ping 10.1.56.1
PING 10.1.56.1 (10.1.56.1): 56 data bytes
64 bytes from 10.1.56.1: icmp_seq=0 ttl=255 time=0.837 ms
64 bytes from 10.1.56.1: icmp_seq=1 ttl=255 time=0.792 ms
64 bytes from 10.1.56.1: icmp_seq=2 ttl=255 time=0.856 ms
^C
--- 10.1.56.1 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.792/0.828/0.856/0.027 ms
```

Meaning The sample output confirms that communication between router **R1** and the IP address of the relevant interface on router **R5 (10.1.56.1)** is operational.

View the RSVP Log File on Transit Routers

Purpose Transit router messages that appear in the RSVP log file can help you analyze the problem with an RSVP session. You may need to issue the **clear rsvp session** and **clear log filename** commands to ensure that your records are current. However, if your network is large with many RSVP sessions, this may not be advisable because it may take a while for all sessions to reestablish. However, the **clear rsvp session** command has various options you can include to minimize the effect on your network. For more information about the **clear rsvp session** command, see the *Junos Routing Protocols and Policies Command Reference*.

Action To view the RSVP log file, enter the following Junos OS CLI operational mode commands:

```
user@host> clear rsvp session (Optional)
user@host> clear log filename (Optional)
```

```
user@host> show log filename
```

Sample Output 1

```
user@R3> clear rsvp session
```

```
user@R3> clear log rsvp-log
```

```
user@R3> show log rsvp-log
```

```

Jul 21 17:01:23 RecRoute Len 28 10.1.56.2 10.1.36.1 10.1.13.1

```

Meaning Sample Output 1 from transit router **R3** shows that **R3** (**so-0/0/2.0**) correctly received a Path request message (**recv Path**) from **R1**, and correctly sent the Path message (**send Path**) through interface **so-0/0/3.0** to **R6**. The route record object (**RecRoute**) indicates the list of addresses this Path message transited, in this case, **10.1.36.1** and **10.1.13.1**.

Sample Output 2 from transit router **R6** shows that **R6** (**so-0/0/3.0**) correctly received a Path request message (**recv Path**) from **R3**, and correctly sent the Path message (**send Path**) through interface **so-0/0/0** to **R5**. The route record object (**RecRoute**) indicates the list of addresses this Path message transited, in this case, **10.1.56.2**, **10.1.36.1**, and **10.1.13.1**.

With the information above, the focus shifts to egress router **R5** as the source of the problem, with indications that **R5** ignored the RSVP message.

Check the RSVP Log File on the Egress Router

Purpose After placing an RSVP tracing configuration on router **R5** similar to that on routers **R3** and **R6**, display the RSVP log file for useful information about the problem on router **R5**.

Action To check the RSVP log file, enter the following Junos OS CLI operational mode command:

```
user@host> show log rsvp-log
```

Sample Output

```

user@R5> show log rsvp-log
Jul 21 10:53:16 R5 clear-log[40071]: logfile cleared
Jul 21 11:02:37 trace_on: Tracing to "/var/log/rsvp-log" started
Jul 21 11:03:07 RSVP error, send to DISABLED interface ? Hello New
10.1.56.1->10.1.56.2 Len=8 so-0/0/0.0

```

Meaning The sample output shows that **R5** did not receive the Path message because of a disabled interface, **so-0/0/0.0**.

Determine and Correct the Problem on the Egress Router

Problem Description: Check the configuration of interface **so-0/0/0.0** on egress router **R5** to determine the reason it was disabled.

Solution To determine the problem on **R5**, enter the following Junos OS CLI commands:

```
user@R5> show configuration protocols rsvp
user@R5> edit
[edit protocols rsvp]
user@R5# rename interface so-0/0/3 to interface so-0/0/0
user@R5# show
user@R5# commit
user@R5# run show rsvp session ingress detail
```

Sample Output 1

```

user@R5> show configuration protocols rsvp
traceoptions {
  file rsvp-log;
  flag error detail;
  flag path detail;
  flag pathtear detail;
}
interface so-0/0/3.0;      <<< so-0/0/3 incorrectly included
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
  disable;
}

```

Sample Output 2

```

[edit protocols rsvp]
user@R5# rename interface so-0/0/3 to interface so-0/0/0

[edit protocols rsvp]
user@R5# show
traceoptions {
  file rsvp-log;
  flag packets detail;
  flag error detail;
}
interface so-0/0/0.0;
interface so-0/0/1.0;
interface so-0/0/2.0;
interface fxp0.0 {
  disable;
}

[edit protocols rsvp]
user@R5# commit
commit complete

```

Sample Output 3

```

[edit protocols mpls]
user@R5# run show rsvp session ingress detail
Ingress RSVP: 1 sessions
To          From          State  Rt Style Labelin Labelout LSPname
10.0.0.1    10.0.0.5    Up     1  1 FF      -    103104 R5-to-R1
Total 1 displayed, Up 1, Down 0
Egress RSVP: 1 sessions
To          From          State  Rt Style Labelin Labelout LSPname
10.0.0.5    10.0.0.1    Up     0  1 FF   3    - R1-to-R5
Total 1 displayed, Up 1, Down 0

Transit RSVP: 0 sessions
Total 0 displayed, Up 0, Down 0

```

Meaning Sample Output 1 from egress router **R5** shows three interfaces configured at the `[edit protocols rsvp]` hierarchy level, non of which is `so-0/0/0.0`. On examination of the network

topology, it is apparent that the **so-0/0/0.0** interface was configured incorrectly as **so-0/0/3.0**.

Sample Output 2 shows the correct configuration of interfaces at the **[edit protocols rsvp]** hierarchy level, and the **rename** command issued to correct the configuration error.

Sample Output 3 shows that the RSVP-signaled LSP (**R1-to-R5**) is correctly established after the changes to the RSVP configuration are committed.

Check the Routing CPU Memory Usage

Purpose Software processes on the router can consume a considerable amount of CPU and memory. The routing protocol process (rpd) can consume enormous amounts of memory to store information needed for the operation of routing and related protocols, such as Border Gateway Protocol (BGP), Open Shortest Path First (OSPF), Intermediate System-to-Intermediate System (ISIS), Resource Reservation Protocol (RSVP), Label Distribution Protocol (LDP), and Multiprotocol Label Switching (MPLS).

To verify the traffic passing through the router and check memory utilization, follow these steps:

1. [Check Overall CPU and Memory Usage on page 1400](#)
2. [Check Routing Protocol Process \(rpd\) Memory Usage on page 1402](#)
3. [Display Tasks on page 1405](#)

Check Overall CPU and Memory Usage

Purpose You can display exhaustive system process information about software processes that are running on the router and have controlling terminals. This command is equivalent to the UNIX **top** command. However, the UNIX **top** command shows real-time memory usage, with the memory values constantly changing, while the **show system processes extensive** command provides a snapshot of memory usage in a given moment.

Action To check overall CPU and memory usage, enter the following Junos OS command-line interface (CLI) command:

```
user@host> show system processes extensive
```

Sample Output

```
user@R1> show system processes extensive
last pid: 5251; load averages: 0.00, 0.00, 0.00 up 4+20:22:16 10:44:41

```

Meaning The sample output shows the amount of virtual memory used by the Routing Engine and software processes. For example, 118 MB of physical memory is free and 512 MB of the swap file is free, indicating that the router is not short of memory. The **processes** field

shows that most of the 58 processes are in the **sleeping** state, with 1 in the **running** state. The process or command that is running is the **top** command.

The **commands** column lists the processes that are currently running. For example, the chassis process (chassisd) has a process identifier (**PID**) of 4480, with a current priority (**PRI**) of 2. A lower priority number indicates a higher priority.

The processes are listed according to level of activity, with the most active process at the top of the output. For example, the chassis (chassisd) process is consuming the largest amount of CPU resource at 2.34 percent.

The memory field (**Mem**) shows the virtual memory managed by the Routing Engine and used by processes. The value in the memory field is in KB and MB, and is broken down as follows:

- **Active**—Memory that is allocated and actually in use by programs.
- **Inact**—Memory that is either allocated but not recently used or memory that was freed by programs. Inactive memory is still mapped in the address space of one or more processes and, therefore, counts toward the resident set size of those processes.
- **Wired**—Memory that is not eligible to be swapped, and is usually used for Routing Engine memory structures or memory physically locked by a process.
- **Cache**—Memory that is not associated with any program and does not need to be swapped before being reused.
- **Buf**—The size of the memory buffer used to hold data recently called from disk.
- **Free**—Memory that is not associated with any programs. Memory freed by a process can become **Inactive**, **Cache**, or **Free**, depending on the method used by the process to free the memory.

When the system is under memory pressure, the pageout process reuses memory from the free, cache, inactive and, if necessary, active pages.

The **Swap** field shows the total swap space available and how much is unused. In the example, the output shows 512 MB of total swap space and 512 MB of free swap space.

Finally, the memory usage of each process is listed. The **SIZE** field indicates the size of the virtual address space, and the **RES** field indicates the amount of the program in physical memory, which is also known as RSS or Resident Set Size. In the sample output, the chassis (chassisd) process has 3728 KB of virtual address space and 1908 KB of physical memory.

Check Routing Protocol Process (rpd) Memory Usage

Purpose When you notice a lot of memory usage, you can obtain detailed information about the memory utilization of routing tasks to get an idea of what is going on. The routing process (rpd) is the main task that uses Routing Engine memory.

Action To check routing process memory usage, enter the following Junos OS CLI operational mode commands:

```
user@host> show route summary
user@host> show task memory detail
```

Sample Output

```
user@host> show route summary
Autonomous system number: 209
Router ID: 205.175.0.170
inet.0: 179783 destinations, 898393 routes (179771 active, 146 holddown, 157
hidden)
    Direct:    17 routes,      17 active
    Local:    18 routes,      18 active
    BGP: 896632 routes, 178010 active
    Static:   32 routes,      31 active
    IS-IS: 1694 routes, 1694 active
inet.2: 8766 destinations, 22700 routes (8766 active, 124 holddown, 73 hidden)
    Direct:    17 routes,      17 active
    Local:    18 routes,      18 active
    BGP: 20939 routes, 7006 active
    Static:   32 routes,      31 active
    IS-IS: 1694 routes, 1694 active

```

Meaning The sample output shows summary statistics about the entries in the routing table (**show route summary** command) and the memory usage breakdown (**show task memory detail** command) for the routing process (rpd). The two commands provide a comprehensive picture of the memory utilization of the routing protocol process.

The **show route summary** command shows the number of routes in the various routing tables. In the sample output, the routing tables represented are **inet.0**, **inet.2**, **inet.3**, **iso.0**, and **mpls.0**. Within each routing table, all of the active, hold-down, and hidden destinations and routes are summarized for all the protocols from which routes are learned. Routes are in the **hold-down** state prior to being declared inactive, and **hidden** routes are not used because of routing policy. Routes in the **hold-down** and **hidden** states are still using memory because they appear in the routing table.

In addition, routes are summarized in the following categories: those directly connected to the network (**Direct**), local routes (**Local**), and routes learned from configured routing protocols, such as BGP and IS-IS.

The **show task memory detail** command lists the data structures within the tasks run by the routing protocol process (rpd). Tasks are enabled depending on the router's configuration. For example, **isis_area_addr** is a data structure resulting from the IS-IS configuration. The **AllocBytes** field indicates the highest amount of memory used by the data structure. For example, the **isis_area_addr** data structure has 544 blocks of allocated memory, each block is allocated a value of 16 bytes, resulting in allocated bytes of 8704. The maximum allocated blocks and bytes are high-water marks for a data structure. For more information on displaying task-related information, see ["Display Tasks" on page 1405](#).

The **Total bytes in use** field shows the total amount of memory used by the routing protocol process (rpd).

Display Tasks

Purpose You can display information about tasks to further your investigation of a memory problem on the router.

Action To display a list of tasks that are enabled on the router, enter the following Junos OS CLI operational mode commands:

```
user@host> show task
user@host> show task memory
user@host> show task task-name
```

Sample Output

```
user@R1> show task

SNMP_Subagent./var/run/snmpd_s	23	0	0	0	0
IF Delete	0	0	0	0	0

Meaning The sample output shows a list of routing, routing protocol, and interface tasks that are currently running on the router (**show task**), a summary of memory utilization (**show task memory**), and the memory utilization of a particular task (**show task io**). Tasks can be baseline tasks performed regardless of the router configuration, and other tasks that depend on the router configuration. For example, the **BGP_Group_internal** task is the result of the configuration of BGP on the router, while the **INET6** task is a base task associated with the routing process (rpd).

Each task in the **show task** command output has a priority and a task name. For example, the current priority is 10 for **LMP Client** and 80 for **IF Delete**. A lower number indicates a higher priority.

Some tasks have flags attached to them. For example, the **BGP.0.0.0.0+179** task has two flags, **Accept** and **LowPrio**. The **Accept** flag indicates that the task is waiting for incoming connections, and the **LowPrio** flag indicates that the task will be dispatched to read its socket after other, higher priority tasks. Two additional flags are **Connect**, which indicates that a task is waiting for a connection to complete, and **Delete**, which indicates that a task has been deleted and is being cleaned up.

The **show task io** command shows the statistics gathered for each IO operation. The counters show the following:

- **Reads**—This counter increments when a datagram arrives on a connected socket of the task and the task's read callback is called.
- **Writes**—This counter increments when a connected socket of a task becomes writable and the task's callback is called.
- **Rcvd**—This counter increments when the task calls the Routing Engine to read a datagram from a socket which may or may not be connected.
- **Sent**—This counter increments when a task attempts to read or write a datagram on an existing or nonexistent socket.
- **Drops**—This counter increments when a task attempts to read or write a datagram through the Routing Engine on a prebuilt socket, but the request fails for any reason.

Run Snmpwalk from an NMS System to a Juniper Router

Purpose Snmpwalk is an SNMP application that you can use to query a MIB for information about the functioning of a router in your network. Snmpwalk uses **GetNext** requests to retrieve the specified information. Object identifiers (OIDs) are used to query the MIB. If the OID argument is not present, Snmpwalk searches MIB-2.

Action To run Snmpwalk for a specific OID, from a management station that has access to the router, and using a tool such as Snmpwalk, enter the following command:

```
user-nms# snmpwalk [common arguments] hostname community object-id
```

Sample Output

```
user-nms % snmpwalk -Os -M /volume/~/.mibs -m all tp1 public .1.3.6.1.2.1.4
ipForwarding.0 = forwarding(1)
ipDefaultTTL.0 = 64
ipInReceives.0 = Counter32: 9262713
ipInHdrErrors.0 = Counter32: 0
ipInAddrErrors.0 = Counter32: 0
ipForwDatagrams.0 = Counter32: 614171
ipInUnknownProtos.0 = Counter32: 0
ipInDiscards.0 = Counter32: 0
ipInDelivers.0 = Counter32: 8648408
ipOutRequests.0 = Counter32: 1226483
ipOutDiscards.0 = Counter32: 0
ipOutNoRoutes.0 = Counter32: 0
ipReasmTimeout.0 = 60
ipReasmReqds.0 = Counter32: 0
ipReasmOKs.0 = Counter32: 0
ipReasmFails.0 = Counter32: 0
ipFragOKs.0 = Counter32: 0
ipFragFails.0 = Counter32: 0
ipFragCreates.0 = Counter32: 0
ipAdEntAddr.10.0.0.1 = IPAddress: 10.0.0.1
ipAdEntAddr.10.1.12.1 = IPAddress: 10.1.12.1
ipAdEntAddr.10.1.15.1 = IPAddress: 10.1.15.1
ipAdEntAddr.10.168.70.143 = IPAddress: 10.168.70.143
[...Output truncated...]
```

Meaning The sample output shows that the user is on a network management station (**user-nms %**) that has access to the router, **tp1**. In the command, the following options are used:

- **Os**—Deletes all but the last symbolic part of the OID **sysUpTime.0**. For example, Timeticks: (14096763) 1 day, 15:09:27.63.
- **-M**—Compiles the MIB and gives a path or location to the MIBs.
- **-m**—Uses the files in the directory pointed to by the **-M** option.
- **all**—Uses all the files in the directory pointed to by the **-M** option.

In addition, the command includes the hostname **tp1**, the community string **public**, and the OID **.1.3.6.1.2.1.4**.

The OID in this example is from RFC 2096, *IP Forwarding Table MIB*, which displays multipath IP routes that have the same network number but different network masks.

Before you can retrieve SNMP information from a router, you must have the minimum SNMP configuration for that router. Following is the minimum SNMP configuration required:

```
[edit]
snmp {
  community public {
    authorization read-only;
  }
}
```

With this configuration, the system responds to SNMP **Get**, **GetNext**, and **GetBulk** commands that contain the community string **public**.

For more detailed information on configuring SNMP on a router, see the *Junos Network Management Configuration Guide*.

Configure Trace Operations for SNMP

Purpose Define tracing for SNMP to access more granular information about the packets sent and received through SNMP.

Action To configure SNMP tracing operations, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@R1# edit snmp
```

2. Configure trace operations:

```
[edit snmp]
user@R1# set traceoptions flag pdu
```

3. Commit the configuration:

```
user@R1# commit and-quit
commit complete
Exiting configuration mode
```

Sample Output

```
user@R1> show configuration snmp
view all {
    oid .1 include;
}
view system {
    oid system;
}
community public {
    view all;
    authorization read-only;
}
community private {
    view system;
    authorization read-write;
}
traceoptions {
    flag pdu;
}
```

Meaning The sample output shows a configuration for SNMP that includes traceoptions. The **pdu** flag is configured, which results in the generation of SNMP request and response packets. The output for the tracing operation is placed into various log files in the **/var/log** directory.

Protocol-specific tracing operations override any equivalent operations that you specify in the global **traceoptions** statement. If there are no equivalent operations, they supplement the global tracing options. If you do not specify any protocol-specific tracing, the routing protocol inherits all the global tracing operations.

Query a MIB With SNMPGet

Purpose Send an SNMP request to check that the SNMP configuration is correct.

Action To query a MIB with **SNMPGet**, enter the following command:

```
user@nms % snmpget hostname community oid
```

Sample Output

```
user-nms % snmpget tp1 public .1.3.6.1.2.1.1.0
system.sysDescr.0 = m7i internet router, kernel 6.0R1.5

user-nms % snmpget tp1 public sysDescr.0
system.sysDescr.0 = m7i internet router, kernel 6.0R1.5
```

Meaning The sample output shows a query from a network management station (**nms**) for the description of the system running on the router **tp1**. The OID is entered in numerical form in the command line, and a description (**sysDescr.0**) is obtained in the output. You can also use **sysDescr.0** in the command line to obtain the same output.

Check CPU Utilization

Purpose The enterprise-specific chassis MIB provides information about the router and its components. Within the chassis MIB, the `jnxMIBs` branch contains one main subbranch, `jnxBoxAnatomy`, which in turn contains a section, `jnxOperatingTable`. Within `jnxOperatingTable`, and under the `jnxOperatingEntry`, you can use the `jnxOperatingCPU` object to monitor the CPU on your router. (See [Figure 113 on page 1411](#).)

Figure 113: Chassis MIB Tree

```

+--juniperMIB(2636)¶
|  +--jnxProducts(1)¶
|  +--jnxServices(2)¶
|  +--jnxMibs(3)¶

|  |  |  |  |  +-- jnxOperatingStateOrdered(16)¶
|  |  |  +--jnxRedundancyTable(14)¶
|  |  +--jnxFruTable(15)¶

```

After each object description is a value in parenthesis, such as (1). This value can be used to enter an OID for the specific object. For example, to gather information on the CPU, you can type the object description (`jnxOperatingCPU`) or the OID (`.1.3.6.1.4.1.2636.3.1.13.1.8`).

Action To check CPU utilization using the Juniper Networks enterprise chassis MIB, from a management station that has access to the router, and using a tool such as `Snmpwalk`, enter the following command:

```
user-bsd# snmpwalk [common arguments] hostname community object-id
```

Sample Output

```

user-nms % snmpwalk -Os -M /volume/~ /mibs -m all tp1 public jnxOperatingCPU
jnxOperatingCPU.1.1.1.0 = Gauge32: 0
jnxOperatingCPU.1.1.2.0 = Gauge32: 0
jnxOperatingCPU.1.1.3.0 = Gauge32: 0

```

```

jnxOperatingCPU.2.1.0.0 = Gauge32: 0
jnxOperatingCPU.4.1.1.0 = Gauge32: 0
jnxOperatingCPU.4.1.2.0 = Gauge32: 0
jnxOperatingCPU.4.1.3.0 = Gauge32: 0
jnxOperatingCPU.4.1.4.0 = Gauge32: 0
jnxOperatingCPU.6.1.1.0 = Gauge32: 224
jnxOperatingCPU.6.1.2.0 = Gauge32: 224
jnxOperatingCPU.7.1.0.0 = Gauge32: 2
jnxOperatingCPU.7.2.0.0 = Gauge32: 2
jnxOperatingCPU.8.1.1.0 = Gauge32: 0
jnxOperatingCPU.8.2.3.0 = Gauge32: 0
jnxOperatingCPU.8.2.4.0 = Gauge32: 0
jnxOperatingCPU.9.1.0.0 = Gauge32: 6
jnxOperatingCPU.9.1.1.0 = Gauge32: 0

user-nms % snmpwalk -Os -M /volume/~ /mibs -m all tp1 public jnxOperatingDesc
jnxOperatingDescr.1.1.1.0 = midplane
jnxOperatingDescr.1.1.2.0 = midplane
jnxOperatingDescr.1.1.3.0 = midplane
jnxOperatingDescr.2.1.0.0 = Power Supply A
jnxOperatingDescr.4.1.1.0 = Left Tray front fan
jnxOperatingDescr.4.1.2.0 = Left Tray second fan
jnxOperatingDescr.4.1.3.0 = Left Tray third fan
jnxOperatingDescr.4.1.4.0 = Left Tray fourth fan
jnxOperatingDescr.6.1.1.0 = CFEB Internet Processor Ilv1
jnxOperatingDescr.6.1.2.0 = CFEB Internet Processor Ilv1
jnxOperatingDescr.7.1.0.0 = FPC @ 0/*/*
jnxOperatingDescr.7.2.0.0 = FPC @ 1/*/*
jnxOperatingDescr.8.1.1.0 = PIC: 4x OC-3 SONET, MM @ 0/0/*
jnxOperatingDescr.8.2.3.0 = PIC: 1x Tunnel @ 1/2/*
jnxOperatingDescr.8.2.4.0 = PIC: 1x G/E, 1000 BASE-SX @ 1/3/*
jnxOperatingDescr.9.1.0.0 = Routing Engine
jnxOperatingDescr.9.1.1.0 = Routing Engine PCMCIA Card

```

Meaning The sample output shows the percentage CPU utilization on router, **tp1**. The Routing Engine (**9.1.0.0**) has 6 percent CPU utilization, the two CFEB Internet Processors Ilv1 (**6.1.1.0** and **6.1.2.0**) have 22 percent each, and the FPCs (**7.1.0.0** and **7.2.0.0**) have 2 percent each. Components with a value of zero indicate that the information is either unavailable or inapplicable.

The output for the **jnxOperatingDesc** object provides a description of the separate instances in the **jnxOperatingCPU** object. For example, **9.1.0.0** represents the Routing Engine.

Check CPU Utilization per Process

Purpose The standard system application MIB (RFC 2287, *Definitions of System-Level Managed Objects for Applications*), describes a set of managed objects that are restricted to information that can be determined from the system itself. The object **sysAppElmtRunCPU** provides information about applications and associated elements that have run or are currently running on the host system. (See [Figure 114 on page 1413](#).)

Figure 114: System Application MIB Tree

```
+--System# Application MIB#

```

Meaning The sample output shows the number of centi-seconds of total system CPU resources consumed by a particular process. For example, the chassis process (**chassisd, 3.2.2163**) has consumed 3 days, or 33,548,776 centi-seconds of total system CPU resources.

The **sysAppElmtRunName** object retrieves the name of the OID. For example, **sysAppElmtRunCPU.3.2.2163** represents the chassis process.

Retrieve Version Information about Router Software Components

Purpose RFC 2790, *Host Resources MIB*, describes a set of managed objects that are useful for managing host systems, including routers.

Action To retrieve version information about software components on the router, from a management station that has access to the router and using a tool, such as Snmpwalk, enter the following command:

```
user-bsd# snmpwalk [common arguments] hostname community object-id
```

Sample Output

```

user-nms % snmpwalk -Os -M /volume/~ /mibs -m all tp1 public

```

Meaning The sample output shows the version information for various software components on the router.

Checklist for Displaying Basic Chassis Information

Purpose [Table 51 on page 1416](#) provides links and commands for displaying basic chassis information, including a list of all Flexible PIC Concentrators (FPCs) and Physical Interface Cards (PICs) installed in the router chassis, the hardware version level, and the serial number.

Action

Table 51: Checklist for Displaying Basic Chassis Information

Task	Command or Action
"Display Basic Chassis Information" on page 1416	<code>show chassis hardware <detail></code>

Display Basic Chassis Information

Purpose Before you return a router component to Juniper Networks, you must contact the Juniper Networks Technical Assistance Center (JTAC) with the serial number of the failed component and failure information. JTAC will then grant a Return Materials Authorization (RMA).

Action To display a list of the serial numbers of components installed in the router chassis, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show chassis hardware <detail>
```

Sample Output

```
user@host> show chassis hardware
```

```
Hardware inventory:
```

Item	Version	Part number	Serial number	Description
Chassis			25708	M20
Backplane	REV 03	710-002334	BB9738

PIC 0	REV 03	750-002914	BC0131	2x OC-3 ATM, MM

Meaning The sample output is for an M20 and an M40 router. It shows a list of all FPCs and PICs installed in the router chassis, including the hardware version level and serial number.

The **detail** option displays detailed information about hardware, including memory, hardware version level, serial number, and additional information about memory.

If the Routing Engine is identified by a 10- and 16-digit serial number, both numbers are displayed in the output for the **detail** option, and are especially important when processing an RMA for such a Routing Engine. In addition, when you request an RMA for the M40 router, include the **maxicab** serial number.

[Table 52 on page 1418](#) provides a description of all the output fields for the **show chassis hardware** command.

Table 52: Output fields for the show chassis hardware command

Output field	Description
Item	<p>(For M-series routers) Chassis component. Information is displayed about the backplane; power supplies; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); System Control Board (SCB), System and Switch Board (SSB), Switching and Forwarding Module (SFM), or Forwarding Engine Board (FEB); Miscellaneous Control Subsystem (MCS) and PFE clock generator (PCG) (for the M160 router only); and each FPC and PIC.</p> <p>(For T-series platforms) Chassis component. Information is displayed about the backplane, power supplies, midplane, Control Board (CB), Connector Interface Panel (CIP), FPC, Front Panel Module (FPM) (craft interface), Power Entry Module (PEM), PIC, SONET Clock Generator (SCG), Small Form-factor Pluggable (SFP) modules, Switch Interface Board (SIB), and Switch Processor Mezzanine Board (SPMB).</p>
Version	Revision level of the chassis component.
Part number	Part number of the chassis component.
Serial number	Serial number of the chassis component. For all RMAs, the chassis serial number must be provided to JTAC. If the RMA is for the chassis itself, you must obtain the backplane or midplane serial number as well.
Description	Brief description of the hardware item.

NOTE: When you request an RMA, you must also include output from the `show chassis environment` command, the `show version` command, and the troubleshooting output used to identify the failure.

Maintain a Single Configuration File for Both Routing Engines

Purpose For routers that support multiple Routing Engines, you can specify **re0** and **re1** as group names to ensure that the correct IP addresses are used for each Routing Engine and to maintain a single configuration file for both Routing Engines. It is important that the names of the Routing Engines correspond to a slot position because the names **re0** and **re1** are special group names that you must use for the Routing Engines to recognize which configuration statement to use. Routing Engine 0 must be in slot position 0 and must be named **re0**, and Routing Engine 1 must be in slot position 1 and must be named **re1**.

To maintain a single configuration file for both Routing Engines, follow these steps:

1. [Configure the New Group on page 1419](#)
2. [Apply the New Group on page 1420](#)

Configure the New Group

Purpose Each **re0** or **re1** group typically contains, at a minimum, the configuration for the hostname and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group must also contain the configuration for the backup router and static routes.

Action To configure the **re0** and **re1** groups, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit groups
```

2. Configure the group:

```
[edit groups]
user@host# set group-name
```

For example:

```
[edit groups]
user@host# set re0
```

3. To configure the management interface, go to the following hierarchy level:

```
[edit groups]
user@host# edit groups re0
```

4. Include the following statement:

```
[edit groups re0]
user@host# set interfaces interface-name unit unit family inet address address
```

For example:

```
[edit groups re0]
user@host# set interfaces fxp0 unit 0 family inet address 1.1.1.1/24
```

5. To configure the hostname, go to the following hierarchy level:

```
[edit groups re0]
user@host# edit groups re0 system
```

6. Include the following statement:

```
[edit groups re0 system]
user@host# set host-name hostname
```

For example:

```
[edit groups re0 system]
user@host# set host-name foo-re0
```

7. Verify the configuration:

```
[edit groups re0]
user@host# show
re0 {
  system {
    host-name foo-re0;
  }
  interfaces {
    fxp0 {
      unit 0 {
        family inet {
          address 1.1.1.1/24;
        }
      }
    }
  }
}
```

8. Commit the configuration:

```
user@host# commit
```

9. Repeat Step 1 through Step 8 for the **re1** group.

Meaning The sample output in Step 7 shows that the **re0** group contains the minimum configuration for a group, the hostname, and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group must also contain the configuration for the backup router and static routes.

Apply the New Group

Action To apply the **re0** group to maintain a single configuration file for both Routing Engines, follow these steps:

1. In configuration mode, go to the top hierarchy level and include the following statement:

```

user@host# [edit]
user@host# set apply-groups group-name

```

For example:

```

user@host# [edit]
user@host# set apply-groups re0

```

2. Verify the configuration:

```

user@host# show
groups {
  re0 {
    system {
      host-name foo-re0;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address 1.1.1.1/24;
          }
        }
      }
    }
  }
  re1 {
    system {
      host-name foo-re1;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address 1.1.1.2/24;
          }
        }
      }
    }
  }
}
apply-groups [ re0 re1 ];

```

3. Commit the configuration:

```

user@host# commit

```

Meaning The sample output shows that each group, **re0** and **re1**, has its own IP address that is used for each Routing Engine to maintain a single configuration file.

Configure the New Group

Purpose Each **re0** or **re1** group typically contains, at a minimum, the configuration for the hostname and the management interface (**fxp0**). If each Routing Engine uses a different

management interface, the group must also contain the configuration for the backup router and static routes.

Action To configure the **re0** and **re1** groups, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit groups
```

2. Configure the group:

```
[edit groups]
user@host# set group-name
```

For example:

```
[edit groups]
user@host# set re0
```

3. To configure the management interface, go to the following hierarchy level:

```
[edit groups]
user@host# edit groups re0
```

4. Include the following statement:

```
[edit groups re0]
user@host# set interfaces interface-name unit unit family inet address address
```

For example:

```
[edit groups re0]
user@host# set interfaces fxp0 unit 0 family inet address 1.1.1.1/24
```

5. To configure the hostname, go to the following hierarchy level:

```
[edit groups re0]
user@host# edit groups re0 system
```

6. Include the following statement:

```
[edit groups re0 system]
user@host# set host-name hostname
```

For example:

```
[edit groups re0 system]
user@host# set host-name foo-re0
```

7. Verify the configuration:

```
[edit groups re0]
user@host# show
re0 {
  system {
    host-name foo-re0;
  }
  interfaces {
    fxp0 {
      unit 0 {
        family inet {
```

```

        address 1.1.1.1/24;
    }
}
}
}
}

```

8. Commit the configuration:

```
user@host# commit
```

9. Repeat Step 1 through Step 8 for the **re1** group.

Meaning The sample output in Step 7 shows that the **re0** group contains the minimum configuration for a group, the hostname, and the management interface (**fxp0**). If each Routing Engine uses a different management interface, the group must also contain the configuration for the backup router and static routes.

Apply the New Group

Action To apply the **re0** group to maintain a single configuration file for both Routing Engines, follow these steps:

1. In configuration mode, go to the top hierarchy level and include the following statement:

```
user@host# [edit]
user@host# set apply-groups group-name
```

For example:

```
user@host# [edit]
user@host# set apply-groups re0
```

2. Verify the configuration:

```
user@host# show
groups {
  re0 {
    system {
      host-name foo-re0;
    }
    interfaces {
      fxp0 {
        unit 0 {
          family inet {
            address 1.1.1.1/24;
          }
        }
      }
    }
  }
  re1 {
    system {

```

```

    host-name foo-rel;
  }
  interfaces {
    fxp0 {
      unit 0 {
        family inet {
          address 1.1.1.2/24;
        }
      }
    }
  }
}
apply-groups [ re0 rel ];

```

3. Commit the configuration:

```
user@host# commit
```

Meaning The sample output shows that each group, **re0** and **re1**, has its own IP address that is used for each Routing Engine to maintain a single configuration file.

List Files and Directories on a Router

Problem	Description: If a system board crashes, you must check that certain files are in specific directories.
----------------	---

Solution To display files in the `/var/tmp` and `var/crash` directories, use the following CLI operational mode command:

```
user@host> file list filename or directory
```

```
Sample Output  sampled.pkts
                vi.recover/
user@host> file list /var/crash/
                bounds
                minfree
                vmcore.0
```

Meaning The sample output shows the files in the `/var/tmp/` and `/var/crash/` directories. The Juniper Networks Technical Assistance Center (JTAC) can ask you to verify the existence of similar files.

Display File Contents

Purpose To display the contents of a file on the local router.

Action To display the contents of a file on the local router, use the following CLI operational mode command:

```
user@host> file show filename
```

Sample Output

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
Apr 13 21:07:36 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:08:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
...Output truncated...
```

Meaning The sample output shows the contents of the `/var/log/messages` file.

Rename a File on a Router

Action To rename a file on the local router, use the following CLI operational mode command:

```
user@host> file rename source destination
```

Sample Output

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

Meaning The sample output shows that the `dcd.core` file was renamed to `dcd.core.990413`. The original name of the file is the **source** and the new name for the file is the **destination**.

Delete a File on a Router

Action To delete a file on the local router, use the following CLI operational mode command:

```
user@host> file delete filename
```

Sample Output

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

Meaning The sample output shows that the **snmpd.core** file was deleted.

Check the Time on a Router

Purpose Display the current time on a router and display information about how long the router, router software, and routing protocols have been running.

Action To check time on a router, use the following Junos OS command-line interface (CLI) operational mode command:

```
user@host> show system uptime
```

Sample Output

```
user@host> show system uptime
Current time:      1998-10-13 19:45:47 UTC
System booted:    1998-10-12 20:51:41 UTC (22:54:06 ago)
Protocols started: 1998-10-13 19:33:45 UTC (00:12:02 ago)
Last configured:  1998-10-13 19:33:45 UTC (00:12:02 ago) by abc
12:45PM up 22:54, 2 users, load averages: 0.07, 0.02, 0.01
```

Meaning The sample output shows the current system time in UTC, the date and time when the router was last booted and how long it has been running, when the routing protocols were last started and how long they have been running, when a configuration was last committed, and the name of the user who issued the last **commit** command. If a different time zone is configured, the output shows that time zone. For information on configuring the time zone, see the *Junos System Basics Configuration Guide*.

The sample output shows that the current time is 12:45 PM, the router has been operational for 22:54 hours, and two users are logged in to the router. The output also shows that the load average is 0.07 seconds for the last minute, 0.02 seconds for the last 5 minutes, and 0.01 seconds for the last 15 minutes.

Check for Users in Configuration Mode

Purpose Before you change the configuration or commit a candidate configuration, it is a good idea to check for users in configuration mode.

Action To display users currently editing the configuration, follow these steps:

1. To enter configuration mode, type the following command:

```
user@host> edit
```

2. Enter the following configuration mode command:

```
[edit]
user@host# status
```

For example:

```
user@host> show system users
4:58PM PST up 5 days, 9:52, 5 users, load averages: 0.01, 0.01, 0.00
USER      TTY      FROM                LOGIN@   IDLE   WHAT
mwazna    p0       bigpunk.juniper.net 4:58PM   -      -cli (cli)

jgchan    p1       bigpunk.juniper.net 2:25PM   2:32   -csh (csh)

jgchan    p2       bigpunk.juniper.net 2:35PM   2:18   cli

taffy     p3       bigpunk.juniper.net 3:28PM   5      -cli (cli)

tmauro    p4       bigpunk.juniper.net 4:16PM   37     cli
```

Sample Output

Meaning The sample output lists the users who are currently logged in to the router. Five users are logged in to the router, with one user logged in twice, **jgchan**. Each user is logged in through a different terminal (**TTY**—**p0**, **p1**, **p2**, **p3**, and **p4**) from the system **bigpunk.juniper.net**. A hyphen in the **FROM** field indicates that the user logged in through the console.

Additional information includes the time when the user logged in (**LOGIN**), the amount of time the user is not active on the router (**IDLE**), and the processes that the user is running (**WHAT**). In this example, the users are running the command-line interface (**cli**) and the UNIX-level shell (**csh**).

Check the Commands That Users Are Entering

Purpose A common set of operations you can check is when users log in to the router and the CLI commands they issue.

To check the commands that users are entering, follow these steps:

1. [Configure the Log File for Tracking CLI Commands on page 1427](#)
2. [Display the Configured Log File on page 1428](#)

Configure the Log File for Tracking CLI Commands

Action To configure the log file for tracking CLI commands, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit system syslog
```

2. Configure the log file:

```
[edit system syslog]
user@host# edit file filename
```

For example:

```
[edit system syslog]
user@host# edit file cli-commands
```

3. Configure the interactive-commands facility and severity level:

```
[edit system syslog filename]
user@host# set interactive-commands info
```

4. Verify the configuration:

```
[edit system syslog]
user@host# show
file cli-commands {
    interactive-commands info;
}
```

5. Commit the configuration:

```
user@host# commit
```

Meaning The configuration example shows that the log file **cli-commands** is configured with the **interactive-commands** facility at the **info** severity level. [Table 53 on page 1428](#) lists and describes the severity levels.

Table 53: Severity Levels

Severity Level	Description
info	Log all top-level CLI commands, including the configure command, and all configuration mode commands.
notice	Log the configuration mode commands rollback and commit .
warning	Log when any software process restarts.

Display the Configured Log File

Purpose To display the log file in configuration mode, enter the following command:

Action

```
[edit system syslog]
user@host# run show log filename
```

For example:

```
[edit system syslog]
user@host# run show log cli-commands
```

Sample Output

```
[edit system syslog]
user@host# run show log cli-commands
Sep 16 11:24:25 nut mgd[3442]: UI_COMMIT_PROGRESS: commit: signaling 'Syslog
daemon', pid 2457, signal 1, status 0
Sep 16 11:24:25 nut mgd[3442]: UI_COMMIT_PROGRESS: commit: signaling 'SNMP
daemon', pid 2592, signal 31, status 0
Sep 16 11:28:36 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'run
show log cli-commands '
Sep 16 11:30:39 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'run
show log security '
Sep 16 11:31:26 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'run
show log messages '
Sep 16 11:41:21 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'edit
file cli-commands '
Sep 16 11:41:25 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'show
'
Sep 16 11:44:57 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'set
interactive-commands info '
Sep 16 14:32:15 nut mgd[3442]: UI_CMDLINE_READ_LINE: User 'user', command 'run
show log cli-commands '
```

Meaning The sample output shows the CLI commands that were entered since the log file was configured.

Configure the Log File for Tracking CLI Commands

Action To configure the log file for tracking CLI commands, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit system syslog
```

2. Configure the log file:

```
[edit system syslog]
user@host# edit file filename
```

For example:

```
[edit system syslog]
user@host# edit file cli-commands
```

3. Configure the interactive-commands facility and severity level:

```
[edit system syslog filename]
user@host# set interactive-commands info
```

4. Verify the configuration:

```
[edit system syslog]
user@host# show
file cli-commands {
    interactive-commands info;
}
```

5. Commit the configuration:

```
user@host# commit
```

Meaning The configuration example shows that the log file **cli-commands** is configured with the **interactive-commands** facility at the **info** severity level. [Table 53 on page 1428](#) lists and describes the severity levels.

Table 54: Severity Levels

Severity Level	Description
info	Log all top-level CLI commands, including the configure command, and all configuration mode commands.
notice	Log the configuration mode commands rollback and commit .
warning	Log when any software process restarts.

Check When the Last Configuration Change Occurred

Purpose When a problem occurs on a router, it is a good idea to check when the last configuration change was made because it may have had some influence on the problem.

To check when the last configuration change occurred, follow these steps:

1. [Configure Configuration Change Tracking on page 1430](#)
2. [Display the Configured Log File on page 1431](#)

Configure Configuration Change Tracking

Action To configure this type of logging, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit system syslog
```

2. Configure the log file:

```
[edit system syslog]
user@host# edit file filename
```

For example:

```
[edit system syslog]
user@host# edit file mw-configuration-changes
```

3. Configure the change-log facility and severity level:

```
[edit system syslog filename]
user@host# set change-log info
```

4. Verify the configuration:

```
[edit system syslog]
user@host# show
file mw-configuration-changes {
  change-log info;
}
```

5. Commit the configuration:

```
user@host# commit
```

Display the Configured Log File

Purpose To display the log file in configuration mode.

Action To display the log file in configuration mode, enter the following command:

```
[edit system syslog]
user@host# run show log filename
```

For example:

```
[edit system syslog]
user@host# run show log mw-configuration-changes
```

Sample Output

```
[edit system syslog]
user@host# run show log mw-configuration-changes
Sep 17 07:03:22 nut mgd[7793]: UI_CFG_AUDIT_OTHER: User 'root' override:
/config/juniper.conf
Sep 17 07:07:21 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [interfaces
  lo0 unit 0 family inet address 127.0.0.1/32]
Sep 17 07:07:21 nut mgd[2751]: UI_CFG_AUDIT_SET: User 'root' set: [system
domain-name] "englab.company.net" -> "englab.company.net"
Sep 17 07:07:21 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [system
name-server 172.17.28.101]
Sep 17 07:07:22 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [system
domain-search] "englab.company.net"
Sep 17 07:07:22 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [system
domain-search] "company.net"
Sep 17 07:07:22 nut mgd[2751]: UI_CFG_AUDIT_OTHER: User 'root' set: [system
domain-search] "jnpr.net"
```

Meaning The sample output shows the contents of the log file and that the last configuration change was on September 17 at 07:07:22.

Configure Configuration Change Tracking

Action To configure this type of logging, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit system syslog
```

2. Configure the log file:

```
[edit system syslog]
user@host# edit file filename
```

For example:

```
[edit system syslog]
user@host# edit file mw-configuration-changes
```

3. Configure the change-log facility and severity level:

```
[edit system syslog filename]
user@host# set change-log info
```

4. Verify the configuration:

```
[edit system syslog]
user@host# show
file mw-configuration-changes {
  change-log info;
}
```

5. Commit the configuration:

```
user@host# commit
```

Display a Log File

Purpose To look at a log or trace file.

Action To look at a log or trace file, use the following Junos OS CLI operational mode command:

```
user@host> show log filename
```

Sample Output

```
user@host> show log messages
Sep 10 07:00:00 host newsyslog[7249]: logfile turned over
Sep 10 07:01:49 host rpd[6451]: bgp_listen_accept: Connection attempt from

```

```
Sep 10 07:21:33 host rpd[6451]: bgp_listen_accept: Connection attempt from
unconfigured neighbor:
```

Meaning The sample output shows the **rp**d log messages in the **messages** file for September 10 from 7:00 to 7:21 AM.

NOTE: Local log files are saved in the `/var/log` directory.

Configure IS-IS-Specific Options

Purpose When unexpected events or problems occur, or if you want to diagnose IS-IS adjacency establishment issues, you can view more detailed information by configuring options specific to IS-IS.

To configure IS-IS options, follow these steps:

1. [Displaying Detailed IS-IS Protocol Information on page 1433](#)
2. [Displaying Sent or Received IS-IS Protocol Packets on page 1435](#)
3. [Analyzing IS-IS Link-State PDUs in Detail on page 1436](#)

Displaying Detailed IS-IS Protocol Information

Action To trace IS-IS messages in detail, follow these steps:

1. Configure the flag to display detailed IS-IS protocol messages.

```
[edit protocols isis traceoptions]
user@host# set flag hello detail
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello detail;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog
```

```

Nov 29 23:17:50 trace_on: Tracing to "/var/log/isislog" started
Nov 29 23:17:50 Sending PTP IIH on so-1/1/1.0

Displaying Sent or Received IS-IS Protocol Packets

To configure the tracing for only sent or received IS-IS protocol packets, follow these steps:

1. Configure the flag to display sent, received, or both sent and received packets.

```
[edit protocols isis traceoptions]
user@host# set flag hello send
```

or

```
[edit protocols isis traceoptions]
user@host# set flag hello receive
```

or

```
[edit protocols isis traceoptions]
user@host# set flag hello
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello send;
```

or

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello receive;
```

or

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;
flag hello send receive;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog
Sep 27 18:17:01 ISIS periodic xmit to 01:80:c2:00:00:15 (IFL 2)
Sep 27 18:17:01 ISIS periodic xmit to 01:80:c2:00:00:14 (IFL 2)
Sep 27 18:17:03 ISIS periodic xmit to 01:80:c2:00:00:15 (IFL 2)
Sep 27 18:17:04 ISIS periodic xmit to 01:80:c2:00:00:14 (IFL 2)
Sep 27 18:17:06 ISIS L2 hello from 0000.0000.0008 (IFL 2) absorbed
Sep 27 18:17:06 ISIS periodic xmit to 01:80:c2:00:00:15 (IFL 2)
Sep 27 18:17:06 ISIS L1 hello from 0000.0000.0008 (IFL 2) absorbed
```

Analyzing IS-IS Link-State PDUs in Detail

To analyze IS-IS link-state PDUs in detail, follow these steps:

1. Configure IS-IS open messages.

```
[edit protocols isis traceoptions]
```

```
user@host# set flag lsp detail
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 5m world-readable;
flag error;
flag lsp detail;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog
Nov 28 20:17:24 Received L2 LSP abc-core-01.00-00, interface so-1/1/0.0
Nov 28 20:17:24 from abc-core-01
Nov 28 20:17:24 sequence 0x1c4f9, checksum 0x9fea, lifetime 1199
Nov 28 20:17:24 max area 0, length 426

Displaying Detailed IS-IS Protocol Information

Action To trace IS-IS messages in detail, follow these steps:

1. Configure the flag to display detailed IS-IS protocol messages.

```

[edit protocols isis traceoptions]
user@host# set flag hello detail

```

2. Verify the configuration.

```

user@host# show

```

For example:

```

[edit protocols isis traceoptions]
user@host# show
file isislog size 10k files 10;

```

flag hello detail;

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog
```

```
Nov 29 23:17:50 trace_on: Tracing to "/var/log/isislog" started

Analyzing IS-IS Link-State PDUs in Detail

To analyze IS-IS link-state PDUs in detail, follow these steps:

1. Configure IS-IS open messages.

```
[edit protocols isis traceoptions]
user@host# set flag lsp detail
```

2. Verify the configuration.

```
user@host# show
```

For example:

```
[edit protocols isis traceoptions]
user@host# show
file isislog size 5m world-readable;
flag error;
flag lsp detail;
```

3. Commit the configuration.

```
user@host# commit
```

4. View the contents of the file containing the detailed messages.

```
user@host# run show log filename
```

For example:

```
user@host# run show log isislog

Configure OSPF-Specific Options

Purpose When unexpected events or problems occur, or if you want to diagnose OSPF neighbor establishment issues, you can view more detailed information by configuring options specific to OSPF.

To configure OSPF options, follow these steps:

1. [Diagnose OSPF Session Establishment Problems on page 1443](#)
2. [Analyze OSPF Link-State Advertisement Packets in Detail on page 1446](#)

Diagnose OSPF Session Establishment Problems

Action To trace OSPF messages in detail, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols ospf traceoptions
```

2. Configure OSPF hello messages:

```
[edit protocols ospf traceoptions]
user@host# set flag hello detail
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit protocols ospf traceoptions]
user@host# show
file ospf size 5m world-readable;
flag hello detail;
```

4. Commit the configuration:

```
user@host# commit
```

5. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
user@host# run show log ospf
```

```

Analyze OSPF Link-State Advertisement Packets in Detail

Action To analyze OSPF link-state advertisement packets in detail, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols ospf traceoptions
```

2. Configure OSPF link-state packages:

```
[edit protocols ospf traceoptions]
user@host# set flag lsa-update detail
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit protocols ospf traceoptions]
```

```

user@host# show
file ospf size 5m world-readable;
flag hello detail;
flag lsa-update detail;

```

4. Commit the configuration:

```
user@host# commit
```

5. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
user@host# run show log ospf
```

```

Dec 2 16:23:47 OSPF sent LSUpdate (4) -> 224.0.0.5 (so-1/1/0.0) ec 2 16:23:47
Version 2, length 196, ID 10.0.0.6, area 0.0.0.0
Dec 2 16:23:47 checksum 0xcc46, authtype 0
Dec 2 16:23:47 adv count 6 Dec 2 16:23:47 OSPF sent LSUpdate (4) -> 224.0.0.5
(so-1/1/1.0)
Dec 2 16:23:47 Version 2, length 196, ID 10.0.0.6, area 0.0.0.0 Dec 2 16:23:47
checksum 0xcc46, authtype 0
Dec 2 16:23:47 adv count 6

```

Diagnose OSPF Session Establishment Problems

Action To trace OSPF messages in detail, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```

[edit]
user@host# edit protocols ospf traceoptions

```

2. Configure OSPF hello messages:

```

[edit protocols ospf traceoptions]
user@host# set flag hello detail

```

3. Verify the configuration:

```
user@host# show
```

For example:

```

[edit protocols ospf traceoptions]
user@host# show
file ospf size 5m world-readable;
flag hello detail;

```

4. Commit the configuration:

```
user@host# commit
```

5. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
user@host# run show log ospf
```

```

Analyze OSPF Link-State Advertisement Packets in Detail

Action To analyze OSPF link-state advertisement packets in detail, follow these steps:

1. In configuration mode, go to the following hierarchy level:

```
[edit]
user@host# edit protocols ospf traceoptions
```

2. Configure OSPF link-state packages:

```
[edit protocols ospf traceoptions]
user@host# set flag lsa-update detail
```

3. Verify the configuration:

```
user@host# show
```

For example:

```
[edit protocols ospf traceoptions]
user@host# show
file ospf size 5m world-readable;
flag hello detail;
flag lsa-update detail;
```

4. Commit the configuration:

```
user@host# commit
```

5. View the contents of the file containing the detailed messages:

```
user@host# run show log filename
```

For example:

```
user@host# run show log ospf
```

```
Dec 2 16:23:47 OSPF sent LSUpdate (4) -> 224.0.0.5 (so-1/1/0.0) ec 2 16:23:47
Version 2, length 196, ID 10.0.0.6, area 0.0.0.0
```

```

Chassis

Chassis dimensions are listed in the physical specifications table for each router. For more information about chassis dimensions, see the router platform-specific hardware guide.

Each Juniper Networks router features a rigid sheet metal chassis that houses all of the router components. The chassis are designed to install into a variety of racks, including standard 19-inch equipment racks, telco center-mount racks, and four-post racks and cabinets. See [Table 59 on page 1452](#) for the maximum number of each router type that can be installed into a rack. Each chassis includes mounting ears or support posts to facilitate rack mounting, and one or more points for connecting an electrostatic discharge (ESD) wrist strap for use when servicing the router.

Table 59: Maximum Number of Routers per Rack

Router or Routing Node	Maximum in Standard Rack
T640	2
T320	3
M160	2
M40e	2
M40	2
M20	5
M5 and M10	14

Each chassis includes a midplane (called the backplane on an M40 router). The midplane transfers data packets to and from the FPCs, distributes power to router components, and provides signal connectivity to the router components for system monitoring and control.

Physical Interface Cards

Juniper Networks M-series routers and T-series platforms use PICs to connect to a wide variety of network media. PICs receive incoming packets from the network and transmit outgoing packets to the network, performing framing and line-speed signaling for their specific media type. Before transmitting outgoing data packets, the PICs encapsulate

the packets received from the FPCs. Each PIC is equipped with an ASIC that performs control functions specific to the PIC's media type. For information about PICs, see the specific PIC guide.

Routing Engine

The Routing Engine consists of an Intel-based PCI platform running the Junos OS. The Routing Engine maintains the routing tables used by the router in which it is installed and controls the routing protocols on the router. The T640 routing node, and the T320, M160, M40e, and M20 routers support up to two Routing Engines, while the M40, M10, and M5 routers support a single Routing Engine.

Each Routing Engine consists of a CPU; SDRAM for storage of the routing and forwarding tables and other processes; a compact flash disk for primary storage of software images, configuration files, and microcode; a hard disk for secondary storage; a PC card slot (on some M40 routers, a floppy disk) for storage of software upgrades; and interfaces for out-of-band management access.

Compare Information Logged Before and After the Reinstall

Purpose Compare the operation of the system before and after the reinstall to ensure that everything is working as expected.

Action To obtain system information, use the following commands:

```
user@host> show version
user@host> show chassis hardware
user@host> show chassis environment
user@host> show system boot-messages
user@host> show configuration
user@host> show interface terse
user@host> show bgp summary
user@host> show isis adjacency brief
user@host> show ospf neighbor brief
user@host> show system storage
```

Compare the information from these commands with the information you obtained before the reinstall.

Back Up the New Software

Purpose After a week or so, when you are satisfied that the new software is running successfully, we recommend that you back up the reinstalled software.

Action To back up the reinstalled software, use the following Junos OS CLI operational mode command:

```
user@host> request system snapshot
```

The root file system is backed up to **/altroot**, and **/config** is backed up to **/altconfig**. The root and **/config** file systems are on the router's internal flash drive, and the **/altroot** and **/altconfig** file systems are on the router's hard drive.

NOTE: After you issue the **request system snapshot** command, you cannot return to the previous version of the software because the running and backup copies of the software are identical.

Monitor Hardware Components

Purpose

NOTE: If the System Control Board (SCB), System and Switch Board (SSB), or Forwarding Engine Board (FEB) is not running, information about chassis components is not available through the command-line interface (CLI).

Action

To use the CLI to monitor Juniper Networks routers, follow these steps:

1. Log in to the router. The CLI operational mode prompt (**>**) appears.

If the operational mode prompt does not appear when you log in to the router, type **cli** to start the Junos OS and enter operational mode. The prompt changes to **>**, indicating that you are in operational mode.

2. Use one of the operational mode CLI commands listed in *Operational Mode CLI Commands for Router Monitoring* to monitor router hardware.

Log Software Version Information

Purpose

To log the Junos OS version information.

Action

To log the Junos OS version information, use the following Junos OS CLI operational mode command:

```
user@host> show version
```

Sample Output `user@host> show version`

```

Meaning The sample output shows the hostname, router model, and the different Junos OS packages, processes, and documents.

