Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 in EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.

NOTE: On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

Default Flow control is enabled.

NOTE: Flow control is enabled by default only on physical interfaces and it is disabled by default on aggregated Ethernet interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

fnp

Syntax

```
fnp {
  interval <100ms | 1s | 10s | 1m | 10m>;;
  loss-threshold number
  interface interface name {
    domain-id domain-id
  }
}
```

Hierarchy Level [edit protocols oam ethernet]

Release Information Command introduced in Junos OS Release 11.4.

Description On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet failure notification protocol.

Options

interval ***number***—Specifies the time between the transmission of FNP messages.

loss-threshold ***number***—FNP messages that can be lost before the FNP message is considered aged out and flushed.

interface ***interface-name***—Name of the Ethernet interface.

domain-id ***number***—Domain ID of the access network.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

forwarding-class (Gigabit Ethernet IQ Classifier)

Syntax

```
forwarding-class class-name {
  loss-priority (high | low);
}
```

Hierarchy Level

[edit interfaces *interface-name* gigether-options ethernet-switch-profile ethernet-policer-profile output-priority-map classifier premium]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For Gigabit Ethernet IQ interfaces only, define forwarding class name and option values.

Options

class-name—Name of forwarding class.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

frame-error

Syntax frame-error *count*;

Hierarchy Level [edit protocols oam ethernet link-fault-management action-profile event link-event-rate],
[edit protocols oam link-fault-management interface *interface-name* event-thresholds]

Release Information Statement introduced in Junos OS Release 8.4.

Description Threshold for sending frame error events or taking the action specified in the action profile.

A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.

The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.

Options *count*—Threshold count for frame error events.

Range: 0 through 100

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Threshold Values for Local Fault Events on an Interface on page 694
- Configuring Threshold Values for Fault Events in an Action Profile on page 703

frame-period

Syntax frame-period *count*;

Hierarchy Level [edit protocols oam ethernet link-fault-management action-profile event link-event-rate],
[edit protocols oam link-fault-management interface *interface-name* event-thresholds]

Release Information Statement introduced in Junos OS Release 8.4.

Description Threshold for sending frame period error events or taking the action specified in the action profile.

A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

Options ***count***—Threshold count for frame period error events.

Range: 0 through 100

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Threshold Values for Local Fault Events on an Interface on page 694
- Configuring Threshold Values for Fault Events in an Action Profile on page 703

frame-period-summary

Syntax frame-period-summary *count*;

Hierarchy Level [edit protocols oam ethernet link-fault-management action-profile event link-event-rate], [edit protocols oam link-fault-management interface *interface-name* event-thresholds]

Release Information Statement introduced in Junos OS Release 8.4.

Description Threshold for sending frame period summary error events or taking the action specified in the action profile.

An errored frame second is any 1-second period that has at least one errored frame. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period window. The default window is 60 seconds. The window is not configurable.

Options *count*—Threshold count for frame period summary error events.

Range: 0 through 100

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Threshold Values for Local Fault Events on an Interface on page 694
- Configuring Threshold Values for Fault Events in an Action Profile on page 703

framing (10-Gigabit Ethernet Interfaces)

Syntax framing (lan-phy | wan-phy);

Hierarchy Level [edit interfaces xe-*fpc/pic/port*]

[edit interfaces et-*fpc/pic/port*] (PTX Series Packet Transport Routers and MX Series Routers)

Release Information Statement introduced in Junos OS Release 8.0.
Statement introduced in Junos OS Release 12.3R2 for PTX Series Packet Transport Routers.

Description For routers supporting the 10-Gigabit Ethernet interface, configure the framing format. WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600,T4000, and PTX Series Packet Transport Routers routers only.

NOTE:

- The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).
- On PTX Series routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ .
- When the PHY mode changes, interface traffic is disrupted because of port reinitialization.

Default Operates in LAN PHY mode.

Options **lan-phy**—10GBASE-R interface framing format that bypasses the WIS sublayer to directly stream block-encoded Ethernet frames on a 10-Gigabit Ethernet serial interface.

wan-phy—10GBASE-W interface framing format that allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and SONET devices.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

- **no-gratuitous-arp-request on page 1274**

guest-vlan (MX Series in Enhanced LAN Mode)

Syntax guest-vlan (*vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Specify the VLAN to which an interface is moved when no 802.1X supplicants are connected on the interface. The VLAN specified must already exist on the switch.

Default None

Options ***vlan-id***—VLAN tag identifier of the guest VLAN.

vlan-name—Name of the guest VLAN.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

guard-interval

Syntax guard-interval *number*;

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name*]

Release Information Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

Description When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL link receives notification, restores the link, and waits for the restore interval before issuing another block on the same link. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.

Options *number*—Guard timer interval, in milliseconds.

Range: 10 through 2000 ms

Default: 500 ms

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

hold-interval (Protection Group)

Syntax hold-interval *number*;

Hierarchy Level [edit protocols protection-group ethernet-ring *name*]

Release Information Statement introduced in Junos OS Release 9.4.

Description Specify the hold-off timer interval *for all rings* in 100 millisecond (ms) increments.

Options *number*—Hold-timer interval, in milliseconds.

Range: 0 through 10,000 ms

Default: 100 ms

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Ethernet Ring Protection Switching Overview on page 221
- *Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS*

hold-multiplier

Syntax hold-multiplier *number*;

Hierarchy Level [edit protocols lldp],
[edit routing-instances *routing-instance-name* protocols lldp]

Release Information Statement introduced in Junos OS Release 9.6.

Description Configure a value for the LLDP hold multiplier.

Hold timer interval in seconds to cache learned LLDP information before discarding.

Options *number*—Advertisement interval multiplier for LLDP cache discard.

Default: 4 (giving 120 second LLDP cache lifetime with other defaults)

Range: 2 through 10

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring LLDP on page 338

hold-time up

Syntax hold-time up *timer-value*;

Hierarchy Level [edit interfaces ae*x* aggregated-ether-options lacp],

Release Information Statement introduced in Junos OS Release 14.2R3.

Description Specifies the time period for which the Link Aggregation Control Protocol (LACP) maintains the state of a child (member) link as expired or default.

When a child link goes from the current state to the expired state, the LACP monitors the reception of protocol data units (PDUs) on the child link for the configured hold-up time interval and does not allow the child link to transition back to the current state. This configuration thus prevents excessive flapping of a child link on an aggregated Ethernet interface.

The configured hold-up timer value is applicable to all the child links within a link aggregated (LAG) interface. By default, this feature is disabled.

Options ***timer-value***—Hold-up interval in seconds.

Range: 1 to 6000 seconds

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

    liveness-detection;
  }
}
```

Hierarchy Level

[edit protocols iccp]
[edit logical-systems *logical-system-name* protocols iccp]

Release Information

Statement introduced in Junos OS Release 10.0.
Support for logical systems introduced in Junos OS Release 14.1.

Description

Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

Default

If you do not include this statement, no ICCP protocol tracing operations are performed.

Options

traceoptions—Set Interchassis Control Protocol (ICCP) tracing options.

local-ip-address—Specify the source address where the ICCP packet is routed.

session-establishment-hold-time—Specify if the chassis takes over as the master at the ICCP session.

authentication-key —Specify TCP Message Digest 5 (MD5) option for an ICCP TCP session.

peer ip-address—Specify the IP address of the peer that hosts an MC-LAG. You must configure ICCP for both peers that host the MC-LAG.

redundancy-group-id-list—Specify the redundancy groups between two ICCP peers.

liveness-detection—Specify Bidirectional Forwarding Detection (BFD) protocol options.

Required Privilege Level
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

Release Information

Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 18.1R1 for SRX1500 devices.
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement introduced in Junos OS Release 13.2 for the QFX Series.

Description

Configure IGMP snooping to constrain multicast traffic to only the ports that have receivers attached. IGMP snooping enables the device to selectively send out multicast packets on only the ports that need them. Without IGMP snooping, the device floods the packets on every port. The device listens for the exchange of IGMP messages by the device and the end hosts. In this way, the device builds an IGMP snooping table that has a list of all the ports that have requested a particular multicast group. The factory default configuration enables IGMP snooping on all VLANs.

NOTE: IGMP snooping must be disabled on the device before enabling ISSU.

Default IGMP snooping is disabled on the device.

Options The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

ignore-l3-incompletes

Syntax ignore-l3-incompletes;

Hierarchy Level [edit interfaces *interface-name* fastether-options],
[edit interfaces *interface-name* gigether-options]

Release Information Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description Ignore the counting of Layer 3 incomplete errors on Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Ignoring Layer 3 Incomplete Errors on page 19

include-sci (MACsec for MX Series)

Syntax include-sci;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name*]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specifies that the SCI tag should be appended to each packet on a link that has enabled MACsec.

SCI tags are automatically appended to packets leaving a MACsec-enabled interface on an MX240, MX480, or MX960 router. This option is, therefore, redundant to be configured.

This option is used only when connecting a router to a host device that requires SCI tagging. SCI tags are eight octets long, so appending an SCI tag to all traffic on the link adds a significant amount of unneeded overhead.

Default SCI tagging is enabled on MX Series routers that have enabled MACsec using static connectivity association key (CAK) security mode, by default.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- *Configuring Media Access Control Security (MACsec) on MX Series Routers*

ingress-policer-overhead

Syntax ingress-policer-overhead *bytes*;

Hierarchy Level [edit chassis fpc *slot-number* pic *pic-number*]

Release Information Statement introduced before Junos OS Release 11.1.
Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.

Description Add the configured number of bytes to the length of a packet entering the interface.

Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.

Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.

You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-avalability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.

NOTE: vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

NOTE: vSRX only supports fpc 0 pic 0. When you commit the ingress-policer-overhead statement, the vSRX takes the PIC offline and then back online.

You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

Options ***bytes***—Number of bytes added to a frame entering an interface.

Range: 0–255 bytes

Default: 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

inner-tag-protocol-id

Syntax inner-tag-protocol-id *tpid*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* output-vlan-map]

Release Information Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Configure the IEEE 802.1Q TPID value to rewrite for the inner tag.

All TPIDs you include in input and output VLAN maps must be among those you specify at the **[edit interfaces *interface-name* gigether-options** ethernet-switch-profile tag-protocol-id **[*tpids*]]** hierarchy level.

On MX Series routers, you can use this statement for Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, and for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs.

Default If the **inner-tag-protocol-id** statement is not configured, the TPID value is 0x8100.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

inner-vlan-id

Syntax inner-vlan-id *number*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* output-vlan-map]

Release Information Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description For Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, and for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers or 100-Gigabit Ethernet Type 5 PIC with CFP, or on Ethernet interfaces on EX Series switches, specify the VLAN ID to rewrite for the inner tag of the final packet.

You cannot include the **inner-vlan-id** statement with the **swap** statement, **swap-push** statement, **push-push** statement, or **push-swap** statement and the **inner-vlan-id** statement at the **[edit interfaces *interface-name* unit *logical-unit-number*output-vlan-map]** hierarchy level. If you include any of those statements in the output VLAN map, the VLAN ID in the outgoing frame is rewritten to the **inner-vlan-id** statement you include at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level.

Options *number*—VLAN ID number.

Range: 0 through 4094

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Inner and Outer TPIDs and VLAN IDs on page 566

input-policer

Syntax input-policer *policer-name*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* layer2-policer]
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* layer2-policer]

Release Information Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Apply a single-rate two-color policer to the Layer 2 input traffic at the logical interface. The **input-policer** and **input-three-color** statements are mutually exclusive.

Options *policer-name*—Name of the single-rate two-color policer that you define at the **[edit firewall]** hierarchy level.

Usage Guidelines See *Applying Layer 2 Policers to Gigabit Ethernet Interfaces*.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

input-vlan-map (Aggregated Ethernet)

Syntax

```
input-vlan-map {
  (pop | push | swap);
  tag-protocol-id tpid;
  vlan-id number;
}
```

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information

Statement introduced in Junos OS Release 8.2.
Starting in Junos OS Release 17.3R1, input-vlan-map for outer vlan is supported for L2 circuit over aggregated Ethernet interfaces for QFX10000 Series switches.

Description

Define the rewrite profile to be applied to incoming frames on this logical interface. On MX Series routers, this statement only applies to aggregated Ethernet inferfaces using Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E interfaces and 100-Gigabit Ethernet Type 5 PIC with CFP.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

input-vlan-map

Syntax

```
input-vlan-map {
  (pop | pop-pop | pop-swap | push | push-push | swap | swap-push | swap-swap);
  inner-tag-protocol-id tpid;
  inner-vlan-id number;
  tag-protocol-id tpid;
  vlan-id number;
}
```

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information

Statement introduced before Junos OS Release 7.4.
pop-pop, **pop-swap**, **push-push**, **swap-push**, and **swap-swap** statements introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

Description

For Gigabit Ethernet IQ, 10-Gigabit Ethernet SFPP interfaces, 100-Gigabit Ethernet Type 5 PIC with CFP only as well as Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces, define the rewrite profile to be applied to incoming frames on this logical interface.

The remaining statements are explained separately. See CLI Explorer.

NOTE: Connectivity fault management (CFM) sessions for all interfaces in which **input-vlan-map** is configured are supported only if the interface also has an explicit configuration for **output-vlan-map** as **output-vlan-map pop;**. See output-vlan-map. This configuration is required for all the interfaces in the topology even when the CFM session is on that interface or on a different interface in the data path of the same topology.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

interface

Syntax

```
interface (all | interface-name) {
  disable;
}
```

Hierarchy Level

[edit protocols lldp],
[edit routing-instances *routing-instance-name* protocols lldp]

Release Information

Statement introduced in Junos OS Release 9.6.

Description

Specify an LLDP interface.

Options

interface-name—A valid physical interface name.

NOTE: On MX Series and T Series routers, you run LLDP on a physical interface, such as ge-1/0/0, and not at the logical interface (unit) level.

Starting with Junos OS Release 14.2, you can also specify LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports* .

all—Run LLDP on all interfaces.

disable—Disable LLDP on the specified interface

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

interface (IEEE 802.1x)

Syntax

```
interface interface-id {
  maximum-requests integer;
  quiet-period seconds;
  reauthentication (disable | interval seconds);
  retries integer;
  server-timeout seconds;
  supplicant (single);
  supplicant-timeout seconds;
  transmit-period seconds;
}
```

Hierarchy Level [edit protocols dot1x authenticator]

Release Information Statement introduced in Junos OS Release 9.3.

Description Use this statement to configure the 802.1x Port-Based Network Access Control protocol-specific Ethernet interface options.

Default The default values are provided for the options below on the respective statement pages.

Options

maximum-requests—Specify the maximum number of retransmission times for an EAPOL Request packet to the client before it times out the authentication session.

quiet-period—Specify the number of seconds the port remains in the wait state following a failed authentication exchange with the client, before reattempting the authentication.

reauthentication—Includes two options:

- **disable**—Periodic reauthentication of the client is disabled.
- **interval**—Specify the periodic reauthentication time interval.

retries—Specify the number of tries after which the port remains in the wait state for **quiet-period** seconds before reattempting the authentication.

server-timeout—Specify the number of seconds the port waits for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.

supplicant (*single*)—Specify supplicant single mode. See the usage guidelines to configure other modes.

supplicant-timeout—Specify the number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.

transmit-period—Specify the number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

interfaces (MACsec for MX Series)

Syntax

```
interfaces interface-name {
   connectivity-association connectivity-association-name;
}
```

Hierarchy Level [edit security macsec]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Applies the specified connectivity association to the specified interface to enable MACsec.

One connectivity association can be applied to multiple interfaces.

You must always use this statement to apply a connectivity association to an interface to enable MACsec. You must complete this configuration step regardless of whether MACsec is enabled using static connectivity association key (CAK) security mode or static secure association key (SAK) security mode.

If you are enabling MACsec using static SAK security mode and need to configure MACsec on inbound and outbound traffic on the same interface, you must configure a connectivity association with one secure channel for inbound traffic and a second secure channel for outbound traffic. The connectivity association is then applied to the interface using this statement to enable MACsec for traffic entering and leaving the interface.

NOTE: Starting in Junos OS Release 16.1R2, when Media Access Control Security (MACsec) is enabled on an interface, the interface flow control capability is enabled by default, regardless of the configuration that you set using the **(flow-control | no-flow-control)** statement at the **[edit interfaces *interface- name* gigether-options]** hierarchy level. When MACsec is disabled, interface flow control is restored to the configuration that you set using the **flow-control** statement at the **[edit interfaces]** hierarchy level. When MACsec is enabled, additional header bytes are added to the packet by the MACsec PHY. With line rate traffic, when MACsec is enabled and flow control is disabled, the pause frames sent by the MACsec PHY are terminated by the MIC's MAC (enhanced 20-port Gigabit Ethernet MICs on MX Series routers) and not transferred to the Packet Forwarding Engine, causing framing errors. Therefore, when MACsec is enabled on an interface, flow control is also automatically enabled on such an interface.

Default Interfaces are not associated with any connectivity associations, by default.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

isolated-vlan (MX Series)

Syntax isolated-vlan *vlan-id*;

Hierarchy Level [edit bridge-domains *bridge-domain-name*],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* bridge-domains *bridge-domain-name* bridge-options],
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* bridge-domains *bridge-domain-name* ,
[edit routing-instances *routing-instance-name* bridge-domains *bridge-domain-name*],

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers.

Description Configure the specified isolated VLAN to be a secondary VLAN of the specified primary VLAN. An isolated VLAN receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN.

NOTE: When you specify this configuration statement, the VLAN ID of a logical interface that you associate with a bridge domain that matches with the VLAN ID that you specify using the **isolated-vlan** state is treated as an isolated port.

Options *vlan-id*—Individual VLAN IDs separated by a space.

Required Privilege Level system—To view this statement in the configuration.
system–control—To add this statement to the configuration.

Related Documentation

key (MACsec for MX Series)

Syntax key *key-string*;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name* secure-channel *secure-channel-name* security-association *security-association-number*]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specifies the static security key to exchange to enable MACsec using static secure association key (SAK) security mode.

The key string is a 32-digit hexadecimal number. The key string and the security association must match on both sides of an Ethernet connection to secure traffic using MACsec when enabling MACsec using SAK security mode.

You must configure at least two security associations with unique security association numbers and key strings to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.

Default This statement does not have a default value.

Options ***key-string***—Specifies the key to exchange with the other end of the link on the secure channel. The *key-string* is a 32-digit hexadecimal string that is created by the user.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

key-server-priority (MACsec for MX Series)

Syntax key-server-priority *priority-number*;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name* mka]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specifies the key server priority used by the MACsec Key Agreement (MKA) protocol to select the key server when MACsec is enabled using static connectivity association key (CAK) security mode.

The switch with the lower *priority-number* is selected as the key server.

If the *priority-number* is identical on both sides of a point-to-point link, the MKA protocol selects the device with the lower MAC address as the key server.

Default The default key server priority number is 16.

Options ***priority-number***—Specifies the MKA server election priority number.

The *priority-number* can be any number between 0 and 255. The lower the number, the higher the priority.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

lacp (802.3ad)

Syntax

```
lacp {
  port-priority port-priority;
}
```

Hierarchy Level

[edit interfaces *interface-name* fastether-options 802.3ad],
[edit interfaces *interface-name* gigether-options 802.3ad]

Release Information

Statement introduced in Junos OS Release 9.3.

Description

Configure the Link Aggregation Control Protocol (LACP) port priority for Ethernet interfaces.

Options

port-priority—Priority for being elected as the active port to collect and distribute traffic. A smaller value indicates a higher priority for selection.

Range: 0 through 65,535

Default: 127

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit interfaces ae*x* aggregated-ether-options]
[edit logical-systems *logical-system-name* interfaces ae*X* aggregated-ether-options]

Hierarchy Level (NFX Series)

[edit interfaces *interface-name*aggregated-ether-options]

Release Information

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.

For EX Series, when you configure the **accept-data** statement at the **[edit interfaces ae*X* aggregated-ether-options lacp]** hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.

NOTE: When you configure the **accept-data** statement at the **[edit interfaces ae*X* aggregated-ether-options lacp]** hierarchy level, this behavior occurs:

- By default, the **accept-data** statement is not configured when LACP is enabled.
- You can configure the **accept-data** statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the **accept-data** statement is configured.

NOTE: The force-up statement is not supported on QFX10002 switches.

Default If you do not specify LACP as either **active** or **passive**, LACP remains passive.

Options **active**—Initiate transmission of LACP packets.

admin-key ***number***—Specify an administrative key for the router or switch.

NOTE: You must also configure multichassis link aggregation (MC-LAG) when you configure the **admin-key**.

fast-failover—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

passive—Respond to LACP packets.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

layer2-policer

Syntax

```
layer2-policer {
  input-policer policer-name;
  input-three-color policer-name;
  output-policer policer-name;
  output-three-color policer-name;
}
```

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*],

Release Information

Statement introduced in Junos OS Release 8.2.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

For 1-Gigabit Ethernet and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces on M Series, MX Series, and T Series routers, and for aggregated Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces on EX Series switches, apply Layer 2 logical interface policers. The following policers are supported:

- Two-color
- Single-rate tricolor marking (srTCM)
- Two-rate tricolor marking (trTCM)

Two-color and tricolor policers are configured at the **[edit firewall]** hierarchy level.

Options

input-policer ***policer-name***—Two-color input policer to associate with the interface. This statement is mutually exclusive with the **input-three-color** statement.

input-three-color ***policer-name***—Tricolor input policer to associate with the interface. This statement is mutually exclusive with the **input-policer** statement.

output-policer ***policer-name***—Two-color output policer to associate with the interface. This statement is mutually exclusive with the **output-three-color** statement.

output-three-color ***policer-name***—Tricolor output policer to associate with the interface. This statement is mutually exclusive with the **output-policer** statement.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

link-adjacency-loss

Syntax link-adjacency-loss;

Hierarchy Level [edit protocols oam ethernet link-fault-management action-profile event]

Release Information Statement introduced in Junos OS Release 8.5.

Description Loss of adjacency with IEEE 802.3ah link-fault management peer event. When included, the loss-of-adjacency event triggers the action specified under the **action** statement.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Monitoring the Loss of Link Adjacency on page 701

link-discovery

Syntax link-discovery (active | passive);

Hierarchy Level [edit protocols oam ethernet link-fault-management interface *interface-name*]

Release Information Statement introduced in Junos OS Release 8.2.

Description For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs.

Options **(active | passive)**—Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Link Discovery on page 692

link-degrade-monitor

Syntax

```
link-degrade-monitor {
  actions media-based;
  recovery {
    (auto | manual);
    timer timer;
  }
  thresholds {
    clear clear-value;
    interval interval-value;
    set set-value;
    warning-clear warning-clear-value;
    warning-set warning-set-value;
  }
}
```

Hierarchy Level [edit interfaces *interfaces- name*]

Release Information Statement introduced in Junos OS Release 15.1.

Description Configure link degrade monitoring on an interface and specify the corrective action to be triggered when a link degrade event is detected. Deleting the configuration disables the feature. When configured, the feature monitors the quality of physical links on Ethernet interfaces (10-Gigabit, 40-Gigabit, and 100-Gigabit) and triggers the user-configured action when the link's bit error rate (BER) value breaches the preconfigured threshold. This feature can detect a BER value as low as 10^{-13} to 10^{-5}.

Options **actions media based**—Action to be taken when a link degrade event is detected. A media-based action brings down the physical link at both local and remote ends of the interface, and stops BER monitoring at the local end until an autorecovery is triggered.

The remaining statements are described separately.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

link-mode

Syntax link-mode *mode* (automatic | full-duplex | half-duplex);

Hierarchy Level [edit interfaces *interface-name*],
[edit interfaces *interface-name* ether-options],
[edit interfaces ge-*pim*/0/0 switch-options switch-port *port-number*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description Set the device's link connection characteristic.

Options *mode*—Link characteristics:

- **automatic**—Link mode is negotiated. This is the default for EX Series switches.
- **full-duplex**—Connection is full duplex.
- **half-duplex**—Connection is half duplex.

Default: Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode. The router's or switch's management Ethernet interface, **fxp0** or **em0**, and the built-in Fast Ethernet interfaces on the FIC (M7i router) autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.

NOTE: On EX Series switches, if **no-auto-negotiation** is specified in **[edit interfaces *interface-name* ether-options]**, you can select only **full-duplex** or **half-duplex**. If **auto-negotiation** is specified, you can select any mode.

NOTE:

- Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.
- Starting with Junos OS release 17.4R1 and later, the **link-mode** configuration is not supported for 10-Gigabit Ethernet interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

link-protection

Syntax

```
link–protection {
  disable;
  (revertive |non-revertive);
}
```

Hierarchy Level

[edit interfaces ae*x* aggregated-ether-options]
[edit interfaces ae*x* aggregated-ether-options *lacp*]

Release Information

Statement introduced in Junos OS Release 8.3.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.
Support for **disable**, **revertive**, and **non-revertive** statements added in Junos OS Release 9.3.

Description

On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the **primary** and **backup** statements at the **[edit interfaces ge-*fpc/pic/port* gigether-options 802.3ad ae*x*]** hierarchy level or the **[edit interfaces fe-*fpc/pic/port* fastether-options 802.3ad ae*x*]** hierarchy level.

On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.

For Junos OS link protection, specify **link-protection** at the following hierarchy levels:

- **[edit interfaces ge-*fpc/pic/port* ether-options 802.3ad ae*x*]**
- **[edit interfaces xe-*fpc/pic/port* ether-options 802.3ad ae*x*]** hierarchy level or at the **[edit interfaces xe-*fpc/pic/port* ether-options 802.3ad ae*x*]** hierarchy level.

  To disable link protection, use the **delete interface ae aggregate-ether-options link-protection** statement at the **[edit interfaces ae*x* aggregated-ether-options]** hierarchy level or the **[edit interfaces ae*x* aggregated-ether-options *lacp*]]** hierarchy level.

Options

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Aggregated Ethernet Link Protection on page 148
- *Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches*

link-protection (non-LACP)

Syntax

```
link–protection {
  link-protection-revertive;
}
```

Hierarchy Level [edit interfaces ae*x* aggregated-ether-options]

Release Information Statement introduced in Junos OS Release 17.3R1.

Description User can specify the *link-protection-revertive* statement in the link protection configuration at the aggregated Ethernet interface level to set revertive mode. In revertive mode, adding a higher-priority link to the aggregated Ethernet bundle results in recalculation of the priorities and traffic will switch from the currently active link to the newly added, higher-priority link. Recalculation of priorities is performed only while link event such as addition\deletion and UP/Down operation on link, that is, configuration of this option will not result in any recalculation immediately until next link-event occurs.

In addition to enabling static link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the **primary** and **backup** statements at the **[edit interfaces ge-*fpc/pic/port* gigether-options 802.3ad ae*x*]** hierarchy level or the **[edit interfaces fe-*fpc/pic/port* fastether-options 802.3ad ae*x*]** hierarchy level.

For static link protection, specify **link-protection** at the following hierarchy levels:

- **[edit interfaces ge-*fpc/pic/port* ether-options 802.3ad ae*x*]**
- **[edit interfaces xe-*fpc/pic/port* ether-options 802.3ad ae*x*]** hierarchy level or at the **[edit interfaces xe-*fpc/pic/port* ether-options 802.3ad ae*x*]** hierarchy level.

  To disable static link protection, use the **delete interface ae aggregate-ether-options link-protection** statement at the **[edit interfaces ae*x* aggregated-ether-options]** hierarchy level.

Options The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Aggregated Ethernet Link Protection on page 148

link-speed (Aggregated Ethernet)

Syntax link-speed *speed*;

Hierarchy Level (EX Series) [edit interfaces ae*x* aggregated-ether-options],
[edit interfaces interface-range *name* aggregated-ether-options],
[edit interfaces interface-range *name* aggregated-sonet-options]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
mixed option added in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers and 15.1F6 and 16.1R2 for PTX3000 routers.

Description For aggregated Ethernet interfaces only, set the required link speed.

Options ***speed***—For aggregated Ethernet links, you can specify ***speed*** in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Aggregated Ethernet links on the M120 router can have one of the following speeds:

- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **oc192**—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

- **10m**—Links are 10 Mbps.
- **100m**—Links are 100 Mbps.
- **1g**—Links are 1 Gbps.
- **10g**—Links are 10 Gbps.

Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:

- **100g**—Links are 100 Gbps.
- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **40g**—Links are 40 Gbps.

- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

mixed—Enables bundling of different Ethernet rate links in the same Aggregated Ethernet interface.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

link-speed (Aggregated SONET/SDH)

Syntax link-speed (*speed* | mixed);

Hierarchy Level [edit interfaces as*x* aggregated-sonet-options]

Release Information Statement introduced before Junos OS Release 7.4.
mixed option added in Release 8.0.

Description For aggregated SONET/SDH interfaces only, set the required link speed.

Options *speed*—Aggregated SONET/SDH links can have one of the following speed values.

- **oc3**—Links are OC3c or STM1c.
- **oc12**—Links are OC12c or STM4c.
- **oc48**—Links are OC48c or STM16c.
- **oc192**—Links are OC192c or STM64c.
- **oc768**—Links are OC768c or STM256c.

mixed—For aggregated SONET/SDH links on T Series routers, you can mix interface speeds in SONET/SDH aggregation bundles. Interface speeds from OC3 through OC768 are supported.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

lmi (Ethernet OAM)

Syntax

```
lmi {
  status-counter count;
  polling-verification-timer value;
  interface name {
    uni-id uni-name;
    status-counter number;
    polling-verification-timer value;
    evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
    evc evc-name {
      default-evc;
      vlan-list vlan-id-list;
    }
  }
}
```

Hierarchy Level [edit protocols oam ethernet]

Release Information Statement introduced in Junos OS Release 9.5.

Description On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet Local Management Interface (E-LMI).

NOTE: On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

Options

status-counter *count*—Status counter (N393), defaults to 4.

interface *name*—Polling verification timer (T392), defaults to 15 seconds.

uni-id *uni-name*—(Optional) Defaults to the physical interface name.

status-counter *number*—(Optional) Defaults to a global value.

polling-verification-timer *value*—(Optional) Defaults to a global value.

evc-map-type (all-to-one-bundling | bundling | service-multiplexing)—Specify the Ethernet virtual connection (EVC) map type.

evc *evc-name*—Specify the name of the EVC.

default-evc—Set the specified EVC as the default EVC.

vlan-list *vlan-id-list*—Specify a group of VLANs to assign to the EVC.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

load-balance

Syntax

```
load-balance {
  adaptive{
    pps;
    scan-interval multiple;
    tolerance percentage;
  }
  no-adaptive;
  per-packet;
}
```

Hierarchy Level [edit interfaces ae*x* aggregated-ether-options]

Release Information Statement introduced in Junos OS Release 13.3.
Statement introduced in Junos OS Release 14.1 for PTX Series Packet Transport Routers.

Description Load-balances the received traffic across all the available paths of aggregated Ethernet bundles for better link utilization.

Options

adaptive— (MX Series and PTX Series) Corrects a genuine traffic imbalance by using a feedback mechanism to distribute the traffic across the links of an Aggregated Ethernet bundle.

no-adaptive— (MX Series and PTX Series) Disables the adaptive load-balancing solution configured to distribute traffic by using a feedback mechanism.

per-packet— (MX Series only) Randomly sprays packets to the aggregate next hops in a round-robin manner to avoid traffic imbalance.

Required Privilege Level interface - To view statement in the configuration.
interface-control - To add this statement to the configuration.

Related Documentation

- Example: Configuring Aggregated Ethernet Load Balancing on page 163

load-balance-stateful (Aggregated Ethernet Interfaces)

Syntax