Hardware Components

Each Juniper Networks router consists of a chassis and a set of components, including FPCs, PICs, Routing Engines, power supplies, cooling system, and cable management system. Many of the components are field-replaceable units. The following major components are discussed in this topic:

- [Chassis on page 1456](#)
- [Flexible PIC Concentrators on page 1456](#)
- [Physical Interface Cards on page 1456](#)
- [Routing Engine on page 1457](#)
- [Power Supplies on page 1457](#)
- [Cooling System on page 1457](#)

Chassis

Chassis dimensions are listed in the physical specifications table for each router. For more information about chassis dimensions, see the router platform-specific hardware guide.

Each Juniper Networks router features a rigid sheet metal chassis that houses all of the router components. The chassis are designed to install into a variety of racks, including standard 19-inch equipment racks, telco center-mount racks, and four-post racks and cabinets. See [Table 59 on page 1452](#) for the maximum number of each router type that can be installed into a rack. Each chassis includes mounting ears or support posts to facilitate rack mounting, and one or more points for connecting an electrostatic discharge (ESD) wrist strap for use when servicing the router.

Table 60: Maximum Number of Routers per Rack

Router or Routing Node	Maximum in Standard Rack
T640	2
T320	3
M160	2
M40e	2
M40	2
M20	5
M5 and M10	14

Each chassis includes a midplane (called the backplane on an M40 router). The midplane transfers data packets to and from the FPCs, distributes power to router components, and provides signal connectivity to the router components for system monitoring and control.

Flexible PIC Concentrators

The FPCs house the PICs used in the router and connect them to other router components. FPCs install into the front of the router in either a vertical or horizontal orientation, depending on the router. A compatible FPC can be installed into any available FPC slot, regardless of the PICs it contains. If a slot is not occupied by an FPC, a blank FPC panel must be installed to shield the empty slot and allow cooling air to circulate properly through the FPC card cage. For information about FPCs, see the specific hardware guide.

Physical Interface Cards

Juniper Networks M-series routers and T-series platforms use PICs to connect to a wide variety of network media. PICs receive incoming packets from the network and transmit outgoing packets to the network, performing framing and line-speed signaling for their

specific media type. Before transmitting outgoing data packets, the PICs encapsulate the packets received from the FPCs. Each PIC is equipped with an ASIC that performs control functions specific to the PIC's media type. For information about PICs, see the specific PIC guide.

Routing Engine

The Routing Engine consists of an Intel-based PCI platform running the Junos OS. The Routing Engine maintains the routing tables used by the router in which it is installed and controls the routing protocols on the router. The T640 routing node, and the T320, M160, M40e, and M20 routers support up to two Routing Engines, while the M40, M10, and M5 routers support a single Routing Engine.

Each Routing Engine consists of a CPU; SDRAM for storage of the routing and forwarding tables and other processes; a compact flash disk for primary storage of software images, configuration files, and microcode; a hard disk for secondary storage; a PC card slot (on some M40 routers, a floppy disk) for storage of software upgrades; and interfaces for out-of-band management access.

Power Supplies

Each Juniper Networks M-series router, T-series platform, or MX-series router has one to four load-sharing power supplies depending on the platform. If a power supply in a redundant configuration is removed or fails, the other power supplies assume the electrical load. For more information about the power supplies in each router, see the router platform-specific hardware guide.

The power supplies are connected to the router midplane, which distributes the different output voltages throughout the router and its components. Some routers can operate using either AC or DC power; other routers operate with DC power only. For information about the type of power used by each router, see the platform-specific hardware guide.

Cooling System

Each Juniper Networks M-series router and T-series platform features a cooling system designed to keep all router components within recommended operating temperature limits. If one component of the cooling system fails or is removed, the system automatically adjusts the speed of the remaining components to keep the temperature within the acceptable range. The cooling system for each router is unique and can consist of fans, impellers, and air filters. For information about the cooling system components of each router, see the "Major Hardware Components" table in the router platform-specific hardware guide.

abstract-hop

Syntax	<pre>abstract-hop <i>abstract-hop-name</i> { constituent-list <i>constituent-list-name</i> (include-any-list include-all-list exclude-all-list exclude-any-list); operators (AND OR); }</pre>
Hierarchy Level	[edit logical systems <i>logical-systems-name</i> protocols mpls] [edit protocols mpls]
Release Information	Statement introduced in Junos OS Release 17.1 for all platforms.
Description	<p>Define router clusters or groups, similar to the sequence of real-hop constraints (strict or loose), as a sequence of abstract hops for setting up a label-switched path (LSP).</p> <p>An abstract hop is a logical combination of the existing traffic engineering constraints, such as administrative groups, extended administrative groups, and Shared Risk Link Groups (SRLGs), along with the ordering property of real hops. As a result, when a sequence of abstract hops is used in a path constraint, ordering is achieved among the groups of routers that meet a logical combination of link or node attributes called constituent attributes. A path can use a combination of real and abstract hops as constraints.</p>
Options	<p><i>abstract-hop-name</i>—Name of the abstract hop that is a logical combination of the existing traffic engineering constraints, such as administrative groups, extended administrative groups, and SRLGs, along with the ordering property of real hops.</p> <p>constituent-list <i>constituent-list-name</i>—Name of the predefined constituent list to be included in defining the abstract hop. A constituent list enables you to define a set of constituent attributes that is identified with a user-defined name.</p> <p>include-any-list—Satisfy any one of the attributes specified in the constituent list.</p> <p>include-all-list—Satisfy all of the attributes specified in the constituent list.</p> <p>exclude-all-list—Satisfy none of the attributes specified in the constituent list.</p> <p>exclude-any-list—Fail to satisfy any one of the attributes specified in the constituent list.</p> <p>operators—Specify the operation between constituent lists when more than one constituent list is included in the abstract hop definition.</p> <p>AND—Satisfy all the constituent lists referenced in the abstract hop definition for the attached node to be a member of the abstract hop.</p> <p>OR—Satisfy at least one of the constituent lists referenced in the abstract hop definition for the attached node to be a member of the abstract hop.</p>

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description During reroute, do not double-count bandwidth on links shared by the old and new paths.
Including this statement causes RSVP to use shared explicit (SE) reservation styles and
assists in smooth transition during rerouting.

Default The configured object is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

adjust-threshold

Syntax	<code>adjust-threshold percent;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Description	<p>Specify in percentage how sensitive the automatic bandwidth adjustment for a label-switched path (LSP) is to changes in bandwidth utilization.</p> <p>To specify the changes in the automatic bandwidth adjustment for a LSP in absolute value, use the <i>adjust-threshold-absolute</i> statement instead.</p>
Options	percent —Bandwidth demand for the current bandwidth adjustment interval is determined and compared to the LSP's current bandwidth allocation. If the percentage difference in bandwidth is greater than or equal to the percentage specified by this statement, the LSP's bandwidth is adjusted to the current bandwidth demand.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Automatic Bandwidth Adjustment Threshold on page 426

adjust-threshold-activate-bandwidth

Syntax	adjust-threshold-activate-bandwidth <i>bps</i> ;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
Release Information	Statement introduced before Junos OS Release 14.1.
Description	Specify an absolute value to prevent automatic adjustment of signaled bandwidth and aggressive re-signaling of a label-switched path (LSP) when the actual bandwidth over the LSP is below the configured threshold, although the adjust-threshold percentage condition is satisfied.
Options	<i>bps</i> —Amount of bandwidth that is compared with the maximum of all traffic samples during an adjustment interval. If the maximum average bandwidth is less than this configured value, automatic bandwidth adjustment or re-signaling does not happen, even if the adjust-threshold percentage condition is satisfied.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Automatic Bandwidth Adjustment Threshold on page 426

adjust-threshold-overflow-limit

admin-groups-extended

Syntax	<code>admin-groups-extended <i>group-name</i> { group-value <i>group-identifier</i>; }</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-options], [edit protocols mpls interface <i>interface-name</i>], [edit routing-options]
Release Information	Statement introduced in Junos OS Release 11.1. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Description	Specifies the group name and group identifier for an administrative group. The group identifier must be within the range of values specified by the admin-groups-extended-range statement. The extended administrative group values are global and must be identically configured on all the supported routers participating in the network. The domain-wide extended administrative groups database, learned from other routers through IGP flooding, is used by CSPF for path computation.
Options	<i>group-name</i> —The range of configurable values is between 32 and 4,294,967,295. The range maximum must be greater than the range minimum. <i>group-value group-identifier</i> —The group identifier must be within the range of configurable values, 32 and 4,294,967,295.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Extended Administrative Groups for LSPs on page 411• Configuring Administrative Groups for LSPs on page 409• admin-group-extended on page 1476• admin-groups-extended-range on page 1479

admin-groups-extended-range

Syntax	<pre>admin-groups-extended-range { maximum <i>maximum-number</i>; minimum <i>minimum-number</i>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-options], [edit routing-options]
Release Information	Statement introduced in Junos OS Release 11.1. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Description	<p>Enables you to configure extended administrative groups, represented by a 32-bit value, expanding the number of administrative groups supported in the network beyond just 32. In MPLS traffic engineering, a link can be configured with a set of administrative groups (also known as colors or resource classes). Administrative groups are carried in IGP (OSPFv2 and IS-IS) as a 32-bit value assigned to each link. By default, Juniper Networks routers interpret this 32-bit value as a bit mask with each bit representing a group. This normally limits each network to a total of 32 distinct administrative groups (value range 0 through 31).</p> <p>The extended administrative groups configuration accepts a set of interfaces with a corresponding set of extended administrative group names. It converts the names into a set of 32-bit values and propagates this information into the IGP. The extended administrative group values are global and must be identically configured on all the supported routers participating in the network. The domain-wide extended administrative groups database, learned from other routers through IGP flooding, is used by CSPF for path computation.</p>
Options	<p>maximum <i>maximum-number</i>—The range of configurable values is between 32 and 4,294,967,295. The range maximum must be greater than the range minimum.</p> <p>minimum <i>minimum-number</i>—The range of configurable values is between 32 and 4,294,967,295. The range maximum must be greater than the range minimum.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

advertise-mode (MPLS)

Syntax	<code>advertise-mode (stub-alias stub-proxy);</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls egress-protection context-identifier <i>context-id</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> egress-protection context-identifier <i>context-id</i>],</code> <code>[edit protocols mpls egress-protection context-identifier <i>context-id</i>],</code> <code>[edit protocols mpls label-switched-path <i>lsp-name</i> egress-protection context-identifier <i>context-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 13.3.
Description	<p>Configure the method for the interior gateway protocol (IGP) to advertise egress protection availability.</p> <p>Egress protection availability is advertised in the IGP. Label protocols along with CSPF use this information to do egress protection.</p>
Options	<p>stub-alias—Context identifier has an alias.</p> <p>In the alias method, the LSP end-point address has an explicit backup egress node where the backup node can be learned or configured on the penultimate hop node (PHN) of a protected LSP. With this model, the PHN of a protected LSP sets up the bypass LSP tunnel to back up the egress node by avoiding the primary egress node. This model requires a Junos OS upgrade in core nodes, but is flexible enough to support all traffic engineering constraints.</p> <p>stub-proxy—Context-identifier has a stub proxy node.</p> <p>A stub node is one that only appears at the end of an AS path, which means it does not provide transit service. In this mode, known as the virtual or proxy mode, the LSP end-point address is represented as a node with bidirectional links, with the LSP's primary egress node and backup egress node. With this representation, the penultimate hop of the LSP primary egress point can behave like a PLR in setting up a bypass tunnel to back up the egress by avoiding the primary egress node. This model has the advantage that you do not need to upgrade Junos OS on core nodes and thereby helps operators to deploy this technology.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

auto-bandwidth (MPLS Tunnel)

Syntax auto-bandwidth {
 adjust-interval *seconds*;
 adjust-threshold *percent*;
 adjust-threshold-absolute *adjust-threshold-absolute-value*;
 adjust-threshold-activate-bandwidth *bps*
 adjust-threshold-overflow-limit *number*;
 adjust-threshold-underflow-limit *number*;
 maximum-bandwidth *bps*;
 minimum-bandwidth *bps*;
 minimum-bandwidth-adjust-interval
 minimum-bandwidth-adjust-threshold-change
 minimum-bandwidth-adjust-threshold-value
 monitor-bandwidth;
 }

Hierarchy Level [edit protocols mpls label-switched-path *lsp-name*]

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 13.2X51-D15 for QFX Series switches.
 Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.

Description Allow an MPLS tunnel to automatically adjust its bandwidth allocation based on the volume of traffic flowing through the tunnel.

NOTE: In calculating the value for Max AvgBW (relative to the ingress LSP), the sample collected during make before break (MBB) is ignored to prevent inaccurate results. The first sample after a bandwidth adjustment, or after a change in the LSP ID (regardless of path change), is also ignored.

Options **adjust-threshold-absolute** *adjust-threshold-absolute-value*—Configure an absolute value based threshold along with the percentage based threshold that helps avoid the bandwidth getting triggered for LSPs of both small and large bandwidth reservations.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level routing—To view this statement in the configuration.
 routing-control—To add this statement to the configuration.

auto-bandwidth (MPLS Statistics)

Syntax	auto-bandwidth;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls statistics], [edit protocols mpls statistics]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for QFX Series switches. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.
Description	Collect statistics related to automatic bandwidth.
Required Privilege Level	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Automatic Bandwidth Allocation for LSPs on page 423• Configuring MPLS to Gather Statistics on page 181• statistics on page 1657

auto-policing

Syntax	<pre>auto-policing { class all (drop loss-priority-high loss-priority-low); class <i>ctnumber</i> (drop loss-priority-high loss-priority-low); }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced for QFX10000 Series switches in release 15.1X53-D40.
Description	Enable the automatic policing of all the MPLS LSPs on the router or logical system.
Options	<p>class all—Apply the same policer action to all the class types (ct0, ct1, ct2, and ct3).</p> <p>class <i>ctnumber</i>—Specific class type (ct0, ct1, ct2, or ct3) to which to apply a policer action.</p> <p>Policer actions—You can specify the following policer actions:</p> <p>Default: no action</p> <ul style="list-style-type: none">• drop—Drop all packets.• loss-priority-high—Set the packet loss priority (PLP) to high.• loss-priority-low—Set the PLP to low.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• policing (Protocols MPLS) on page 1610• Configuring Automatic Policers on page 94v

backup-pe-group

Syntax	<code>backup-pe-group <i>group-name</i> { backups [<i>addresses</i>]; local-address <i>address</i>; }</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast], [edit logical-systems <i>logical-system-name</i> routing-options multicast], [edit routing-instances <i>routing-instance-name</i> routing-options multicast], [edit routing-options multicast]
Release Information	Statement introduced in Junos OS Release 9.0. Statement introduced in Junos OS Release 9.5 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	Configure a backup provider edge (PE) group for ingress PE redundancy when point-to-multipoint label-switched paths (LSPs) are used for multicast distribution.
Options	<i>group-name</i> —Name of the group for PE backups. The remaining statements are explained separately. See CLI Explorer .
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Configuring Ingress PE Redundancy</i>

bandwidth (Fast Reroute, Signaled, and Multiclass LSPs)

Syntax	<pre> bandwidth <i>bps</i> { ct0 <i>bps</i>; ct1 <i>bps</i>; ct2 <i>bps</i>; ct3 <i>bps</i>; } </pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> fast-reroute], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>], [edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i> fast-reroute], [edit protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	<p>When configuring an LSP, specify the traffic rate associated with the LSP.</p> <p>When configuring fast reroute, allocate bandwidth for the reroute path. By default, no bandwidth is reserved for the rerouted path. The fast reroute bandwidth does not need to be identical to that allocated for the LSP itself.</p> <p>When configuring a multiclass LSP, use the ctnumber bandwidth statements to specify the bandwidth to be allocated for each class type.</p>
Options	<p>bps—Bandwidth, in bits per second. You can specify this as an integer value. You can also use the abbreviations k (for a thousand), m (for a million), or g (for a billion).</p> <p>Range: Any positive integer</p> <p>Default: 0 (no bandwidth is reserved)</p>

NOTE: On the ACX Series, *bps* is the only supported option.

ctnumber bps—Bandwidth for the specified class type, in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations **k** (for a thousand), **m** (for a million), or **g** (for a billion [also called a thousand million]).

Range: Any positive integer

Default: 0 (no bandwidth is reserved)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

bandwidth-model

Syntax	<pre>bandwidth-model { extended-mam; mam; rdm; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls diffserv-te], [edit protocols mpls diffserv-te]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Configure the bandwidth model for differentiated services. Note that you cannot configure both bandwidth models at the same time.
Options	<p>extended-mam—The extended maximum allocation model (MAM) is a bandwidth model based on MAM.</p> <p>mam—The MAM is defined in RFC 4125, <i>Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering</i>.</p> <p>rdm—The Russian dolls bandwidth allocation model (RDM) is defined in RFC 4127, <i>Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering</i>. RDM makes efficient use of bandwidth by allowing the class types to share bandwidth.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Bandwidth Model on page 666

bandwidth-percent

Syntax	<code>bandwidth-percent <i>percentage</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> fast-reroute], [edit protocols mpls label-switched-path <i>lsp-name</i> fast-reroute]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Configure the percentage of bandwidth to reserve for the detour path in case the primary path for a traffic engineered LSP or a multiclass LSP fails. The percentage configured indicates the percentage of the protected path's bandwidth that is reserved for the detour path.
Options	<i>percentage</i> —The percentage of the protected path's bandwidth that is reserved for the detour path.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Fast Reroute on page 367• Configuring Fast Reroute for Traffic-Engineered LSPs on page 677• Configuring Fast Reroute for Multiclass LSPs on page 680

bfd-liveness-detection (Protocols MPLS)

Syntax	<pre>bfd-liveness-detection { failure-action { make-before-break teardown-timeout <i>seconds</i>; teardown; } minimum-interval <i>milliseconds</i>; minimum-receive-interval <i>milliseconds</i>; minimum-transmit-interval <i>milliseconds</i>; multiplier <i>detection-time-multiplier</i>; }</pre>
Hierarchy Level	[edit protocols mpls label-switched-path <i>lsp-name</i> oam], [edit protocols mpls oam]
Release Information	Statement introduced in Junos OS Release 7.6. failure-action option added in Junos OS Release 8.5. Statement introduced in Junos OS Release 12.2 for EX Series switches.
Description	Enable Bidirectional Forwarding Detection (BFD) for all of the MPLS LSPs or for just a specific LSP.
Options	<p>minimum-interval—Minimum transmit and receive interval. Range: 50 through 255,000 milliseconds Default: 50</p> <p>minimum-receive-interval—Minimum receive interval. Range: 50 through 255,000 milliseconds Default: 50</p> <p>minimum-transmit-interval—Minimum transmit interval. Range: 50 through 255,000 milliseconds Default: 50</p> <p>multiplier—Detection time multiplier. Range: 1 through 255 Default: 3</p> <p>The failure-action statement is explained separately.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

container-label-switched-path

Syntax	<pre>container-label-switched-path <i>lsp-name</i> { disable; description <i>description</i>; label-switched-path-template; splitting-merging; suffix <i>string</i>; to <i>ip-address</i>; }</pre>
Hierarchy Level	[edit protocols mpls]
Release Information	Statement introduced in Junos OS Release 14.2. Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.
Description	Configure a multi-label-switched path (LSP) tunnel between the ingress and the egress routers. The container LSP consists of several member LSPs to the same destination.
Options	<p>disable—Disable MPLS container-label-switched path.</p> <p>description <i>description</i>—Text describing the container LSP.</p> <p>suffix <i>string</i>—Suffix to generate names of member LSPs of the container LSP.</p> <p>to <i>ip-address</i>—IP address of the egress router.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

corouted-bidirectional

Syntax	corouted-bidirectional;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i>]
Release Information	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify that the label-switched path be established as a corouted bidirectional packet LSP. You cannot configure this statement at the same time as the corouted-bidirectional-passive statement.
Default	This statement is disabled by default.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Corouted Bidirectional LSPs on page 442• corouted-bidirectional-passive on page 1498

corouted-bidirectional-passive

Syntax	corouted-bidirectional-passive;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i>]
Release Information	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify that the label-switched path be a passive LSP associated with a bidirectional LSP when it is signaled at the ingress router. This passive LSP enables the MPLS application to utilize the reverse LSP. You cannot configure this statement at the same time as the corouted-bidirectional statement.
Default	This statement is disabled by default.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Corouted Bidirectional LSPs on page 442• corouted-bidirectional on page 1497

credibility

Syntax	<pre>credibility { direct; isis-level-1; isis-level-2; ospf; static; unknown; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls traffic-engineering database export], [edit protocols mpls traffic-engineering database export]
Release Information	Statement introduced in Junos OS Release 14.2. Statement introduced in Junos OS Release 17.1R1 on QFX Series and QFX10000 switches.
Description	<p>Configure preference values for entries from BGP-TE to the traffic engineering database. A protocol with a higher credibility value is preferred over a protocol with a lower credibility value.</p> <p>The credibility order for the BGP-TE protocols is as follows:</p> <ul style="list-style-type: none"> • Unknown—80 • OSPF—81 • ISIS Level 1—82 • ISIS Level 2—83 • Static—84 • Direct—85
Options	<p>direct—Entries sourced from directly connected links.</p> <p>isis-level-1—Entries sourced from IS-IS Level 1.</p> <p>isis-level-2—Entries sourced from IS-IS Level 2.</p> <p>ospf—Entries sourced from OSPF.</p> <p>static—Entries sourced from static configuration.</p> <p>unknown—Entries sourced from unknown entities.</p> <p>Range: 0 through 512</p>

dual-transport

Syntax	<pre> dual-transport { inet-lsr-id <i>inet-lsr-id</i>; inet6-lsr-id <i>inet6-lsr-id</i>; } </pre>
Hierarchy Level	[edit protocols ldp]
Release Information	Statement introduced in Junos OS Release 16.1 for the M320 Series, MX Series, and PTX Series.
Description	Configure to allow Junos LDP to establish the TCP connection over IPv4 with IPv4 neighbors, and over IPv6 with IPv6 neighbors as a single-stack LSR. inet-lsr-id and inet6-lsr-id are the two LSR IDs that have to be configured to establish an LDP session over IPv4 and IPv6 TCP transport. These two IDs should be non-zero and must be configured with different values.
Options	<p>inet-lsr-id <i>inet-lsr-id</i>— Configure the LSR ID to establish an LDP session over IPv4 TCP transport.</p> <p>inet6-lsr-id <i>inet6-lsr-id</i>— Configure the LSR ID to establish an LDP session over IPv6 TCP transport.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

entropy-label

Syntax	entropy-label { <code>ingress-policy</code> <i>ingress-policy-name</i> ; }
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols <code>ldp</code>],
Release Information	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.
Description	Assists the transit router in load-balancing MPLS traffic across ECMP paths or Link Aggregation groups by introducing the entropy label to the MPLS label stack. The entropy label allows routers to load balance MPLS traffic by using a hash-input without the need to perform deep packet inspection. Deep packet inspection requires more of the router's processing power and is not a capability shared by all routers.
Options	The other statements are explained separately.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Entropy Label for LSPs on page 444

entropy-label

Syntax	<pre>entropy-label { import <i>policy-name</i>; no-next-hop-validation; }</pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system name</i> protocols bgp family inet labeled-unicast], [edit logical-systems <i>logical-system name</i> protocols bgp group <i>group-name</i> family inet labeled-unicast], [edit logical-systems <i>logical-system name</i> protocols bgp group <i>group-name</i> neighbor <i>address</i> labeled-unicast], [edit protocols bgp family inet labeled-unicast], [edit protocols bgp group <i>group-name</i> family inet labeled-unicast], [edit protocols bgp group <i>group-name</i> neighbor <i>address</i> labeled-unicast]</p>
Release Information	<p>Statement introduced in Junos OS Release 15.1. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.</p>
Description	<p>Insert the entropy label into the BGP labeled unicast LSP packets, which assists the transit router in load-balancing BGP traffic across equal-cost multipaths or link aggregation groups. The ingress label edge router inspects the flow information of a packet and maps it to an entropy label, which is inserted into the BGP label stack. LSRs in the core use this entropy label as the key to hash the packet and direct it to the correct path.</p>
Options	<p>import <i>policy-name</i>— (Optional) Specify a policy that lists the routes that allow the use of entropy labels.</p> <p>no-next-hop-validation— (Optional) Do not validate the next-hop field in the entropy label capability attribute against the route next hop.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.</p>

expand-loose-hop

Syntax	expand-loose-hop;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced in Junos OS Release 7.6. Point-to-multipoint LSP support introduced in Junos OS Release 11.2.
Description	<p>Allow an LSP to traverse multiple OSPF areas within a service provider's network.</p> <p>Allows a point-to-multipoint LSP to span multiple domains in a network. Effectively, this allows you to configure one or more sub-LSPs (branches) in separate network domains. Examples of such domains include OSPF areas and autonomous systems (ASs). A sub-LSP of an inter-domain point-to-multipoint LSP can be intra-area, inter-area, or inter-AS, depending on the location of the egress node (leaf) with respect to the ingress node (source). Only OSPF areas are supported for inter-domain point-to-multipoint LSPs. IS-IS levels are not supported.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Enabling Interarea Traffic Engineering on page 617 • Configuring Inter-Domain Point-to-Multipoint LSPs on page 528

explicit-null (Protocols MPLS)

Syntax	explicit-null;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.
Description	Advertise label 0 to the egress router of an LSP.
Default	If you do not include the explicit-null statement in the MPLS configuration, label 3 (implicit null) is advertised.

NOTE: Junos OS does not support explicit null routes with next hops to virtual tunnel (vt-) interfaces.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring RSVP to Pop the Label on the Ultimate-Hop Router</i>

export (MPLS Traffic engineering database)

Syntax	<pre>export { credibility; policy <i>policy-name</i>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls traffic-engineering database], [edit protocols mpls traffic-engineering database]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Configure the traffic engineering database export-related parameters.
Options	<p>policy <i>policy-name</i>—Name of the export policy.</p> <p>The remaining statement is explained separately. See CLI Explorer.</p>

        destination-lsb;
      }
    }
  }
}
```

Hierarchy Level [edit forwarding-options hash-key]

Release Information Statement introduced before Junos OS Release 7.4.
no-label-1-exp option introduced in Junos OS Release 8.0.
label-3 and **no-labels** options introduced in Junos OS Release 8.1.
ether-pseudowire statement introduced in Junos OS Release 9.1 (M320 and T Series routers only); support extended to M120 and MX Series routers in Junos OS Release 9.4.
all-labels and **payload ip disable** options introduced in Junos OS Release 12.1X48R2. (PTX Series Packet Transport Routers only).
zero-control-word option introduced in Junos OS Release 16.1 for the M Series, MX Series, and PTX Series.

Description For aggregated Ethernet and SONET/SDH interfaces only, configure load balancing based on MPLS labels and payload. Only the IPv4 protocol is supported.

Options **family mpls**—(Aggregated Ethernet interfaces, aggregated SONET/SDH interfaces, and multiple equal-cost MPLS next hops only) Incorporate MPLS label and payload information into the hash key for per-flow load balancing. Only the IPv4 protocol is supported.

- **all-labels**—(PTX Series Packet Transport Routers only) Up to eight MPLS labels are included in the hash key to identify the uniqueness of a flow in the Packet Forwarding Engine. This is the default setting.

- **label-1**—(M120, M320, MX Series, and T Series routers only) Include the first MPLS label into the hash key. This is used for a one-label packet for per-flow load balancing IPv4 VPLS traffic based on IP information and MPLS labels.
- **label-2**—(M120, M320, MX Series, and T Series routers only) Include the second MPLS label into the hash key. This is used for a two-label packet for per-flow load balancing IPv4 VPLS traffic based on IP information and MPLS labels. To use the second MPLS label in the hash key, include both the **label-1** and **label-2** statements at the **[edit forwarding-options hash-key family mpls]** hierarchy level. By default, the router provides hashing on the first and second labels. If both labels are specified, the entire first label and the first 16 bits of the second label are hashed.
- **label-3**—(M120, M320, MX Series, and T Series routers only) Include the third MPLS label into the hash key. To use the third MPLS label, include the **label-1**, **label-2**, and **label-3** statements at the **[edit forwarding-options hash-key family mpls]** hierarchy level.
- **no-labels**—Include no MPLS labels into the hash key.

- **no-label-1-exp**—(M120, M320, MX Series, and T Series routers only) The EXP bit of the first label is not used in the hash calculation to avoid reordering complications.
- **payload**—Incorporate bits from the IP payload into the hash key for per-flow load balancing Layer 2 information based on MPLS labels.
 - **disable**—(PTX Series Packet Transport Routers only) Exclude IP payload from the hash key.
 - **ether-pseudowire**—(M120, M320, MX Series, and T Series routers only) Load-balance IPv4 traffic over Layer 2 Ethernet pseudowires.
 - **zero-control-word**—(M Series, MX Series, and PTX Series) Precedes Ethernet packet to indicate the start of an Ethernet frame in an MPLS ether-pseudowire payload.
 - **ip**—Include the IP address of the IPv4 or IPv6 payload into the hash key for per-flow load balancing Layer 2 information based on MPLS labels. For the PTX Series Packet Transport Routers, this is the default setting with both Layer 3 and Layer 4 IP information included in the hash key.
 - **disable**—(PTX Series Packet Transport Routers only) Exclude IP payload from the hash key.
 - **layer-3-only**—Include only Layer 3 IP information from the IP payload data into the hash key for per-flow load balancing Layer 2 information based on MPLS labels.
 - **port-data**—(M120, M320, MX Series, and T Series routers only) Include the source and destination port field information into the hash key. By default, the most significant byte and least significant byte of the source and destination port fields are hashed. To select specific bytes to be hashed, include one or more of the **source-msb**, **source-lsb**, **destination-msb**, and **destination-lsb** options at the [edit forwarding-options hash-key family mpls payload ip port-data] hierarchy level. To prevent all four bytes from being hashed, include the **layer-3-only** statement at the [edit forwarding-options hash-key family mpls payload ip] hierarchy level.
 - **destination-lsb**—Include the least-significant byte of the destination port.
 - **destination-msb**—Include the most-significant byte of the destination port.
 - **source-lsb**—Include the least-significant byte of the source port.
 - **source-msb**—Include the most-significant byte of the source port.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

fate-sharing

Syntax	<pre>fate-sharing { group <i>group-name</i> { cost <i>value</i>; from <i>address</i> <to <i>address</i>>; } }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options], [edit routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Specify a backup path in case the primary path becomes unusable.</p> <p>You specify one or more objects with common characteristics within a group. All objects are treated as /32 host addresses. The objects can be a LAN interface, a router ID, or a point-to-point link. Sequence is insignificant.</p> <p>Changing the fate-sharing database does not affect existing established LSPs until the next CSPF reoptimization. The fate-sharing database does affect fast-reroute detour path computations.</p>
Options	<p>cost <i>value</i>—Cost assigned to the group. Range: 1 through 65,535 Default: 1</p> <p>from <i>address</i>—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate from addresses in the group.</p> <p>group <i>group-name</i>—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.</p> <p>to <i>address</i>—(Optional) Address of egress router. For point-to-point link objects, you must specify both a from and a to address.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

forwarding-table

Syntax	forwarding-table { export [<i>policy--names</i>]; (indirect-next-hop no-indirect-next-hop); }
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-options], [edit routing-options]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure information about the routing device's forwarding table. The remaining statements are explained separately. See CLI Explorer .
Options	remnant-holdtime —Sets the remnant hold time, which is required for the MXVC-ISSU, where the recommended value is 900..
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Per-Packet Load Balancing</i>

from (Protocols MPLS)

Syntax	<code>from address;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.
Description	Specify the source address to use for the LSP. The address you specify does not affect the outgoing interface used by the LSP.
Default	If you do not include this statement, the software automatically selects the loopback interface as the address.
Options	<i>address</i> —IP address.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

gre (Routing Options)

Syntax	gre; next-hop-based-tunnel;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-options dynamic-tunnels <i>tunnel-name</i>], [edit routing-options dynamic-tunnels <i>tunnel-name</i>]
Release Information	Statement introduced in Junos OS Release 10.1. next-hop-based-tunnel option introduced in Junos OS Release 16.2.
Description	Enable generic routing encapsulation (GRE) type for IPv4 to automatically establish label-switched paths (LSPs) for any new provider edge (PE) router added to a full mesh of LSPs.
Options	<p>next-hop-based-tunnel—Create a tunnel composite next hop for every dynamic GRE tunnel configured. The tunnel composite next hop includes the dynamic tunnel's encapsulation data and a VPN label (when chained composite next hop is not enabled). When this option is not configured, the default interface-based tunnel mode is enabled. By configuring this option, a device can scale up to 32,000 IP tunnels, which is otherwise restricted to the system limit on the number of interfaces supported.</p> <p>At a given point in time, either the next-hop-based dynamic tunnel or the default interface-based dynamic GRE tunnel can exist on a device. A switchover from one tunnel mode to another deletes the existing tunnels and creates new tunnels in the new tunnel mode. As a result, a tunnel mode switchover can impact network performance.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring MPLS-Signaled LSPs to Use GRE Tunnels on page 101

hop-limit

Syntax	<code>hop-limit <i>number</i>;</code>
Hierarchy Level	<pre>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> fast-reroute], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>], [edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i> fast-reroute], [edit protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>], [edit protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	<p>Specify the maximum number of routers that an LSP can traverse. This limit can be applied to any of the following:</p> <ul style="list-style-type: none"> LSPs—The configured hop limit includes the ingress and egress routers. You can specify a hop limit for an LSP and for both primary and secondary paths. Fast reroute detour—Specify the number of additional routers a fast reroute detour can traverse relative to the protected LSP. For example, if an LSP traverses 4 routers, any detour for the LSP can be no more than 10 router hops, including the ingress and egress routers. Link protection bypass—Specify the maximum number of routers that a link protection bypass can traverse.
Options	<p><i>number</i>—Maximum number of hops.</p> <p>Range: 2 through 255 (for an LSP or for a link protection bypass); 0 through 255 (for fast reroute)</p> <p>Default: 255 (for an LSP or for a link protection bypass); 6 (for fast reroute)</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

import (MPLS Traffic Engineering Database)

Syntax	<pre>import { bgp-ls-identifier <i>domain-identifier</i>; identifier <i>identifier</i>; policy <i>policy-name</i>; igp-topology{ bgp-link-state; } }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls traffic-engineering database], [edit protocols mpls traffic-engineering database]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Configure the traffic engineering database import parameters.
Options	<p>bgp-ls-identifier <i>domain-identifier</i>—BGP-TE domain identifier.</p> <p>identifier <i>identifier</i>—BGP-TE identifier.</p> <p>Range: 2 through 18446744073709551615</p> <p>policy <i>policy-name</i>—Name of the import policy.</p> <p>igp-topology—Download IGP topology information into the traffic engineering database (TED). In Junos OS, the IGP installs topology information into a database called the traffic engineering database. The traffic engineering database contains the aggregated topology information. The IGP routes are installed by the traffic engineering database on behalf of the corresponding IGP into a user-visible routing table called lsdist.0, subject to route policies.</p> <p>bgp-link-state—Export IGP topology information into BGP-Link State (BGP-LS) from the lsdist.0 routing table. The lsdist.0 routing table stores the network topology information from the traffic engineering database. The BGP-LS reads IGP entries from lsdist.0 and advertises the information to BGP peers.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. cross-credibility-cspf option introduced in Junos OS Release 14.2. self-ping-duration and no-self-ping options introduced in Junos OS Release 16.1.
Description	Configure an LSP to use in dynamic MPLS. When configuring an LSP, you must specify the address of the egress router in the to statement. All remaining statements are optional.

Options *lsp-name*—Name that identifies the LSP. The name can be up to 64 characters and can contain letters, digits, periods, and hyphens. To include other characters, enclose the name in quotation marks. The name must be unique within the ingress router.

cross-credibility-cspf—Enable path computation across credibility levels. The constraint path computation is run across multi-protocol links and nodes, instead of a credibility-by-credibility basis.

link-protection—Enable protection for LSP from link faults only.

no-self-ping—Disable self-ping for the LSP.

NOTE: Starting in Junos OS 17.4, you can override the behavior of self-ping running by default using **no-self-ping** statement.

self-ping-duration seconds—Specify the duration (in seconds) for which to run the self-ping mechanism unless the ping succeeds sooner.

LSP self-ping for an LSP starts at the ingress label edge router (LER), once a Resv message for that LSP has been received. The configured self-ping time indicates the duration for which the self-ping mechanism runs once the LSP instance is signaled to be UP.

By default, self-ping is enabled. The LSP types like CCC, P2MP, VLAN-based , and non-default instances do not support self-ping .

The self-ping mechanism runs until the self-ping probe is received back (at which point the traffic is immediately switched to it) , or until the configured self-ping duration for the LSP is over (at which point traffic is switched over).

When LSP self-ping-duration is enabled, the LSP behavior reverts back to a timer-based mechanism similar to the **optimize-switchover-delay**, where a specific amount of time is provided for all the downstream nodes to install the forwarding path before switchover. When LSP self-ping-duration is not enabled, the default behavior is to wait for an infinite amount of time for the self-ping to succeed before switching the traffic.

Range: 1 through 65535 seconds

NOTE: Starting in Junos OS 17.4R1, the default time-out duration for which the self-ping runs on an LSP instance is reduced from 65535 (runs until success) to 1800 seconds. You can also configure the self ping duration value between 1 to 65535 (runs until success) seconds.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

label-switched-path

Syntax label-switched-path *lsp-name* to *remote-provider-edge-switch*;

Hierarchy Level [edit protocols [mpls](#)]

Release Information Statement introduced in Junos OS Release 9.5 for EX Series switches.

Description Define a label-switched path (LSP) to the remote provider edge switch to use for MPLS traffic. You must specify this statement on the provider edge switch.

Options *lsp-name* —Name that identifies the LSP. The name can be up to 32 characters and can contain letters, digits, periods, and hyphens. To include other characters, enclose the name in quotation marks. The name must be unique on the ingress switch.

remote-provider-edge-switch —Either the loopback address or the switch address.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

label-switched-path-template (Container LSP)

Syntax	label-switched-path-template { (default-template lsp-template-name); }
Hierarchy Level	[edit protocols mpls container-label-switched-path <i>lsp-name</i>]
Release Information	Statement introduced in Junos OS Release 14.2. Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.
Description	Specify the LSP template. An LSP template is used as the basis for other dynamically generated LSPs.
Options	default-template —Specify that the default LSP template be used for the dynamically generated LSPs. lsp-template-name —Specify the name of an LSP to be used as a template for the dynamically generated LSPs.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

link-protection (Dynamic LSPs)

Syntax	link-protection;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
Description	<p>Enable link protection on the specified LSP, which helps to ensure that traffic sent over a specific interface to a neighboring router can continue to reach the router if that interface fails. For point-to-multipoint LSPs, including this statement extends link protection to all of the paths used by the LSP.</p> <p>To fully enable link protection, you must also include the link-protection statement at the [edit protocols rsvp interface <i>interface-name</i>] or [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i>] hierarchy level.</p>
Default	Link protection is disabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Link Protection for Point-to-Multipoint LSPs on page 529• Configuring Node Protection or Link Protection for LSPs• link-protection (RSVP) on page 1707

link-protection (Static LSPs)

Syntax	link-protection bypass-name <i>name</i> ;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	Enable link protection on the specified static LSP. Link protection helps to ensure that traffic sent over a specific interface to a neighboring router can continue to reach the router if that interface fails.
Default	Link protection is disabled.
Options	bypass-name <i>name</i> —Bypass LSP name.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

load-balance-label-capability

Syntax	load-balance-label-capability;
Hierarchy Level	[edit forwarding-options]
Release Information	Statement introduced in Junos OS Release 14.1.
Description	Enables the router to push and pop the load balancing label and causes LDP and RSVP to advertise the entropy label TLV to neighboring routers.

NOTE: Although you can enable and disable the load-balance-label capability at the same time using the load-balance-label-capability and the no-load-balance-label-capability statements, respectively, at the [edit forwarding-options] hierarchy level, it is recommended that only one of the statements be configured at a given point in time. The no-load-balance-label-capability statement overrides the load-balance-label-capability statement when both the statements are configured together.

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

Related Documentation	<ul style="list-style-type: none">• Configuring the Entropy Label for LSPs on page 444• no-load-balance-label-capability on page 1587
------------------------------	--

log-updown (Protocols MPLS)

Syntax

```
log-updown {
  no-trap {
    mpls-lsp-traps;
    rfc3812-traps;
  }
  (syslog | no-syslog);
  trap;
  trap-path-down;
  trap-path-up;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols mpls],
[edit protocols mpls]

Release Information Statement introduced before Junos OS Release 7.4.
The **mpls-lsp-traps** and **rfc-3812-traps** options added in Junos OS Release 9.0.
Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.

Description Log a message or send an SNMP trap whenever an LSP makes a transition from up to down, or vice versa, and whenever an LSP switches from one active path to another. Only the ingress router performs these operations.

NOTE: System log messages for LSPs are generated by default. To disable the default logging of messages for LSPs, configure the **no-syslog** option under the **log-updown** statement.

Default There is no default behavior for this statement. If you do not specify the options, the configuration cannot be committed.

Options

- no-syslog**—Do not log a message to the system log file.
- no-trap**—Do not send an SNMP trap.
- syslog**—Log a message to the system log file.
- trap**—Send an SNMP trap.
- trap-path-down**—Send an SNMP trap when an LSP path goes down.
- trap-path-up**—Send an SNMP trap when an LSP path comes up.

The **no-trap** statement is explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

longest-match

Syntax longest-match {
 policy *value* [(*expression*)] [*values*];
}

Hierarchy Level [edit protocols ldp]

Release Information Statement introduced in Junos OS Release 16.1 for the M Series, MX Series, and PTX Series.

Description Enable longest match to allow LDP to learn the routes aggregated or summarized across OSPF areas or IS-IS levels in inter-domain.

Options policy *value* [(*expression*)] [*values*]— Specify policy to provide per prefix granularity.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

lsping-channel-type

Syntax	lsping-channle-type { ipv4; on-demand-cv; }
Hierarchy Level	[edit protocols mpls label-switched-path <i>lsp-name</i> oam mpls-tp-mode] [edit protocols mpls oam mpls-tp-mode]
Release Information	Statement introduced in Junos OS Release 16.1.
Description	Specify the control-channel types for MPLS-TP mode. By default, LSPING (0x0008) is used, and the GACH-TLV is used along with this channel type. As per RFC 7026, GACH-TLV is deprecated for ipv4 and on-demand-cv channel types.
Options	ipv4 —Channel type 0x0021. This channel type uses the IP/UDP encapsulation and provides interoperability support with other vendor devices using IP addressing. on-demand-cv —Channel type 0x0025. This is a new pseudowire channel type and is used for on-demand CV without IP/UDP encapsulation, where IP addressing is not available or non-IP encapsulation is preferred.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • mpls-tp-mode on page 1576

maximum-bandwidth (Protocols MPLS)

Syntax	<code>maximum-bandwidth <i>bps</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Description	Specify the maximum amount of bandwidth in bits per second (bps).
Options	<i>bps</i> —Maximum amount of bandwidth.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Maximum and Minimum Bounds of the LSP's Bandwidth on page 425

maximum-helper-recovery-time

Syntax	<code>maximum-helper-recovery-time <i>seconds</i>;</code>
Hierarchy Level	[edit protocols rsvp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols rsvp graceful-restart]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify the length of time the router or switch retains the state of its Resource Reservation Protocol (RSVP) neighbors while they undergo a graceful restart.
Options	<i>seconds</i> —Length of time that the router retains the state of its Resource Reservation Protocol (RSVP) neighbors while they undergo a graceful restart. Range: 1 through 3600 Default: 180
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

maximum-helper-restart-time (RSVP)

Syntax	<code>maximum-helper-restart-time seconds;</code>
Hierarchy Level	[edit protocols rsvp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols rsvp graceful-restart]
Release Information	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify the length of time the router or switch waits after it discovers that a neighboring router has gone down before it declares the neighbor down. This value is applied to all RSVP neighbor routers and should be based on the time that the slowest RSVP neighbor requires for restart.
Options	seconds —The time the router or switch waits after it discovers that a neighboring router has gone down before it declares the neighbor down. Range: 1 through 1800 Default: 60
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Hierarchy Level [edit logical-systems *logical-system-name* protocols l2circuit],
[edit protocols l2circuit]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for EX Series switches.

Description	Each Layer 2 circuit is represented by the logical interface connecting the local provider edge (PE) router or switch to the local customer edge (CE) router or switch. All the Layer 2 circuits using a particular remote PE router or switch designated for remote CE routers or switches are listed under the neighbor statement (neighbor designates the PE router or switch). Each neighbor is identified by its IP address and is usually the end-point destination for the LSP tunnel (transporting the Layer 2 circuit).
Options	address —IP address of a neighboring router or switch. The remaining statements are explained separately. See CLI Explorer .
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring the Neighbor Interface for the Layer 2 Circuit</i>

next-hop (Protocols MPLS)

Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for IPv6 addresses in static LSP configurations added in Junos OS Release 17.2R1.</p> <p>Support for IPv4 or IPv6 lookup after popping the label added in Junos OS Release 17.4R1.</p>
Description	Location of the next hop to the destination, specified as the IPv4 or IPv6 address of the next hop, the interface name (for point-to-point interfaces only), or the address/interface-name to specify an IP address on an operational interface.
Options	address —IPv4 or IPv6 address of the next-hop router.
<div>  <p>NOTE: IPv6 static LSPs are not supported at the [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress] hierarchy level.</p> </div>	
<p>interface-name—IP address of the outgoing interface. It must be a point-to-point interface. The name can be a simple or fully qualified domain name.</p>	
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring the Ingress Router for Static LSPs on page 468

no-bfd-triggered-local-repair

Syntax	no-bfd-triggered-local-repair;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-options], [edit routing-options]
Release Information	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Description	<p>Disable Bidirectional Forwarding Detection (BFD) sessions to trigger fast reroute (FRR) using MPLS-FRR and loop-free alternates (LFAs). When this statement is configured, no BFD-triggered local repair is supported. However, logical interface down-based local repair is in force.</p> <p>When using this statement to disable local repair, you also must restart routing to ensure proper behavior. To restart routing, include the graceful-restart command for the interior gateway protocol (IGP) used in your configuration. For example, if your IGP is OSPF, include the graceful-restart statement at the [edit protocols ospf] hierarchy level.</p>
Default	BFD-triggered local repair is the default behavior. The loss of a neighbor results in BFD local repair for all next hops that derive themselves from the base next hop with which the BFD session is established.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • BFD-Triggered Local Repair for Rapid Convergence on page 81 • graceful-restart (Enabling Globally) on page 1584

no-cspf

Syntax	no-cspf;
Hierarchy Level	<pre>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls <i>label-switched-path lsp-name</i> (<i>primary</i> <i>secondary</i>) <i>path-name</i>], [edit protocols mpls], [edit protocols mpls <i>label-switched-path lsp-name</i>], [edit protocols mpls <i>label-switched-path lsp-name</i> (<i>primary</i> <i>secondary</i>) <i>path-name</i>]</pre>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>Disable constrained-path LSP computation.</p> <p>An explicit-path LSP is completely configured through operator action. Once configured, it is initiated only along the explicitly specified path.</p> <p>A constrained-path LSP relies on an ingress router to compute the complete path. The ingress router takes into account the following information during the computation:</p> <ul style="list-style-type: none">• Interior gateway protocol (IGP) topology database• Link utilization information from extensions in the IGP link-state database• Administrative group information from extensions in the IGP link-state database• LSP requirements, including bandwidth, hop count, and administrative group <p>Constrained-path LSPs can generally avoid link failures and congested links. They also permit recomputation (therefore, a new path) during topology changes or unsuccessful setup.</p>
Default	Constrained-path LSP computation enabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Disabling Constrained-Path LSP Computation on page 376• Configuring Explicit-Path LSPs on page 498

no-decrement-ttl

Syntax	no-decrement-ttl;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>], [edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	<p>Disable normal time-to-live (TTL) decrementing, which decrements the TTL field in the IP header by 1. This statement decrements the IP TTL by 1 before encapsulating the IP packet within an MPLS packet. When the penultimate router pops off the top label, it does not use the standard write-back procedure of writing the MPLS TTL into the IP TTL field. Therefore, the IP packet is decremented by 1. The ultimate router then decrements the packet by one more for a total cloud appearance of 2, thus hiding the network topology.</p>
Default	Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Disabling Normal TTL Decrementing on page 435 • no-propagate-ttl on page 1589

graceful-restart (Enabling Globally)

Syntax	<pre> graceful-restart { disable; helper-disable; maximum-helper-recovery-time <i>seconds</i>; maximum-helper-restart-time <i>seconds</i>; notify-duration <i>seconds</i>; recovery-time <i>seconds</i>; restart-duration <i>seconds</i>; stale-routes-time <i>seconds</i>; }</pre>
Hierarchy Level	<pre> [edit logical-systems <i>logical-system-name</i> routing-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options], [edit routing-options], [edit routing-instances <i>routing-instance-name</i> routing-options]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>You configure the graceful restart routing option globally to enable the feature, but not to enable graceful restart for all routing protocols in a routing instance. Because all routing protocols are not usually run on every routing instance, you must also configure graceful restart for individual routing protocols running on a routing instance, including the main routing instance. You can, optionally, modify the global settings at the individual protocol level.</p>
	<div>  <p>NOTE:</p> <ul style="list-style-type: none"> For VPNs, the <code>graceful-restart</code> statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers. For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities. LDP sessions flap when <code>graceful-restart</code> configurations change. </div>
Default	Graceful restart is disabled by default.
Options	The remaining statements are explained separately. See CLI Explorer .

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

helper-disable (Multiple Protocols)

Syntax helper-disable;

Hierarchy Level [edit logical-systems *logical-system-name* protocols (isis | ldp | ospf | ospf3 | rsvp) [graceful-restart](#)],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols (ldp | ospf | ospf3) [graceful-restart](#)],
[edit protocols (isis | ldp | ospf | ospf3 | rsvp) [graceful-restart](#)],
[edit routing-instances *routing-instance-name* protocols (ldp | ospf | ospf3) [graceful-restart](#)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Disable helper mode for graceful restart. When helper mode is disabled, a router or switch cannot help a neighboring router that is attempting to restart.

Default Helper mode is enabled by default for these supported protocols: IS-IS, LDP, OSPF/OSPFv3, and RSVP.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

no-install-to-address

Syntax	no-install-to-address;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Prevent the egress router address configured using the to statement from being installed into the inet.3 and inet.0 routing tables.
Default	The egress router address for an LSP is installed into the inet.3 and inet.0 routing tables.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Preventing the Addition of Egress Router Addresses to Routing Tables on page 393• to on page 1664

no-load-balance-label-capability

Syntax	no-load-balance-label-capability;
Hierarchy Level	[edit forwarding-options]
Release Information	Statement introduced in Junos OS Release 14.1.
Description	Disables advertisement of entropy label capability in LDP and RSVP.

NOTE: Although you can enable and disable the load-balance-label capability at the same time using the `load-balance-label-capability` and the `no-load-balance-label-capability` statements, respectively, at the [edit forwarding-options] hierarchy level, it is recommended that only one of the statements be configured at a given point in time. The `no-load-balance-label-capability` statement overrides the `load-balance-label-capability` statement when both the statements are configured together.

Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

------------------------------	--

no-mcast-replication

Syntax	no-mcast-replication;
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i>], [edit chassis lcc <i>number</i> fpc <i>slot-number</i> pic <i>pic-number</i>]
Release Information	Statement introduced in Junos OS Release 11.3.
Description	For point-to-multipoint LSPs configured on T Series routers, protect the Packet Forwarding Engine (PFE) from bandwidth saturation. When a PFE does not need to replicate traffic, the PFE's bandwidth is less likely to become saturated. When you include the no-mcast-replication statement, the PFE is forced to be a leaf node in the binary tree. Leaf nodes, unlike branch nodes, do not replicate traffic in the process of forwarding traffic. Because leaf nodes have no children, they do not need to replicate traffic, and thus are less likely to become saturated with traffic.
Default	If you omit the no-mcast-replication statement, the PFE can become a branch node or a leaf node. When the PFE becomes a branch node, the PFE must replicate traffic.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Point-to-Multipoint LSPs Overview on page 503

no-propagate-ttl

Syntax	no-propagate-ttl;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>Disable normal time-to-live (TTL) decrementing. You configure this statement once per router, and it affects all RSVP-signaled or LDP-signaled LSPs. When this router acts as an ingress router for an LSP, it pushes an MPLS header with a TTL value of 255, regardless of the IP packet TTL. When the router acts as the penultimate router, it pops the MPLS header without writing the MPLS TTL into the IP packet.</p> <p>When you add the no-propagate-ttl statement to the configuration or delete it from the configuration, the effect takes place immediately. There is no need to clear existing RSVP LSPs or LDP sessions.</p>
Default	Normal TTL decrementing enabled; the TTL field value is decremented by 1 as the packet passes through each label-switched router in the LSP.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Disabling Normal TTL Decrementing on page 435 • <i>Example: Diagnosing Networking Problems Related to Layer 3 VPNs by Disabling TTL Decrementing</i> (on <i>Layer 3 VPNs Feature Guide for Routing Devices</i> or in the <i>Junos VPNs Configuration Guide</i>) • no-decrement-ttl on page 1583

no-transit-statistics

Syntax	no-transit-statistics;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls statistics], [edit protocols mpls statistics]
Release Information	Statement introduced in Junos OS Release 10.2 for PTX Series.
Description	(PTX Series only) Disables the collection of MPLS statistics for LSPs transiting the router.
Required Privilege Level	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring MPLS to Gather Statistics on page 181• statistics on page 1657

no-trap

Syntax	no-trap { mpls-lsp-traps; rfc-3812-traps; }
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls log-updown], [edit protocols mpls log-updown]
Release Information	Statement introduced before Junos OS Release 7.4. The mpls-lsp-traps and rfc-3812-traps options added in Junos OS Release 9.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Prevent the transmission of SNMP traps.
Options	mpls-lsp-traps —Block the MPLS LSP traps defined in the rfc-3812-traps , but allows the rfc3812.mib traps. rfc-3812-traps —Block the traps defined in the rfc3812.mib , but allows the MPLS LSP traps defined in the jnx-mpls.mib .
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

node-protection (Static LSP)

Syntax	<code>node-protection bypass-name <i>name</i> next-next-label <i>label</i>;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>],</code> <code>[edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress],</code> <code>[edit protocols mpls static-label-switched-path <i>lsp-name</i> transit <i>incoming-label</i>]</code>
Release Information	Statement introduced in JUNOS Release 10.1.
Description	Enable node protection on the specified static bypass LSP. Node protection ensures that traffic from an LSP traversing a neighboring router can continue to reach its destination even if the neighboring router fails.
Default	Node protection is disabled.
Options	<code>bypass-name <i>name</i></code> —Bypass LSP name. <code>next-next-label <i>label</i></code> —Bypass LSP name.
Required Privilege Level	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Static LSPs on page 468

normalization

Syntax	<pre> normalization { failover-normalization; no-incremental-normalize; normalization-retry-duration <i>seconds</i>; normalization-retry-limits <i>number</i>; normalize-interval <i>seconds</i>; } </pre>
Hierarchy Level	[edit protocols mpls container-label-switched-path <i>lsp-name</i> splitting-merging]
Release Information	<p>Statement introduced in Junos OS Release 14.2.</p> <p>Statement introduced in Junos OS Release 17.2R1 for QFX Series switches.</p>
Description	Perform normalization.
Options	<p>failover-normalization—Enable the ingress router to pro-actively normalize or re-distribute traffic when a link or node failure happens on a member LSP. A member LSP can go down between two scheduled normalization events because of a link-failure or pre-emption.</p> <p>Default: Disabled</p> <p>no-incremental-normalize—Disables automatic switchover by the ingress router to a new instance of the container LSP until the desired demand is satisfied, although the given number of LSPs can be successfully signaled such that the new aggregate bandwidth value exceeds the old aggregate bandwidth value.</p> <p>Default: False (disabled)</p> <p>normalization-retry-duration <i>seconds</i>—Specifies the duration before which the ingress router performs a normalization reattempt when the previous normalization has not been successful. Normalization is done until a sufficient number of LSPs come up with an aggregate bandwidth that is more than the current aggregate or desired bandwidth.</p> <p>Default: 30 seconds</p> <p>normalization-retry-limits <i>number</i>—Specifies the maximum number of times the ingress router performs normalization reattempts until a sufficient number of LSPs come up successfully with new bandwidth values.</p> <p>Default: 1</p> <p>normalize-interval <i>seconds</i>—Specifies the duration between two normalization events.</p> <p>Range: 21600 seconds through 6 hours</p> <p>Default: 21600 seconds</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

optimize-adaptive-teardown

Syntax	<pre>optimize-adaptive-teardown { p2p: }</pre>
Hierarchy Level	[edit protocols mpls]
Release Information	Statement introduced in Junos OS Release 15.1R1.
Description	Make use of a new feedback mechanism from TAG library which relies on RPD infrastructure to decide when all the routes using the old LSP instance have fully shifted to the new LSP instance after MBB switchover. When this statement is configured, the optimize-hold-dead-delay statement, which delays the teardown of the old LSP instance after MBB switchover, is ignored.
Options	p2p —This is the only option. Only point-to-point LSPs configured in the system will be affected.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Optimizing Signaled LSPs on page 417• Achieving a Make-Before-Break, Hitless Switchover for LSPs on page 414

optimize-aggressive

Syntax	optimize-aggressive;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	If enabled, the LSP reoptimization is based solely on the IGP metric. The reoptimization process ignores the available bandwidth ratio calculations, the least-fill 10 percent congestion improvement rule, and the hop-counts rule. This statement makes reoptimization more aggressive than the default.
Default	Aggressive optimization is disabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Optimizing Signaled LSPs on page 417

optimize-hold-dead-delay

Syntax	<code>optimized-hold-dead-delay <i>seconds</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switch-path <i>lsp-name</i>], [edit protocols mpls], [edit protocols mpls label-switch-path <i>lsp-name</i>]
Description	<p>Allows you to specify the amount of time to delay the tear down of old paths after the router has switched traffic to new optimized paths. This delay timer starts when the timer specified by the optimize-switchover-delay statement has elapsed, which is typically 30 seconds, and at the start of the next retry sequence (in other words, the delay is not an absolute countdown of the seconds configured here).</p> <p>You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that old paths are not torn down before all routes have been switched over to the new optimized paths.</p>
Options	<p>seconds—Configure the time in seconds to wait before tearing down the old paths that were in use prior to the last LSP optimization.</p> <p>Default: 60 to 90 seconds</p> <p>Range: 0 through 65,535 seconds</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Optimizing Signaled LSPs on page 417 • optimize-switchover-delay on page 1600 • optimize-timer on page 1601

optimize-switchover-delay

Syntax	<code>optimize-switchover-delay seconds;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced in Junos OS Release 11.1R1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Delays the switch over of LSPs to newly optimized paths. You only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers). The specified delay helps to ensure that the new optimized paths have been established before traffic is switched over from the old paths.
Options	seconds —Configure the time in seconds to wait before switching LSPs to newly optimized paths. Default: 1 second Range: 1 through 900 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Optimizing Signaled LSPs on page 417• optimize-hold-dead-delay on page 1599• optimize-timer on page 1601

optimize-timer (Protocols MPLS)

Syntax	<code>optimize-timer <i>seconds</i>;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>], [edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric.</p>
Description	<p>Enable periodic reoptimization of an LSP that is already set up. If topology changes occur, an existing path might become suboptimal, and a subsequent recomputation might be able to determine a better path. This feature is useful only on LSPs for which constrained-path computation is enabled; that is, for which the no-cspf statement is not configured. Also, you only need to configure this statement on routers acting as the ingress for the affected LSPs (you do not need to configure this statement on transit or egress routers).</p> <p>To avoid extensive resource consumption that might result because of frequent path recomputations, or to avoid destabilizing the network as a result of constantly changing LSPs, we recommend that you either leave the timer value sufficiently large or disable the timer value.</p>
Default	The optimize timer is disabled.
Options	<p><i>seconds</i>—Length of the optimize timer, in seconds.</p> <p>Range: 0 through 65,535 seconds</p> <p>Default: 0 seconds (the optimize timer is disabled)</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

path (Protocols MPLS)

Syntax	<pre>path <i>path-name</i> { abstract-hop-name (abstract loose loose-link strict); (<i>address</i> <i>hostname</i>) <strict loose>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series Virtual Chassis and Virtual Chassis Fabric. abstract-hop-name option introduced in Junos OS Release 17.1 for all platforms.
Description	Create a named path and optionally specify the sequence of explicit routers that form the path. You must include this statement when configuring explicit LSPs.
Options	<p>abstract-hop-name—Name of the predefined abstract hop. The abstract hop can be used in combination with real IP next hops. An abstract hop is traversed by traversing the member nodes. This traversal can be done by either links that satisfy the logical combination of defined constituent attributes, or by any kind of link. This choice is controlled by the use of abstract hop qualifiers – abstract, loose, loose-link, and strict.</p> <p>abstract—Indicate that the next hop configured in the path statement is an abstract hop..</p> <p>loose-link—Indicate that the next hop in the path statement is a loose-link abstract hop. This means that the LSP cannot traverse other routers before reaching this router. In other words, the abstract hop of type loose-link is processed only if any of the viable routers is reached in constraint through a link of associated abstract hop membership.</p> <p>loose—Indicate that the next hop in the path statement is a loose abstract hop. The path can traverse any real nodes that do not have abstract hop membership, before reaching a node with abstract hop membership, which is a feasible starting point for processing the next abstract hop.</p> <p>strict—Indicate that the next hop in the path statement is a strict abstract hop. After the last processed hop in the constraint list, the path can traverse any real nodes that do not have abstract hop membership, before reaching a node with abstract hop membership, which is a feasible starting point for processing the next abstract hop.</p> <p>address—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is loose. As an option, you can include the ingress and egress routers in the</p>

path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.

Default: If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.

hostname—See **address**.

Default: If you do not specify any routers explicitly, no routing limitations are imposed on the LSP.

loose—(Optional) Indicate that the next address in the **path** statement is a loose link. This means that the LSP can traverse through other routers before reaching this router.

Default: **strict**

path-name—Name that identifies the sequence of nodes that form an LSP. The name can contain up to 32 characters and can include letters, digits, periods, and hyphens. To include other characters or use a longer name, enclose the name in quotation marks. The name must be unique within the ingress router.

strict—(Optional) Indicate that the LSP must go to the next address specified in the **path** statement without traversing other nodes. This is the default.

Required Privilege	routing—To view this statement in the configuration.
Level	routing-control—To add this statement to the configuration.

Release Information	<p>Statement introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.</p> <p>Statement introduced in Junos OS Release 12.3 for M Series, T Series, and MX Series routers.</p>
Description	<p>Allocate a unique label for each prefix. The per-prefix-label statement helps minimize packet loss in most deployments.</p> <p>Although allocating a label for each prefix is not generally ideal for scaling, it is assumed that a small number of labels are used for BGP labeled-unicast. When labeled BGP is used to set up transport label-switched paths (LSPs), the common case is that each prefix has a unique next hop. Thus, the use of per-prefix labels does not have an adverse scaling impact. On the contrary, the use of per-prefix labels reduces churn in the network when multipath load balancing is enabled for IPv4 labeled-unicast, and a subset of the paths are withdrawn for some reason.</p> <p>The advantage of per-prefix labeling is that the advertised upstream label is more stable during network changes. That is, if the downstream label changes, the advertised upstream label remains the same under most scenarios. This way, the upstream router is isolated from the downstream network change, and the overall network is more stable. The greater stability of the advertised upstream label helps to reduce traffic loss during many different network change scenarios.</p>
Default	By default, label allocation is per next-hop router.

aggregate-bandwidth and **limit-bandwidth** *limit-bandwidth* options introduced in Junos OS Release 17.4R1 for MX Series, PTX Series, and QFX Series.

Description Define a routing policy, including subroutine policies.

A *term* is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.

Each term contains a set of match conditions and a set of actions:

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of **accept** or **reject** is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either **accept** or **reject**) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the **[edit policy-options]** hierarchy level by **policy-statement** *policy-name* in alphabetical order, enter the **show policy-options** configuration command.

The statements are explained separately.

Options **actions**—(Optional) One or more actions to take if the conditions match. The actions are described in *Configuring Flow Control Actions*.

family **family-name**—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**. For traffic engineering, specify **traffic-engineering**.

NOTE: When family is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the *family* statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

from—(Optional) Match a route based on its source address.

as-path-unique-count **count** (**equal** | **orhigher** | **orlower**)—(Optional) Specify a number from 0 through 1024 to filter routes based on the number of unique autonomous systems (ASs) in the AS path. Specify the match condition for the unique AS path count.

aggregate-bandwidth—(Optional) Enable BGP to advertise aggregate outbound link bandwidth for load balancing.

dynamic-tunnel-attributes **dynamic-tunnel-attributes**—(Optional) Choose a set of defined dynamic tunnel attributes for forwarding traffic over V4oV6 tunnels.

match-conditions—(Optional in **from** statement; required in **to** statement) One or more conditions to use to make a match. The qualifiers are described in *Routing Policy Match Conditions*.

multipath-resolve **multipath-resolve**—(Optional) Enable the use of all paths for resolution over the specified prefix.

limit-bandwidth **limit-bandwidth**—(Optional) Specify the limit for advertised aggregate outbound link bandwidth for load balancing.

Range: 0 through 4,294,967,295 bytes

no-entropy-label-capability—(Optional) Disable the entropy label capability advertisement at egress or transit routes specified in the policy.

priority (**high** | **medium** | **low**)—(Optional) Configure the priority for an IS-IS route to change the default order in which the routes are installed in the routing table, in the event of a network topology change.

policy *subroutine-policy-name*—Use another policy as a match condition within this policy.

The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form `__.*-internal__`, as this form is reserved. For information about how to configure subroutines, see *Understanding Policy Subroutines in Routing Policy Match Conditions*.

policy-name—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

prefix-list *prefix-list-name*—Name of a list of IPv4 or IPv6 prefixes.

prefix-list-filter *prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match, and *actions* is the action to take if the prefixes match.

protocol *protocol-name*—Name of the protocol used to control traffic engineering database import at the originating point.

route-filter *destination-prefix match-type <actions>*—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see *Configuring Route Lists*), and *actions* is the action to take if the *destination-prefix* matches.

source-address-filter *source-prefix match-type <actions>*—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see *Configuring Route Lists*), and *actions* is the action to take if the *source-prefix* matches.

tag value—(Optional) A numeric value that identifies a route. You can tag certain routes to prioritize them over other routes. In the event of a network topology change, Junos OS updates these routes in the routing table before updating other routes with lower priority. You can also tag some routes to identify and reject them based on your requirement.

term *term-name*—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the **term** statement when defining match conditions and actions.

to—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

then—(Optional) Actions to take on matching routes. The actions are described in *Configuring Flow Control Actions* and *Configuring Actions That Manipulate Route Characteristics*.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

push

Syntax	<code>push out-label;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> bypass], [edit logical-systems <i>logical-system-name</i> protocols mpls static-label-switched-path <i>lsp-name</i> ingress], [edit protocols mpls static-label-switched-path <i>lsp-name</i> bypass], [edit protocols mpls static-label-switched-path <i>lsp-name</i> ingress]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Add a new label to the top of the label stack. This statement is used to configure static LSPs at ingress routers and to configure bypass LSPs for static LSPs.
Options	out-label —Manually assigned outgoing label value. Range: 0 through 1,048,575.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • pop on page 1616 • swap on page 1659 • Configuring the Ingress Router for Static LSPs on page 468

random

Syntax	(random least-fill most-fill);
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	<p>Configure the preferred path when several equal-cost candidate paths to a destination exist, and prefer the path with the highest available bandwidth (with the largest minimum available bandwidth ratio). The available bandwidth ratio of a link is the available bandwidth on a link divided by the maximum reservable bandwidth on the link.</p> <ul style="list-style-type: none">• least-fill—Prefer the path with the most available bandwidth (with the largest available bandwidth ratio).• most-fill—Prefer the path with the least available bandwidth (with the minimum available bandwidth ratio). The minimum available bandwidth ratio of a path is the smallest available bandwidth ratio belonging to any of the links in the path.• random—Choose the path at random.
Default	random
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

remote-interface-switch

Syntax	<pre>remote-interface-switch <i>connection-name</i> { interface <i>interface-name.unit-number</i>; receive-lsp <i>label-switched-path</i>; transmit-lsp <i>label-switched-path</i>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols connections], [edit protocols connections (MPLS)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.5 for EX Series switches.
Description	Configure MPLS LSP tunnel cross-connects. This makes an association between a CCC interface and two LSPs, one for transmitting MPLS packets from the local provider edge switch to the remote provider edge switch and the other for receiving MPLS packets on the local provider edge switch from the remote provider edge switch.
Options	<p><i>connection-name</i>—Connection name.</p> <p><i>interface interface-name.unit-number</i>—Interface name. Include the logical portion of the name, which corresponds to the logical unit number of the CCC interface.</p> <p><i>receive-lsp label-switched-path</i>—Name of the LSP from the connection's source. This LSP name was specified by the label-switched-path statement on the remote provider edge switch in the protocols mpls stanza.</p> <p><i>transmit-lsp label-switched-path</i>—Name of the LSP to the connection's destination. This LSP name was specified by the label-switched-path statement on the local provider edge switch in the protocols mpls stanza.</p>

rpf-check-policy (Routing Options)

Syntax	<code>rpf-check-policy <i>policy</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-options multicast], [edit routing-options multicast]
Release Information	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Description	Enable you to control whether a reverse path forwarding (RPF) check is performed for a source and group entry before installing a route in the multicast forwarding cache. This makes it possible to use point-to-multipoint LSPs to distribute multicast traffic to Protocol Independent Multicast (PIM) islands situated downstream from the egress routers of the point-to-multipoint LSPs.
Options	<i>policy</i> —Name of the RPF check routing policy.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring a Multicast RPF Check Policy for Point-to-Multipoint LSPs on page 530

rsvp-error-hold-time

Syntax	<code>rsvp-error-hold-time <i>seconds</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations. The more time you configure, the more time a source node (ingress of an RSVP LSP) can have to learn about the failures of its LSP by monitoring PathErr messages transmitted from downstream nodes.</p> <p>Information from the PathErr messages is incorporated into subsequent LSP computations, which can improve the accuracy and speed of LSP setup. Some PathErr messages are also used to update traffic engineering database bandwidth information, reducing inconsistencies between the database and the network.</p>
Options	<p><i>seconds</i>—Amount of time MPLS retains RSVP PathErr messages and considers them for CSPF computations.</p> <p>Range: 0 through 240 seconds</p> <p>Default: 25 seconds</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

segment

Syntax	<pre>segment { (pop swap <i>swap</i>); description <i>description</i>; next-hop <i>next-hop</i>; sid-label; }</pre>
Hierarchy Level	[edit logical-systems <i>name</i> protocols mpls static-label-switched-path], [edit logical-systems <i>name</i> routing-instances <i>name</i> protocols mpls static-label-switched-path], [edit protocols mpls static-label-switched-path], [edit routing-instances <i>name</i> protocols mpls static-label-switched-path]
Release Information	Statement introduced in Junos OS Release OS 18.1R1 for MX Series, PTX Series, and QFX Series.
Description	Static segment for segment routing. A static segment is identified by a unique name. This segment type is assigned a segment identifier (SID) which falls under a default range of 100000 through 1048575. The segment has label operation such as pop-and-forward for adjacency segment and swap-and-forward for prefix or node segment. For both types of label operation, the segment is assigned a next hop that specifies the remote IP address if the outgoing interface is a multi-access interface, or the name of the outgoing interface if the interface is a point-to-point interface. Static segment configuration is used to statically configure or provision the adjacency SIDs, node SIDs, and prefix SIDs on transit routers.
Options	<p>pop—Pop the SID label</p> <p>swap—Swap the SID label to this label</p> <p>description—Text description of label-switched path</p> <p>next-hop—IPv4 address or interface of next-hop router</p> <p>sid-label—Segment identifier (SID) label</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	routing

segment-list

Syntax

```
segment-list name {
  hop-name name {
    ip_address ip address;
    label label;
  }
}
```

Hierarchy Level [edit logical-systems *name* protocols source-packet-routing],
[edit protocols source-packet-routing]

Release Information Statement introduced in Junos OS Release 17.4R1 for MX Series and PTX Series with FPC-PTX-P1-A.
ip-address statement introduced in Junos OS Release 18.1R1 for MX Series.

Description Specify an explicit path for source routing label switched path (LSPs) to traverse through traffic engineering segments. The segment list is essentially a stack of segment identifiers. that

NOTE: The segment list enables BGP and static segment routing LSP to steer traffic based on segment routing policies. When a segment list is used by the protocol BGP, the BGP protocol validates these segment identifiers and selects valid segments for traffic engineering.

Options **name**—Specify a name to identify the segment routing list, which is used in traffic engineering policy.

hop-name—Specify the name of a hop from the segment list in the segment routing traffic engineering policy.

ip-address—Specify the IP address of the hop. For a segment-list to be used by a non-colored segment routing LSP, the first hop must specify an IP address..

label—Specify the SID label of the hop in a segment routing traffic engineering segment list. In static segment routing LSPs, the source routing path uses the segment list only if the second to Nth hop specifies segment identifiers (SID) labels.

Range: 0 through 1,048,576

NOTE: The range is applicable for protocol BGP and static segment routing LSPs.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

select

Syntax	select (manual unconditional);
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify the conditions under which the path is selected to carry traffic. The manual and unconditional options are mutually exclusive.
Options	manual —The path is selected for carrying traffic if it is up and stable for at least the revert timer window (potentially before the revert timer has elapsed). Traffic is sent to other working paths if the current path is down or degraded (receiving errors). unconditional —The path is always selected for carrying traffic, even if it is currently down or degraded (receiving errors).
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

smart-optimize-timer

Syntax	<code>smart-optimize-timer <i>seconds</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>Enable the smart optimization timer. When you enable the smart optimization timer on a router, the Junos OS operates on the assumption that the original LSP path is preferable to any alternate or secondary path. When you enable the smart optimization timer and an LSP fails and its traffic is switched to an alternate path, the smart optimization timer starts and waits 3 minutes (this time is configurable). After 3 minutes have passed, the LSP is switched back to the original path. If the original path fails again and the LSP is switched to an alternate path again, the router waits 1 hour before attempting to switch the LSP back to its original path.</p> <p>If you want to disable the smart optimizer, you can set it to zero. The smart-optimize-timer value in seconds indicates the time before which the LSP is switched back to its primary path in case the primary path becomes available. Otherwise, the time to wait is controlled by the optimize-timer, which is usually set to a high value. Some ISPs have the optimize-timer set to once a day. Sometimes after the smart optimizer causes the LSP to be placed back on its primary path, the primary path goes down again within 60 minutes. When this happens, the smart-optimize-timer is disabled automatically, and the optimize-timer (regular path optimization) goes into effect. This is to protect against a flapping link being used.</p>
Default	The smart optimization timer is enabled by default.
Options	<p>seconds—(Optional) Specify the number of seconds to wait before switching an LSP back to its original path. If you do not specify the number of seconds, the default value is used.</p> <p>Range: 0 through 65,535 seconds</p> <p>Default: 180 seconds</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

soft-preemption (Protocols MPLS)

Syntax	soft-preemption;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Attempt to establish a new path for a preempted LSP before tearing it down.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring MPLS Soft Preemption on page 407

source-routing-path

Syntax	<pre> source-routing-path <i>name</i> { binding-sid <i>binding-sid</i>; color <i>color</i>; metric <i>value</i>; no-ingress; preference <i>preference</i>; primary <i>name</i> { weight <i>weight</i>; } secondary <i>name</i> { weight <i>weight</i>; } sr-preference <i>sr-preference</i>; to <i>to</i>; } </pre>
Hierarchy Level	[edit logical-systems <i>name</i> protocols source-packet-routing], [edit protocols source-packet-routing]
Release Information	<p>Statement introduced in Junos OS Release 17.4R1 for MX Series and PTX Series with FPC-PTX-P1-A.</p> <p>The metric, no-ingress, and secondary statements are introduced in Junos OS Release 18.1R1 for MX Series.</p>
Description	<p>Configure a source routing label switched path (LSP) for steering traffic at an ingress router. Specify a binding segment identifier from the static label range. Configure other parameters such as color, weight, preference, and segment routing preference for traffic engineering.</p> <p>Starting with Junos OS Release 18.1R1, non-colored static segment routing LSPs are supported in an MPLS network. Configure parameters such as destination address, binding SIDs, primary segment, secondary segment, metric, and preference. These segment routing LSPs do not have a color associated with them. If an ingress route is not required for a non-colored segment routing LSP then the ingress route installation in inet.3 table can be disabled.</p>
Options	<p>name—Specify a name to identify a source routing path.</p> <p>binding-sid—Specify the binding label to enable transit functionality for this tunnel. For a non-colored static segment routing LSP, a label route for the binding SID is installed in mpls.0 table, by default, with a preference of 8 and a metric of 1.</p>

NOTE: This is optional for MPLS networks.

Range: 16 through 1,048,576

color—Specify a color identifier for the tunnel end point.

NOTE: This is only for colored segment routing LSPs. For non-colored segment routing LSPs, you should not configure the color parameter. For colored segment routing LSP, the first hop in the segment list is a label whereas for non-colored segment routing LSP, the first hop is an IP address of the next hop.

metric—Specify metric for routes downloaded for the non-colored static segment routing tunnel.

Range: 1 through 16777215

NOTE: This range is for protocol BGP.

no-ingress—Disable installing the destination address of the segment routing LSP in the inet.3 table. This disables the ability to use the given non-colored static segment routing tunnel as ingress.

preference—Specify the preference for routes downloaded for this tunnel.

primary—Specify a primary segment list for the configured source routing path.

The non-colored static segment routing LSP can have a maximum of 8 primary paths. In case of multiple operational primary paths, the PFE distributes the traffic over the paths based on the weight configured on the paths. If none of the paths have weights configured then the weights default to 1 making it an ECMP path. The paths become weighted ECMP if the at least one of the paths have a non-zero weight. In both cases, when one or some of the paths fail, the PFE automatically re-balances the traffic over the remaining paths resulting in path protection.

weight weight_value—Specify a percentage of the bandwidth with respect to the sum of weights of all paths for the primary segment list. If forwarding interfaces are also configured with weighted ECMP, then Junos OS applies hierarchical weighted ECMP. If the weight percentage is not configured, then only IGP weights are applied on the forwarding interfaces.

secondary—Specify a secondary path for the non-colored static segment routing LSP. In case, all the primary paths fail then the traffic gets switched to the secondary path.

sr-preference—Configure a preference for segment routing routes for traffic engineering. BGP chooses a higher preference over a lower preference value.

Range: 0 through 4,294,967,295

to—Specify the IP address of the tunnel end-point

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details..

splitting-merging

Syntax `splitting-merging {
 maximum-member-lsps number;
 maximum-signaling-bandwidth bps;
 merging-bandwidth bps;
 minimum-member-lsps number;
 minimum-signaling-bandwidth bps;
 normalization;
 sampling;
 splitting-bandwidth bps;
 splitting-merging-threshold percent;
 }`

Hierarchy Level `[edit protocols mpls container-label-switched-path lsp-name]`

Release Information Statement introduced in Junos OS Release 14.2.
 Statement introduced for QFX Series switches in Junos OS Release 15.1X53-D30.

Description Perform splitting and merging.

Options **maximum-member-lsps *number***—Number of label-switched paths (LSPs) that a container LSP can have as member LSPs at maximum.
 Default: 1

maximum-signaling-bandwidth *bandwidth*—Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at maximum after normalization. When **maximum-signaling-bandwidth** is not configured, the value is derived from the **splitting-bandwidth**.

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the **splitting-bandwidth**.

Default: 1 bps

merging-bandwidth *bandwidth*—Amount of bandwidth in bits per second (bps) that is used for merging during normalization.

Default: 1 bps

minimum-member-lsps *number*—Number of LSPd that a container LSP can have as member LSPs at minimum.

Default: 64

minimum-signaling-bandwidth *bandwidth*—Amount of bandwidth in bits per second (bps) that can be signaled for an LSP at minimum after normalization. When **minimum-signaling-bandwidth** is not configured, the value is derived from the **merging-bandwidth**.

When auto-bandwidth adjustment is done between two normalization events, per LSP auto-bandwidth configuration and thresholds are used instead of the **merging-bandwidth**.

Default: 1 bps

splitting-bandwidth *bandwidth*—Amount of bandwidth in bits per second (bps) that can be used for splitting during normalization.

Default: 1 bps

splitting-merging-threshold *percent*—Percentage changes in aggregate bandwidth relevant for splitting and merging.

Default: 0%

statistics (Protocols MPLS)

Syntax	<pre> statistics { auto-bandwidth (MPLS Statistics); file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; interval <i>seconds</i>; no-transit-statistics; traffic-class-statistics; transit-statistics-polling; } </pre>
Hierarchy Level	<pre> [edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls] </pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p> <p>traffic-class-statistics option introduced in Junos OS Release 14.2.</p> <p>Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.</p>
Description	Enable MPLS statistics collection and reporting.
Options	<p>file <i>filename</i>—(Optional) Name of the file to receive the output. We recommend that you place MPLS tracing output in the file <code>mpls-stat</code> in the <code>/var/log</code> directory.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named <i>file</i> reaches its maximum size, it is renamed <i>file.0</i>, then <i>file.1</i>, and so on, until the maximum number of files is reached. Then, the oldest file is overwritten.</p> <p>Range: 2 or more</p> <p>Default: 2 files</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>interval <i>seconds</i>—Interval at which to periodically collect statistics.</p> <p>Range: 1 through 65,535</p> <p>Default: 300 seconds</p> <p>no-world-readable—(Optional) Prevent users from reading the log file.</p> <p>size <i>size</i>—(Optional) Maximum size of each file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a file named <i>file</i> reaches this size, it is renamed <i>file.0</i>. When the <i>file</i> again reaches its maximum size, <i>file.0</i> is renamed <i>file.1</i> and <i>file</i> is renamed <i>file.0</i>. This renaming scheme continues until the maximum number of files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum file size, you also must specify a maximum number of files with the files option.</p> <p>world-readable—(Optional) Enable users to read the log file.</p>

Syntax: Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

traffic-class-statistics—(Optional) Create counters that maintain data traffic statistics per traffic class at the ingress of all types of LSPs and egress of ultimate hop popping (UHP) point-to-point LSPs. These counters are not created by default and are required to be configured to perform traffic-class-scoped loss measurement.

transit-statistics-polling—(Optional) Enable the polling and display of MPLS statistics for LSPs transiting the router. By default, RSVP does not periodically poll for transit LSP statistics. You cannot configure this statement and the **no-transit-statistics** statement at the same time.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege	routing and trace—To view this statement in the configuration.
Level	routing-control and trace-control—To add this statement to the configuration.

sync-active-path-bandwidth

Syntax	sync-active-path-bandwidth;
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth (MPLS Tunnel)], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>], [edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i> auto-bandwidth (MPLS Tunnel)], [edit protocols mpls label-switched-path <i>lsp-name</i> (primary secondary) <i>path-name</i>]</p>
Release Information	Statement introduced in Junos OS Release 13.2.
Description	<p>When you have a primary and a secondary path configuration, specify that a path needs to be signaled with the active-path bandwidth when the auto-bandwidth adjustment happens and that the secondary path synchronizes the bandwidth reservations to that of the primary path.</p> <p>When a primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. If you include the sync-active-path-bandwidth statement, the secondary path releases the bandwidth it has reserved and adjusts its bandwidth after the primary path begins carrying traffic.</p> <p>For example, suppose the active path is a secondary path with a reserved bandwidth of 10 GB as a result of the automatic bandwidth adjustment. Then suppose there is a switchover from the secondary path to the primary path. After some time the primary path reserves 5 GB as a result of a new automatic adjustment. Without the sync-active-path-bandwidth statement, the secondary path does not release the 10 GB after a switchover occurs. That bandwidth is wasted. If the sync-active-path-bandwidth is included in the configuration, the secondary path adjusts its bandwidth to 5 GB along with the primary path.</p>
Default	When you have a primary and a secondary path configuration, and the primary path fails, bandwidth reservations are made by the secondary path on the links that it uses. When the primary path comes back and the traffic switches over, the secondary path does not release its bandwidth reservations.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

- **nsr-synchronization**—Trace NSR synchronization events
- **nsr-synchronization-detail**—Trace NSR synchronization events in detail
- **state**—All LSP state transitions
- **static**—Trace static label-switched path
- **ted-export**—Trace leaking of entries from **lsdist.0** table into the traffic engineering database
- **ted-import**—Trace leaking traffic engineering database entries into the **lsdist.0** table
- **timer**—Timer usage

no-world-readable—(Optional) Allow only certain users to read the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.

traffic-engineering (Protocols MPLS)

Syntax	traffic-engineering (bgp bgp-igp bgp-igp-both-ribs mpls-forwarding);
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit protocols mpls]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Select whether MPLS performs traffic engineering on BGP destinations only or on both BGP and IGP destinations. Affects only LSPs originating from this routing device, not transit or egress LSPs.
Default	bgp
Options	<p>bgp—On BGP destinations only. Ingress routes are installed in the inet.3 routing table.</p> <p>bgp-igp—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 routing table. If IGP shortcuts are enabled, the shortcut routes are automatically installed in the inet.0 routing table.</p> <p>bgp-igp-both-ribs—On both BGP and IGP destinations. Ingress routes are installed in the inet.0 and inet.3 routing tables. This option is used to support VPNs.</p> <p>mpls-forwarding—On both BGP and IGP destinations. Use ingress routes for forwarding only, not for routing.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

transit-lsp-association

Syntax	<pre>transit-lsp-association <i>transit-association-lsp-group-name</i> { <i>from-1 address-of-associated-lsp-1</i>; <i>from-2 address-of-associated-lsp-2</i>; <i>lsp-name-1 name-of-associated-lsp-1</i>; <i>lsp-name-2 name-of-associated-lsp-2</i>; }</pre>
Hierarchy Level	[edit protocols mpls]
Release Information	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Associate two label-switched paths (LSPs) at a transit node to configure a path for sending and receiving GAL and G-Ach messages for MPLS-TP OAM.
Options	<p><i>transit-association-lsp-group-name</i>—Name of the transit association LSP group.</p> <p><i>from-1 address-of-associated-lsp-1</i>—Address of the first associated LSP.</p> <p><i>from-2 address-of-associated-lsp-2</i>—Address of the second associated LSP.</p> <p><i>lsp-name-1 name-of-associated-lsp-1</i>—Name of the first associated LSP.</p> <p><i>lsp-name-2 name-of-associated-lsp-1</i>—Name of the second associated LSP.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Example: Configuring the MPLS Transport Profile for OAM on page 686

ultimate-hop-popping

Syntax	ultimate-hop-popping;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>label-switched-path-name</i>], [edit protocols mpls], [edit protocols mpls label-switched-path <i>label-switched-path-name</i>]
Release Information	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
Description	<p>Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.</p> <p>Be aware of the following platform requirements and restrictions:</p> <ul style="list-style-type: none"> • UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers. • UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only. • UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed. • UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only. • UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the <i>no-tunnel-services</i> statement at the [edit routing-instances <i>routing-instance-name</i> protocols vpls] hierarchy level.
Default	Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Ultimate-Hop Popping for LSPs on page 465 • explicit-null on page 1520

vrf-table-label

Syntax	<pre>vrf-table-label { source-class-usage; static; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>], [edit routing-instances <i>routing-instance-name</i>]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for the source-class-usage statement added in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> <p>Statement introduced in Junos OS Release 15.1F5 and 16.1R2 for PTX5000 routers with third-generation FPCs installed.</p> <p>Statement introduced in Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers with third-generation FPCs.</p> <p>Statement introduced in Junos OS Release 16.1X65 and 17.2R1 for PTX1000 routers.</p> <p>Support for the static statement added in Junos OS Release 17.2.</p>
Description	<p>Map the inner label of a packet to a specific VPN routing and forwarding (VRF) instance. This allows the examination of the encapsulated IP header. The first lookup is done on the VPN label to determine which VRF instance to refer to, and the second lookup is done on the IP header to determine how to forward packets to the correct end hosts.</p> <p>When you include the vrf-table-label statement in the configuration of a VRF routing instance, a label-switched interface (LSI) logical interface label is created and mapped to the VRF routing table. Any routes in the VRF routing table are advertised with the LSI logical interface label allocated for the VRF routing table. When packets destined for the VRF routing instance arrive on a core-facing interface, they are treated as if the enclosed IP packet arrived on the LSI interface and are then forwarded and filtered based on the correct table.</p> <p>All routes in a VRF routing instance configured with this option are advertised with one label allocated per VRF.</p>

NOTE:

- The **vrf-table-label** statement is supported on PTX5000 and PTX3000 routers only when third-generation FPCs are installed on the router and **enhanced-ip** command is configured on the chassis.
- Starting in Junos OS Release 17.2, you can configure the **enhanced-ip** command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability. The **vrf-table-label** space is increased to at least 16,000, if the platform can support the scale.

Options The remaining statements are explained separately.

Required Privilege routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

bandwidth (Protocols RSVP)

Syntax	<code>bandwidth <i>bps</i>;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i></code> <code>link-protection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i></code> <code>link-protection bypass <i>bypass-name</i>],</code> <code>[edit protocols rsvp interface <i>interface-name</i>],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>For certain logical interfaces (such as Asynchronous Transfer Mode [ATM], Permanent Virtual Circuit [PVC], or Frame Relay), you cannot determine the correct bandwidth from the hardware. This statement enables you to specify the actual available bandwidth.</p> <p>This statement also enables you to specify the bandwidth for a bypass label switched path (LSP). If you have configured multiple bypasses, this statement is mandatory and is applied to all of the bypass LSPs.</p>
Default	The hardware raw bandwidth is used.
Options	<p><i>bps</i>—Bandwidth in bits per second. You can specify this as an integer value. If you do so, count your zeros carefully, or you can use the abbreviations k (for a thousand), m (for a million), or g (for a billion [also called a thousand million]).</p> <p>Range: Any positive integer</p> <p>Default: 0 (no bandwidth is reserved)</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring the Bandwidth for Bypass LSPs</i>• <i>Configuring Link Protection on Interfaces Used by LSPs</i>• <i>Configuring Bypass LSPs</i>

bypass (Signaled LSP)

Syntax	<pre> bypass <i>bypass-name</i> { bandwidth <i>bps</i>; description <i>text</i>; hop-limit <i>number</i>; no-cspf; path <i>address</i> <strict loose>; priority <i>setup-priority reservation-priority</i>; to <i>address</i>; } </pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection],</p> <p>[edit protocols rsvp interface <i>interface-name</i> link-protection]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>The description option was added in Junos OS Release 10.4.</p>
Description	<p>Enables you to configure specific bandwidth and path constraints for a bypass LSP. It is possible to individually configure multiple bypass LSPs. If you do not configure the bypass LSPs individually, they all share the same path and bandwidth constraints.</p> <p>If you specify the bandwidth, hop-limit, and path statements for the bypass LSP, these values take precedence over the values configured at the [edit protocols rsvp interface <i>interface-name</i> link-protection] hierarchy level. The other attributes (subscription, no-node-protection, and optimize-timer) are inherited from the general constraints.</p>
Options	<p>bypass-name—(Required) Specify a name for the bypass LSP. The name can be up to 64 characters.</p> <p>description—Provides a textual description of the bypass LSP. Enclose any descriptive text that includes spaces in quotation marks (" "). Any descriptive text you include is displayed in the output of the show mpls lsp bypass detail command and has no effect on the operation of the bypass LSP. The description text can be no more than 80 characters in length.</p> <p>to address—(Required) Specify the address for the interface of the immediate next-hop node (for link protection) or the next-next-hop node (for node-link protection). The address specified determines whether this is a link protection bypass or a node-link protection bypass. On multiaccess networks (for example, a LAN), this address is also used to specify which next-hop node is being protected.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

chained-composite-next-hop

Syntax chained-composite-next-hop {
 ingress;
 transit;
 }

Hierarchy Level [edit logical-systems *logical-system-name* routing-options forwarding-table],
 [edit routing-options forwarding-table]

NOTE: The [edit logical-systems] hierarchy level is not supported on the QFX10000 switches.

Release Information Statement introduced in Junos OS Release 12.1.
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.
 Statement introduced in Junos OS Release 15.1 for QFX10000 Series switches.

Description Allows you to configure the chained composite next hops for devices handling ingress or transit traffic in the network.

Chained composite next hops help to facilitate the handling of large volumes of transit traffic in the core of large networks by allowing the router to process much larger volumes of routes. A chained composite next hop allows the router to direct sets of routes sharing the same destination to a common forwarding next hop, rather than having each route also include the destination. In the event that a network destination is changed, rather than having to update all of the routes sharing that destination with the new information, just the shared forwarding next hop is updated with the new information. The chained composite next hops continue to point to this forwarding next hop which now contains the new destination.

On platforms containing only MPCs, such as PTX Series Packet Transport Routers, the MX80 router, the MX2020 router, and the QFX10000 switches, chained composite next hops are enabled by default. On MX Series 3D Universal Edge Routers containing both DPC and MPC FPCs and on T4000 Core Routers containing MPC and FPCs, chained composite next hops are disabled by default and need to be explicitly configured.

NOTE:

- Starting with Junos OS Release 13.3, for chained composite next hop feature to take effect for directly connected PE devices, the chassis must be configured to use the enhanced-ip option (in the case of MX Series 3D Universal Edge Routers containing both DPC and MPC FPCs) or the enhanced-mode option (in the case of T4000 Core Routers containing MPC and FPCs) in the network service mode, in addition to the l3vpn configuration.

For more information about configuring chassis network services, see the *Junos OS Administration Library*.

- On MX Series routers, removing the `chained-composite-next-hop` statement from a PE device configuration causes all IBGP sessions to be torn down and triggers the BGP session to flap as well. A similar change on a router configured as a route reflector does not have any effect, however.

The following is a sample system log message that is generated to record such an event:

```
Nov  6 15:16:21.670 host PE1: rpd[6947]: bgp_peer_mgmt_clear:5995:
NOTIFICATION sent to 10.0.100.2 (External AS 100): code 6 (Cease)
subcode 4 (Administratively Reset), Reason: Management session cleared
BGP neighbor
```

NOTE: Starting in Junos OS Release 14.1, the `transit l3vpn` statement is enabled by default on PTX Series Packet Transport Routers only.

The remaining statements are explained separately. See [CLI Explorer](#).

Default This statement is disabled by default.

Options `ingress`—Enable or disable composite chained next hop for ingress traffic.

`transit`—Enable or disable composite chained next hop for transit traffic.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level `routing`—To view this statement in the configuration.
`routing-control`—To add this statement to the configuration.

keep-multiplier

Syntax	<code>keep-multiplier <i>number</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>Specify a value used by RSVP to calculate timer values for network outages, and declare that a reservation or a neighbor is down. It indicates the number of messages that can be lost before a particular state is declared stale and must be deleted. The keep multiplier directly affects the lifetime of an RSVP state.</p> <p>Starting in Junos OS Release 16.1, for MX Series routers and PTX Series routers, the default RSVP message refresh time, to which this multiplier is applied, has increased from 30 seconds to 20 minutes. The higher message refresh time provides support for RSVP Refresh Reduction Extensions, and improved scaling for MPLS traffic-engineered LSPs, as defined in RFC 2961. The changes are backward compatible so if any nodes in the two-hop neighborhood do not support the higher refresh time, the updated node will automatically fall back to the previous default refresh time to prevent error or tear down messages.</p>
Options	<p><i>number</i>—Multiplier value.</p> <p>Range: 1 through 255</p> <p>Default: 3</p>
	<hr/> <div> NOTE: For MX Series routers and PTX Series routers (running Junos OS release 16.1 or later), this multiplier is applied to a default refresh time of 20 minutes. In earlier Junos OS releases, and for other platforms, the default refresh time remains 30 seconds.</div> <hr/>

Release Information	Statement introduced in Junos OS Release 8.5.
Description	<p>Specify the LSP template. An LSP template is used as the basis for other dynamically generated LSPs. This feature can be used for a number of applications, including point-to-multipoint LSPs, flooding VPLS traffic, configuring ingress replication for IP multicast using MBGP MVPNs, and to enable RSVP automatic mesh. There is no default setting for the label-switched-path-template statement, so you must configure either the default-template using the default-template option, or you must specify the name of your preconfigured LSP template.</p>
Options	<p>default-template—Specify that the default LSP template be used for the dynamically generated LSPs.</p> <p><i>lsp-template-name</i>—Specify the name of an LSP to be used as a template for the dynamically generated LSPs.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

```

Hierarchy Level [edit logical-systems *logical-system-name* protocols rsvp interface *interface-name*],
[edit protocols rsvp interface *interface-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.

Description Enable link protection on the specified interface. Using link protection, you can configure a network to reroute traffic quickly around broken links. To fully enable link protection, you also need to configure the **link-protection** statement at the [edit protocols mpls label-switched-path *lsp-name*] hierarchy level. You can configure single or multiple bypasses for protected interface.

Default Link protection is disabled.

Options **no-node-protection**—Disable node-link protection on the RSVP interface. Link protection remains active. When this option is configured, the router can only initiate a next-hop bypass, not a next-next-hop bypass.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level routing—To view this statement in the configuration.
 routing-control—To add this statement to the configuration.

Related Documentation • *Configuring Link Protection on Interfaces Used by LSPs*

load-balance (Protocols RSVP)

Syntax load-balance {
 bandwidth;
 }

Hierarchy Level [edit logical-systems *logical-system-name* protocols rsvp],
 [edit protocols rsvp]

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Load-balance traffic between RSVP LSPs.

Options **bandwidth**—Load-balance traffic between RSVP LSPs based on the bandwidth configured for each LSP.

Required Privilege Level routing—To view this statement in the configuration.
 routing-control—To add this statement to the configuration.

Related Documentation • *Configuring Load Balancing Across RSVP LSPs*

max-bypasses

Syntax	<code>max-bypasses <i>number</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i>], [edit protocols rsvp interface <i>interface-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Range modified in Junos OS Release 9.3.
Description	Specify the maximum number of dynamic bypass LSPs permitted for protecting this interface. When this option is configured, multiple bypasses for link protection are enabled. Call admission control (CAC) is also enabled. The limit on bypasses configured applies only to dynamically generated bypass LSPs. By default, this option is disabled and only one dynamic bypass LSP is enabled for each interface. If you configure max-bypasses , you must also configure the bandwidth statement.
Options	number —Configure the maximum number of bypass LSPs. If you configure a value of 0, no dynamic bypass LSPs are allowed to be established for the interface. Only static bypass LSPs can be configured. Range: 0 through 99 Default: 1
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the Maximum Number of Bypass LSPs</i>

no-local-reversion

Syntax	local-reversion; no-local-reversion;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced in Junos OS Release 10.4.
Description	Disable RSVP local revertive mode as specified in RFC 4090, <i>Fast Reroute Extensions to RSVP-TE for LSP Tunnels</i> .

NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, **no-local-reversion** is enabled by default, that is, local reversion is not running, and the statement has been deprecated. To enable local reversion, use the **local-reversion** statement.

RSVP local revertive mode is supported on all Juniper Networks routers running Junos OS. It is the default behavior. If you include this statement, the Juniper Networks router uses global revertive mode instead. You might need to disable RSVP local revertive mode on Juniper Networks routers if your network includes equipment that does not support this mode.

The following information can also be found in RFC 4090. Refer to the RFC for additional information. When an LSP fails, the connection can be repaired locally using a traffic protection mechanism such as fast reroute. To restore the LSP to a full working path, RFC 4090 specifies the following strategies:

- Local revertive mode—Upon detecting that the path is restored, the point of local repair (PLR) resignals each of the LSPs that were formerly routed over the restored path. Every LSP successfully resignaled along the restored path is switched back.
- Global revertive mode—The ingress router of each tunnel is responsible for reoptimizing the LSPs that used the failed path. There are several potential reoptimization triggers: RSVP error messages, inspection of OSPF LSAs or IS-IS LSPs, and timers. This re-optimization process can proceed as soon as the failure is detected. It is not tied to the restoration of the failed path.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
---------------------------------	---

node-hello

Syntax	(node-hello no-node-hello);
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Enable node-ID based RSVP hellos globally on all of the RSVP interfaces on the router to allow Juniper Networks routers to interoperate with the equipment of other vendors. By default, the Junos OS uses interface-based RSVP hellos; node-ID based RSVP hellos are disabled. If you have not enabled RSVP node IDs on the router, Junos OS does not accept any node-ID hello packets.
	<p> NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, when using enhanced FRR, node-ID based hellos are enabled by default. Disabling the enhanced fast reroute (FRR) profile by using the no-enhanced-frr-bypass command also disables the node-hello command. To re-enable node hellos after the enhanced FRR profile has been disabled, use the node-hello command.</p> <p> NOTE: If link-protection is enabled, remote node hellos that are initiated by the Point of Local Repair (PLR) to Node Protecting Merge Point (NP-MP) are enabled automatically. Similarly, if no-enhanced-frr-profile is enabled (that is, enhanced FRR is off), remote node hellos are automatically disabled. There is no command to explicitly enable or disable remote-node hellos.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring RSVP Node-ID Hellos • no-enhanced-frr-bypass on page 1717

no-adjacency-down-notification (Protocols IS-IS)

Syntax	no-adjacency-down-notification;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols isis interface <i>interface-name</i>], [edit protocols isis interface <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 8.0.
Description	<p>Disable adjacency down notification for IS-IS to allow for migration from IS-IS to OSPF without disruption of the RSVP neighbors and associated RSVP-signaled label-switched paths (LSPs).</p> <p>Whenever IS-IS is deactivated, the IS-IS adjacencies are brought down. IS-IS signals to RSVP to bring down any RSVP neighbors associated with the IS-IS adjacencies, and this further causes the associated LSPs signaled by RSVP to go down as well.</p> <p>A similar process occurs whenever OSPF is deactivated. The OSPF neighbors are brought down. OSPF signals to RSVP to bring down any of the RSVP neighbors associated with the OSPF neighbors, and this further causes the associated LSPs signaled by RSVP to go down as well.</p> <p>If you need to migrate from IS-IS to OSPF or from OSPF to IS-IS, the internal gateway protocol (IGP) notification to RSVP for an adjacency or neighbor down event needs to be ignored. Using the no-adjacency-down-notification or no-neighbor-down-notification statements, you can disable IS-IS adjacency down notification or OSPF neighbor down notification, respectively, until the migration is complete. The network administrator is responsible for configuring the statements before the migration, and then removing them from the configuration afterward, so that IGP notification can function normally.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• no-neighbor-down-notification on page 1715

no-cspf (Protocols RSVP)

Syntax	no-cspf;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>], [edit protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]
Release Information	Statement introduced in Junos OS Release 7.5.
Description	Disable CSPF computation on all bypass LSPs or on a specific bypass LSP. You need to disable CSPF for link protection to function properly on interarea paths.
Default	CSPF is enabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Disabling CSPF for Bypass LSPs</i>

no-interface-hello

Syntax	no-interface-hello;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Explicitly disable RSVP interface hellos globally on the router.

NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling RSVP interface hellos globally, the **no-interface-hello** command triggers a switch back to the previous profile for all label-switched paths (LSPs.)

This type of configuration might be necessary in networks where the Juniper Networks router has numerous RSVP connections with equipment from other vendors. However, if you disable RSVP interface hellos globally, you can also configure a hello interval on an RSVP interface using the [hello-interval](#) statement. This configuration disables RSVP interface hellos globally but enables RSVP interface hellos on the specified interface. This configuration might be necessary in a heterogeneous network where some devices support RSVP node-ID hellos and other devices support RSVP interface hellos.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring RSVP Node-ID Hellos• hello-interval (Protocols RSVP) on page 1699

no-neighbor-down-notification

Syntax	no-neighbor-down-notification;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ospf area <i>area-id</i> interface <i>interface-name</i>], [edit protocols ospf area <i>area-id</i> interface <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 8.0.
Description	Disable neighbor down notification for OSPF to allow for migration from OSPF to IS-IS without disruption of the RSVP neighbors and associated RSVP-signaled LSPs.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

no-node-id-subobject

Syntax	no-node-id-subobject;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Disable the record route object (RRO) node-ID subobject for compatibility with earlier versions of Junos OS.

NOTE: For Junos OS Release 16.1 running on MX Series or PTX Series routers, the behavior of this statement has changed. On these platforms, rather than disabling the record route object (RRO) node ID sub-object, the **no-node-id-subobject** command triggers a switch back to the previous profile for all label-switched paths (LSPs).

To interoperate with other vendors' equipment, Junos OS supports the RRO node-ID subobject for use in inter-AS link and node protection configurations.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Inter-AS Node and Link Protection</i>

no-p2mp-sublsp

Syntax	no-p2mp-sublsp;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Reject Resv messages that include the S2L_SUB_LSP object. By default, Resv messages that include the S2L_SUB_LSP object are accepted. However, in a network which includes Juniper Networks devices running both Junos OS Release 9.2 and later and Junos OS Release 9.1 and earlier, it is necessary to configure the no-p2mp-sublsp statement on devices running Junos OS Release 9.2 and later to ensure that point-to-multipoint LSPs function properly.
Default	Resv messages that include the S2L_SUB_LSP object are accepted.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Preserving Point-to-Multipoint LSP Functioning with Different Junos OS Releases on page 533

no-enhanced-frr-bypass (Protocols RSVP)

Syntax	no-enhanced-frr-bypass;
Hierarchy Level	[edit protocols rsvp]
Release Information	Statement introduced in Junos OS Release 15.2R1.
Description	<p>Enable no-enhanced-frr-bypass to turn off all Fast reroute (FRR) facility protection enhancements, which includes improved LSP scaling and enhanced RSVP message handling, and reduce the default refresh time to 30 seconds.</p> <p>FRR is enabled by default for MX Series and PTX Series routers starting in Junos OS Release 15.2R1.</p>
Default	This feature, no-enhanced-frr-bypass , is disabled by default. That is, enhanced FRR is enabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>RSVP Refresh Reduction</i>

node-link-protection (Protocols MPLS)

Syntax	node-link-protection;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>lsp-name</i>], [edit protocols mpls label-switched-path <i>lsp-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
Description	Enable node and link protection on the specified LSP. To fully enable node and link protection, you also need to include the link-protection statement at the [edit protocols rsvp interface <i>interface-name</i>] hierarchy level.
Default	Node and link protection is disabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring Node Protection or Link Protection for LSPs</i>• MPLS Feature Support on QFX Series and EX4600 Switches on page 18• <i>Understanding Interprovider and Carrier-of-Carriers VPNs</i>

optimize-timer (Protocols RSVP)

Syntax	<code>optimize-timer <i>seconds</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection], [edit protocols rsvp interface <i>interface-name</i> link-protection]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Configure an optimize timer for a bypass LSP. The optimize timer initiates a periodic optimization process that reshuffles data LSPs among bypass LSPs to achieve the most efficient use of network resources. The optimization process attempts to either minimize the number of bypasses currently in use, minimize the total amount of bandwidth reserved for all bypasses, or both.
Options	<i>seconds</i> —Specify the number of seconds between optimizations. Range: 0 through 65,535 seconds Default: 0 (disabled)
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the Optimization Interval for Bypass LSPs</i>

path (Protocols RSVP)

Syntax	<code>path address <strict loose>;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection],</code> <code>[edit protocols rsvp interface <i>interface-name</i> link-protection bypass <i>bypass-name</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Configure an explicit path (a sequence of strict or loose routes) to control where and how a bypass LSP is established. If multiple bypasses are configured, they all will use the same explicit path.
Default	No path is configured. CSPF automatically calculates the path the bypass LSP takes.
Options	<p>address—IP address of each transit router in the LSP. You must specify the address or hostname of each transit router, although you do not need to list each transit router if its type is loose. As an option, you can include the ingress and egress routers in the path. Specify the addresses in order, starting with the ingress router (optional) or the first transit router, and continuing sequentially along the path until reaching the egress router (optional) or the router immediately before the egress router.</p> <p>Default: If you do not specify any routers explicitly, no routing limitations are imposed on the bypass LSP.</p> <p>loose—(Optional) The next address in the path statement is loose. The LSP can traverse other routers before reaching this router.</p> <p>Default: strict</p> <p>strict—(Optional) The LSP must go to the next address specified in the path statement without traversing other nodes. This is the default.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• <i>Configuring an Explicit Path for Bypass LSPs</i>

peer-interface (Protocols RSVP)

Syntax	<pre>peer-interface <i>peer-interface-name</i> { disable; (aggregate no-aggregate); authentication-key <i>key</i>; dynamic-bidirectional-transport template <i>template</i>; hello-interval <i>seconds</i>; (reliable no-reliable); }</pre>
Hierarchy Level	[edit protocols rsvp]

setup-protection

Syntax	setup-protection;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Description	The facility-backup fast reroute mechanism can provide setup protection for LSPs which are in the process of being signaled. Both point-to-point LSPs and point-to-multipoint LSPs are supported. You should configure the setup-protection statement on each of the routers along the LSP path on which you want to enable LSP setup protection. You should also configure IGP traffic engineering on all of the routers on the LSP path.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring RSVP Setup Protection

soft-preemption (Protocols RSVP)

Syntax	soft-preemption { cleanup-timer <i>seconds</i> ; }
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp preemption], [edit protocols rsvp preemption]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Enable soft preemption to attempt to establish a new path for a preempted LSP before tearing it down.
Options	cleanup-timer —A value of 0 disables soft preemption. Range: 0 through 180 seconds Default: 30 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring MPLS Soft Preemption on page 407

subscription

Syntax