```
load-balance-stateful {
  per-flow;
    rebalance interval;
  load-type (low | medium | large);
}
```

Hierarchy Level [edit interfaces ae*X* *unit logical-unit-number* forwarding-options]

Release Information Statement introduced in Junos OS Release 13.2R1.

Description Define the capability to perform uniform load balancing and also perform rebalancing is introduced on MX Series routers with MPCs, except MPC3Es and MPC4Es. Rebalancing is not supported when load-balancing is skewed or distorted owing to a change in the number of flows. The mechanism to record and retain states for the flows and distribute the traffic load accordingly is added. As a result, for m number of flows, they are distributed among n member links of a LAG bundle or among the unilist of next-hops in an ECMP link. This method of splitting the load among member links is called stateful load balancing and it uses 5-tuple information (source and destination addresses, protocol, source and destination ports). Such a method can be mapped directly to the flows, or to a precompute hash based on certain fields in the flow. As a result, the deviation observed on each child link is reduced.

Options **stateful**—Define the stateful load-distribution mechanism for traffic flows on aggregated Ethernet interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

load-type (Aggregated Ethernet Interfaces)

Syntax load-type (low | medium | large);

Hierarchy Level [edit interfaces ae*X* *unit logical-unit-number* forwarding-options load-balance-stateful]

Release Information Statement introduced in Junos OS Release 13.2R1.

Description Define the load-balancing type to inform the Packet Forwarding Engine regarding the appropriate memory pattern to be used for traffic flows. The approximate number of flows for effective load-balancing for each keyword is a derivative.

Options **low**—Define a low load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is less or minimal (between 1 and 100 flows).

medium—Define a medium or moderate load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is relatively higher (between 100 and 1000 flows).

large—Define a high load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is excessive or reaches the maximum supported flows (between 1000 and 10,000 flows).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces on page 181

lockout

Syntax request protection-group ethernet-aps lockout md <md> ma <ma>

Hierarchy Level [edit protocols protection-group ethernet-aps]

Description Configure a lockout of the protection path, forcing the use of the working path and locking out the protect path regardless of anything else.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Ethernet Automatic Protection Switching Overview on page 213

logical-interface-policer

Syntax logical-interface-policer;

Hierarchy Level [edit dynamic-profiles *profile-name* firewall policer *policer-name*],
[edit dynamic-profiles *profile-name* firewall three-color-policer *name*],
[edit firewall atm-policer*atm-policer-name*],
[edit firewall policer *policer-name*],

loopback (Aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet)

Syntax (loopback | no-loopback);

Hierarchy Level [edit interfaces *interface-name* aggregated-ether-options],
[edit interfaces *interface-name* ether-options],
[edit interfaces *interface-name* fastether-options],
[edit interfaces *interface-name* gigether-options],
[edit interfaces interface-range *name* ether-options]

For QFX Series and EX Series:

[edit interfaces *interface-name* aggregated-ether-options],
[edit interfaces *interface-name* ether-options],

For SRX Series Devices and vSRX:

[edit interfaces *interface-name* redundant-ether-options]

Release Information Statement introduced before Junos OS Release 7.4 for MX Series.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Statement modified in Junos OS Release 9.2 for the SRX Series.

Description For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode.

NOTE:

- By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system.
- IPv6 Neighbor Discovery Protocol (NDP) addresses are not supported on Gigabit Ethernet interfaces when loopback mode is enabled on the interface. That is, if the **loopback** statement is configured at the **[edit interfaces ge-*fpc/pic/port* gigether-options]** hierarchy level, an NDP address cannot be configured at the **[edit interfaces ge-*fpc/pic/port* unit *logical-unit-number* family inet6 address]** hierarchy level.

Default By default, loopback is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- *Understanding Interfaces*

loopback (Local and Remote)

Syntax loopback (local | remote);

Hierarchy Level [edit interfaces *interface-name* gigether-options]

Release Information Statement introduced in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers.
Statement introduced in Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers.

Description Enables local loopback and enables remote loopback. This allows you to test the transceiver cable connection from the far end to the retimer interface without changing the cable.

Options **local**—Enables local loopback

remote—Enables remote loopback

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- *Configuring Ethernet Loopback Capability*

loopback-tracking

Syntax loopback-tracking;

Hierarchy Level [edit protocols oam ethernet link-fault-management]

Release Information Statement introduced in Junos OS Release 14.2.

Description Enables loopback tracking on Ethernet interfaces. When loopback tracking is enabled and the Ethernet Operation, Administration, and Management (OAM) link-fault management process (lfmd) detects its own generated packets on an interface, it marks the interface as down. When the loopback issue resolves, the interface is brought back up.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

loss-priority

Syntax loss-priority (high | low);

Hierarchy Level [edit interfaces *interface-name* gigether-options ethernet-switch-profile ethernet-policer-profile output-priority-map classifier premium forwarding-class *class-name*]

Release Information Statement introduced before Junos OS Release 7.4.

Description Specify the packet loss priority value.

Options **high**—Packet has high loss priority.

low—Packet has low loss priority.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Specifying an Output Priority Map on page 541

mac

Syntax mac *mac-address*;

Hierarchy Level [edit interfaces *interface-name*]

Release Information Statement introduced before Junos OS Release 7.4.

Description Set the MAC address of the interface.

Use this statement at the **[edit interfaces ... ps0]** hierarchy level to configure the MAC address for a pseudowire logical device that is used for subscriber interfaces over point-to-point MPLS pseudowires.

Options *mac-address*—MAC address. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0000.5e00.5355** or **00:00:5e:00:53:55**.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

mac (IRB)

Syntax mac *mac-address*;

Hierarchy Level [edit interfaces *irb* unit *logical-unit-number*]

Release Information Statement introduced in Junos OS Release 13.2.

Description Specify the MAC address of the IRB interface in devices that have Modular Port Concentrator (MPC) cards.

Options **mac-address**— Specify the MAC address as six hexadecimal bytes in one of the following hexadecimal formats: *nnnn:nnnn:nnnn*or *nn:nn:nn:nn:nn:nn.*

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Example: Configuring the MAC Address of an IRB Interface on page 327

mac-address (Accept Source Mac)

Syntax

mac-address *mac-address* policer;

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number* accept-source-mac],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* accept-source-mac]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP, specify a remote MAC address on which to count incoming and outgoing packets.

Options

mac-address—MAC address. Specify the MAC address as six hexadecimal bytes in one of the following formats: ***nnnn.nnnn.nnnn*** or ***nn:nn:nn:nn:nn:nn***. For example, **0011.2233.4455** or **00:11:22:33:44:55**.

policer—MAC policer. For more information, see policer (MAC).

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring MAC Address Filtering on page 544

mac-address (MACsec)

Syntax mac-address *mac-address*;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name* secure-channel *secure-channel-name* id]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specify a MAC address to enable MACsec using static secure association key (SAK) security mode. The **mac-address** variables must match on the sending and receiving ends of a link to enable MACsec using static SAK security mode.

If you are configuring a MAC address on a secure channel in the outbound direction, you should specify the MAC address of the interface as the **mac-address**.

If you are configuring a MAC address on a secure channel in the inbound direction, you should specify the MAC address of the interface at the other end of the link as the **mac-address**.

You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.

Default No MAC address is specified in the secure channel, by default.

Options ***mac-address***—The MAC address, in six groups of two hexadecimal digits.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

mac-learn-enable

Syntax

mac-learn-enable;

Hierarchy Level

[edit interfaces *interface-name* gigether-options ethernet-switch-profile]
[edit interfaces ae*x* aggregated-ether-options ethernet-switch-profile]

Release Information

Statement introduced before Junos OS Release 7.4.
Support for statement under the **[edit interfaces ae*x* aggregated-ether-options ethernet-switch-profile]** hierarchy introduced in Junos OS Release 15.1.

Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, for 100-Gigabit Ethernet Type 5 PIC with CFP, and for MPC3E, MPC4E, MPC5E, MPC5EQ, and MPC6E MPCs, configure dynamic learning of the source and destination MAC addresses. By default, the interface is not allowed to dynamically learn source and destination MAC addresses.

To disable dynamic learning of the source and destination MAC addresses after it has been configured, you must delete **mac-learn-enable** from the configuration.

MPCs support MAC address accounting for an individual interface or an aggregated Ethernet interface member link only after the interface has received traffic from the MAC source. If traffic is only exiting an interface, the MAC address is not learned and MAC address accounting does not occur.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring MAC Address Filtering on page 544

mac-radius (MX Series in Enhanced LAN Mode)

Syntax mac-radius <flap-on-disconnect> <restrict>;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Configure MAC RADIUS authentication for specific interfaces. MAC RADIUS authentication allows LAN access to permitted MAC addresses. When a new MAC address appears on an interface, the switch consults the RADIUS server to check whether the MAC address is a permitted address. If the MAC address is configured on the RADIUS server, the device is allowed access to the LAN.

If MAC RADIUS is configured, the switch first tries to get a response from the host for 802.1X authentication. If the host is unresponsive, the switch attempts to authenticate using MAC RADIUS.

To restrict authentication to MAC RADIUS only, use the **restrict** option. In restrictive mode, all 802.1X packets are eliminated and the attached device on the interface is considered a nonresponsive host.

Options **flap-on-disconnect**—(Optional) When the RADIUS server sends a disconnect message to a supplicant, the switch resets the interface on which the supplicant is authenticated. If the interface is configured for multiple supplicant mode, the switch resets all the supplicants on the specified interface. This option takes effect only when the **restrict** option is also set.

restrict—(Optional) Restricts authentication to MAC RADIUS only. When **mac-radius restrict** is configured the switch drops all 802.1X packets. This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface, and eliminates the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

mac-validate

Syntax mac-validate (loose | strict);

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family *family*]

Release Information Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Enable IP and MAC address validation for static Ethernet and IP demux interfaces.

Options **loose**—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the IP source address matches one of the trusted tuples, but the MAC address does not match the MAC address of the tuple. Continues to forward incoming packets when the source address of the incoming packet does not match any of the trusted IP addresses.

strict—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the MAC address does not match the tuple's MAC source address, or when IP source address of the incoming packet does not match any of the trusted IP addresses.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

max-sessions (PPPoE Service Name Tables)

Syntax max-sessions *number*;

Hierarchy Level [edit protocols pppoe service-name-tables *table-name* service *service-name*]

Release Information Statement introduced in Junos OS Release 10.2.

Description Configure the maximum number of active PPPoE sessions using either static or dynamic PPPoE interfaces that the router can establish with the specified named service, **empty** service, or **any** service entry in a PPPoE service name table. The router maintains a count of active PPPoE sessions for each service entry to determine when the maximum sessions limit has been reached.

The router uses the **max-sessions** value for a PPPoE service name table entry in conjunction with the **max-sessions** value configured for the PPPoE underlying interface, and with the maximum number of PPPoE sessions supported on your router. If your configuration exceeds any of these maximum session limits, the router is unable to establish the PPPoE session.

Options *number*—Maximum number of active PPPoE sessions that the router can establish with the specified PPPoE service name table entry, in the range 1 to the platform-specific maximum PPPoE sessions supported for your router. The default value is equal to the maximum number of PPPoE sessions supported on your routing platform.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family pppoe],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* pppoe-underlying-options]

Release Information

Statement introduced in Junos OS Release 11.4.

Description

Configure the router to ignore (clear) the value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks vendor-specific attribute (VSA) [26-143], and restore the PPPoE maximum session value on the underlying interface to the value configured in the CLI with the **max-sessions** statement. The PPPoE maximum session value specifies the maximum number of concurrent static or dynamic PPPoE logical interfaces (sessions) that the router can activate on the PPPoE underlying interface, or the maximum number of active static or dynamic PPPoE sessions that the router can establish with a particular service entry in a PPPoE service name table.

Default

If you do not include the **max-sessions-vsa-ignore** statement, the maximum session value returned by RADIUS in the Max-Clients-Per-Interface VSA takes precedence over the PPPoE maximum session value configured with the **max-sessions** statement.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

maximum-links

Syntax maximum-links *maximum-links-limit*;

Hierarchy Level [edit chassis aggregated-devices]

Release Information Statement introduced in Junos OS Release 11.1 for T Series routers.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Statement introduced in Junos OS Release 12.3 for MX Series routers.

Description Configure the maximum links limit for aggregated devices. Note that for MX Series routers, to set a range of 32 or 64 the router must be running in Enhanced IP mode, which is only supported for Trio-based MPCs and multiservice DPCs (MS-DPCs). For more information on Enhanced IP mode, *Network Services Mode Overview*.

For MX series routers and PTX series switches, the option for 64 links is only supported for Junos OS release 12.3 and later.

NOTE: **This statement is not supported on the MX80, MX104, and PTX1000 routers.**

Options *maximum-links-limit*—Maximum links limit for aggregated devices.

Range: 16, 32, 64

NOTE: **On T-Series routers, the maximum-links supported is 32 in an aggregated Ethernet link.**

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

maximum-requests (MX Series in Enhanced LAN Mode)

Syntax maximum-requests *number*;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X authentication, configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out.

Default Two retransmission attempts

Options *number*—Number of retransmission attempts.

Range: 1 through 10

Default: 2

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

mc-ae

Syntax

```
mc-ae {
  chassis-id chassis-id;
    events {
      iccp-peer-down;
        force-icl-down;
      prefer-status-control-active;
      }
      init-delay-time seconds;
      mc-ae-id mc-ae-id;
      mode (active-active | active-standby);
      redundancy-group group-id;
      revert-time revert-time;
      status-control (active | standby);
      switchover-mode (non-revertive |revertive);
    }
```

Hierarchy Level

[edit interfaces ae*X* aggregated-ether-options],
[edit logical-systems *logical-system-name interfaces* ae*X* aggregated-ether-options]

Release Information

Statement introduced in Junos OS Release 9.6 for MX Series routers.
events statement introduced in Junos OS Release 11.4R4 for MX Series routers.
Statement introduced in Junos OS Release 12.2 for the QFX Series. Only the **chassis-id**, **mc-ae-id**, **mode active-active**, and **status-control (active | standby)** options are supported on QFX Series devices.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
prefer-status-control-active statement introduced in Junos OS Release 13.2R1 for EX Series switches.
init-delay-time *seconds* statement introduced in Junos OS Release 13.2R3 for EX Series switches.
switchover-mode and **revert-time** statements introduced in Junos OS Release 13.3.
Support for logical systems introduced in Junos OS Release 14.1.

Description

Enable multichassis link aggregation groups (MC-LAG), which enables one device to form a logical LAG interface with two or more other devices.

Options

chassis-id—Specify the chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links.

Values: 0 or 1

events—Specify an action if a specific MC-LAG event occurs.

iccp-peer-down—Specify an action if the ICCP peer of this node goes down.

force-icl-down—If the node’s ICCP peer goes down, bring down the interchassis-link logical interface.

prefer-status-control-active—Specify that the node configured as **status-control active** become the active node if the peer of this node goes down.

When ICCP goes down, you can use this keyword to make a mc-lag PE to become the active PE. For example, if you want mc-lag PE1 to be Active on ICCP down, then configure this keyword in PE1. It is not recommended to configure this keyword in both the mc-lag PEs.

NOTE: The **prefer-status-control-active** statement can be configured with the **status-control standby** configuration to prevent the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the **hold-time down** value (at the **[edit interfaces *interface-name*]** hierarchy level) for the interchassis link with the **status-control standby** configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the **status-control active** configuration goes down, the router or switch with the **status-control standby** configuration does not go into standby mode.

To make the **prefer-status-control-active** configuration work with the **status-control standby** configuration when an interchassis-link logical interface is configured on aggregate Ethernet interface, you must either configure the **lacp periodic *interval*** statement at the **[edit interface *interface-name* aggregated-ether-options]** hierarchy level as **slow** or configure the **detection-time threshold** statement at the **[edit protocols iccp peer liveness-detection]** hierarchy level as less than 3 seconds.

init-delay-time *seconds*—To minimize traffic loss, specify the number of seconds in which to delay bringing the multichassis aggregated Ethernet interface back to the up state when you reboot an MC-LAG peer.

mc-ae-id *mc-ae-id*—Specify the identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number.

Range: 1 through 65,535

mode (active-active | active-standby)—Specify whether the MC-LAG is in active-active or active-standby mode.

NOTE: You can configure IPv4 (inet) and IPv6 (inet6) addresses on **mc-ae** interfaces when the **active-standby** mode is configured.

redundancy-group ***group-id***—Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions.

Range: 1 through 4,294,967,294

revert-time—Wait interval (in minutes) before the switchover to the preferred node is performed when the **switchover-mode** is configured as revertive.

Range: 1 through 10

status-control (active | standby)—Specify whether the chassis becomes active or remains in standby mode when an interchassis link failure occurs.

switchover-mode (non-revertive | revertive)—Specify whether Junos OS should trigger a link switchover to the preferred node when the active node is available.

NOTE: For **revertive** mode to automatically switch over to the preferred node, the **status-control** statement should be configured as **active**.

init-delay-time ***seconds***—To minimize traffic loss, specify the number of seconds by which to delay bringing the multichassis aggregated Ethernet (mc-ae) interface back to the up state when you reboot an MC-LAG peer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

minimum-bandwidth (aggregated Ethernet)

Syntax minimum-bandwidth bw-unit *unit* bw-value *value*;

Hierarchy Level [edit interfaces ae*x* aggregated-ether-options]

Release Information Statement introduced before Junos OS Release 14.1R1 and 14.2 for MX Series.

Description Configure the minimum bandwidth unit for an aggregated Ethernet bundle as bps, Gbps, Kbps, or Mbps and the bandwidth value from 1 through 128,000.

Options ***unit***—Minimum bandwidth unit for the aggregated Ethernet bundle as bps, Gbps, Kbps, or Mbps.

value—Minimum bandwidth value from 1 through 128,000.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Hierarchy Level (QFX Series)

[edit interfaces ae*x* aggregated-ether-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description

For aggregated Ethernet, SONET/SDH, multilink, link services, and voice services interfaces only, set the minimum number of links that must be up for the bundle to be labeled up.

Options

number—Number of links.

Range: On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, the valid range for minimum-links number is 1 through 64. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled up.On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up.On EX8200 switches, the range of valid values for minimum-links number is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled up.On EX4600, QFX Series and Q Fabric Systems , the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up.

Default: 1

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

mka (MX Series)

Syntax

```
mka {
  must-secure;
  key-server-priority priority-number;
  transmit-interval interval;
}
```

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name*]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specify parameters for the MACsec Key Agreement (MKA) protocol.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Configuring Media Access Control Security (MACsec) on MX Series Routers*

must-secure (MX Series)

Syntax must-secure;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name* mka]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specifies that all traffic travelling on the MACsec-secured link must be MACsec-secured to be forwarded onward.

When the **must-secure** option is enabled, all traffic that is not MACsec-secured that is received on the interface is dropped.

When the **must-secure** option is disabled, all traffic from devices that support MACsec is MACsec-secured while traffic received from devices that do no support MACsec is forwarded through the network.

The **must-secure** option is particularly useful in scenarios where multiple devices, such as a phone and a PC, are accessing the network through the same Ethernet interface. If one of the devices supports MACsec while the other device does not support MACsec, the device that doesn’t support MACsec can continue to send and receive traffic over the network—provided the **must-secure** option is disabled—while traffic to and from the device that supports MACsec is MACsec-secured. In this scenario, traffic to the device that is not MACsec-secured must be VLAN-tagged.

Default The **must-secure** option is disabled.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Support for Layer 2 VPNs and VPLS introduced in Junos OS Release 10.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Support at the **[set interfaces interface-name unit logical-unit-number family ccc]** hierarchy level introduced in Junos OS Release 12.3R3 for MX Series routers.
Statement introduced in Junos OS 17.3R1 Release for MX Series Routers.

Description

Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

To route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named irb or vlan, respectively).

CAUTION: For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

NOTE:

The MTU for an IRB interface is calculated by removing the Ethernet header overhead [6(DMAC)+6(SMAC)+2(EtherType)]. Because, the MTU is the lower value of the MTU configured on the IRB interface and the MTU configured on the IRB's associated bridge domain IFDs or IFLs, the IRB MTU is calculated as follows:

- In case of Layer 2 IFL configured with the **flexible-vlan-tagging** statement, the IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
- In case of Layer 2 IFL configured with the **vlan-tagging** statement, the IRB MTU is calculated by including a single VLAN 4 bytes overhead.

NOTE:

- If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.
- Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxp0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.
- On ACX Series routers, you can configure the protocol MTU by including the **mtu** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet]** or **[edit interfaces *interface-name* unit *logical-unit-number* family inet6]** hierarchy level.
  - If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
  - If you are configuring the protocol MTU for both **inet** and **inet6** families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for **inet** and **inet6** families that are configured on the same logical interface.
- Starting in Release 14.2, MTU for IRB interfaces is calculated by removing the Ethernet header overhead (**6(DMAC)+6(SMAC)+2(EtherType)**), and the MTU is a minimum of the two values:
  - Configured MTU
  - Associated bridge domain's physical or logical interface MTU
    - For Layer 2 logical interfaces configured with **flexible-vlan-tagging**, IRB MTU is calculated by including 8 bytes overhead (**SVLAN+CVLAN**).
    - For Layer 2 logical interfaces configured with **vlan-tagging**, IRB MTU is calculated by including single VLAN 4 bytes overhead.

  NOTE: Changing the Layer 2 logical interface option from **vlan-tagging** to **flexible-vlan-tagging** or vice versa adjusts the logical interface MTU by 4 bytes with the existing MTU size. As a result, the Layer 2 logical interface is deleted and re-added, and the IRB MTU is re-computed appropriately.

For more information about configuring MTU for specific interfaces and router or switch combinations, see *Configuring the Media MTU*.

Options *bytes*—MTU size.

Range: 256 through 9192 bytes, 256 through 9216 (EX Series switch interfaces), 256 through 9500 bytes (Junos OS 12.1X48R2 for PTX Series routers), 256 through 9500 bytes (Junos OS 16.1R1 for MX Series routers)

NOTE: Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

Default: 1500 bytes (INET, INET6, and ISO families), 1448 bytes (MPLS), 1514 bytes (EX Series switch interfaces)

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

multicast-router-interface (IGMP Snooping)

Syntax multicast-router-interface;

Hierarchy Level [edit bridge-domains *bridge-domain-name* protocols igmp-snooping interface *interface-name*],
[edit bridge-domains *bridge-domain-name* protocols igmp-snooping vlan *vlan-id* interface *interface-name*],
[edit protocols igmp-snooping vlan (all | *vlan-name*) interface (all | *interface-name*)],
[edit routing-instances *routing-instance-name* bridge-domains *bridge-domain-name* protocols igmp-snooping interface *interface-name*],
[edit routing-instances *routing-instance-name* bridge-domains *bridge-domain-name* protocols vlan *vlan-id* igmp-snooping interface *interface-name*]
[edit protocols igmp-snooping vlan *vlan-name* interface *interface-name*]

Release Information Statement introduced in Junos OS Release 8.5.
Statement introduced in Junos OS Release 9.1 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Statically configure the interface as an IGMP snooping multicast-router interface—that is, an interface that faces toward a multicast router or other IGMP querier.

NOTE: If the specified interface is a trunk port, the interface becomes a multicast-routing device interface for all VLANs configured on the trunk port. In addition, all unregistered multicast packets, whether they are IPv4 or IPv6 packets, are forwarded to the multicast routing device interface, even if the interface is configured as a multicast routing device interface only for IGMP snooping.

Configure an interface as a bridge interface toward other multicast routing devices.

Default Disabled. If this statement is disabled, the interface drops IGMP messages it receives.

The interface can either be a host-side or multicast-routing device interface.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

multi-chassis-protection

Syntax

```
multi-chassis-protection {
  peer a.b.c.d {
    interface interface-name;
    }
  }
```

Hierarchy Level [edit interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1.

Description For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, you can use this statement under the physical interface level to reduce the configuration at the logical interface level if the following assumption exists:

If there are n +1 logical interfaces under **ae0**, from **ae0.0** through **ae0.n**, there will be n + 1 logical interfaces under **ge-0/0/0** as well, from **ge-0/0/0.0** through **ge-0/0/0.n**, and each **ge-0/0/0** logical interface will be a protection link for the **ae0** logical interface.

NOTE: **A bridge domain cannot have MC-AE logical interfaces which belong to different redundancy groups.**

If the Inter-Chassis Control Protocol (ICCP) connection is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer.

The remaining statements are explained separately. See CLI Explorer.

Options **interface** ***interface-name***—Specify the interface: **interface** ***interface-name-fpc/pic/port***

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

no-allow-link-events

Syntax no-allow-link-events;

Hierarchy Level [edit protocols oam ethernet link-fault-management interface *interface-name* negotiation-options]

Release Information Statement introduced in Junos OS Release 8.4.

Description Disable the sending of link event TLVs.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Disabling the Sending of Link Event TLVs on page 695

no-encryption (MACsec for MX Series)

Syntax no-encryption;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name*]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Disables MACsec encryption for a connectivity association that is configured to enable MACsec using static connectivity association key (CAK) or dynamic security mode.

You can enable MACsec without enabling encryption. If a connectivity association that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the packet, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic does not represent a security threat.

This command is used to disable encryption when MACsec is configured using static CAK or dynamic security mode only. When MACsec is configuring using static secure association key (SAK) security mode, the encryption setting is managed in the secure channel using the **encryption** configuration statement.

Default MACsec encryption is enabled if MACsec is enabled using static CAK or dynamic security mode.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Configuring Media Access Control Security (MACsec) on MX Series Routers*

no-auto-mdix

Syntax no-auto-mdix;

Hierarchy Level [edit interface ge-*fpc/port/pic* gigether-options]

Release Information Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description Disable the Auto MDI/MDIX feature.

MX Series routers with Gigabit Ethernet interfaces automatically detect MDI and MDIX port connections. Use this statement to override the default setting. Remove this statement to return to the default setting.

Default Auto MDI/MDIX is enabled by default.

Options There are no options for this statement.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

no-gratuitous-arp-request

Syntax no-gratuitous-arp-request;

Hierarchy Level [edit interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 9.6 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description For Ethernet interfaces and pseudowire logical interfaces, do not respond to gratuitous ARP requests.

Default Gratuitous ARP responses are enabled on all Ethernet interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Gratuitous ARP on page 19

no-keepalives

Syntax

no-keepalives;

Hierarchy Level

[edit interfaces *interface-name*],
[edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

Disable the sending of keepalives on a physical interface configured with PPP, Frame Relay, or Cisco HDLC encapsulation. The default keepalive interval is 10 seconds.

For ATM2 IQ interfaces only, you can disable keepalives on a logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- **atm-ppp-llc**—PPP over AAL5 LLC encapsulation.
- **atm-ppp-vc-mux**—PPP over AAL5 multiplex encapsulation.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

no-mac-table-binding (802.1X for MX Series in Enhanced LAN Mode)

Syntax no-mac-table-binding;

Hierarchy Level [edit protocols authentication-access-control]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X authentication, disable the removal of the session from the authentication session table when the MAC address ages out of the Ethernet switching table.

Default Not enabled

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

no-native-vlan-insert

Syntax

no-native-vlan-insert;

Hierarchy Level

[edit interfaces *interface-name*]

Release Information

Statement introduced in Junos OS Release 17.1R1.

Description

Send traffic without the native VLAN ID (*native-vlan-id*) to the remote end of the network if untagged traffic is received.

If this statement is not configured, then *native-vlan-id* is added to untagged traffic. But if this statement is configured, then *native-vlan-id* is not added to untagged traffic.

NOTE:

- This feature works only on MX Series routers with MPCs/MICs. Configuring this statement on MX Series routers with DPCs results is no behavioral change. However, if you configure the statement on aggregated Ethernet (ae) interfaces with logical interfaces across MPCs/MICs and DPCs, then the MPCs/MICs and DPCs behave differently.
- In the egress direction, this feature is disrupted by VLAN normalization. Because of normalization, the egress interface cannot distinguish between untagged traffic and tagged traffic. And untagged traffic is sent out with *native-vlan-id*. Consider this while configuring both VLAN normalization and new *native-vlan-id* statement.

  There will be a problem with ingress firewall filter if filter term includes *native-vlan-id*. With **no-native-vlan-insert** statement configured, *native-vlan-id* will not be inserted to untagged traffic. So, firewall filter term will not match with untagged traffic. But if incoming traffic have VLAN ID which is equal to *native-vlan-id*, then firewall filter term will match and firewall will work.
- When this feature is used with AE, all sub-interfaces of AE should be in same type of FPC.

Default

By default, *native-vlan-id* is inserted to untagged traffic. That is, if this statement is not configured, then *native-vlan-id* is inserted to untagged traffic.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

no-pre-classifier

Syntax no-pre-classifier;

Hierarchy Level [edit chassis fpc *n* pic *n*]

Release Information Statement introduced in Junos OS Release 10.4.

Description Specify disabling the control queue for all ports on the 10-Gigabit Ethernet LAN/WAN PIC. Deleting this configuration re-enables the control queue feature on all ports of the 10-Gigabit Ethernet LAN/WAN PIC.

NOTE: For the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP), the control queue has a rate limiter to limit the control traffic to 2 Mbps (fixed, not user-configurable) per port. If the transit control traffic crosses this limit, then it can cause drops on locally terminating control traffic, causing flap of protocols such as BGP and OSPF. To avoid the control traffic being dropped, configure the **no-pre-classifier** statement to disable the control queue.

Default The **no-pre-classifier** statement is not configured and the control queue is operational.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

no-reauthentication (MX Series in Enhanced LAN Mode)

Syntax no-reauthentication;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X authentication, disables reauthentication.

Default Not disabled

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

no-send-pads-ac-info

Syntax no-send-pads-ac-info;

Hierarchy Level [edit protocols pppoe]

Release Information Statement introduced in Junos OS Release 12.2.

Description Prevent the router from sending the AC-Name and AC-Cookie tags in the PPPoE Active Discovery Session (PADS) packet. When you configure this statement, it affects PADS packets sent on all PPPoE interfaces configured on the router after the command is issued; it has no effect on previously created PPPoE interfaces. By default, the AC-Name and AC-Cookie tags are transmitted in the PADS packet, along with the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags.

NOTE: In Junos OS Release 12.1 and earlier, only the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags are contained in the PADS packet by default. The AC-Name and AC-Cookie tags are not transmitted in the PADS packet by default.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- *Disabling the Sending of PPPoE Access Concentrator Tags in PADS Packets*

no-send-pads-error

Syntax no-send-pads-error;

Hierarchy Level [edit protocols pppoe]

Release Information Statement introduced in Junos OS Release 12.3.

Description Discard PADR messages to prevent transmission of PADS control packets with AC-System-Error tags.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- *Discarding PADR Messages to Accommodate Abnormal CPE Behavior*

non-revertive (Interfaces)

Syntax non-revertive;

Hierarchy Level [edit interfaces ae*X* aggregated-ether-options lacp link-protection]

Release Information Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.4 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Description Disable the ability to switch to a better priority link (if one is available) once a link is established as active and collection distribution is enabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Aggregated Ethernet Link Protection on page 148
- *Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches*

non-revertive

Syntax non-revertive;

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name*]

Release Information Statement introduced in Junos OS Release 14.2.

Description Enable nonrevertive operation where traffic is allowed to use the RPL if it has not failed, even after a switch condition has cleared. The default mode of operation is revertive.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Ethernet Ring Protection Switching Overview on page 221
- *Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure)*

non-vc-mode

Syntax non-vc-mode;

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name*]

Release Information Statement introduced in Junos OS Release 14.2.

Description Configure a node on the sub-ring to operate in non-virtual channel mode. If this option is enabled then all the nodes in the sub-ring are configured with this option. Also, the **non-vc-mode** option should be used with care and only for open rings. Using this option for closed rings creates loops for RAPS control messages.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Ethernet Ring Protection Switching Overview on page 221
- *Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure)*

node-id

Syntax node-id *mac-address*;

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name*]

Release Information Statement introduced in Junos OS Release 9.4.

Description For EX Series switches and QFX Series switches, node-id is not configurable.

For MX Series routers, optionally specify the MAC address of a node in the protection group. If this statement is not included, the router assigns the node's MAC address.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

offset (MX Series)

Syntax

offset (0 |30 | 50);

Hierarchy Level

[edit security macsec connectivity-association *connectivity-association-name*]
[edit security macsec connectivity-association *connectivity-association-name* secure-channel *secure-channel-name*]

Release Information

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description

Specifies the number of octets in an Ethernet frame that are sent in unencrypted plain-text when encryption is enabled for MACsec.

Setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the remaining traffic. Setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the remaining traffic.

You would typically forward traffic with the first 30 or 50 octets unencrypted if a feature needed to see the data in the octets to perform a function, but you otherwise prefer to encrypt the remaining data in the frames traversing the link. Load balancing features, in particular, typically need to see the IP and TCP/UDP headers in the first 30 or 50 octets to properly load balance traffic.

You configure the **offset** in the **[edit security macsec connectivity-association *connectivity-association-name*]** hierarchy when you are enabling MACsec using static connectivity association key (CAK) or dynamic security mode.

You configure the **offset** in the **[edit security macsec connectivity-association *connectivity-association-name* secure-channel*secure-channel-name*]** hierarchy when you are enabling MACsec using static secure association key (SAK) security mode.

Default

0

Options

0—Specifies that no octets are unencrypted. When you set the offset to 0, all traffic on the interface where the connectivity association or secure channel is applied is encrypted.

30—Specifies that the first 30 octets of each Ethernet frame are unencrypted.

NOTE: In IPv4 traffic, setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 30, therefore, is typically used when a feature needs this information to perform a task on IPv4 traffic.

50—Specified that the first 50 octets of each Ethernet frame are unencrypted.

NOTE: In IPv6 traffic, setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 50, therefore, is typically used when a feature needs this information to perform a task on IPv6 traffic.

Required Privilege Level
admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

output-vlan-map (Aggregated Ethernet)

Syntax

```
output-vlan-map {
  (pop | push | swap);
  tag-protocol-id tpid;
  vlan-id number;
}
```

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information

Statement introduced in Junos OS Release 8.2.
Starting in Junos OS Release 17.3R1, input-vlan-map for outer vlan is supported for L2 circuit over aggregated Ethernet interfaces for QFX10000 Series switches.

Description

Define the rewrite profile to be applied to outgoing frames on this logical interface. On MX Series routers, this statement only applies to aggregated Ethernet inferfaces using Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E interfaces and 100-Gigabit Ethernet Type 5 PIC with CFP..

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

pdu-threshold

Syntax pdu-threshold *threshold-value*;

Hierarchy Level [edit protocols oam ethernet link-fault-management interface *interface-name*]

Release Information Statement introduced in Junos OS Release 8.2 for T, M, MX and ACX Series routers, SRX Series firewalls and EX Series switches.
Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.

Description Configure how many protocol data units (PDUs) are missed before declaring the peer lost in Ethernet OAM link fault management (LFM) for all interfaces or for specific interfaces.

For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, specify the number of OAM PDUs to miss before an error is logged. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

Options ***threshold-value***—The number of PDUs missed before declaring the peer lost.

Range: 3 through 10 PDUs

Default: 3 PDUs

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

per-flow (Aggregated Ethernet Interfaces)

Syntax per-flow;

Hierarchy Level [edit interfaces ae*X unit logical-unit-number* forwarding-options load-balance-stateful]

Release Information Statement introduced in Junos OS Release 13.2R1.

Description Enable the mechanism to perform an even, effective distribution of traffic flows across member links of an aggregated Ethernet interface (**ae**) bundle on MX Series routers with MPCs, except MPC3Es and MPC4Es. When multiple flows are transmitted out of an **ae** interface, the flows must be distributed across the different member links evenly to enable an effective and optimal load-balancing behavior. To obtain a streamlined and robust method of load-balancing, the member link of the aggregated Ethernet interface bundle that is selected each time for load balancing plays a significant part.

Options **per-flow**—Enable the stateful load-distribution mechanism per traffic flow on an aggregated Ethernet interface.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

peer

Syntax

peer *a.b.c.d* {
  interface *interface-name*;
}

Hierarchy Level

[edit interfaces *interface-name* multi-chassis-protection]

Release Information

Statement introduced in Junos OS Release 11.1.

Description

For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, use the **multi-chassis-protection** statement under the physical interface level to reduce the configuration at the logical interface level. If the interchassis control protocol connection (ICCP) is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the **peer** statement. You must also specify the peer's physical interface.

Options

a.b.c.d—Specify the IP address of the peer.

interface *interface-name*—Specify the peer's physical interface: interface *interface-name-fpc/pic/port*

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

periodic

List of Syntax

Syntax (EX Series) on page 1302
Syntax (QFX Series) on page 1302

Syntax (EX Series)

periodic *interval*;

Syntax (QFX Series)

periodic (fast | slow);

Hierarchy Level (EX Series)

[edit interfaces ae*x* aggregated-ether-options lacp],
[edit interfaces interface-range *name* aggregated-ether-options lacp]

Hierarchy Level (QFX Series)

[edit interfaces ae*x* aggregated-ether-options lacp]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Description

For aggregated Ethernet interfaces only, configure the interval for periodic transmission of LACP packets.

Options

interval—Interval for periodic transmission of LACP packets.

- **fast**—Transmit packets every second.
- **slow**—Transmit packets every 30 seconds.

Default: fast

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

policer (CoS)

Syntax