```
subscription percentage {
    ct0 percentage;
    ct1 percentage;
    ct2 percentage;
    ct3 percentage;
}
```

Hierarchy Level [edit logical-systems *logical-system-name* protocols rsvp interface *interface-name*],
 [edit logical-systems *logical-system-name* protocols rsvp interface *interface-name* link-protection],
 [edit protocols rsvp interface *interface-name*],
 [edit protocols rsvp interface *interface-name* link-protection]

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Configure the amount of bandwidth subscribed to a class type (when you have enabled Differentiated Services) or bypass LSP (when you have enabled link protection).
subscription is the percentage of the link bandwidth that can be used for the RSVP reservation process.

Options **ctnumber percentage**—Percentage of the class-type bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type. You can specify bandwidth subscriptions for class types 0 through 3. This option is not available for bypass LSPs.

Range: 0 through 65,000

Default: 100 percent

percentage—Percentage of the class-type or bypass LSP bandwidth allowed for reservations. If you specify a value greater than 100, you are oversubscribing the class type or bypass LSP.

Range: 0 through 65,000

Default: 100 percent

Required Privilege routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

traceoptions (Protocols RSVP)

Syntax	<pre>traceoptions { enhanced-frr ; file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <flag-modifier> <disable>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Enable RSVP-level trace options.
Default	The default RSVP-level trace options are those inherited from the routing protocols traceoptions statement included at the [edit routing-options] hierarchy level.
Options	<p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>enhanced-frr —(Optional) Enable this option to trace internal events and state changes related to the FRR facility protection enhancements associated with the increased RSVP scaling introduced in Junos OS Release 16.1.</p> <p>filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. We recommend that you place RSVP tracing output in the file rsvp-log.</p> <p>files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>Range: 2 through 1000</p> <p>Default: 2 files</p> <p>If you specify a maximum number of files, you must also include the size statement to specify the maximum file size.</p> <p>flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.</p> <ul style="list-style-type: none">• all—All tracing operations• error—All detected error conditions• event—RSVP-related events

- **io-event [detail] [disable]** —Enable tracing of events that occur within the RSVP I/O task; can only be configured for the master routing instance. The trace output is generally independent of routing instance.
- **io-packets [detail] [disable] [receive] [send]** —Enable tracing of messages as they are received from the network or as they are sent out. This flag can be configured independently for each routing instance. Both bundled and individual messages are identified. Use *detail* to show all objects contained in the message. Use *send* and *receive* to limit tracing to outgoing or incoming packets.
- **lmp**—RSVP-LMP interactions
- **packets**—All RSVP packets
- **path**—All path messages
- **pathtear**—PathTear messages
- **resv**—Resv messages
- **resvtear**—ResvTear messages
- **route**—Routing information
- **state**—Session state transitions, including when RSVP-signaled LSPs come up and go down.

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-world-readable—(Optional) Enable only certain users to read the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

world-readable—(Optional) Enable any user to read the log file.

Required Privilege Level	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.

tunnel-services (RSVP)

Syntax	tunnel-services { devices <i>device-names</i> ; }
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols rsvp], [edit protocols rsvp]
Release Information	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Enable ultimate-hop popping on point-to-multipoint LSPs. The Junos OS selects one of the available virtual tunnel (VT) interfaces to de-encapsulate the egress traffic. By default, the selection process is performed automatically.
Default	Ultimate-hop popping is disabled.
Options	devices <i>device-names</i> —Specify which VT interfaces are used to handle the RSVP traffic. Range: 0 to 8 devices
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Enabling Ultimate-Hop Popping on Point-to-Multipoint LSPs</i>

ultimate-hop-popping

Syntax	ultimate-hop-popping;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols mpls], [edit logical-systems <i>logical-system-name</i> protocols mpls label-switched-path <i>label-switched-path-name</i>], [edit protocols mpls], [edit protocols mpls label-switched-path <i>label-switched-path-name</i>]
Release Information	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
Description	<p>Enable ultimate-hop popping on LSPs. Configure this statement on the device at the LSP ingress. In ultimate-hop popping, the MPLS label is popped from the IP packet at the PE router. The IP address is checked in a second address lookup (also at the PE router), and then the packet is forwarded to its destination.</p> <p>Be aware of the following platform requirements and restrictions:</p> <ul style="list-style-type: none">• UHP LSPs using VT interfaces—Supported on all M Series, MX Series, T Series, and TX Matrix routers.• UHP LSPs using LSI interfaces—Supported on MX 3D Series routers only.• UHP LSP requirements for the egress PE device—For M Series and T Series routers, a VT interface is needed.• UHP LSPs and Layer 3 VPNs—UHP LSPs are supported for Layer 3 VPNs configured on MX 3D Series routers only.• UHP LSPs and VPLS—UHP LSPs are supported for VPLS configured on MX 3D Series routers only. You must configure the <i>no-tunnel-services</i> statement at the [edit routing-instances <i>routing-instance-name</i> protocols vpls] hierarchy level.
Default	Ultimate-hop popping is disabled by default on LSPs. Penultimate-hop popping is the default behavior. In penultimate-hop popping, the final MPLS label is popped from the IP packet at the last provider router in the network before being forwarded to the PE router. The PE router receives the packet and checks the IP address, and then the packet is forwarded to its destination.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

 Statement introduced for BGP in Junos OS Release 8.0.
 Statement introduced in Junos OS Release 9.0 for EX Series switches.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
 Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.
 Statement introduced for BMP in Junos OS Release 13.3.
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Configure an authentication algorithm type.

NOTE: Keep the following points in mind when you configure the authentication algorithm in an IPsec proposal:

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, an error occurs and the tunnel is not established in this scenario. For example, if one end of the tunnel contains router 1 configured with the authentication algorithm as hmac-sha-256-128 and the other end of the tunnel contains router 2 configured with the authentication algorithm as hmac-md5-96, the VPN tunnel is not established.

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, and when one end of the tunnel contains two IPsec proposals to check whether a less secure algorithm is selected or not, an error occurs and the tunnel is not established. For example, if you configure two authentication algorithms for an IPsec proposal as `hmac-sha-256-128` and `hmac-md5-96` on one end of the tunnel, router 1, and if you configure the algorithm for an IPsec proposal as `hmac-md5-96` on the other end of the tunnel, router 2, the tunnel is not established and the number of proposals mismatch.
 - When you configure two IPsec proposals at both ends of a tunnel, such as the `authentication-algorithm hmac-sha-256-128` and `authentication-algorithm hmac-md5-96` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 1 (with the algorithms in two successive statements to specify the order), and the `authentication-algorithm hmac-md5-96` and `authentication-algorithm hmac-sha-256-128` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 2 (with the algorithms in two successive statements to specify the order, which is the reverse order of router 1), the tunnel is established in this combination as expected because the number of proposals is the same on both ends and they contain the same set of algorithms. However, the authentication algorithm selected is `hmac-md5-96` and not the stronger algorithm of `hmac-sha-256-128`. This method of selection of the algorithm occurs because the first matching proposal is selected. Also, for a default proposal, regardless of whether the router supports the Advanced Encryption Standard (AES) encryption algorithm, the `3des-cbc` algorithm is chosen and not the `aes-cfb` algorithm, which is because of the first algorithm in the default proposal being selected. In the sample scenario described here, on router 2, if you reverse the order of the algorithm configuration in the proposal so that it is the same order as the one specified on router 1, `hmac-sha-256-128` is selected as the authentication method.
 - You must be aware of the order of proposals in an IPsec policy at the time of configuration if you want the matching of proposals to happen in a certain order of preference, such as the strongest algorithm to be considered first when a match is made when both policies from the two peers have a proposal.
-

- Options** *algorithm*—Specify one of the following types of authentication algorithms:
- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
 - **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
 - **md5**—Message digest 5.
- Default:** hmac-sha-1-96

NOTE: The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

deaggregate

Syntax deaggregate | no-deaggregate;

Hierarchy Level [edit logical-systems *logical-system-name* protocols ldp],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],
[edit protocols ldp],
[edit routing-instances *routing-instance-name* protocols ldp]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Control forwarding equivalence class (FEC) deaggregation on the router. The use of the **deaggregate** statement in LDP is a standard practice that we recommend for LDP deployments.

Default Deaggregation is disabled on the router.

Options **deaggregate**—Deaggregate FECs.
no-deaggregate—Aggregate FECs.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

disable (Protocols LDP)

Syntax	disable;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options graceful-restart], [edit protocols ldp graceful-restart], [edit protocols ldp interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> routing-options graceful-restart]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Explicitly disable LDP on an interface, or explicitly disable LDP graceful restart.
Default	LDP is enabled on interfaces configured with the LDP interface statement. LDP graceful restart is automatically enabled when graceful restart is enabled under the [edit routing-options] hierarchy level.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Enabling and Disabling LDP</i> • <i>Configuring LDP Graceful Restart</i>

dod-request-policy

Syntax	<code>dod-request-policy <i>dod-request-policy-name</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit protocols ldp]
Release Information	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify the name of the LDP downstream on demand request policy. LDP sends label request messages only for those FECs matching in the downstream on demand request policy.
Options	<i>dod-request-policy-name</i> —Specify the name of the downstream on demand request policy.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring LDP Downstream on Demand</i>

downstream-on-demand

Syntax	<code>downstream-on-demand;</code>
Hierarchy Level	[edit logical systems <i>logical-system-name</i> protocols ldp session <i>session-address</i>], [edit protocols ldp session <i>session-address</i>]
Release Information	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Enable LDP downstream on demand on the LDP session. LDP is widely deployed in downstream unsolicited advertisement mode. As service providers integrate the access and aggregation networks into a single MPLS domain, LDP downstream on demand is needed to distribute the bindings between access and aggregation networks to minimize the workload for the access node (AN) control plane and to avoid the storage of tens of thousands of label bindings from upstream aggregation nodes.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring LDP Downstream on Demand</i>

ecmp

Syntax	<code>ecmp;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp oam bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>address</i> bfd-liveness-detection], [edit protocols ldp oam bfd-liveness-detection], [edit protocols ldp oam fec <i>address</i> bfd-liveness-detection]
Release Information	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.
Description	Allows LDP to establish BFD sessions for all ECMP paths configured for the specified FEC. If you configure the ecmp statement, you must also configure the periodic-traceroute statement for the specified FEC. If you do not do so, the commit operation fails. You can configure the periodic-traceroute statement at the global hierarchy level ([edit protocols ldp oam]) while only configuring the ecmp statement for a specific FEC ([edit protocols ldp oam fec <i>address</i> bfd-liveness-detection]).
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> Configuring ECMP-Aware BFD for LDP LSPs

egress-policy

Syntax	<code>egress-policy [<i>policy-names</i>];</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Control the prefixes advertised into LDP.
Default	Only the loopback address is advertised.
Options	<i>policy-names</i> —Name of one or more routing policies.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring the Prefixes Advertised into LDP from the Routing Table</i>

explicit-null (Protocols LDP)

Syntax	explicit-null;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Advertise label 0 to the egress router of a label-switched path (LSP).
Default	If you do not include the explicit-null statement in the MPLS configuration, label 3 (implicit null) is advertised.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring MPLS and LDP to Pop the Label on the Ultimate-Hop Router</i>

export (Protocols LDP)

Syntax	<code>export [<i>policy-names</i>];</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Apply policy filters to outbound LDP label bindings. Filters are applied to all label bindings from all neighbors.
Options	<i>policy-names</i> —Name of one or more routing policies.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Filtering Outbound LDP Label Bindings</i>

failure-action (Protocols LDP)

Syntax	<pre>failure-action { remove-nexthop; remove-route; }</pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp oam bfd-livenessss-detection], [edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>address</i> bfd-livenessss-detection], [edit protocols ldp oam bfd-livenessss-detection], [edit protocols ldp oam fec <i>address</i> bfd-livenessss-detection]</p>
Release Information	Statement introduced in Junos OS Release 9.4.
Description	Configure route and next-hop properties in the event of a BFD session failure event on an LDP LSP. The failure event could be an existing BFD session that has gone down or could be a BFD session that never came up. LDP adds back the route or next hop when the relevant BFD session comes back up.
Options	<p>remove-nexthop—Remove a route corresponding to a next hop of the LSP's route at the ingress node when a BFD session failure event is detected.</p> <p>remove-route—Remove the route corresponding to an LSP from the appropriate routing tables when a BFD session failure event is detected. If the LSP is configured with ECMP and a BFD session corresponding to any path goes down, the route is removed.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

graceful-restart (Protocols LDP)

Syntax graceful-restart {
 disable;
 helper-disable;
 maximum-neighbor-recovery-time *value*;
 reconnect-time *seconds*;
 recovery-time *value*;
 }

Hierarchy Level [edit logical-systems *logical-system-name* protocols ldp],
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols ldp],
 [edit protocols ldp],
 [edit routing-instances *routing-instance-name* protocols ldp]

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Configure LDP graceful restart on the LDP master protocol instance or for a specific routing instance.

NOTE: When you alter the graceful restart configuration at either the [edit routing-options graceful-restart] or [edit protocols ldp graceful-restart] hierarchy levels, any running LDP session is automatically restarted to apply the graceful restart configuration. This behavior mirrors the behavior of BGP when you alter its graceful restart configuration.

Required Privilege routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

Related Documentation • *Configuring LDP Graceful Restart*

hello-interval (Protocols LDP)

Syntax	hello-interval <i>seconds</i> ;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> protocols ldp targeted-hello], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp targeted-hello], [edit protocols ldp interface <i>interface-name</i>], [edit protocols ldp targeted-hello], [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols ldp targeted-hello]
Release Information	Statement introduced before Junos OS Release 7.4. Support for LDP targeted hellos added in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Control the LDP timer that regulates how often hello messages are sent. You can control the rate both link hello messages and targeted hello messages are sent depending on the hierarchy level at which you configure the hello-interval statement.
Options	seconds —Length of time between transmission of hello packets. Range: 1 through 65,535 seconds Default: 5 seconds for link hello messages, 15 seconds for targeted hello messages
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring the LDP Timer for Hello Messages</i>

helper-disable (LDP)

Syntax	helper-disable;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Disable helper mode for LDP graceful restart. When helper mode is disabled, a router cannot help a neighboring router that is attempting to restart LDP.
Default	Helper mode is enabled by default on all routing protocols (including LDP) that support graceful restart.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring LDP Graceful Restart</i>

holddown-interval

Syntax	<code>holddown-interval <i>holddown-interval</i>;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp oam bfd-livenesss-detection],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols ldp oam fec <i>address</i></code> <code> <i>bfd-livenesss-detection</i>],</code> <code>[edit protocols ldp oam bfd-livenesss-detection],</code> <code>[edit protocols ldp oam fec <i>address</i> <i>bfd-livenesss-detection</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.4.
Description	Specify how long the BFD session should be up before adding the route or next hop. Specifying a time of 0 seconds causes the route or next hop to be added as soon as the BFD session comes back up.
Options	<i>holddown-interval</i> —Number of seconds the BFD session should remain up before adding the route or next hop. Default: 0 seconds Range: 0 through 65,535 seconds
Required Privilege Level	routing —To view this statement in the configuration. routing-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring the Holddown Interval for the BFD Session</i>

hold-time (Protocols LDP)

Syntax	<code>hold-time seconds;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> protocols ldp targeted-hello],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code> ldp interface <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols</code> <code> ldp targeted-hello],</code> <code>[edit protocols ldp interface <i>interface-name</i>],</code> <code>[edit protocols ldp targeted-hello],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp targeted-hello]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for LDP targeted hellos added in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	Specify how long an LDP node should wait for a hello message before declaring a neighbor to be down. This value is sent as part of a hello message so that each LDP node tells its neighbors how long to wait. You can specify times for both link hello messages and targeted hello messages depending on the hierarchy level at which you configure the hold-time statement.
Options	<p>seconds—Hold-time value.</p> <p>Range: 1 through 65,535 seconds</p> <p>Default: 15 seconds for link hello messages, 45 seconds for targeted hello messages</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the Delay Before LDP Neighbors Are Considered Down</i>

ignore-lsp-metrics

Syntax	ignore-lsp-metrics;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ospf traffic-engineering shortcuts], [edit protocols ospf traffic-engineering shortcuts]
Release Information	Statement introduced in Junos OS Release 7.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	<p>Cause OSPF to ignore the RSVP LSP metric.</p> <p>Some other vendors use an OSPF metric of 1 for the loopback address. Juniper Networks routers use an OSPF metric of 0 for the loopback address. This can cause interoperability problems when you configure LDP tunneling over RSVP LSPs in heterogeneous networks.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Enabling LDP over RSVP-Established LSPs in Heterogeneous Networks</i>

igp-synchronization

Syntax	<code>igp-synchronization holddown-interval <i>seconds</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
Release Information	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Configure the time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational. For large networks with numerous FECs, you might need to configure a longer value to allow enough time for the LDP label databases to be exchanged.
Options	holddown-interval <i>seconds</i> —Time the LDP waits before informing the IGP that the LDP neighbor and session for an interface are operational. Default: 10 seconds Range: 10 through 60 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring LDP Synchronization with the IGP on the Router</i>

import (Protocols LDP)

Syntax	<code>import [<i>policy-names</i>];</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> protocols ldp],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp],</code> <code>[edit protocols ldp],</code> <code>[edit routing-instances <i>routing-instance-name</i> protocols ldp]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Apply policy filters to received LDP label bindings. Filters are applied to all label bindings from all neighbors.
Options	<i>policy-names</i> —Name of one or more routing policies.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Filtering Inbound LDP Label Bindings</i>

ingress-policy

Syntax	<code>ingress-policy [<i>ingress-policy-names</i>];</code>
Hierarchy Level	[edit logical-system <i>logical-system-name</i> protocols ldp entropy-label], [edit logical-system <i>logical-system-name</i> protocols ldp oam], [edit protocols ldp entropy-label], [edit protocols ldp oam]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced at the [edit protocols ldp entropy-label] hierarchy level in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.
Description	Configure an LDP ingress policy for either the entropy label or Operation, Administration, and Management (OAM). For OAM, configure the ingress policy to choose which forwarding equivalence classes (FECs) need to have OAM enabled. If the FEC passes through the policy or if the FEC is explicitly configured, OAM is enabled for a FEC. For FECs chosen using a policy, the BFD parameters configured under [edit protocols ldp oam bfd-liveness-detection] are applied.
Options	<i>ingress-policy-names</i> —Specify the names of the ingress policies.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring OAM Ingress Policies for LDP on page 698 • Configuring the Entropy Label for LSPs on page 444

interface (Protocols LDP)

Syntax	<pre>interface <i>interface-name</i> { disable; hello-interval <i>seconds</i>; hold-time <i>seconds</i>; transport-address (interface loopback); }</pre>

mldp-inband-signalling (Protocols Multipoint LDP)

Syntax	<pre>mldp-inband-signalling { <i>policy</i> <i>policy-name</i>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols pim], [edit protocols pim],
Release Information	Statement introduced in Junos OS Release 13.2.
Description	<p>Multipoint LDP (M-LDP) in-band signaling enables you to carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.</p> <p>On the label-edge router (LER), enable PIM to use M-LDP in-band signaling for the upstream neighbors when the LER does not detect a PIM upstream neighbor. On the egress nodes, configure the MPLS LSP root in the PIM configuration, using the policy statement.</p> <p>The remaining statement is explained separately. See CLI Explorer.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring Multipoint LDP In-Band Signaling for Point-to-Multipoint LSPs</i>

mofrr-asm-starg (Multicast-Only Fast Reroute in a PIM Domain)

Syntax	<code>mofrr-asm-starg;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit logical-systems <i>logical-system-name</i> routing-options multicast stream-protection], [edit routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit routing-options multicast stream-protection]
Release Information	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.
Description	Enable mofrr-asm-starg to include any-source multicast (ASM) for (*,G) joins in the Multicast-only fast reroute (MoFRR).

NOTE: **mofrr-asm-starg** applies to IP-PIM only. When enabled for group G, *,G will undergo MoFRR as long as there is no S#,G for Group G. In other words, *,G MoFRR will cease and any old states will be torn down when S#,G is created. Note too, that **mofrr-asm-starg** is not supported for mLDP (since mLDP itself does not support *,G).

In a PIM domain with MoFRR enabled, the default for **stream-protection** is S,G routes only.

Context: Multicast-only fast reroute (MoFRR) can be used to reduce traffic loss in a multicast distribution tree in the event of link down. To employ MoFRR, a downstream router is configured with an alternative path back towards the source, over which it receives a backup live stream of the same multicast traffic. That router propagates the same (S,G) join toward both upstream neighbors in order to create duplicate multicast trees. If a failure is detected on the primary tree, the router switches to the backup tree to prevent packet loss.

Required Privilege	routing—To view this statement in the configuration.
Level	routing-control—To add this statement to the configuration.

mofrr-disjoint-upstream-only (Multicast-Only Fast Reroute in a PIM Domain)

Syntax	<code>mofrr-disjoint-upstream-only;</code>
Hierarchy Level	<code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-options multicast stream-protection],</code> <code>[edit routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection],</code> <code>[edit routing-options multicast stream-protection]</code>
Release Information	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.
Description	<p>When you configure multicast-only fast reroute (MoFRR) in a PIM domain, allow only a disjoint RPF (an RPF on a separate plane) to be selected as the backup RPF path.</p> <p>In a multipoint LDP MoFRR domain, the same label is shared between parallel links to the same upstream neighbor. This is not the case in a PIM domain, where each link forms a neighbor. The mofrr-disjoint-upstream-only statement does not allow a backup RPF path to be selected if the path goes to the same upstream neighbor as that of the primary RPF path. This ensures that MoFRR is triggered only on a topology that has multiple RPF upstream neighbors.</p>
Required Privilege Level	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Understanding Multicast-Only Fast Reroute</i>• <i>Understanding Multicast-Only Fast Reroute on Switches</i>• <i>Example: Configuring Multicast-Only Fast Reroute in a PIM Domain</i>• <i>Example: Configuring Multicast-Only Fast Reroute in a PIM Domain on Switches</i>• <i>Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain</i>

mofrr-no-backup-join (Multicast-Only Fast Reroute in a PIM Domain)

Syntax	mofrr-no-backup-join;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit logical-systems <i>logical-system-name</i> routing-options multicast stream-protection], [edit routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit routing-options multicast stream-protection]
Release Information	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.
Description	When you configure multicast-only fast reroute (MoFRR) in a PIM domain, prevent sending join messages on the backup path, but retain all other MoFRR functionality.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Understanding Multicast-Only Fast Reroute</i> • <i>Understanding Multicast-Only Fast Reroute on Switches</i> • <i>Example: Configuring Multicast-Only Fast Reroute in a PIM Domain</i> • <i>Example: Configuring Multicast-Only Fast Reroute in a PIM Domain on Switches</i> • <i>Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain</i>

mofrr-primary-path-selection-by-routing (Multicast-Only Fast Reroute)

Syntax	mofrr-primary-path-selection-by-routing;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit logical-systems <i>logical-system-name</i> routing-options multicast stream-protection], [edit routing-instances <i>routing-instance-name</i> routing-options multicast stream-protection], [edit routing-options multicast stream-protection]
Release Information	Statement introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.
Description	<p>MoFRR is supported on both equal-cost multipath (ECMP) paths and non-ECMP paths. Unicast loop-free alternate (LFA) routes need to be enabled to support MoFRR on non-ECMP paths. LFA routes are enabled with the link-protection statement in the interior gateway protocol (IGP) configuration. When you enable link protection on an OSPF or IS-IS interface, Junos OS creates a backup LFA path to the primary next hop for all destination routes that traverse the protected interface.</p> <p>In the context load balancing, MoFRR prioritizes the disjoint backup in favor of load balancing the available paths.</p> <p>For Junos OS releases before 15.1R7, for both ECMP and Non-ECMP scenarios, the default MoFRR behavior was <i>sticky</i>, that is, if the Active link went down, the Active Path selection would give preference to Backup Path for the transition. The Active Path would not follow the unicast selected gateway</p> <p>Starting in Junos OS Release 15.1R7 however, the default behavior for non-EMCP scenarios is to be <i>nonsticky</i>, that is, the selection of Active Path strictly follows unicast selected gateway. MoFRR no longer chooses a unicast LFA path to become the MoFRR Active path; only a unicast LFA path can be selected to become MoFRR Backup.</p>
Default	By default, the backup path gets promoted to be the primary path when MoFRR is configured in a PIM domain.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Understanding Multicast-Only Fast Reroute</i>• <i>Understanding Multicast-Only Fast Reroute on Switches</i>• <i>Example: Configuring Multicast-Only Fast Reroute in a PIM Domain</i>• <i>Example: Configuring Multicast-Only Fast Reroute in a PIM Domain on Switches</i>• <i>Example: Configuring Multicast-Only Fast Reroute in a Multipoint LDP Domain</i>

no-forwarding

Syntax	no-forwarding;
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Do not add ingress routes to the inet.0 routing table even if traffic-engineering bgp-igp (configured at the [edit protocols mpls] hierarchy level) is enabled.
Default	The no-forwarding statement is disabled. Ingress routes are added to the inet.0 routing table instead of the inet.3 routing table when traffic-engineering bgp-igp is enabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Hierarchy Level [edit logical-systems *logical-system-name* protocols *ldp*]
[edit protocols *ldp*]

Release Information Statement introduced in Junos OS Release 7.6.
lsp-ping-interval option introduced in Junos OS Release 9.4.

Description Configure Operation, Administration, and Maintenance (OAM) and Bidirectional Forwarding Detection (BFD) protocol for LDP.

Options ***fec fec-address***—Specify the forwarding equivalence class (FEC) address. You must either specify a FEC address or configure an OAM ingress policy to ensure that the BFD session comes up.

lsp-ping-interval *seconds*—Specify the duration of the LSP ping interval in seconds. To issue a ping on an LDP-signaled LSP, use the **ping mpls ldp** command.

Default: 60 seconds

Range: 30 through 3,600 seconds

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

policy (Multicast-Only Fast Reroute)

Syntax `policy policy-name;`

Hierarchy Level [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast stream-protection],
[edit logical-systems *logical-system-name* routing-options multicast stream-protection],
[edit routing-instances *routing-instance-name* routing-options multicast stream-protection],
[edit routing-options multicast stream-protection]

Release Information Statement introduced in Junos OS Release 14.1.
Statement introduced in Junos OS Release 17.4R1 for QFX Series switches.

Description When you configure multicast-only fast reroute (MoFRR), apply a routing policy that filters for a restricted set of multicast streams to be affected by your MoFRR configuration. You can apply filters that are based on source or group addresses.

For example:

```
routing-options {
  multicast {
    stream-protection {
      policy mofrr-select;
    }
  }
}
policy-statement mofrr-select {
  term A {
    from {
      source-address-filter 225.1.1.1/32 exact;
    }
    then {
      accept;
    }
  }
  term B {
    from {
      source-address-filter 226.0.0.0/8 orlonger;
    }
    then {
      accept;
    }
  }
  term C {
    from {
      source-address-filter 227.1.1.0/24 orlonger;
      source-address-filter 227.4.1.0/24 orlonger;
      source-address-filter 227.16.1.0/24 orlonger;
    }
    then {
      accept;
    }
  }
}
```

```

term D {
  from {
    source-address-filter 227.1.1.1/32 exact;
  }
  then {
    reject; #MoFRR disabled
  }
}
term E {
  from {
    route-filter 227.1.1.0/24 orlonger;
  }
  then accept;
}
...
}

```

policy (Protocols Multipoint LDP)

Syntax	<code>policy <i>policy-name</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols pim mldp-inband-signalling], [edit protocols pim mldp-inband-signalling]
Release Information	Statement introduced in Junos OS Release 13.2.
Description	<p>Multipoint LDP (M-LDP) in-band signaling enables you to carry multicast traffic across an existing IP/MPLS backbone, while avoiding the use of PIM in the provider core.</p> <p>On the egress nodes of the point-to-multipoint LSP, specify an M-LDP join translation filter policy where PIM messages are translated into M-LDP FEC bindings. The policy statement is needed when internal BGP (IBGP) is not available in the core site or to override IBGP-based LSP root detection.</p> <p>The filter policy is configured at the [edit policy-options] hierarchy level. The policy generally specifies one or more source-address filters and the point-to-multipoint LDP root IP address using the p2mp-lsp-root policy action.</p>
Options	<i>policy-name</i> —Name of a policy configured at the [edit policy-options] hierarchy level.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring Multipoint LDP In-Band Signaling for Point-to-Multipoint LSPs</i>

preference (Protocols LDP)

Syntax	<code>preference <i>preference</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit protocols ldp interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit protocols ldp interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Set the route preference level for LDP routes.
Options	<i>preference</i> —Preferred value. Range: 0 through 255 Default: 9
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring LDP Route Preferences</i>

reconnect-time

Syntax	<code>reconnect-time seconds;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
Release Information	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify the length of time required to reestablish a Label Distribution Protocol (LDP) session after graceful restart.
Options	seconds —Time required for reconnection. Range: 30 through 300 Default: 60 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring LDP Graceful Restart on MPLS Applications Feature Guide</i>• <i>Configuring Graceful Restart Options for LDP</i>

recovery-time

Syntax	<code>recovery-time seconds;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart], [edit protocols ldp graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ldp graceful-restart]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify the amount of time a router waits for LDP to restart gracefully.
Options	seconds —Configure the recovery time, in seconds. Range: 120 through 1800 seconds Default: 140 seconds
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

session-protection

Syntax	<code>session-protection { timeout <i>seconds</i>; }</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
Description	Configure when an LDP session is torn down and resignaled after the router stops receiving hello messages from a neighboring router. You might want to modify this behavior to prevent an LDP session from being unnecessarily terminated and reestablished. The LDP session remains up for the duration specified as long as the routers maintain IP network connectivity.
Options	timeout <i>seconds</i> —Time in seconds before the LDP session is torn down and resignaled. Range: 1 through 65,535 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

targeted-hello

Syntax	targeted-hello { hello-interval <i>seconds</i> ; hold-time <i>seconds</i> ; }
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
Release Information	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify the LDP timer and LDP hold time for targeted hellos.
Options	The remaining statements are explained separately. See CLI Explorer .
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the LDP Timer for Hello Messages</i> • <i>Configuring the Delay Before LDP Neighbors Are Considered Down</i>

traceoptions (Protocols LDP)

Syntax	<pre>traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <flag-modifier> <disable>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]
Release Information	Statement introduced before Junos OS Release 7.4. match-on address option for the filter flag modifier added in Junos OS Release 10.4. nsr-synchronization and p2mp-nsr-synchronization operations for flag statement introduced in Junos OS Release 13.3. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Specify LDP protocol-level trace options.
Default	The default LDP protocol-level trace options are inherited from the routing protocols traceoptions statement included at the [edit routing-options] hierarchy level.
Options	<p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory ldp-log. We recommend that you place LDP tracing output in the file ldp-log.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>Range: 2 through 1000</p> <p>Default: 2 files</p> <p>If you specify a maximum number of files, you must also include the size statement to specify the maximum file size.</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.</p> <ul style="list-style-type: none">• address—Operation of address and address withdrawal messages• binding—Label-binding operations

- **error**—Error conditions
- **event**—Protocol events
- **initialization**—Operation of initialization messages
- **label**—Operation of label request, label map, label withdrawal, and label release messages
- **notification**—Operation of notification messages
- **nsr-synchronization**—Nonstop active routing synchronization events
- **p2mp-nsr-synchronization**—Point-to-multipoint nonstop active routing synchronization events
- **packets**—Equivalent to setting **address**, **initialization**, **label**, **notification**, and **periodic** flags (see also the **filter** flag modifier)
- **path**—Label-switched path operations
- **periodic**—Operation of hello and keepalive messages
- **route**—Operation of route messages
- **state**—Protocol state transitions

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable this trace flag.
- **filter**—Filter to apply to this flag. The **filter** flag modifier can be applied only to the **route**, **path**, and **binding** flags. This flag modifier has the following options:
 - **match-on**—Match on argument specified. The **match-on** option has the following suboptions:
 - **address**—Filter based on the source and destination addresses of packets. Available for the **packets** flag option only.
 - **fec**—Filter based on the FEC associated with the traced object.
 - **policy policy-name**—Specify the filter policy.
 - **receive**—Packets being received.
 - **send**—Packets being transmitted.

no-world-readable—(Optional) Prevent all users from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

world-readable—(Optional) Enable any user to read the log file.

Required Privilege Level	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.

traffic-statistics (Protocols LDP)

Syntax	<pre>traffic-statistics { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; interval <i>seconds</i>; no-penultimate-hop; }</pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit routing-instances <i>routing-instance-name</i> protocols ldp]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	LDP traffic statistics display the amount of traffic passed through a router for a particular FEC.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the LDP statistics operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.</p> <p>files <i>number</i>—(Optional) Maximum number of LDP statistics files. When a statistics file named ldp-stat reaches its maximum size, it is renamed ldp-stat.0, then ldp-stat.1, and so on, until the maximum number of LDP statistics files is reached. Then the oldest file is overwritten.</p> <p>Range: 2 through 1000 Default: 2 files</p> <p>If you specify a maximum number of files, you also must include the size statement to specify the maximum file size.</p> <p>interval <i>seconds</i>—(Optional) Specify the interval at which the statistics are polled and written to the file. Default: 300 seconds (5 minutes)</p> <p>no-penultimate-hop—(Optional) Do not collect traffic statistics on the penultimate hop router.</p> <p>no-world-readable—(Optional) Prevent all users from reading the log file.</p> <p>size <i>size</i>—(Optional) Maximum size of each statistics file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a statistics file named ldp-stat reaches this size, it is renamed ldp-stat.0. When ldp-stat again reaches this size, ldp-stat.0 is renamed ldp-stat.1 and ldp-stat is renamed ldp-stat.0. This renaming scheme continues until the maximum number of statistics files is reached. Then the oldest statistics file is overwritten.</p> <p>Syntax: xk to specify KB, xm to specify MB, or xg to specify GB</p>

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

If you specify a maximum file size, you also must also include the **files** statement to specify the maximum number of files.

world-readable—(Optional) Enable log file access for all users.

Required Privilege	routing—To view this statement in the configuration.
Level	routing-control—To add this statement to the configuration.

Related Documentation	<ul style="list-style-type: none">• <i>Collecting LDP Statistics</i>

transport-address

Syntax	<code>transport-address (interface router-id);</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> protocols ldp], [edit logical-systems <i>logical-system-name</i> protocols ldp interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ldp], [edit protocols ldp], [edit protocols ldp interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols ldp interface <i>interface-name</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	<p>Enables you to configure the IP address used to specify the TCP session for the LDP session. Routers must first establish a TCP session between one another before they can establish an LDP session. The TCP session enables the routers to exchange the label advertisements needed for the LDP session. To establish the TCP session, each router must learn the other router's transport address. The transport address is an IP address used to identify the TCP session over which the LDP session will run.</p>
Default	<code>router-id</code>
Options	<p>interface—The first IP address on the interface is used as the transport address for any LDP sessions to neighbors that can be reached over that interface. You cannot specify the interface option when there are multiple parallel links to the same LDP neighbor, because the LDP specification requires that the same transport address be advertised on all interfaces to the same neighbor. If LDP detects multiple parallel links to the same neighbor, it disables interfaces to that neighbor one by one until the condition is cleared, either by disconnecting the neighbor on an interface or by specifying the router-id option.</p> <p>router-id—The router identifier is used as the transport address. Unless otherwise configured, the router identifier is the loopback address.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <i>Specifying the Transport Address Used by LDP</i>

version (BFD)

Syntax	version (0 1 automatic);

Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers (ethernet , vlan-ccc , and vlan-tcc options only). Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers. Only the atm-ccc-cell-relay and atm-ccc-vc-mux options are supported on ACX Series routers. Statement introduced in Junos OS Release 17.3R1 for QFX10000 Series switches (ethernet-ccc and vlan-ccc options only).
Description	Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.
Options	<p>atm-ccc-cell-relay—Use ATM cell-relay encapsulation.</p> <p>atm-ccc-vc-mux—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.</p> <p>atm-cisco-nlpid—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the inet family only.</p> <p>atm-mlppp-llc—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.</p> <p>atm-nlpid—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the inet family only.</p> <p>atm-ppp-llc—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.</p> <p>atm-ppp-vc-mux—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.</p>

atm-snap—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

atm-tcc-snap—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

atm-tcc-vc-mux—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

atm-vc-mux—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the **inet** family only.

ether-over-atm-llc—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

ether-vpls-over-atm-llc—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

ether-vpls-over-fr—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

NOTE: The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

ether-vpls-over-ppp—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

ethernet—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

ethernet-ccc—Use Ethernet CCC encapsulation on Ethernet interfaces.

ethernet-vpls—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

NOTE: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

ethernet-vpls-fr—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

frame-relay-ccc—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

frame-relay-ether-type—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

frame-relay-ether-type-tcc—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

frame-relay-ppp—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the **ppp** family only.

frame-relay-tcc—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

gre-fragmentation—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet's size exceeds the tunnel's maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

multilink-frame-relay-end-to-end—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

multilink-ppp—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

ppp-over-ether—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

ppp-over-ether-over-atm-llc—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

vlan-bridge—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

vlan-ccc—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

vlan-vci-ccc—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

vlan-tcc—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

vlan-vpls—Use Ethernet VLAN encapsulation on VPLS circuits.

vxlan—Use VXLAN data plane encapsulation for EVPN.

Required Privilege Level	interface —To view this statement in the configuration. interface-control —To add this statement to the configuration.

Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 11.1 for EX Series switches. Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers (flexible-ethernet-services , ethernet-ccc , and ethernet-tcc options only).
Description	For M Series, MX Series, QFX Series, T Series, PTX Series, specify the physical link-layer encapsulation type. For SRX Series, specify logical link layer encapsulation.
	<div>  NOTE: Not all encapsulation types are supported on the switches. See the switch CLI. </div>
Default	ppp —Use serial PPP encapsulation.

Physical Interface Options and Logical Interface Options

[Warning: element unresolved in stylesheets: <title> (in <config-options>). This is probably a new element that is not yet supported in the stylesheets.]

Physical Interface Options and Logical Interface Options

For physical interfaces:

NOTE: Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on EX Series switches.

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.
- **atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).
- **cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
 - CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.
 - TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.
- **cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.
- **ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.
- **ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDUs as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.
- **ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

- **ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.
- **ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.
- **ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.
- **ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.
- **extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the **ccc** family only.
- **extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.
- **extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.
- **extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.
- **extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the **ccc** family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.
- **extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

- **extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

NOTE: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

- **flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.
- **flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.
- **frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.
- **frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.
- **frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

NOTE: When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

- **frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

- **frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the **ccc** family only.
- **frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.
- **multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.
-
- **ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.
- **ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.
- **ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.
- **vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the **ccc** family only.

- **vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.
- **vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:**

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
 - Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure **family inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.
-

For logical interfaces:

- **frame-relay**—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.
- **multilink-frame-relay-uni-nni**—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.
- **ppp**—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.
- **ppp-over-ether**—This encapsulation is used for underlying interfaces of pp0 interfaces.

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

interface-switch

Syntax	<pre>interface-switch <i>connection-name</i> { interface <i>interface-name.unit-number</i>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols connections], [edit protocols connections]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	<p>Configure Layer 2 switching cross-connects. The cross-connect is bidirectional, so packets received on the first interface are transmitted out the second interface, and those received on the second interface are transmitted out the first.</p> <p>For Layer 2 switching cross-connects to work, you must also configure MPLS.</p>
Options	<p><i>connection-name</i>—Connection name (up to 128 characters in Junos 12.3 and later).</p> <p><i>interface interface-name.unit-number</i>—Interface name. Include the logical portion of the name, which corresponds to the logical unit number.</p>

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 9.0 for EX Series switches.
 Support for the **realm** statement introduced in Junos OS Release 9.2.
 Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series
 switches.
 Statement introduced in Junos OS Release 11.3 for the QFX Series.
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Disable OSPF, an OSPF interface, or an OSPF virtual link.

By default, control packets sent to the remote end of a virtual link must be forwarded using the default topology. In addition, the transit area path consists only of links that are in the default topology. You can disable a virtual link for a configured topology, but not for a default topology. Include the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id* topology *name*]** hierarchy level.

NOTE: If you disable the virtual link by including the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id*]** hierarchy level, you disable the virtual link for all topologies, including the default topology. You cannot disable the virtual link only in the default topology.

Default	The configured object is enabled (operational) unless explicitly disabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.

If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of **metric 500** defined in the next policy.

It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.

Hidden routes can be viewed by using the **show route receive-protocol bgp neighbor-address hidden** command. The hidden routes can then be retained or dropped from the routing

table by configuring the **keep all | none** statement at the **[edit protocols bgp]** or **[edit protocols bgp group *group-name*]** hierarchy level.

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the **keep all** statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the **keep none** statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

Options *policy-names*—Name of one or more policies.

Required Privilege Level routing—To view this statement in the configuration.
 routing-control—To add this statement to the configuration.

instance-type

Syntax	<code>instance-type type;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>], [edit routing-instances <i>routing-instance-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. virtual-switch and layer2-control options introduced in Junos OS Release 8.4. Statement introduced in Junos OS Release 9.2 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 12.3 for ACX Series routers. mpls-internet-multicast option introduced in Junos OS Release 11.1 for the EX Series, M Series, MX Series, and T Series. evpn option introduced in Junos OS Release 13.2 for MX 3D Series routers. evpn option introduced in Junos OS Release 17.3 for the QFX Series. forwarding option introduced in Junos OS Release 14.2 for the PTX Series. mpls-forwarding option introduced in Junos OS Release 16.1 for the MX Series. evpn-vpws option introduced in Junos OS Release 17.1 for MX Series routers. Support for logical systems on MX Series routers added in Junos OS Release 17.4R1.
Description	Define the type of routing instance.

Options

NOTE: On ACX Series routers, you can configure only the forwarding, virtual router, and VRF routing instances.

type—Can be one of the following:

- **evpn**—(MX 3D Series routers, QFX switches, and EX9200 switches)—Enable an Ethernet VPN (EVPN) on the routing instance.
hierarchy level.
- **evpn-vpws**—Enable an Ethernet VPN (EVPN) Virtual Private Wire Service (VPWS) on the routing instance.
- **forwarding**—Provide support for filter-based forwarding, where interfaces are not associated with instances. All interfaces belong to the default instance. Other instances are used for populating RPD learned routes. For this instance type, there is no one-to-one mapping between an interface and a routing instance. All interfaces belong to the default instance inet.0.
- **l2backhaul-vpn**—Provide support for Layer 2 wholesale VLAN packets with no existing corresponding logical interface. When using this instance, the router learns both the outer tag and inner tag of the incoming packets, when the **instance-role** statement is defined as **access**, or the outer VLAN tag only, when the **instance-role** statement is defined as **nni**.

- **l2vpn**—Enable a Layer 2 VPN on the routing instance. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.
- **layer2-control**—(MX Series routers only) Provide support for RSTP or MSTP in customer edge interfaces of a VPLS routing instance. This instance type cannot be used if the customer edge interface is multihomed to two provider edge interfaces. If the customer edge interface is multihomed to two provider edge interfaces, use the default BPDU tunneling.
- **mpls-forwarding**—(MX Series routers only) Allow filtering and translation of route distinguisher (RD) values in IPv4 and IPv6 VPN address families on both routes received and routes sent for selected BGP sessions. In particular, for Inter-AS VPN Option-B networks, this option can prevent the malicious injection of VPN labels from one peer AS boundary router to another.
- **mpls-internet-multicast**—(EX Series, M Series, MX Series, and T Series routers only) Provide support for ingress replication provider tunnels to carry IP multicast data between routers through an MPLS cloud, using MBGP or next-generation MVPN.
- **no-forwarding**—This is the default routing instance. Do not create a corresponding forwarding instance. Use this routing instance type when a separation of routing table information is required. There is no corresponding forwarding table. All routes are installed into the default forwarding table. IS-IS instances are strictly nonforwarding instance types.
- **virtual-router**—Enable a virtual router routing instance. This instance type is similar to a VPN routing and forwarding instance type, but used for non-VPN-related applications. You must configure the **interface** statement for this type of routing instance. You do not need to configure the **route-distinguisher**, **vrf-import**, and **vrf-export** statements.
- **virtual-switch**—(MX Series routers, EX9200 switches, and QFX switches only) Provide support for Layer 2 bridging. Use this routing instance type to isolate a LAN segment with its Spanning Tree Protocol (STP) instance and to separate its VLAN identifier space.
- **vpls**—Enable VPLS on the routing instance. Use this routing instance type for point-to-multipoint LAN implementations between a set of sites in a VPN. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.
- **vrf**—VPN routing and forwarding (VRF) instance. Provides support for Layer 3 VPNs, where interface routes for each instance go into the corresponding forwarding table only. Required to create a Layer 3 VPN. Create a VRF table (**instance-name.inet.0**) that contains the routes originating from and destined for a particular Layer 3 VPN. For this instance type, there is a one-to-one mapping between an interface and a routing instance. Each VRF instance corresponds with a forwarding table. Routes on an interface go into the corresponding forwarding table. You must configure the **interface**, **route-distinguisher**, **vrf-import**, and **vrf-export** statements for this type of routing instance.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

 [edit routing-instances *routing-instance-name* protocols ospf3 realm (ipv4-unicast | ipv4-multicast | ipv6-multicast) area *area-id* interface *interface-name*]

Release Information Statement introduced before Junos OS Release 7.4.
 Statement introduced in Junos OS Release 9.0 for EX Series switches.
 Support for the **realm** statement introduced in Junos OS Release 9.2.
 Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series switches.

Description Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements (LSAs) to an interface's neighbors.

Options **seconds**—Interval to wait.
Range: 1 through 65,535 seconds
Default: 5 seconds

NOTE: You must configure LSA retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because Junos OS delays LSA acknowledgments by up to 2 seconds.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

route-distinguisher

Syntax	<code>route-distinguisher (as-number:id ip-address:id);</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>], [edit routing-instances <i>routing-instance-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Support at [edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>] hierarchy level introduced in Junos OS Release 11.2.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> <p>Support at [edit routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>] hierarchy level introduced in Junos OS Release 13.2.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for QFX Series switches.</p>
Description	<p>Specify an identifier attached to a route, enabling you to distinguish to which VPN or virtual private LAN service (VPLS) the route belongs. Each routing instance must have a unique route distinguisher (RD) associated with it. The RD is used to place bounds around a VPN so that the same IP address prefixes can be used in different VPNs without having them overlap. If the instance type is vrf, the route-distinguisher statement is required.</p> <p>For Layer 2 VPNs and VPLS, if you configure the l2vpn-use-bgp-rules statement, you must configure a unique RD for each PE router participating in the routing instance.</p> <p>For other types of VPNs, we recommend that you use a unique RD for each provider edge (PE) router participating in specific routing instance. Although you can use the same RD on all PE routers for the same VPN routing instance, if you use a unique RD, you can determine the customer edge (CE) router from which a route originated within the VPN.</p> <p>For Layer 2 VPNs and VPLSs, if you configure mesh groups, the RD in each mesh group must be unique.</p>

CAUTION: We strongly recommend that if you change an RD that has already been configured, make the change during a maintenance window, as follows:

1. Deactivate the routing instance.
2. Change the RD.
3. Activate the routing instance.

This is not required if you are configuring the RD for the first time.

Options *as-number:number*—*as-number* is an assigned AS number, and *number* is any 2-byte or 4-byte value. The AS number can be from 1 through 4,294,967,295. If the AS number is a 2-byte value, the administrative number is a 4-byte value. If the AS number is a 4-byte value, the administrative number is a 2-byte value. An RD consisting of a 4-byte AS number and a 2-byte administrative number is defined as a type 2 RD in RFC 4364 *BGP/MPLS IP VPNs*.

NOTE: In Junos OS Release 9.1 and later, the numeric range for AS numbers is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. All releases of Junos OS support 2-byte AS numbers. To configure an RD that includes a 4-byte AS number, append the letter “L” to the end of the AS number. For example, an RD with the 4-byte AS number 7,765,000 and an administrative number of 1,000 is represented as 77765000L:1000.

In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in the plain-number format is represented as 1.10 in AS dot notation format.

ip-address:id—IP address (*ip-address* is a 4-byte value) within your assigned prefix range and a 2-byte value for the *id*. The IP address can be any globally unique unicast address.

Range: 0 through 4,294,967,295 ($2^{32} - 1$). If the router you are configuring is a BGP peer of a router that does not support 4-byte AS numbers, you need to configure a local AS number. For more information, see *Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview*.

NOTE: For Ethernet VPN (EVPN), an RD that includes zero as the *id* value is reserved for the default EVPN routing instance by default. Because the same RD cannot be assigned for two routing instances, using a *ip-address:id* RD for another routing instance (default-switch), where the *id* value is zero, throws a commit error.

Required Privilege routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

traceoptions (Protocols Link Management)

Syntax	<pre>traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <flag-modifier> <disable>; }</pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols link-management], [edit protocols link-management]
Release Information	Statement introduced before Junos OS Release 7.4. Support for hello-packets , packets , and state flags added in Junos OS Release 8.1.
Description	Trace options for the LMP protocol.
Options	<p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.</p> <p>files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>Range: 2 through 1000</p> <p>Default: 2 files</p> <p>If you specify a maximum number of files, you must also include the size statement to specify the maximum file size.</p> <p>flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.</p> <ul style="list-style-type: none">• all—Trace all available operations• hello-packets—Trace hello packets on any LMP control channel• init—Output from the initialization messages• packets—Trace all packets other than hello packets on any LMP control channel• parse—Operation of the parser• process—Operation of the general configuration• route-socket—Operation of route socket events• routing—Operation of the routing protocols• server—Server processing operations

- **show**—**show** command servicing operations
- **state**—Trace state transitions of the LMP control channels and traffic engineering links

flag-modifier—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

no-world-readable—(Optional) Prevent all users from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

world-readable—(Optional) Enable log file access for all users.

Required Privilege Level	routing and trace—To view this statement in the configuration. routing-control and trace-control—To add this statement to the configuration.

upstream-label

Syntax	<pre>upstream-label { vlan-id <i>vlan-id</i>; }</pre>
Hierarchy Level	[edit protocols mpls label-switched-path <i>lsp-name</i> lsp-attributes]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Specify the upstream label for the bidirectional label-switched path (LSP).
Options	vlan-id <i>vlan-id</i> —VLAN ID to be used for the Generalized MPLS (GMPLS) VLAN LSP at the ingress provider edge (PE) to customer edge (CE) link.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring MPLS LSPs for GMPLS on page 807

vrf-target

Syntax	<pre>vrf-target { community; auto import community-name; export community-name; }</pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols evpn vni-options], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn mesh-group <i>mesh-group-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols vpls mesh-group <i>mesh-group-name</i>], [edit switch-options]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 11.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for QFX Series switches. auto option was also added at this time.</p>
Description	<p>Specify a virtual routing and forwarding (VRF) target community. If you configure the community option only, default VRF import and export policies are generated that accept and tag routes with the specified target community. The purpose of the vrf-target statement is to simplify the configuration by allowing you to configure most statements at the [edit routing-instances] hierarchy level. In effect, this statement configures a single policy for import and a single policy for export to replace the per-VRF policies for every community.</p> <p>You can still create more complex policies by explicitly configuring VRF import and export policies using the import and export options.</p>
Options	<p>community—Community name.</p> <p>auto—Automatically derives the route target (RT) for QFX5100 switches.</p> <p>import community-name—Allowed communities accepted from neighbors.</p> <p>export community-name—Allowed communities sent to neighbors.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

delegation-cleanup-timeout

Syntax	<code>delegation-cleanup-timeout seconds;</code>
Hierarchy Level	[edit protocols pcep pce <i>pce-id</i>]
Release Information	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series switches added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
Description	Specify the amount of time (in seconds) that a Path Computation Client (PCC) must wait before returning control of all LSPs to the routing protocol process after a PCEP session with the main active stateful Path Computation Element (PCE) is disconnected.
	<div> NOTE: In compliance with <i>draft-ietf-pce-stateful-pce-09</i>, revoking of PCE-initiated LSP delegations by a PCC happens in a make-before-break fashion before the LSPs are redelegated to an alternate PCE. Starting in Junos OS Release 18.1R1, the <code>lsp-cleanup-timer</code> must be greater than or equal to the <code>delegation-cleanup-timeout</code> for the PCC to revoke the LSP delegations. If not, the redelegation timeout interval for the PCC can be set to infinity, where the LSP delegations to that PCE remain intact until specific action is taken by the PCC to change the parameters set by the PCE.</div>
Options	seconds —Time (in seconds) that a PCC must wait before returning control of all LSPs to the routing protocol process after a PCEP session with the main active stateful PCE is disconnected. Range: 0 through 600 seconds Default: 30 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	• pce on page 1883

delegation-priority

Syntax	<code>delegation-priority <i>priority-number</i>;</code>
Hierarchy Level	[edit protocols pcep pce <i>pce-id</i>]
Release Information	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series switches added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
Description	Specify the priority number of the active stateful Path Computation Element (PCE). This value is used by the Path Computation Client (PCC) to elect a PCE to delegate LSPs. No two PCEs can have the same delegation-priority value. The PCC elects the PCE with a lower priority as the main active stateful PCE to delegate LSPs.
Options	<i>priority-number</i> —Priority number of the active stateful PCE. Range: 1 through 65535 Default: 0 (no priority is set)
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • pce on page 1883

destination-ipv4-address

Syntax	<code>destination-ipv4-address <i>ipv4-address</i>;</code>
Hierarchy Level	<code>[edit protocols pcep pce <i>pce-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFX Series switches added in Junos OS Release 16.1R3. Support for ACX Series added in Junos OS Release 17.1R1.
Description	Specify the IPv4 address of the Path Computation Element (PCE) to which the Path Computation Client (PCC) should connect.
Options	<i>ipv4-address</i> —IPv4 address of the PCE.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• pce on page 1883

destination-port

Syntax	<code>destination-port <i>port-number</i>;</code>
Hierarchy Level	<code>[edit protocols pcep pce <i>pce-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 12.3. Support for PTX Series added in Junos OS Release 14.2. Support for QFXswitches added in Junos OS Release 16.1R3.
Description	Specify the TCP port number of the Path Computation Element (PCE) to which the Path Computation Client (PCC) should connect.
Options	<i>port-number</i> —Destination TCP port number. Range: 1 through 65535 Default: 4189
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• pce on page 1883

label-switched-path-template

Syntax	label-switched-path-template { (default-template <i>lsp-template-name</i>); }
Hierarchy Level	[edit protocols mpls lsp-external-controller <i>lsp-external-controller</i>]
Release Information	Statement introduced in Junos OS Release 13.3.
Description	Specify the LSP template with parameters for setting up the PCE-initiated LSPs when the PCE initiating the LSP does not provide the PCE-initiated parameters. When label-switched-path-template is not configured, the default LSP parameters are used.
Options	<p>default-template—Specify that the default LSP template be used for the dynamically generated PCE-initiated LSPs.</p> <p><i>lsp-template-name</i>—Specify the name of the LSP template to be used for setting up PCE-initiated LSPs.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • pcep on page 1872

lsp-cleanup-timer

Syntax	<code>lsp-cleanup-timer <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols pcep pce <i>pce-id</i>]</code> <code>[edit protocols pcep pce-group <i>group-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 13.3.
Description	Specify the amount of time (in seconds) that the Path Computation Client (PCC) must wait before deleting any non-delegated Path Computation Element (PCE)-initiated LSPs from the failed PCE after a PCEP session terminates.
<div> NOTE: In compliance with <i>draft-ietf-pce-stateful-pce-09</i>, revoking of PCE-initiated LSP delegations by a PCC happens in a make-before-break fashion before the LSPs are redelegated to an alternate PCE. Starting in Junos OS Release 18.1R1, the <code>lsp-cleanup-timer</code> must be greater than or equal to the <code>delegation-cleanup-timeout</code> for the PCC to revoke the LSP delegations. If not, the redelegation timeout interval for the PCC can be set to infinity, where the LSP delegations to that PCE remain intact until specific action is taken by the PCC to change the parameters set by the PCE.</div>	
Options	<i>seconds</i> —Time (in seconds) that the PCC must wait before deleting any non-delegated PCE-initiated LSPs from the failed PCE after a PCEP session terminates. Range: 0 through 4294967294 seconds Default: 0 (Non-delegated PCE-initiated LSPs are deleted immediately)
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• pcep on page 1872

`lsp-external-controller`

Syntax	<code>lsp-external-controller <i>controller-name</i>;</code>
Hierarchy Level	[edit protocols mpls], [edit protocols mpls label-switched-path <i>lsp-name</i>] [edit protocols spring-traffic-engineering]
Release Information	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 16.1R3 for QFX Series switches. Support for ACX Series added in Junos OS Release 17.1. Support at the [edit protocols spring-traffic-engineering] hierarchy level introduced in Junos OS Release 17.2.
Description	Enable external path computing capability for the device.
Options	<i>controller-name</i> —Name of the external path computing entity. By default, <i>pccd</i> is the only allowed LSP external controller. Values: <i>pccd</i>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

authentication-key key, **authentication-key-chain key-chain**, and **p2mp-lsp-report-capability** statements introduced in Junos OS Release 16.1.
max-sid-depth and **spring-capability** statements introduced in Junos OS Release 17.2.

Description Configure per-Path Computation Element (PCE) parameters.

Options `pce-id`—IP address of the PCE.

authentication-key key—(Optional) Authentication password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

It is recommended to define and bind an authentication key for securing a PCEP session, as opposed to binding an authentication keychain.

authentication-key-chain *key-chain*—(Optional) Authentication keychain password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

local-address *ip-address*—(Optional) IP address of the local end of the PCEP session, the PCC.

lsp-retry-delegation—(Optional) Enable retry LSP delegation process.

lsp-retry-delegation-timer—(Optional) Specify the amount of time (in seconds) that the Path Computation Client (PCC) must wait before retrying delegation of Path Computation Element (PCE)-initiated LSPs in case of delegation failure or re-delegation.

Default: 3600 seconds

Range: 0 through 4294967294 seconds

max-sid-depth—(Optional) Specify the maximum value for service identifier (SID) depth.

Default: 5

Range: 1 through 5

p2mp-lsp-report-capability—(Optional) Capability to report point-to-multipoint RSVP-TE LSPs to a PCE. By default, this capability is not supported on a PCC, and should be explicitly configured to enable reporting of point-to-multipoint LSPs to a PCE.

spring-capability—(Optional) Enable SPRING-based provisioning for the PCE.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

traceoptions (PCE)

Syntax `traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag (all | pcep);
 no-remote-trace;
 }`

Hierarchy Level [edit protocols pcep pce *pce-id*]

Description Configure the Path Computation Element Protocol (PCEP) tracing options.

Options ***filename***—Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`.

files number—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Range: 2 through 1000 files

Default: 2 files. If you specify a maximum number of files, you must also include the ***size*** statement to specify the maximum file size.

flag—Area of path computation client process (`pccd`) to enable debugging output.

- **all**—Trace all areas of PCD code.
- **pcep**—Trace Path Computation Element Protocol (PCEP) operations.

no-remote-trace—(Optional) Disable remote tracing options.

no-world-readable—(Optional) Allow only certain users to read the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the trace-file again reaches this size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.

Range: 10 KB through the maximum file size supported on your system.

Default: 1 MB. If you specify a maximum file size, you must also include the ***files*** statement to specify the maximum number of files.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege	routing and trace—To view this statement in the configuration.
Level	routing-control and trace-control—To add this statement to the configuration.

traceoptions (Protocols PCEP)

Syntax `traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag flag;
 no-remote-trace;
 }`

Hierarchy Level [edit protocols pcep]

Description Configure the Path Computation Element Protocol (PCEP) tracing options.

Options *filename*—Name of the file to receive the output of the tracing operation. All files are placed in the directory `/var/log`.

files number—(Optional) Maximum number of trace files. When a trace file named `trace-file` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Range: 2 through 1000 files

Default: 2 files. If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

flag—Area of path computation client process (pccd) to enable debugging output.

PCEP Tracing Flags

- *all*—Trace all areas of PCCD code
- *pccd-config*—All configuration parsing operations
- *pccd-core*—PCCD core operations
- *pccd-functions*—PCCD function entries and outs
- *pccd-main*—PCCD main module
- *pccd-rpd*—PCCD communication with RPD
- *pccd-ui*—PCCD user interface handling

no-remote-trace—(Optional) Disable remote tracing options.

no-world-readable—(Optional) Allow only certain users to read the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the trace-file again reaches this size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.

Range: 10 KB through the maximum file size supported on your system.

Default: 1 MB. If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of files.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

update-rate-limit

Syntax update-rate-limit *updates-per-minute*;

Hierarchy Level [edit protocols pcep]

Release Information Statement introduced in Junos OS Release 12.3.
Support for PTX Series added in Junos OS Release 14.2.
Support for QFX Series switches added in Junos OS Release 16.1R3.
Support for ACX Series added in Junos OS Release 17.1R1.

Description Specify the number of updates per minute that the Path Computation Client (PCC) can receive at maximum. Updates above this limit are ignored by the PCC.

Options *updates-per-minute*—Number of updates per minute that the PCC can receive at maximum.
Range: 1 through 16384
Default: 0 (disabled or no limit)

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

clear mpls lsp

List of Syntax [Syntax on page 1899](#)
 [Syntax \(EX and QFX Series Switches\) on page 1899](#)

Syntax clear mpls lsp
 <all>
 <autobandwidth>
 <counters>
 <logical-system (all | *logical-system-name*)>
 <name *name*>
 <optimize | optimize-aggressive>
 <path *regular-expression*>
 <statistics>

Syntax (EX and QFX Series Switches) clear mpls lsp
 <all>
 <autobandwidth>
 <name *name*>
 <optimize | optimize-aggressive>
 <path *regular-expression*>
 <statistics>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.5 for EX Series switches.
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

Description Release the routes and states associated with MPLS label-switched paths (LSPs), and start new LSPs.

CAUTION: This command disconnects existing Resource Reservation Protocol (RSVP) sessions on the ingress routing device. If there is a time lag between the old path being torn down and the new path being set up, this command might impact traffic traveling along the LSPs.

Options **all**—Reset and restart all LSPs that originated from this routing device; that is, all LSPs for which this routing device is the ingress routing device. Depending on the number of LSPs involved, it might take a while to restart all the LSPs.

autobandwidth—(Optional) Clear LSP autobandwidth counters.

counters—(Optional) Reset the flap and the MBB counters to zero.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name *name*—(Optional) Reset and restart the specified LSP or group of LSPs. You can include wildcard characters in the interface name, as described in the *Junos Network Interfaces Configuration Guide*.

optimize | optimize-aggressive—(Optional) Run nonpreemptive optimization or aggressive optimization computation now.

path *regular-expression*—(Optional) Clear the specific LSP path matching the specified regular expression.

statistics—(Optional) Clear LSP statistics. You cannot clear the MPLS LSP statistics using a regular expression (**name** and **path** options) on transit routers.

Required Privilege Level clear

monitor mpls delay rsvp

Syntax `monitor mpls delay rsvp lsp-name`
 `<detail>`
 `<count count>`
 `<interval seconds>`
 `<padding-size padding-size>`
 `<traffic-class traffic-class>`

Release Information Command introduced in Junos OS Release 14.2.

Description Perform an on-demand delay measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

Options ***lsp-name***—Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.

detail—(Optional) Display detailed output of the LSP delay measurement.

count count—(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.

Default: 10

Range: 1 through 1000000

interval seconds—(Optional) Specify in seconds the interval between two successive query messages.

Range: 1 through 255 seconds

padding-size padding-size— (Optional) Specify the length of padding TLV to be included in the query message.

Range: 0 through 1500

traffic-class traffic-class—(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

Range: 0 though 7

Output Fields [Table 61 on page 1905](#) describes the output fields for the **monitor mpls delay rsvp** command. Output fields are listed in the approximate order in which they appear.

Table 61: monitor mpls delay rsvp Output Fields

Field Name	Field Description	Level of Output
Current two-way channel delay	Sum of packet delays, excluding the processing time of the remote provider edge (PE) router.	All Levels
Current round-trip-time	Total time taken for completing round-trip of packet.	All Levels
Best two-way channel delay	Best available two-way channel delay count.	All Levels
Worst two-way channel delay	Worst available two-way channel delay count.	All Levels
Average two-way channel delay	Average of the available two-way channel delay counts.	All Levels
Best round-trip-time	Best available round-trip-time count.	All Levels
Worst round-trip-time	Worst available round-trip-time count.	All Levels
Average round-trip-time	Average of the available round-trip-time counts.	All Levels
Average forward delay variation	Average of the variation in forward delay.	All Levels
Average reverse delay variation	Average of the variation in reverse delay.	All Levels
DM queries sent	Number of queries sent for delay measurement.	All Levels
DM responses received	Number of responses received for delay measurement queries.	All Levels
DM queries timedout	Number of timed out queries sent for delay measurement.	All Levels
DM responses dropped due to errors	Number of loss measurement responses dropped due to errors.	All Levels
Response code	Status of the messages used for delay measurement. Response code can be one of the following: <ul style="list-style-type: none"> • Success—Successful response code. • Failed—Failed response code. 	detail
Querier transmit timestamp	Timestamp on the query message when the message is sent out the ingress PE router (querier). This is done in the hardware before packet is sent out of an interface.	detail

Table 61: monitor mpls delay rsvp Output Fields (continued)

Field Name	Field Description	Level of Output
Responder receive timestamp	Timestamp on the response message when the message is received by the egress PE router (responder). This is done in the hardware before packet is received by an interface.	detail
Responder transmit timestamp	Timestamp on the query message when the message is sent out the egress PE router (responder). This is done in the hardware before packet is sent out of an interface.	detail
Querier receive timestamp	Timestamp on the response message when the message is received by the ingress PE router (querier). This is done in the hardware before packet is received by an interface.	detail

monitor mpls loss rsvp

Syntax `monitor mpls loss rsvp lsp-name`
 `<detail>`
 `<bytes>`
 `<count count>`
 `<interval seconds>`
 `<traffic-class traffic-class>`

Release Information Command introduced in Junos OS Release 14.2.

Description Perform an on-demand loss measurement and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

Options *lsp-name*—Name of the associated bidirectional MPLS UHP LSP for which the loss measurement is performed.

detail—(Optional) Display detailed output of the LSP loss measurement.

bytes—(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

NOTE: The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

count *count*—(Optional) Specify the number of loss measurements to be carried out for the MPLS UHP LSP. For LSP loss measurement, the number of queries sent is the specified count number plus one additional query, because the LSP loss is measured using successive messages.

Default: 10

Range: 1 through 1000000

interval *seconds*—(Optional) Specify in seconds the interval between two successive query messages.

Range: 1 through 255 seconds

traffic-class *traffic-class*—(Optional) Specify the traffic class and enable traffic-class-statistics for the LSP loss measurement.

Range: 0 though 7

Table 62: monitor mpls loss rsvp Output Fields

Field Name	Field Description	Level of Output
Current forward loss	Difference between the current forward transmit count and the current forward receive count.	All Levels
Current forward loss ratio	Total packet loss (current forward loss divided by current forward transmit count).	All Levels
Current forward throughput	Current forward transmit count divided by 1000.	All Levels
Current reverse loss	Difference between the current reverse transmit count and the current reverse receive count.	All Levels
Current reverse loss ratio	Total packet loss (current reverse loss divided by current reverse transmit count).	All Levels
Current reverse throughput	Current reverse transmit count divided by 1000.	All Levels
Cumulative forward transmit count	Cumulative forward transmit counter value at the time the loss measurement message was originated.	All Levels
Cumulative forward loss	Cumulative forward loss counter value at the time the loss measurement message was originated.	All Levels
Average forward loss ratio	Average packet loss (current forward loss divided by current forward transmit count).	All Levels
Average forward throughput	Average forward transmit count divided by 1000.	All Levels
Cumulative reverse transmit count	Cumulative reverse transmit counter value at the time the loss measurement message was originated.	All Levels
Cumulative reverse loss	Difference between the cumulative reverse transmit count and the cumulative reverse receive count.	All Levels
Average reverse loss ratio	Average packet loss (average reverse loss divided by average reverse transmit count).	All Levels
Average reverse throughput	Average reverse transmit count divided by 1000.	All Levels

Table 62: monitor mpls loss rsvp Output Fields (continued)

Field Name	Field Description	Level of Output
LM queries sent	Number of queries sent for loss measurement.	All Levels
LM responses received	Number of responses received for loss measurement queries.	All Levels
LM queries timedout	Number of timed out queries sent for loss measurement.	All Levels
LM responses dropped due to errors	Number of loss measurement responses dropped due to errors.	All Levels
Response code	Status of the messages used for loss measurement. Response code can be one of the following: <ul style="list-style-type: none"> • Success—Successful response code. • Failed—Failed response code. 	detail
Origin timestamp	Time and date the loss measurement message is originated without any specific format (NTP and PTP).	detail
Forward transmit count	Forward transmit counter value at the time the loss measurement message was originated.	detail
Forward receive count	Forward receive counter value at the time the loss measurement message was originated.	detail
Reverse transmit count	Reverse transmit counter value at the time the loss measurement message was originated.	detail
Reverse receive count	Reverse receive counter value at the time the loss measurement message was originated.	detail
Current forward transmit count	Difference between the current forward transit count and the previous forward transit count.	detail
Current forward receive count	Difference between the current forward receive count and the previous forward receive count.	detail
Current reverse transmit count	Difference between the current reverse transit count and the previous reverse transit count.	detail
Current reverse receive count	Difference between the current reverse receive count and the previous reverse receive count.	detail

monitor mpls loss-delay rsvp

Syntax `monitor mpls loss-delay rsvp lsp-name`
 `<detail>`
 `<bytes>`
 `<count count>`
 `<interval seconds>`
 `<padding-size padding-size>`
 `<traffic-class traffic-class>`

Release Information Command introduced in Junos OS Release 14.2.

Description Perform a simultaneous on-demand loss and delay measurement using combined loss and delay messages, and display the measured values for associated bidirectional MPLS ultimate hop popping (UHP) point-to-point label-switched paths (LSPs).

Options *lsp-name*—Name of the associated bidirectional MPLS UHP LSP for which the delay measurement is performed.

detail—(Optional) Display detailed output of the LSP delay measurement.

bytes—(Optional) Specify the measurement quantity for the LSP loss measurement as bytes. By default, LSP loss is measured in packets.

NOTE: The byte count of a packet sent or received over a channel counts only the payload, including the total length of that packet and excluding the headers, labels, and framing of the channel itself.

count *count*—(Optional) Specify the number of delay measurements to be carried out for the MPLS UHP LSP. For LSP delay measurement, the number of queries sent is the specified count number plus one additional query, because the LSP delay is measured using successive messages.

Default: 10

Range: 1 through 1000000

interval *seconds*—(Optional) Specify in seconds the interval between two successive query messages.

Range: 1 through 255 seconds

padding-size *padding-size*—(Optional) Specify the length of padding TLV to be included in the query message.

Range: 0 through 1500

traffic-class *traffic-class*—(Optional) Specify the traffic class for the LSP delay measurement. When the traffic-class value is not specified, the default traffic-class code-point of 111 is used.

Range: 0 though 7

Required Privilege Level view

ping mpls bgp

Syntax ping mpls bgp *fec*
 <bottom-label-ttl>
 <count *count*>
 <destination *address*>
 <detail>
 <exp *forwarding-class*>
 <instance *routing-instance-name*>
 <logical-system (all | *logical-system-name*)>
 <size *bytes*>
 <source *source-address*>
 <sweep>

Release Information Command introduced in Junos OS Release 11.1.

Description Check the operability of MPLS BGP-signaled label-switched path (LSP) connections. Press Ctrl+c to interrupt a **ping mpls bgp** command.

NOTE: The **ping mpls bgp *fec*** command only supports single paths.

- Options** **bottom-label-ttl**—(Optional) Time-to-live (TTL) value for the bottom label in the label stack. The range of values is 1 through 255. The default value is **255**.
- count *count***—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.
- destination *address***—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.
- detail**—(Optional) Display detailed information about the echo requests sent and received.
- exp *forwarding-class***—(Optional) Value of the forwarding class for the MPLS ping packets.
- fec***—Ping a BGP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.
- instance *routing-instance-name***—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.
- logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on the specified logical system.
- size *bytes***—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller

than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only BGP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

NOTE: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

Required Privilege Level network

List of Sample Output [ping mpls bgp fec count on page 1918](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately. To display the error codes, use the **detail** option (for example, **ping mpls bgp 10.255.245.222 detail**).

Sample Output

ping mpls bgp fec count