```
policer cos-policer-name {
  aggregate {
    bandwidth-limit bps;
    burst-size-limit bytes;
  }
  premium {
    bandwidth-limit bps;
    burst-size-limit bytes;
  }
}
```

Hierarchy Level

[edit interfaces *interface-name* gigether-options ethernet-switch-profile ethernet-policer-profile]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For Gigabit Ethernet IQ , Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, define a CoS policer template to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits. The premium policer is not supported on MX Series routers or for Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router).

Options

cos-policer-name—Name of one policer to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Gigabit Ethernet Policers on page 539

policer (MAC)

Syntax

```
policer {
  input cos-policer-name;
  output cos-policer-name;
}
```

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number* accept-source-mac mac-address *mac-address*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* accept-source-mac mac-address *mac-address*]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure MAC policing.

NOTE:
On MX Series routers with Gigabit Ethernet or Fast Ethernet PICs, the following considerations apply:

- Interface counters do not count the 7-byte preamble and 1-byte frame delimiter in Ethernet frames.
- In MAC statistics, the frame size includes MAC header and CRC before any VLAN rewrite/imposition rules are applied.
- In traffic statistics, the frame size encompasses the L2 header without CRC after any VLAN rewrite/imposition rule.

Options

input *cos-policer-name*—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

output *cos-policer-name*—Name of one policer to specify the premium bandwidth and aggregate bandwidth.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

port-description-type

Syntax

```
port-description-type {
  interface-alias;
  interface-description;
}
```

Hierarchy Level

[edit protocols lldp]
[edit routing- instances *routing-instance-name* protocols lldp]

Release Information

Statement introduced in Junos OS Release 13.3R5, 14.2R2, 14.1R4, and 12.3R9.

Description

For Link Layer Discovery Protocol, configure the value to be used for port description TLV.

Options

interface-alias—Use the *ifAlias* MIB object value to generate the port description TLV.

interface-description—Use the *ifDescr* MIB object value to generate the port description TLV.

Default: By default, **interface-alias** is used for generation of port description TLV. The **interface-alias** value is same as description of an interface configured by statement **set interface *name* description *description***.

NOTE: The LLDP MIB *lldpLocPortDesc* value gets changed depending on the setting of **port-description-type** statement. That is:

- If you configure the **port-description-type interface-alias** statement, the MIB variable *lldpLocPortDesc* displays the value same as that of MIB variable *ifAlias*, which is same as the description of the interface. By default, the MIB variable *lldpLocPortDesc* displays the value same as that of MIB variable *ifAlias*.
- If you configure the **port-description-type interface-description** statement , the MIB variable *lldpLocPortDesc* displays the value of MIB variable *ifDescr*, which is same as that of interface name.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

port-id (MACsec for MX Series)

Syntax port-id *port-id-number*;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name* secure-channel *secure-channel-name* id]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specify a port ID in a secure channel when enabling MACsec using static secure association key (SAK) security mode. The port IDs must match on a sending and receiving secure channel on each side of a link to enable MACsec.

Once the port numbers match, MACsec is enabled for all traffic on the connection.

You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.

Default No port ID is specified.

Options ***port-id-number***—The port ID number.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation
- *Configuring Media Access Control Security (MACsec) on MX Series Routers*

port-priority

Syntax port-priority *priority*;

Hierarchy Level [edit interfaces *interface-name* gigether-options 802.3ad lacp]

Release Information Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.4 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Description Define LACP port priority at the interface level.

Options *priority*—Priority for being elected to be the active port and both collect and distribute traffic. A smaller value indicates a higher priority for being elected.

Range: 0 through 65535

Default: 127

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

port-id-subtype

Syntax

```
port-id-subtype {
  interface-name;
  locally-assigned;
}
```

Hierarchy Level

[edit protocols lldp]
[edit routing- instances *routing-instance-name* protocols lldp]

Release Information

Statement introduced in Junos OS Release 12.3R1

Description

For Link Layer Discovery Protocol, configure the port ID type, length, and value (TLV).

Options

interface-name—Use the interface name to generate the port ID TLV.

Default: Use the SNMP index of the interface to generate the port ID TLV. This is the default option used to generate port ID TLV.

NOTE: For QFX5200 switches, the default value used to generate port ID TLV in LLDP messages is interface name, not SNMP index.

NOTE: The **show lldp neighbors** command displays the content of the **port ID** TLV received from the peer in the **port Info** field. Changing the configuration of **port-id-subtype** affects the display of the **show lldp neighbors** command on the peer device running Junos OS.

When the value of **port-id-subtype** is set to **locally-assigned**, which is the default value, the **show lldp neighbors** command on the peer device running Junos OS displays the SNMP index as the port information for the local device.

When the value of **port-id-subtype** is set to **interface-name**, the **show lldp neighbors** command on the peer device running Junos OS displays the interface name as the port information for the local device.

The value of the MIB variable instance **lldpLocPortId** depends on the entity that is used to generate the port ID TLV. If the port ID TLV generation is configured to use the interface-name in the command **set port-id-subtype interface-name**, then the value of the MIB variable **lldpLocPortId** instance is the interface name and not the SNMP index.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

preferred-source-address

Syntax preferred-source-address *address*;

Hierarchy Level [edit dynamic-profiles interfaces *interface-name* unit *logical-unit-number* family *family* unnumbered-address *interface-name*],
[edit dynamic-profiles *profile-name* interfaces demux0 unit *logical-unit-number* family *family*],

Release Information Statement introduced in Junos OS Release 9.2.
Support for the **$junos-preferred-source-address** and **$junos-preferred-source-ipv6-address** predefined variables introduced in Junos OS Release 9.6.

Description For unnumbered Ethernet interfaces configured with a loopback interface as the donor interface, specify one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. To configure the preferred source address dynamically, instead of using this statement, you must include the **$junos-preferred-source-address** predefined variable for IPv4 (family inet) addresses or the **$junos-preferred-source-ipv6-address** predefined variable for IPv6 (family inet6) addresses.

Configuration of a preferred source address for unnumbered Ethernet interfaces is supported for IPv4 and IPv6 address families.

NOTE: When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the **$junos-routing-instance** predefined variable, you must not configure a preferred source address, whether with the **$junos-preferred-source-address** predefined variable, the **$junos-preferred-source-ipv6-address** predefined variable, or the **preferred-source-address** statement. Configuring the preferred source address in this circumstance causes a commit failure.

Options *address*—Secondary IP address of the donor loopback interface. Alternatively, use the **$junos-preferred-source-address** or the **$junos-preferred-source-ipv6-address** predefined variable to dynamically apply a preferred source address to the unnumbered Ethernet interface.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

pre-shared-key (MX Series)

Syntax

```
pre-shared-key {
  cak hexadecimal-number;
  ckn hexadecimal-number;
}
```

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name*]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specifies the pre-shared key used to enable MACsec using static connectivity association key (CAK) security mode.

A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the pre-shared keys are successfully verified and exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link.

Default No pre-shared keys exist, by default.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

protocols

Syntax protocols [inet iso mpls];

Hierarchy Level [edit interfaces *interface-name* unit logical-unit-number family tcc]

Release Information Statement introduced in Junos OS Release 8.3.

Description For Layer 2.5 VPNs on T Series, MX Series, M120, and M320 routers support, configure IS-IS (ISO traffic) or MPLS traffic to traverse a TCC interface. By default, IPv4 (inet) traffic runs on T Series, MX, Series, M120, and M320 routers and over TCC interfaces. You must configure the same traffic type on both ends of the Layer 2.5 VPN.

NOTE: Some platform and FPC combinations can not pass TCC encapsulated ISO traffic. See *Platforms/FPCs That Cannot Forward TCC Encapsulated ISO Traffic* for details.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

protocol-down

Syntax protocol-down;

Hierarchy Level [edit protocols oam ethernet link-fault-management action-profile event]

Release Information Statement introduced in Junos OS Release 8.5.

Description Upper layer indication of protocol down event. When the **protocol-down** statement is included, the protocol down event triggers the action specified under the **action** statement.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring an OAM Action Profile on page 698

ptopo-configuration-maximum-hold-time

Syntax ptopo-configuration-maximum-hold-time *seconds*;

Hierarchy Level [edit protocols lldp],
[edit routing-instances *routing-instance-name* protocols lldp]

Release Information Statement introduced in Junos OS Release 9.6.

Description Configure a time to maintain dynamic topology entries.

Options *seconds*—Time to maintain interval dynamic topology entries.

Default: 300

Range: 1 through 2147483647

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring LLDP on page 338

ptopo-configuration-trap-interval

Syntax ptopo-configuration-trap-interval *seconds*;

Hierarchy Level [edit protocols lldp],
[edit routing-instances *routing-instance-name* protocols lldp]

Release Information Statement introduced in Junos OS Release 9.6.

Description Configure a time for the period of SNMP trap notifications to the Master Agent to wait regarding changes in topology global statistics.

Options *seconds*—Time for the period of SNMP trap notifications about global statistics. This feature is disabled by default.

Range: 0 through 3600

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

push

Syntax

push;

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* output-vlan-map]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

Description

NOTE: On EX4300 switches, **push** is not supported at the [edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map] hierarchy level.

Specify the VLAN rewrite operation to add a new VLAN tag to the top of the VLAN stack. An outer VLAN tag is pushed in front of the existing VLAN tag.

You can use this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.

If you include the **push** statement in the configuration, you must also include the pop statement at the **[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map]** hierarchy level.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

proxy

Syntax

proxy inet-address *address*;

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number* family tcc],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family tcc]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the IP address for which the TCC router is proxying. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only. Ethernet TCC is not supported on the T640 router.

Options

inet-address—Configure the IP address of the neighbor to the TCC router.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

proxy-arp

Syntax proxy-arp (restricted | unrestricted);

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.6 for EX Series switches.
restricted added in Junos OS Release 10.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for the QFX Series.

Description For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request's target address.

NOTE: You must configure the IP address and the inet family for the interface when you enable proxy ARP.

Default Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own.

Options

- **none**—The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.
- **restricted**—(Optional) The router or switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The router or switch must also have a route to the target IP address.
- **unrestricted**—(Optional) The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address.

Default: **unrestricted**

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

quiet-period (MX Series in Enhanced LAN Mode)

Syntax quiet-period *seconds*;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*])]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X and captive portal authentication, configure the number of seconds the interface remains in the wait state following a failed authentication attempt by a supplicant before reattempting authentication.

Default 60 seconds

Options ***seconds***—Number of seconds the interface remains in the wait state.

Range: 0 through 65,535 seconds

Default: 60 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

reauthentication

Syntax reauthentication (disable | interval *seconds*);

Hierarchy Level [edit protocols dot1x authenticator interface *interface-id*]

Release Information Statement introduced in Junos OS Release 9.3.

Description Set or disable the periodic reauthentication of the client.

Options

- **disable**—Disable the periodic reauthentication of the client.
- **interval** ***seconds***—Specify the periodic reauthentication time interval.

Range: 1 through 65,535 seconds
Default: 3600 seconds

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

reauthentication (MX Series in Enhanced LAN Mode)

Syntax reauthentication *interval*;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X authentication, specify the number of seconds before an authentication session times out.

Options *interval*—Sets the periodic reauthentication time interval in seconds.
Range: 1 through 4,294,967,296 seconds
Default: 3600 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

rebalance (Aggregated Ethernet Interfaces)

Syntax rebalance *interval*

Hierarchy Level [edit interfaces ae*X unit logical-unit-number* forwarding-options load-balance-stateful per-flow]

Release Information Statement introduced in Junos OS Release 13.2R1.

Description Configure periodic rebalancing of traffic flows of an aggregated Ethernet bundle by clearing the load balance state at a specified interval.

Options ***interval***—Number of minutes after which the load-balancing state must be cleared for the specified interface.

Range: 1 through 1000 flows per minute

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

recovery

Syntax

```
recovery {
  (auto | manual);
  timer timer-value;
}
```

Hierarchy Level [edit interfaces *interfaces-name* link-degrade-monitor]

Release Information Statement introduced in Junos OS Release 15.1.

Description Configure the mechanism to be used to recover a degraded link. The recovery options supported are auto and manual.

Options **auto**—Recover a degraded link automatically. Use this option with the media-based action when there are no Layer 2 or Layer 3 protocols configured on the interface. If this option is configured, the degraded link is monitored at user-configured intervals; and if the link quality is found to have improved (if bit error rate hits the clear threshold), the link is automatically recovered. With this configuration, you must configure a timer value.

manual— Recover a degraded link manually. Use this option with the media-based action configuration when Layer 2 and Layer 3 protocols are configured on the interface. If this option is configured, you need to use the **request interface link-degrade-recover *interface-name*** statement to recover the link.

NOTE: The manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while autorecovery is in progress.

timer *timer-value*—Specify the interval value (in seconds) after which autorecovery of the degraded link must be triggered. This option is applicable if you configure the autorecovery option. The interval period starts from the time the link is degraded. The default interval is 1800 seconds. The autorecovery attempt is repeated until the link is recovered or the link monitoring feature is disabled through configuration.

NOTE: During autorecovery, you might notice link flaps at the remote end of the link.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

remote

Syntax

```
remote {
   (inet-address address | mac-address address);
}
```

Hierarchy Level

[edit interfaces *interface-name* unit *logical-unit-number* family tcc],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family tcc]

Release Information

Statement introduced before Junos OS Release 7.4.

Description

For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the location of the remote router. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only.

Options

mac-address—Configure the MAC address of the remote site.

inet-address—Configure the IP address of the remote site.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

remote-loopback

Syntax remote-loopback;

Hierarchy Level [edit protocols oam link-fault-management interface *interface-name*]

Release Information Statement introduced in Junos OS Release 8.2.

Description For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, set the remote DTE into loopback mode. Remove the statement from the configuration to take the remote DTE out of loopback mode. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Setting a Remote Interface into Loopback Mode on page 705

replay-window-size (MX Series)

Syntax replay-window-size *number-of-packets*;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name* replay-protect]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specifies the size of the replay protection window.

This statement has to be configured to enable replay protection.

When MACsec is enabled on an Ethernet link, an ID number is assigned to each packet entering the link. The ID number of the packet is checked by the receiving interface after the packet has traversed the MACsec-enabled link.

When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving interface. For instance, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

Default Replay protection is disabled.

Options ***number-of-packets***—Specifies the size of the replay protection window, in packets.

When this variable is set to 0, all packets that arrive out-of-order are dropped.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Configuring Media Access Control Security (MACsec) on MX Series Routers*

replay-protect (MX Series)

Syntax

replay-protect {
  replay-window-size *number-of-packets*;
}

Hierarchy Level

[edit security macsec connectivity-association*connectivity-association-name*]

Release Information

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description

Enable replay protection for MACsec.

A replay window size specified using the **replay-window-size** ***number-of-packets*** statement must be specified to enable replay protection.

Options

The remaining statements are explained separately.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Release Information Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

Description Configures the number of minutes that the node does not process any Ethernet ring protection (ERP) protocol data units (PDUs).. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.

Options *number*—Specify the restore interval.

Range: 1 through 12 minutes

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

retries

Syntax

retries *integer*;

Hierarchy Level

[edit protocols dot1x authenticator interface *interface-id*]

Release Information

Statement introduced in Junos OS Release 9.3.

Description

Set a limit on the number of failed authentication attempts between a port and a client. When the limit is exceeded, the port waits to reattempt authentication for the number of seconds set by the **quiet-period** statement configured at the same hierarchy level.

Options

integer—Specify the number of retries.

Range: 1 through 10

Default: 3 retries

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

retries (MX Series in Enhanced LAN Mode)

Syntax retries *number*;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*])]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X and captive portal authentication, configure the number of times the switch attempts to authenticate the port after an initial failure. The port remains in a wait state during the quiet period after the authentication attempt.

Options *number*—Number of retries.

Default: 3 retries

Range: 1 through 10

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

revertive

Syntax revertive;

Hierarchy Level [edit interfaces ae*X* aggregated-ether-options lacp link-protection]

Release Information Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 12.3 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Description Enable the ability to switch to a better priority link (if one is available).

NOTE: By default, LACP link protection is revertive. However, you can use this statement to define a specific aggregated Ethernet interface as revertive to override a global **non-revertive** statement specified at the **[edit chassis]** hierarchy level.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- *non-revertive (Chassis)*
- *Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches*

ring-id

Syntax ring-id *number*;

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name*]

Release Information Statement introduced in Junos OS Release 14.2.

Description Specify the ring ID.

Options *number*—Ring ID number.

Range: 1 through 239

Default: 1

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Ethernet Ring Protection Switching Overview on page 221
- *Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure)*

ring-protection-link-end

Syntax ring-protection-link-end;

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name* (east-interface | west-interface)]

Release Information Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.

Description Specify that the port is one side of a ring protection link (RPL) by setting the RPL end flag.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Ethernet Ring Protection Switching Overview on page 221

ring-protection-link-owner

Syntax ring-protection-link-owner;

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name*]

Release Information Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

Description Specify the ring protection link (RPL) owner flag in the Ethernet protection ring. Include this statement only once for each ring (only one node can function as the RPL owner).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

routing-instance

Syntax

```
routing-instance {
  destination routing-instance-name;
}
```

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* tunnel],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* tunnel]

Release Information Statement introduced before Junos OS Release 7.4.

Description To configure **interfaces** and **logical-systems**, specify the destination routing instance that points to the routing table containing the tunnel destination address.

Default The default Internet routing table is **inet.0**.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- *Junos OS Services Interfaces Library for Routing Devices*

routing-instance (PPPoE Service Name Tables)

Syntax

routing-instance *routing-instance-name*;

Hierarchy Level

[edit protocols pppoe service-name-tables *table-name* service *service-name*],
[edit protocols pppoe service-name-tables *table-name* service *service-name* agent-specifier aci *circuit-id-string* ari *remote-id-string*]

Release Information

Statement introduced in Junos OS Release 10.2.

Description

Use in conjunction with the **dynamic-profile** statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, **empty** service entry, or **any** service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.

The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.

If you include the **routing-instance** statement at the **[edit protocols pppoe service-name-tables *table-name* service *service-name* agent-specifier aci *circuit-id-string* ari *remote-id-string*]** hierarchy level, you cannot also include the **static-interface** statement at this level. The **routing-instance** and **static-interface** statements are mutually exclusive for ACI/ARI pair configurations.

Options

routing-instance-name—Name of the routing instance in which the router instantiates the dynamic PPPoE interface.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- *Configuring PPPoE Service Name Tables*
- *Assigning a Dynamic Profile and Routing Instance to a Service Name or ACI/ARI Pair for Dynamic PPPoE Interface Creation*

sa-multicast (100-Gigabit Ethernet)

Syntax sa-multicast;

Hierarchy Level [edit chassis fpc *slot* pic *slot* forwarding-mode]

Release Information Statement introduced in Junos OS Release 10.4.

Description Configure the 100-Gigabit Ethernet PIC or MIC to interoperate with other Juniper Networks 100-Gigabit Ethernet PICs.

NOTE: **The default packet steering mode for PD-1CE-CFP-FPC4 is SA multicast bit mode. No SA multicast configuration is required to enable this mode.**

sa-multicast supports interoperability between the following PICs and MICs:

- 100-Gigabit Ethernet Type 5 PIC with CFP (PF-1CGE-CFP) and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4) .
- 100-Gigabit Ethernet MICs and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

sa-multicast (PTX Series Packet Transport Routers)

Syntax sa-multicast;

Hierarchy Level [edit chassis fpc *slot* pic *slot* port *port-number* forwarding-mode]

Release Information Statement introduced in Junos OS Release 12.1X48R4.

Description Configure source address (SA) multicast bit mode on the 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP to enable interoperability with 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4.

> NOTE: When SA multicast bit steering mode is configured on a PTX Series Packet Transport Router 100-Gigabit Ethernet port, VLANs are not supported for that port.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

secure-authentication (MX Series in Enhanced LAN Mode)

Syntax secure-authentication (http | https);

Hierarchy Level [edit protocols captive-portal-custom-options]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Enable HTTP or HTTPS access on the captive portal interface.

Default **http**

Options **http**—Enables HTTP access on the captive portal interface.

https—Enables HTTPS access on the captive portal interface. HTTPS is recommended.

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

secure-channel

Syntax

```
secure-channel secure-channel-name {
  direction (inbound | outbound);
  encryption (MACsec);
  id {
    mac-address mac-address;
    port-idport-id-number;
  }
  offset (0|30|50);
  security-association security-association-number {
    key key-string;
  }
}
```

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name*]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Create and configure a secure channel to enable and configure MACsec when MACsec is enabled using static secure association key (SAK) security mode.

You do not need to use this option to enable MACsec using static connectivity association key (CAK) security mode. All configuration for MACsec using static CAK security mode is done inside of the connectivity association but outside of the secure channel. When MACsec is enabled using static CAK security mode, an inbound and an outbound secure channel—neither of which is user-configurable—is automatically created within the connectivity association.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Configuring Media Access Control Security (MACsec) on MX Series Routers*

security-association

Syntax

security-association *security-association-number* {
  key *key-string*;
}

Hierarchy Level

[edit security macsec connectivity-association *connectivity-association-name* secure-channel *secure-channel-name*]

Release Information

Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description

Specifies the number of one of the security associations in the secure channel when MACsec is enabled using static secure association key (SAK) security mode. Because SAKs are created by the key server when MACsec is enabled using static connectivity association key (CAK) security mode, the **security-association** statement is not used when enabling MACsec using static CAK security mode.

You must configure at least two security associations to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.

Default

No security keys are configured, by default.

Options

security-association-number—Specifies the security association number and creates the SAK.

The security association number is a whole number between 0 and 3. You can configure two security associations in a secure channel when enabling MACsec using static security keys.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

- *Configuring Media Access Control Security (MACsec) on MX Series Routers*

send-critical-event

Syntax send-critical-event;

Hierarchy Level [edit protocols oam ethernet link-fault-management action-profile action]

Release Information Statement introduced in Junos OS Release 8.5.

Description Send OAM PDUs with the critical event bit set.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Specifying the Actions to Be Taken for Link-Fault Management Events on page 700

server

Syntax server;

Hierarchy Level [edit interfaces pp0 unit *logical-unit-number* pppoe-options],
[edit logical-systems *logical-system-name* interfaces pp0 unit *logical-unit-number* pppoe-options]

Release Information Statement introduced in Junos OS Release 8.5.

Description Configure the router to operate in the PPPoE server mode. Supported on M120 and M320 Multiservice Edge Routers and MX Series Universal Edge Routers operating as access concentrators.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring the PPPoE Server Mode on page 357

server-fail

Syntax server-fail (deny | permit | use-cache | *vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For EX Series switches configured for 802.1X authentication, specify the server fail fallback action the switch takes when all RADIUS authentication servers are unreachable.

When you specify the action ***vlan-name*** or ***vlan-id***, the VLAN must already be configured on the switch.

Default Authentication is denied.

Options **deny**—Force fail the supplicant authentication. No traffic will flow through the interface.

permit—Force succeed the supplicant authentication. Traffic will flow through the interface as if it were successfully authenticated by the RADIUS server.

use-cache—Force succeed the supplicant authentication only if it was previously authenticated successfully. This action ensures that already authenticated supplicants are not affected.

vlan-id—Move supplicant on the interface to the VLAN specified by this numeric identifier. This action is allowed only if it is the first supplicant connecting to the interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.

vlan-name—Move supplicant on the interface to the VLAN specified by this name. This action is allowed only if it is the first supplicant connecting to an interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

server-reject-vlan (MX Series in Enhanced LAN Mode)

Syntax

```
server-reject-vlan (vlan-id | vlan-name) {
   eapol-block;
   block-interval block-interval;
}
```

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For EX Series switches configured for 802.1X authentication, specify that when the switch receives an Extensible Authentication Protocol Over LAN (EAPoL) Access-Reject message during the authentication process between the switch and the RADIUS authentication server, supplicants attempting access to the LAN are granted access and moved to a specific VLAN. Any VLAN name or VLAN ID sent by a RADIUS server as part of the EAPoL Access-Reject message is ignored.

When you specify the VLAN ID or VLAN name, the VLAN must already be configured on the switch.

The remaining statements are explained separately. See CLI Explorer.

Default None

Options ***vlan-id***—Numeric identifier of the VLAN to which the supplicant is moved.

vlan-name—Name of the VLAN to which the supplicant is moved.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

server-timeout

Syntax server-timeout *seconds*;

Hierarchy Level [edit protocols dot1x authenticator interface *interface-id*]

Release Information Statement introduced in Junos OS Release 9.3.

Description Sets the number of seconds the port waits for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.

Options ***seconds***—The number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.

Range: 1 through 60 seconds

Default: 30 seconds

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- IEEE 802.1x Port-Based Network Access Control Overview on page 33
- **authenticator on page 1087**

server-timeout (MX Series in Enhanced LAN Mode)

Syntax server-timeout *seconds*;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*])]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X and captive portal authentication, configure the amount of time a port will wait for a reply when relaying a response from the supplicant to the authentication server before timing out and invoking the server-fail action.

Default 30 seconds

Options *seconds* —Number of seconds.

Range: 1 through 60 seconds

Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

service (PPPoE)

Syntax

```
service service-name {
  drop;
  delay seconds;
  terminate;
  dynamic-profile profile-name;
  routing-instance routing-instance-name;
  max-sessions number;
  agent-specifier {
    aci circuit-id-string ari remote-id-string {
      drop;
      delay seconds;
      terminate;
      dynamic-profile profile-name;
      routing-instance routing-instance-name;
      static-interface interface-name;
    }
  }
}
```

Hierarchy Level

[edit protocols pppoe service-name-tables *table-name*]

Release Information

Statement introduced in Junos OS Release 10.0.
any, **dynamic-profile**, **routing-instance**, **max-sessions**, and **static-interface** options introduced in Junos OS Release 10.2.

Description

Specify the action taken by the interface on receipt of a PPPoE Active Discovery Initiation (PADI) control packet for the specified named service, **empty** service, or **any** service in a PPPoE service name table. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service.

Default

The default action is terminate.

Options

service-name—Service entry in the PPPoE service name table:

- *service-name*—Named service entry of up to 32 characters; for example, **premiumService**. You can configure a maximum of 512 named service entries across all PPPoE service name tables on the router.
- **empty**—Service entry of zero length that represents an unspecified service. Each PPPoE service name table includes one **empty** service entry by default.
- **any**—Default service for non-empty service entries that do not match the named or **empty** service entries configured in the PPPoE service name table. Each PPPoE service name table includes one **any** service entry by default.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* pppoe-underlying-options]

Release Information

Statement introduced in Junos OS Release 10.0.
Support at the **[edit … family pppoe]** hierarchies introduced in Junos OS Release 11.2.

Description

Specify the PPPoE service name table assigned to a PPPoE underlying interface. This underlying interface is configured with either the **encapsulation ppp-over-ether** statement or the **family pppoe** statement; the two statements are mutually exclusive.

NOTE: The **[edit … family pppoe]** hierarchies are supported only on MX Series routers with MPCs.

Options

table-name—Name of the PPPoE service name table, a string of up to 32 alphanumeric characters.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

session-expiry (MX Series in Enhanced LAN Mode)

Syntax session-expiry *seconds*;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*])]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Configure the maximum duration in seconds of a session.

Options *seconds*—Duration of session.

Range: 1 through 65535

Default: 3600

Required Privilege Level routing—To view this statement in the configuration.
routing–control—To add this statement to the configuration.

source-address-filter

Syntax

```
source-address-filter {
  mac-address;
}
```

Hierarchy Level

[edit interfaces *interface-name* aggregated-ether-options],
[edit interfaces *interface-name* fastether-options],
[edit interfaces *interface-name* gigether-options]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

Description

For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the **source-filtering** statement in the configuration to enable source address filtering.

Options

mac-address—MAC address filter. You can specify the MAC address as ***nn*:*nn*:*nn*:*nn*:*nn*:*nn*** or ***nnnn.nnnn.nnnn***, where ***n*** is a decimal digit. To specify more than one address, include multiple ***mac-address*** options in the **source-address-filter** statement.

If you enable the VRRP on a Fast Ethernet or Gigabit Ethernet interface, as described in "VRRP and VRRP for IPv6 Overview" on page 345, and if you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the **source-address-filter** statement. MAC addresses ranging from **00:00:5e:00:01:00** through **00:00:5e:00:01:ff** are reserved for VRRP, as defined in RFC 3768, *Virtual Router Redundancy Protocol*. When you configure the VRRP group, the group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

On untagged Gigabit Ethernet interfaces, you should not configure the **source-address-filter** statement and the **accept-source-mac** statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the **source-address-filter** statement and the **accept-source-mac** statement with an identical MAC address specified in both filters.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

source-filtering

Syntax (source-filtering | no-source-filtering);

Hierarchy Level [edit interfaces *interface-name* aggregated-ether-options],
[edit interfaces *interface-name* fastether-options],
[edit interfaces *interface-name* gigether-options]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.

Description For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and Gigabit Ethernet IQ interfaces only, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the **source-address-filter** statement.

If the remote Ethernet card is changed, the interface is no longer able to receive packets from the new card because it has a different MAC address.

Default Source address filtering is disabled.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Speed option 2.5Gbps introduced in Junos OS Release 18.1R2 for EX2300 switch.
Speed option 10Gbps and 5Gbps introduced in Junos OS Release 18.2R1 for EX4300 switch.

Description

Configure the interface speed. This statement applies to the management Ethernet interface (**fxp0** or **em0**), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet port on the FIC (M7i router), Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, and Gigabit Ethernet interfaces on EX Series switches.

When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.

NOTE: On MX Series routers with Tri-rate Enhanced DPC (DPCE-R-40GE-TX), when you configure the interface speed using the **auto-10m-100m** option, the speed is negotiated to the highest value possible (100 Mbps), if the same value is configured on both sides of the link. However, when you view the interface speed of the DPC, using the **show interfaces** command, the value of the speed is not accurately displayed. For instance, if you configure the speed of the Tri-rate enhanced DPC, as 100Mbps on both sides of the link, the interface speed of the DPC is negotiated to 100 Mbps. However, the interface speed of the DPC displays 1 bps. This is an issue with the **show interfaces** command only. The actual interface speed is 100 Mbps.

On 10-Gigabit Ethernet SFP interfaces, autonegotiation is enabled by default and auto-detects the speed to be either 1 Gbps or 10 Gbps. On QFX5100-48S, QFX5100-96S, and QFX5100-24Q devices using 10-Gigabit Ethernet SFP interfaces, the speed is set to 10 Gbps by default and cannot be configured to operate in a different speed. On QFX5100-48S and QFX5100-96S devices using 1-Gigabit Ethernet SFP interfaces, the speed is set to 1 Gbps by default and cannot be configured to operate in a different speed.

NOTE: In Junos OS Release 14.1X53-D35 on QFX5100-48T-6Q devices using 10-Gigabit Ethernet Copper interfaces, autonegotiation is disabled by default on the copper ports, and the interfaces operate at a speed of 100M. You can, however, enable auto-negotiation by issuing the **set interface *name* ether-options auto-negotiation** command on the interface for which you want to change the interface speed. With autonegotiation enabled, the interface auto-detects the speed in which to operate.

NOTE: Only 10 Gbps and 40 Gbps interfaces are supported on OCX Series switches.

NOTE: When displaying interface information with **show interfaces** commands, you might see speed values for 1 Gbps interfaces displayed as **1000mbps**.

(For EX2300 only) Starting in Junos OS Release 18.1R2, the multi-rate speed is supported on EX2300-48MP and EX2300-24MP switches. The speed configuration statement is supported on both multi-rate gigabit ethernet interface (mge) and gigabit ethernet (ge) interface. The mge interface is a rate-selectable (multirate) Gigabit Ethernet interface that can support speeds of 10 Gbps, 5 Gbps, and 2.5 Gbps over CAT5e/CAT6/CAT6a cables. In the EX2300, the mge interface supports 100 Mbps, 1 Gbps, and 2.5 Gbps speeds, which can be configured by using the speed configuration statement. Note that 10Mbps speed is supported only on **ge** interfaces of EX2300 switch.

Default (EX Series) If the auto-negotiation statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level is enabled, the auto-negotiation option is enabled by default.

Options You can specify the speed as either **10m** (10 Mbps), **100m** (100 Mbps), and on MX Series routers, **1g** (1 Gbps). You can also specify the **auto** option on MX Series routers.

For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:

Table 100: Options for speed

Platforms	Speed Supported	Auto-negotiation
EX Series Switches	**100m**—100 Mbps **10m**—10 Mbps **1g**—1 Gbps	auto-negotiation—Automatically negotiate the speed based on the speed of the other end of the link. This option is available only when the auto-negotiation statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level is enabled.
ACX, MX Series	**100m**—100 Mbps **10m**—10 Mbps **1g**—1 Gbps	**auto**—Automatically negotiate the speed (10 Mbps, 100 Mbps, or 1 Gbps) based on the speed of the other end of the link. **auto-10m-100m**—Automatically negotiate the speed (10 Mbps or 100 Mbps) based on the speed of the other end of the link.
EX4600, QFX Series, QFabric, OCX100, QFX Series	**10g**—10 Gbps **1g**—1 Gbps **100m**—100 Mbps	auto-negotiation—Automatically negotiate the speed based on the speed of the other end of the link. This option is available only when the auto-negotiation statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level is enabled.
EX2300	**10m**—10 Mbps (supported on EX series switches and only on **ge** interfaces of EX2300 switch) **100m**—100 Mbps **1g**—1 Gbps **2.5g**—2.5 Gbps (supported only on **mge** interfaces of E2300 switch) **10g**—10 Gbps (supported only on **mge** interfaces for EX4300 switches) **5g**—5 Gbps (supported only on **mge** interfaces for EX4300 switches)	*speed*—Specify the interface speed. If the auto-negotiation statement at the **[edit interfaces *interface-name* ether-options]** hierarchy level is disabled, you must specify a specific value. This value sets the speed that is used on the link. If the **auto-negotiation** statement is enabled, you might want to configure a specific speed value to advertise the desired speed to the remote end.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release History Table

Release	Description
18.2R1	Starting in Junos OS Release 18.1R2, the multi-rate speed is supported on EX2300-48MP and EX2300-24MP switches.

speed (MX Series DPC)

Syntax speed (auto | 1Gbps | 100Mbps | 10Mbps);

Hierarchy Level [edit interfaces ge-*fpc/pic/port*]

Release Information Statement introduced in Junos OS Release 9.5.

Description On MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs you can set auto negotiation of speed. To specify the auto negotiation speed, use the **speed (auto | 1Gbps | 100Mbps | 10Mbps)** statement under the **[edit interface ge-/fpc/pic/port]** hierarchy level. The **auto** option will attempt to automatically match the rate of the connected interface. To set port speed negotiation to a specific rate, set the port speed to **1Gbps**, **100Mbps**, or **10Mbps**.

NOTE: If the negotiated speed and the interface speed do not match, the link will not be brought up. Half duplex mode is not supported.

Options You can specify the speed as either **auto** (autonegotiate), **10Mbps** (10 Mbps), **100Mbps** (100 Mbps), or **1Gbps** (1 Gbps).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

stacked-vlan-tagging

Syntax stacked-vlan-tagging;

Hierarchy Level [edit interfaces *interface-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Description For Gigabit Ethernet IQ interfaces, Gigabit Ethernet, 10-Gigabit Ethernet LAN/WAN PIC, and 100-Gigabit Ethernet Type 5 PIC with CFP, enable stacked VLAN tagging for all logical interfaces on the physical interface.

For pseudowire subscriber interfaces, enable stacked VLAN tagging for logical interfaces on the pseudowire service.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

static (Protocols 802.1X)

Syntax