```
user@host> ping mpls bgp 10.255.245.222 count 10
```

```
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,  
70% packet loss 4 packets received with error status, not counted as received.
```

ping mpls lsp-end-point

Syntax ping mpls lsp-end-point *prefix-name*
 <count *count*>
 <destination *address*>
 <detail>
 <exp *forwarding-class*>
 <instance *routing-instance-name*>
 <logical-system (all | *logical-system-name*)>
 <size *bytes*>
 <source *source-address*>
 <sweep>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.
 The **instance** option was introduced in Junos OS Release 10.0.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Check the operability of MPLS label-switched path (LSP) endpoint connections. Type Ctrl+c to interrupt a **ping mpls** command.

Options **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

instance *routing-instance-name*—(Optional) Ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP connection.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

prefix-name—LDP forwarding equivalence class (FEC) prefix or RSVP LSP endpoint address.

size *bytes*—(Optional) Size of the LSP ping request packet. If the endpoint is LDP-based, the minimum size of the packet is 88 bytes. If the endpoint is RSVP-based, the minimum size of the packet is 100 bytes. The maximum size in either case is 65468 bytes.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

NOTE: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

```

ping mpls l2circuit

Syntax ping mpls l2circuit (interface *interface-name* | virtual-circuit *virtual-circuit-id* neighbor *address*)
 <count *count*>
 <destination *address*>
 <detail>
 <exp *forwarding-class*>
 <logical-system (all | *logical-system-name*)>
 reply-mode (application-level-control-channel | ip-udp | no-reply)
 <size *bytes*>
 <source *source-address*>
 <sweep>
 <v1>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.
 The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

Description Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a ping mpls l2circuit command.

NOTE: This command is not supported on EX4500 and EX4550 switches.

Options **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

interface *interface-name*—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:

application-level-control-channel—Reply using an application level control channel.

ip-udp—Reply using an IPv4 or IPv6 UDP packet.

no-reply—Do not reply to the ping request.

NOTE: The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

size bytes—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

vl—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

virtual-circuit virtual-circuit-id neighbor address—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

Additional Information You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level network

List of Sample Output [ping mpls l2circuit interface on page 1925](#)
[ping mpls l2circuit virtual-circuit detail on page 1925](#)
[ping mpls l2circuit interface <interface-name> reply-mode on page 1925](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an

echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls l2circuit interface

```
user@host> ping mpls l2circuit interface so-1/0/0.1
Request for seq 1, to interface 69, labels <100000, 100208>, packet size 100
Reply for seq 1, return code: Egress-ok, time: 0.439 ms
```

ping mpls l2circuit virtual-circuit detail

```
user@host> ping mpls l2circuit virtual-circuit 200 neighbor 10.255.245.122/32 detail
Request for seq 1, to interface 68, labels <100048, 100128>, packet size 100

Reply for seq 1, return code: Egress-ok time: 0.539 ms
```

ping mpls l2circuit interface <interface-name> reply-mode

```
user@host> ping mpls l2circuit interface lt-1/2/0.21 reply-mode application-level-control-channel
!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

ping mpls l2vpn

Syntax ping mpls l2vpn (instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number* | interface *interface-name*)
<bottom-label-ttl>
<count *count*>
<destination *address*>
<detail>
<exp *forwarding-class*>
<logical-system (all | *logical-system-name*)>
reply-mode (application-level-control-channel | ip-udp | no-reply)
<size *bytes*>
<source *source-address*>
<sweep>

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
The **size** and **sweep** options were introduced in Junos OS Release 9.6.
The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

Description Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a **ping mpls l2vpn** command.

Options **bottom-label-ttl**—(Optional) Display the time-to-live value for the bottom label in the label stack.

count *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number*—Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.

interface *interface-name*—Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:

application-level-control-channel—Reply using an application level control channel.

ip-udp—Reply using an IPv4 or IPv6 UDP packet.

no-reply—Do not reply to the ping request.

The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

size bytes—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

request mpls lsp adjust-autobandwidth

List of Syntax	Syntax on page 1933 Syntax (EX and QFX Series Switches) on page 1933
Syntax	<pre>request mpls lsp adjust-autobandwidth <logical-system (all <i>logical-system-name</i>)> <name <i>lsp-name</i>></pre>
Syntax (EX and QFX Series Switches)	<pre>request mpls lsp adjust-autobandwidth <name <i>lsp-name</i>></pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.</p>
Description	<p>Manually trigger a bandwidth allocation adjustment for active label-switched paths (LSPs).</p> <p>Without running this command, the bandwidth adjustment is recomputed at a configurable interval. The default interval is 5 minutes. If you do not want to wait for the periodic adjustment (for example, during a software demonstration), this command is useful.</p> <p>During bandwidth allocation adjustment, the LSP stays up to enable the bandwidth to be changed without dropping any traffic. This functionality is often referred to as <i>make-before-break</i>.</p>
Options	<p>none—Manually trigger a bandwidth allocation adjustment for all active LSP paths.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>name <i>lsp-name</i>—(Optional) Manually trigger a bandwidth allocation adjustment on the specified LSP only.</p>
Additional Information	<p>For this command to work properly, the following conditions must exist:</p> <ul style="list-style-type: none"> Automatic bandwidth allocation must be enabled on the LSP. The parameters for adjustment interval and maximum average bandwidth are not reset after you issue the request mpls lsp adjust-autobandwidth command. The difference between the adjusted bandwidth and the current LSP path bandwidth must be greater than the threshold limit.
Required Privilege Level	clear, maintenance

show link-management

Syntax	show link-management
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
Description	Display Multiprotocol Label Switching (MPLS) peer and traffic engineering link information.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show link-management peer on page 1942 • show link-management routing on page 1944 • show link-management statistics on page 1948 • show link-management te-link on page 1950
List of Sample Output	show link-management on page 1941
Output Fields	Table 64 on page 1938 describes the output fields for the show link-management command. Output fields are listed in the approximate order in which they appear.

Table 64: show link-management Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: Up or Down .
Control address	Address to which a control channel is established.
CC local ID	Identifier assigned to the control channel by the local peer. The range of values is 1 through 4,294,967,296.
CC remote ID	Identifier assigned to the control channel by the remote peer. The range of values is 1 through 4,294,967,296.
State	State of the control channel: Up or Down .
TxSeqNum	Sequence number of the hello message being sent to the peer. The range of values is 1 through 4,294,967,295.

Table 64: show link-management Output Fields (continued)

Field Name	Field Description
RcvSeqNum	Sequence number of the last hello message received from the peer. The range of values is 0 through 4,294,967,295.
Flags	Code that provides information about the control channel. Currently supports only code value R , which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts.
TE links	Traffic-engineered links that are managed by their peer.
TE link name	Name of the traffic-engineered link.
State	State of the traffic-engineered link: Up , Down , or Init .
Local identifier	Identifier of the local side of the link.
Remote identifier	Identifier of the remote side of the link.
Local address	Address of the local side of the link.
Remote address	Address of the remote side of the link.
Encoding	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include SDH/SONET , Ethernet , Packet , and PDH .
Switching	Type of switching that can be performed on the traffic-engineered link. Supported values are PSC-1 and Packet .
Minimum bandwidth	Smallest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link (in bps).
Maximum bandwidth	Largest single allocation of bandwidth possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).
Total bandwidth	Sum of the bandwidth, in bits per second (bps) and megabits per second (Mbps), of all interfaces that are members of the link.
Available bandwidth	Sum of the bandwidths of all interfaces that are members of the link and that are not yet allocated (in bps).
Name	Name of the interface.
State	State of the interface: Up or Down .
Local ID	Identifier of the local side of the interface.
Remote ID	Identifier of the remote side of the interface.
Bandwidth	Bandwidth, in bps or Mbps, of the member interface.

Table 64: show link-management Output Fields (continued)

Field Name	Field Description
Used	Whether the resource is allocated to an LSP: Yes or No .
LSP-name	LSP name.

Sample Output

List of Sample Output	show link-management peer on page 1943
Output Fields	Table 65 on page 1942 describes the output fields for the show link-management peer command. Output fields are listed in the approximate order in which they appear.

Table 65: show link-management peer Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: Up or Down.
Control address	Address to which a control channel is established.
Hello interval	How often the routing device sends Link Management Protocol (LMP) hello packets.
Hello dead interval	How long LMP waits before declaring the control channel to be dead. This is an interval during which the routing device receives no LMP hello packets from the neighbor on a control that is active or up.
CC local ID	Identifier assigned to the control channel by the local peer. The range of values is 1 through 4,294,967,296.

Table 65: show link-management peer Output Fields (continued)

Field Name	Field Description
CC remote ID	Identifier assigned to the control channel by the remote peer. The range of values is 1 through 4,294,967,296.
State	State of the control channel: Up or Down .
TxSeqNum	Sequence number of the hello message being sent to the peer. The range of values is 1 through 4,294,967,295.
RcvSeqNum	Sequence number of the last hello message received from the peer. The range of values is 0 through 4,294,967,295.
Flags	Code that provides information about the control channel. Currently supports only code value R , which indicates that the control channel is restarting after a failure in the control plane, as when the Link Management Protocol (LMP) process starts or restarts.
TE links	Traffic-engineered links that are managed by their peer.

Sample Output

show link-management peer

```

user@host> show link-management peer
Peer name: sonet, System identifier: 41448
State: Up, Control address: 70.70.70.70
Hello interval: 10000, Hello dead interval: 30000
  CC local ID CC remote ID State      TxSeqNum  RcvSeqNum  Flags
          3265             0 ConfSnd         1           0 R

show link-management routing

Syntax	show link-management routing <peer <name <i>name</i> > te-link <name <i>name</i> >> <resource <name <i>name</i> >>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
Description	Display Multiprotocol Label Switching (MPLS) peer or traffic engineering link information from the routing process.
Options	<p>none—Display all peer and traffic-engineered link information.</p> <p>peer <name <i>name</i>>—(Optional) Display information for all peers or for the specified peer only.</p> <p>resource <name <i>name</i>>—(Optional) Display information for all resources or for the specified resource only.</p> <p>te-link <name <i>name</i>>—(Optional) Display information for all traffic-engineered forwarding paths or for the specified path only.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show link-management on page 1938 • show link-management peer on page 1942 • show link-management statistics on page 1948 • show link-management te-link on page 1950
List of Sample Output	show link-management routing on page 1947
Output Fields	Table 66 on page 1944 describes the output fields for the show link-management routing command. Output fields are listed in the approximate order in which they appear.

Table 66: show link-management routing Output Fields

Field Name	Field Description
Peer Name	Name of the peer.
System identifier	Internal identifier for the peer. The range of values is 0 through 64,000.
State	State of the peer: Up or Down.

Table 66: show link-management routing Output Fields (continued)

Field Name	Field Description
Control address	Address to which a control channel is established.
Control channel	Interface over which control packets are sent.
State	State of the control channel.
TE link name	Traffic-engineered link name.
State	State of the traffic-engineered link: Up or Down .
Local identifier	Identifier of the local side of the link.
Remote identifier	Identifier of the remote side of the link.
Local address	Address of the local side of the link.
Remote address	Address of the remote side of the link.
Encoding	Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include SDH/SONET , Ethernet , and Packet .
Minimum bandwidth	Smallest single allocation of bandwidth, in bits per second (bps) or megabits per second (Mbps), possible on the traffic-engineered link. This number is equal to the smallest bandwidth interface that is a member of the traffic-engineered link.
Maximum bandwidth	Largest single allocation of bandwidth, in bps or Mbps, possible on the traffic-engineered link. This number is equal to the largest bandwidth interface that is a member of the link (in bps).
Total bandwidth	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link.
Available bandwidth	Sum of the bandwidth, in bps or Mbps, of all interfaces that are members of the link and that are not yet allocated.
Resource	Forwarding adjacency LSP information.
Type	Type of resource. The type is always a forwarding adjacency LSP.
State	State of the LSP: Up or Down .
System Identifier	Internal identifier for the peer. The range of values is 0 through 64,000 .
Total bandwidth	Bandwidth resource, in bps or Mbps, on the TE-link learned from the routing process.

Table 66: show link-management routing Output Fields (continued)

Field Name	Field Description
Traffic parameters	<ul style="list-style-type: none">• Encoding—Physical layer media type determined by the interfaces contained in the traffic-engineered link. Typical values include SDH/SONET, Ethernet, and Packet.• Switching—Type of switching that can be performed on the traffic-engineered link: PSC-1 and Packet.• Granularity—Layer 2 data for switching Layer 2 LSPs for this resource. Not supported. This value is always unknown.

show link-management statistics

Syntax	show link-management statistics <peer <name <i>name</i> >>
Release Information	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.5 for EX Series switches.
Description	Display statistical information for Link Management Protocol (LMP) packets.
Options	none —Display information for all peers. peer <name <i>name</i>> —(Optional) Display information for all peers or for the specified peer only.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show link-management on page 1938 • show link-management peer on page 1942 • show link-management routing on page 1944 • show link-management te-link on page 1950
List of Sample Output	show link-management statistics on page 1949
Output Fields	Table 67 on page 1948 describes the output fields for the show link-management statistics command. Output fields are listed in the approximate order in which they appear.

Table 67: show link-management statistics Output Fields

Field Name	Field Description
Received packets	Number of received packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Received bad packets	Number of received bad packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Small packets	Number of packets that are too small.
Wrong protocol version	Number of packets specifying the wrong LMP version.
Messages for unknown peer	Number of packets destined for an unknown peer.
Messages for bad state	Number of packets indicating a state that does not match the recipient.

Table 67: *show link-management statistics Output Fields (continued)*

Field Name	Field Description
Stale acknowledgments	Number of configAck and LinkSummaryAck packets received that have a stale message ID.
Stale negative acknowledgments	Number of configNack and LinkSummaryNack packets received that have a stale message ID.
Sent packets	Number of sent packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Retransmitted packets	Number of retransmitted packets by message type. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.
Dropped packets	Number of packets sent, by message type, that have been dropped by the receiver after the LMP retransmission interval has been exceeded. If the count for a message type is zero, that message type is not displayed. If the count for all message types is zero, this field is not displayed.

Sample Output

show link-management statistics

```

user@host> show link-management statistics peer pro4-a
Statistics for peer pro4-a
  Received packets
    Config: 1
    Hello: 2572
  Small packets: 0

show mpls association

Syntax	<code>show mpls association (iif <i>incoming-interface</i> oif <i>outgoing-interface</i>) <logical-system (all <i>logical-system-name</i>)></code>
Release Information	Command introduced in Junos OS Release 16.1 for the M Series, MX Series, and T Series.
Description	Display the Multiprotocol Label Switching (MPLS) label-switched paths (LSPs) based on the association with an incoming or outgoing LSP interface. The command output displays the list of RSVP-TE LSPs carrying traffic in and out of the same interface.
Options	<p>iif <i>incoming-interface-name</i>—Display list of RSVP-TE LSPs that share the specified incoming interface to bring in traffic. This option works on transit label-switching routers (LSRs) and egress label edge routers (LERs).</p> <p>oif <i>outgoing-interface-name</i>—Display list of RSVP-TE LSPs that share the specified outgoing interface to carry out traffic. This option works on ingress LERs and transit LSRs.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>

show mpls call-admission-control

List of Syntax	Syntax on page 1959 Syntax (EX Series Switches) on page 1959
Syntax	<pre>show mpls call-admission-control <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <lsp-name></pre>
Syntax (EX Series Switches)	<pre>show mpls call-admission-control <lsp-name></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>instance <i>instance-name</i> option added in Junos OS Release 15.1.</p>
Description	Display Multiprotocol Label Switching (MPLS) label-switched path (LSP) call admission control (CAC) information.
Options	<p>none—Display CAC information for all LSPs.</p> <p>instance <i>instance-name</i>—(Optional) Display MPLS LSP CAC information for the specified instance. If <i>instance-name</i> is omitted, MPLS LSP CAC information for the master instance is displayed.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><i>lsp-name</i>—(Optional) Display CAC information for the specified LSP only.</p>
Additional Information	The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by any Layer 2 connection at that class type.
Required Privilege Level	view
List of Sample Output	show mpls call-admission-control on page 1960
Output Fields	Table 72 on page 1960 describes the output fields for the show mpls call-admission-control command. Output fields are listed in the approximate order in which they appear.

Table 72: show mpls call-admission-control Output Fields

Field Name	Field Description
Available bandwidth	Current available bandwidth on each LSP path. Depending on whether the LSP is an E-LSP or a regular LSP, either per-class bandwidth or a single bandwidth value (corresponding to best-effort bandwidth at ct0) is displayed. The available bandwidth on an LSP path at a particular class type is the total path bandwidth at that class type minus the total bandwidth reserved by some Layer 2 connections at that class type.
Layer2 connections	Different Layer 2 connections that had some bandwidth requirement and were admitted into an LSP path.
LSP name	LSP pathname.
Neighbor address	Neighbor address from which CAC and bandwidth booking are configured for Layer 2 circuits.
Circuit	Interface name and circuit information.
Primary	LSP's primary standby path.
Standby	LSP's secondary standby path.
VC bandwidth	Bandwidth constraints associated with a Layer 2 circuit route.

Release Information Command introduced in Junos OS Release 14.2.
 Statement introduced for QFX Switches in Junos OS Release 15.1X53-D30.

Description Display information about configured and active Multiprotocol Label Switching (MPLS) container label-switched paths (LSPs).

Options **none**—Display standard information about all configured and active member LSPs of the container LSP.

brief | detail | extensive | terse—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

count-active-routes—(Optional) Show active routes for the container LSP.

defaults—(Optional) Display the default settings of the container LSP.

descriptions—(Optional) Display the container LSP descriptions. To view this information, you must configure the description statement at the **[edit protocol mpls container-lsp]** hierarchy level. Only the LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

egress—(Optional) Display the LSPs ending at this device.

NOTE: The **egress** option displays all the LSPs including regular LSPs, members of container LSPs, and transit LSPs. This is an expected behavior for all platforms.

ingress—(Optional) Display the member LSPs originating from this device.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name *name*—(Optional) Display information about the specified LSP or group of LSPs.

statistics—(Optional) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

transit—(Optional) Display LSPs transiting this routing device.

unidirectional—(Optional) Display unidirectional LSP information.

List of Sample Output [show mpls container-lsp on page 1967](#)
[show mpls container-lsp extensive on page 1967](#)

Output Fields [Table 73 on page 1963](#) describes the output fields for the **show mpls container-lsp** command. Output fields are listed in the approximate order in which they appear.

Table 73: show mpls container-lsp Output Fields

Field Name	Field Description	Level of Output
Ingress LSP	Information about the member LSPs on the ingress routing device. Each LSP has one line of output.	All levels
Container LSP name	Name of the container LSP.	All levels
Member LSP count	Number of member LSPs in the container LSP.	All levels
To	Destination (egress routing device) of the session.	brief
From	Source (ingress routing device) of the session.	brief detail
State	State of the LSP handled by this RSVP session: <ul style="list-style-type: none"> • Up • Dn (down) • Restart 	brief detail

Table 73: show mpls container-lsp Output Fields (continued)

Field Name	Field Description	Level of Output
Rt	Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0).	brief
P	Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.	brief
ActivePath	(Ingress LSP) Name of the active path: Primary or Secondary.	detail extensive
LSPname	Name of the member LSP.	brief detail
Egress LSP	Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output.	All levels
Transit LSP	Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
Min LSPs	Minimum number of member LSPs. Default: 1	extensive
Max LSPs	Number of member LSPs that the container LSP can have at maximum. Default: 64 (due to ECMP limit)	extensive
Aggregate bandwidth	Sum of the bandwidths of all member LSPs.	extensive
NormalizeTimer	Duration between two normalization events. When not configured, 21600 seconds (6 hours) is set as the default value.	extensive
NormalizeThreshold	Change in aggregate LSP utilization to trigger splitting or merging expressed in percentage.	extensive
Max Signaling BW	Maximum bandwidth used to signal LSPs after a normalization event. Default value is 0 bps. When not configured, the value is inherited from the splitting bandwidth configuration. NOTE: Between two normalization events, when auto-bandwidth adjustment happens, the per-LSP auto-bandwidth configuration and thresholds are used, instead of the maximum signaling bandwidth threshold.	extensive

Table 73: show mpls container-lsp Output Fields (continued)

Field Name	Field Description	Level of Output
Min Signaling BW	<p>Minimum bandwidth used to signal LSPs after a normalization event.</p> <p>Default value is 0 bps. When not configured, the value is inherited from the merging bandwidth configuration.</p> <p>NOTE: Between two normalization events, when auto-bandwidth adjustment happens, the per-LSP auto-bandwidth configuration and thresholds are used, instead of the minimum signaling bandwidth threshold.</p>	extensive
Splitting BW	<p>Bandwidth used for LSP splitting and merging.</p> <p>Default value is 0 bps. When not configured, the value is inherited from the auto-bandwidth maximum bandwidth configuration.</p>	extensive
Merging BW	<p>Bandwidth used for LSP splitting and merging.</p> <p>Default value is 0 bps. When not configured, the value is inherited from the auto-bandwidth minimum bandwidth configuration.</p>	extensive
LSPtype		extensive
LoadBalance		extensive
MinBW	Minimum LSP bandwidth in bps related to auto-bandwidth.	extensive
AdjustTimer	<p>Total amount of time in seconds allowed before LSP bandwidth adjustment take place.</p> <p>Range: 300 through 315360000 seconds</p>	extensive
Max AvgBW util	Current value of the actual maximum average bandwidth utilization in bps.	extensive
Overflow limit	Threshold overflow limit.	extensive
Underflow limit	Threshold underflow limit.	extensive
Encoding type		extensive
Switching type		extensive
GPID		extensive
Priorities	<p>Setup priority and hold priority values.</p> <p>For setup priority, 0 and 7 is the highest and lowest priority, respectively.</p> <p>When not explicitly configured, 7 and 0 are set as the default values for the setup priority and hold priority, respectively.</p>	extensive
Bandwidth		extensive

Table 73: show mpls container-lsp Output Fields (continued)

Field Name	Field Description	Level of Output
SmartOptimizeTimer	Time in seconds allowed before path reoptimization.	extensive
Computed ERO	Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (S) or loose (L).	extensive
Received RRO	<p>Received record route.</p> <p>RRO is a series of hops, each with an address followed by a flag. In most cases, the received RRO is the same as the computed ERO. If the received RRO is different from the computed ERO, there is a topology change in the network, and the route is taking a detour.</p> <p>The following flags identify the protection capability and status of the downstream node:</p> <ul style="list-style-type: none"> • 0x01—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding path message. • 0x02—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously). • 0x03—Combination of 0x01 and 0x02. • 0x04—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section. • 0x08—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the local protection available bit is set but the node protection bit is cleared. • 0x09—Detour is established. Combination of 0x01 and 0x08. • 0x10—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted. • 0x20—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently. • 0xb—Detour is in use. Combination of 0x01, 0x02, and 0x08. 	extensive
Make-before-break		extensive
Record Route		extensive
Automatic Autobw adjustment succeeded		extensive
CSPF		extensive
Created	Date and time the LSP was created.	extensive

Output Fields	<p>Table 77 on page 1975 describes the output fields for the show mpls diffserv-te command. Output fields are listed in the approximate order in which they appear.</p>

Table 77: show mpls diffserv-te Output Fields

Field Name	Field Description
Bandwidth model	Bandwidth constraint model supported. The maximum allocation model (MAM) for EXP-inferred LSPs (E-LSPs) is currently supported.
TE class	DiffServ traffic engineering class.

Table 77: show mpls diffserv-te Output Fields (continued)

Field Name	Field Description
Traffic class	MPLS class type that corresponds to the DiffServ traffic engineering class: <ul style="list-style-type: none">• ct0—Best effort• ct1—Assured forwarding• ct2—Expedited forwarding• ct3—Network control
Priority	MPLS preemption priority for this class type, a value from 0 through 7. Interior gateway protocols (IGPs) distribute information about the available bandwidth for each traffic engineering class.

Sample Output

show mpls diffserv-te

```
user@host> show mpls diffserv-te
Bandwidth model: Maximum Allocation Model with support for E-LSPs.
TE class   Traffic class   Priority
te0        ct0             3
te1        ct1             2
```

show mpls interface

Syntax `show mpls interface`

Release Information Command introduced in Junos OS Release 9.5 for EX Series switches.

Description Display information about MPLS-enabled interfaces. MPLS is enabled on an interface when the interface is configured with both the `set protocols mpls interface interface-name` and `set interfaces interface-name unit 0 family mpls` commands.

Required Privilege Level view

Table 79: show mpls lsp Output Fields

Field Name	Field Description
Instance	Indicates egress instance name
Type	Indicates type of the VRF. It can be either local-vrf or remote-vrf
RIB	Indicates the edge-protection created routing table
Context-Id	Indicates the context-ID associated with the RIB.

Table 79: show mpls lsp Output Fields (continued)

Field Name	Field Description
Interface / EnhancedLookup	Show VT interfaces associated with the backup RIB. Shows Enhanced-lookup for MX Series 3D Universal Edge Routers with the Enhanced IP Network Services mode configured using the network-services enhanced-ip statement at the [edit chassis] hierarchy level.

Sample Output

show mpls egress-protection detail (Centralized Protector)

```

user@host> show mpls egress-protection detail

Instance           Type           Protection-Type
rsite1              remote-vrf     Protector
  RIB __99.99.1.4-rsite1__.inet.0, Context-Id 99.99.1.4, Enhanced-lookup
  Route Target 1:1
rsite24             remote-vrf     Protector
  RIB __99.99.1.4-rsite24__.inet.0, Context-Id 99.99.1.4, Enhanced-lookup
  Route Target 100:1023

```

Sample Output

show mpls egress-protection detail (Collocated Protector)

```

user@host> show mpls egress-protection detail

Instance           Type           Protection-Type
site2              local-vrf      Protector
  RIB __66.6.6.6-site2__.inet.0, Context-Id 66.6.6.6, Interface vt-1/3/0.87031809

  Route Target 100:251
site12             local-vrf      Protector
  RIB __66.6.6.6-site12__.inet.0, Context-Id 66.6.6.6, Interface vt-1/3/0.87031808

  Route Target 100:250
  Route Target 100:251

site2              local-vrf      Protector

show mpls interface

List of Syntax	Syntax on page 1980 Syntax (EX Series Switches) on page 1980
Syntax	<pre>show mpls interface <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Syntax (EX Series Switches)	show mpls interface
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>instance <i>instance-name</i> option added in Junos OS Release 15.1.</p>
Description	Display information about Multiprotocol Label Switching (MPLS)-enabled interfaces.
Options	<p>none—Display information about MPLS-enabled interfaces.</p> <p>instance <i>instance-name</i>—(Optional) Display information about MPLS-enabled interfaces for the specified routing instance. If <i>instance-name</i> is omitted, information about MPLS-enabled interfaces is displayed for the master instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Additional Information	MPLS is enabled on an interface when the interface is configured with both the set protocol mpls interface <i>interface-name</i> and set interface <i>interface-name</i> unit 0 family mpls statements.
Required Privilege Level	view
List of Sample Output	show mpls interface on page 1981
Output Fields	<p>Table 80 on page 1980 describes the output fields for the show mpls interface command. Output fields are listed in the approximate order in which they appear.</p>

Table 80: show mpls interface Output Fields

Field Name	Field Description
Interface	Name of the interface.
State	State of the interface: Up or Dn (down).
Administrative groups	Administratively assigned colors of the link.

Table 80: show mpls interface Output Fields (continued)

Field Name	Field Description
Maximum labels	Maximum number of MPLS labels upon which MPLS can operate on a logical interface. This is configured using the maximum-labels statement at the [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls] or the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family mpls] hierarchy levels.
Static protection revert time	Time (in seconds) that a static LSP must wait before traffic reverts from the bypass path to the original path. This is configured using the protection-revert-time statement at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels.
Always mark connection protection tlv	Enabled or Disabled: Enabled indicates that the always-mark-connection-protection-tlv statement is configured at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels. When this statement is configured, it marks all OAM traffic transiting this interface in preparation for switching the traffic to an alternate path based on the OAM functionality. To switch traffic to the bypass LSP, the switch-away-lsps statement must be configured.
Switch away lsps	Enabled or Disabled: Enabled indicates that the switch-away-lsps statement is configured at the [edit logical-systems <i>logical-system-name</i> protocols mpls interface <i>interface-name</i> static] or the [edit protocols mpls interface <i>interface-name</i> static] hierarchy levels. This enables you to switch an LSP away from a network node using a bypass LSP. This feature can be used in maintenance of active networks when a network device needs to be replaced without interrupting traffic passing through the network. The LSPs can be either static or dynamic.

Sample Output

show mpls interface

```

user@host> show mpls interface

Interface: ge-0/2/1.57
State: Up
Administrative group: <none>
Maximum labels: 5
Static protection revert time: 5 seconds
Always mark connection protection tlv: Disabled
Switch away lsps : Disabled

```

show mpls label usage

Syntax	<pre>show mpls label usage <label <i>label value</i>> <label-range <i>range-start range-end</i>> <logical-system (<i>all</i> <i>logical-system-name</i>)></pre>
Release Information	<p>Command introduced in Junos OS Release 15.1.</p> <p>Support for the label statement added in Junos OS Release 17.2.</p> <p>Support for the label-range statement added in Junos OS Release 17.2.</p>
Description	<p>Show the available label space resource in RPD and also the applications that use the label space in RPD. There are four different label spaces currently used in MPLS—namely LSI, dynamic, block, and static. Each label space has a fixed number and cannot grow beyond the fixed value. Using this command, the administrator can monitor the available labels in each label space and the applications that are using the labels. Based on the availability of labels, the administrator can decide to stop any service and free some labels or use other service where the labels are available.</p> <p>Starting in Junos OS Release 17.2, you can configure the enhanced-ip command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability.</p> <p>When you set each member router's network services to enhanced-ip, only MPC or Modular Interface Cards (MICs) modules and Multiservices Dense Port Concentrator (MS-DPC) modules are powered on in the chassis. Non-service DPCs do not work with enhanced IP network services.</p>
Options	<p>none— Display the available labels in each label space and the applications using the labels.</p> <p>label <i>label value</i>—(Optional) Display the information about which <i>label value</i> is used by which protocol, if any.</p> <p>label-range <i>range-start range-end</i> —(Optional) Display the complete information about the label-range specified. With the enhanced-ip command enabled on the supported device, effective ranges and configured ranges along with details of different label spaces such as LSI, dynamic, block, and static types are displayed.</p> <p>logical-system (<i>all</i> <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Additional Information	<p>Once the label space crosses the threshold, a new syslog message is added.</p> <p><label-space-name> label space usage crossed threshold limit of 90%.</p> <p>For instance, LSI label space usage crossed threshold limit of 90%.</p>

List of Sample Output [show mpls label usage on page 1983](#)

Output Fields [Table 81 on page 1983](#) describes the output fields for the **show mpls label usage** command. Output fields are listed in the order in which they appear.

Table 81: show mpls label usage Fields

Field Name	Field Description
Label Space	Indicates the different types of labels currently used in MPLS.
Total	Indicates the total label space available.
Available	Indicates the number of freely available labels and also the percentage of the label space available.
Applications	Indicates the applications that use the MPLS label spaces.
Effective Ranges	Indicates actual ranges in use, which can be different from configured ranges, if conflicting with label already allocated.
Configured Ranges	Indicates the currently configured range assigned to different label spaces on the device.

Sample Output

show mpls label usage

```
user@host> show mpls label usage
Label space Total Available Applications
LSI 999984 999971 (100.00%) BGP/LDP VPLS with no-tunnel-services, BGP
L3VPN with vrf-table-label
Block 999984 999971 (100.00%) BGP/LDP VPLS with tunnel-services, BGP L2VPN
Dynamic 999984 999971 (100.00%) RSVP, LDP, PW, L3VPN, RSVP-P2MP, LDP-P2MP,
MVPN, EVPN, BGP
Static 48576 48576 (100.00%) Static LSP, Static PW
```

With **enhanced-ip** enabled on the supported device, you get the following additional output.

```
user@host> show mpls label usage
Label space Total Available Applications
LSI 101 99 (98.02% ) BGP/LDP VPLS with no-tunnel-services, BGP
L3VPN with vrf-table-label
Block 101 101 (100.00%) BGP/LDP VPLS with tunnel-services, BGP L2VPN
Dynamic 101 98 (97.03% ) RSVP, LDP, PW, L3VPN, RSVP-P2MP, LDP-P2MP,
MVPN, EVPN, BGP
Static 48576 48576 (100.00%) Static LSP, Static PW
Effective Ranges
Range name Shared with Start End
LSI 300 400
Block 500 600
```

```
Dynamic      100      200
Static      1000000 1048575

Range name  Shared with Start   End
LSI         300      400
Block       500      600
Dynamic     100      200
Static      1000000 1048575

user@host> show mpls label usage label 101
Label 101 is used by protocol BGP

user@host> show mpls label usage label 102
Label 102 is used by protocol LDP

user@host> show mpls label usage label 103
Label 103 is not allocated to any protocol
```

show mpls label usage label-range

Syntax `show mpls label usage label-range`
 `<block-label-range range-start range-end>`
 `<dynamic-label-range range-start range-end>`
 `<label-limit label-limit value>`
 `<lsi-label-range range-start range-end>`
 `<static-label-range range-start range-end>`

Release Information Command introduced in Junos OS Release 17.2.