```
static mac-address {
  interface interface-names;
  vlan-assignment (vlan-id |vlan-name );
}
```

Hierarchy Level [edit protocols authentication-access-control]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Configure MAC addresses to exclude from 802.1X authentication. The static MAC list provides an authentication bypass mechanism for supplicants connecting to a port, permitting devices such as printers that are not 802.1X-enabled to be connected to the network on 802.1X-enabled ports.

Using this 802.1X authentication-bypass mechanism, the supplicant connected to the MAC address is assumed to be successfully authenticated and the port is opened for it. No further authentication is done for the supplicant.

You can optionally configure the VLAN that the supplicant is moved to or the interfaces on which the MAC address can gain access from.

Options *mac-address* —The MAC address of the device for which 802.1X authentication should be bypassed and the device permitted access to the port.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

static-interface

Syntax static-interface *interface-name*;

Hierarchy Level [edit protocols pppoe service-name-tables *table-name* service *service-name* agent-specifier aci *circuit-id-string* ari *remote-id-string*]

Release Information Statement introduced in Junos OS Release 10.2.

Description Reserve the specified static PPPoE interface for use only by the PPPoE client with matching agent circuit identifier (ACI) and agent remote identifier (ARI) information. You can specify only one static interface per ACI/ARI pair configured for a named service entry, **empty** service entry, or **any** service entry in the PPPoE service name table.

The static interface associated with an ACI/ARI pair takes precedence over the general pool of static interfaces associated with the PPPoE underlying interface.

If you include the **static-interface** statement in the configuration, you cannot also include either the **dynamic-profile** statement or the **routing-instance** statement. The **dynamic-profile**, **routing-instance**, and **static-interface** statements are mutually exclusive for ACI/ARI pair configurations.

Options *interface-name*—Name of the static PPPoE interface reserved for use by the PPPoE client with matching ACI/ARI information. Specify the interface in the format **pp0.*logical***, where ***logical*** is a logical unit number from 0 through 16385 for static interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

supplicant

Syntax supplicant *single*;

Hierarchy Level [edit protocols dot1x authenticator interface *interface-id*]

Release Information Statement introduced in Junos OS Release 9.3.

Description Specify the supplicant mode. Only single mode is supported.

This option will authenticate only the first client that connects to a port. All other clients that connect later (802.1x compliant or non-compliant) will be allowed free access on that port without any further authentication. If the first authenticated client logs out, all other users are locked out until a client authenticates again.

Options **single**—Sets single mode.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

supplicant (MX Series in Enhanced LAN Mode)

Syntax supplicant (multiple | single | single-secure);

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*])]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Configure the MAC-based method used to authenticate clients for 802.1X or captive portal authentication.

Default single

Options

single—Authenticates only the first client that connects to an authenticator port. All other clients connecting to the authenticator port after the first are permitted free access to the port without further authentication. If the first authenticated client logs out, all other supplicants are locked out until a client authenticates again.

single-secure—Authenticates only one client to connect to an authenticator port. The host must be directly connected to the switch.

multiple—Authenticates multiple clients individually on one authenticator port. You can configure the number of clients per port. If you also configure a maximum number of devices that can be connected to a port through port security settings, the lower of the configured values is used to determine the maximum number of clients allowed per port.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

supplicant-timeout

Syntax supplicant-timeout *seconds*;

Hierarchy Level [edit protocols dot1x authenticator interface *interface-id*]

Release Information Statement introduced in Junos OS Release 9.3.

Description Specify the number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.

Options *seconds*—Specify the number of seconds the port waits for the supplicant timeout.

Range: 1 through 60 seconds

Default: 30 seconds

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- **interface (IEEE 802.1x) on page 1205**

supplicant-timeout (MX Series in Enhanced LAN Mode)

Syntax supplicant-timeout *seconds*;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X authentication, configure how long the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request.

Default 30 seconds

Options ***seconds*** —Number of seconds.

Range: 1 through 60 seconds

Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

swap

Syntax swap;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* output-vlan-map]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.

Description Specify the VLAN rewrite operation to replace a VLAN tag. The outer VLAN tag of the frame is overwritten with the user-specified VLAN tag information.

On MX Series routers, you can enter this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, aggregated Ethernet using Gigabit Ethernet IQ interfaces, and 100-Gigabit Ethernet Type 5 PIC with CFP. On EX Series switches, you can enter this statement on Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

swap-by-poppush

Syntax swap-by-poppush;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced in Junos OS Release 11.2

Description For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, and aggregated Ethernet using Gigabit Ethernet IQ interfaces, specify the VLAN rewrite operation to replace a VLAN tag. Pop original tag, then push an entirely new tag. The swap operation is performed as pop followed by push.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

swap-push

Syntax swap-push;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* output-vlan-map]

Release Information Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Specify the VLAN rewrite operation to replace the outer VLAN tag of the frame with a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.

You can use this statement on Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, and for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

swap-swap

Syntax swap-swap;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* output-vlan-map]

Release Information Statement introduced in Junos OS Release 8.1.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Specify the VLAN rewrite operation to replace both the inner and the outer VLAN tags of the frame with a user-specified VLAN tag value.

You can use this statement on Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers, and for 100-Gigabit Ethernet Type 5 PIC with CFP.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

switch-options

Syntax

```
switch-options {
  switch-port port-number {
    (auto-negotiation | no-auto-negotiation);
    speed (10m | 100m | 1g);
    link-mode (full-duplex | half-duplex);
  }
}
```

Hierarchy Level [edit interfaces ge-*pim*/0/0]

Release Information Statement introduced in Junos OS Release 8.4.

Description Configuration of the physical port characteristics is done under the single physical interface.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

switch-port

Syntax

```
switch-port port-number {
  (auto-negotiation | no-auto-negotiation);
  speed (10m | 100m | 1g);
  link-mode (full-duplex | half-duplex);
}
```

Hierarchy Level [edit interfaces ge-*pim*/0/0 switch-options]

Release Information Statement introduced in Junos OS Release 8.4.

Description Configuration of the physical port characteristics, done under the single physical interface.

Default Autonegotiation is enabled by default. If the link speed and duplex are also configured, the interfaces use the values configured as the desired values in the negotiation.

Options ***port-number***—Ports are numbered 0 through 5 on the 6-port Gigabit Ethernet uPIM, 0 through 7 on the 8-port Gigabit Ethernet uPIM, and 0 through 15 on the 16-port Gigabit Ethernet uPIM.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

symbol-period

Syntax symbol-period *count*;

Hierarchy Level [edit protocols oam ethernet link-fault-management action-profile event, link-event-rate], [edit protocols oam link-fault-management interface *interface-name* event-thresholds]

Release Information Statement introduced in Junos OS Release 8.4.

Description Configure the threshold for sending symbol period events or taking the action specified in the action profile.

A symbol error is any symbol code error on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period window. The default period window is the number of symbols that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.

Options ***count***—Threshold count for symbol period events.

Range: 0 through 100

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring Threshold Values for Local Fault Events on an Interface on page 694

syslog (OAM Action)

Syntax

syslog;

Hierarchy Level

[edit protocols oam ethernet link-fault-management action-profile action]

Release Information

Statement introduced in Junos OS Release 8.5 for T, M, MX and ACX Series routers, SRX Series firewalls and EX Series switches.
Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.

Description

Generate a syslog message for the Ethernet Operation, Administration, and Management (OAM) event.

Generate a system log message for the Ethernet Operation, Administration, and Maintenance (OAM) link fault management (LFM) event.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Specifying the Actions to Be Taken for Link-Fault Management Events on page 700
- *Configuring Ethernet OAM Link Fault Management (CLI Procedure)*

system-id

Syntax system-id *system-id*;

Hierarchy Level [edit interfaces ae*X* aggregated-ether-options lacp]

Release Information Statement introduced in Junos OS Release 12.2R1
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Description Define the LACP system identifier at the aggregated Ethernet interface level.

The user-defined system identifier in LACP enables two ports from two separate routers (M Series or MX Series routers) to act as though they were part of the same aggregate group.

The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Configuring LACP for Aggregated Ethernet Interfaces on page 140

system-priority

Syntax system-priority *priority*;

Hierarchy Level [edit interfaces ae*X* aggregated-ether-options lacp]

Release Information Statement introduced in Junos OS Release 9.3.
Statement introduced in Junos OS Release 11.4 for EX Series switches.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Description Define LACP system priority at the aggregated Ethernet interface level. This system priority value takes precedence over a system priority value configured at the global **[edit chassis]** hierarchy level.

The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.

Options ***priority***—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.

Range: 0 through 65535

Default: 127

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

tag-protocol-id (TPIDs Expected to Be Sent or Received)

Syntax

tag-protocol-id [*tpids*];

Hierarchy Level

[edit interfaces *interface-name* gigether-options ethernet-switch-profile],
[edit interfaces *interface-name* aggregated-ether-options ethernet-switch-profile],
[edit interfaces *interface-name* aggregated-ether-options ethernet-switch-profile],
[edit interfaces *interface-name* ether-options ethernet-switch-profile]

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.
Statement introduced in Junos OS Release 14.1X53-D15 for the QFX Series.

Description

For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, aggregated Ethernet with Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, and the built-in Gigabit Ethernet port on the M7i router), define the TPIDs expected to be sent or received on a particular VLAN. For each Gigabit Ethernet port, you can configure up to eight TPIDs using the **tag-protocol-id** statement; but only the first four TPIDs are supported on IQ2 and IQ2-E interfaces.

For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers only the default TPID value (**0x8100**) is supported.

For Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, define the TPIDs expected to be sent or received on a particular VLAN. The default TPID value is **0x8100**. Other supported values are **0x88a8**, **0x9100**, and **0x9200**.

Options

tpids—TPIDs to be accepted on the VLAN. Specify TPIDs in hexadecimal.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

tag-protocol-id (TPID to Rewrite)

Syntax tag-protocol-id *tpid*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* input-vlan-map],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* output-vlan-map]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces only, configure the outer TPID value. All TPIDs you include in input and output VLAN maps must be among those you specify at the **[edit interfaces *interface-name* gigether-options ethernet-switch-profile tag-protocol-id [*tpids*]]** hierarchy level.

For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers the default TPID value (**0x8100**) is supported.

Default If the **tag-protocol-id** statement is not configured, the TPID value is 0x8100.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

targeted-options (Grouping Subscribers by Bandwidth Usage)

Syntax

```
targeted-options {
  backup backup;
  group group;
  primary primary;
  weight weight-value;
}
```

Hierarchy Level

[edit dynamic-profiles *name* interfaces *name* unit],
[edit dynamic-profiles *name* logical-systems *name* interfaces *name* unit],
[edit interfaces *name* unit *unit-number*]

Release Information

Statement introduced in Junos OS Release 16.1.
weight statement introduced in Junos OS Release 17.3 for MX240, MX480, MX960, and MX Virtual Chassis.

Description

Configure primary and backup links for manual targeting.

Options

backup—Specify a backup member link per subscriber when you configure manual targeting. Configuring a backup link is optional.

group—(Optional) Assign a group name for subscribers with similar bandwidth usage. Subscribers that are configured for targeted distribution without a group name are added to the **default** group and distributed evenly across member links. Grouping of subscribers is supported only for static subscribers.

Default: default

primary—Specify a primary member link per subscriber when you configure manual targeting. You must always configure a primary link when you configure manual targeting.

weight ***weight-value***—Specify the weight for all the targeted subscribers like PPPoe, demux, and conventional VLANs based on the customers preferences, class of service (CoS), or bandwidth requirement. Member links for logical interfaces of aggregated Ethernet logical interfaces are assigned based on the value of the weight . When a new VLAN is added to the same aggregated Ethernet bundle, then the primary member link selected for targeting is the one with the minimum primary load and the backup link selected for targeting is the one with the minimum overall load.

NOTE: **The weight *weight-value* statement is supported only at the [edit interfaces *name* unit *unit-number*] hierarchy level.**

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

targeted-options (Manual Targeting)

Syntax

```
targeted-options {
  (logical-interface-chassis-redundancy | logical-interface-fpc-redundancy);
  rebalance-periodic {
    interval interval;
    start-time start-time;
  }
  type (auto | manual);
}
```

Hierarchy Level

[edit dynamic-profiles *name* interfaces *name* aggregated-ether-options],
[edit dynamic-profiles *name* logical-systems *name* interfaces *name*
aggregated-ether-options],
[edit interfaces *name* aggregated-ether-options]
[edit interfaces *name* unit]

Release Information Statement introduced in Junos OS Release 16.1.

Description Configure manual targeting or auto-targeting.

Options

type—Configure manual targeting type as **manual** or **auto**.

Values:

- **auto**—Configure targeted-distribution without specific primary and backup links.
- **manual**—Configure targeted distribution with specific member links as primary and backup for a subscriber. When you configure manual targeting, you must always configure a primary link. Configuring a backup link is optional. You specify the primary and backup links for a subscriber in the individual interface configuration. You configure primary and backup links by using the targeted-options statement at the **[edit interfaces *name* unit]** hierarchy level.

  Manual targeting enhances the distribution of targeted VLANs or subscribers across member links of an aggregated Ethernet bundle by making it bandwidth-aware.

Default: **auto**

The remaining statements are described separately.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

terminate (PPPoE Service Name Tables)

Syntax

terminate;

Hierarchy Level

[edit protocols pppoe service-name-tables *table-name* service *service-name*],
[edit protocols pppoe service-name-tables *table-name* service *service-name* agent-specifier aci *circuit-id-string* ari *remote-id-string*]

Release Information

Statement introduced in Junos OS Release 10.0.
Support at **[edit protocols pppoe service-name-tables *table-name* service *service-name* agent-specifier aci *circuit-id-string* ari *remote-id-string*]** hierarchy level introduced in Junos OS Release 10.2.

Description

Direct the router to immediately respond to a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client by sending the client a PPPoE Active Discovery Offer (PADO) packet. The PADO packet contains the name of the access concentrator (router) that can service the client request. The **terminate** action is the default action for a named service entry, **empty** service entry, **any** service entry, or agent circuit identifier/agent remote identifier (ACI/ARI) pair in a PPPoE service name table.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

thresholds

Syntax

```
thresholds {
  clear clear-value;
  interval interval-value;
  set set-value;
  warning-clear warning-clear-value;
  warning-set warning-set-value;
}
```

Hierarchy Level [edit interfaces *interfaces-name* link-degrade-monitor]

Release Information Statement introduced in Junos OS Release 15.1.

Description Configure the BER threshold values (such as set and clear thresholds) at which different corrective actions must be triggered on a degraded interface.

Options

clear *clear- value*—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. You can configure this value in the 1E–*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of IE–3 refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 12.

interval *interval-value*—The number of consecutive link degrade events that are considered before any corrective action is taken. The supported value range for the interval is 1 through 256, and the default interval is 10.

set *set- value*—The BER threshold value at which the link is considered degraded and a corrective action, specified by the user, is triggered. You can configure this value in the 1E–*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of IE–3 refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 7.

warning clear *warning-clear-value*—The link clear warning threshold. Every time this threshold value is reached, a system message is logged to indicate that the link degrade condition has been cleared on the interface. You can configure this value in the 1E–*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of IE–3 refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 11.

warning set *warning-set-value*—The link degrade warning threshold. Every time this threshold value is reached, a system message is logged to indicate that a link degrade has occurred on the interface. You can configure this value in the 1E–*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of IE–3 refers to the BER threshold value of $1x10^{-3}$. The supported exponent range is 1 through 16, and the default value is 9.

NOTE: The lower the BER with high confidence level, the longer it takes to estimate it. In such cases, a few packet drops might be noticed (based on the bit error distribution) before a link degrade event is detected.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

traceoptions

Syntax

```
traceoptions {
  file filename <files number> <size maximum-file-size> <world-readable |
    no-world-readable>;
  flag flag <disable>;
}
```

Hierarchy Level [edit protocols lldp],
[edit routing-instances *routing-instance-name* protocols lldp]

Release Information Statement introduced in Junos OS Release 9.6.

Description Set LLDP protocol-level tracing options.

Default The default LLDP protocol-level trace options are inherited from the global **traceoptions** statement.

Options **disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place spanning-tree protocol tracing output in the file **/var/log/stp-log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 1 trace file only

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. The following are the LLDP-specific tracing options:

- **all**—Trace all operations.
- **config**—Log configuration events.
- **interface**—Trace interface update events.
- **protocol**—Trace protocol information.
- **rtsock**—Trace socket events.

- **vlan**—Trace vlan update events.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events. This is the default. If you do not specify this option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

no-world-readable—(Optional) Prevent any user from reading the log file. This is the default. If you do not include this option, tracing output is appended to an existing trace file.

size *maximum-file-size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0**. When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the files option.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.

Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in JUNOS Release 10.2 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Define tracing operations for individual interfaces.

To specify more than one tracing operation, include multiple **flag** statements.

The interfaces **traceoptions** statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system **syslog** file in the directory **/var/log/dcd**.

On EX Series, QFX Series, and NFX Series platforms, configure tracing options the link fault management.

On ACX Series, SRX Series, MX Series, M Series, and T Series platforms define tracing operations for the interface process (dcd).

Default If you do not include this statement, no interface-specific tracing operations are performed.

Table 101: OptiOptionsfor traceoptions

Option	Individual interfaces with PTX Series, ACX Series, EX Series	Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series	Interface Process with OAMLFM with EX Series, QFX Series, NFX Series	Interface process with ACX Series, SRX Series, MX Series, M Series, T Series
file*filename*	—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log/dcd**. By default, interface process tracing output is placed in the file.	-	—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. traceoptions (LACP)

Syntax

```
traceoptions {
  file <filename> <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
  no-remote-trace;
}
```

Hierarchy Level [edit protocols lacp]

Release Information Statement introduced in Junos OS Release 7.6.
Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.

Description Define tracing operations for the LACP protocol.

Default If you do not include this statement, no LACP protocol tracing operations are performed.

Options ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, interface process tracing output is placed in the file **lacpd**.

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file*.0**, then ***trace-file*.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—All LACP tracing operations
- **configuration**—Configuration code
- **packet**—Packets sent and received
- **process**—LACP process events
- **protocol**—LACP protocol state machine
- **routing-socket**—Routing socket events
- **startup**—Process startup events

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file*.0.** When the ***trace-file*** again reaches its maximum size, ***trace-file*.0** is renamed ***trace-file*.1** and ***trace-file*** is renamed ***trace-file*.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option:

Syntax: ***x*k** to specify kilobytes, ***x*m** to specify megabytes, or ***x*g** to specify gigabytes

Range: 10 KB through the maximum file size supported on your router

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Statement introduced in Junos OS Release 17.3R2 for JNP-MIC1-MACSEC MIC on MX10003 routers.

Description

Define tracing operations at the MACsec level. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple **flag** statements.

The interfaces **traceoptions** statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the **syslog** file in the directory **/var/log/dcd**.

Default

If you do not include this statement, no tracing operations are performed.

Options

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the trace file, all files are placed in the directory **/var/log/dcd**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches the maximum value, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. The following are the tracing operation options:

all—Trace all operations.

config—Trace configuration messages.

debug—Trace debug messages.

normal—Trace normal messages.

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

traceoptions (MACsec interfaces)

Syntax

```
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable>;
  flag flag;
}
```

Hierarchy Level [edit security macsec interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 16.1 for MPC7E-10G on MX Series routers. Statement introduced in Junos OS Release 17.3R2 for JNP-MIC1-MACSEC MIC on MX10003 routers.

Description Define tracing operations for individual MACsec interfaces. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple **flag** statements.

The interfaces **traceoptions** statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the system **syslog** file in the directory **/var/log/dcd**.

Default If you do not include this statement, no tracing operations are performed.

Options

file ***filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the tracefile, all files are placed in the directory **/var/log/dcd**.

files ***number***—(Optional) Maximum number of trace files. When a trace file named trace-file reaches the maximum value, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. The following are the tracing operation options:

all—Trace all operations.

keys—Trace key creation or generation information.

mka-packets—Trace MACsec Key Agreement (MKA) protocol input and output packet information.

normal—Trace all normal events and messages.

state—Trace MKA protocol state information.

to-secy—Trace MKA to security entity state change information.

no-world-readable—(Optional) Prevent any user from reading the log file.

size ***size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level

admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

traceoptions (PPPoE)

Syntax

```
traceoptions {
  file <filename> <files number> <match regular-expression > <size maximum-file-size>
    <world-readable | no-world-readable>;
  filter {
    aci regular-expression;
    ari regular-expresion;
    service-name regular-expresion;
    underlying-interface interface-name;
  }
  flag flag;
  level (all | error | info | notice | verbose | warning);
  no-remote-trace;
}
```

Hierarchy Level [edit protocols pppoe]

Release Information Statement introduced in Junos OS Release 9.6.
Option **filter** introduced in Junos OS Release 12.3

Description Define tracing operations for PPPoE processes.

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

disable—Disable this trace flag.

filter—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

BEST PRACTICE: Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.

- **aci *regular-expression***—Regular expression to match the agent circuit identifier provided by PPPoE client.

- **ari** ***regular-expression***—Regular expression to match the agent remote identifier provided by PPPoE client.
- **service** ***regular-expression***—Regular expression to match the name of PPPoE service.
- **underlying-interface** ***interface-name***—Name of a PPPoE underlying interface. You cannot use a regular expression for this filter option.

flag ***flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **config**—Trace configuration events.
- **events**—Trace events.
- **gres**—Trace GRES events.
- **init**—Trace initialization events.
- **interface-db**—Trace interface database operations.
- **memory**—Trace memory processing events.
- **protocol**—Trace protocol events.
- **rtsock**—Trace routing socket events.
- **session-db**—Trace connection events and flow.
- **signal**—Trace signal operations.
- **state**—Trace state handling events.
- **timer**—Trace timer processing.
- **ui**—Trace user interface processing.

level—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

Default: **error**

match ***regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace—Disable remote tracing.

no-world-readable—(Optional) Disable unrestricted file access.

size ***maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***size*k** to specify KB, ***size*m** to specify MB, or ***size*g** to specify GB

Range: 10240 through 1073741824

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

trace—To view this statement in the configuration.
trace-control—To add this statement to the configuration.

traceoptions (802.1X and Captive Portal for MX Series in Enhanced LAN Mode)

Syntax

traceoptions {
  file *filename* <files *number*> <size *size*> <world-readable | no-world-readable> <match
    regex>;
  flag *flag*;
}

Hierarchy Level

[edit protocols authentication-access-control]

Release Information

Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description

Define tracing operations for the 802.1X protocol, LLDP, and captive portal authentication.

Default

Tracing operations are disabled.

Options

file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size by using the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **config-internal**—Trace internal configuration operations.
- **dot1x-event**—Trace 802.1x events.
- **dot1x-debug**—Trace 802.1x events.
- **dot1x-ipc**—Trace IPC interactions.
- **eapol**—Trace EAPOL packets transmitted and received.
- **general**—Trace general operations.
- **normal**—Trace normal operations.
- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **state**—Trace protocol state changes.

- **task**—Trace protocol task operations.
- **timer**—Trace protocol timer operations.
- **vlan**—Trace VLAN transactions.

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restrict file access to the user who created the file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files with the **files** option, you also must specify a maximum file size.

Syntax: ***x*k** to specify KB, ***x*m** to specify MB, or ***x*g** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

transmit-delay

Syntax

transmit-delay *seconds*;

Hierarchy Level

[edit protocols lldp],
[edit routing-instances *routing-instance-name* protocols lldp]

Release Information

Statement introduced in Junos OS Release 9.6.

Description

(MX Series and T Series routers only) Configure a delay between two successive LLDP advertisements.

Options

seconds—Delay between two successive LLDP advertisements.

Default: 2

Range: 1 through 8192

Required Privilege Level

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation

- Configuring LLDP on page 338

transmit-interval (MACsec for MX Series)

Syntax transmit-interval *interval*;

Hierarchy Level [edit security macsec connectivity-association *connectivity-association-name* mka]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Specifies the transmit interval for MACsec Key Agreement (MKA) protocol data units (PDUs).

The MKA transmit interval setting sets the frequency for how often the MKA PDU is sent to the directly connected device to maintain MACsec on a point-to-point Ethernet link. A lower *interval* increases bandwidth overhead on the link; a higher *interval* optimizes the MKA protocol data unit exchange process.

The transmit interval settings must be identical on both ends of the link when MACsec using static connectivity association key (CAK) security mode is enabled.

We recommend increasing the interval to 6000 ms in high-traffic load environments.

Default The default transmit interval is 2000 milliseconds.

Options ***interval***—Specifies the transmit interval, in milliseconds.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Related Documentation

transmit-period

Syntax transmit-period *seconds*;

Hierarchy Level [edit protocols dot1x authenticator interface *interface-id*]

Release Information Statement introduced in Junos OS Release 9.3.

Description Set the number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

Options *seconds*—The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.

Range: 1 through 65,535 seconds

Default: 30 seconds

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

transmit-period (MX Series in Enhanced LAN Mode)

Syntax transmit-period *seconds*;

Hierarchy Level [edit protocols authentication-access-control interface (all | [*interface-names*]) dot1x]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description For 802.1X authentication, how long the port waits before retransmitting the initial EAPOL PDUs to the supplicant.

Default 30 seconds

Options *seconds*—Number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant.

Range: 1 through 65,535 seconds

Default: 30 seconds

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

uac-policy (MX Series in Enhanced LAN Mode)

Syntax uac-policy;

Hierarchy Level [edit protocols authentication-access-control]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Configure Junos Pulse Access Control Service as the access policy to authenticate and authorize users connected to the switch for admission to the network and for access to protected network resources.

Default The Access Control Service access policy is disabled.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* interfaces pp0 unit *logical-unit-number* pppoe-options]

Release Information Statement introduced before Junos OS Release 7.4.
Support for aggregated Ethernet added in Junos OS Release 9.4.

Description Configure the interface on which PPP over Ethernet is running.

For demux interfaces, configure the underlying interface on which the demultiplexing (demux) interface is running.

Options *interface-name*—Name of the interface on which PPP over Ethernet or demux is running. For example, **at-0/0/1.0** (ATM VC), **fe-1/0/1.0** (Fast Ethernet interface), **ge-2/0/0.0** (Gigabit Ethernet interface), **ae1.0** (for IP demux on an aggregated Ethernet interface), or **ae1** (for VLAN demux on an aggregated Ethernet interface).

NOTE: **Demux interfaces are currently supported on Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet interfaces, or aggregated Ethernet devices.**

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

        }
      }
    }
```

Hierarchy Level [edit interfaces *interface-name*],
[edit logical-systems *logical-system-name* interfaces *interface-name*],
[edit interfaces interface-set *interface-set-name* interface *interface-name*]

Release Information Statement introduced before Junos OS Release 7.4.

Description Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

Options ***logical-unit-number***—Number of the logical unit.

Range: 0 through 1,073,741,823 for demux and PPPoE static interfaces. 0 through 16,385 for all other static interface types.

etree-ac-role (leaf | root)—To configure an interface as either leaf or root.

The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

unnumbered-address (Dynamic Profiles)

Syntax unnumbered-address *interface-name* <preferred-source-address *address*>;

Hierarchy Level [edit dynamic-profiles *profile-name* interfaces *interface-name* unit *logical-unit-number* family *family*],
[edit dynamic-profiles *profile-name* interfaces demux0 unit *logical-unit-number* family *family*]

Release Information Statement introduced in Junos OS Release 9.2.
Support for the **$junos-preferred-source-address** and **$junos-preferred-source-ipv6-address** predefined variables introduced in Junos OS Release 9.6.
Support for the **$junos-loopback-interface** predefined variable introduced in Junos OS Release 9.6.

Description For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the **$junos-loopback-interface-address** predefined variable.

You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.

Options *interface-name*—Name of the interface from which the local address is derived. The specified interface must have a logical unit number, a configured IP address, and must not be an unnumbered interface. This value can be a specific interface name or the **$junos-loopback-interface** predefined variable.

When defining the **unnumbered-address** statement using a static interface, keep the following in mind:

- If you choose to include the **routing-instance** statement at the **[edit dynamic-profiles]** hierarchy level, that statement must be configured with a dynamic value by using the **$junos-routing-instance** predefined variable. In addition, whatever static unnumbered interface you specify must belong to that routing instance; otherwise, the profile instantiation fails.
- If you choose to not include the **routing-instance** statement at the **[edit dynamic-profiles]** hierarchy level, the unnumbered-address statement uses the default routing instance. The use of the default routing instance requires that the unnumbered interface be configured statically and that it reside in the default routing instance.

NOTE: When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the $junos-routing-instance predefined variable, you must not configure a preferred source address, whether with the $junos-preferred-source-address predefined variable, the $junos-preferred-source-ipv6-address predefined variable, or the

preferred-source-address statement. Configuring the preferred source address in this circumstance causes a commit failure.

When defining the **unnumbered-address** statement using the **$junos-loopback-interface** predefined variable, keep the following in mind:

- To use the **$junos-loopback-interface** predefined variable, the dynamic profile must also contain the **routing-instance** statement configured with the **$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The applied loopback interface is based on the dynamically obtained routing instance of the subscriber.

address—(Optional) Secondary IP address of the donor interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. This value can be a static IP address, the **$junos-preferred-source-address** predefined variable for the inet family, or the **$junos-preferred-source-ipv6-address** predefined variable for the inet6 family.

When defining the **preferred-source-address** value using a static IP address, keep the following in mind:

- The unnumbered interface must be statically configured.
- The IP address specified as the **preferred-source-address** must be configured in the specified unnumbered interface.

When defining the **preferred-source-address** value using the **$junos-preferred-source-address** or the **$junos-preferred-source-ipv6-address** predefined variables, keep the following in mind:

- You must configure the **unnumbered-address** statement using the **$junos-loopback-interface** predefined variable.
- You must configure the **routing-instance** statement using the **$junos-routing-instance** predefined variable at the **[edit dynamic-profiles]** hierarchy level.
- The preferred source address chosen is based on the dynamically applied loopback address which is in turn derived from the dynamically obtained routing instance of the subscriber. The configured loopback address with the closest network match to the user IP address is selected as the preferred source address.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

vlan-assignment

Syntax vlan-assignment (*vlan-id* | *vlan-name*);

Hierarchy Level [edit protocols authentication-access-control]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Configure the VLAN that is associated with the list of MAC addresses that are excluded from RADIUS authentication.