Description There are four different label spaces currently used in MPLS—namely LSI, dynamic, block, and static. Each label space has a fixed number and cannot grow beyond the fixed value. Using **show mpls label usage label-range** command, the administrator can monitor the available labels in each label space and the applications that are using the labels. Based on the availability of labels, the administrator can decide to stop any service and free some labels or use other service where the labels are available.

Starting in Junos OS Release 17.2, you can configure the **enhanced-ip** command, which is supported on platforms using Modular Port Concentrators (MPCs) equipped with Junos Trio chipsets. You can also separate the MPLS labels used for different label spaces which provides more flexibility and scalability.

When you set each member router's network services to **enhanced-ip**, only MPC or Modular Interface Cards (MICs) modules and Multiservices Dense Port Concentrator (MS-DPC) modules are powered on in the chassis. Non-service DPCs do not work with enhanced IP network services.

Options **block-label-range range-start range-end**—Display the details of block label type.

dynamic-label-range range-start range-end —Display the details of dynamic label type.

label-limit label-limit value—Limit for the number of concurrent active labels.

lsi-label-range range-start range-end—Display the details of LSI label type.

static-label-range range-start range-end—Display the details of static label type.

Release Information Command introduced before Junos OS Release 7.4.
 defaults option added in Junos OS Release 8.5.
 Command introduced in Junos OS Release 9.5 for EX Series switches.
 autobandwidth option added in Junos OS Release 11.4.
 externally-controlled option added in Junos OS Release 12.3.
 externally-provisioned option added in Junos OS Release 13.3.
 Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.
 instance *instance-name* option added in Junos OS Release 15.1.

Description Display information about configured and active dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

Options **none**—Display standard information about all configured and active dynamic MPLS LSPs.

brief | detail | extensive | terse—(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.

autobandwidth—(Optional) Display automatic bandwidth information. This option is explained separately (see [show mpls lsp autobandwidth](#)).

bidirectional | unidirectional—(Optional) Display bidirectional or unidirectional LSP information, respectively.

bypass—(Optional) Display LSPs used for protecting other LSPs.

count-active-routes—(Optional) Display active routes for LSPs.

defaults—(Optional) Display the MPLS LSP default settings.

descriptions—(Optional) Display the MPLS label-switched path (LSP) descriptions. To view this information, you must configure the description statement at the **[edit protocol mpls lsp]** hierarchy level. Only LSPs with a description are displayed. This command is only valid for the ingress routing device, because the description is not propagated in RSVP messages.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

externally-controlled—(Optional) Display the LSPs that are under the control of an external Path Computation Element (PCE).

externally-provisioned—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

instance *instance-name*—(Optional) Display MPLS LSP information for the specified instance. If *instance-name* is omitted, MPLS LSP information is displayed for the master instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-type—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

name *name*—(Optional) Display information about the specified LSP or group of LSPs.

p2mp—(Optional) Display information about point-to-multipoint LSPs.

statistics—(Optional) (Ingress and transit routers only) Display accounting information about LSPs. Statistics are not available for LSPs on the egress routing device, because the penultimate routing device in the LSP sets the label to 0. Also, as the packet

arrives at the egress routing device, the hardware removes its MPLS header and the packet reverts to being an IPv4 packet. Therefore, it is counted as an IPv4 packet, not an MPLS packet.

NOTE: If a bypass LSP is configured for the primary static LSP, display cumulative statistics of packets traversing through the protected LSP and bypass LSP when traffic is re-optimized when the protected LSP link is restored. (Bypass LSPs are not supported on QFX Series switches.)

When used with the `bypass` option (`show mpls lsp bypass statistics`), display statistics for the traffic that flows only through the bypass LSP.

transit—(Optional) Display LSPs transiting this routing device.

Output Fields

[Table 83 on page 1990](#) describes the output fields for the `show mpls lsp` command. Output fields are listed in the approximate order in which they appear.

Table 83: show mpls lsp Output Fields

Field Name	Field Description	Level of Output
Ingress LSP	Information about LSPs on the ingress routing device. Each session has one line of output.	All levels

Table 83: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
Egress LSP	Information about the LSPs on the egress routing device. MPLS learns this information by querying RSVP, which holds all the transit and egress session information. Each session has one line of output.	All levels
Transit LSP	Number of LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
P2MP name	Name of the point-to-multipoint LSP. Dynamically generated P2MP LSPs used for VPLS flooding use dynamically generated P2MP LSP names. The name uses the format <i>identifier:vpls:router-id:routing-instance-name</i> . The <i>identifier</i> is automatically generated by Junos OS.	All levels
P2MP branch count	Number of destination LSPs the point-to-multipoint LSP is transmitting to.	All levels
P	An asterisk (*) under this heading indicates that the LSP is a primary path.	All levels
address	(detail and extensive) Destination (egress routing device) of the LSP.	detail extensive
To	Destination (egress routing device) of the session.	brief
From	Source (ingress routing device) of the session.	brief detail
State	State of the LSP handled by this RSVP session: Up , Dn (down), or Restart .	brief detail
Active Route	Number of active routes (prefixes) installed in the forwarding table. For ingress LSPs, the forwarding table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (mpls.0).	detail extensive
Rt	Number of active routes (prefixes) installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0).	brief
P	Path. An asterisk (*) underneath this column indicates that the LSP is a primary path.	brief
ActivePath	(Ingress LSP) Name of the active path: Primary or Secondary .	detail extensive
LSPname	Name of the LSP.	brief detail
Statistics	Displays the number of packets and the number of bytes transmitted over the LSP. These counters are reset to zero whenever the LSP path is optimized (for example, during an automatic bandwidth allocation).	extensive
Aggregate statistics	Displays the number of packets and the number of bytes transmitted over the LSP. These counters continue to iterate even if the LSP path is optimized. You can reset these counters to zero using the clear mpls lsp statistics command.	extensive
Packets	Displays the number of packets transmitted over the LSP.	brief extensive

Table 83: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
Bytes	Displays the number of bytes transmitted over the LSP.	brief extensive
DiffServInfo	Type of LSP: multiclass LSP (multiclass diffServ-TE LSP) or Differentiated-Services-aware traffic engineering LSP (diffServ-TE LSP).	detail
LSPtype	Type of LSP: <ul style="list-style-type: none"> • Static configured—Static • Dynamic configured—Dynamic • Externally controlled—External path computing entity Also indicates if the LSP is a Penultimate hop popping LSP or an Ultimate hop popping LSP.	detail extensive
Bypass	(Bypass LSP) Destination address (egress routing device) for the bypass LSP.	All levels
LSPpath	Indicates whether the RSVP session is for the primary or secondary LSP path. LSPpath can be either primary or secondary and can be displayed on the ingress, egress, and transit routing devices.	detail
Bidir	(GMPLS) The LSP allows data to travel in both directions between GMPLS devices.	All levels
Bidirectional	(GMPLS) The LSP allows data to travel both ways between GMPLS devices.	All levels
FastReroute desired	Fast reroute has been requested by the ingress routing device.	detail
Link protection desired	detail	
Node/Link protection desired	Link protection has been requested by the ingress routing device.	detail
LSP Control Status	(Ingress LSP) LSP control mode: <ul style="list-style-type: none"> • External—By default, all PCE-controlled LSPs are under external control. When an LSP is under external control, the PCC uses the PCE-provided parameters to set up the LSP. • Local—A PCE-controlled LSP can come under local control. When the LSP switches from external control to local control, path computation is done using the CLI-configured parameters and constraint-based routing. Such a switchover happens only when there is a trigger to re-signal the LSP. Until then, the PCC uses the PCE-provided parameters to signal the PCE-controlled LSP, although the LSP remains under local control. A PCE-controlled LSP switches to local control from its default external control mode in cases such as no connectivity to a PCE or when a PCE returns delegation of LSPs back to the PCC.	extensive

Table 83: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
External Path CSPF status	(PCE-controlled LSPs) Status of the PCE-controlled LSP with per path attributes: <ul style="list-style-type: none"> Local External 	extensive
Externally Computed ERO	(PCE-controlled LSPs) Externally computed explicit route when the route object is not null or empty. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (S) or loose (L).	extensive
EXTCTRL_LSP	(PCE-controlled LSPs) Display path history including the bandwidth, priority, and metric values received from the external controller.	extensive
LoadBalance	(Ingress LSP) CSPF load-balancing rule that was configured to select the LSP's path among equal-cost paths: Most-fill , Least-fill , or Random .	detail extensive
Signal type	Signal type for GMPLS LSPs. The signal type determines the peak data rate for the LSP: DS0 , DS3 , STS-1 , STM-1 , or STM-4 .	All levels
Encoding type	LSP encoding type: Packet , Ethernet , PDH , SDH/SONET , Lambda , or Fiber .	All levels
Switching type	Type of switching on the links needed for the LSP: Fiber , Lambda , Packet , TDM , or PSC-1 .	All levels
GPID	Generalized Payload Identifier (identifier of the payload carried by an LSP): HDLCL , Ethernet , IPv4 , PPP , or Unknown .	All levels
Protection	Configured protection capability desired for the LSP: Extra , Enhanced , none , One plus one , One to one , or Shared .	All levels
Upstream label in	(Bidirectional LSPs) Incoming label for reverse direction traffic for this LSP.	All levels
Upstream label out	(Bidirectional LSPs) Outgoing label for reverse direction traffic for this LSP.	All levels
Suggested label received	(Bidirectional LSPs) Label the upstream node suggests to use in the Resv message that is sent.	All levels
Suggested label sent	(Bidirectional LSPs) Label the downstream node suggests to use in the Resv message that is returned.	All levels
Autobandwidth	(Ingress LSP) The LSP is performing autobandwidth allocation.	detail extensive
MinBW	(Ingress LSP) Configured minimum value of the LSP, in bps.	detail extensive
MaxBW	(Ingress LSP) Configured maximum value of the LSP, in bps.	detail extensive
Dynamic MinBW	(Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps.	detail extensive

Table 83: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
Dynamic MinBW	(Ingress LSP) Displays the current dynamically specified minimum bandwidth allocation for the LSP, in bps.	detail extensive
AdjustTimer	(Ingress LSP) Configured value for the adjust-timer statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.	detail extensive
Adjustment Threshold	(Ingress LSP) Configured value for the adjust-threshold statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization.	detail extensive
Time for Next Adjustment	(Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.	detail extensive
Time of Last Adjustment	(Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.	detail extensive
MaxAvgBW util	(Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps.	detail extensive
Overflow limit	(Ingress LSP) Configured value of the threshold overflow limit.	detail extensive
Overflow sample count	(Ingress LSP) Current value for the overflow sample count.	detail extensive
Bandwidth Adjustment in <i>nnn</i> second(s)	(Ingress LSP) Current value of the bandwidth adjustment timer, indicating the amount of time remaining until the bandwidth adjustment will take place, in seconds.	detail extensive
Underflow limit	(Ingress LSP) Configured value of the threshold underflow limit.	detail extensive
Underflow sample count	(Ingress LSP) Current value for the underflow sample count.	detail extensive
Underflow Max AvgBW	(Ingress LSP) The highest sample bandwidth among the underflow samples recorded currently. This is the signaling bandwidth if an adjustment occurs because of an underflow.	detail extensive
Active path indicator	(Ingress LSP) A value of * indicates that the path is active. The absence of * indicates that the path is not active. In the following example, "long" is the active path. *Primary long Standby short	detail extensive
Primary	(Ingress LSP) Name of the primary path.	detail extensive
Secondary	(Ingress LSP) Name of the secondary path.	detail extensive
Standby	(Ingress LSP) Name of the path in standby mode.	detail extensive

Table 83: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
State	(Ingress LSP) State of the path: Up or Dn (down).	detail extensive
COS	(Ingress LSP) Class-of-service value.	detail extensive
Bandwidth per class	(Ingress LSP) Active bandwidth for the LSP path for each MPLS class type, in bps.	detail extensive
Priorities	(Ingress LSP) Configured value of the setup priority and the hold priority respectively (the setup priority is displayed first), where 0 is the highest priority and 7 is the lowest priority. If you have not explicitly configured these values, the default values are displayed (7 for the setup priority and 0 for the hold priority).	detail extensive
OptimizeTimer	(Ingress LSP) Configured value of the optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.	detail extensive
SmartOptimizeTimer	(Ingress LSP) Configured value of the smart optimize timer, indicating the total amount of time allowed before path reoptimization, in seconds.	detail extensive
Flap Count	Number of times an LSP flaps down and up. Syslog messages are logged when an LSP goes down – RPD_MPLS_(PATH LSP)_DOWN , and when an LSP goes up – RPD_MPLS_(PATH LSP)_UP .	detail extensive
MBB Count	Number of times an LSP incurs a make before break (MBB). A syslog message is logged when a make-before-break completes for an LSP.	detail extensive
Reoptimization in xxx seconds	(Ingress LSP) Current value of the optimize timer, indicating the amount of time remaining until the path will be reoptimized, in seconds.	detail extensive
Computed ERO (S [L] denotes strict [loose] hops)	(Ingress LSP) Computed explicit route. A series of hops, each with an address followed by a hop indicator. The value of the hop indicator can be strict (S) or loose (L).	detail extensive
CSPF metric	(Ingress LSP) Constrained Shortest Path First metric for this path.	detail extensive

Table 83: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
Received RRO	<p>(Ingress LSP) Received record route. A series of hops, each with an address followed by a flag. (In most cases, the received record route is the same as the computed explicit route. If Received RRO is different from Computed ERO, there is a topology change in the network, and the route is taking a detour.) The following flags identify the protection capability and status of the downstream node:</p> <ul style="list-style-type: none"> • 0x01—Local protection available. The link downstream from this node is protected by a local repair mechanism. This flag can be set only if the Local protection flag was set in the SESSION_ATTRIBUTE object of the corresponding Path message. • 0x02—Local protection in use. A local repair mechanism is in use to maintain this tunnel (usually because of an outage of the link it was routed over previously). • 0x03—Combination of 0x01 and 0x02. • 0x04—Bandwidth protection. The downstream routing device has a backup path providing the same bandwidth guarantee as the protected LSP for the protected section. • 0x08—Node protection. The downstream routing device has a backup path providing protection against link and node failure on the corresponding path section. If the downstream routing device can set up only a link-protection backup path, the Local protection available bit is set but the Node protection bit is cleared. • 0x09—Detour is established. Combination of 0x01 and 0x08. • 0x10—Preemption pending. The preempting node sets this flag if a pending preemption is in progress for the traffic engine LSP. This flag indicates to the ingress legacy edge router (LER) of this LSP that it should be rerouted. • 0x20—Node ID. Indicates that the address specified in the RRO's IPv4 or IPv6 sub-object is a node ID address, which refers to the router address or router ID. Nodes must use the same address consistently. • 0xb—Detour is in use. Combination of 0x01, 0x02, and 0x08. 	detail extensive
Index number	(Ingress LSP) Log entry number of each LSP path event. The numbers are in chronological descending order, with a maximum of 50 index numbers displayed.	extensive
Date	(Ingress LSP) Date of the LSP event.	extensive
Time	(Ingress LSP) Time of the LSP event.	extensive
Event	(Ingress LSP) Description of the LSP event.	extensive
Created	(Ingress LSP) Date and time the LSP was created.	extensive
Resv style	(Bypass) RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be FF (fixed filter), SE (shared explicit), or WF (wildcard filter).	brief detail extensive
Labelin	Incoming label for this LSP.	brief detail
Labelout	Outgoing label for this LSP.	brief detail

Table 83: show mpls lsp Output Fields (continued)

Field Name	Field Description	Level of Output
LSPname	Name of the LSP.	brief detail
Time left	Number of seconds remaining in the lifetime of the reservation.	detail
Since	Date and time when the RSVP session was initiated.	detail
Tspec	Sender's traffic specification, which describes the sender's traffic parameters.	detail
Port number	Protocol ID and sender or receiver port used in this RSVP session.	detail
PATH rcvfrom	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this router, and number of packets received from the upstream neighbor.	detail
PATH sentto	Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor, and number of packets sent to the downstream routing device.	detail
RESV rcvfrom	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor. The output in this field, which is consistent with that in the PATH rcvfrom field, indicates that the RSVP negotiation is complete.	detail
Record route	Recorded route for the session, taken from the record route object.	detail
Soft preempt	Number of soft preemptions that occurred on a path and when the last soft preemption occurred. Only successful soft preemptions are counted (those that actually resulted in a new path being used).	detail
Soft preemption pending	Path is in the process of being soft preempted. This display is removed once the ingress router has calculated a new path.	detail
MPLS-TE LSP Defaults	Default settings for MPLS traffic engineered LSPs: <ul style="list-style-type: none"> • LSP Holding Priority—Determines the degree to which an LSP holds on to its session reservation after the LSP has been set up successfully. • LSP Setup Priority—Determines whether a new LSP that preempts an existing LSP can be established. • Hop Limit—Specifies the maximum number of routers the LSP can traverse (including the ingress and egress). • Bandwidth—Specifies the bandwidth in bits per second for the LSP. • LSP Retry Timer—Length of time in seconds that the ingress router waits between attempts to establish the primary path. 	defaults

The XML tag name of the **bandwidth** tag under the **auto-bandwidth** tag has been updated to **maximum-average-bandwidth**. You can see the new tag when you issue the **show mpls lsp extensive** command with the **| display xml** pipe option. If you have any scripts that use the **bandwidth** tag, ensure that they are updated to **maximum-average-bandwidth**.

show mpls lsp abstract-computation

Syntax	show mpls lsp abstract-computation <brief detail extensive>; <logical-system (all <i>logical-system-name</i>)>; <name <i>lsp-name</i> >;
Release Information	Command introduced in Junos OS Release 17.1 for all platforms.
Description	Display the ingress to egress abstract hop computation used by the constrained shortest path in the preprocessing for LSPs. The command output displays the various computation passes involved per LSP, and the qualifying exit devices for each pass. It also displays the affinity per pass, and the current start device chosen for the pass.
Options	<p>brief detail extensive—(Optional) Display the desired level of output.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Display the abstract computation for abstract hop constraints on all logical systems or on a particular logical system.</p> <p><i>lsp-name</i>—(Optional) Name of the LSP for which the abstract hop computation is displayed.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Example: Configuring Abstract Hops for MPLS LSPs on page 339 • abstract-hop on page 1467 • constituent-list on page 1495 • show mpls abstract-hop-membership on page 1953
List of Sample Output	show mpls lsp abstract-computation on page 2008
Output Fields	Table 84 on page 2007 describes the output fields for the show mpls lsp abstract-computation command. Output fields are listed in the approximate order in which they appear.

Table 84: show mpls lsp abstract-computation Output Fields

Field Name	Field Description
Path computation using abstract hops for LSP	Name of the LSP for which the abstract hop computation is performed.
Path type	The type of the path can be primary or secondary.
Path name	Name of the path.

Table 84: show mpls lsp abstract-computation Output Fields (continued)

Field Name	Field Description
Credibility	Credibility value associated with the interior gateway protocol in use.
Total no of CSPF passes	Number of constrained shortest path passes for the abstract hop.
CSPF pass no	Constrained shortest path pass number for the abstract hop computation.
Start address of the pass	IP address where the pass starts.
Affinity	Name of the abstract hop.
Destination	Destination IP address for a node in the pass.
State	State of the backtracking: <ul style="list-style-type: none"> Valid Disqualified

Sample Output

show mpls lsp abstract-computation

```

user@R0> show mpls lsp abstract-computation

show mpls lsp autobandwidth

Syntax	<pre>show mpls lsp autobandwidth <brief detail extensive> <logical-system (all <i>logical-system-name</i>)> <name <i>lsp-name</i>></pre>
Release Information	<p>Statement introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 15.1X54-D60 for the ACX5000 Series.</p> <p>Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.</p> <p>name <i>lsp-name</i> option introduced in Junos OS Release 18.1R1 for all platforms.</p>
Description	<p>Display automatic bandwidth information for the LSP(s).</p> <p>After a Routing Engine switchover, the output of the show mpls autobandwidth command might not be up-to-date, as the automatic bandwidth information for the LSP(s) is gathered by the new master Routing Engine during the first adjustment interval.</p>
Options	<p>brief detail extensive —(Optional) Display the specified level of output. The extensive option displays the same information as the detail option, but covers the most recent 50 events.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>name <i>lsp-name</i>—(Optional) Specify name of the LSP for which the automatic bandwidth information should be displayed.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show mpls lsp on page 1988 • Achieving a Make-Before-Break, Hitless Switchover for LSPs on page 414
List of Sample Output	show mpls lsp autobandwidth on page 2011
Output Fields	<p>Table 85 on page 2009 describes the output fields for the show mpls lsp autobandwidth command. Output fields are listed in the approximate order in which they appear.</p>

Table 85: show mpls lsp autobandwidth Output Fields

Field Name	Field Description	Level of Output
To	Destination (egress routing device) of the session.	All Levels
From	Source (ingress routing device) of the session.	All Levels

Table 85: show mpls lsp autobandwidth Output Fields (continued)

Field Name	Field Description	Level of Output
LSPname	Name of the LSP.	All Levels
Min BW	(Ingress LSP) Configured minimum value of the LSP, in bps.	detail extensive
Max BW	(Ingress LSP) Configured maximum value of the LSP, in bps.	detail extensive
Max AvgBW util	(Ingress LSP) Current value of the actual maximum average bandwidth utilization, in bps. NOTE: In calculating this value, the sample collected during make before break (MBB) is ignored to prevent inaccurate results. The first sample after a bandwidth adjustment, or after a change in the LSP ID (regardless of path change), is also ignored.	detail extensive
Overflow limit	(Ingress LSP) Configured value of the threshold overflow limit.	detail extensive
Overflow sample count	(Ingress LSP) Current value for the overflow sample count.	detail extensive
Underflow limit	(Ingress LSP) Configured value of the threshold underflow limit.	detail extensive
Underflow sample count	(Ingress LSP) Current value for the underflow sample count.	detail extensive
Adjustment Timer	(Ingress LSP) Configured value for the adjust-timer statement, indicating the total amount of time allowed before bandwidth adjustment will take place, in seconds.	detail extensive
Adjustment Threshold	(Ingress LSP) Configured value for the adjust-threshold statement. Specifies how sensitive the automatic bandwidth adjustment for an LSP is to changes in bandwidth utilization.	detail extensive
Time for Next Adjustment	(Ingress LSP) Time in seconds until the next automatic bandwidth adjustment sample is taken.	detail extensive
Time of Last Adjustment	(Ingress LSP) Date and time since the last automatic bandwidth adjustment was completed.	detail extensive
Last BW	Previous active bandwidth of the LSP.	detail extensive
Last Requested BW	Bandwidth requested in the previous automatic bandwidth adjustment.	detail extensive
Last Signaled BW	Bandwidth signaled in the previous automatic bandwidth adjustment.	detail extensive
Highest Watermark BW	Maximum bandwidth used by the LSP.	detail extensive
Total AutoBW Adjustments	Total number of attempts to adjust automatic bandwidth including failed and successful adjustments.	detail extensive

Table 85: show mpls lsp autobandwidth Output Fields (continued)

Field Name	Field Description	Level of Output
Successful Adjustments	Number of successful automatic bandwidth adjustments.	detail extensive
Failed Adjustments	Number of failed automatic bandwidth adjustments.	detail extensive

Sample Output

show mpls lsp autobandwidth

```

user@host> show mpls lsp autobandwidth extensive
To: 10.255.106.133,
From: 10.255.106.135, LSPname: r0-r1
Min BW: 100kbps, Max BW: 0bps, Max AvgBW util: 2.33249Mbps
Overflow limit: 0, Overflow sample count: 0

Total AutoBw Adjustments: 1, Successful Adjustments: 1, Failed Adjustments: 0

```

show mpls path

List of Syntax [Syntax on page 2012](#)
[Syntax \(EX Series Switches\) on page 2012](#)

Syntax `show mpls path`
`<instance instance-name>`
`<logical-system (all | logical-system-name)>`
`<path-name>`

Syntax (EX Series Switches) `show mpls path`
`<path-name>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.5 for EX Series switches.
instance *instance-name* option added in Junos OS Release 15.1.

Description Display dynamic Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

Options **none**—Display standard information about all MPLS LSPs.

instance *instance-name*—(Optional) Display the dynamic MPLS LSP for the specified instance. If ***instance-name*** is omitted, dynamic MPLS LSP for the master instance is displayed.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

path-name—(Optional) Display information about the specified LSP only.

Required Privilege Level view

List of Sample Output [show mpls path on page 2013](#)

Output Fields [Table 86 on page 2012](#) describes the output fields for the **show mpls path** command. Output fields are listed in the approximate order in which they appear.

Table 86: show mpls path Output Fields

Field Name	Field Description
Path name	Information about ingress LSPs. Each path has one line of output.
Address	Addresses of the routing devices that form the LSP.
Strict/loose address	Whether the address is configured as a strict or loose address.

Sample Output

show mpls path

```
user@host> show mpls path
Path name      Address          Strict/loose address
p1             123.456.55.6    Strict
               123.456.1.6     Loose
p2             191.456.1.4     Strict
```

show mpls srlg

Syntax `show mpls srlg`
`<logical-systems (all | logical-system-name)>`

Release Information Command introduced before Junos OS Release 11.4.

Description Display Shared Risk Link Group (SRLG) cost and value configuration information.

NOTE: If an SRLG is associated with a link that is used by an ingress LSP in the router, then on deleting the SRLG configuration from that router, the SRLG gets removed from the SRLG table only on the next reoptimization of the LSP. Until then, the output of the run `show mpls srlg` command displays `Unknown-XXX` instead of the SRLG name and a non zero `srlg-cost` for that SRLG.

Options `logical-system (all | logical-system-name)`—(Optional) View SRLG configuration information for all logical systems or a particular logical system.

Required Privilege Level view

Related Documentation

- [Example: Configuring SRLG on page 210](#)

Output Fields [Table 87 on page 2014](#) lists the output fields for the `show mpls srlg` command. Output fields are listed in the approximate order in which they appear.

Table 87: show mpls srlg Output Fields

Field Name	Field Description
SRLG	Name of the SRLG.
Value	A group ID for the SRLG ranging from 1 through 4294967295.
Cost	A cost for the Shared Risk Link Group (SRLG) ranging from 1 through 65535.

Sample Output

```
user@host> show mpls srlg
```

```
SRLG      Value      Cost
srlg-a    101        10
```

show mpls static-lsp

Syntax `show mpls static-lsp`
 `<brief | detail | extensive | terse>`
 `<bypass>`
 `<descriptions>`
 `<down | up>`
 `<ingress>`
 `<instance instance-name>`
 `<logical-system (all | logical-system-name)>`
 `<lsp-type>`
 `<name name>`
 `<statistics>`
 `<transit>`

Release Information Command introduced in Junos OS Release 10.1.
 Command updated in Junos OS Release 14.1X53-D25 to accommodate the stitching feature of MPLS.
 Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
 Statement introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.

Description Display information about configured and active static Multiprotocol Label Switching (MPLS) label-switched paths (LSPs).

Options **none**—Display standard information about all configured and active static MPLS LSPs.

brief | detail | extensive | terse—(Optional) Display the specified level of output. The **extensive** option displays the same information as the **detail** option, but covers the most recent 50 events.

bypass—(Optional) Display LSPs used for protecting other static LSPs.

descriptions—(Optional) Display the MPLS static LSP descriptions. To view this information, you must configure the description statement at the **[edit protocols mpls static-label-switched-path *path-name* bypass]**, **[edit protocols mpls static-label-switched-path *path-name* ingress]**, or **[edit protocols mpls static-label-switched-path *path-name* transit *incoming-label*]** hierarchy levels. Only static LSPs with a description are displayed.

down | up—(Optional) Display only static LSPs that are inactive or active, respectively.

instance *instance-name*—(Optional) Display information about all configured and active static MPLS LSPs for the specified routing instance. If ***instance-name*** is omitted, information about all configured and active static MPLS LSPs for the master instance is displayed.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-type—(Optional) Display information about a particular LSP type:

- **bypass**—Sessions for bypass LSPs.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that pass through this routing device.

name *name*—(Optional) Display information about the specified static LSP or group of LSPs.

statistics—(Optional) Display accounting information about static LSPs.

transit—(Optional) Display static LSPs transiting this routing device.

Required Privilege Level view

List of Sample Output [show mpls static-lsp extensive on page 2018](#)
[show mpls static-lsp statistics ingress on page 2018](#)
[show mpls static-lsp \(when MPLS stitching is used\) on page 2018](#)

Output Fields [Table 73 on page 1963](#) describes the output fields for the **show mpls static-lsp** command. Output fields are listed in the approximate order in which they appear.

Table 88: show mpls static-lsp Output Fields

Field Name	Field Description	Level of Output
Ingress LSPs	Information about the static LSPs on the ingress routing device. Each session has one line of output.	All levels
Transit LSPs	Number of static LSPs on the transit routing devices and the state of these paths. MPLS learns this information by querying RSVP, which holds all the transit and egress session information.	All levels
Bypass LSPs	Information about the bypass LSPs configured on the routing device. Each session has one line of output.	All levels
LSPname	Name of the static LSP.	All levels
To	Destination (egress routing device) of the session.	All levels
State	State of the static LSP handled by this RSVP session: Up , Dn (down), or Restart .	All levels
Packets	Number of packet transiting the static LSP (statistics option only).	All levels
Bytes	Number of bytes transiting the static LSP (statistics option only).	All levels
Nexthop	IP address for the next-hop router for the static LSP.	detail, extensive
Bypass	(Bypass LSP) Destination address (egress routing device) for the bypass LSP.	All levels

Table 88: show mpls static-lsp Output Fields (continued)

Field Name	Field Description	Level of Output
Link protection desired	Link protection has been requested by the ingress routing device.	detail, extensive
LabelOperation	Label operation to perform: Push, Pop, Swap.	detail, extensive
Outgoing-label	Outgoing label to use for the MPLS packet in either push or swap label operations.	detail, extensive
Created	(Ingress LSP) Date and time the static LSP was created.	extensive
Bandwidth	Bandwidth configured for the static LSP.	detail, extensive
Resv style	(Bypass) RSVP reservation style. This field consists of two parts: the number of active reservations and the reservation style, which can be FF (fixed filter), SE (shared explicit), or WF (wildcard filter).	All levels

Sample Output

show mpls static-lsp extensive

```

user@host> show mpls static-lsp extensive
Ingress LSPs:
LSPname: alpha-to-beta, To: 192.168.14.1
State: Dn
Nexthop: 192.168.10.1
LabelOperation: Push, Outgoing-label: 1000001
Created: Thu Jan 14 16:44:43 2010
Bandwidth: 0 bps
Total 1, displayed 1, Up 0, Down 1

Transit LSPs:
Total 0, displayed 0, Up 0, Down 0

Bypass LSPs:
Total 0, displayed 0, Up 0, Down 0

```

show mpls static-lsp statistics ingress

```

user@host> show mpls static-lsp statistics ingress
Ingress LSPs:
LSPname                To           State    Packets    Bytes

Total 1, displayed 1, Up 0, Down 1

```

show mpls static-lsp (when MPLS stitching is used)

The show mpls static-lsp command was extended in Junos release 14.1X53-D25 to accommodate the stitching feature of MPLS. This example shows the LSP state as 'InProgress' because the LSP is waiting for protocol next-hop resolution. For more information, see

```
user@host> show mpls static-lsp
Ingress LSPs:
Total 0, displayed 0, Up 0, Down 0
Transit LSPs: LSPname
to-165
```

Incoming-label	State
1000000	InProgress

show performance-monitoring mpls lsp

Syntax `show performance-monitoring mpls lsp`
 `<brief | detail | extensive>`
 `<name lsp name>`

Release Information Command introduced in Junos OS Release 15.1.

Description Display the following performance monitoring data:

- Packet loss measurement
- Packet throughput measurement
- Two-way channel delay
- Round-trip delay
- Inter-packet delay variation (IPDV)

Options **none**—Display standard information performance monitoring data.

brief | detail | extensive—(Optional) Display the specified level of output.

NOTE: The extensive option displays the same information as the detail option.

name lsp name—(Optional) Display information about the specified LSP.

Required Privilege Level View

Table 89: show performance-monitoring mpls lsp Output Fields

Field Name	Display Data		Field Description	Level of Output
Session	Total		Total number of performance monitoring sessions created.	All Levels
	Up		Number of performance monitoring sessions that are up and running.	All Levels
	Down		Number of performance monitoring sessions that are down.	All Levels
LSP name			Name of the LSP.	All Levels
Loss measurement Data	Traffic-class		Traffic class for which loss measurement is performed.	All Levels
	Queries sent		Total number of queries sent for loss measurement.	All Levels
	Responses received		Total number of responses received for loss measurement queries.	All Levels
	Responses dropped due to errors		Total number of loss measurement responses dropped due to errors.	All Levels
	Queries timeout		Number of timed out queries sent for loss measurement.	All Levels
	Forward loss measurement	Average packet loss	Average packet loss (total loss of packets divided by the total number of samples used since the session is up).	All Levels
		Average packet throughput	Total number of packets sent divided by the time considered for measurement.	All Levels
	Reverse loss measurement	Average packet loss	Average packet loss (total loss of packets divided by the total number of samples used since the session is up).	All Levels
		Average packet throughput	Total number of packets sent divided by the time considered for measurement.	All Levels

Table 89: show performance-monitoring mpls lsp Output Fields (continued)

Field Name	Display Data	Field Description	Level of Output
Delay measurement Data	Traffic-class	Traffic class for which delay measurement is performed.	All Levels
	Queries sent	Total number of queries sent for delay measurement.	All Levels
	Responses received	Total number of responses received for delay measurement queries.	All Levels
	Responses dropped due to errors	Total number of delay measurement responses dropped due to errors.	All Levels
	Queries timeout	Number of timed out queries sent for delay measurement.	All Levels
	Best 2-way channel delay	Best available two-way channel delay.	All Levels
	Worst 2-way channel delay	Worst available two-way channel delay.	All Levels
	Best round trip time	Best available round-trip time.	All Levels
	Worst round trip time	Worst available round-trip time.	All Levels
	Avg absolute fw delay variation	Average of the variation in forward delay.	All Levels
	Avg absolute rv delay variation	Average of the variation in reverse delay.	All Levels
	Two-way channel delay	Sum of packet delays, excluding the processing time of the remote provider edge (PE) router.	detail, extensive
	Two-way round trip delay	Total time taken for completing round-trip of packet.	detail, extensive

show route forwarding-table

Syntax	<code>show route forwarding-table</code> <code><detail extensive summary></code> <code><ccc ccc-interface-name></code> <code><destination></code> <code><family family-name></code> <code><label label></code> <code><matching ip_prefix></code> <code><multicast></code> <code><vpn vpn></code>
Release Information	Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D30 for QFX Virtual Chassis and Virtual Chassis Fabric.
Description	Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.
Options	<p>none—Display the routes in the forwarding table.</p> <p>detail extensive summary—(Optional) Display the specified level of output.</p> <p>ccc—(Optional) Display the specified circuit cross-connect interface name for entries to match.</p> <p>destination—(Optional) Display the destination prefix.</p> <p>family family-name—(Optional) Display routing table entries for the specified family: ethernet-switching, inet, inet6, iso, mpls, vlan classification.</p> <p>label label—(Optional) Display route entries for the specified label name.</p> <p>matching ip_prefix—(Optional) Display route entries for the specified IP prefix.</p> <p>multicast—(Optional) Display route entries for multicast routes.</p> <p>vpn vpn—(Optional) Display route entries for the specified VPN.</p>
Required Privilege Level	view

Output Fields Table 90 on page 2027 lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified or when the **detail** keyword is used instead of the **extensive** keyword.

Table 90: show route forwarding-table Output Fields

Field Name	Field Description	Level of Output
Routing table	Name of the routing table (for example, inet , inet6 , mpls).	All levels
Address family	Address family (for example, IP , IPv6 , ISO , MPLS).	All levels
Destination	Destination of the route.	detail , extensive
Route Type (Type)	How the route was placed into the forwarding table. When the detail keyword is used, the route type might be abbreviated (as shown in parentheses): <ul style="list-style-type: none"> cloned (clon)—(TCP or multicast only) Cloned route. destination (dest)—Remote addresses directly reachable through an interface. destination down (iddn)—Destination route for which the interface is unreachable. interface cloned (ifcl)—Cloned route for which the interface is unreachable. route down (ifdn)—Interface route for which the interface is unreachable. ignore (ignr)—Ignore this route. interface (intf)—Installed as a result of configuring an interface. permanent (perm)—Routes installed by the kernel when the routing table is initialized. user—Routes installed by the routing protocol process or as a result of the configuration. 	All levels
Route reference (RtRef)	Number of routes to reference.	detail , extensive

Table 90: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Flags	Route type flags: <ul style="list-style-type: none"> • none—No flags are enabled. • accounting—Route has accounting enabled. • cached—Cache route. • incoming-iface <i>interface-number</i>—Check against incoming interface. • prefix load balance—Load balancing is enabled for this prefix. • sent to PFE—Route has been sent to the Packet Forwarding Engine. • static—Static route. 	extensive
Nexthop	IP address of the next hop to the destination.	detail, extensive
Next hop type (Type)	Next-hop type. When the detail keyword is used, the next-hop type might be abbreviated (as indicated in parentheses): <ul style="list-style-type: none"> • broadcast (bcst)—Broadcast. • deny—Deny. • hold—Next hop is waiting to be resolved into a unicast or multicast type. • indexed (idxd)—Indexed next hop. • indirect (indr)—Indirect next hop. • local (locl)—Local address on an interface. • routed multicast (mcrt)—Regular multicast next hop • multicast (mcst)—Wire multicast next hop (limited to the LAN). • multicast discard (mdsc)—Multicast discard. • multicast group (mgrp)—Multicast group member. • receive (rcv)—Receive. • reject (rjct)—Discard. An ICMP unreachable message was sent. • resolve (rslv)—Resolving the next hop. • unicast (ucst)—Unicast. • unilist (ulst)—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. 	detail, extensive
Index	Software index of the next hop that is used to route the traffic for a given prefix.	detail, extensive none
Route interface-index	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	extensive
Reference (NhRef)	Number of routes that refer to this next hop.	none detail, extensive
Next-hop interface (Netif)	Interface used to reach the next hop.	none detail, extensive
Alternate forward nh index	Index number of the alternate next hop interface. Seen with multicast option only.	extensive

Table 90: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Next-hop L3 Interface	The next hop layer 3 interface. This option can be expressed as a VLAN name and is only seen with the multicast option.	extensive
Next-hop L2 Interfaces	The next hop layer 2 interfaces. Seen with multicast option only.	extensive

Output Fields [Table 91 on page 2035](#) describes the output fields for the **show route table** command. Output fields are listed in the approximate order in which they appear.

Table 91: show route table Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
Restart complete	<p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> • Pending:<i>protocol-name</i>—List of protocols that have not yet completed graceful restart for this routing table. • Complete—All protocols have restarted for this routing table. <p>For example, if the output shows-</p> <ul style="list-style-type: none"> • LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden) Restart Pending: OSPF LDP VPN <p>This indicates that OSPF, LDP, and VPN protocols did not restart for the LDP.inet.0 routing table.</p> <ul style="list-style-type: none"> • vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden) Restart Complete <p>This indicates that all protocols have restarted for the vpls_1.l2vpn.0 routing table.</p>
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 91: show route table Output Fields (continued)

Field Name	Field Description
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> • active (routes that are active) • holddown (routes that are in the pending state before being declared inactive) • hidden (routes that are not used because of a routing policy)
<i>route-destination</i> (entry, announced)	<p>Route destination (for example:10.0.0.1/24). The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> • MPLS-label (for example, 80001). • interface-name (for example, ge-1/0/2). • neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> • neighbor-address—Address of the neighbor. • control-word-status—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. • encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • vc-id—Virtual circuit identifier. • source—Source of the advertisement: Local or Remote. • inclusive multicast Ethernet tag route—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> • route distinguisher—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI. • Ethernet tag ID—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value. • IP address length—(1 octet) Length of IP address in bits. • originating router's IP address—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.
<i>label stacking</i>	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> • S=0 route indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed). • If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).

Table 91: show route table Output Fields (continued)

Field Name	Field Description
[<i>protocol, preference</i>]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop. For a description of possible values for this field, see Table 92 on page 2041 .
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.
Label-switched-path <i>lsp-path-name</i>	Name of the LSP used to reach the next hop.

Table 91: show route table Output Fields (continued)

Field Name	Field Description
Label operation	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See Table 93 on page 2042 .
Local AS	AS number of the local routing devices.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.
Task	Name of the protocol that has added the route.
Announcement bits	<p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, n-Resolve inet indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> • n—An index used by Juniper Networks customer support only.

Table 91: show route table Output Fields (continued)

Field Name	Field Description
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • Recorded—The AS path is recorded by the sample process (sampled). • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. • []—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> • Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers. • Valid—Indicates that the prefix and autonomous system pair are found in the database.
FECs bound to route	Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.

Table 91: show route table Output Fields (continued)

Field Name	Field Description
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See Table 94 on page 2044 for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: none or Site Down .
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.
Accepted LongLivedStaleImport	<p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p>
ImportAccepted LongLivedStaleImport	<p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.

Table 91: show route table Output Fields (continued)

Field Name	Field Description
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

[Table 92 on page 2041](#) describes all possible values for the Next-hop Types output field.

Table 92: Next-hop Types Output Field Values

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.
Deny	Deny next hop.
Discard	Discard next hop.
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.
Reject (rjct)	Discard. An ICMP unreachable message was sent.

Table 92: Next-hop Types Output Field Values (continued)

Next-Hop Type	Description
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrtr)	Regular multicast next hop.
Router	<p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as a next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> • Must not be a direct or local subnet for the routing device. • Must have a next hop that is directly connected to the routing device.
Table	Routing table next hop.
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

[Table 93 on page 2042](#) describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 93: State Output Field Values

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.

Table 93: State Output Field Values (continued)

Value	Description
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGp path is available.
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.

Table 93: State Output Field Values (continued)

Value	Description
Pending	Route pending because of a hold-down configured on another route.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available.
Router ID	Path through a neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> The route is damped. The route is rejected by an import policy. The route is unresolved.
Update source	Last tiebreaker is the lowest IP address value.

[Table 94 on page 2044](#) describes the possible values for the Communities output field.

Table 94: Communities Output Field Values

Value	Description
<i>area-number</i>	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
bandwidth: local AS number:link-bandwidth-number	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
domain-id	Unique configurable number that identifies the OSPF domain.
domain-id-vendor	Unique configurable number that further identifies the OSPF domain.
<i>link-bandwidth-number</i>	Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).
<i>local AS number</i>	Local AS number: from 1 through 65,535.

Table 94: Communities Output Field Values (continued)

Value	Description
<i>options</i>	1 byte. Currently this is only used if the route type is 5 or 7 . Setting the least significant bit in the field indicates that the route carries a type 2 metric.
<i>origin</i>	(Used with VPNs) Identifies where the route came from.
<i>ospf-route-type</i>	1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.
<i>route-type-vendor</i>	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000 . The format is <i>area-number:ospf-route-type:options</i> .
<i>rte-type</i>	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306 . The format is <i>area-number:ospf-route-type:options</i> .
<i>target</i>	Defines which VPN the route participates in; target has the format <i>32-bit IP address:16-bit number</i> . For example, 10.19.0.0:100.
<i>unknown IANA</i>	Incoming IANA codes with a value between 0x1 and 0x7fff . This code of the BGP extended community attribute is accepted, but it is not recognized.
<i>unknown OSPF vendor community</i>	Incoming IANA codes with a value above 0x8000 . This code of the BGP extended community attribute is accepted, but it is not recognized.

Sample Output

show route table bgp.l2vpn

```

user@host> show route table bgp.l2vpn
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

List of Syntax	Syntax on page 2072 Syntax (EX Series Switches) on page 2072
Syntax	<pre>show ted database <brief detail extensive> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <<i>system-name</i>> <topology-id <i>topology</i>></pre>
Syntax (EX Series Switches)	<pre>show ted database <brief detail extensive> <<i>system-name</i>></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches. instance <i>instance-name</i> option added in Junos OS Release 15.1. topology-id <i>topology</i> option added in Junos OS Release 17.4R1 for MX Series and PTX Series.
Description	Display the entries in the Multiprotocol Label Switching (MPLS) traffic engineering database.
Options	<p>none—Display standard information about all entries in the traffic engineering database.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>instance <i>instance-name</i>—(Optional) Display routing instance information for the specified instance. If <i>instance-name</i> is omitted, information is displayed for the master instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><i>system-name</i>—(Optional) Display traffic engineering database information for a particular system.</p> <p>topology-id <i>topology</i>— Display the topology information. By default, traffic engineering topology information is displayed.</p>
Required Privilege Level	view

Output Fields Table 95 on page 2073 describes the output fields for the **show ted database** command. Output fields are listed in the approximate order in which they appear.

Table 95: show ted database Output Fields

Field Name	Field Description	Level of Output
TED database	Number of nodes and pseudonodes participating in IS-IS and OSPF domain routing.	All levels
ID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode. If the node contains a router ID, it is displayed in parentheses.	brief
NodeID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	extensive
Type	Type of node. It can be either Rtr (router) or Net (pseudonode).	All levels
Age(s)	How long since the node was last refreshed, in seconds.	All levels
LnkIn	Number of nodes pointing toward this node.	All levels
LnkOut	Number of nodes to which this node points.	All levels
Protocol	Protocol that reported the node information: <ul style="list-style-type: none"> IS-IS(1)—IS-IS Level 1. IS-IS(2)—IS-IS Level 2. OSPF (area-number)—OSPF from the specified area. 	All levels
To	Address on the far end of a link.	detail extensive
Local	Address of the local interface being used to reach the remote node.	detail extensive
Remote	Address of the interface on the remote node.	detail extensive
Local interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail extensive
Remote interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail extensive
Metric	Configured traffic engineering metric.	extensive
IGP metric	Configured interior gateway protocol metric.	extensive
Static BW	Total interface bandwidth in bps.	extensive

Table 95: *show ted database Output Fields (continued)*

Field Name	Field Description	Level of Output
Reservable bandwidth	Subscription factor for the interface, which is the percentage of the link bandwidth that can be used for the RSVP reservation process. You configure this by including the subscription statement when configuring RSVP.	extensive
Available BW [priority]	(Must include diffserv-te statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each priority level. The bandwidth shown is for the entire interface, not for each individual LSP.	extensive
Diffserv-TE BW Model	Bandwidth constraint model used by the LSPs.	extensive
Available BW [TE-class]	(Must include the diffserv-te statement when configuring LSPs) Amount of bandwidth actually reserved by RSVP for each traffic engineering class.	extensive
Static BW [CT-class]	Total interface bandwidth used by an MPLS traffic class, in bps.	extensive

Table 95: show ted database Output Fields (continued)

Field Name	Field Description	Level of Output
Interface Switching Capability Descriptor (<i>n</i>)	<p>Information about the interface switching capability descriptor, which is a subtype length value (TLV) of the link TLV. <i>n</i> is the index number.</p> <ul style="list-style-type: none"> • Switching type—Type of switching to be performed on a particular link: <ul style="list-style-type: none"> • PSC-1—Packet switch-capable 1 • PSC-2—Packet switch-capable 2 • PSC-3—Packet switch-capable 3 • PSC-4—Packet switch-capable 4 • L2SC—Layer-2-switch-capable • TDM—Time-division-multiplexing-capable • LSC—Lambda switch-capable • FSC—Fiber switch-capable • Encoding type—Encoding of the LSP being requested: <ul style="list-style-type: none"> • Packet • Ethernet • ANSI/ETSI PDH • Reserved • SDH /SONET • Digital Wrapper • Lambda (photonic) • Fiber • FiberSDH/SONET • Maximum LSP BW [priority] bps—Maximum LSP bandwidth information. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface. <ul style="list-style-type: none"> • [<i>n</i>]—Priority level. The range is from 0 (high) through 7 (low). • <i>n</i> Mbps—Amount of the maximum bandwidth. • Minimum LSP BW—Minimum LSP bandwidth in Mbps. Amount of bandwidth actually reserved for each priority level. The bandwidth shown is for the entire interface. Minimum LSP BW is displayed only when switching type is PSC-1 or TDM. • Interface MTU—Displayed only when switching type is TDM. • Interface supports standard SONET/SDH—Displayed only when switching type is TDM. 	extensive

List of Syntax [Syntax on page 2081](#)
 [Syntax \(EX Series Switches\) on page 2081](#)

Syntax show ted link
 <brief | detail>
 <instance *instance-name*>
 <logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches) show ted link
 <brief | detail>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.5 for EX Series switches.
 instance *instance-name* option added in Junos OS Release 15.1.

Description Display Multiprotocol Label Switching (MPLS) traffic engineering database link information.

Options **none**—Display standard information about traffic engineering database link information.
 brief | detail—(Optional) Display the specified level of output.
 instance *instance-name*—(Optional) Display routing instance information for the specified instance. If ***instance-name*** is omitted, information is displayed for the master instance.
 logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show ted link brief on page 2082](#)
 [show ted link detail on page 2082](#)

Output Fields [Table 96 on page 2081](#) describes the output fields for the **show ted link** command. Output fields are listed in the approximate order in which they appear.

Table 96: show ted link Output Fields

Field Name	Field Description	Level of Output
ID	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	brief
-->ID	Hostname and address of the node that the link is going to. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	brief

Table 96: show ted link Output Fields (continued)

Field Name	Field Description	Level of Output
hostname	Hostname and address of the node that the link is coming from. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	detail
hostname	Hostname and address of the node that the link is going to. An address of .00 indicates that the node is the routing device itself. An address in the range 0.01 through 0.FF indicates that the node is a pseudonode.	detail
Local Path	Number of paths CSPF on the local routing device has placed on the link.	All levels
Metric	Configured traffic engineering metric.	extensive
IGP metric	Configured interior gateway protocol metric.	detail
Local BW	Amount of bandwidth the local routing device has placed on the link.	All levels
Local	Address of the local interface being used to reach the remote node.	detail extensive
Remote	Address of the interface on the remote node.	detail extensive
Local interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail
Remote interface index	The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205.	detail

List of Syntax [Syntax on page 2084](#)
[Syntax \(EX Series Switches\) on page 2084](#)

Syntax show ted protocol
 <brief | detail>
 <instance *instance-name*>
 <logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches) show ted protocol
 <brief | detail>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.5 for EX Series switches.
instance *instance-name* option added in Junos OS Release 15.1.

Description Display information about the protocols from which the Multiprotocol Label Switching (MPLS) traffic engineering database learned about its nodes.

Options **none**—Display standard information about the protocols from which the traffic engineering database learned about its nodes.

brief | detail—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display routing instance information for the specified instance. If ***instance-name*** is omitted, information is displayed for the master instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show ted protocol on page 2085](#)

Output Fields [Table 97 on page 2084](#) describes the output fields for the **show ted protocol** command. Output fields are listed in the approximate order in which they appear.

Table 97: show ted protocol Output Fields

Field Name	Field Description
Protocol name	Protocol that reported the node information: <ul style="list-style-type: none"> IS-IS(1)—IS-IS Level 1. IS-IS(2)—IS-IS Level 2. OSPF (<i>area-number</i>)—OSPF from the specified area.

Table 97: show ted protocol Output Fields (continued)

Field Name	Field Description
Credibility	If the protocols provide conflicting information about a node, the protocol with the highest credibility value is the one that the traffic engineering database uses.
Self node	Address the protocol uses as the local address.

Sample Output

show ted protocol

```
user@host> show ted protocol
Protocol name      Credibility Self node
IS-IS(2)           2 (highest) corriedale.00(123.456.1.11)
IS-IS(1)           1           corriedale.00(123.456.1.11)
```

traceroute mpls bgp

Syntax `traceroute mpls bgp fec`
 `<destination destination-address>`
 `<detail>`
 `<exp exp>`
 `<fanout fanout-number>`
 `<logical-system logical system-name>`
 `<no-resolve>`
 `<paths paths-number>`
 `<pipe-mode>`
 `<retries retries-number>`
 `<routing-instance routing-instance-name>`
 `<source source-address>`
 `<ttl value>`
 `<wait seconds>`

Release Information Command introduced in Junos OS Release 14.2.

Description Trace route to a remote host for an MPLS label-switched path (LSP) signaled by the Border Gateway Protocol (BGP). Use **traceroute mpls bgp** as a debugging tool to locate MPLS BGP forwarding issues in a network. (Currently supported for IPv4 packets only.)

NOTE: The **traceroute mpls bgp fec** command only supports single paths.

Options **fec**—Specify the IP address and optional prefix of the forwarding equivalence class (FEC). Suppose you are at PE1, you would want to use the IP address of PE2 to trace the BGP path to that router.

destination destination-address—(Optional) Specify the destination address to use when sending probes.

detail—(Optional) Display detailed output.

exp exp—(Optional) Specify the class of service to use when sending probes.

Range: 0 through 7

Default: 7

fanout fanout-number—(Optional) Specify the maximum number of next hops to search per node.

Range: 1 through 16

Default: 16

logical-system logical-system-name—(Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

paths *paths-number*—(Optional) Specify the number of paths to search.

Range: 1 through 255

Default: 16

pipe-mode—(Optional) Specify to trace only the outermost FEC.

retries *retries-number*—(Optional) Specify the number of times to resend probe values.

Range: 1 through 9

Default: 3

routing-instance *routing-instance-name*—(Optional) Specify the name of the routing instance for the trace route attempt.

source *source-address*—(Optional) Specify the source address of the outgoing traceroute packets.

ttl *value*—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

Range: 1 through 125

Default: 64

wait *seconds*—(Optional) Specify the number of seconds to wait before resending a probe.

Range: 5 through 15

Default: 10

Output Fields

[Table 98 on page 2087](#) describes the output fields for the **traceroute mpls bgp fec** command and the **traceroute mpls bgp fec detail** command. Output fields are listed in the approximate order in which they appear.

Table 98: traceroute mpls bgp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the traceroute mpls bgp fec command.	All levels

Table 98: traceroute mpls bgp Output Fields (continued)

Field Name	Field Description	Level of Output
ttl	Time to live value of the labeled packet.	None
Label	Outgoing label used for forwarding the packet along the label-switched paths.	None
Protocol	Signaling protocol used. For this command, it is BGP.	None
Address	Address of the next hop.	None
Previous Hop	Address of the previous hop. Previous hop address of the first hop is null .	None
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	None
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	detail
Parent	Address of the previous hop. Parent value for the first hop is null .	detail
Return Code	Return code for reporting the result of processing the echo request by the receiver.	detail
Response time	Time for the echo request to reach the receiver.	detail
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none .	detail
Label Stack	Label stack used to forward the packet.	detail

Sample Output

traceroute mpls bgp

transit (Chained Composite Next Hops)

Syntax transit {
 (all | no-all);
 (l2vpn | no-l2vpn);
 (l3vpn | no-l3vpn);
 (labeled-bgp | no-labeled-bgp);
 (ldp | no-ldp);
 (ldp-p2mp | no-ldp-p2mp);
 lsp-statistics-from-route;
 (rsvp | no-rsvp);
 (rsvp-p2mp | no-rsvp-p2mp);
 (static | no-static);
 }

Hierarchy Level [edit logical-systems *logical-system-name* routing-options forwarding-table
 chained-composite-next-hop],
 [edit routing-options forwarding-table chained-composite-next-hop]

NOTE: The [edit logical-systems] hierarchy level is not supported on the QFX10000 switches.

Release Information Statement introduced in Junos OS Release 12.1.
 Statement introduced in Junos OS Release 15.1 for QFX10000 Series switches.

Description Allows you to configure the chained composite next hops transit configuration options for devices handling transit traffic in the network. This statement and the associated functionality is available on PTX Packet Transport Routers and QFX10000 switches.

Default All of the **transit** statement options are enabled on PTX transport routers and QFX10000 switches. However, you can disable any of the statements with a **no** option.

Options **all | no-all**—Enable or disable chained composite next-hops for all of the possible packet transit protocols and applications. The **all | no-all** statements do not apply to the **lsp-statistics-from-route** statement.

l2vpn | no-l2vpn—Enable or disable chained composite next-hops for Layer 2 VPNs.

l3vpn | no-l3vpn—Enable or disable chained composite next-hops for Layer 3 VPNs.

labeled-bgp | no-labeled-bgp—Enable or disable chained composite next-hops for labeled BGP.

ldp | no-ldp—Enable or disable chained composite next-hops for LDP.

ldp-p2mp | no-ldp-p2mp—Enable or disable chained composite next-hops for LDP-signaled P2MP LSPs.

NOTE: On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `rsvp-p2mp` and `ldp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current master logical system to fail at the time of a Routing Engine switchover.

`lsp-statistics-from-route`—Enable LSP statistics collection from the route.

`rsvp` | `no-rsvp`—Enable or disable chained composite next-hops for RSVP.

`rsvp-p2mp` | `no-rsvp-p2mp`—Enable or disable chained composite next-hops for RSVP-signaled P2MP LSPs.

NOTE: On an MX series router with redundant Routing Engines and enhanced-ip mode configuration, enabling the `rsvp-p2mp` and `ldp-p2mp` statements under the `[edit routing-options forwarding-table chained-composite-next-hop transit]` hierarchy level causes ping from the current master logical system to fail at the time of a Routing Engine switchover.

`static` | `no-static`—Chained composite next hops are enabled for transit static LSPs by default. You can also disable this functionality for transit static LSPs.

Required Privilege Level

routing	—To view this statement in the configuration.
routing-control	—To add this statement to the configuration.

 <connection-destination *address*>
 <connection-source *address*>
 <gracefully>
 <lsp-id *identifier*>
 <name *name*>
 <optimize-fast-reroute>
 <tunnel-id *identifier*>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.5 for EX Series switches.
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

Description Reset and restart Resource Reservation Protocol (RSVP) sessions.

Options **all**—Clear all RSVP sessions for which this routing device is the ingress, transit, or egress routing device.

connection-source *address*—(Optional) Source address for GMPLS and MPLS LSPs from the RSVP sender template.

connection-destination *address*—(Optional) Destination address for GMPLS and MPLS LSPs from the RSVP sender template.

gracefully—(Optional) Gracefully reset an RSVP session for a nonpacket LSP in two passes. In the first pass, the Admin-Status object is signaled along the path to the other endpoint of the RSVP session. In the second pass, the path used by the RSVP session is torn down. This option can only be used on the ingress or egress routing device of the RSVP session and is only valid for nonpacket LSPs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-id *identifier*—(Optional) LSP identifier (source port) for the RSVP sender template.

name *name*—(Optional) Reset and restart the specified RSVP session.

optimize-fast-reroute—(Optional) Begin fast reroute optimization.

tunnel-id *identifier*—(Optional) Tunnel identifier (destination port) for the RSVP session.

monitor label-switched-path

Syntax `monitor label-switched-path lsp-name`
`<logical-system (logical-system-name)>`

Release Information Command introduced before Junos OS Release 7.4.
 Logical system support introduced in Junos OS Release 9.4.
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

Description Display the real-time status of the specified RSVP label-switched path (LSP). You can also use this command to monitor LSPs configured within logical systems.

Options `logical-system (logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-name—Name of the LSP.

Additional Information You can track the amount of traffic traversing an RSVP LSP and observe its essential parameters, such as uptime, ingress and egress addresses, labels, routes, and ports. Values are typically sampled every second. The display also allows you to scroll to other currently running LSPs. You cannot use this command to display information about static LSPs or LDP-signaled LSPs.

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the `c` key. To control the output of the `monitor label-switched-path` command while it is running, use the keys listed in [Table 99 on page 2097](#). The keys are not case-sensitive.

Table 99: Output Control Keys for the monitor label-switched-path Command

Key	Action
c	Clears the screen and refreshes the display for this LSP.
f	Freezes the display, preventing new information from being displayed.
l	Monitors a different LSP. After you type <code>l</code> , you can type the new LSP name.
n	Displays information about the next LSP (whose name is alphabetically higher than the current LSP name) configured on the router.
p	Goes to the previous LSP (whose name is alphabetically lower than the current LSP name) configured on the router.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws, or restarts, the data display for this LSP.

Required Privilege Level trace

List of Sample Output [monitor label-switched-path on page 2099](#)

Output Fields [Table 100 on page 2098](#) describes the output fields for the **monitor label-switched-path** command. Output fields are listed in the approximate order in which they appear.

Table 100: monitor label-switched-path Output Fields

Field Name	Field Description
(1)	Displays the following information: <ul style="list-style-type: none"> • hostname—Name of the router. • Seconds—Time elapsed since this display was started. • Time—Current local time.
(2)	Delay —Length of the time delay, in milliseconds, required to obtain the information in the monitor display. The first number shows the current sampling delay. The second number shows the shortest delay recorded to date. The third number shows the worst delay recorded to date. This delay can vary substantially depending on the system load.
(3)	Displays the following: <ul style="list-style-type: none"> • To—Destination address of the LSP. • From—Originating address of the LSP. • State—Current state of the LSP: Up or Down.
(4)	Displays the following: <ul style="list-style-type: none"> • LSPName—Name of the LSP. • Type—Type of LSP: Ingress, Egress, or Transit.
(5)	Displays the following: <ul style="list-style-type: none"> • Label in—Incoming label of the LSP. • Label out—Outgoing label of the LSP.
(6)	Port number —Port number for the sending router, the port number for the receiving router, and the protocol ID. For MPLS traffic engineering applications, the protocol ID is always 0 .
(7/8)	Record route —All intermediate and egress router addresses for this LSP.
(9/10/11)	Displays traffic statistics: <ul style="list-style-type: none"> • Output packets—Number of packets that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago. • Output bytes—Number of bytes that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.
(12)	Displays any errors the router encountered while attempting to retrieve information on the LSP.
(13)	Lists the keyboard commands you can use to navigate to other LSPs. For a description of the keyboard commands, see Table 99 on page 2097 .

Sample Output

monitor label-switched-path

```
user@host> monitor label-switched-path
(1) host                               Seconds: 112           Time: 15:32:22
(2)                                     Delay: 0/0/0

```

ping mpls rsvp

Syntax ping mpls rsvp
 <lsp-name>
 <count count>
 <destination address>
 <detail>
 <dynamic-bypass>
 <egress egress-address>
 <exp forwarding-class>
 <interface interface-name>
 <logical-system (all | logical-system-name)>
 <manual-bypass>
 <multipoint>
 <size bytes>
 <source source-address>
 <standby standby-path-name>
 <sweep>

Release Information Command introduced before Junos OS Release 7.4.
 The **egress** and **multipoint** options were introduced in Junos OS Release 9.2.
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.
 The **dynamic-bypass** and **manual-bypass** options were introduced in Junos OS Release 10.2.
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections.
 Type Ctrl+c to interrupt a **ping mpls** command.

Options **count count**—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

NOTE: When using the **detail** option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the **detail** option (even when synchronized using NTP).

dynamic-bypass—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

egress egress-address—(Optional) Only the specified egress router or switch responds to the ping request.

exp forwarding-class—(Optional) Value of the forwarding class for the MPLS ping packets.

interface—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the **manual-bypass** option.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.

lsp-name—Ping an RSVP-signaled LSP using an LSP name.

manual-bypass—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the **interface** option.

multipoint—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the **egress** option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

size bytes—(Optional) Size of the LSP ping request packet (100 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

standby standby-path-name—(Optional) Name of the standby path.

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response might be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

NOTE: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

Required Privilege Level	network
List of Sample Output	ping mpls rsvp (Echo Reply Received) on page 2102 ping mpls rsvp (Echo Reply with Error Code) on page 2102 ping mpls rsvp detail on page 2102 ping mpls rsvp multipoint egress detail count on page 2103 ping mpls rsvp multipoint detail count on page 2103 ping mpls rsvp destination detail count size on page 2103 ping mpls rsvp destination detail sweep size on page 2104
Output Fields	When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls rsvp (Echo Reply Received)

```
user@host> ping mpls rsvp test1
!!!!!--- lsping statistics ---5 packets transmitted, 5 packets received, 0% packet
loss
```

ping mpls rsvp (Echo Reply with Error Code)

```
user@host> ping mpls rsvp test2
!!xxx--- lsping statistics ---5 packets transmitted, 2 packets received, 60%
packet loss3 packets received with error status, not counted as received.

Syntax show rsvp interface
 <brief | detail | extensive>
 <instance *instance-name*>
 <link-management>
 <logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches) show rsvp interface
 <brief | detail | extensive>
 <link-management>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.5 for EX Series switches.
 instance option added in Junos OS Release 15.1 for the MX Series.

Description Display the status of Resource Reservation Protocol (RSVP)-enabled interfaces and packet statistics. The RSVP input/input module collects statistics for certain events on a per-interface basis. Most of these events were tracked on a routing-instance basis in Junos OS releases earlier than Release 17.2. The "show rsvp interface detail" command displays these event counters under the Events section of the output only when the values of these fields are higher than zero. These statistics are also maintained at the global level (per routing-instance) and are also displayed in the output of the "show rsvp statistics" command.

Options **none**—Display standard information about the status of RSVP-enabled interfaces and packet statistics.

brief | detail | extensive | link-management—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display RSVP status information for the specified instance. If **instance-name** is omitted, RSVP status information is displayed for the master instance.

link-management—(Optional) Use the link-management option to display the control peers and corresponding TE-link information created by the Link Management Protocol (LMP).

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

Output Fields [Table 101 on page 2106](#) lists the output fields for the **show rsvp interface** command. Output fields are listed in the approximate order in which they appear.

Table 101: show rsvp interface Output Fields

Field Name	Field Description	Level of Output
RSVP interface	Number of interfaces on which RSVP is active. Each interface has one line of output.	All levels
Interface	Name of the interface.	All levels
Index	Index of the interface.	detail
State	State of the interface. <ul style="list-style-type: none"> • Disabled—No traffic engineering information is displayed. • Down—Interface is not operational. • Enabled—Displays traffic engineering information. • Up—Interface is operational. 	All levels
NoAuthentication	Interface does not support RSVP authentication.	detail
NoAggregate	Interface does not support refresh reduction.	detail
NoReliable	Interface does not support refresh reduction message ID extension.	detail
NoLinkProtection	Interface does not support link protection.	detail
HelloInterval	Frequency at which RSVP hellos are sent on this interface (in seconds).	detail
Address	IP address of the local interface.	detail
Active control channel	Next-hop link address to transmit messages.	None specified
TElink	Traffic-engineered links that are managed by the peer they are associated with.	None specified
Active resv	Number of reservations that are actively reserving bandwidth on the interface.	All levels
PreemptionCnt	Number of times an RSVP session was preempted on this interface.	detail
Update threshold	Percentage change in reserved bandwidth to trigger an IGP update.	detail
Subscription	User-configured subscription factor.	All levels

Table 101: *show rsvp interface Output Fields (continued)*

Field Name	Field Description	Level of Output
Actual	Available RSVP bandwidth that is recalculated after considering SPRING bandwidth utilization.	extensive
bc number	Bandwidth allocated for the specified bandwidth constraint.	extensive
ct number	Bandwidth allocated for the specified class type.	extensive
Static BW	Total interface bandwidth, in bps.	All levels
Available BW	Amount of bandwidth that RSVP is allowed to reserve, in bps. It is equal to (static bandwidth * subscription factor).	all levels
Reserved BW	Currently reserved bandwidth, in bps.	All levels
SoftPreemptionCnt	Number of times a soft preemption occurred on this interface. This number is not included in the PreemptionCnt value.	detail
Overbooked BW	Currently overbooked bandwidth, in bps, by class type (ct0 through ct3).	detail
Highwater mark	Highest bandwidth that has ever been reserved on this interface, in bps.	brief
PacketType	Type of RSVP packet.	detail
Total Sent	Total number of packets sent.	detail
Total Received	Total number of packets received since RSVP was enabled.	detail
Last 5 seconds Sent	Number of packets sent in the last 5 seconds.	detail
Last 5 seconds Received	Number of packets received in the last 5 seconds.	detail
Path	Statistics about Path messages, which are sent from the RSVP sender along the data paths and store path state information in each node along the path.	detail
PathErr	Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.	detail
PathTear	Statistics about PathTear messages, which remove path states and dependent reservation states in any routers along a path.	detail
Resv	Statistics about Resv messages, which are sent from the RSVP receiver along the data paths and store reservation state information in each node along the path.	detail
ResvErr	Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.	detail

Table 101: show rsvp interface Output Fields (continued)

Field Name	Field Description	Level of Output
ResvTear	Statistics about ResvTear messages, which remove reservation states along a path.	detail
Hello	Number of RSVP hello packets that have been sent to and received from the neighbor.	detail
Ack	Acknowledge message for refresh reductions.	detail
Srefresh	Summary refresh messages.	detail
EndtoEnd RSVP	Statistics for the number of end-to-end RSVP messages sent.	detail
Queue	CoS transmit queue number and its associated forwarding class designation.	extensive
TxRate	Configured bandwidth in Mbps and configured bandwidth as a percentage of the specified queue.	extensive
Priority	Weight of the queue relative to other configured queues, in percentage.	extensive
queue-priority-value	Low, High, None, or Exact. None indicates no rate limiting. Exact indicates the queue transmits at the configured rate only.	extensive

List of Sample Output [show rsvp neighbor on page 2115](#)
[show rsvp neighbor detail on page 2115](#)

Output Fields [Table 102 on page 2111](#) lists the output fields for the **show rsvp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 102: show rsvp neighbor Output Fields

Field Name	Field Description	Level of Output
RSVP neighbor	Number of neighbors that the routing device has learned of. Each neighbor has one line of output.	All levels

Table 102: *show rsvp neighbor* Output Fields (continued)

Field Name	Field Description	Level of Output
via	Name of the interface where the neighbor has been detected. In the case of generalized MPLS (GMPLS) LSPs, the name of the peer where the neighbor has been detected.	detail
Address	Address of a learned neighbor.	All levels
Idle	Length of time the neighbor has been idle, in seconds. NOTE: Until Junos OS Release 15.1, in the output of the <i>show rsvp neighbor</i> command, the value under the <i>Idle</i> field immediately reflects the changed idle time when a link in the neighboring router is brought down. Starting with Junos OS Release 15.2, a router does not declare a neighbor as idle when a hello adjacency exists and has not timed out. When an interface is brought down, RSVP brings down the neighbor because of the notification it receives from IGP. The reason for considering the IGP-down notification is to support BFD-triggered fast reroute (FRR) and RSVP-TE is not directly a client for BFD notifications. When RSVP brings down the neighbor, the input/output process is not impacted. As a result, the idle time in the output of the <i>show</i> command is not immediately updated.	All levels
Up/Dn	Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.	All levels
Up cnt and Down cnt	Number of neighbor up or down transitions detected by RSVP hello packets. If the up count is 1 greater than the down count, the neighbor is currently up. Otherwise, the neighbor is down. Neighbors that do not support RSVP hello packets, such as routers running Junos OS Release 3.2 or earlier, are not reported as up or down.	detail
status	State of the RSVP neighbor: <ul style="list-style-type: none"> • Up—Routing device can detect RSVP Hello messages from the neighbor. • Down—Routing device has received one of the following indications: <ul style="list-style-type: none"> • Communication failure from the neighbor. • Communication from IGP that the neighbor is unavailable. • Change in the sequence numbers in the RSVP Hello messages sent by the neighbor. • Restarting—RSVP neighbor is unavailable and might be restarting. The neighbor remains in this state until it has restarted or is declared dead. This state is possible only when graceful restart is enabled. • Restarted—RSVP neighbor has restarted and is undergoing state recovery (graceful restart) procedures. • Dead—Routing device has lost all communication with the RSVP neighbor. Any RSVP sessions with that neighbor are torn down. 	detail
LastChange	Time elapsed since the neighbor state changed either from up to down or from down to up. The format is <i>hh:mm:ss</i> .	All levels

Table 102: *show rsvp neighbor* Output Fields (continued)

Field Name	Field Description	Level of Output
Last changed time	Time elapsed since the neighbor state changed either from up to down or from down to up.	detail
HelloInt	Frequency at which RSVP hellos are sent on this interface (in seconds).	All levels
HelloTx/Rx	Number of hello packets sent to and received from the neighbor.	All levels
Hello	Number of RSVP hello packets that have been sent to and received from the neighbor.	detail
Message received	Number of Path and Resv messages that this routing device has received from the neighbor.	detail
Remote Instance	Identification provided by the remote routing device during Hello message exchange.	detail
Local Instance	Identification sent to the remote routing device during Hello message exchange.	detail
Refresh reduction	<p>Measure of processing overhead requests of refresh messages. Refresh reduction extensions improve routing device performance by reducing the process overhead, thus increasing the number of LSPs a routing device can support. Refresh reduction can have the following values:</p> <ul style="list-style-type: none"> • operational—All four RSVP refresh reduction extensions—message ack, bundling, summary refresh, and staged refresh timer—are functional between the two neighboring routing devices. For a detailed explanation of these extensions, see RFC 2961. • incomplete—Some RSVP refresh reduction extensions are functional between the two neighboring routing devices. • not operational—Either the refresh reduction feature has been turned off, or the remote routing device cannot support the refresh reduction extensions. 	detail
Remote end	<p>Neighboring routing device's status with regard to refresh reduction:</p> <ul style="list-style-type: none"> • enabled—Remote routing device has requested refresh reduction during RSVP message exchanges. • disabled—Remote routing device does not require refresh reduction. 	detail
Pop label	Pop labels of the RSVP-TE pop-and-forward LSP tunnels.	detail
Ack-extension	<p>An RSVP refresh reduction extension:</p> <ul style="list-style-type: none"> • enabled—Both local and remote routing devices support the ack-extension (RFC 2961). • disabled—Remote routing device does not support the ack-extension. 	detail
Link protection	<p>Status of the MPLS fast reroute mechanism that protects traffic from link failure:</p> <ul style="list-style-type: none"> • enabled—Link protection feature has been turned on, protecting the neighbor with a bypass LSP. • disabled—No link protection feature has been enabled for this neighbor. 	detail

Table 102: *show rsvp neighbor Output Fields (continued)*

Field Name	Field Description	Level of Output
LSP name	Name of the bypass LSP.	detail
Bypass LSP	Status of the bypass LSP. It can have the following values: <ul style="list-style-type: none"> • does not exist—Bypass LSP is not available. • connecting—Routing device is in the process of establishing a bypass LSP, and the LSP is not available for link protection at the moment. • operational—Bypass LSP is up and running. • down—Bypass LSP has gone down, with the most probable cause a node or a link failure on the bypass path. 	detail
Backup routes	Number of user LSPs (or routes) that are being protected by a bypass LSP (before link failure).	detail
Backup LSPs	Number of LSPs that have been temporarily established to maintain traffic by refreshing the downstream LSPs during link failure (not a one-to-one correspondence).	detail
Bypass explicit route	Explicit route object's (ERO) path that is taken by the bypass LSP.	detail
Restart time	Length of time a neighbor waits to receive a Hello from the restarting node before declaring the node dead and deleting the states (in milliseconds).	detail
Recovery time	Length of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds). Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.	detail

Sample Output

show rsvp neighbor

```
user@host> show rsvp neighbor
RSVP neighbor: 2 learned
Address          Idle Up/Dn LastChange HelloInt HelloTx/Rx
192.168.207.203   0 3/2    13:01      3   366/349
192.168.207.207   0 1/0    22:49      3   448/448
```

show rsvp neighbor detail

Starting in Junos OS Release 16.1, this command also shows whether enhanced FRR procurers are enabled on the neighbor. Neighbors with Point of Local Repair (PLR) or Node Protecting Merge Point (NP-MP) also show the Hellos sent /received count.

```
user@host> show rsvp neighbor detail
RSVP neighbor: 2 learned
Address: 192.168.207.203 via: ecstasy1 status: Up
  Last changed time: 28:47, Idle: 0 sec, Up cnt: 3, Down cnt: 2
  Message received: 632
  Hello: sent 673, received 656, interval 3 sec
  Remote instance: 0x6432838a, Local instance: 0x74b72e36
  Refresh reduction: operational
    Remote end: enabled, Ack-extension: enabled
  Enhanced FRR local protection: enabled
    LSPs (total 76): Phop 0, PPhop 0, Nhop 76, NNhop 0
  Pop Label: 299808(unprotected) 299840(link-protected)
Link protection: enabled
  LSP name: Bypass_to_192.168.207.203
  Bypass LSP: operational, Backup routes: 1, Backup LSPs: 0
  Bypass explicit route: 192.168.207.207 192.168.207.224
Restart time: 60000 msec, Recovery time: 0 msec
```

show rsvp route-session-id

Syntax `show rsvp route-session-id`

Release Information Command introduced in Junos OS Release 16.1 for the MX Series.

Description Display the session ID and the version information associated with the ingress route added by the Resource Reservation Protocol (RSVP) in the inet.3 table.

Session ID is a pre-populated identifier used for indirect next hops in BGP Prefix Independent Convergence (PIC) enabled router. Session ID is used to identify the session or path.

Options **none**—Validate and display RSVP route session details.

Required Privilege Level view

List of Sample Output [show rsvp route-session-id on page 2116](#)

Output Fields [Table 103 on page 2116](#) describes the output fields for the **show rsvp route-session-id** command. Output fields are listed in the approximate order in which they appear.

Table 103: show rsvp route-session-id Output Fields

Field Name	Field Description
Ingress Route Destination	Destination (egress routing device) of the session.
Ingress Route Preference	RSVP preference value of the ingress session.
Ingress Route Metric 1	Metric 1 associated with the RSVP ingress route.
Ingress Route Metric 2	Metric 2 associated with the RSVP ingress route.
Ingress Route Session ID	Session ID associated with the RSVP ingress route.
Version	Version number associated with the RSVP ingress route.

Sample Output

show rsvp route-session-id

```
user@host> show rsvp route-session-id
```

```
RSVP Ingress Route Session ID Database:
```

```
=====
```

```
Ingress Route Destination: 1.1.1.5/32
Ingress Route Preference: 7
```

Ingress Route Metric 1: 20, Metric 2: 0
Ingress Route Session ID: 0x146, Version: 0

show rsvp pop-and-forward

Syntax	<pre>show rsvp pop-and-forward <brief detail extensive> <instance <i>routing-instance-name</i>> <label <i>label</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Release Information	Command introduced in Junos OS Release 18.1R1 on MX Series routers, PTX Series routers, and vMX series routers.
Description	Display RSVP-TE pop-and-forward LSP tunnel information. This information includes the set of in-labels (one-hop pop label or a delegation label), the number of session using each label and the next segment-label (if there is another delegation hop downstream), and whether the in-label is used for unprotected or protected LSPs.
Options	<p>none—Display the standard level of information for the RSVP-TE pop-and-forward LSP tunnels.</p> <p>brief detail extensive—(Optional) Display the desired level of output. The brief option is the default level of output.</p> <p>The detail option provides more information about the hops in a delegation segment (whether its one-hop or multi-hop).</p> <p>The extensive option lists the set of LSPs that are using a given pop or delegation label.</p> <p>instance <i>routing-instance-name</i>—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for the specified routing instance.</p> <p>label <i>label</i>—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for the specified label.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Display the RSVP-TE pop-and-forward LSP tunnel information for all or the specified logical system.</p>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.5 for EX Series switches.
 externally-provisioned option added in Junos OS Release 13.3.
 Command introduced in Junos OS Release 13.2X51-D15 for QFX Series.
 instance option added in Junos OS Release 15.1 for the MX Series.

Description Display information about Resource Reservation Protocol (RSVP) sessions.

Options **none**—Display standard information about all RSVP sessions.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

bidirectional | unidirectional—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.

bypass—(Optional) Display RSVP sessions for bypass LSPs.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

externally-provisioned—(Optional) Display the LSPs that are generated dynamically and provisioned by an external Path Computation Element (PCE).

instance *instance-name*—(Optional) Display RSVP sessions for the specified instance. If *instance-name* is omitted, RSVP session information is displayed for the master instance.

interface *interface-name*—(Optional) Display RSVP sessions for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-type—(Optional) Display information about RSVP sessions with regard to LSPs:

- **bypass**—Sessions used for bypass LSPs.
- **lsp**—Sessions used to set up LSPs.
- **nolsp**—Sessions not used to set up LSPs.

name *session-name*—(Optional) Display information about the named session.

p2mp—(Optional) Display point-to-multipoint information.

session-type—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this routing device.
- **ingress**—Sessions that originate from this routing device.
- **transit**—Sessions that transit through this routing device.

statistics—(Optional) Display packet statistics.

te-link *te-link*—(Optional) Display sessions with reservations on the specified TE link.

Output Fields Table 104 on page 2122 describes the output fields for the **show rsvp session** command. Output fields are listed in the approximate order in which they appear.

Table 104: show rsvp session Output Fields

Field Name	Field Description	Level of Output
Ingress RSVP	Information about ingress RSVP sessions.	detail
Ingress RSVP	Information about ingress RSVP sessions. Each session has one line of output.	All levels
Egress RSVP	Information about egress RSVP sessions.	All levels
Transit RSVP	Information about the transit RSVP sessions.	All levels
P2MP name	(Appears only when the p2mp option is specified). Name of the point-to-multipoint LSP path.	All levels
P2MP branch count	(Appears only when the p2mp option is specified). Number of LSPs receiving packets from the point-to-multipoint LSP.	All levels
To	Destination (egress routing device) of the session.	All levels
From	Source (ingress routing device) of the session.	All levels
State	State of the path: Up , Down , or AdminDn . AdminDn indicates that the LSP is being taken down gracefully.	All levels
Address	Destination (egress routing device) of the LSP.	detail
From	Source (ingress routing device) of the session.	detail
LSPstate	State of the LSP that is being handled by this RSVP session. It can be either Up , Dn (down), or AdminDn . AdminDn indicates that the LSP is being taken down gracefully.	brief detail
Rt	Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0).	brief
Active Route	Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (mpls.0).	detail
LSPname	Name of the LSP.	brief detail

Table 104: *show rsvp session Output Fields (continued)*

Field Name	Field Description	Level of Output
LSPpath	Indicates whether the RSVP session is for the primary or secondary LSP path. LSPpath can be either primary or secondary and can be displayed on the ingress, egress, and transit routing devices. LSPpath can also indicate when a graceful LSP deletion has been triggered.	detail
Bypass	(Egress routing device) Destination address for the bypass LSP.	detail
Bidir	(When LSP is bidirectional) LSP will allow data to travel in both directions between GMPLS devices.	detail
Bidirectional	(When LSP is bidirectional) LSP will allow data to travel both ways between GMPLS devices.	detail
Upstream label in	(When LSP is bidirectional) Incoming label for reverse direction traffic for this LSP.	detail
Upstream label out	(When LSP is bidirectional) Outgoing label for reverse direction traffic for this LSP.	detail
Recovery label received	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	detail
Recovery label sent	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned.	detail
Suggested label received	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	detail
Suggested label sent	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned.	detail
Resv style or Style	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be FF (fixed filter), SE (shared explicit), or WF (wildcard filter).	brief detail
Label in	Incoming label for this LSP.	brief detail
Label out	Outgoing label for this LSP.	brief detail
Time left	Number of seconds remaining in the lifetime of the reservation.	brief detail
Since	Date and time when the RSVP session was initiated.	detail
Tspec	Sender's traffic specification, which describes the sender's traffic parameters.	detail
DiffServ info	Indicates whether the LSP is a multiclass LSP (multiclass diffServ-TE LSP) or a Differentiated-Services-aware traffic engineering LSP (diffServ-TE LSP).	detail
bandwidth	Bandwidth for each class type (ct0 , ct1 , ct2 , or ct3).	detail

Table 104: *show rsvp session Output Fields (continued)*

Field Name	Field Description	Level of Output
Port number	Protocol ID and sender/receiver port used in this RSVP session.	detail
Attrib flags	Non-PHP indicates that ultimate hop popping has been requested by the LSP using this RSVP session	extensive
FastReroute desired	Fast reroute has been requested by the ingress routing device.	detail
Soft preemption desired	Soft preemption has been requested by the ingress routing device.	detail
FastReroute desired	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Fast reroute (one-to-one backup) has been requested by the ingress routing device.	detail extensive
Link protection desired	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Link protection (many-to-one backup) has been requested by the ingress routing device.	detail extensive
Node/Link protection desired	(Data [not a bypass or backup] LSP when the protection scheme has been requested) Node and link protection (many-to-one backup) has been requested by the ingress routing device.	detail extensive
Type	LSP type: <ul style="list-style-type: none"> • Link protected LSP—LSP has been protected by link protection at the outgoing interface. The name of the bypass used is also listed here (extensive). • Node/Link protected LSP—LSP has been protected by node and link protection at the outgoing interface. The name of the bypass used is also listed here (extensive). • Protection down—LSP is not currently protected. • Bypass LSP—LSP that is used to protect one or more user LSPs in case of link failure. • Backup LSP at Point-of-Local-Repair (PLR)—LSP that has been temporarily established to protect a user LSP at the ingress of a failed link. • Backup LSP at Merge Point (MP)—LSP that has been temporarily established to protect a user LSP at the egress of a failed link. 	detail extensive
New bypass	New bypass (the bypass name is also displayed) has been activated to protect the LSP.	extensive
Link protection up, using <i>bypass-name</i>	Link protection (the bypass name is also displayed) has been activated for the LSP.	extensive
Creating backup LSP, link down	A link down event occurred, and traffic is being switched over to the bypass LSP.	extensive
Deleting backup LSP, protected LSP restored	Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted.	extensive

Table 104: *show rsvp session Output Fields (continued)*

Field Name	Field Description	Level of Output
Path mtu	Displays the value of the path MTU received from the network (through signaling) and the value used for forwarding. This value is only displayed on ingress routing devices with the allow-fragmentation statement configured at the [edit protocols mpls path-mtu] hierarchy level. If there is a detour LSP, the path MTU for the detour is also displayed.	detail
Egress protection PLR as protector	RSVP state on the Protector or the point-of-local-repair (PLR) routing device: <ul style="list-style-type: none"> • Active— Egress protection is available at the Protector or the PLR routing device. • In Use— Local repair has been completed. 	detail
PATH rcvfrom	Address of the previous-hop (upstream) routing device or client, interface the neighbor used to reach this routing device, and number of packets received from the upstream neighbor.	detail
Adspec	MTU signaled from the ingress routing device to the egress routing device by means of the adspec object.	detail
PATH sentto	Address of the next-hop (downstream) routing device or client, interface used to reach this neighbor (or peer-name in the GMPLS LSP case), and number of packets sent to the downstream routing device.	detail
Explct route	Explicit route for the session. Normally this value will be the same as that of record route. Differences indicate that path rerouting has occurred, typically during fast reroute.	detail
Record route	Recorded route for the session, taken from the record route object. Normally this value will be the same as that of explct route. Differences indicate that path rerouting has occurred, typically during fast reroute.	detail

 `<te-link te-link>`

Release Information Command introduced in Junos OS Release 9.5 for EX Series switches.

Description Display information about Resource Reservation Protocol (RSVP) sessions.

Options **none**—Display standard information about all RSVP sessions.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

bidirectional | unidirectional—(Optional) Display information about bidirectional or unidirectional RSVP sessions only, respectively.

down | up—(Optional) Display only LSPs that are inactive or active, respectively.

interface interface-name—(Optional) Display RSVP sessions for the specified interface only.

lsp-type —(Optional) Display information about RSVP sessions with regard to LSPs:

- **bypass**—Sessions used for bypass LSPs.
- **lsp**—Sessions used to set up LSPs.
- **nolsp**—Sessions not used to set up LSPs.

name session-name—(Optional) Display information about the named session.

session-type—(Optional) Display information about a particular session type:

- **egress**—Sessions that terminate on this switch.
- **ingress**—Sessions that originate from this switch.
- **transit**—Sessions that transit through this switch.

statistics—(Optional) Display packet statistics.

te-link te-link—(Optional) Display sessions with reservations on the specified traffic-engineered link name.

Output Fields [Table 105 on page 2132](#) describes the output fields for the **show rsvp session** command. Output fields are listed in the approximate order in which they appear.

Table 105: show rsvp session Output Fields

Field Name	Field Description	Level of Output
Ingress RSVP	Information about ingress RSVP sessions.	detail
Ingress RSVP	Information about ingress RSVP sessions. Each session has one line of output.	All levels
Egress RSVP	Information about egress RSVP sessions.	All levels
Transit RSVP	Information about the transit RSVP sessions.	All levels
To	Destination (egress switch) of the session.	All levels
From	Source (ingress switch) of the session.	All levels
State	State of the path: Up , Down , or AdminDn . AdminDn indicates that the LSP is being taken down gracefully.	All levels
Address	Destination (egress switch) of the LSP.	detail
LSPstate	State of the LSP that is being handled by this RSVP session. It can be either Up , Dn (down), or AdminDn . AdminDn indicates that the LSP is being taken down gracefully.	brief, detail
Rt	Number of active routes (prefixes) that have been installed in the routing table. For ingress RSVP sessions, the routing table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the routing table is the primary MPLS table (mpls.0).	brief

Table 105: show rsvp session Output Fields (continued)

Field Name	Field Description	Level of Output
ActiveRoute	Number of active routes (prefixes) that have been installed in the forwarding table. For ingress RSVP sessions, the forwarding table is the primary IPv4 table (inet.0). For transit and egress RSVP sessions, the forwarding table is the primary MPLS table (mpls.0).	detail
LSPname	Name of the LSP.	brief, detail
LSPpath	Indicates whether the RSVP session is for the primary or secondary LSP path. LSPpath can be either primary or secondary and can be displayed on the ingress, egress, and transit switches. LSPpath can also indicate when a graceful LSP deletion has been triggered.	detail
Recovery label received	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	detail
Recovery label sent	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv messages that is returned.	detail
Suggested label received	(When LSP is bidirectional) Label the upstream node suggests for use in the Resv message that is sent.	detail
Suggested label sent	(When LSP is bidirectional) Label the downstream node suggests for use in its Resv message that is returned.	detail
Resv style or Style	RSVP reservation style. This field consists of two parts. The first is the number of active reservations. The second is the reservation style, which can be FF (fixed filter), SE (shared explicit), or WF (wildcard filter).	brief detail
Label in	Incoming label for this LSP.	brief, detail
Label out	Outgoing label for this LSP.	brief, detail
Time left	Number of seconds remaining in the lifetime of the reservation.	brief, detail
Since	Date and time when the RSVP session was initiated.	detail
Tspec	Sender's traffic specification, which describes the sender's traffic parameters.	detail
Port number	Protocol ID and sender/receiver port used in this RSVP session.	detail
Creating backup LSP, link down	A link down event occurred, and traffic is being switched over to the bypass LSP.	extensive
Deleting backup LSP, protected LSP restored	Link has come back up and the LSP has been restored. Because the backup LSP is no longer needed, it is deleted.	extensive
PATH rcvfrom	Address of the previous-hop (upstream) switch or client, interface the neighbor used to reach this switch, and number of packets received from the upstream neighbor.	detail

show rsvp statistics

List of Syntax	Syntax on page 2136 Syntax (EX Series Switches) on page 2136
Syntax	<code>show rsvp statistics</code> <code><instance <i>instance-name</i>></code> <code><logical-system (all <i>logical-system-name</i>)></code>
Syntax (EX Series Switches)	<code>show rsvp statistics</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches. instance option added in Junos OS Release 15.1 for the MX Series.
Description	Display Resource Reservation Protocol (RSVP) packet and error statistics. The RSVP input/input module collects statistics for certain events on a per-interface basis. Most of these events were tracked on a routing-instance basis in Junos OS releases earlier than Release 17.2. The "show rsvp interface detail" command displays these event counters under the Events section of the output only when the values of these fields are higher than zero. These statistics are also maintained at the global level (per routing-instance) and are also displayed in the output of the "show rsvp statistics" command.
Options	none —Display RSVP packet and error statistics. instance <i>instance-name</i> —(Optional) Display RSVP packet and error statistics for the specified instance. If instance-name is omitted, RSVP statistics are displayed for the master instance. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view

List of Sample Output	show rsvp statistics on page 2139 show rsvp statistics on page 2140
Output Fields	Table 106 on page 2137 describes the output fields for the show rsvp statistics command. Output fields are listed in the approximate order in which they appear.

Table 106: show rsvp statistics Output Fields

Field Name	Field Description
Packet Type	Statistics about different RSVP messages.
Total Sent	Total number of packets sent since RSVP was enabled.
Total Received	Total number of packets received since RSVP was enabled.
Last 5 seconds Sent	Total number of packets sent in the last 5 seconds.
Last 5 seconds Received	Number of packets received in the last 5 seconds.
Path	Statistics about Path messages, which are sent from the RSVP sender along the data paths and which store path state information in each node along the path.
PathErr	Statistics about PathErr messages, which are advisory messages that are sent upstream to the sender.
PathTear	Statistics about PathTear messages, which remove path states and dependent reservation states in any routing devices along a path.
Resv FF	Statistics about fixed-filter reservation style messages, which consist of distinct reservations among explicit senders.
Resv WF	Statistics about wildcard-filter reservation style messages, which consist of shared reservations among wildcard senders.
Res SE	Statistics about shared-explicit reservation style messages, which consist of shared reservations among explicit senders.
ResvErr	Statistics about ResvErr messages, which are advisory messages that are sent when an attempt to establish a reservation fails.
ResvTear	Statistics about ResvTear messages, which remove reservation states along a path.
ResvConf	Statistics about ResvConfirm messages, which are responses to confirm a reservation request.
Ack	Acknowledge message for refresh reductions.
SRefresh	Summary refresh messages.
Hello	Number of RSVP hello packets that have been sent to and received from the neighbor.
EndtoEnd RSVP	Statistics for the number of End-to-end RSVP messages.
Errors	Statistics about errored RSVP packets.
Rcv pkt bad length	The packet was not processed because its length is inappropriate.

Table 106: show rsvp statistics Output Fields (continued)

Field Name	Field Description
Rcv pkt unknown type	The packet is not one of the well-known RSVP types, as defined in RFC 2205, <i>Resource ReSerVation Protocol (RSVP)</i> .
Rcv pkt bad version	The packet is not an RSVP version 1 packet.
Rcv pkt auth fail	The packet failed authentication checks.
Rcv pkt bad checksum	The RSVP checksum check failed.
Rcv pkt bad format	General packet processing failed because the packet was badly formed.
Memory allocation fail	An internal resource failure occurred.
No path information	A reservation was received, but no sender is active.
Resv style conflict	The same session contains inconsistent reservation styles.
Port conflict	There were inconsistent port numbers for the same session.
Resv no interface	An interface for the receive reservation packets cannot be located.
PathErr to client	Number of PathErr packets delivered to the local client.
ResvErr to client	Number of ResvErr packets delivered to the local client.
Path timeout	Number of times the sender timed out because the path was removed.
Resv timeout	Number of times the receiver timed out because the reservation was removed.
Message out-of-order	Records the number of RSVP incoming messages that are considered out of order. This is detected from the message ID object's sequence number.
Unknown ack msg	A neighboring routing device replies with an ACK object that contains an unknown message ID. This can indicate a message ID handshake problem. For example, a router receives an ACK for message IDs 1, 2, and 3. However, it only has state for message IDs 1 and 3. The router increments the unknown ack counter by 1.
Recv nack	If a neighboring router receives an unknown message ID in an RSVP refresh message, the router sends a Resv nack message back to the sender. This can happen if that neighbor has been rebooted. For this case, the router sends a regular RSVP refresh message to recover the state and start the message-ID handshake process again.
Recv duplicated msg-id	Number of times the same message ID is used by two different RSVP messages. This duplication is usually caused when a neighboring routing device restarts.
No TE-link to rcv Hop	Counter of packets discarded because a TE link was not found.
Rcv pkt disabled interface	Number of RSVP packets received on an interface that is not enabled for RSVP.

Table 106: show rsvp statistics Output Fields (continued)

Field Name	Field Description
Transmit buffer full	Number of times the buffer for assembling an outgoing RSVP message was not large enough.
Transmit failure	Number of times the RSVP task failed to send out a packet.
Receive failure	Number of times the RSVP task failed to read an incoming packet.
P2MP RESV discarded by appl	Number of Resv messages discarded because the MPLS label is not valid for the P2MP LSP application.
Rate limit	Number of RSVP packets dropped due to rate limiting.
Err msg loop detected	Number of RSVP error messages that have looped back to their originator. This is detected by checking the error node address in the ERROR_SPEC object.

Sample Output

show rsvp statistics

Starting in Junos OS Release 16.1, this command also shows conditional PathTear statistics and the number of times an LSP state has been retained because of Link Protecting Merge Point (LP-MP) or Node Protecting Merge Point (NP-MP) determination.

```

user@host> show rsvp statistics

show rsvp version

List of Syntax	Syntax on page 2142 Syntax (EX Series Switches) on page 2142
Syntax	show rsvp version <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches)	show rsvp version
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.5 for EX Series switches.
Description	Display information about the Resource Reservation Protocol (RSVP) protocol settings, such as the version of the RSVP software, the refresh timer and keep multiplier, and local RSVP graceful restart capabilities on a routing device.
Options	none —Display RSVP protocol settings. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
List of Sample Output	show rsvp version on page 2144
Output Fields	Table 107 on page 2142 describes the output fields for the show rsvp version command. Output fields are listed in the approximate order in which they appear.

Table 107: show rsvp version Output Fields

Field Name	Field Description
Resource ReSerVation Protocol, version	RSVP software version.
RSVP protocol	Status of RSVP: Enabled or Disabled .
R(refresh timer)	Configured time interval used to generate periodic RSVP messages.
K(keep multiplier)	Number of RSVP messages that can be lost before an RSVP state is declared stale.
Preemption	Currently configured preemption capability: Aggressive , Disabled , or Normal . The default is Normal .
Soft-preemption cleanup	Time, in seconds, that an LSP is kept after it has been soft preempted. This is a global property of the RSVP protocol.

Table 107: *show rsvp version* Output Fields (continued)

Field Name	Field Description
Graceful deleting timeout	Currently configured value for the graceful-deletion-timeout statement. The router that initiates the graceful deletion procedure for an RSVP session waits for the graceful deletion timeout interval to ensure that all routers along the path (especially the ingress and egress routers) have prepared for the LSP to be taken down.
NSR Mode	Status of the nonstop active routing feature for RSVP on the restarting device: Disabled , Enabled/Master , or Enabled/Standby .
NSR State	State of the nonstop active routing feature for RSVP on the restarting device. Possible values are: <ul style="list-style-type: none"> • Idle • TE-link sync complete • Neighbor sync complete • Path state sync complete • Resv state sync complete • Bypass sync complete • Init sync complete
Setup protection	Status of point-to-point and point-to-multipoint LSP setup protection configuration on the device: Enabled or Disabled .
Route Session-Id count	Total count of session IDs associated with the combination of all the RSVP ingress routes. NOTE: Starting in Junos OS Release 16.1, the show rsvp version command output displays the Route Session-Id count output field by default, irrespective of the presence of associated session IDs. When there are no session IDs associated with any RSVP ingress route, the <i>Route Session-Id count</i> value is zero (0).
Graceful restart	Status of the graceful restart feature for RSVP on the restarting routing device: Enabled or Disabled .
Restart helper mode	Status of the helper mode feature: Enabled or Disabled . When this feature is enabled, the restarting routing device can help the neighbor with its RSVP restart procedures.
Maximum helper restart time	Number of milliseconds (ms) configured for the maximum helper restart time. The maximum helper restart time is the length of time the routing device waits before declaring that an RSVP neighbor attempting to restart gracefully is down.
Maximum helper recovery time	Number of milliseconds configured for the maximum helper recovery time. The maximum helper recovery time is the amount of time the routing device maintains the state of an RSVP neighbor attempting to restart gracefully.
Restart time	Number of milliseconds that a neighbor waits to receive a Hello message from the restarting node before declaring the node dead and deleting the states.
Recovery time	Number of milliseconds during which the restarting node attempts to recover its lost states with help from its neighbors. Recovery time is advertised by the restarting node to its neighbors, and applies to nodal faults. The restarting node considers its graceful restart complete after this time has elapsed.

Table 107: show rsvp version Output Fields (continued)

Field Name	Field Description
P2p transit LSP nexthop mode	Point-to-point transit LSP next-hop mode on PTX Series devices. The possible values are Chained or Unchained .
P2mp transit LSP nexthop mode	Point-to-multipoint transit LSP next-hop mode on PTX Series devices. The possible values are Chained or Unchained .

Sample Output

show rsvp version

Starting with Junos OS Release 16.1, this command also shows whether enhanced FRR procurers are enabled on the router.

```

user@host> show rsvp version
Resource ReSerVation Protocol, version 1. rfc2205
  RSVP protocol:           Enabled
  R(refresh timer):        30 seconds
  K(keep multiplier):      3
  Preemption:             Normal
  Soft-preemption cleanup:  30 seconds
  Graceful deletion timeout: 30 seconds
  NSR mode:               Enabled/Master
  NSR state:              Init sync complete
  Setup protection:        Disabled
  Route Session-Id count:  1
  Graceful restart:        Disabled
  Restart helper mode:     Enabled
  Maximum helper restart time: 20000 msec
  Maximum helper recovery time: 180000 msec
  Restart time:            0 msec
  P2p transit LSP nexthop mode: Unchained
  P2mp transit LSP nexthop mode: Unchained
  Enhanced FRR local protection: Enabled

```

traceroute mpls rsvp

Syntax	<pre>traceroute mpls <rsvp> <i>lsp-name</i> <detail> <egress> <exp> <logical-system> <multipoint> <no-resolve> <retries> <source <i>source-address</i>> <ttl></pre>
Release Information	<p>Command introduced in Junos OS Release 9.2.</p> <p>egress, multipoint, and ttl options added in Junos OS Release 11.2.</p>
Description	<p>Trace route to a remote host for an MPLS LSP signaled by RSVP. Use traceroute mpls rsvp as a debugging tool to locate MPLS label-switched path (LSP) forwarding issues in a network. (Currently supported for IPv4 packets only.)</p>
Options	<p><i>lsp-name</i>—Specify the name of the LSP to be traced.</p> <p>detail—(Optional) Display detailed output.</p> <p>egress—(Optional) Request that a specific point-to-multipoint egress node reply to the trace route. The trace route would follow the associated sub-LSP to the egress node.</p> <p>exp—(Optional) Specify the class of service to use when sending probes. The range of values is 0 through 7. The default value is 7.</p> <p>logical-system—(Optional) Specify the name of the logical system for the traceroute attempt.</p> <p>multipoint—(Optional) Perform a trace route on a point-to-multipoint LSP.</p> <p>no-resolve—(Optional) Specify not to resolve the hostname that corresponds to the IP address.</p> <p>retries—(Optional) Specify the number of times to resend probe. The range of values is 1 through 9. The default value is 3.</p> <p>source <i>source-address</i>—(Optional) Specify the source address of the outgoing traceroute packets.</p> <p>ttl—(Optional) Specify the number of hops to follow before forcing the trace route to quit.</p>
Required Privilege Level	network

List of Sample Output [traceroute mpls rsvp on page 2147](#)
[traceroute mpls rsvp detail on page 2147](#)
[traceroute mpls rsvp multipoint \(branch node for sub-LSPs\) on page 2148](#)
[traceroute mpls rsvp multipoint \(single-hop sub-LSPs\) on page 2148](#)

Output Fields [Table 108 on page 2146](#) describes the output fields for the **traceroute mpls rsvp *lsp-name*** and **traceroute mpls rsvp *lsp-name* detail** commands. Output fields are listed in the approximate order in which they appear.

Table 108: traceroute mpls rsvp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the traceroute mpls rsvp <i>lsp-name</i> command.	all levels
ttl	Time-to-live value of the labeled packet.	none specified
Label	MPLS label used to forward the packets along the LSP.	none specified
Protocol	Signaling protocol used. For this command, it is RSVP-TE.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is null.	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). Displays Success if the trace to a hop is successful or Egress if the trace has reached the last router on the path.	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	detail
Parent	Address of the previous hop. Parent value for the first hop is null.	detail
Return Code	Return code for reporting the result of processing the echo request by the receiver.	detail
Sender timestamp	Displays the timestamp when the MPLS echo request is sent to the next hop.	detail
Receiver timestamp	Timestamp when the echo request from the previous hop is received and acknowledged with an echo response by the next hop.	detail
Response time	Time for the echo request to reach the receiver.	detail

Table 108: traceroute mpls rsvp Output Fields (continued)

Field Name	Field Description	Level of Output
MTU	Size of the largest packet that includes the label stack forwarded to the next hop.	detail
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none.	detail
Label stack	Label stack used to forward the packet.	detail
Path	Displays the sub-lsp path number for this traceroute, the interface used, and the destination address.	all levels

Sample Output

clear ldp neighbor

Syntax	<code>clear ldp neighbor</code> <code><instance <i>instance-name</i>></code> <code><logical-system (all <i>logical-system-name</i>)></code> <code><neighbor></code>
Description	Tear down Label Distribution Protocol (LDP) neighbor connections.
Options	none —Tear down connections with all LDP neighbors for all routing instances. instance <i>instance name</i> —(Optional) Clear the LDP session for the specified routing instance only. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. neighbor —(Optional) Clear an LDP session for the specified neighbor (IP address) only.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show ldp neighbor on page 2168

Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear ldp neighbor

```
user@host> clear ldp neighbor
```

clear ldp session

Syntax	clear ldp session <all> <destination> <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)>
Release Information	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Clear Label Distribution Protocol (LDP) sessions.
Options	<p>all—Clear LDP sessions for all destinations for all routing instances.</p> <p>destination—(Optional) Clear an LDP session for the specified destination (IP address).</p> <p>instance <i>instance-name</i>—(Optional) Clear the LDP session for the specified routing instance only.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	clear

Sample Output

clear ldp statistics

```
user@host> clear ldp statistics
```

ping mpls ldp

Syntax	<pre>ping mpls ldp fec <count count> <destination address> <detail> <exp forwarding-class> <instance routing-instance-name> <logical-system (all logical-system-name)> <p2mp root-addr ip-address lsp-id identifier> <size bytes> <source source-address> <sweep></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>size and sweep options introduced in Junos OS Release 9.6.</p> <p>instance option introduced in Junos OS Release 10.0.</p> <p>p2mp, root-address, and lsp-id options introduced in Junos OS Release 11.2.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	<p>Check the operability of MPLS LDP-signaled label-switched path (LSP) connections.</p> <p>Type Ctrl+c to interrupt a ping mpls command.</p>
Options	<p>count count—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p>destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p>detail—(Optional) Display detailed information about the echo requests sent and received.</p> <p>exp forwarding-class—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p>fec—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.</p> <p>instance routing-instance-name—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p>p2mp root-addr ip-address lsp-id identifier—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.</p> <p>size bytes—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the</p>

router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. For more information, see the *MPLS Applications Feature Guide*.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

NOTE: In a Juniper-Cisco interoperation network scenario, a point-to-multipoint LSP ping echo reply message from a Cisco device in a different IGP area is dropped on the Juniper device when the source address of the reply message is an interface address other than the loopback address or router ID. Starting in Junos OS Release 13.3X8, 14.2R6, 15.1R4, 15.1F6, 15.1F5-S8, 16.1R1, and later releases, such point-to-multipoint LSP ping echo reply messages are accepted by the Juniper device and the messages get logged as uncorrelated responses.