Options ***vlan-id*** | ***vlan-name***—The name of the VLAN or the VLAN tag identifier to associate with the device. The VLAN already exists on the switch.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

vlan-id (VLAN ID to Be Bound to a Logical Interface)

Syntax vlan-id *number*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced before Junos OS Release 7.4.

Description For Fast Ethernet, Gigabit Ethernet, and Aggregated Ethernet interfaces only, bind a 802.1Q VLAN tag ID to a logical interface.

Options ***number***—A valid VLAN identifier.

Range: For aggregated Ethernet, 4-port, 8-port, and 12-port Fast Ethernet PICs, and for management and internal Ethernet interfaces, 1 through 1023.

For 48-port Fast Ethernet and Gigabit Ethernet PICs, 1 through 4094.

VLAN ID 0 is reserved for tagging the priority of frames.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Release Information

Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 9.2 for EX Series switches VLAN tagging and Layer 3 subinterfaces.
Support for Layer 2 trunk ports added in Junos OS Release 9.2.
Support for SRX 5600, and SRX 5800 devices added in Junos OS Release 9.6.
Support for logical systems added in Junos OS Release 9.6.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description

For VLANs, specify a VLAN identifier (VID) to include in the packets sent to and from the VLAN, or a VPLS routing instance.

NOTE: When configuring a VLAN identifier for provider backbone bridge (PBB) routing instances, dual-tagged VIDs and the none option are not permitted.

For 802.1Q tagging, configure an 802.1Q tag to apply to all traffic that originates on the VLAN.

The number zero is reserved for priority tagging and the number 4095 is also reserved.

For VLAN ID to Rewrite Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2, 10-Gigabit Ethernet LAN/WAN PIC, and IQ2-E interfaces and aggregated Ethernet using Gigabit Ethernet IQ interfaces, specify the line VLAN identifiers to be rewritten at the input or output interface.

You cannot include the **vlan-id** statement with the **swap** statement, **swap-push** statement, **push-push** statement, or **push-swap** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map]** hierarchy level. If you include any of those statements in the output VLAN map, the VLAN ID in the outgoing frame is rewritten to the **vlan-id** statement that you include at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level.

Default For 802.1Q Tagging on EX Series and SRX Series, If you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1.

For VLANs on a QFX3500 and QFX3500 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.

On a QFX5100 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.

NOTE: You can only create up 4090 VLANs on a QFX5100 switch. If you create more than 4090 VLANs, the interfaces associated with the extra VLANs are not displayed in the **show vlans** command output. For example, if you create 4094 VLANs, the extra VLANs will not have interfaces associated with the VLANs. The order in which you configure the extra VLANs determines which interfaces are missing from the **show vlans** command output.

For VLAN tagging and Layer 3 subinterfaces, bind an 802.1Q VLAN tag ID to a logical interface.

NOTE: The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.

Options For VLANs:

number—A valid VLAN identifier. If you configure multiple VLANs with a valid VLAN identifier, you must specify a unique VLAN identifier for each. However, you can use the same VLAN identifier for VLANs that belong to different virtual switches. Use this option to send single tagged frames with the specified VLAN identifier over VPLS VT interfaces.

NOTE: If you specify a VLAN identifier, you cannot also use the **all** option. They are mutually exclusive.

all—Specify that the VLAN spans all the VLAN identifiers configured on the member logical interfaces.

NOTE: You cannot specify the **all** option if you include a routing interface in the VLAN.

none—Specify to enable shared VLAN learning or to send untagged frames over VPLS VT interfaces.

NOTE: Multichassis link aggregation (MC-LAG) does not support the **none** option with the **vlan-id** statement with VLANs.

For 802.1Q Tagging:

number —VLAN tag identifier

Range:

- 1 through 4094 (all switches except EX8200 Virtual Chassis)
- 1 through 4092 (EX8200 Virtual Chassis only)

Default: 1

Required Privilege Level
routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.
system—To view this statement in the configuration.
system-control—To add this statement to the configuration.
interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

vlan-id-list (Ethernet VLAN Circuit)

Syntax vlan-id-list [*vlan-id vlan-id–vlan-id*];

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced in Junos OS Release 9.5.

Description Binds a single-tag logical interface to a list of VLAN IDs. Configures a logical interface to receive and forward any tag frame whose VLAN ID tag matches the list of VLAN IDs you specify.

NOTE:
When you create a circuit cross-connect (CCC) using VLAN-bundled single-tag logical interfaces on Layer 2 VPN routing instances, the circuit automatically uses **ethernet** encapsulation. For Layer 2 VPN, you need to include the **encapsulation-type** statement and specify the value **ethernet** at either of the following hierarchy levels:

- **[edit routing-instances *routing-instance-name* protocols l2vpn]**
- **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols l2vpn]**

For more information about the **encapsulation-type** configuration statement and the Layer 2 encapsulation types **ethernet** and **ethernet-vlan**, see the *Junos OS VPNs Library for Routing Devices*.

Options **[*vlan-id vlan-id–vlan-id*]**—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

Range: 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

NOTE: Configuring **vlan-id-list** with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
vlan-tagging;
```

```
unit number {
    vlan-id-range 1-4094;
}

[edit interfaces interface-name]
unit 0;
```

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

vlan-id-range

Syntax vlan-id-range *vlan-id–vlan-id*

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Description Bind a range of VLAN IDs to a logical interface.

Options **number**—The first number is the lowest VLAN ID in the range the second number is the highest VLAN ID in the range.

Range: 1 through 4094

NOTE: Configuring **vlan-id-range** with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id-range 1-4094;
}

[edit interfaces interface-name]
unit 0;
```

VLAN ID 0 is reserved for tagging the priority of frames.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

vlan-tagging

Syntax vlan-tagging;

Syntax (QFX Series, NFX Series, and EX4600) vlan-tagging;

Syntax (SRX Series Interfaces) vlan-tagging native-vlan-id *vlan-id*;

Hierarchy Level [edit interfaces *interface-name*],
[edit logical-systems *logical-system-name* interfaces *interface-name*]

QFX Series, NFX Series, and EX4600 Interfaces [edit interfaces (QFX Series) *interface-name*]
[edit interfaces (QFX Series) interface-range *interface-range-name*]

SRX Series Interfaces [edit interfaces *interface*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 11.3 for the QFX Series.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 13.2 for PTX Series Routers.
Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series.

Description For Fast Ethernet and Gigabit Ethernet interfaces, aggregated Ethernet interfaces configured for VPLS, and pseudowire subscriber interfaces, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

NOTE: For QFX Series configure VLAN identifier for untagged packets received on the physical interface of a trunk mode interface. Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.

On EX Series switches except for EX4300 and EX9200 switches, the **vlan-tagging** and **family ethernet-switching** statements cannot be configured on the same interface. Interfaces on EX2200, EX3200, EX3300, EX4200, and EX4500 switches are set to **family ethernet-switching** by the default factory configuration. EX6200 and EX8200 switch interfaces do not have a default **family** setting.

Default VLAN tagging is disabled by default.

SRX Series [Warning: element unresolved in stylesheets: <title> (in <config-options>). This is probably a new element that is not yet supported in the stylesheets.]

SRX Series

native-vlan-id—Configures a VLAN identifier for untagged packets. Enter a number from 0 through 4094.

NOTE: The **native-vlan-id** can be configured only when either **flexible-vlan-tagging** mode or **interface-mode** trunk is configured.

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

vlan-tags

Syntax vlan-tags outer [*tpid*].*vlan-id* [inner [*tpid*].*vlan-id*];

Hierarchy Level [edit dynamic-profiles *profile-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced in Junos OS Release 9.5.
VLAN demux interface support introduced in Junos OS Release 10.2.

Description For Gigabit Ethernet IQ and IQE interfaces only, binds TPIDs and 802.1Q VLAN tag IDs to a logical interface. You must include the **stacked-vlan-tagging** statement at the **[edit interfaces *interface-name*]** hierarchy level.

NOTE: The **inner-range** ***vid1–vid2*** option is supported on IQE PICs only.

Options **inner [*tpid*].*vlan-id***—A TPID (optional) and a valid VLAN identifier in the format *tpid.vlan-id*. When used in the **dynamic-profiles** hierarchy, specify the **$junos-vlan-id** predefined variable to dynamically obtain the VLAN ID.

NOTE: On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the **inner-range** ***tpid*. *vid1—vid2*** option with the **vlan-tags** statement for ISP-facing interfaces.

Range: For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

outer [*tpid*].*vlan-id*—A TPID (optional) and a valid VLAN identifier in the format *tpid.vlan-id*. When used in the **dynamic-profiles** hierarchy, specify the **$junos-stacked-vlan-id** predefined variable.

Range: For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation
- Configuring Dual VLAN Tags on page 565

vlan-tags (Dual-Tagged Logical Interface)

Syntax vlan-tags inner-list [*vlan-id vlan-id–vlan-id*] outer <*tpid*.>*vlan-id*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced in Junos OS Release 9.5.

Description (MX Series routers only) Binds a dual-tag logical interface to a list of VLAN IDs. Configures the logical interface to receive and forward any dual-tag frame whose inner VLAN ID tag matches the list of VLAN IDs you specify.

NOTE:
To create a circuit cross-connect (CCC) using VLAN-bundled dual-tag logical interfaces on Layer 2 VPN routing instances, you must include the **encapsulation-type** statement and specify the value **ethernet-vlan** at the one of the following hierarchy levels:

- **[edit routing-instances *routing-instance-name* protocols l2vpn]**
- **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols l2vpn]**

For more information about the **encapsulation-type** configuration statement and the Layer 2 encapsulation types **ethernet** and **ethernet-vlan**, see the *Junos OS VPNs Library for Routing Devices*.

Options **inner-list [*vlan-id vlan-id vlan-id-vlan-id*]**—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

Range: 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

outer <*tpid*.>*vlan-id*—An optional Tag Protocol ID (TPID) and a valid VLAN ID.

Range: For TPID, specify a hexadecimal value in the format **0x*nnnn***.

Range: For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

NOTE: Configuring **inner-list** with the entire vlan-id range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through

4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-tags outer vid inner-list 1-4094;
}

[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id vid;
}
```

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

vlan-tags (Stacked VLAN Tags)

Syntax vlan-tags inner *tpid.vlan-id* inner-list *value* inner-range *vid1—vid2* outer *tpid.vlan-id*;

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

Description Bind TPIDs and 802.1Q VLAN tag IDs to a logical interface. TPID fields are used to identify the frame as an IEEE 802.1Q-tagged frame.

Options **inner *tpid.vlan-id***—A TPID and a valid VLAN identifier. TPID is a 16-bit field set to a value of 0x8100 in order to identify the frame as an IEEE 802.1Q-tagged frame.

Range: (most routers) For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

inner-list *value*— List or a set of VLAN identifiers.

NOTE: This is supported on MX Series routers with Trio-based FPCs.

inner-range *tpid. vid1–vid2*—Specify a TPID and a range of VLAN IDs where vid1 is the start of the range and vid2 is the end of the range.

NOTE: On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the **inner-range *tpid. vid1—vid2*** option with the **vlan-tags** statement for ISP-facing interfaces.

Range: For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

outer *tpid.vlan-id*—A TPID and a valid VLAN identifier.

Range: (most routers) For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

NOTE: Configuring **inner-range** with the entire vlan-id range consumes system resources and is not a best practice. The **inner-range** must be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through 4094), it has the same result as not specifying a range; however, it consumes Packet Forwarding Engine resources such as VLAN lookup table entries, and so on.

The following examples illustrate this further:

```
[edit interfaces  interface-name]
stacked-vlan-tagging;
unit number {
    vlan-tags outer vid inner-range 1-4094;
}

[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id vid;
}
```

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

wait-to-block-interval

Syntax wait-to-block-interval *number*;

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name*]

Release Information Statement introduced in Junos OS Release 14.2.

Description Enable the Wait to Block (WTB) timer interval when clearing force switch and manual switch commands.

Options *number*—Wait-to-block interval, in seconds.

Range: 5 through 10 s

Default: 5 s

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

- Ethernet Ring Protection Switching Overview on page 221

west-interface

Syntax

```
west-interface {
  node-id mac-address;
  control-channel channel-name {
    vlan number;
    interface name interface-name
  }
  interface-none
  ring-protection-link-end;
  virtual-control-channel {
    west-interface name;
    east-interface name;
  }
}
```

Hierarchy Level [edit protocols protection-group ethernet-ring *ring-name*]

Release Information Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

Description Define one of the two interface ports for Ethernet ring protection, the other being defined by the **east-interface** statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

NOTE: Always configure this port second, after configuring the **east-interface** statement.

The remaining statements are explained separately. See CLI Explorer.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

clear interfaces interface-set statistics

Syntax clear interfaces interface-set statistics *interface-set-name*

Release Information Command introduced in Junos OS Release 8.5.

Description Set interface set statistics to zero.

Options ***interface-set-name***—Set statistics on a specified interface set to zero. Wildcard values can be used in the interface set name. This command will not clear the statistics of the member logical interfaces.

Required Privilege Level clear

List of Sample Output clear interfaces interface-set statistics on page 1456

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear interfaces interface-set statistics

`user@host>` **clear interfaces interface-set statistics**

clear interfaces interval

Syntax clear interfaces interval *interface-name*

Release Information Command introduced before Junos OS Release 7.4.

Description Clear the channel service unit (CSU) alarm and defect counters so that only the current time interval is displayed. This operation affects the **show interface interval** command, but not an SNMP query.

Options *interface-name*—Name of a particular interface.

Required Privilege Level clear

clear interfaces aeX forwarding-options load-balance state

Syntax clear interfaces ae*X* unit *logical-unit-number* aggregate forwarding-options load-balance state

Release Information Command introduced in Junos OS Release 13.2R1.

Description Clear the specified aggregate Ethernet interface load balancing state and re-create it newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.

If you observe load distribution to be not very effective, you can clear the load-balancing states or use rebalancing functionality to cause an automatic clearance of the hardware states. When you configure the rebalancing facility, traffic flows can get redirected to different links, which can cause packet reordering.

Options **ae*X***—Name of a particular aggregated Ethernet interface.

logical-unit-number—Number of the logical unit of the interface.

forwarding-options load-balance state—Cause the load-balancing state to be cleared for the specific interface.

Required Privilege Level clear

clear interfaces transport pm

Syntax

clear interfaces transport pm (all | optics | otn) (all | current | current-day) (all | *interface-name*)

Release Information

Command introduced in Junos OS Release 14.2 on the PTX Series.

Description

Clear optics and OTN information from the transport performance monitoring data.

Options

(all | optics | otn)—Clear both optics and OTN information or either only optics or only OTN information.

(all | current | current-day)—Clear information for the current 15-minute interval, the ninety-six 15-minute intervals, the current day, and the previous day; information only for the current 15-minute interval; or information only for the current 24 hours.

(all | *interface-name*)—Clear information for all interfaces or only for the specified interface (for example, *et-fpc/pic/port*)).

Required Privilege Level

clear

clear interfaces transport pm

```
user@host> clear interfaces transport pm transport otn current all
```

clear lldp neighbors

Syntax

clear lldp neighbor
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 9.6.

Description

Clear information regarding all Link Layer Discovery Protocol (LLDP) neighbors or LLDP neighbors of the specified interface.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about interface names in the Junos Fusion technology, see *Understanding Junos Fusion Ports* .

Options

interface *interface-name*—(Optional) Clear the LLDP neighbors on the specified interface.

Required Privilege Level

clear oam ethernet connectivity-fault-management continuity-measurement

Syntax

clear oam ethernet connectivity-fault-management continuity-measurement
maintenance-domain ***md-name***
maintenance-association ***ma-name***
<**local-mep** ***local-mep-id***>
<**remote-mep** ***remote-mep-id***>

Release Information

Command introduced in Junos OS Release 11.1.

Description

For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear the existing continuity measurement and restart counting the operational uptime (that is, the total time during which CCM adjacency is active for a particular remote MEP.).

Options

maintenance-domain ***md-name***—Name of an existing CFM maintenance domain.

maintenance-association ***ma-name***—Name of an existing CFM maintenance association.

local-mep ***local-mep-id***—(Optional) Display connectivity fault management information for the specified local MEP only.

remote-mep ***remote-mep-id***—(Optional) Display connectivity fault management information for the specified remote MEP only.

This command produces no output.
```

clear oam ethernet connectivity-fault-management loss-statistics

Syntax

clear oam ethernet connectivity-fault-management loss-statistics
<interface *ethernet-interface-name*>
<level *md-level*>

Release Information

Command introduced in Junos OS Release 11.1.

Description

For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear all loss statistics maintained by CFM for a given maintenance domain and maintenance association.

In addition, for Ethernet interfaces on MX Series routers , clear any ITU-T Y.1731 Ethernet frame loss measurement (ETH-LM) statistics.

By default, the command clears ETH-LM statistics for CFM maintenance association end points (MEPs) attached to any interface on the router.

Options

interface *ethernet-interface-name*—(Optional) Clear ETH-LM statistics and ETH-LM frame counts only for MEPs attached to the specified Ethernet physical interface.

level *md-level*—(Optional) Clear ETH-LM statistics and ETH-LM frame counts only for MEPs within CFM maintenance domains (MDs) of the specified level.

Required Privilege Level

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear oam ethernet connectivity-fault-management loss-statistics

```
user@host> clear oam ethernet connectivity-fault-management loss-statistics
Cleared loss measurements statistics of all CFM sessions
```

clear oam ethernet connectivity-fault-management policer

Syntax clear oam ethernet connectivity-fault-management policer maintenance-domain *md-name* maintenance-association *ma-name*

Release Information Command introduced in Junos OS Release 10.0.

Description On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, M120, MX Series, T320, and T640 routers, clear connectivity-fault-management policer statistics.

Options The following options are supported:

maintenance-domain md-name—Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are cleared for all maintenance associations for all maintenance domains.

maintenance-association ma-name—Name of an existing CFM maintenance association. If this option is not specified, policer statistics are cleared for all maintenance associations for given maintenance domain. This option cannot be specified without specifying maintenance-domain name.

Required Privilege Level view

Policer statistics cleared
```

clear oam ethernet connectivity-fault-management statistics

Syntax

clear oam ethernet connectivity-fault-management statistics
<interface *ethernet-interface-name*>
<level *md-level*>

Release Information

Command introduced in Junos OS Release 8.4.
Support for ETH-DM statistics and frame counts added in Junos OS Release 9.5.

Description

For all routers that support IEEE 802.1ag OAM connectivity-fault management (CFM), clear all statistics maintained by CFM.

In addition, for Ethernet interfaces on Dense Port Concentrators (DPCs) in MX Series routers only, also clear any ITU-T Y.1731 Ethernet frame delay measurement (ETH-DM) statistics and ETH-DM frame counts.

By default, the command clears CFM statistics and ETH-DM statistics and frame counts for CFM maintenance association end points (MEPs) attached to any interface on the router.

Options

ethernet-interface-name—(Optional) Clear CFM statistics, ETH-DM statistics, and ETH-DM frame counts only for MEPs attached to the specified Ethernet physical interface.

level—(Optional) Clear CFM statistics, ETH-DM statistics, and ETH-DM frame counts only for MEPs within CFM maintenance domains (MDs) of the specified level.

Required Privilege Level

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear oam ethernet connectivity-fault-management statistics

```
user@host> clear oam ethernet connectivity-fault-management statistics
Cleared statistics of all CFM sessions
```

clear oam ethernet connectivity-fault-management synthetic-loss-measurement

Syntax

clear oam ethernet connectivity-fault-management synthetic-loss-measurement
maintenance-domain ***md-name***
maintenance-association ***ma-name***
<**local-mep** ***local-mep-id***>
<**remote-mep** ***remote-mep-id***>

Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.

Description

(MX Series routers)—For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear the existing on-demand Ethernet synthetic loss measurement (ETH-SLM) statistics and restart counting the ETH-SLM frame counts and statistics.

Options

maintenance-domain ***md-name***—Name of an existing CFM maintenance domain.

maintenance-association ***ma-name***—Name of an existing CFM maintenance association.

local-mep ***local-mep-id***—(Optional) Clear connectivity fault management information for the specified local MEP only.

remote-mep ***remote-mep-id***—(Optional) Clear connectivity fault management information for the specified remote MEP only.

monitor ethernet delay-measurement

Syntax

monitor ethernet delay-measurement
maintenance-domain *md-name*
maintenance-association *ma-name*
(one-way | two-way)
(*remote-mac-address* | mep *remote-mep-id*)
<count *frame-count*>
<local-mep *mep-id*>
<wait *interval-seconds*>
<priority *802.1p value*>
<size>
<no-session-id-tlv>
<xml>

Release Information

Command introduced in Junos OS Release 9.5.
local-mep option introduced in Junos OS Release 15.1.

Description

Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

NOTE: **If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +c to explicitly quit the monitor ethernet delay-measurement command and return to the CLI command prompt.**

To start an Ethernet frame delay measurement session, the router initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the runtime output of the **monitor ethernet delay-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

Options **maintenance-domain** ***md-name***—Name of an existing CFM maintenance domain.

maintenance-association ***ma-name***—Name of an existing CFM maintenance association.

one-way—Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (1DM) frame and the time at which the receiver MEP receives the frame.

two-way—Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.

mep ***remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: ***nnnn.nnnn.nnnn*** or ***nn:nn:nn:nn:nn:nn***. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

count ***frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.

local-mep ***mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance association end point.

wait ***interval-seconds***—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

priority ***802.1p value***—(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.

size—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

no-session-id-tlv—(Optional) Prevent insertion of the session ID TLV in the request frame.

xml—(Optional) Allow the output of the command to be displayed in XML format supported by both one-way delay measurement and two-way delay measurement. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

Additional Information

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer.

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the CLI Explorer.

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

List of Sample Output

monitor ethernet delay-measurement one-way on page 1480
monitor ethernet delay-measurement two-way on page 1481
monitor ethernet delay-measurement two-way (Invalid DMR Frames Received) on page 1481

Output Fields

The **monitor ethernet delay-measurement** command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- Table 102 on page 1479 lists the run-time output fields for the **monitor ethernet delay-measurement one-way** command.
- Table 103 on page 1480 lists the run-time output fields for the **monitor ethernet delay-measurement two-way** command.

Output fields are listed in the approximate order in which they appear.

Table 102: monitor ethernet delay-measurement one-way Output Fields

Output Field Name	Output Field Description
One-way ETH-DM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
1DM Frames sent	PDU frames sent to the remote MEP in this ETH-DM session.
Packets transmitted	Total number of 1DM PDU frames sent to the remote MEP during this measurement session.

Table 102: monitor ethernet delay-measurement one-way Output Fields (continued)

Output Field Name	Output Field Description
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.
NOTE: For one-way delay measurement, these CLI output fields display **NA** ("not applicable") at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.	

Table 103: monitor ethernet delay-measurement two-way Output Fields

Output Field Name	Output Field Description
Two-way Ethernet frame delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
DMR received from	Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.
Delay	Two-way delay, in microseconds, for the initiator-transmitted DMM frame.
Delay variation	Difference, in microseconds, between the current and previous delay values. This is also known as frame jitter.
Packets transmitted	Total number of DMM PDU frames sent to the remote MEP in this measurement session.
Valid packets received	Total number of DMR PDU frames received from the remote MEP in this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

<no-session-id-tlv>
<xml>

Release Information

Command introduced in Junos OS Release 11.1.
local-mep option introduced in Junos OS Release 15.1

Description

Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval. For MX Series routers, supports point-to-point down MEPs for Ethernet interfaces (as per IEEE 802.1ag over VPWS).

NOTE: If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the **monitor ethernet loss-measurement** command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the **monitor ethernet loss-measurement** command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

Options

maintenance-domain ***md-name***—Name of an existing CFM maintenance domain.

maintenance-association ***ma-name***—Name of an existing CFM maintenance association.

mep ***remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: ***nnnn.nnnn.nnnn*** or ***nn:nn:nn:nn:nn:nn*** (for example, **0011.2233.4455** or **00:11:22:33:44:55**). Multicast MAC addresses are not supported.

count ***frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.

local-mep ***mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

wait ***interval-seconds***—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

priority ***802.1p value***—(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.

no-session-id-tlv—(Optional) Disable the **session id TLV** argument set in the request frame.

xml—(Optional) Allow the output of the command to be displayed in XML format.

Additional Information

To display the interator output for an LM session, run the following command:

- **show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator <profile> maintenance-association <MA> maintenance-domain <MD> local-mep <MEP> remote-mep <RMEP>**

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- **show oam ethernet connectivity-fault-management loss-statistics**
- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the CLI Explorer:

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain *md-name* maintenance-association *ma-name*** command, as described in the CLI Explorer.

For a complete description of Ethernet frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

List of Sample Output

monitor ethernet loss-measurement on page 1485

Output Fields

Table 104 on page 1484 lists the output fields for the **monitor ethernet loss-measurement** command and their descriptions. Output fields are listed in the approximate order in which they appear.

Table 104: monitor ethernet loss-measurement output fields

Output Field Name	Output Field Description
Ethernet loss delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
LMR received from	Unicast MAC address of the remote MEP that transmitted this LMR frame in response to a loss measurement message (LMM) frame.
Near-end frame loss	Count of frame loss associated with ingress data frames.
Far-end frame loss	Count of frame loss associated with egress data frames.
Near-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
Far-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
LMM packets transmitted	Total number of LMM PDU frames sent to the remote MEP in this measurement session.
LMR packets received	Total number of LMR PDU frames received from the remote MEP in this measurement session.
Average near-end frame loss	Average frame loss measured in this session associated with ingress data frames.
Average near-end loss ratio	Average frame loss ratio measured in this session associated with ingress data frames.
Average far-end frame loss	Average frame loss measured in this session associated with egress data frames.
Average far-end loss ratio	Average frame loss ratio measured in this session associated with egress data frames.
Near-end best case frame loss	Lowest frame loss measured in this session associated with ingress data frames.
Near-end best case loss ratio	Lowest frame loss ratio measured in this session associated with ingress data frames.

Table 104: monitor ethernet loss-measurement output fields (continued)

Output Field Name	Output Field Description
Near-end worst case frame loss	Highest frame loss measured in this session associated with ingress data frames.
Near-end worst case loss ratio	Highest frame loss ratio measured in this session associated with ingress data frames.
Far-end best case frame loss	Lowest frame loss measured in this session associated with egress data frames.
Far-end best case loss ratio	Lowest frame loss ratio measured in this session associated with egress data frames.
Far-end worst case frame loss	Highest frame loss measured in this session associated with egress data frames.
Far-end worst case loss ratio	Highest frame loss ratio measured in this session associated with egress data frames.

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

monitor ethernet synthetic-loss-measurement

Syntax

monitor ethernet synthetic-loss-measurement
maintenance-domain *md-name*
maintenance-association *ma-name*
(*remote-mac-address* | mep *remote-mep-id*)
<count *frame-count*>
<local-mep *mep-id*>
<wait *interval-milliseconds*>
<priority *802.1p value*>
<size>
<xml>

Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.
local-mep option introduced in Junos OS Release 15.1

Description

(MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the **monitor ethernet synthetic-loss-measurement** command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the **monitor ethernet synthetic-loss-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

Options

maintenance-domain *md-name*—Name of an existing CFM maintenance domain.

maintenance-association *ma-name*—Name of an existing CFM maintenance association.

mep ***remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: ***nnnn.nnnn.nnnn*** or ***nn*:*nn*:*nn*:*nn*:*nn*:*nn***. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

count ***frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

local-mep ***mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

wait ***interval-milliseconds***—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.

priority ***802.1p value***—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

size—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

xml—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

Additional Information

To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer:

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer.

- **show oam ethernet connectivity-fault-management synthetic-loss-measurement**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the CLI Explorer.

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

List of Sample Output

monitor ethernet synthetic-loss-measurement on page 1490

Output Fields

The **monitor ethernet synthetic-loss-measurement** command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- Table 105 on page 1489 lists the run-time output fields for the **monitor ethernet synthetic-loss-measurement** command.

Output fields are listed in the approximate order in which they appear.

Table 105: monitor ethernet synthetic-loss-measurement Output Fields

Output Field Name	Output Field Description
ETH-SLM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

Sample Output

monitor ethernet synthetic-loss-measurement

Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.
local-mep option introduced in Junos OS Release 15.1

Description

(MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the **monitor ethernet synthetic-loss-measurement** command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the **monitor ethernet synthetic-loss-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

Options

maintenance-domain *md-name*—Name of an existing CFM maintenance domain.

maintenance-association *ma-name*—Name of an existing CFM maintenance association.

mep ***remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: ***nnnn.nnnn.nnnn*** or ***nn*:*nn*:*nn*:*nn*:*nn*:*nn***. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

count ***frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

local-mep ***mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

wait ***interval-milliseconds***—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.

priority ***802.1p value***—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

size—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

xml—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

Additional Information

To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer:

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the CLI Explorer.

- **show oam ethernet connectivity-fault-management synthetic-loss-measurement**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the CLI Explorer.

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

Output Fields

The **monitor ethernet synthetic-loss-measurement** command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- Table 105 on page 1489 lists the run-time output fields for the **monitor ethernet synthetic-loss-measurement** command.

Output fields are listed in the approximate order in which they appear.

Table 106: monitor ethernet synthetic-loss-measurement Output Fields

Output Field Name	Output Field Description
ETH-SLM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

Sample Output

monitor ethernet synthetic-loss-measurement

```
user@host> monitor ethernet synthetic-loss-measurement 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10

      Synthetic Loss measurement statistics:
       SLM packets sent                            : 100
       SLR packets received                        : 100
       Accumulated SLM statistics:
       Local TXFC1 value                           : 100
       Local RXFC1 value                           : 100
       Last Received SLR frame TXFCf(tc)           : 100
       Last Received SLR frame TXFCb(tc)           : 100
       SLM Frame Loss:
       Frame Loss (far-end)                        : 0 (0.00 %)
       Frame Loss (near-end)                       : 0 (0.00 %)
```

request interface link-degrade-recover

Syntax request interface link-degrade-recover *interfaces-name*

Release Information Command introduced in Junos OS Release 15.1.

Description Manually recover a degraded physical link. Manual recovery is used when the interface has any Layer 2 and Layer 3 protocols that prevents autorecovery. This command is applicable only if you have configured the manual link recovery option on the interface.

NOTE: Manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while auto-recovery is in progress.

Options *interfaces-name*—Name of the interface.

request interface mc-ae switchover (Multichassis Link Aggregation)

Syntax

request interface mc-ae switchover
<immediate> mcae-id *mcae-id*;
mcae-id *mcae-id*;

Release Information

Command introduced in Junos OS Release 13.3.

Description

Manually revert egress traffic from the active node to the designated preferred node of a multichassis aggregated Ethernet interface. You can use this command to manually switch over traffic to the preferred node when the **switchover-mode** statement for the multichassis aggregated Ethernet interface is configured as **non-revertive** at the **[edit interfaces ae*X* mc-ae]** hierarchy level.

NOTE: To run this command successfully, the **status-control** statement should be configured as **active** at the **[edit interfaces ae*X* mc-ae]** hierarchy level.

Options

immediate—(Optional) Trigger immediate switchover to the preferred node. If this option is not configured, Junos OS waits for the timer configured using the **revert-time** statement at the **[edit interfaces ae*X* mc-ae]** hierarchy level to expire before it triggers the switchover.

mcae-id ***mcae-id***—Triggers switchover for the specified mc-ae interface.

List of Sample Output

request interface mc-ae switchover immediate mcae-id on page 1498
request interface mc-ae switchover mcae-id on page 1499

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface mc-ae switchover immediate mcae-id

```
user@host >request interface mc-ae switchover immediate mcae-id 2
MCAE: Switchover Done
```

Sample Output

request interface mc-ae switchover mcae-id

```
user@host >request interface mc-ae switchover mcae-id 2
Switchover In Progress: Please check after 1 minutes,

Use “show interfaces mc-ae revertive-info” to check for the status
```

request interface (revert | switchover) (Aggregated Ethernet Link Protection)

Syntax request interface (revert | switchover) ae*x*

Release Information Command introduced in Junos OS Release 8.3.

Description Manually revert egress traffic from the designated backup link to the designated primary link of an aggregated Ethernet interface for which link protection is enabled, or manually switch egress traffic from the primary link to the backup link. This traffic includes transit traffic and local traffic originated on the router itself.

NOTE: When link protection is enabled on an aggregated Ethernet interface, if the primary link fails, the router automatically routes egress traffic to the backup link. However, the router does not automatically route egress traffic back to the primary link when the primary link is subsequently reestablished. Instead, you manually control when to have traffic diverted back to the primary link by issuing the **request interface (revert | switchover)** (Aggregated Ethernet Link Protection) operational command and specifying the **revert** keyword.

On M Series and T Series routers, use the **request interface (revert | switchover)** (Adaptive Services) operational command to manually revert to the primary adaptive services interface or link services interface, or to switch from the primary to the secondary interface. For information about this command, see *request interface (revert | switchover) (Adaptive Services)*.

Options **revert**—Restores egress traffic processing to the primary link.

switchover—Transfers egress traffic processing to the secondary (backup) link.

ae*x*—Aggregated Ethernet logical interface number: 0 through 15.

Required Privilege Level view

List of Sample Output request interface revert on page 1500

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface revert

```
user@host >request interface revert ae1
```

request lacp link-switchover

Syntax request lacp link-switchover ae*x*

Release Information Command introduced in Junos OS Release 9.3.

Description Manually switch aggregated Ethernet active or standby LACP links.

NOTE: Because this command overrides LACP priority calculations, we strongly recommend that you use this command only when the actor (in this case, the Juniper Networks router) is controlling the active or standby link and the partner (peer) is following. This scenario occurs when you configure only the actor for link protection.

Options **ae*x***—Aggregated Ethernet logical interface number: 0 through 15.

Required Privilege Level view

List of Sample Output request lacp link-switchover aeX on page 1501

Output Fields When you enter this command, you are provided feedback on the status of your request. To view the switchover, use the **show lacp interfaces** command.

Sample Output

request lacp link-switchover aeX

```
user@host >request lacp link-switchover ae0ae0: Request succeeded
```

Release Information

Command introduced before Junos OS Release 7.4.
models option introduced in Junos OS Release 8.2.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced in Junos OS Release 9.6 for the TX Matrix Plus router.
Command introduced in Junos OS Release 11.1 for QFX Series.

Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Command introduced in Junos OS Release 12.3 for MX2010 and MX2020 3D Universal Edge Routers.
Information for **disk** and **usb** introduced in Junos OS Release 15.1X53-D60 for QFX10002, QFX10008, and QFX10016 switches.
Command introduced in Junos OS Release 15.1X54-D20 for ACX5048 and ACX5096 Routers.
Command introduced in Junos OS Release 17.2 for MX2008 3D Universal Edge Routers.
Command introduced in Junos OS Release 17.2 for PTX10008 Routers.
Command introduced in Junos OS Release 17.3 for MX10003 3D Universal Edge Routers.
Command introduced in Junos OS Release 17.3 for MX150 Router Appliance.
Command introduced in Junos OS Release 17.4 for MX204 Routers.
Command introduced in Junos OS Release 18.1R1 for EX9251 Switches.
Command introduced in Junos OS Release 18.2 for EX9253 Switches.
Command introduced in Junos OS Release 18.2R1 for MX10008 Routers

Description Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.

In the EX Series switch command output, FPC refers to the following:

- On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC *number* is always 0.
- On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC *number* equals the member ID, from 0 through 9.
- On EX8208 and EX8216 switches—Refers to a line card; FPC *number* equals the slot number for the line card.

On QFX3500, QFX5100, and OCX Series standalone switches, and PTX1000 routers both the FPC and FPC *number* are always **0**.

On T4000 Type 5 FPCs, there are no **top temperature sensor** or **bottom temperature sensor** parameters. Instead, **fan intake temperature sensor** and **fan exhaust temperature sensors** parameters are displayed.

Starting from Junos OS Release 11.4, the output of the **show chassis hardware models** operational mode command displays the enhanced midplanes FRU model numbers (CHAS-BP3-MX240-S, CHAS-BP3-MX480-S or CHAS-BP3-MX960-S) based on the router. Prior to release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through the Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 14.1, the output of the **show chassis hardware detail | extensive | clei-models | models** operational mode command displays the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-P1A) and other components in a PTX5000 Packet Transport Router.

Options

none—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.

clei-models—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).

detail—(Optional) Include RAM and disk information in output.

extensive—(Optional) Display ID EEPROM information.

all-members—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

member *member-id*—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

models—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

node-device *name*—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

satellite [slot-id *slot-id* | device-alias *alias-name*]—(Junos Fusion only) (Optional) Display hardware information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

scc—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with **0**.

Additional Information

The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines, as shown in Table 107 on page 1506.

Table 107: Routing Engines Displaying DIMM Information

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

In Junos OS Release 11.4 and later, the output for the **show chassis hardware models** operational mode command for MX Series routers display the enhanced midplanes FRU model numbers—CHAS-BP3-MX240-S, CHAS-BP3-MX480-S, or CHAS-BP3-MX960-S—based on the router. In releases before Junos OS Release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 17.3R1, the output of the **show chassis hardware** command displays the mode in which vMX is running (performance mode or lite mode) in the part number field for the FPC. **RIOT-PERF** indicates performance mode and **RIOT-LITE** indicates lite mode.

List of Sample Output

Output Fields Table 108 on page 1511 lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 108: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
Item	Chassis component: • (EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. • (MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two "pseudo" FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). MX104 routers have a built-in Packet forwarding Engine and a Forwarding Engine Board (FEB). The Packet Forwarding Engine of the MX104 router has three "pseudo" FPCs (FPC0, FPC1, and FPC2). • (M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller. • (M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB. • (QFX Series)—Information about the chassis, Pseudo CB, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). • (PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal). • (MX2010, MX2020, and MX2008 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays. • (vMX routers)—Information about the chassis, midplane, Routing Engines, and Control Boards (CBs). Also displays information about Flexible PIC Concentrators (FPCs) and associated Modular Interface Cards (MICs) and Physical Interface Cards (PICs).	All levels
Version	Revision level of the chassis component.	All levels
Part number	Part number of the chassis component.	All levels

Table 108: show chassis hardware Output Fields (continued)

Field Name	Field Description	Level of Output
Serial number	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels
Assb ID or **Assembly ID**	(**extensive** keyword only) Identification number that describes the FRU hardware.	**extensive**
Assembly Version	(**extensive** keyword only) Version number of the FRU hardware.	**extensive**
Assembly Flags	(**extensive** keyword only) Flags.	**extensive**
FRU model number	(**clei-models**, **extensive**, and **models** keyword only) Model number of the FRU hardware component.	none specified
CLEI code	(**clei-models** and **extensive** keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
EEPROM Version	ID EEPROM version used by the hardware component: **0x00** (version 0), **0x01** (version 1), or **0x02** (version 2).	**extensive**
Description	Brief description of the hardware item: • Type of power supply. • Type of PIC. If the PIC type is not supported on the current software release, the output states **Hardware Not Supported**. • Type of FPC: **FPC Type 1**, **FPC Type 2**, **FPC Type 3**, **FPC Type 4** , or **FPC TypeOC192**. On EX Series switches, a brief description of the FPC. The following list shows the PIM abbreviation in the output and the corresponding PIM name. ◦ **2x FE**—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM ◦ **4x FE**—4-port Fast Ethernet ePIM ◦ **1x GE Copper**—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port) ◦ **1x GE SFP**—SFP Gigabit Ethernet ePIM (one fiber port) ◦ **2x Serial**—Dual-port serial PIM ◦ **2x T1**—Dual-port T1 PIM ◦ **2x E1**—Dual-port E1 PIM ◦ **2x CT1E1**—Dual-port channelized T1/E1 PIM ◦ **1x T3**—T3 PIM (one port) ◦ **1x E3**—E3 PIM (one port) ◦ **4x BRI S/T**—4-port ISDN BRI S/T PIM ◦ **4x BRI U**—4-port ISDN BRI U PIM ◦ **1x ADSL Annex A**—ADSL 2/2+ Annex A PIM (one port, for POTS)	All levels

Table 108: show chassis hardware Output Fields (continued)

Field Name	Field Description	Level of Output
	- **1x ADSL Annex B**—ADSL 2/2+ Annex B PIM (one port, for ISDN) - **2x SHDSL (ATM)**—G SHDSL PIM (2-port two-wire module or 1-port four-wire module) - **1x TGM550**—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog **LINE** ports, and two analog **TRUNK** ports) - **1x DS1 TIM510**—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup) - **4x FXS, 4xFX0, TIM514**—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog **LINE** ports and four analog **TRUNK** ports) - **4x BRI TIM521**—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports) - **Crypto Accelerator Module**—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services • **MPC M 16x 10GE**—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.) • For hosts, the Routing Engine type. • For small form-factor pluggable transceiver (SFP) modules, the type of fiber: **LX**, **SX**, **LH**, or **T**. • LCD description for EX Series switches (except EX2200 switches). • **MPC2**—1-port MPC2 that supports two separate slots for MICs. • **MPC3E**—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs. • 100GBASE-LR4, pluggable CFP optics • Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy. • Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs). • **MPC4E**—Fixed configuration MPC4E that is available in two flavors: MPC4E-3D-32XGE-SFPP and MPC4E-3D-2CGE-8XGE on MX2020, MX960, MX480, and MX240 routers. • LCD description for MX Series routers

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
transport option introduced in Junos OS Release 16.1R1 for MX Series Routers.
Command introduced in Junos OS Release 17.2 for MX2008 3D Universal Edge Routers.
Command introduced in Junos OS Release 17.2 for PTX10008 Routers.
Command introduced in Junos OS Release 17.3 for MX10003 3D Universal Edge Routers.
Command introduced in Junos OS Release 17.3 for MX150 Router Appliance.
Command introduced in Junos OS Release 17.4 for MX204 3D Universal Edge Routers.
Command introduced in Junos OS Release 18.1R1 for EX9251 switches.
Command introduced in Junos OS Release 18.2 for EX9253 Switches.

Description

Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.

Options

fpc-slot *slot-number*—Display information about the PIC in this particular FPC slot:

- On a TX Matrix router, if you specify the number of the T640 router by using the **lcc *number*** option (the recommended method), replace ***slot-number*** with a value from **0** through **7**. Otherwise, replace ***slot-number*** with a value from **0** through **31**.

  Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc *number*** option (the recommended method), replace ***slot-number*** with a value from **0** through **7**. Otherwise, replace ***slot-number*** with a value from **0** through **31**. For example, the following commands have the same result:

  user@host> **show chassis pic fpc-slot 1 lcc 1 pic-slot 1**
  user@host> **show chassis pic fpc-slot 9 pic-slot 1**

- M120 routers only—Replace ***slot-number*** with a value from **0** through **5**.
- MX80 routers only—Replace ***slot-number*** with a value from **0** through **1**.
- MX104 routers only—Replace ***slot-number*** with a value from **0** through **2**.

- MX240 routers only—Replace ***slot-number*** with a value from **0** through **2**.
- MX480 routers only—Replace ***slot-number*** with a value from **0** through **5**.
- MX960 routers only—Replace ***slot-number*** with a value from **0** through **11**.
- MX2010 routers only—Replace ***slot-number*** with a value from **0** through **9**.
- MX2020 routers only—Replace ***slot-number*** with a value from **0** through **19**.
- MX2008 routers only—Replace ***slot-number*** with a value from **0** through **9**.
- MX10003 routers only—Replace ***slot-number*** with a value from **0** through **1**.
- Other routers—Replace ***slot-number*** with a value from **0** through **7**.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace ***slot-number*** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace ***slot-number*** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace ***slot-number*** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace ***slot-number*** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500, QFX3600, QFX5100, and OCX Series standalone switches—Replace ***slot-number*** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace ***slot-number*** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

all-members—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

interconnect-device ***name***—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

lcc ***number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

member ***member-id***—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device ***name***—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

pic-slot ***slot-number***—Display information about the PIC in this particular PIC slot. For routers, replace ***slot-number*** with a value from **0** through **3**. For EX3200 and EX4200 switches, replace ***slot-number*** with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace ***slot-number*** with 0. For the QFX3500 standalone switch and the QFabric system, replace ***slot-number*** with 0 or 1.

transport—Display PIC information for optical transport network.

List of Sample Output

Output Fields

Table 109 on page 1748 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

Table 109: show chassis pic Output Fields

Field Name	Field Description
Type	PIC type. NOTE: On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as **MIC-3D-1STM64-XFP** and with the SONET framing mode, the type is displayed as **MIC-3D-1OC192-XFP**. By default, the 1-port OC192/STM64 MICs displays the type as **MIC-3D-1OC192-XFP**.
Account Layer2 Overhead	(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.
ASIC type	Type of ASIC on the PIC.
State	Status of the PIC. State is displayed only when a PIC is in the slot. • **Online**— PIC is online and running. • **Offline**—PIC is powered down.
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.
Package	(Multiservices PICs only) Services package supported: **Layer-2** or **Layer-3**.
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: **LH**, **LX**, or **SX.**

Table 109: show chassis pic Output Fields (continued)

Field Name	Field Description
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	Port-level information for the PIC. • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction • Xcvr Firmware—Transceiver firmware version.

PIC Port Information (MX960 Router Bidirectional Optics)	Port-level information for the PIC.
	• Port—Port number
	• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.
	• Fiber type—Type of fiber. SM is single-mode.
	• Xcvr vendor—Transceiver vendor name.
	• Xcvr vendor part number—Transceiver vendor part number.
	  ◦ BX10-10-km bidirectional optics.
	  ◦ BX40-40-km bidirectional optics.
	  ◦ SFP-LX-40-km SFP optics.
	• Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.

PIC Port Information (Next-Generation SONET/SDH SFP)	Port-level information for the next-generation SONET/SDH SFP PIC. • Port—Port number. • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. • Fiber type—Type of fiber: **SM** (single-mode) or **MM** (multimode). • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.
PIC port information (MX104 router)	Port-level information for the PIC. • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. • Xcvr Firmware—Firmware version of the transceiver.

Table 109: show chassis pic Output Fields (continued)

Field Name	Field Description
Port speed information	Information pertaining to port speed: • Port—Port number. • PFE—Packet Forwarding Engine slot number. • Capable Port Speed—Speed supported by each port.
Multirate Mode	Rate-selectabilty status for the MIC: **Enabled** or **Disabled**.
Channelization	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.
Administrative State	Indicates the administrative state of the PIC. Possible values are: In Service (Default) and Out of Service.
Operational State	Indicates the operational state of the PIC. Possible values are: Normal and Fault.

show ethernet-switching redundancy-groups

Syntax

show ethernet-switching redundancy-groups
<redundancy-group-id [0 to 4294967294]>
arp-statistics
nd-statistics
remote-macs

Release Information

Command introduced in Junos OS Release 13.2.
Command introduced in Junos OS Release 15.1R1 for EX Series switches

Description

Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.

Options

redundancy-group-id—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.

arp-statistics—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.

nd-statistics—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.

remote-macs —(Optional) List of remote MAC addresses in the "Installed" state, as learned from the remote MC-AE node.

show ethernet-switching redundancy-groups group-id on page 1773

Output Fields

Output fields are listed in the approximate order in which they appear.

Table 110: show ethernet-switching redundancy-groups arp-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.

Table 110: show ethernet-switching redundancy-groups arp-statistics Output Fields (continued)

Field Name	Field Description
MCLAG ARP Statistics Group ID	ARP statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ARP Rx Count From Line	Total number of ARPs received from the Line.
ARP Tx Count To Peer	Total number of ARPs sent to the peer.
ARP Rx Count From Peer	Total number of ARPs received from the peer.
ARP Drop Count received from line	Total number of ARPs sent by the peer that were received.
ARP Drop Count received from peer	Total number of ARPs sent by the peer that were dropped
ARP Install Count	ARP Install Count

Table 111: show ethernet-switching redundancy-groups nd-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ND Statistics Group ID	Neighbor Discovery statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ND Rx Count From Line	Total number of Neighbor Discovery packets received from the Line.
ND Tx Count To Peer	Total number of Neighbor Discovery packets sent to the peer.
ND Rx Count From Peer	Total number of Neighbor Discovery packets received from the peer.
ND Drop Count received from line	Total number of Neighbor Discovery packets sent by the peer that were received.
ND Drop Count received from peer	Total number of Neighbor Discovery packets sent by the peer that were dropped
ND Install Count	ND Install Count

Table 112: show ethernet-switching redundancy-groups remote-macs Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.

Table 112: show ethernet-switching redundancy-groups remote-macs Output Fields (continued)

Field Name	Field Description
Service ID	Service ID (configured at the routing instance level).
Peer-Addr	IP address of the remote peer.
VLAN	Virtual LAN identifier associated with the redundancy group.
MAC	Hardware media access control address associated with the redundancy group.
MCAE-ID	ID number of the MC-AE used by the redundancy group.
Flags	Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected.
Status	Installation state: Installed or Not Installed.

Sample Output

show ethernet-switching redundancy-groups arp-statistics

```
user@host> show ethernet-switching redundancy-groups arp-statistics

Redundancy Group ID : 1       Flags : Local Connect,Remote Connect

 MCLAG ARP Statistics
 Group ID                                : 1
 ARP Rx Count From Line                  : 3493
 ARP Tx Count To Peer                    : 647
 ARP Rx Count From Peer                  : 0
 ARP Install Count                       : 0
 ARP Drop Count received from line       : 2846
 ARP Drop Count received from peer       : 0
```

show ethernet-switching redundancy-groups nd-statistics

```
user@host> show ethernet-switching redundancy-groups nd-statistics

 Redundancy Group ID : 1     Flags : Local Connect, Remote Connect

MCLAG ND Statistics
Group ID                                 : 1
ND Rx Count From Line                   : 52
ND Tx Count To Peer                     : 15
ND Rx Count From Peer                   : 39
ND Install Count                        : 34
ND Drop Count received from line        : 37
ND Drop Count received from peer        : 5
```

show ethernet-switching redundancy-groups group-id

`user@host>` **show ethernet-switching redundancy-groups 1**

```
Redundancy Group ID : 1       Flags : Local Connect,Remote Connect
```

show interfaces (Adaptive Services)

Syntax

show interfaces *interface-type*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified adaptive services interface.

Options

interface-type—On M Series and T Series routers, the interface type is **sp-** ***fpc/pic/port***.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index ***snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Output Fields

Table 113 on page 1774 lists the output fields for the **show interfaces** (adaptive services and redundant adaptive services) command. Output fields are listed in the approximate order in which they appear.

Table 113: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none

Table 113: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Type	Encapsulation being used on the interface.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source: can be **Internal** or **External**.	All levels
Speed	Speed at which the interface is running.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under *Common Output Fields Description*.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under *Common Output Fields Description*.	All levels
Link type	Physical interface link type: **Full-Duplex** or **Half-Duplex**.	**detail extensive** none
Link flags	Information about the link. Possible values are described in the “Link Flags” section under *Common Output Fields Description*.	**detail extensive** none
Physical info	Information about the physical interface.	**detail extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	MAC address of the hardware.	**detail extensive** none
Alternate link address	Backup address of the link.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour*:*minute*:*second timezone*** **(*hour*:*minute*:*second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**

Table 113: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. NOTE: With static NAT configured as basic NAT44 or destination NAT44 on MX Series routers with MS-MICs and MS-MPCs, the Input bytes field might show 16 more bytes than the Output bytes field. This is caused by the accounting of 16 bytes of the Juniper Forwarding Module cookie. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Frames received smaller than the runt threshold. • **Giants**—Frames received larger than the giant threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **Resource errors**—Sum of transmit drops.	**extensive**
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets larger than the MTU threshold. • **Resource errors**—Sum of transmit drops.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number.	**detail extensive** none

Table 113: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under *Common Output Fields Description*.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	Number and rate of bytes and packets received and transmitted on the logical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes generally less than 1 second for the counter to stabilize.	**detail extensive**
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, **mpls**.	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the "Family Flags" section under *Common Output Fields Description*.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under *Common Output Fields Description*.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none

Table 113: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Broadcast	Broadcast address.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

Sample Output

show interfaces (Adaptive Services)

```
user@host> show interfaces sp-1/2/0
Physical interface: sp-1/2/0, Enabled, Physical link is Up

show interfaces (Aggregated Ethernet)

Syntax

show interfaces ae*number*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series, T Series, and MX Series routers only) Display status information about the specified aggregated Fast Ethernet or Gigabit Ethernet interface.

Options

ae*number*—Display standard information about the specified aggregated Fast Ethernet or Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

Output Fields

Table 114 on page 1782 lists the output fields for the **show interfaces** (Aggregated Ethernet) command. Output fields are listed in the approximate order in which they appear.

Table 114: Aggregated Ethernet show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface and state of the interface.	All levels

Table 114: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Enabled	State of the physical interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	All levels
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Minimum links needed	Number of child links that must be operational for the aggregate interface to be operational.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under *Common Output Fields Description*.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interfaces Flags” section under *Common Output Fields Description*.	All levels
Current address	Configured MAC address.	**detail extensive**
Hardware address	Hardware MAC address.	**detail extensive**
Last flapped	Date, time, and how long ago the interface went from down to up or from up to down. The format is **Last flapped:** ***year-month-day hours:minutes:seconds timezone*** **(*hours:minutes:seconds* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive**
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**

Table 114: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes and rate, in bps, at which bytes are received on the interface. • **Output bytes**—Number of bytes and rate, in bps, at which bytes are transmitted on the interface. • **Input packets**—Number of packets and rate, in pps, at which packets are received on the interface. • **Output packets**—Number of packets and rate, in pps, at which packets are transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface: • **Errors**—Sum of incoming frame aborts and frame check sequence (FCS) errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's random early detection (RED) mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos OS does not handle. • **Resource errors**—Sum of transmit drops.	**detail extensive**
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions** —Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**detail extensive**

Table 114: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Queue counters	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism. NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the **show interfaces** command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs	**detail extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface (which reflects its initialization sequence).	**detail extensive** none
SNMP ifIndex	SNMP interface index number of the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags Field" section under *Common Output Fields Description*.	All levels
VLAN-Tag	Tag Protocol Identifier (TPID) and VLAN identifier.	All levels
Demux	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: • **Source Family Inet** • **Destination Family Inet**	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	All levels

Table 114: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output

Statistics	Information about the number of packets, packets per second, number of bytes, and bytes per second on this aggregate interface.
	• **Bundle**—Information about input and output bundle rates.
	• **Link**—(**detail** and **extensive** only) Information about specific links in the aggregate, including link state and input and output rates.
	• **Adaptive Statistics**—(**extensive** only) Information about adaptive load balancing counter statistics.
	  ◦ **Adaptive Adjusts**—Number of times traffic flow imbalance was corrected by implementation of adaptive load balancing.
	  ◦ **Adaptive Scans**—Number of times the link utilization on each member link of the AE bundle was scanned by for adaptive load balancing
	  ◦ **Adaptive Tolerance**—Tolerance level, in percentage, for load imbalance on link utilization on each member link of the AE bundle.
	  ◦ **Adaptive Updates**—Number of times traffic flow loads have been updated on an AE bundle.
	• **Marker Statistics**—(**detail** and **extensive** only) Information about 802.3ad marker protocol statistics on the specified links.
	  ◦ **Marker Rx**—Number of valid marker protocol data units (PDUs) received on this aggregation port.
	  ◦ **Resp Tx**—Number of marker response PDUs transmitted on this aggregation port.
	  ◦ **Unknown Rx**—Number of frames received that either carry the slow protocols Ethernet type value (43B.4) but contain an unknown PDU, or are addressed to the slow protocols group MAC address (43B.3) but do not carry the slow protocols Ethernet type.
	  ◦ **Illegal Rx**—Number of frames received that carry the slow protocols Ethernet type value (43B.4) but contain a badly formed PDU or an illegal value of protocol subtype (43B.4).
		detail extensive none

LACP info	Link Aggregation Control Protocol (LACP) information for each aggregated interface.
	• **Role** can be one of the following:
	  ◦ **Actor**—Local device participating in LACP negotiation.
	  ◦ **Partner**—Remote device participating in LACP negotiation.
	• **System priority**—Priority assigned to the system (by management or administrative policy), encoded as an unsigned integer.
	• **System identifier**—Actor or partner system ID, encoded as a MAC address.
	• **Port priority**—Priority assigned to the port by the actor or partner (by management or administrative policy), encoded as an unsigned integer.
	• **Unknown Rx**—Number of frames received that either carry the slow protocols Ethernet type value (43B.4) but contain an unknown protocol data unit (PDU), or are addressed to the slow protocols group MAC address (43B.3) but do not carry the slow protocols Ethernet type.
	• **Port key**—Operational key value assigned to the port by the actor or partner, encoded as an unsigned integer.	

Table 114: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LACP Statistics	LACP statistics for each aggregated interface. • **LACP Rx**—LACP received counter that increments for each normal hello. • **LACP Tx**—Number of LACP transmit packet errors logged. • **Unknown Rx**—Number of unrecognized packet errors logged. • **Illegal Rx**—Number of invalid packets received. NOTE: For **LACP Rx** and **LACP Tx**, Packet count is updated only on snmp timer expiry (30 secs).	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. Possible values are described in the “Protocol Field” section under *Common Output Fields Description*.	**brief**
Protocol	Protocol family configured on the logical interface. Possible values are described in the “Protocol Field” section under *Common Output Fields Description*.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about protocol family flags. Possible values are described in the “Family Flags Field” section under *Common Output Fields Description*.	**detail extensive** none
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about address flags. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

show interfaces demux0 (Demux Interfaces)

Syntax

show interfaces demux0.*logical-interface-number*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced in Junos OS Release 9.0.

Description

(MX Series and M Series routers only) Display status information about the specified demux interface.

Options

none—Display standard information about the specified demux interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index ***snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

Output Fields

Table 115 on page 1793 lists the output fields for the **show interfaces** demux0 (Demux Interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 115: show interfaces demux0 (Demux Interfaces) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		

Table 115: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface.	**brief detail extensive** none
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**brief detail extensive** none
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	**brief detail extensive** none
Physical link	Status of the physical link (**Up** or **Down**).	**detail extensive** none
Admin	Administrative state of the interface (**Up** or **Down**).	**terse**
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
Link	Status of the physical link (**Up** or **Down**).	**terse**
Targeting summary	Status of aggregated Ethernet links that are configured with targeted distribution (**primary** or **backup**)	**extensive**
Bandwidth	Bandwidth allocated to the aggregated Ethernet links that are configured with targeted distribution.	**extensive**
Proto	Protocol family configured on the interface.	**terse**
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Type	Type of interface. **Software-Pseudo** indicates a standard software interface with no associated hardware device.	**brief detail extensive** none
Link-level type	Encapsulation being used on the physical interface.	**brief detail extensive**
MTU	Maximum transmission unit size on the physical interface.	**brief detail extensive**
Clocking	Reference clock source: **Internal** (1) or **External** (2).	**brief detail extensive**
Speed	Speed at which the interface is running.	**brief detail extensive**
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under *Common Output Fields Description*.	**brief detail extensive** none
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under *Common Output Fields Description*.	**brief detail extensive** none
Link type	Data transmission type.	**detail extensive** none

Table 115: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Link Flags” section under *Common Output Fields Description*.	**detail extensive** none
Physical info	Information about the physical interface.	**detail extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive**
Hardware address	Hardware MAC address.	**detail extensive**
Alternate link address	Backup address of the link.	**detail extensive**
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour*:*minute*:*second*:*timezone*** **(*hour*:*minute*:*second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface. • **IPv6 transit statistics**—Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. NOTE: These fields include dropped traffic and exception traffic, as those fields are not separately defined. ◦ **Input bytes**—Number of bytes received on the interface ◦ **Output bytes**—Number of bytes transmitted on the interface. ◦ **Input packets**—Number of packets received on the interface. ◦ **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

Table 115: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface whose definitions are as follows: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant packet threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **Resource errors**—Sum of transmit drops.	**extensive**
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	none
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Output Rate	Output rate in bps and pps.	none
Logical Interface		
Logical interface	Name of the logical interface.	**brief detail extensive** none
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail**
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under *Common Output Fields Description*.	**brief detail extensive** none
Encapsulation	Encapsulation on the logical interface.	**brief extensive** none

Table 115: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
ACI VLAN: Dynamic Profile	Name of the dynamic profile that defines the agent circuit identifier (ACI) interface set. If configured, the ACI interface set enables the underlying demux interface to create dynamic VLAN subscriber interfaces based on ACI information.	**brief detail extensive** none
Demux	Specific IP demultiplexing (demux) values: • **Underlying interface**—The underlying interface that the demux interface uses. • **Index**—Index number of the logical interface. • **Family**—Protocol family configured on the logical interface. • **Source prefixes, total**—Total number of source prefixes for the underlying interface. • **Destination prefixes, total**—Total number of destination prefixes for the underlying interface. • **Prefix**—**inet** family prefix.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface.	**brief**

Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set.
	• **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set.
	• **Input packets, Output packets**—Number of packets received and transmitted on the interface set.
	• **IPv6 transit statistics**—Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.
	NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.
	  ◦ **Input bytes**—Number of bytes received on the interface.
	  ◦ **Output bytes**—Number of bytes transmitted on the interface.
	  ◦ **Input packets**—Number of packets received on the interface.
	  ◦ **Output packets**—Number of packets transmitted on the interface.
		detail extensive

Local statistics	Number of transit bytes and packets received and transmitted on the local interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

Table 115: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
IPv6 Transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input packets	Number of packets received on the interface.	none
Output packets	Number of packets transmitted on the interface.	none
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under *Common Output Fields Description*.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under *Common Output Fields Description*.	**detail extensive** none
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive statistics** none

Table 115: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Local	IP address of the logical interface.	**detail extensive terse** none
Remote	IP address of the remote interface.	**terse**
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	**detail extensive** none
Dynamic-profile	Name of the PPPoE dynamic profile assigned to the underlying interface.	**detail extensive** none
Service Name Table	Name of the PPPoE service name table assigned to the PPPoE underlying interface.	**detail extensive** none
Max Sessions	Maximum number of dynamic PPPoE logical interfaces that the router can activate on the underlying interface.	**detail extensive** none
Duplicate Protection	State of duplicate protection: **On** or **Off**. Duplicate protection prevents the activation of another dynamic PPPoE logical interface on the same underlying interface when a dynamic PPPoE logical interface for a client with the same MAC address is already active on that interface.	**detail extensive** none
Direct Connect	State of the configuration to ignore DSL Forum VSAs: **On** or **Off**. When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	**detail extensive** none
AC Name	Name of the access concentrator.	**detail extensive** none