Required Privilege Level network

List of Sample Output [ping mpls ldp fec count on page 2155](#)
[ping mpls ldp p2mp root-addr lsp-id on page 2155](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls ldp fec count

```
user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.
```

ping mpls ldp p2mp root-addr lsp-id

```
user@host> ping mpls ldp p2mp root-addr 10.1.1.1/32 lsp-id 1 count 1

show ldp database

Syntax	<code>show ldp database</code> <code><brief detail extensive></code> <code><inet l2circuit></code> <code><instance <i>instance-name</i>></code> <code><logical-system (all <i>logical-system-name</i>)></code> <code><p2mp></code> <code><session <i>session</i>></code> <code><summary></code>
Release Information	Command introduced before Junos OS Release 7.4. summary option introduced in Junos OS Release 14.2.
Description	Display entries in the LDP database.
Options	none —Display standard information about all entries in the LDP database for all routing instances. brief detail extensive —(Optional) Display the specified level of output. inet l2circuit —(Optional) Display only IPv4 or Layer 2 circuit bindings. instance <i>instance-name</i> —(Optional) Display routing instance information for the specified instance only. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. p2mp —(Optional) Display point-to-multipoint binding information. session <i>session</i> —(Optional) Display database for the specified session only. session is the destination address of the LDP session. summary —(Optional)—Display summary output. This option displays the number of labels received and advertised for each LDP session.
Required Privilege Level	view

Output Fields [Table 109 on page 2157](#) describes the output fields for the **show ldp database** command. Output fields are listed in the approximate order in which they appear.

Table 109: show ldp database Output Fields

Field Name	Field Description	Level of Output
Input label database	Label received from the other router.	All levels
Output label database	Label advertised to the other router.	All levels
<i>session-identifier</i>	Session identifier, which includes the local and remote label space identifiers.	All levels
Labels received	Number of labels received from the other router.	All levels
Labels advertised	Number of labels advertised to the other router.	All levels.
Label	Label binding to a route prefix.	All levels

Table 109: show ldp database Output Fields (continued)

Field Name	Field Description	Level of Output
Prefix	<p>Route prefix.</p> <p>It can be one of the following values:</p> <ul style="list-style-type: none"> • IP prefix. • Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured. • Layer 2 encapsulation type. <p>Layer 2 encapsulation types are displayed in the format L2CKT control word status encapsulation-type vc-number, for example, L2CKT CtrlWord FRAME RELAY VC 2</p> <ul style="list-style-type: none"> • control-word-status—Displays whether the use of the control word has been negotiated for this virtual circuit: <ul style="list-style-type: none"> • NoCtrlWord • CtrlWord • encapsulation-type—Encapsulation type: <ul style="list-style-type: none"> • FRAME RELAY • ATM AAL5 • ATM CELL • VLAN • ETHERNET • CISCO_HDLC • PPP • VC number—Virtual circuit number. It can have any numeric value. • (Stale)—When you display the LDP database for the neighbor of a restarting router, the bindings learned from the restarting neighbor are displayed as (Stale). Stale bindings are deleted if they are not refreshed within the recovery time. 	All levels
MTU	MTU of the Layer 2 circuit. MTU is displayed for all encapsulation types except ATM cell encapsulations.	detail
VCCV Control Channel types	<p>Virtual Circuit Connection Verification (VCCV) control channel types.</p> <ul style="list-style-type: none"> • MPLS router alert label • MPLS PW label with TTL=1 	extensive
VCCV Control Verification types	The only valid VCCV control verification type is LSP ping .	extensive
TDM payload size	Size of the Time Division Multiplex (TDM) payload.	All levels
TDM bitrate	Bit rate for the TDM traffic.	All levels
Requested VLAN ID	(VLANs) VLAN identifier of the Layer 2 circuit.	detail
Cell bundle size	(ATM cell encapsulations) Maximum number of cells that the Layer 2 circuit can receive in a packet.	detail

Table 109: show ldp database Output Fields (continued)

Field Name	Field Description	Level of Output
State	State of the label binding: <ul style="list-style-type: none"> • Active—Label binding has been installed and distributed appropriately. A label binding is almost always in this state. • New—New label that has not yet been distributed. <ul style="list-style-type: none"> • MapRcv—Waiting to receive a label mapping message. • MapSend—Waiting to send a label mapping message. • RelRcv—Waiting to receive a label release message. • RelRsnd—Waiting to receive a label release message before resending label mapping message. • RelSend—Waiting to send a label release message. • ReqSend—Waiting to send a label request message. • W/dSend—Waiting to send a label withdrawal message. 	detail
Age	Time elapsed since the binding was created.	detail

show ldp fec-filters

Syntax	show ldp fec-filters <fec> <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)>
Release Information	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Display information about configured Label Distribution Protocol (LDP) forwarding equivalence class (FEC) filters.
Options	<p>fec—(Optional) Display FEC filter information for the specified FEC.</p> <p>instance <i>instance-name</i>—(Optional) Display FEC filter information for the specified instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
List of Sample Output	show ldp fec-filters on page 2165
Output Fields	Table 110 on page 2165 lists the output fields for the show ldp fec-filters command. Output fields are listed in the approximate order in which they appear.

Table 110: show ldp fec-filters Output Fields

Field Name	Field Description
Ingress	Names of the FEC filters on the ingress routers.
Transit	Names of the FEC filters on the transit routers.

Sample Output

show ldp fec-filters

```
user@host> show ldp fec-filters 10/8
10.22.1.2/32
  Ingress: f1-10.22.1.2/32 (index: 3)
  Transit: (null) (index: 0)
```

show ldp interface

Syntax	<pre>show ldp interface <brief detail extensive> <interface-name> <instance instance-name> <logical-system (all logical-system-name)></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	Display the status of Label Distribution Protocol (LDP)-enabled interfaces.
Options	<p>none—Display standard status information about all LDP-enabled interface for all routing instances.</p> <p>interface-name—(Optional) Display information for the specified interface.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>instance instance-name—(Optional) Display information for the specified routing instance.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
List of Sample Output	show ldp interface extensive on page 2167
Output Fields	<p>Table 111 on page 2166 describes the output fields for the show ldp interface command. Output fields are listed in the approximate order in which they appear.</p>

Table 111: show ldp interface Output Fields

Field Name	Field Description	Level of Output
Interface	Interface name.	All levels
Label space ID	Label space identifier that the router is advertising on the interface.	All levels
Nbr count	Number of neighbors on the interface.	All levels
Next hello	How long until the next hello packet is sent on this interface, in seconds.	All levels

Table 111: show ldp interface Output Fields (continued)

Field Name	Field Description	Level of Output
Hello interval	One-third of the negotiated hold time (in seconds). If the user-configured value for the hello interval is smaller than the computed value, the user-configured value is used.	detail extensive
Hold time	Configured hold time, in seconds.	detail extensive
Transport address	Address to which the neighbor wants the local route to establish the LDP session.	extensive
Local hello interval	Locally configured hello interval.	extensive

Sample Output

show ldp interface extensive

```

user@host> show ldp interface extensive
Interface          Label space ID      Nbr count  Next hello
fe-0/0/3.0         10.255.245.6:0      2          0
  Hello interval: 1, Hold time: 15, Transport address: 10.255.245.6
  Local hello interval: 2, Index: 69

```

show ldp neighbor

Syntax	<pre>show ldp neighbor <brief detail extensive> <auto-targeted> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <neighbor-address></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>neighbor-address option added in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p> <p>auto-targeted option added in Junos OS Release 14.2.</p>
Description	Display Label Distribution Protocol (LDP) neighbor information.
Options	<p>none—Display standard information about LDP neighbors for all routing instances.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>auto-targeted—(Optional) Display information about LDP neighbors that are automatically targeted using the loopback addresses.</p> <p>instance <i>instance-name</i>—(Optional) Display information for the specified routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>neighbor-address—(Optional) Display information about the specified LDP neighbor.</p>
Required Privilege Level	view

Table 112: show ldp neighbor Output Fields

Field Name	Field Description	Level of Output
Address	IP address of the neighbor.	All levels

Table 112: show ldp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
Interface	Interface over which the neighbor was discovered.	All levels
Label space ID	Label space identifier advertised by the neighbor.	All levels
Hold time	Remaining hold time before the neighbor expires, in seconds.	All levels
Transport address	Address to which the neighbor wants the local route to establish the LDP session.	detail
Configuration sequence	Counter that increments whenever the neighbor changes its configuration.	detail
Up for	Length of time the LDP neighbor has been in operation.	detail extensive
Reference count	Reference count for the LDP neighbor.	extensive
Hold time	Displays the neighbor's hold time. The hold time is the proposed hold times for the local and peer routers.	extensive
Proposed local/peer	Hold time value proposed by the local router and the peer router.	extensive

Sample Output

show ldp neighbor extensive

```

user@host> show ldp neighbor extensive
Address          Interface      Label space ID  Hold Time
192.168.37.23    so-1/0/0.0    10.255.245.5:0  44
Transport address: 10.255.245.5, Configuration sequence: 6
Up for 00:03:37
Reference count: 1
Hold time: 45, Proposed local/peer: 15/45

```

show ldp neighbor auto-targeted extensive

```

Up for 00:10:53
Reference count: 2
Hold time: 45, Proposed local/peer: 45/45
Hello interval: 15
Hello flags: targeted
Neighbor types: Auto-targeted

```

show ldp overview

Syntax	<pre>show ldp overview <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Syntax (EX Series Switch and QFX Series)	<pre>show ldp overview <instance <i>instance-name</i>></pre>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display LDP overview information.
Options	<p>none— Display standard overview information about LDP for all routing instances.</p> <p>instance <i>instance-name</i>— (Optional) Display LDP overview information for the specified routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)— (Optional) Display LDP information from systems or a particular logical system on the devices.</p>
Required Privilege Level	view
List of Sample Output	show ldp overview on page 2173
Output Fields	Table 113 on page 2170 lists the output fields for the show ldp overview command. Output fields are listed in the approximate order in which they appear.

Table 113: show ldp overview Output Fields

Field Name	Field description	Level of Output
Instance	LDP routing instance.	All Levels
Router ID	Router ID of the routing device.	All Levels
Message ID	Unique identifier of message.	All Levels
Configuration sequence	Value of configuration sequence.	All Levels
Deaggregate	Status of control forwarding equivalence class (FEC) deaggregation on the router. By default it is disabled on the router.	All Levels
Explicit null	Advertise label 0 to the egress routing device of an LSP. Explicit null: enabled or disabled . NOTE: If you do not include the explicit-null statement in the configuration, label 3 (implicit null) is advertised.	All Levels

Table 113: show ldp overview Output Fields (continued)

Field Name	Field description	Level of Output
IPv6 tunneling	Internet Protocol version 6 tunneling: enabled or disabled .	All Levels
Strict targeted hellos	Prevent LDP sessions from being established with remote neighbors that have not been specifically configured. Strict targeted hellos: enabled or disabled . <i>NOTE:</i> LDP peers will not respond to targeted hellos coming from a source that is not one of the configured remote neighbors.	All Levels
Loopback if added	Loopback interface is added: yes or no .	All Levels
Route preference	Default preference value (also known as an administrative distance) assigned to each route that the routing table receives. LDP preference is: 9	All Levels
Unicast transit LSP chaining	Unicast transit LSP chaining: enabled or disabled .	All Levels
P2MP transit LSP chaining	P2MP transit LSP chaining: enabled or disabled .	All Levels
Transit LSP statistics based on route statistics	Transit LSP statistics based on route statistics: enabled or disabled .	All Levels
Longest match	Longest match for label mapping: enabled or disabled .	All Levels
Capabilities enabled	Enabled capabilities: none	All Levels
Timers	<ul style="list-style-type: none"> Keepalive interval: Keepalive interval value. Keepalive timeout: Time interval for which the neighbor LDP node waits before determining session failure. Link hello interval: Specify how often the router sends Link Management Protocol (LMP) hello packets. Link hello hold time: Time interval for which an LDP node waits for a hello message before declaring a neighbor is down. Targeted hello interval: Specify how often LDP sends targeted hello messages. Targeted hello hold time: Time interval for which a sending LSR maintains a record of targeted hello messages from the receiving LSR without receipt of another targeted hello message from that LSR. Label withdraw delay: Time interval for withdrawing labels to reduce router workload during IGP convergence. 	All Levels

Table 113: show ldp overview Output Fields (continued)

Field Name	Field description	Level of Output
Graceful restart	Graceful restart attributes. <ul style="list-style-type: none"> • Restart— Graceful restart capability: enabled or disabled. • Helper— Standard graceful restart helper capability: enabled or disabled. • Restart in process— Graceful restart in process. • Reconnect time— Period of time that a restarting LSR (label switched router) designates to LDP neighbors to wait until the former reestablishes the session after restarting. • Max neighbor reconnect time— Maximum reconnect time. • Recovery time— Period of time that an LSR preserves its state across the restart. • Max neighbor recovery time— Maximum recovery time designated to LDP neighbors by a restarting LSR. 	All Levels
Traffic Engineering	<ul style="list-style-type: none"> • Bgp igp— BGP and IGP destinations: enabled or disabled. When enabled, IGP uses MPLS paths for forwarding traffic. • Both ribs— BGP and IGP destinations with routes in both RIBs: enabled or disabled. • Mpls forwarding— MPLS routes used for forwarding: enabled or disabled. 	All Levels
IGP	<ul style="list-style-type: none"> • Tracking igp metric— Cause the IGP route metric to be used for the LDP routes instead of the default LDP route metric (the default LDP route metric is 1). • Sync session up delay— Time interval to synchronize LDP session. 	All Levels
Session protection	<ul style="list-style-type: none"> • Session protection— Remote neighbor added to LDP configuration which enables protection for all sessions in the corresponding LDP instance: enabled or disabled. • Session protection timeout— Period of time until which the remote neighbor is connected to LSR in the absence of link neighbors. 	All Levels
Interface addresses advertising	Advertises interface address.	All Levels
Label allocation	Label accounting information. <ul style="list-style-type: none"> • Current number of LDP labels allocated— Number of labels currently in use. • Total number of LDP labels allocated— Cumulative number of labels being allocated. • Total number of LDP labels freed— Cumulative number of labels being freed. • Total number of LDP label allocation failures— Cumulative number of failures for allocating a label. • Current number of labels allocated by all protocols— Number of labels currently being used by routing protocols. 	All Levels

Sample Output

show ldp overview

```
user@host> show ldp overview
Instance: master
Router ID: 192.168.2.1

Configuration sequence: 1
Deaggregate: disabled
Explicit null: disabled
IPv6 tunneling: disabled
Strict targeted hellos: disabled
Loopback if added: yes
Route preference: 9
Unicast transit LSP chaining: disabled
P2MP transit LSP chaining: disabled
Transit LSP statistics based on route statistics: disabled
Longest Match: enabled
Capabilities enabled: none
Timers:
  Keepalive interval: 10, Keepalive timeout: 30
  Link hello interval: 5, Link hello hold time: 15
  Targeted hello interval: 15, Targeted hello hold time: 45
  Label withdraw delay: 60
Graceful restart:
  Restart: enabled, Helper: enabled, Restart in process: false
  Reconnect time: 60000, Max neighbor reconnect time: 120000
  Recovery time: 160000, Max neighbor recovery time: 240000
Traffic Engineering:
  Bgp igp: disabled
  Both ribs: disabled
  Mpls forwarding: disabled
IGP:
  Tracking igp metric: disabled
  Sync session up delay: 10
Session protection:
  Session protection: disabled
  Session protecton timeout: 0
Interface addresses advertising:
  192.168.2.1
Label allocation:
  Current number of LDP labels allocated: 3
  Total number of LDP labels allocated: 3
  Total number of LDP labels freed: 0
  Total number of LDP label allocation failure: 0
  Current number of labels allocated by all protocols: 3
```

show ldp p2mp tunnel

Syntax `show ldp p2mp tunnel`
 `<brief | detail | extensive>`
 `<instance instance-name>`
 `<logical-system (all | logical-system-name)>`

Release Information Command introduced in Junos OS Release 13.3.

Description Display LDP point-to-multipoint tunnel table information.

Options **brief | detail | extensive**—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display routing instance information for the specified instance only.

logical-system (all | *logical-system-name*)—(Optional) Display LDP point-to-multipoint tunnel table information of all logical systems or a particular logical system.

Required Privilege Level View

Sample Output

`show ldp p2mp tunnel`

```
user@host> show ldp p2mp tunnel extensive

Instance   Tunnel type      Tunnel name
0          Name            10.254.1.1:1:ldp-p2mp:mvpn:vpn-1
P2MP root-addr 10.255.107.232, lsp-id 16777217
Self id 805306372
Reference count 2
```

show ldp path

Syntax `show ldp path`
`<brief | detail | extensive>`
`<destination>`
`<instance instance-name>`
`<logical-system (all | logical-system-name)>`

Release Information Command introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Display Label Distribution Protocol (LDP) label-switched paths (LSPs).

Options **none**—Display standard information about all LDP LSPs for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

destination—(Optional) Restrict the output to entries that match the specified destination prefix.

instance instance-name—(Optional) Display information for the specified routing instance only.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show ldp path extensive on page 2176](#)

Output Fields [Table 114 on page 2175](#) describes the output fields for the **show ldp path** command. Output fields are listed in the approximate order in which they appear.

Table 114: show ldp path Output Fields

Field Name	Field Description
Output Session (label)	Session ID and labels that this system has sent using LDP. These correspond to MPLS packets received.
Input Session (label)	Session ID and labels that this system has received using LDP. These correspond to MPLS packets transmitted.
route	MPLS route.
Attached route	Route corresponding to the LSP.
Ingress route	The router acts as the ingress for the LSP.

Table 114: show ldp path Output Fields (continued)

Field Name	Field Description
Reference count	Reference count for the LDP neighbor.
Transit route	Names of the forwarding equivalence class (FEC) filters on the transit routers.
Global label	MPLS label that is used globally.

Sample Output

show ldp path extensive

```
user@host> show ldp path extensive
Output Session (label)      Input Session (label)
10.255.14.220:0(3)         ( )
  Attached route: 10.255.14.221/32
  Reference count: 3, Global label: 3
10.255.14.220:0(100000)     10.255.14.220:0(3)
  Attached route: 10.255.14.220/32, Ingress route
  Reference count: 2, Transit route, Global label: 100000
10.255.14.220:0(100001)     10.255.14.220:0(100001)
  Attached route: 10.255.14.214/32, Ingress route
  Reference count: 2, Transit route, Global label: 100001
```

show ldp route

Syntax	<pre>show ldp route <brief detail extensive> <destination> <fec-and-route> <fec-only> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3X50 for the QFX Series.</p>
Description	<p>Display the entries in the Label Distribution Protocol (LDP) internal topology table. The internal topology table contains routes from inet.0 and inet.3 and is used when binding a label to a forwarding equivalence class (FEC).</p>
Options	<p>none—Display standard information about all entries in the LDP internal topology table for all routing instances.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>destination—(Optional) Restrict the output to entries that are longer than the specified destination prefix and prefix length.</p> <p>fec-and-route—Display the show routes and the FECs.</p> <p>fec-only—Display only LDP FECs.</p> <p>instance <i>instance-name</i>—(Optional) Display entries for the specified routing instance only.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
List of Sample Output	<p>show ldp route detail on page 2179</p> <p>show ldp route extensive on page 2179</p> <p>show ldp route fec-and-route on page 2180</p> <p>show ldp route fec-and-route on page 2181</p> <p>show ldp route fec-only on page 2183</p> <p>show ldp route fec-only detail on page 2184</p>
Output Fields	<p>Table 115 on page 2178 describes the output fields for the show ldp route command. Output fields are listed in the approximate order in which they appear.</p>

Table 115: show ldp route Output Fields

Field Name	Field Description
Destination	Destination prefix.
Next-hop intf/lsp/table	Interface that is the next hop to the destination prefix.
Next-hop address	IP address of the next hop.
Session ID	LDP session ID.
Route flags	Information about the route. For example, the Ingress TTL propagate flag indicates that the time-to-live (TTL) value is being propagated with the route.
Bound to outgoing label	The route has been bound to LSPs with the label being distributed for that LSP.
Topology entry	The topology that the route is bound to.
Ingress route status	Status of the ingress route. For example, it could be Active or Inactive .
Last modified	The length of time since the ingress route status last changed.
Last event(s)	The last event that occurred.

Sample Output

show ldp session

Syntax	show ldp session <brief detail extensive> <auto-targeted> <destination> <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)>
Release Information	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series. auto-targeted option added in Junos OS Release 14.2.
Description	Display information about Label Distribution Protocol (LDP) sessions.
Options	<p>none—Display standard information about all LDP sessions for all routing instances.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>auto-targeted—(Optional) Display information about LDP sessions that are automatically targeted using loopback addresses.</p> <p>destination—(Optional) Restrict LDP session display to the specified address.</p> <p>instance <i>instance-name</i>—(Optional) Display routing instance information for the specified instance. If <i>instance-name</i> is omitted, information is displayed for the master instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear ldp session on page 2151
List of Sample Output	show ldp session brief on page 2189 show ldp session detail on page 2189 show ldp session extensive on page 2190 show ldp session auto-targeted detail on page 2190
Output Fields	Table 116 on page 2185 describes the output fields for the show ldp session command. Output fields are listed in the approximate order in which they appear.

Table 116: show ldp session Output Fields

Field Name	Field Description	Level of Output
Address	Transport address of the session.	any

Table 116: show ldp session Output Fields (continued)

Field Name	Field Description	Level of Output
State	State of the session: Nonexistent , Connecting , Initialized , OpenRec , OpenSent , Operational , or Closing . The states correspond to the state diagram specified in Internet Draft LDP Specification draft-ietf-mpls-rfc3036bis-01.txt.	any
Connection	TCP connection state: Closed , Opening , or Open .	any
Hold time	Time remaining until the session will be closed, in seconds.	any
Session ID	LDP identifiers of the peers of this session.	detail extensive
Next keepalive	Time until next keepalive is sent, in seconds.	detail extensive
Active	Whether the local router is playing the active role in the session and during session establishment.	detail extensive
Passive	Whether the local router is playing the passive role in the session and during session establishment.	detail extensive
Maximum PDU	Maximum protocol data unit (PDU) size (packet size) for the session.	detail extensive
Hold time	Time remaining until the session will be closed, in seconds. This value corresponds to the one configured using the keepalive-timeout statement configured at the [edit protocols ldp] hierarchy level.	detail extensive
Neighbor count	Number of neighbors that are contributing to the session.	detail extensive
Neighbor types	Category of LDP session: discovered or auto-targeted .	any
Keepalive interval	Keepalive interval, in seconds.	detail extensive
Connect retry interval	TCP connection retry interval, in seconds.	detail extensive
Local address	Local transport address.	detail extensive
Remote address	Remote transport address.	detail extensive
Up for	Time that this session has been up.	detail extensive
Last down	Time since the session last went down.	detail extensive

Table 116: show ldp session Output Fields (continued)

Field Name	Field Description	Level of Output
Reason	Reason the session went down: <ul style="list-style-type: none"> • Aborted graceful restart • Authentication key was changed • Bad type length value (TLV) • Bad protocol data unit (PDU) packets • Command-line interface (CLI) command • Connect time expired • Connection error • Connection reset • Error during initialization • Hold time expired • No adjacency or all adjacencies down • Notification received • Received notification from peer • Unexpected End of File (EOF) • Unknown reason 	detail extensive
Number of session flaps	Number of times the session changes from up to down.	detail extensive
Restarting	LDP is in the process of gracefully restarting.	detail extensive
Capabilities advertised	LDP capabilities advertised to a peer.	detail extensive
Capabilities received	LDP capabilities received from a peer.	detail extensive
Protection	Information about the status of MPLS LDP session protection.	detail extensive
restart complete in nnn msec	Amount of time (in milliseconds) remaining until graceful restart is declared complete.	detail extensive
Authentication type	Shows the longest match MD5 authentication	detail extensive

Table 116: show ldp session Output Fields (continued)

Field Name	Field Description	Level of Output
Local	<p>Information about graceful restart for the local end of an LDP session. Graceful restart and helper mode are independent.</p> <ul style="list-style-type: none"> • Restart—Status of the graceful restart feature at the local end of the LDP session: enabled or disabled. • Helper mode—Status of the helper mode feature at the local end of the LDP session: enabled or disabled. When this feature is enabled, the local end of the LDP session can help the restarting router with its LDP restart procedures. • Reconnect time—Amount of time to wait from when a restart is initiated until the router can exchange LDP messages with its neighbors. The default is 60000 msec and is not configurable. (Reconnect timeout refers to "FT Reconnect timeout" in draft-ietf-mpls-ldp-restart-06, <i>Internet Draft Graceful Restart Mechanism for LDP</i>.) 	detail extensive
Remote	<p>Information about graceful restart at the remote end of an LDP session. Graceful restart and helper mode are independent.</p> <ul style="list-style-type: none"> • Restart—Status of the graceful restart feature at the remote end of the LDP session: enabled or disabled. • Helper mode—Status of the helper mode feature at the remote end of the LDP session: enabled or disabled. When this feature is enabled, the remote end of the LDP session can help the restarting router with its LDP restart procedures. • Reconnect time—Amount of time in milliseconds from when a restart is initiated until the remote router can exchange LDP messages with its neighbors. 	detail extensive
Local maximum recovery time	Amount of time during which the restarting node attempts to recover its lost states with help from its neighbors (in milliseconds).	detail extensive
Next-hop addresses received	Next-hop addresses received on the session.	detail extensive
Queue depth	Number of messages that are queued for sending to the peers in the group.	extensive

Table 116: show ldp session Output Fields (continued)

Field Name	Field Description	Level of Output
Message type	<p>Type of message being sent:</p> <ul style="list-style-type: none"> • Initialization—Session initialization negotiation messages sent by an LSR to an LDP peer when the transport connection is established. • Keepalive—Keepalive timer messages sent by an LSR to an LDP peer to keep the session active when there is no information or PDU exchanged between them. • Notification—Notification messages (such as state of the LDP session) or error information (such as bad PDU length) sent by an LSR to an LDP peer. • Address—Message sent by an LSR to an LDP peer to advertise interface addresses. • Address withdraw—Message sent by an LSR to an LDP peer to withdraw a previously advertised interface address. • Label mapping—Message sent by an LSR to an LDP peer to advertise label mapping for a forwarding equivalence class (FEC). • Label request—Message sent by an LSR to an LDP peer to request a label mapping for an FEC. • Label withdraw—Message sent by an LSR to an LDP peer to withdraw a previously advertised FEC-label mapping. • Label release—Message sent by an LSR to an LDP peer to notify the peer that a specific FEC-label mapping has been released. • Label abort—Message sent by an LSR to an LDP peer to abort a label request message. • Total—Messages sent and received during the lifetime of the session. • Last 5 seconds—Messages sent and received during the current session. 	extensive

show ldp statistics

Syntax	show ldp statistics <instance <i>instance-name</i> > <logical-system (all <i>logical-system-name</i>)>
Release Information	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Display Label Distribution Protocol (LDP) statistics.
Options	<p>none—Display LDP statistics for all routing instances.</p> <p>instance <i>instance-name</i>—(Optional) Display information for the specified routing instance only.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear ldp statistics on page 2152
List of Sample Output	show ldp statistics on page 2195
Output Fields	Table 117 on page 2192 lists the output fields for the show ldp statistics command. Output fields are listed in the approximate order in which they appear.

Table 117: show ldp statistics Output Fields

Field Name	Field Description
Total Sent, Received	Total number of each message type sent and received.
Last 5 seconds Sent, Received	Number of each message type sent and received in the last 5 seconds.

Table 117: show ldp statistics Output Fields (continued)

Field Name	Field Description
Message type	<p>LDP message types:</p> <ul style="list-style-type: none"> • Hello—Messages that enable LDP nodes to discover one another and to detect the failure of a neighbor or of the link to the neighbor. • Initialization—Messages that indicate an LDP session has started. • Keepalive—Messages that ensure that the keepalive timeout is not exceeded. • Notification—Advisory information and signal error information. • Address—Messages with address information. • Address withdrawal—Messages regarding address withdrawal. • Label mapping—Messages with label mapping information. • Label request—Request for a label mapping from a neighboring router. • Label withdrawal—Withdrawal message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use. • Label release—Message sent by the downstream LSR to recall a label that it previously mapped. If an LSR that has received a label mapping subsequently determines that it no longer needs that label, it can send a label release message that frees the label for use. • Label abort—Messages about label interruptions. • All UDP—All hello messages sent by LSRs to the well-known UDP port, 646. • All TCP—All LDP session messages.

Table 117: show ldp statistics Output Fields (continued)

Field Name	Field Description
Event type	<p>LDP events and errors:</p> <ul style="list-style-type: none"> • Sessions opened—Number of LDP sessions that have been opened. • Sessions closed—Number of LDP sessions that have been closed. • Topology changes—Number of changes to the known LDP topology. • No interface—Number of missing interface address messages. When a new LDP session is initialized and before sending label lapping or label request messages, the LSR advertises its interface addresses with one or more address messages. • No session—Number of missing session messages. Session messages are used to establish, maintain, and terminate sessions between LDP peers. • No adjacency—The exchange of hello adjacency messages results in the creation of an adjacency. The LDP identifier, together with the sender's LDP identifier in the PDU header, enables the receiver to match the initialization message with one of its hello adjacencies. If there is no matching hello adjacency, the LSR sends a session the initialization message is rejected. • Unknown version—The LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment. • Malformed PDU—An LDP PDU received on a TCP connection for an LDP session is malformed if the LDP identifier in the PDU header is unknown to the receiver, or if it is known but is not the LDP identifier associated by the receiver with the LDP peer for this LDP session. An LDP PDU is considered to be malformed if the LDP protocol version is not supported by the receiver, or it is supported but is not the version negotiated for the session during session establishment. An LDP PDU is considered malformed if the PDU length field is too small (less than 14) or too large (greater than maximum PDU length). • Malformed message—Malformed LDP messages that are part of the LDP discovery mechanism are handled by silently discarding them. An LDP message is malformed if the message type is unknown. If the message type is less than 0x8000 (high order bit = 0), it is an error signaled by the unknown message type status code. An LDP message is considered to be malformed if the message length is too large, meaning that the message extends beyond the end of the containing LDP PDU. The LDP message is considered to be malformed if the message length is too small, meaning that it is smaller than the smallest possible value component. The LDP message is considered to be malformed if the message is missing one or more mandatory parameters. • Unknown message type—If the message type is less than 0x8000 (high order bit = 0) or greater than or equal to 0x8000 (high order bit = 1) it is considered to be an unknown message. • Inappropriate message—The message is not of the type that the receiver expects to receive. • Malformed TLV—The TLV Length is too large or the receiver cannot decode the TLV value. This can indicate an issue in either the sending or receiving LSR. • Bad TLV value—The TLV Length is too large. • Missing TLV—The TLV is missing one or more mandatory parameters. • PDU too large—The PDF is greater than the maximum PDU length. Section "Initialization Message" in RFC 5036 describes how the maximum PDU length for a session is determined.
Total	Total number of each event or error.
Last 5 seconds	Number of each event or error in the last 5 seconds.

Sample Output

show ldp statistics

show ldp traffic-statistics

Syntax	<pre>show ldp traffic-statistics <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <p2mp></pre>
Release Information	Command introduced before Junos OS Release 7.4. p2mp option added in Junos OS Release 11.2. Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Description	Display Label Distribution Protocol (LDP) traffic statistics.
<div> NOTE: If nonstop active routing features is configured, show ldp traffic-statistics command is not supported on backup Routing Engines.</div>	
Options	<p>none—Display LDP traffic statistics for all routing instances.</p> <p>instance <i>instance-name</i>—(Optional) Display LDP traffic statistics for the specified routing instance only.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>p2mp—(Optional) Display only the data traffic statistics for a point-to-multipoint LSP.</p>
Additional Information	To collect output from this command on a periodic basis, configure the traffic-statistics statement for the LDP protocol. For more information, see the <i>Junos MPLS Applications Configuration Guide</i> .

Output Fields Table 118 on page 2197 lists the output fields for the **show ldp traffic-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 118: show ldp traffic-statistics Output Fields

Field Name	Field Description
Message type	LDP message types.
FEC	Forwarding equivalence class (FEC) for which LDP traffic statistics are collected. For P2MP LSPs, FEC appears as a combination of root address and the LSP ID (root_addr:lsp_id). For M-LDP P2MP LSPs, FEC appears as a combination of root address multicast source address, and multicast group address (root_addr:lsp_id/grp,src).
Type	Type of traffic originating from a router, either Ingress (originating from this router) or Transit (forwarded through this router).
Packets	Number of packets passed by the FEC since its LSP came up.
Bytes	Number of bytes of data passed by the FEC since its LSP came up.
Shared	Whether a label is shared by prefixes: Yes or No . A Yes value indicates that several prefixes are bound to the same label (for example, when several prefixes are advertised with an egress policy). The LDP traffic statistics for this case apply to all the prefixes and should be treated as such.
Nexthop	The next hop address for P2MP LSPs. (This is the downstream LDP Session ID.)
Label	For multipoint LDP with multicast-only fast reroute (MoFRR), the multipoint LDP node selects two separate upstream peers and sends two separate labels, one to each upstream peer. The same algorithm described in RFC 6388 is used to select the primary upstream path. The backup upstream path selection again uses the same algorithm but excludes the primary upstream LSR as a candidate. Two streams of MPLS traffic are sent to the egress node from the two different upstream peers. The MPLS traffic from only one of the upstream neighbors is selected as the primary path to accept the traffic, and the other becomes the backup path. The traffic on the backup path is dropped. When the primary upstream path fails, the traffic from the backup path is then accepted. The multipoint LDP node selects the two upstream paths based on the interior gateway protocol (IGP) root node next hop. Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
Backup route	For multipoint LDP with MoFRR, the route that is used if the primary route becomes unavailable.

Sample Output

show ldp traffic-statistics

```
user@host> show ldp traffic-statistics
```

FEC	Type	Packets	Bytes	Shared
10.35.3.0/30	Transit	0	0	Yes

show security keychain

Syntax	show security keychain <brief detail>
Release Information	Command introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 12.3X50 for the QFX Series.
Description	Display information about authentication keychains configured for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, the Bidirectional Forwarding Detection (BFD) protocol, and the Intermediate System-to-Intermediate System (IS-IS) protocol.
Options	none —Display information about authentication keychains. brief detail —(Optional) Display the specified level of output.
Required Privilege Level	view
List of Sample Output	show security keychain brief on page 2202 show security keychain detail on page 2202
Output Fields	Table 119 on page 2200 describes the output fields for the show security keychain command. Output fields are listed in the approximate order in which they appear.

Table 119: show security keychain Output Fields

Field Name	Field Description	Level of Output
keychain	The name of the keychain in operation.	All levels
Active-ID Send	Number of routing protocols packets sent with the active key.	All levels
Active-ID Receive	Number of routing protocols packets received with the active key.	All levels
Next-ID Send	Number of routing protocols packets sent with the next key.	All levels
Next-ID Receive	Number of routing protocols packets received with the next key.	All levels
Transition	Amount of time until the current key will be replaced with the next key in the keychain.	All levels
Tolerance	Configured clock-skew tolerance, in seconds, for accepting keys for a key chain.	All levels
Id	Identification number configured for the current key.	detail
Algorithm	Authentication algorithm configured for the current key.	detail

Table 119: show security keychain Output Fields (continued)

Field Name	Field Description	Level of Output
State	<p>State of the current key.</p> <p>The value can be:</p> <ul style="list-style-type: none"> • receive • send • send-receive <p>For the active key, the State can be send-receive, send, or receive. For keys that have a future start time, the State is inactive. Compare the State field to the Mode field.</p>	detail
Option	<p>For IS-IS only, the option determines how Junos OS encodes the message authentication code in routing protocol packets.</p> <p>The values can be:</p> <ul style="list-style-type: none"> • basic—Based on RFC 5304. • isis-enhanced—Based on RFC 5310. <p>The default value is basic. When you configure the isis-enhanced option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.</p> <p>When you configure basic (or do not include the options statement in the key configuration) Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.</p> <p>Because this setting is for IS-IS only, the TCP and the BFD protocol ignore the encoding option configured in the key.</p>	detail
Start-time	Time that the current key became active.	detail
Mode	<p>Mode of each key (Informational only.)</p> <p>The value can be</p> <ul style="list-style-type: none"> • receive • send • send-receive <p>The mode of the key is based on the configuration. Suppose you configure two keys, one with a start-time of today and the other with a start-time of next week. For both keys, the Mode can be send-receive, send, or receive, regardless of the configured start-time. Compare the Mode field to the State field.</p>	detail

```

traceroute mpls ldp

Syntax `traceroute mpls <ldp> fec`
`<destination ip-address>`
`<detail>`
`<exp exp>`
`<fanout fanout-number>`
`<logical-system logical-system-name>`
`<no-resolve>`
`<paths maximum-paths>`
`<pipe-mode>`
`<retries retries-number>`
`<routing-instance routing-instance-name>`
`<source ip-address>`
`<ttl value>`
`<update>`
`<wait seconds>`

Release Information Command introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.3X50 for the QFX Series.

Description Trace route to a remote host for an MPLS label-switched path signaled by the LDP. Use **traceroute mpls ldp** as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

Options *fec*—Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

destination *ip-address*—(Optional) Specify the destination address to use when sending probes.
Values: The destination IP address must be within the 127.0.0.0/8 IP address space for Operation, Administration, and Maintenance (OAM) packets.

detail—(Optional) Display detailed output.

exp *exp*—(Optional) Specify the class-of-service to use when sending probes.
Range: 0 through 7
Default: 7

fanout *fanout-number*—(Optional) Specify the maximum number of nexthops to search per node.
Range: 1 through 16
Default: 16

logical-system—(Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

paths *maximum-paths*—(Optional) Specify the maximum number of paths to search.

Range: 1 through 255

Default: 16

pipe-mode—(Optional) Specify to trace only nodes that understand LDP FEC.

In an interoperation with other vendor devices or devices running Junos OS Release that do not support tracing of hierarchical LSPs as described in RFC 6424, continuous non-complaint probe status is displayed in the **traceroute mpls ldp** command output. To avoid this LDP loop creation, use the **pipe-mode** option with the **traceroute mpls ldp fec** command.

NOTE: Even after using the **traceroute mpls ldp fec pipe-mode** command, one or more intermediate transit nodes that do not understand LDP FEC can return non-complaint probe status in the command output.

retries *retries-number*—(Optional) Specify the number of times to resend probe values.

Range: 1 through 9

Default: 3

routing-instance *routing-instance-name*—(Optional) Specify the name of the routing instance for the traceroute attempt.

source *source-address*—(Optional) Specify the source address of the outgoing traceroute packets.

ttl *value*—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds.

Range: 1 through 125

Default: 64

update—(Optional) Update database contents with traceroute results.

wait *seconds*—(Optional) Specify the number of seconds to wait before resending a probe.

Range: 5 through 15

Default: 10

Required Privilege Level network

Output Fields [Table 98 on page 2087](#) describes the output fields for the **traceroute mpls ldp fec** command and the **traceroute mpls ldp fec detail** commands. Output fields are listed in the approximate order in which they appear.

Table 120: traceroute mpls ldp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the traceroute mpls ldp fec command.	all levels
ttl	Time to live value of the labeled packet.	none specified
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is LDP.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is null .	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	detail
Parent	Address of the previous hop. Parent value for the first hop is null .	detail
Return Code	Return code for reporting the result of processing the echo request by the receiver.	detail
Response time	Time for the echo request to reach the receiver.	detail
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none .	detail
Label Stack	Label stack used to forward the packet.	detail

CCC and TCC Operational Commands

- `show connections`
- `show route ccc`
- `show route forwarding-table`

show connections

List of Syntax [Syntax on page 2208](#)
 [Syntax \(EX Series Switches\) on page 2208](#)

Syntax show connections
 <brief | extensive>
 <all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch |
 remote-interface-switch>
 <down | up | up-down>
 <history>
 <labels>
 <logical-system (all | *logical-system-name*)>
 <*name*>
 <status>

Syntax (EX Series Switches) show connections
 <brief | extensive>
 <all | interface-switch | lsp-switch | p2mp-receive-switch | p2mp-transmit-switch |
 remote-interface-switch>
 <down | up | up-down>
 <history>
 <labels>
 <*name*>
 <status>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.5 for EX Series switches.

Description Display information about the configured circuit cross-connect (CCC) connections.

Options **none**—Display the standard level of output for all configured CCC connections.

all—(Optional) Display all connections.

brief | extensive—(Optional) Display the specified level of output. Use history to display information about connection history. Use labels to display labels used for transmit and receive LSPs. Use status to display information about the connection and interface status.

interface-switch—(Optional) Display interface switch connections only.

lsp-switch—(Optional) Display LSP switch connections only.

p2mp-receive-switch—(Optional) Display point-to-multipoint LSP to local interfaces switch connections only.

p2mp-transmit-switch—(Optional) Display local interface to point-to-multipoint LSP switch connections only.

remote-interface-switch—(Optional) Display remote interface switch connections only.

down | up | up-down—(Optional) Display nonoperational, operational, or both kinds of connections.

history—(Optional) Display information about connection history.

labels—(Optional) Display labels used for transmit and receive.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name—(Optional) Display information about the specified connection only.

status—(Optional) Display information about the connection and interface status.

Required Privilege Level view

Output Fields [Table 63 on page 1936](#) describes the output fields for the **show connections** command. Output fields are listed in the approximate order in which they appear.

Table 121: show connections Output Fields

Field Name	Field Description
CCC and TCC connections [Link Monitoring On Off]	Whether link monitoring is enabled: On or Off .
Legend for Status (St)	Connection or circuit status. See the output's legend for an explanation of the status field values.
Legend for connection types	Type of connection: <ul style="list-style-type: none"> • if-sw—Layer 2 switching cross-connect. • rmt-if—Remote interface switch. While graceful restart is in progress, rmt-if will display a state (St) of Restart. • lsp-sw—LSP stitching cross-connect. While graceful restart is in progress, lsp-sw will display a state (St) of Restart.
Legend for circuit types	Type of circuits: <ul style="list-style-type: none"> • intf—Interface circuit. • tlsp—Transmit LSP circuit. • rlsp—Receive LSP circuit.
Connection/Circuit	Name of the configured CCC connection.
Type	Type of connection.
St	State of the connection.
Time last up	Time that the connection or circuit last transitioned to the Up (operational) state.

Table 121: show connections Output Fields (continued)

Field Name	Field Description
# Up trans	Number of times that the connection or circuit has transitioned to the Up (operational) state.

Release Information Command introduced before Junos OS Release 7.4.
 Option **bridge-domain** introduced in Junos OS Release 7.5

Option **learning-vlan-id** introduced in Junos OS Release 8.4

Options **all** and **vlan** introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

NOTE: The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

Options **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

detail | extensive | summary—(Optional) Display the specified level of output.

all—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

bridge-domain (all | bridge-domain-name)—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

ccc interface-name—(Optional) Display route entries for the specified circuit cross-connect interface.

destination destination-prefix—(Optional) Destination prefix.

family family—(Optional) Display routing table entries for the specified family: **bridge** (**ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn**), **ethernet-switching**, **evpn**, **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mcsnoop-inet**, **mcsnoop-inet6**, **mpls**, **satellite-inet**, **satellite-inet6**, **satellite-vpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

interface-name interface-name—(Optional) Display routing table entries for the specified interface.

label name—(Optional) Display route entries for the specified label.

lcc number—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers,

display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

learning-vlan-id *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

matching *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

multicast—(Optional) Display routing table entries for multicast routes.

table —(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the **show route instance** command.

vlan (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

vpn *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege
Level**

Output Fields [Table 90 on page 2027](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

Table 122: show route forwarding-table Output Fields

Field Name	Field Description	Level of Output
Logical system	Name of the logical system. This field is displayed if you specify the table logical-system-name/routing-instance-name option on a device that is configured for and supports logical systems.	All levels
Routing table	Name of the routing table (for example, inet, inet6, mpls).	All levels

Table 122: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Enabled protocols	<p>The features and protocols that have been enabled for a given routing table. This field can contain the following values:</p> <ul style="list-style-type: none"> • BUM hashing—BUM hashing is enabled. • MAC Stats—Mac Statistics is enabled. • Bridging—Routing instance is a normal layer 2 bridge. • No VLAN—No VLANs are associated with the bridge domain. • All VLANs—The vlan-id all statement has been enabled for this bridge domain. • Single VLAN—Single VLAN ID is associated with the bridge domain. • MAC action drop—New MACs will be dropped when the MAC address limit is reached. • Dual VLAN—Dual VLAN tags are associated with the bridge domain • No local switching—No local switching is enabled for this routing instance.. • Learning disabled—Layer 2 learning is disabled for this routing instance. • MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached. • VPLS—The VPLS protocol is enabled. • No IRB I2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance. • ACKed by all peers—All peers have acknowledged this routing instance. • BUM Pruning—BUM pruning is enabled on the VPLS instance. • Def BD VXLAN—VXLAN is enabled for the default bridge domain. • EVPN—EVPN protocol is enabled for this routing instance. • Def BD OVSDb—Open vSwitch Database (OVSDb) is enabled on the default bridge domain. • Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain. • L2 backhaul—Layer 2 backhaul is enabled. • FRR optimize—Fast reroute optimization • MAC pinning—MAC pinning is enabled for this bridge domain. • MAC Aging Timer—The MAC table aging time is set per routing instance. • EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation. • PBBN—This routing instance is configured as a provider backbone bridged network. • PBN—This routing instance is configured as a provider bridge network. • ETREE—The ETREE protocol is enabled on this EVPN routing instance. • ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance. • Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain. • MPLS control word—Control word is enabled for this MPLS routing instance. 	All levels
Address family	Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).	All levels
Destination	Destination of the route.	detail extensive

Table 122: *show route forwarding-table* Output Fields (continued)

Field Name	Field Description	Level of Output
Route Type (Type)	<p>How the route was placed into the forwarding table. When the detail keyword is used, the route type might be abbreviated (as shown in parentheses):</p> <ul style="list-style-type: none"> • cloned (clon)—(TCP or multicast only) Cloned route. • destination (dest)—Remote addresses directly reachable through an interface. • destination down (iddn)—Destination route for which the interface is unreachable. • interface cloned (ifcl)—Cloned route for which the interface is unreachable. • route down (ifdn)—Interface route for which the interface is unreachable. • ignore (ignr)—Ignore this route. • interface (intf)—Installed as a result of configuring an interface. • permanent (perm)—Routes installed by the kernel when the routing table is initialized. • user—Routes installed by the routing protocol process or as a result of the configuration. 	All levels
Route Reference (RtRef)	Number of routes to reference.	detail extensive
Flags	<p>Route type flags:</p> <ul style="list-style-type: none"> • none—No flags are enabled. • accounting—Route has accounting enabled. • cached—Cache route. • incoming-iface interface-number—Check against incoming interface. • prefix load balance—Load balancing is enabled for this prefix. • rt nh decoupled—Route has been decoupled from the next hop to the destination. • sent to PFE—Route has been sent to the Packet Forwarding Engine. • static—Static route. 	extensive
Next hop	IP address of the next hop to the destination.	detail extensive

Table 122: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Next hop Type (Type)	<p>Next-hop type. When the detail keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> • broadcast (bcst)—Broadcast. • deny—Deny. • discard (dscd) —Discard. • hold—Next hop is waiting to be resolved into a unicast or multicast type. • indexed (idxd)—Indexed next hop. • indirect (indr)—Indirect next hop. • local (locl)—Local address on an interface. • routed multicast (mcrst)—Regular multicast next hop. • multicast (mcst)—Wire multicast next hop (limited to the LAN). • multicast discard (mdsc)—Multicast discard. • multicast group (mgrp)—Multicast group member. • receive (rcv)—Receive. • reject (rjct)—Discard. An ICMP unreachable message was sent. • resolve (rslv)—Resolving the next hop. • unicast (ucst)—Unicast. • unilist (ulst)—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. 	detail extensive
Index	Software index of the next hop that is used to route the traffic for a given prefix.	detail extensive none
Route interface-index	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	extensive
Reference (NhRef)	Number of routes that refer to this next hop.	detail extensive none
Next-hop interface (Netif)	Interface used to reach the next hop.	detail extensive none
Weight	Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the Balance field description).	extensive
Balance	Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.	extensive
RPF interface	List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when rpf-check is configured on the interface.	extensive

show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```

so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;
      address 192.0.2.2/30;
    }
  }
}

user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
Destination: 192.0.2.3/32

```

```

Route type: destination
Route reference: 0
Flags: sent to PFE
Nexthop: 192.0.2.3
Next-hop type: broadcast
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0
Route interface-index: 67
Index: 328      Reference: 1

```

show route forwarding-table (dynamic list next hop)

The **show route forwarding table** output shows the two next hop elements for a multihomed EVPN destination.

```

user@host> show route forwarding-table label 299952 extensive

CHAPTER 44

PCEP Operational Commands

- `clear path-computation-client statistics`
- `request path-computation-client active-pce`
- `show path-computation-client active-pce`
- `show path-computation-client lsp`
- `show path-computation-client statistics`
- `show spring-traffic-engineering`

clear path-computation-client statistics

Syntax	<code>clear path-computation-client statistics</code> <code><pce-id all></code>
Release Information	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 16.1R3 for QFX Series switches. Command introduced in Junos OS Release 17.1R1 for ACX Series routers.
Description	Clear Path Computation Element (PCE) statistics.
Options	pce-id —(Optional) Clear statistics of the specified PCE. all —(Optional) Clear statistics of all available PCEs configured on the path computation client (PCC).
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show path-computation-client statistics on page 2240
List of Sample Output	clear path-computation-client statistics pce-id on page 2232 clear path-computation-client statistics all on page 2232
Output Fields	When you enter this command, you are not provided feedback on the status of your request.

Sample Output

clear path-computation-client statistics pce-id

```
user@host> clear path-computation-client statistics pce1
```

clear path-computation-client statistics all

```
user@host> clear path-computation-client statistics all
```

request path-computation-client active-pce

Syntax	request path-computation-client active-pce <i>pce-id</i>
Release Information	Command introduced in Junos OS Release 12.3. Command introduced in Junos OS Release 16.1R3 for QFX Series switches. Command introduced in Junos OS Release 17.1R1 for ACX Series routers.
Description	Request a new active Path Computation Element (PCE).
Options	<i>pce-id</i> —Unique user defined ID for this PCE.
Required Privilege Level	request
Related Documentation	<ul style="list-style-type: none">• show path-computation-client active-pce on page 2234
List of Sample Output	request path-computation-client active-pce pce-id on page 2233

Sample Output

request path-computation-client active-pce pce-id

```
user@host> request path-computation-client active-pce pce1
```

show path-computation-client active-pce

Syntax	<code>show path-computation-client active-pce</code> <code><brief detail></code>
Release Information	Command introduced in Junos OS Release 12.3. Command introduced in Junos OS Release 16.1R3 for QFX Series switches. Command introduced in Junos OS Release 17.1R1 for ACX Series routers.
Description	Displays information about the current active Path Computation Element (PCE).
Options	none —Display brief information about the current active PCE. brief detail —(Optional) Display the specific level of output.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> request path-computation-client active-pce on page 2233
List of Sample Output	show path-computation-client active-pce on page 2236 show path-computation-client active-pce detail on page 2237
Output Fields	Table 123 on page 2234 describes the output fields for the show path-computation-client active-pce command. Output fields are listed in the approximate order in which they appear.

Table 123: show path-computation-client active-pce Output Fields

Field Name	Field Description	Level of Output
IP address	IP address of the current active PCE.	All levels
Priority	Active PCE priority.	All levels
PCE status	Active PCE state: <ul style="list-style-type: none"> PCE_STATE_NEW—Initial PCEP session state. PCE_STATE_RECONNECT—Trying to re-establish TCP connection with the PCEP peer. PCE_STATE_CONNECTING—Establishing TCP connection with the PCEP peer. PCE_STATE_CONNECTED—TCP connection established with the PCEP peer. PCE_STATE_SYNC—Open messages exchanged with the PCEP peer and entering SYNC state. PCE_STATE_UP—PCEP session established. 	All levels

Table 123: show path-computation-client active-pce Output Fields (continued)

Field Name	Field Description	Level of Output
Session type	Active PCE type: <ul style="list-style-type: none"> PCE_TYPE_STATELESS—Does not learn LSP state information from PCC. PCE_TYPE_STATEFUL—Uses LSP state information learned from PCCs to optimize path computations, but does not actively update LSP state. A PCC maintains synchronization with the PCE. PCE_TYPE_STATEFULACTIVE—Uses LSP state information learned from PCCs to optimize path computations, and actively updates LSP parameters in those PCCs that delegate control of their LSPs to the PCE. 	All levels
PCE-mastership	PCE mastership state: <ul style="list-style-type: none"> main—Current active PCE. backup—Backup PCE. 	All levels
PCRpts	Number of PC report (PCRpt) messages sent by PCC to a stateful PCE to report current state of LSP(s).	All levels
PCUpdates	Number of PC update (PCUpd) messages sent by a PCE to a PCC to update LSP parameters.	All levels
Local Keepalive timer	Keepalive timer used by or for the PCC.	All levels
Local Dead timer	Dead timer used by or for the PCC.	All levels
Remote Keepalive timer	Keepalive timer used by or for the PCE.	All levels
Remote Dead timer	Dead timer used by or for the PCE.	All levels
PCErr-recv	Information about type, value, and number of PC Error messages received.	All levels
Max unknown messages	Maximum number of unknown messages received for a PCEP session. Recommended value is 5. If the number of unknown messages received by a PCC or PCE is greater than or equal to the maximum number, the PCEP session is closed.	detail
Keepalives received	Number of Keepalive messages received by a PCC from a PCE.	detail
Keepalives sent	Number of Keepalive messages sent by a PCC to a PCE.	detail
Dead timer	Dead timer used by the current active PCE.	detail
Elapsed as main current	Time (in seconds) the PCE is in the main mastership state.	detail
Elapsed as main total	Time (in seconds) the PCE became main from the last PCCD restart.	detail

Table 123: show path-computation-client active-pce Output Fields (continued)

Field Name	Field Description	Level of Output
Unknown msgs/min rate	Number of unknown messages received per minute.	detail
Session failures	Number of PCEP session failures with the PCE.	detail
Delegation timeout in	Time (in seconds) left for LSP delegation to timeout.	detail
Delegation failures	Number of LSP delegation failures.	detail
Connection down	Time (in seconds) since the PCEP session is down.	detail
PCErr-sent	Information about type, value, and number of PC Error messages sent.	All levels

show path-computation-client lsp

Syntax `show path-computation-client lsp`

Release Information Command introduced in Junos OS Release 17.2R1 on MX Series routers.

Description Display the state of label-switched paths (LSPs) known to the Path Computation Client (PCC).

Required Privilege Level view