Sample Output

show interfaces demux0 (Demux)

```

show interfaces diagnostics optics (Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, and Virtual Chassis Port)

Syntax show interfaces diagnostics optics *interface-name*

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for PTX Series routers.

Description Display diagnostics data, warnings, and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, or Virtual Chassis port interfaces.

Options *interface-name*—Interface name. For example:

- ge-*fpc/pic/port*
- et-*fpc/pic/port*
- et-*fpc/pic/port*:*channel*
- xe-*fpc/pic/port*
- vcp-*fpc/pic/port*

Additional Information The transceivers are polled in 1-second intervals for diagnostics data, warnings, and alarms. The alarms do not cause the links to go down or the LEDs to change color, nor generate SNMP traps. Changes in alarm and warning status generate system log messages.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transceiver vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a device is not working.

NOTE: Some transceivers do not support all optical diagnostics features described in the output fields.

If optics measures transmit or receive power as zero, then, the measured power is displayed as **0.000 mW / - Inf dBm**

You can configure the P2-10G-40G-QSFPP PIC to operate either in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode. When the PIC is in 40-Gigabit Ethernet mode, you must execute the **show interfaces diagnostics optics et-*fpc/pic/port*** command. The output of this command displays the diagnostic optics information about the corresponding 40-Gigabit Ethernet port of the PIC. However, when the PIC is in 10-Gigabit Ethernet mode, you must execute the **show interfaces diagnostics optics et-*fpc/pic/port*:*channel*** command. The output of this command displays the diagnostic optics information about the corresponding 10-Gigabit Ethernet port of the PIC. For information about the P2-10G-40G-QSFPP PIC, see "P2-10G-40G-QSFPP PIC Overview" on page 409.

List of Sample Output

Output Fields Table 116 on page 1804 lists the output fields for the **show interfaces diagnostics optics** command for DWDM and DWDM OTN PICs. Output fields are listed in the approximate order in which they appear.

Table 116: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet DWDM and DWDM OTN PICs

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm). This is a software equivalent to the **LsPOWMON** pin in hardware.
Receiver signal average optical power	Average received optical power, in mW and dBm. This indicator is a software equivalent to the **RxPOWMON** pin in hardware. Average optical power is vendor-specific.

Table 116: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet DWDM and DWDM OTN PICs (continued)

Field Name	Field Description
Laser end-of-life alarm	Laser end-of-life alarm: **On** or **Off**.
Laser wavelength alarm	Laser wavelength alarm: **On** or **Off**.
Laser bias current alarm	Laser bias current alarm: **On** or **Off**.
Laser temperature alarm	Laser temperature alarm: **On** or **Off**.
Laser power alarm	Laser power alarm: **On** or **Off**.
Modulator temperature alarm	Modulator temperature alarm: **On** or **Off**. Transceivers from some vendors do not support this field.
Modulator bias alarm	Modulator bias alarm: **On** or **Off**.
Tx multiplexer FIFO error alarm	Transmit multiplexer first in, first out (FIFO) error alarm: **On** or **Off**.
Tx loss of PLL lock alarm	Transmit loss of phase-locked loop (PLL) lock alarm: **On** or **Off**.
Rx loss of average optical power alarm	Receive loss of average optical power alarm: **On** or **Off**.
Rx loss of AC power alarm	Receive loss of AC power alarm: **On** or **Off**. Transceivers from some vendors do not support this field.
Rx loss of PLL lock alarm	Receive loss of phase-locked loop (PLL) lock alarm: **On** or **Off**.

Table 117 on page 1805 lists the output fields for the **show interfaces diagnostics optics** command when the router is operating with bidirectional SFP optics. Output fields are listed in the approximate order in which they appear.

Table 117: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm).

Table 117: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Module temperature	Temperature of the optics module, in Celsius and Fahrenheit.
Module voltage	Internally measured module voltage.
Receiver signal average optical power	Average received optical power, in mW and dBm.
Wavelength Channel number	Wavelength channel number set in the optics module.
Wavelength setpoint	Wavelength set in the optics module.
Tx Dither	Transmit dither status. Displays whether transmit dither is enabled or disabled.
Frequency Error	Frequency error reported from optics module.
Wavelength Error	Wavelength error reported from optics module.
Laser bias current high alarm	Laser bias power setting high alarm. Displays **on** or **off**.
Laser bias current low alarm	Laser bias power setting low alarm. Displays **on** or **off**.
Laser bias current high warning	Laser bias power setting high warning. Displays **on** or **off**.
Laser bias current low warning	Laser bias power setting low warning. Displays **on** or **off**.
Laser output power high alarm	Laser output power high alarm. Displays **on** or **off**.
Laser output power low alarm	Laser output power low alarm. Displays **on** or **off**.
Laser output power high warning	Laser output power high warning. Displays **on** or **off**.
Laser output power low warning	Laser output power low warning. Displays **on** or **off**.
Module temperature high alarm	Module temperature high alarm. Displays **on** or **off**.
Module temperature low alarm	Module temperature low alarm. Displays **on** or **off**.

Table 117: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Module temperature high warning	Module temperature high warning. Displays **on** or **off**.
Module temperature low warning	Module temperature low warning. Displays **on** or **off**.
Module voltage high alarm	Module voltage high alarm. Displays **on** or **off**.
Module voltage low alarm	Module voltage low alarm. Displays **on** or **off**.
Module voltage high warning	Module voltage high warning. Displays **on** or **off**.
Module voltage low warning	Module voltage high warning. Displays **on** or **off**.
Laser rx power high alarm	Receive laser power high alarm. Displays **on** or **off**.
Laser rx power low alarm	Receive laser power low alarm. Displays **on** or **off**.
Laser rx power high warning	Receive laser power high warning. Displays **on** or **off**.
Laser rx power low warning	Receive laser power low warning. Displays **on** or **off**.
TEC fault alarm	TEC fault alarm. Displays **on** or **off**.
Wavelength unlocked alarm	Wavelength unlocked alarm. Displays **on** or **off**.
TxTune	Optical transmit side status. Displays whether optical transmit side is not ready due to tuning.
Laser bias current high alarm threshold	Vendor-specified threshold for the laser bias current high alarm: **70.000 mA.**
Laser bias current low alarm threshold	Vendor-specified threshold for the laser bias current low alarm: **0.0002 mA.**
Laser bias current high warning threshold	Vendor-specified threshold for the laser bias current high warning: **65.000 mA.**
Laser bias current low warning threshold	Vendor-specified threshold for the laser bias current low warning: **0.0002 mA.**

Table 117: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Laser output power high alarm threshold	Vendor-specified threshold for the laser output power high alarm: **1.0000 mW** or **0.00 dBm.**
Laser output power low alarm threshold	Vendor-specified threshold for the laser output power low alarm: **0.0560 mW** or **-12.52 dBm.**
Laser output power high warning threshold	Vendor-specified threshold for the laser output power high warning: **0.6300 mW** or **-2.01 dBm.**
Laser output power low warning threshold	Vendor-specified threshold for the laser output power low warning: **0.0890 mW** or **-10.51 dBm.**
Module temperature high alarm threshold	Vendor-specified threshold for the module temperature high alarm: **100**° C or **212**° F.
Module temperature low alarm threshold	Vendor-specified threshold for the module temperature low alarm: **-50**° C or **-58**° F.
Module temperature high warning threshold	Vendor-specified threshold for the module temperature high warning: **95** ° C or **203** ° F.
Module temperature low warning threshold	Vendor-specified threshold for the module temperature low warning: **-48**° C or **-54**° F.
Module voltage high alarm threshold	Module voltage high alarm threshold: **3.700 v**.
Module voltage low alarm threshold	Module voltage low alarm threshold: **2.900 v**.
Module voltage high warning threshold	Module voltage high warning threshold: **3.7600 v**.
Module voltage low warning threshold	Module voltage low warning threshold: **3.000 v**.
Laser rx power high alarm threshold	Vendor-specified threshold for the laser Rx power high alarm: **1.9953 mW** or **3.00 dBm.**
Laser rx power low alarm threshold	Vendor-specified threshold for the laser Rx power low alarm: **0.0001 mW** or **-40.00 dBm.**
Laser rx power high warning threshold	Vendor-specified threshold for the laser Rx power high warning: **1.0000 mW** or **0.00 dBm.**
Laser rx power low warning threshold	Vendor-specified threshold for the laser Rx power low warning: **0.0010 mW** or **-30.00 dBm.**

Table 118 on page 1809 lists the output fields for the **show interfaces diagnostics optics** command for SFP transceivers. Output fields are listed in the approximate order in which they appear.

Table 118: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Measured laser bias current in uA.
Laser output power	Measured laser output power in mW.
Module temperature	Internally measured module temperature.
Module voltage	Internally measured module voltage.
Laser rx power	Measured receive optical power in mW.
Laser bias current high alarm	Laser bias current high alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser bias current low alarm	Laser bias current low alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser output power high alarm	Laser output power high alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser output power low alarm	Laser output power low alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Module temp high alarm	Module temperature high alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Module temp low alarm	Module temperature low alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser rx power high alarm	Laser receive power high alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser rx power low alarm	Laser receive power low alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser bias current high warning	Laser bias current high warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser bias current low warning	Laser bias current low warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser output power high warning	Laser output power high warning: **On** or **Off**. Warning ranges are vendor-specific.

Table 118: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers (continued)

Field Name	Field Description
Laser output power low warning	Laser output power low warning: **On** or **Off**. Warning ranges are vendor-specific.
Module temperature high warning	Module temperature high warning: **On** or **Off**. Warning ranges are vendor-specific.
Module temperature low warning	Module temperature low warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser rx power high warning	Laser receive power high warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser rx power low warning	Laser receive power low warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser bias current high alarm threshold	Laser bias current high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser bias current low alarm threshold	Laser bias current low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser bias current high warning threshold	Laser bias current high warning threshold. Warning ranges are vendor-specific.
Laser bias current low warning threshold	Laser bias current low warning threshold. Warning ranges are vendor-specific.
Laser output power high alarm threshold	Laser output power high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser output power low alarm threshold	Laser output power low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser output power high warning threshold	Laser output power high warning threshold. Warning ranges are vendor-specific.
Laser output power low warning threshold	Laser output power low warning threshold. Warning ranges are vendor-specific.
Module temperature high alarm threshold	Module temperature high alarm threshold. Alarm threshold ranges are vendor-specific.
Module temperature low alarm threshold	Module temperature low alarm threshold. Alarm threshold ranges are vendor-specific.
Module temperature high warning threshold	Module temperature high warning threshold. Warning ranges are vendor-specific.

Table 118: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers (continued)

Field Name	Field Description
Module temperature low warning threshold	Module temperature low warning threshold. Warning ranges are vendor-specific.
Module voltage high alarm threshold	Module voltage high alarm threshold. Alarm ranges are vendor-specific.
Module voltage low alarm threshold	Module voltage low alarm threshold. Alarm ranges are vendor-specific.
Module voltage high warning threshold	Module voltage high warning threshold. Warning ranges are vendor-specific.
Module voltage low warning threshold	Module voltage low warning threshold. Warning ranges are vendor-specific.
Laser rx power high alarm threshold	Laser receive power high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser rx power low alarm threshold	Laser receive power low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser rx power high warning threshold	Laser receive power high warning threshold. Warning threshold ranges are vendor-specific.
Laser rx power high low threshold	Laser receive power high warning threshold. Warning threshold ranges are vendor-specific.

Table 119 on page 1811 lists the output fields for the **show interfaces diagnostics optics** command for 10-Gigabit Ethernet transceivers. Output fields are listed in the approximate order in which they appear.

Table 119: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet Transceivers

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Measured laser bias current in mA.
Laser output power	Measured laser output power in mW.
Module temperature	Internally measured module temperature.
Laser rx power	Measured receive optical power in mW.
Laser bias current high alarm	Laser bias current high alarm: **On** or **Off**. Alarm ranges are vendor-specific.

Table 119: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet Transceivers (continued)

Field Name	Field Description
Laser bias current low alarm	Laser bias current low alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser output power high alarm	Laser output power high alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser output power low alarm	Laser output power low alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Module temp high alarm	Module temperature high alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Module temp low alarm	Module temperature low alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser rx power high alarm	Laser receive power high alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser rx power low alarm	Laser receive power low alarm: **On** or **Off**. Alarm ranges are vendor-specific.
Laser bias current high warning	Laser bias current high warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser bias current low warning	Laser bias current low warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser output power high warning	Laser output power high warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser output power low warning	Laser output power low warning: **On** or **Off**. Warning ranges are vendor-specific.
Module temperature high warning	Module temperature high warning: **On** or **Off**. Warning ranges are vendor-specific.
Module temperature low warning	Module temperature low warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser rx power high warning	Laser receive power high warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser rx power low warning	Laser receive power low warning: **On** or **Off**. Warning ranges are vendor-specific.
Laser bias current high alarm threshold	Laser bias current high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser bias current low alarm threshold	Laser bias current low alarm threshold. Alarm threshold ranges are vendor-specific.

Table 119: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet Transceivers (continued)

Field Name	Field Description
Laser output power high alarm threshold	Laser output power high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser output power low alarm threshold	Laser output power low alarm threshold. Alarm threshold ranges are vendor-specific.
Module temperature high alarm threshold	Module temperature high alarm threshold. Alarm threshold ranges are vendor-specific.
Module temperature low alarm threshold	Module temperature low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser rx power high alarm threshold	Laser receive power high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser rx power low alarm threshold	Laser receive power low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser bias current high warning threshold	Laser bias current high warning threshold. Warning ranges are vendor-specific.
Laser bias current low warning threshold	Laser bias current low warning threshold. Warning ranges are vendor-specific.
Laser output power high warning threshold	Laser output power high warning threshold. Warning ranges are vendor-specific.
Laser output power low warning threshold	Laser output power low warning threshold. Warning ranges are vendor-specific.
Module temperature high warning threshold	Module temperature high warning threshold. Warning ranges are vendor-specific.
Module temperature low warning threshold	Module temperature low warning threshold. Warning ranges are vendor-specific.
Laser rx power high warning threshold	Laser receive power high warning threshold. Warning threshold ranges are vendor-specific.
Laser rx power low warning threshold	Laser receive power low warning threshold. Warning threshold ranges are vendor-specific.

Table 120 on page 1814 lists the output fields for the **show interfaces diagnostics optics** command for XFP transceivers. Output fields are listed in the approximate order in which they appear.

Table 120: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm). This is a software equivalent to the **LsPOWMON** pin in hardware.
Module temperature	Temperature of the XFP optics module, in Celsius and Fahrenheit.
Laser rx power	Laser received optical power, in mW and dBm.
Laser bias current high alarm	Laser bias power setting high alarm. Displays **on** or **off**.
Laser bias current low alarm	Laser bias power setting low alarm. Displays **on** or **off**.
Laser bias current high warning	Laser bias power setting high warning. Displays **on** or **off**.
Laser bias current low warning	Laser bias power setting low warning. Displays **on** or **off**.
Laser output power high alarm	Laser output power high alarm. Displays **on** or **off**.
Laser output power low alarm	Laser output power low alarm. Displays **on** or **off**.
Laser output power high warning	Laser output power high warning. Displays **on** or **off**.
Laser output power low warning	Laser output power low warning. Displays **on** or **off**.
Module temperature high alarm	Module temperature high alarm. Displays **on** or **off**.
Module temperature low alarm	Module temperature low alarm. Displays **on** or **off**.
Module temperature high warning	Module temperature high warning. Displays **on** or **off**.
Module temperature low warning	Module temperature low warning. Displays **on** or **off**.

Table 120: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers (continued)

Field Name	Field Description
Laser rx power high alarm	Receive laser power high alarm. Displays **on** or **off**.
Laser rx power low alarm	Receive laser power low alarm. Displays **on** or **off**.
Laser rx power high warning	Receive laser power high warning. Displays **on** or **off**.
Laser rx power low warning	Receive laser power low warning. Displays **on** or **off**.
Module not ready alarm	Module not ready alarm. When **on**, indicates the module has an operational fault. Displays **on** or **off**.
Module power down alarm	Module power down alarm. When **on**, module is in a limited power mode, low for normal operation. Displays on or off.
Tx data not ready alarm	Any condition leading to invalid data on the transmit path. Displays **on** or **off**.
Tx not ready alarm	Any condition leading to invalid data on the transmit path. Displays **on** or **off**.
Tx laser fault alarm	Laser fault condition. Displays **on** or **off**.
Tx CDR loss of lock alarm	Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays **on** or **off**.
Rx not ready alarm	Any condition leading to invalid data on the receive path. Displays **on** or **off**.
Rx loss of signal alarm	Receive Loss of Signal alarm. When **on**, indicates insufficient optical input power to the module. Displays **on** or **off**.
Rx CDR loss of lock alarm	Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays **on** or **off**.
Laser bias current high alarm threshold	Vendor-specified threshold for the laser bias current high alarm: **130.000 mA.**
Laser bias current low alarm threshold	Vendor-specified threshold for the laser bias current low alarm: **10.000 mA.**
Laser bias current high warning threshold	Vendor-specified threshold for the laser bias current high warning: **120.000 mA.**
Laser bias current low warning threshold	Vendor-specified threshold for the laser bias current low warning: **12.000 mA.**
Laser output power high alarm threshold	Vendor-specified threshold for the laser output power high alarm: **0.8910 mW** or **-0.50 dBm.**

Table 120: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers (continued)

Field Name	Field Description
Laser output power low alarm threshold	Vendor-specified threshold for the laser output power low alarm: **0.2230 mW** or **-6.52 dBm.**
Laser output power high warning threshold	Vendor-specified threshold for the laser output power high warning: **0.7940 mW** or **-100 dBm.**
Laser output power low warning threshold	Vendor-specified threshold for the laser output power low warning: **0.2510 mW** or **-600 dBm.**
Module temperature high alarm threshold	Vendor-specified threshold for the module temperature high alarm: **90**° C or **194**° F.
Module temperature low alarm threshold	Vendor-specified threshold for the module temperature low alarm: **-5**° C or **23**° F.
Module temperature high warning threshold	Vendor-specified threshold for the module temperature high warning: **85** ° C or **185** ° F.
Module temperature low warning threshold	Vendor-specified threshold for the module temperature low warning: **0**° C or **32**° F.
Laser rx power high alarm threshold	Vendor-specified threshold for the laser Rx power high alarm: **1.2589 mW** or **1.00 dBm.**
Laser rx power low alarm threshold	Vendor-specified threshold for the laser Rx power low alarm: **0.0323 mW** or **-14.91 dBm.**
Laser rx power high warning threshold	Vendor-specified threshold for the laser Rx power high warning: **1.1220 mW** or **0.50 dBm.**
Laser rx power low warning threshold	Vendor-specified threshold for the laser Rx power low warning: **0.0363 mW** or **-14.40 dBm.**

Table 121 on page 1816 lists the output fields for the **show interfaces diagnostics optics** command for VCP. Output fields are listed in the approximate order in which they appear.

Table 121: show interfaces diagnostics optics Output for Virtual Chassis Ports

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm).
Module temperature	Temperature of the optics module, in Celsius and Fahrenheit.

Table 121: show interfaces diagnostics optics Output for Virtual Chassis Ports (continued)

Field Name	Field Description
Module voltage	Internally measured module voltage.
Receiver signal average optical power	Average received optical power, in mW and dBm.
Laser bias current high alarm	Laser bias power setting high alarm. Displays **on** or **off**.
Laser bias current low alarm	Laser bias power setting low alarm. Displays **on** or **off**.
Laser bias current high warning	Laser bias power setting high warning. Displays **on** or **off**.
Laser bias current low warning	Laser bias power setting low warning. Displays **on** or **off**.
Laser output power high alarm	Laser output power high alarm. Displays **on** or **off**.
Laser output power low alarm	Laser output power low alarm. Displays **on** or **off**.
Laser output power high warning	Laser output power high warning. Displays **on** or **off**.
Laser output power low warning	Laser output power low warning. Displays **on** or **off**.
Module temperature high alarm	Module temperature high alarm. Displays **on** or **off**.
Module temperature low alarm	Module temperature low alarm. Displays **on** or **off**.
Module temperature high warning	Module temperature high warning. Displays **on** or **off**.
Module temperature low warning	Module temperature low warning. Displays **on** or **off**.
Module voltage high alarm	Module voltage high alarm. Displays **on** or **off**.
Module voltage low alarm	Module voltage low alarm. Displays **on** or **off**.
Module voltage high warning	Module voltage high warning. Displays **on** or **off**.

Table 121: show interfaces diagnostics optics Output for Virtual Chassis Ports (continued)

Field Name	Field Description
Module voltage low warning	Module voltage high warning. Displays **on** or **off**.
Laser rx power high alarm	Receive laser power high alarm. Displays **on** or **off**.
Laser rx power low alarm	Receive laser power low alarm. Displays **on** or **off**.
Laser rx power high warning	Receive laser power high warning. Displays **on** or **off**.
Laser rx power low warning	Receive laser power low warning. Displays **on** or **off**.
Laser bias current high alarm threshold	Vendor-specified threshold for the laser bias current high alarm.
Laser bias current low alarm threshold	Vendor-specified threshold for the laser bias current low alarm.
Laser bias current high warning threshold	Vendor-specified threshold for the laser bias current high warning.
Laser bias current low warning threshold	Vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Vendor-specified threshold for the module temperature high warning.

Table 121: show interfaces diagnostics optics Output for Virtual Chassis Ports (continued)

Field Name	Field Description
Module temperature low warning threshold	Vendor-specified threshold for the module temperature low warning.
Module voltage high alarm threshold	Module voltage high alarm threshold.
Module voltage low alarm threshold	Module voltage low alarm threshold.
Module voltage high warning threshold	Module voltage high warning threshold.
Module voltage low warning threshold	Module voltage low warning threshold.
Laser rx power high alarm threshold	Vendor-specified threshold for the laser Rx power high alarm.
Laser rx power low alarm threshold	Vendor-specified threshold for the laser Rx power low alarm.
Laser rx power high warning threshold	Vendor-specified threshold for the laser Rx power high warning.
Laser rx power low warning threshold	Vendor-specified threshold for the laser Rx power low warning.

show interfaces (far-end-interval)

Syntax show interfaces far-end-interval *interface-fpc/pic/port*

Release Information Command introduced in Junos OS Release 9.4.

Description On channelized interfaces, display the far end interval data for the specified interface.

Required Privilege Level view

List of Sample Output
show interfaces far-end-interval coc12-5/2/0 on page 1838
show interfaces far-end-interval coc1-5/2/1:1 on page 1839

Output Fields Table 122 on page 1838 lists the output fields for the **show interfaces far-end-interval** command. Output fields are listed in the approximate order in which they appear.

Table 122: show interfaces far-end-interval Output Fields

Field Name	Field Description
Physical interface	Interface FPC/PIC/port values.
SNMP ifIndex	SNMP interface index value.
ES-L/P	Error detection—Errored seconds.
SES-L/P	Error detection—Severely errored seconds.
UAS-L/P	Error detection—Unavailable seconds.

Sample Output

show interfaces far-end-interval coc12-5/2/0

```
user@host> show interfaces far-end-interval coc12-5/2/0
Physical interface: coc12-5/2/0, SNMP ifIndex: 121
  05:30-current:
    ES-L: 1, SES-L: 1, UAS-L: 0
  05:15-05:30:
    ES-L: 0, SES-L: 0, UAS-L: 0
  05:00-05:15:

```

show interfaces (Fast Ethernet)

Syntax

show interfaces *interface-type*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information Command introduced before Junos OS Release 7.4.

Description Display status information about the specified Fast Ethernet interface.

Options

interface-type—On M Series and T Series routers, the interface type is **fe-*fpc/pic/port***.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level view

List of Sample Output

show interfaces (Fast Ethernet) on page 1853
show interfaces brief (Fast Ethernet) on page 1854
show interfaces detail (Fast Ethernet) on page 1854
show interfaces extensive (Fast Ethernet) on page 1854

Output Fields Table 123 on page 1840 lists the output fields for the **show interfaces** (Fast Ethernet) command. Output fields are listed in the approximate order in which they appear.

Table 123: show interfaces Fast Ethernet Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Link-mode	Type of link connection configured for the physical interface: **Full-duplex** or **Half-duplex**	**extensive**
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: **Enabled** or **Disabled** for parent interface; **Rx-only** or **Tx-only** for child interfaces.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: **Enabled** or **Disabled**.	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under *Common Output Fields Description*.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under *Common Output Fields Description*.	All levels
Link flags	Information about the link. Possible values are described in the “Links Flags” section under *Common Output Fields Description*.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none
Schedulers	(GigabitEthernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	**extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Hardware MAC address.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second:timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface. Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes. For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces command.	**detail extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface. NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the **show interfaces** command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenorio, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs	**detail extensive**
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	**extensive**
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
OTN FEC statistics	The forward error correction (FEC) counters provide the following statistics:. • **Corrected Errors**—The count of corrected errors in the last second. • **Corrected Error Ratio**—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.	
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. • **Bit errors**—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • **Errored blocks**—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.	**detail extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following: • **Total octets** and **total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the show interfaces command. • **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets. • **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • **MAC control frames**—Number of MAC control frames. • **MAC pause frames**—Number of MAC control frames with **pause** operational code. • **Oversized frames**—Number of frames that exceed 1518 octets. • **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”	**extensive**
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	**extensive**
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	**extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.	**extensive**
PMA PHY	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **PHY Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
WIS section	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOL**—Loss of light • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • **SES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)	**extensive**
WIS line	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)	**extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
WIS path	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B3**—Bit interleaved parity for SONET section overhead • **REI-P**—Remote error indication • **LOP-P**—Loss of pointer (path) • **AIS-P**—Path alarm indication signal • **RDI-P**—Path remote defect indication • **UNEQ-P**—Path unequipped • **PLM-P**—Path payload (signal) label mismatch • **ES-P**—Errored seconds (near-end STS path) • **SES-P**—Severely errored seconds (near-end STS path) • **UAS-P**—Unavailable seconds (near-end STS path) • **SES-PFE**—Severely errored seconds (far-end STS path) • **UAS-PFE**—Unavailable seconds (far-end STS path)	**extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner:**
	  ◦ **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	• **Local resolution**—Information from the link partner:
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.	**extensive**
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under *Common Output Fields Description*.	All levels
VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (**Out**) VLAN tag or for both the outer and inner (**In**) VLAN tags. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **pop**—The outer VLAN tag of the incoming frame is removed. • **swap**—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **push-push**—Two VLAN tags are pushed in from the incoming frame. • **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. • **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.	**brief detail extensive** none

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Demux:	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: • Source Family Inet • Destination Family Inet	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under *Common Output Fields Description*.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set • **Input packets, Output packets**—Number of packets received and transmitted on the interface set.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	**extensive**
Local statistics	Number and rate of bytes and packets destined to the routing device.	**extensive**
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	**extensive**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under *Common Output Fields Description*.	**detail extensive**
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	**detail extensive** none

Table 123: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	**detail extensive**
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	**detail extensive**
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about address flag (possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

Release Information

Command introduced before Junos OS Release 7.4 for Gigabit interfaces.
Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.
Command modified in Junos OS Release 9.5 for SRX Series devices.

Command introduced in Junos OS Release 18.1 for Gigabit interfaces.

Description Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

NOTE: On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Options For Gigabit interfaces:

ge-*fpc/pic/port*—Display standard information about the specified Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

xe-*fpc/pic/port*—Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For SRX interfaces:

- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
  - **at-** ***pim/0/port***—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **ce1-*pim/0/ port***—Channelized E1 interface.
  - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-*pim/0/port***—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-*pim/0/port***—E1 interface.
  - **e3-*pim/0/port***—E3 interface.
  - **fe-*pim/0/port***—Fast Ethernet interface.
  - **ge-*pim/0/port***—Gigabit Ethernet interface.
  - **se-*pim/0/port***—Serial interface.
  - **t1-*pim/0/port***—T1 (also called DS1) interface.
  - **t3-*pim/0/port***—T3 (also called DS3) interface.
  - **wx-*slot*/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
  - **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
    - **at-** ***pim/0/port***—ATM-over-ADSL or ATM-over-SHDSL interface.
    - **ce1-*pim/0/ port***—Channelized E1 interface.
    - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
    - **ct1-*pim/0/port***—Channelized T1 interface.
    - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
    - **e1-*pim/0/port***—E1 interface.
    - **e3-*pim/0/port***—E3 interface.
    - **fe-*pim/0/port***—Fast Ethernet interface.
    - **ge-*pim/0/port***—Gigabit Ethernet interface.
    - **se-*pim/0/port***—Serial interface.
    - **t1-*pim/0/port***—T1 (also called DS1) interface.

- **t3-*pim*/0/*port***—T3 (also called DS3) interface.
- **wx-*slot*/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

Additional Information In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

List of Sample Output

Output Fields

Table 124 on page 1861 describes the output fields for the **show interfaces** (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see Table 125 on page 1889.

Table 124: show interfaces (Gigabit Ethernet) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: **Enabled** or **Disabled** for parent interface; **Rx-only** or **Tx-only** for child interfaces.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: **Enabled** or **Disabled**.	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under *Common Output Fields Description*.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under *Common Output Fields Description*.	All levels
Link flags	Information about the link. Possible values are described in the “Links Flags” section under *Common Output Fields Description*.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Schedulers	(Gigabit Ethernet intelligent queuing 2 [IQ2] interfaces only) Number of CoS schedulers configured.	**extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds (ms).	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Hardware MAC address.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second:timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Egress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	**detail extensive**
Ingress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Output bytes**—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface. Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes. For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces command.	**detail extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the **Drops** field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface. NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the **show interfaces** command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs	**detail extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism. NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the **Dropped packets** field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.	**detail extensive**
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	**extensive**
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
Interface transmit statistics	(On MX Series devices) Status of the **interface-transmit-statistics** configuration: Enabled or Disabled. • **Enabled**—When the **interface-transmit-statistics** statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface. • **Disabled**—When the **interface-transmit-statistics** statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface.	**detail extensive**
OTN FEC statistics	The forward error correction (FEC) counters provide the following statistics: • **Corrected Errors**—Count of corrected errors in the last second. • **Corrected Error Ratio**—Corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.	**detail extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. • **Bit errors**—Number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • **Errored blocks**—Number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.	**detail extensive**

Link Degrade	Shows the link degrade status of the physical link and the estimated bit error rates (BERs). This field is available only for the PICs supporting the physical link monitoring feature.
	• **Link Monitoring**—Indicates if physical link degrade monitoring is enabled on the interface.
	  ◦ **Enable**—Indicates that link degrade monitoring has been enabled (using the **link-degrade-monitor** statement) on the interface.
	  ◦ **Disable**—Indicates that link degrade monitoring has not been enabled on the interface. If link degrade monitoring has not been enabled, the output does not show any related information, such as BER values and thresholds.
	• **Link Degrade Set Threshold**—The BER threshold value at which the link is considered degraded and a corrective action is triggered.
	• **Link Degrade Clear Threshold**—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted.
	• **Estimated BER**—The estimated bit error rate.
	• **Link-degrade event**—Shows link degrade event information.
	  ◦ **Seconds**—Time (in seconds) elapsed after a link degrade event occurred.
	  ◦ **Count**—The number of link degrade events recorded.
	  ◦ **State**—Shows the link degrade status (example: **Defect Active**).
		detail extensive

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output

MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following:
	• **Total octets** and **total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the show interfaces command.
	• **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets.
	• **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
	• **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.
	• **MAC control frames**—Number of MAC control frames.
	• **MAC pause frames**—Number of MAC control frames with **pause** operational code.
	• **Oversized frames**—There are two possible conditions regarding the number of oversized frames:
	  ◦ Packet length exceeds 1518 octets, or
	  ◦ Packet length exceeds MRU
	• **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.
	• **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.
	• **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.
	NOTE: The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the **VLAN tagged frames** field displays 0 when the **show interfaces** command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.
	• **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”
		extensive

OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	**extensive**
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	**extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet may enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.	**extensive**
PMA PHY	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **PHY Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
WIS section	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOL**—Loss of light • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • **SES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)	**extensive**
WIS line	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)	**extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
WIS path	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B3**—Bit interleaved parity for SONET section overhead • **REI-P**—Remote error indication • **LOP-P**—Loss of pointer (path) • **AIS-P**—Path alarm indication signal • **RDI-P**—Path remote defect indication • **UNEQ-P**—Path unequipped • **PLM-P**—Path payload (signal) label mismatch • **ES-P**—Errored seconds (near-end STS path) • **SES-P**—Severely errored seconds (near-end STS path) • **UAS-P**—Unavailable seconds (near-end STS path) • **SES-PFE**—Severely errored seconds (far-end STS path) • **UAS-PFE**—Unavailable seconds (far-end STS path)	**extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner**—Information from the remote Ethernet device:
	  ◦ **Link mode**—Depending on the capability of the link partner, either **Full-duplex** or **Half-duplex**.
	  ◦ **Flow control**—Types of flow control supported by the link partner. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), **Symmetric/Asymmetric** (link partner supports **PAUSE** on receive and transmit or only **PAUSE** on transmit), and **None** (link partner does not support flow control).
	  ◦ **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	• **Local resolution**—Information from the local Ethernet device:
	  ◦ **Flow control**—Types of flow control supported by the local device. For Gigabit Ethernet interfaces, advertised capabilities are **Symmetric/Asymmetric** (local device supports **PAUSE** on receive and transmit or only **PAUSE** on receive) and **None** (local device does not support flow control). Depending on the result of the negotiation with the link partner, local resolution flow control type will display **Symmetric** (local device supports **PAUSE** on receive and transmit), **Asymmetric** (local device supports **PAUSE** on receive), and **None** (local device does not support flow control).
	  ◦ **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.	**extensive**
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under *Common Output Fields Description*.	All levels
VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (**Out**) VLAN tag or for both the outer and inner (**In**) VLAN tags. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **pop**—The outer VLAN tag of the incoming frame is removed. • **swap**—The outer VLAN tag of the incoming frame is overwritten with the user-specified VLAN tag information. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **push-push**—Two VLAN tags are pushed in from the incoming frame. • **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user-specified VLAN tag value. • **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.	**brief detail extensive** none

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Demux	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: • Source Family Inet • Destination Family Inet	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	All levels
ACI VLAN	Information displayed for agent circuit identifier (ACI) interface set configured with the **agent-circuit-id** autoconfiguration stanza. **Dynamic Profile**—Name of the dynamic profile that defines the ACI interface set. If configured, the ACI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ACI information. NOTE: The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the **line-identity** autoconfiguration stanza.	**brief detail extensive** none
Line Identity	Information displayed for access-line-identifier (ALI) interface sets configured with the **line-identity** autoconfiguration stanza. • **Dynamic Profile**—Name of the dynamic profile that defines the ALI interface set. • Trusted option used to create the ALI interface set: **Circuit-id**, **Remote-id**, or **Accept-no-ids**. More than one option can be configured. If configured, the ALI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ALI information. NOTE: The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the **agent-circuit-id** autoconfiguration stanza.	**detail**
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under *Common Output Fields Description*.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Neighbor Discovery Protocol (NDP)Queue Statistics	NDP statistics for protocol **inet6** under logical interface statistics. • **Max nh cache**—Maximum interface neighbor discovery nexthop cache size. • **New hold nh limit**—Maximum number of new unresolved nexthops. • **Curr nh cnt**—Current number of resolved nexthops in the NDP queue. • **Curr new hold cnt**—Current number of unresolved nexthops in the NDP queue. • **NH drop cnt**—Number of NDP requests not serviced.	All levels
Dynamic Profile	Name of the dynamic profile that was used to create this interface configured with a Point-to-Point Protocol over Ethernet (PPPoE) family.	**detail extensive** none
Service Name Table	Name of the service name table for the interface configured with a PPPoE family.	**detail extensive** none

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Max Sessions	Maximum number of PPPoE logical interfaces that can be activated on the underlying interface.	**detail extensive** none
Duplicate Protection	State of PPPoE duplicate protection: **On** or **Off**. When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client.	**detail extensive** none
Direct Connect	State of the configuration to ignore DSL Forum VSAs: **On** or **Off**. When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	**detail extensive** none
AC Name	Name of the access concentrator.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets, Output packets**—Number of packets received and transmitted on the interface set.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	**extensive**
Local statistics	Number and rate of bytes and packets destined to the router.	**extensive**
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	**extensive**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under *Common Output Fields Description*.	**detail extensive**

Table 124: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	**detail extensive** none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	**detail extensive**
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	**detail extensive**
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about the address flag. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

The following table describes the output fields for the **show interfaces** (10–Gigabit Ethernet) command.

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none

SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: **Enabled** or **Disabled** for parent interface; **Rx-only** or **Tx-only** for child interfaces.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: **Enabled** or **Disabled**.	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under *Common Output Fields Description*.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under *Common Output Fields Description*.	All levels
Link flags	Information about the link. Possible values are described in the “Links Flags” section under *Common Output Fields Description*.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none

Schedulers	(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	**extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Hardware MAC address.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second:timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Egress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	**detail extensive**
Ingress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Output bytes**—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	extensive
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	extensive

Egress queues	Total number of egress queues supported on the specified interface. NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the **show interfaces** command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenorio, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs	**detail extensive**
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	**extensive**
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
OTN alarms	Active OTN alarms identified on the interface.	**detail extensive**
OTN defects	OTN defects received on the interface.	**detail extensive**
OTN FEC Mode	The FECmode configured on the interface. • **efec**—Enhanced forward error correction (EFEC) is configured to defect and correct bit errors. • **gfec**—G.709 Forward error correction (GFEC) mode is configured to detect and correct bit errors. • **none**—FEC mode is not configured.	**detail extensive**

OTN Rate	OTN mode. • **fixed-stuff-bytes**—Fixed stuff bytes 11.0957 Gbps. • **no-fixed-stuff-bytes**—No fixed stuff bytes 11.0491 Gbps. • **pass-through**—Enable OTN passthrough mode. • **no-pass-through**—Do not enable OTN passthrough mode.	detail extensive
OTN Line Loopback	Status of the line loopback, if configured for the DWDM OTN PIC. Its value can be: **enabled** or **disabled**.	detail extensive
OTN FEC statistics	The forward error correction (FEC) counters for the DWDM OTN PIC. • **Corrected Errors**—The count of corrected errors in the last second. • **Corrected Error Ratio**—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.	detail extensive
OTN FEC alarms	OTN FEC excessive or degraded error alarms triggered on the interface. • **FEC Degrade**—OTU FEC Degrade defect. • **FEC Excessive**—OTU FEC Excessive Error defect.	detail extensive
OTN OC	OTN OC defects triggered on the interface. • **LOS**—OC Loss of Signal defect. • **LOF**—OC Loss of Frame defect. • **LOM**—OC Loss of Multiframe defect. • **Wavelength Lock**—OC Wavelength Lock defect.	detail extensive
OTN OTU	OTN OTU defects detected on the interface • **AIS**—OTN AIS alarm. • **BDI**—OTN OTU BDI alarm. • **IAE**—OTN OTU IAE alarm. • **TTIM**—OTN OTU TTIM alarm. • **SF**—OTN ODU bit error rate fault alarm. • **SD**—OTN ODU bit error rate defect alarm. • **TCA-ES**—OTN ODU ES threshold alarm. • **TCA-SES**—OTN ODU SES threshold alarm. • **TCA-UAS**—OTN ODU UAS threshold alarm. • **TCA-BBE**—OTN ODU BBE threshold alarm. • **BIP**—OTN ODU BIP threshold alarm. • **BBE**—OTN OTU BBE threshold alarm. • **ES**—OTN OTU ES threshold alarm. • **SES**—OTN OTU SES threshold alarm. • **UAS**—OTN OTU UAS threshold alarm.	detail extensive
Received DAPI	Destination Access Port Interface (DAPI) from which the packets were received.	detail extensive
Received SAPI	Source Access Port Interface (SAPI) from which the packets were received.	detail extensive
Transmitted DAPI	Destination Access Port Interface (DAPI) to which the packets were transmitted.	detail extensive

Transmitted SAPI	Source Access Port Interface (SAPI) to which the packets were transmitted.	**detail extensive**
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. • **Bit errors**—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • **Errored blocks**—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.	**detail extensive**
MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following: • **Total octets** and **total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets. • **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • **MAC control frames**—Number of MAC control frames. • **MAC pause frames**—Number of MAC control frames with **pause** operational code. • **Oversized frames**—Number of frames that exceed 1518 octets. • **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”	**extensive**
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	**extensive**
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	**extensive**

Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.	**extensive**
PMA PHY	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem.	**extensive**

WIS section	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOL**—Loss of light • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • S**ES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)	**extensive**
WIS line	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)	**extensive**

WIS path	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B3**—Bit interleaved parity for SONET section overhead • **REI-P**—Remote error indication • **LOP-P**—Loss of pointer (path) • **AIS-P**—Path alarm indication signal • **RDI-P**—Path remote defect indication • **UNEQ-P**—Path unequipped • **PLM-P**—Path payload label mismatch • **ES-P**—Errored seconds (near-end STS path) • **SES-P**—Severely errored seconds (near-end STS path) • **UAS-P**—Unavailable seconds (near-end STS path) • **SES-PFE**—Severely errored seconds (far-end STS path) • **UAS-PFE**—Unavailable seconds (far-end STS path)	**extensive**

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner:**
	  ◦ **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	• **Local resolution**—Information from the link partner:
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.	**extensive**
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under *Common Output Fields Description*.	All levels

VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (**Out**) VLAN tag or for both the outer and inner (**In**) VLAN tags. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **pop**—The outer VLAN tag of the incoming frame is removed. • **swap**—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **push-push**—Two VLAN tags are pushed in from the incoming frame. • **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. • **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.	**brief detail extensive** none
Demux:	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: • Source Family Inet • Destination Family Inet	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under *Common Output Fields Description*.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets, Output packets**—Number of packets received and transmitted on the interface set.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	**extensive**
Local statistics	Number and rate of bytes and packets destined to the routing device.	**extensive**

Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	**extensive**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under *Common Output Fields Description*.	**detail extensive**
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	**detail extensive** none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	**detail extensive**
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	**detail extensive**
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about address flag (possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit **.50** (VLAN 50).

Table 125: Gigabit and 10 Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type

Interface Type	Sample Command	Byte and Octet Counts Include	Comments
Inbound physical interface	**show interfaces ge-0/3/0 extensive**	Traffic statistics: Input bytes: 496 bytes per packet, representing the Layer 2 packet MAC statistics: Received octets: 500 bytes per packet, representing the Layer 2 packet + 4 bytes	The additional 4 bytes are for the CRC.
Inbound logical interface	**show interfaces ge-0/3/0.50 extensive**	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	
Outbound physical interface	**show interfaces ge-0/0/0 extensive**	Traffic statistics: Input bytes: 490 bytes per packet, representing the Layer 3 packet + 12 bytes MAC statistics: Received octets: 478 bytes per packet, representing the Layer 3 packet	For input bytes, the additional 12 bytes include 6 bytes for the destination MAC address plus 4 bytes for VLAN plus 2 bytes for the Ethernet type.
Outbound logical interface	**show interfaces ge-0/0/0.50 extensive**	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	

Table 126 on page 1890 lists the output fields for the **show interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 126: show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Link-level type	Encapsulation being used on the physical interface.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
MTU	Maximum transmission unit size on the physical interface.	All levels
Link mode	Link mode: Full-duplex or Half-duplex.	
Speed	Speed at which the interface is running.	All levels
BPDU error	Bridge protocol data unit (BPDU) error: Detected or None	
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: **Enabled** or **Disabled**.	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the physical link.	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none
Current address	Configured MAC address.	**detail extensive** none

Table 126: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour*:*minute*:*second*:*timezone*** **(*hour*:*minute*:*second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None
Output Rate	Output rate in bps and pps.	None
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

Table 126: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface. • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** . • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**
Output errors	Output errors on the interface. • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 126: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface.	**extensive**
Queue counters and queue number	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**

MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following:
	• **Total octets** and **total packets**—Total number of octets and packets.
	• **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets.
	• **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
	• **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.
	• **MAC control frames**—Number of MAC control frames.
	• **MAC pause frames**—Number of MAC control frames with **pause** operational code.
	• **Oversized frames**—There are two possible conditions regarding the number of oversized frames:
	  ◦ Packet length exceeds 1518 octets, or
	  ◦ Packet length exceeds MRU
	• **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.
	• **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.
	• **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.
	• **Code violations**—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."
		extensive

Table 126: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.	**extensive**

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
		extensive

Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**

Table 126: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Interface transmit statistics	Status of the **interface-transmit-statistics** configuration: Enabled or Disabled.	**detail extensive**
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets, Output packets**—Number of packets received and transmitted on the interface set.	**detail extensive**

Table 126: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Local statistics	Number and rate of bytes and packets destined to the device.	**extensive**
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	**extensive**
Security	Security zones that interface belongs to.	**extensive**
Flow Input statistics	Statistics on packets received by flow module.	**extensive**
Flow Output statistics	Statistics on packets sent by flow module.	**extensive**
Flow error statistics (Packets dropped due to)	Statistics on errors in the flow module.	**extensive**
Protocol	Protocol family.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. .	**detail extensive**
Addresses, Flags	Information about the address flags..	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

```

NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics displayed in the **show interfaces** command output might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the interface counters. For detailed information, see the description of the logical interface **Transit statistics** fields in Table 124 on page 1861.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.

Description

(M Series, T Series, TX Matrix Plus, and PTX Series devices only) Display status information about the management Ethernet and internal Ethernet interfaces.

Options

em0 | fxp0—(M Series, MX Series, T Series, and PTX Series) Display standard information about the management Ethernet interface. For supported Ethernet interface by chassis and Routing Engine, see *Supported Routing Engines by Router*.

bcm0 | em0 | em1 | fxp1 | fxp2 | ixgbe0 | ixgbe1—(M Series, MX Series, T Series, and PTX Series) Display standard information about the internal Ethernet interfaces. See *Supported Routing Engines by Router* for the internal Ethernet interface names for each Routing Engine by hardware platform.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level view

List of Sample Output

Output Fields Table 127 on page 1936 lists the output fields for the **show interfaces** (management) command on the M Series routers, T Series routers, TX Matrix Plus routers, and PTX Series. Output fields are listed in the approximate order in which they appear.

Table 127: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	All levels
Interface index	Physical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Type	Type of interface.	All levels

Table 127: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Link-level type	Encapsulation type used on the physical interface.	All levels
MTU	Maximum transmission unit (MTU)—Size of the largest packet to be transmitted.	All levels
Clocking	Reference clock source of the interface.	All levels
Speed	Network speed on the interface.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under *Common Output Fields Description*.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under *Common Output Fields Description*.	All levels
Link type	Data transmission type.	**detail extensive** none
Link flags	Information about the link. Possible values are described in the "Link Flags" section under *Common Output Fields Description*.	**detail extensive**
Physical info	Information about the physical interface.	**detail extensive**
Hold-times	Current interface hold-time up and hold-time down. Value is in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Media access control (MAC) address of the interface.	**detail extensive** none
Alternate link address	Backup link address.	**detail extensive**
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Input packets	Number of packets received on the physical interface.	None specified
Output packets	Number of packets transmitted on the physical interface.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the logical and physical interface. • **Input bytes**, **Output bytes**—Number of bytes received and transmitted on the interface. • **Input packets**, **Output packets**—Number of packets received and transmitted on the interface.	**detail extensive**

Table 127: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Input errors	• **Errors**—Input errors on the interface. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Frames received smaller than the runt threshold. • **Giants**—Frames received larger than the giant threshold. • **Policed Discards**—Frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos does not support. • **Resource errors**—Sum of transmit drops.	**extensive**
Output errors	• **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning. • **Errors**—Sum of outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC RED mechanism. • **Resource errors**—Sum of transmit drops.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface; values are described in the “Device Flags” section under *Common Output Fields Description*.	All levels
Encapsulation	Encapsulation on the logical interface.	**detail extensive** none
inet	IP address of the logical interface.	**brief**
Protocol	Protocol family configured on the logical interface (such as **iso** or **inet6**).	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

Table 127: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Route table	Route table in which this address exists. For example, **Route table:0** refers to inet.0.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under *Common Output Fields Description*.	**detail extensive** none
Addresses, Flags	Information about address flags. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

Sample Output

show interfaces brief (Management Ethernet)

```
user@host> show interfaces fxp0 brief
Physical interface: fxp0, Enabled, Physical link is Up
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps

  Logical interface fxp0.0
    Flags: SNMP-Traps Encapsulation: ENET2
    inet  192.168.70.143/21
```

show interfaces (Management Ethernet)

```
user@host> show interfaces fxp0
Physical interface: fxp0, Enabled, Physical link is Up
  Interface index: 1, SNMP ifIndex: 1
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Half-Duplex
  Current address: 00:00:5E:00:53:89, Hardware address: 00:00:5E:00:53:89
  Last flapped   : Never
    Input packets : 80804
    Output packets: 1105

  Logical interface fxp0.0 (Index 2) (SNMP ifIndex 13)
    Flags: SNMP-Traps Encapsulation: ENET2
    Protocol inet, MTU: 1500
      Flags: Is-Primary
      Addresses, Flags: Is-Preferred Is-Primary
```

```
        Destination: 192.168.64/21, Local: 192.168.70.143,
        Broadcast: 192.168.71.255
```

show interfaces (Management Ethernet [TX Matrix Plus Router])

```
user@host> show interfaces em0
Physical interface: em0, Enabled, Physical link is Up
  Interface index: 8, SNMP ifIndex: 17

show interfaces (PPPoE)

Syntax

show interfaces pp0.*logical*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.

Options

pp0.*logical*—Display standard status information about the PPPoE interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about PPPoE interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display PPPoE interface statistics.

Required Privilege Level

view

List of Sample Output

show interfaces (PPPoE) on page 1957
show interfaces (PPPoE over Aggregated Ethernet) on page 1957
show interfaces brief (PPPoE) on page 1958
show interfaces detail (PPPoE) on page 1958
show interfaces extensive (PPPoE on M120 and M320 Routers) on page 1959

Output Fields

Table 128 on page 1951 lists the output fields for the **show interfaces** (PPPoE) command. Output fields are listed in the approximate order in which they appear.

Table 128: show interfaces (PPPoE) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	All levels
Interface index	Physical interface index number, which reflects its initialization sequence.	**detail extensive** none

Table 128: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Type	Physical interface type (PPPoE).	All levels
Link-level type	Encapsulation on the physical interface (PPPoE).	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be **Internal** or **External**.	All levels
Speed	Speed at which the interface is running.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under *Common Output Fields Description*.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under *Common Output Fields Description*.	All levels
Link type	Physical interface link type: **full duplex** or **half duplex**.	All levels
Link flags	Information about the interface. Possible values are described in the “Link Flags” section under *Common Output Fields Description*.	All levels
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Physical Info	Physical interface information.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive**
Hardware address	MAC address of the hardware.	**detail extensive**
Alternate link address	Backup address of the link.	**detail extensive**
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**

Table 128: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. NOTE: These fields include dropped traffic and exception traffic, as those fields are not separately defined. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface: • **Errors**—Sum of incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **Resource errors**—Sum of B chip Tx drops and IXP Tx net transmit drops.	**extensive**
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions** —Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of B chip Tx drops and IXP Tx net transmit drops.	**extensive**
Logical Interface		

Table 128: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number (which reflects its initialization sequence).	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under *Common Output Fields Description*.	All levels
Encapsulation	Type of encapsulation configured on the logical interface.	All levels
PPP parameters	PPP status: • LCP restart timer—Length of time (in milliseconds) between successive Link Control Protocol (LCP) configuration requests. • NCP restart timer—Length of time (in milliseconds) between successive Network Control Protocol (NCP) configuration requests.	**detail**
PPPoE	PPPoE status: • **State**—State of the logical interface (**up** or **down**). • **Session ID**—PPPoE session ID. • **Service name**—Type of service required. Can be used to indicate an Internet service provider (ISP) name or a class or quality of service. • **Configured AC name**—Configured access concentrator name. • **Auto-reconnect timeout**—Time after which to try to reconnect after a PPPoE session is terminated, in seconds. • **Idle Timeout**—Length of time (in seconds) that a connection can be idle before disconnecting. • **Underlying interface**—Interface on which PPPoE is running.	All levels
Link	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.	**detail extensive**

Table 128: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.	**detail extensive**
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize. NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.	**detail extensive**
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. • **interval** ***seconds***—The time in seconds between successive keepalive requests. The range is **10** seconds through **32,767** seconds, with a default of **10** seconds. • **down-count** ***number***—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is **1** through **255**, with a default of **3**. • **up-count** ***number***—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is **1** through **255**, with a default of **1**.	**detail extensive**

Keepalive statistics	(PPP and HDLC) Information about keepalive packets.
	
	• **Input**—Number of keepalive packets received by PPP.
	  ◦ **(last seen 00:00:00 ago)**—Time the last keepalive packet was received, in the format ***hh:mm:ss***.
	• **Output**—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received.
	  ◦ **(last seen 00:00:00 ago)**—Time the last keepalive packet was sent, in the format ***hh:mm:ss***.
	
	(MX Series routers with MPCs/MICs) When an MX Series router with MPCs/MICs is using PPP fast keepalive for a PPP link, the display does not include the number of keepalive packets received or sent, or the amount of time since the router received or sent the last keepalive packet.
		detail extensive

Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified

Table 128: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—LCP is not configured on the interface. • **Opened**—LCP negotiation is successful.	none **detail extensive**
NCP state	(PPP) Network Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—NCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—NCP is not configured on the interface. • **Opened**—NCP negotiation is successful.	**detail extensive** none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Chal-received**—Challenge was received but response not yet sent. • **Chap-Chal-sent**—Challenge was sent. • **Chap-Resp-received**—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response was sent for the challenge received. • **Closed**—CHAP authentication is incomplete. • **Failure**—CHAP authentication failed. • **Not-configured**—CHAP is not configured on the interface. • **Success**—CHAP authentication was successful.	none **detail extensive**
Protocol	Protocol family configured on the logical interface.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under *Common Output Fields Description*.	**detail extensive** none

Table 128: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the addresses configured for the protocol family. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none

Sample Output

show interfaces (PPPoE)

```
user@host> show interfaces pp0
Physical interface: pp0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 24
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532
  Device flags    : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link type       : Full-Duplex
  Link flags      : None
  Input rate      : 0 bps (0 pps)
  Output rate     : 0 bps (0 pps)

  Logical interface pp0.0 (Index 72) (SNMP ifIndex 72)
    Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
    PPPoE:
      State: SessionDown, Session ID: None,
      Service name: None, Configured AC name: sapphire,
      Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
      Underlying interface: at-5/0/0.0 (Index 70)
  Input packets : 0
  Output packets: 0

show interfaces interface-set (Ethernet Interface Set)

Syntax

show interfaces interface-set *interface-set-name*
<detail | terse>

Release Information

Command introduced in Junos OS Release 8.5.

Description

Display information about the specified gigabit or 10-Gigabit Ethernet interface set.

You can also use the **show interfaces interface-set** command to display information about agent circuit identifier (ACI) interface sets.

Options

interface-set ***interface-set-name***—Display information about the specified Gigabit Ethernet, 10-Gigabit Ethernet, ACI, or ALI interface set.

detail | terse—(Optional) Display the specified level of output.

Required Privilege Level

show interfaces interface-set (ACI Interface Set based on Accept-No-IDs Trusted Option when neither ACI nor ARI is received) on page 1964
show interfaces interface-set (L2BSA and PPPoE Subscribers) on page 1965

Output Fields

Table 129 on page 1961 describes the information for the **show interfaces interface-set** command. Output fields are listed in the approximate order in which they appear.

Table 129: Ethernet show interfaces interface-set Output Fields

Field Name	Field Description	Level of Output
Physical Interface		

Table 129: Ethernet show interfaces interface-set Output Fields (continued)

Field Name	Field Description	Level of Output
Interface set	Name of the interface set or sets. For ACI interface sets, the set name is prefixed with **aci-**. For ALI interface sets, the set name is prefixed with the trusted option that the interface set is based on: • **aci-**— The ACI is configured as the trusted option. • **ari-**— The ARI is configured as the trusted option. • **aci+ari-**— Both ACI and ARI are configured as the trusted option. • **noids-**— Neither the ACI nor the ARI is configured as the trusted option and neither ACI nor ARI is received.	All levels
Interface set index	Index number of the interface set.	**detail** none
ACI VLAN	For ACI interface sets, the string received in DHCP or PPPoE control packets that uniquely identifies the subscriber's access node and the DSL line on the access node. Only the **Agent Circuit ID** can be used to create the interface set. NOTE: The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the **line-identity** autoconfiguration stanza.	**detail** none
Line Identity	For ALI interface sets, the trusted option received in DHCP or PPPoE control packets that uniquely identifies the subscriber's access node and the DSL line on the access node. The trusted option can be either or both of the following: • **Agent Circuit ID**—The ACI value • **Agent Remote ID**—The ARI value. NOTE: When only **accept-no-ids** is configured as the trusted option, this field is not displayed. NOTE: The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the **agent-circuit-id** autoconfiguration stanza.	**detail** none
PPPoE	Dynamic PPPoE subscriber interface that the router creates using the ACI or ALI interface set.	**detail** none
Max Sessions	For dynamic PPPoE subscriber interfaces, maximum number of PPPoE logical interfaces that that can be activated on the underlying interface.	**detail** none
Max Sessions VSA Ignore	For dynamic PPPoE subscriber interfaces, whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configured with the **max-sessions** statement: **Off** (default) or **On**.	**detail** none

Table 129: Ethernet show interfaces interface-set Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes and number of bytes per second received and transmitted on the interface set • **Input packets, Output packets**—Number of packets and number of packets per second received and transmitted on the interface set.	**detail**
Egress queues supported	Total number of egress queues supported on the specified interface set.	**detail**
Egress queues in use	Total number of egress queues used on the specified interface set.	**detail**
Queue counters	**Queued packets**, **Transmitted packets**, and **Dropped packets** statistics for the four forwarding classes.	**detail**
Members	List of all interface sets or, for ACI interface sets, list of all subscriber interfaces belonging to the specified ACI interface set.	**detail** none

show interfaces interface-set queue

Syntax

show interfaces interface-set queue *interface-set-name*
<aggregate | remaining-traffic>
<forwarding-class *class-name*>

Release Information

Command introduced in Junos OS Release 8.5.

Description

Display information about the gigabit or 10-Gigabit Ethernet interface set queue. Supported in MX Series routers with enhanced queuing DPCs.

Options

interface-set-name—(Optional) Display information about the specified gigabit or 10-Gigabit Ethernet interface set. Wildcard values can be used in the interface set name.

aggregate—(Optional) Display the aggregated queuing statistics of all member logical interfaces for interface sets that have traffic-control profiles configured.

both-ingress-egress—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics.

egress—(Optional) Display egress queue statistics.

forwarding-class *class-name*—(Optional) Display queuing statistics for the specified forwarding class.

ingress—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics.

remaining-traffic—(Optional) Display the queuing statistics of all member logical interfaces for interface sets that do not have traffic-control profiles configured.

Required Privilege Level

view

List of Sample Output

show interfaces interface-set queue (Gigabit Ethernet) on page 1967
show interfaces interface-set queue both-ingress-egress (Enhanced DPC) on page 1968
show interfaces interface-set queue egress (Enhanced DPC) on page 1970
show interfaces interface-set queue forwarding-class (Gigabit Ethernet) on page 1971
show interfaces interface-set queue (Enhanced DPC) on page 1972
show interfaces interface-set queue remaining-traffic (Gigabit Ethernet) on page 1973

Output Fields

Table 130 on page 1966 describes the information for the **show interfaces interface-set queue** command.

Table 130: Ethernet show interfaces interface-set queue Output Fields

Field Name	Field Description	Level of Output
Physical Interface		

Table 130: Ethernet show interfaces interface-set queue Output Fields (continued)

Field Name	Field Description	Level of Output
Interface set	Name of the interface set.	All levels
Interface set index	Index number of the interface set.	All levels
Forwarding classes supported	Total number of forwarding classes supported on the specified interface set.	All levels
Forwarding classes in use	Total number of forwarding classes used on the specified interface set.	All levels
Egress queues supported	Total number of egress queues supported on the specified interface set.	All levels
Egress queues in use	Total number of egress queues used on the specified interface set.	All levels
Ingress queues supported	Total number of ingress queues supported on the specified interface set.	All levels
Ingress queues in use	Total number of ingress queues used on the specified interface set.	All levels
Queue	Egress or ingress queue number for the statistics being displayed.	All levels
Forwarding classes	Forwarding class name for the statistics being displayed.	All levels
Queued	**Packet** and **Byte** statistics for the specified queue. • **Packets**—Number of packets queued and input rate in packets per second. • **Bytes**—Number of bytes queued and input rate in bytes per second.	All levels
Transmitted	**Packet** and **Byte** statistics for the specified forwarding class. • **Packets**—Number of packets transmitted and transmit rate in packets per second. • **Bytes**—Number of bytes transmitted and transmit rate in bytes per second. • **Tail-dropped packets**—Number of packets tail dropped. • **RED-dropped packets**—Number of RED-dropped packets for the **low**, **medium-low**, **medium-high**, and **high** loss priorities. • **RED-dropped bytes**—Number of RED-dropped bytes for the **low**, **medium-low**, **medium-high**, and **high** loss priorities.	All levels

Sample Output

show interfaces interval

Syntax

show interfaces interval
<*interface-name*>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display the channel service unit (CSU) interface alarm and error count in 15-minute intervals for the past 24 hours. If the system has been operational for less than 24 hours, the maximum number of intervals available is displayed.

Options

interface-name—(Optional) Name of a particular interface.

Required Privilege Level

view

show interfaces interval (E3) on page 1976
show interfaces interval (SONET/SDH) on page 1976

Output Fields

Table 131 on page 1974 lists the output fields for the **show interfaces interval** command. Output fields are listed in the approximate order in which they appear.

Table 131: show interfaces interval Output Fields

Field Name	Field Description
Physical interface	Name of the interface.
SNMP ifIndex	SNMP index number for the physical interface.
***hh:mm*-current**	Time of day (in hours and minutes) at the beginning of the latest counter interval. The value of the latest counter interval is always less than 15 minutes.
hh:mm-hh:mm	Time of day (in hours and minutes) at the beginning and end of each 15-minute interval.
alarm or **event:** ***n***	Count of alarms and events within each 15-minute interval. The specific alarm or event depends on the interface media type. For a description of the alarm or event listed, see the ***interface-type*** **media** field (for example, **T1 media**) under the **show interfaces** command for the particular interface type in which you are interested.
Interval Total	Sum of all the alarm and defect counters for the last 24-hour period.

Table 131: show interfaces interval Output Fields (continued)

Field Name	Field Description
Interval Total	Sum of all the alarm and defect counters for the last 24-hour period.
Current Day Interval Total	Sum of all the alarm and defect counters in the current day. NOTE: The **Current Day Interval** output field is reset after 24 hours.
Previous Day Interval Total	Sum of all the alarm and defect counters in the previous day.

show interfaces irb

Syntax

show interfaces irb
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced in Junos OS Release 8.4.

Description

Display integrated routing and bridging interfaces information.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

mac—Display hardware MAC address

media—(Optional) Display media-specific information about network interfaces.

snmp-index ***snmp-index***—(Optional) Display information for the interface with the specified SNMP index.

statistics—(Optional) Display static interface statistics.

Additional Information

Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another bridging domain that has a Layer 3 protocol configured.

List of Sample Output

show interfaces irb extensive on page 1982
show interfaces irb snmp-index on page 1983

Output Fields

Table 132 on page 1978 lists the output fields for the **show interfaces irb** command. Output fields are listed in the approximate order in which they appear.

Table 132: show interfaces irb Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the physical interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.	All levels

Table 132: show interfaces irb Output Fields (continued)

Field Name	Field Description	Level of Output
Proto	Protocol configured on the interface.	**terse**
Interface index	Physical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Type	Physical interface type.	**detail extensive** none
Link-level type	Encapsulation being used on the physical interface.	**detail extensive brief** none
MTU	MTU size on the physical interface.	**detail extensive brief** none
Clocking	Reference clock source: **Internal** or **External**. Always unspecified on IRB interfaces.	**detail extensive brief**
Speed	Speed at which the interface is running. Always unspecified on IRB interfaces.	**detail extensive brief**
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under *Common Output Fields Description*.	**detail extensive brief** none
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under *Common Output Fields Description*.	**detail extensive brief** none
Link type	Physical interface link type: **full duplex** or **half duplex**.	**detail extensive** none
Link flags	Information about the link. Possible values are described in the "Links Flags" section under *Common Output Fields Description*.	**detail extensive** none
Physical Info	Physical interface information.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	MAC address of the hardware.	**detail extensive** none
Alternate link address	Backup address of the link.	**detail extensive**
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**

Table 132: show interfaces irb Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **Resource errors**—Sum of transmit drops.	**detail extensive**
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**detail extensive**

Logical Interface

Table 132: show interfaces irb Output Fields (continued)

Field Name	Field Description	Level of Output
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface (which reflects its initialization sequence).	**detail extensive** none
SNMP ifIndex	SNMP interface index number of the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under *Common Output Fields Description*.	**detail extensive**
Encapsulation	Encapsulation on the logical interface.	**detail extensive**
Bandwidth	Dummy value that is ignored by an IRB interface. IRB interfaces are pseudo interfaces and do not have physical bandwidth associated with them.	**detail extensive**
Routing Instance	Routing instance IRB is configured under.	**detail extensive**
Bridging Domain	Bridging domain IRB is participating in.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the logical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine.	**detail extensive**
Transit statistics	Statistics for traffic transiting the router.	**detail extensive**
Protocol	Protocol family configured on the local interface. Possible values are described in the "Protocol Field" section under *Common Output Fields Description*.	**detail extensive**
MTU	Maximum transmission unit size on the logical interface.	**detail extensive**
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none

Table 132: show interfaces irb Output Fields (continued)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Addresses, Flags	Information about address flags. Possible values are described in the “Addresses Flags” section under *Common Output Fields Description*.	**detail extensive**
Policer	The policer that is to be evaluated when packets are received or transmitted on the interface.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under *Common Output Fields Description*.	**detail extensive**

show interfaces mac-database

Syntax

show interfaces mac-database (ge-*fpc/pic/port* | ge-*fpc/pic/port.n* | aex| xe-*fpc/pic/port* | xe-*fpc/pic/port.n* | et-*fpc/pic/port* | et-*fpc/pic/port.n*) <mac-address *mac-address*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.
Support for statement with the **ae*x*** option introduced in Junos OS Release 15.1.

Description

(M Series, T Series, MX Series routers, and PTX Series Packet Transport Routers only) Display media access control (MAC) address information for the specified interface.

Options

ge-*fpc/pic/port*—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.

ge-*fpc/pic/port.n*—Display MAC addresses that have been learned on a particular logical interface.

ae*x*—Display MAC addresses that have been learned on a particular aggregated Ethernet interface.

xe-*fpc/pic/port*—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.

xe-*fpc/pic/port.n*—Display MAC addresses that have been learned on a particular logical interface.

et-*fpc/pic/port*—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.

et-*fpc/pic/port.n*—Display MAC addresses that have been learned on a particular logical interface.

mac-address *mac-address*—(Optional) Display detailed MAC address statistics, including policer information for **ge**, **xe**, and **et** interfaces.

Additional Information

On IQ2 PIC interfaces, the default value for maximum retention of entries in the MAC address table has changed, for cases in which the table is not full. The new holding time is 12 hours. The previous retention time of 3 minutes is still in effect when the table is full.

show interfaces mac-database (All MAC Addresses on an Aggregated Ethernet Interface) on page 1988
show interfaces mac-database (All MAC Addresses on a Service) on page 1989

show interfaces mac-database mac-address on page 1989

Output Fields Table 133 on page 1986 lists the output fields for the **show interfaces mac-database** command. Output fields are listed in the approximate order in which they appear.

Table 133: show interfaces mac-database Output Fields

Field Name	Field Description
Physical Interface	
Physical interface	Name of the physical interface.
Enabled	State of the physical interface. Possible values are described in the “Enabled Field” section under *Common Output Fields Description*.
Interface index	Physical interface index number, which reflects its initialization sequence.
SNMP ifIndex	SNMP index number for the physical interface.
Description	Description and name of the interface.
Link-level type	Encapsulation being used on the physical interface.
MTU	MTU size on the physical interface.
Speed	Speed at which the interface is running.
Loopback	Whether loopback is enabled and the type of loopback: **local** or **remote**.
Source filtering	Whether source filtering is configured.
Flow control	Whether flow control is enabled or disabled.
Minimum links needed	(Aggregated Ethernet interfaces only) Number of child links that must be operational for the aggregated interface to be operational.
Minimum bandwidth needed	(Aggregated Ethernet interfaces only) Minimum amount of bandwidth of child links that must be operational for the aggregated interface to be operational.
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under *Common Output Fields Description*.
Currrent address	(Aggregated Ethernet interfaces only) Configured MAC address.
Hardware address	(Aggregated Ethernet interfaces only) Hardware MAC address.
Last flapped	(Aggregated Ethernet interfaces only) Date, time, and how long ago the interface went from down to up or from up to down. The format is **Last flapped:** ***year-month-day hours:minutes:seconds timezone*** **(*wweeksddays hours:minutes* ago)**. For example, **Last flapped: 2013-12-18 04:33:22 PST (1w5d 22:23 ago).**

Table 133: show interfaces mac-database Output Fields (continued)

Field Name	Field Description
Input Rate	(Aggregated Ethernet interfaces only) Input rate in bits per second (bps) and packets per second (pps).
Output Rate	(Aggregated Ethernet interfaces only) Output rate in bps and pps.
Interface flags	Information about the interface. Possible values are described in the “Links Flags” section under *Common Output Fields Description*.
Link flags	Information about the link. Possible v4alues are described in the “Device Flags” section under *Common Output Fields Description*.
Logical Interface	
Logical interface	Name of the logical interface.
Index	Logical interface index number, which reflects its initialization sequence.
SNMP ifIndex	Logical interface SNMP interface index number.
Flags	Information about the logical interface (possible values are described in the “Logical Interface Flags” section under *Common Output Fields Description*.
Encapsulation	Encapsulation on the logical interface.
MAC address, Input frames, Input bytes, Output frames, Output bytes	MAC address and corresponding number of input frames, input bytes, output frames, and output bytes.
Number of MAC addresses	Number of MAC addresses configured.

Policer Statistics	(Displayed for **mac-address** option for **ge**, **xe**, and **et** interface types only) Display information about policers applied to a logical interface-MAC pair.
	• **Policer type**—Type of policer that is out of spec with respect to the configuration. It can be one or more of the following:
	  ◦ **Input premium**—Number of high-priority rating out-of-spec frames or bytes received.
	  ◦ **Output premium**—Number of high-priority rating out-of-spec frames or bytes sent.
	  ◦ **Input aggregate**—Total number of out-of-spec frames or bytes received.
	  ◦ **Output aggregate**—Total number of out-of-spec frames or bytes sent.
	• **Discarded Frames**—Number of discarded frames.
	• **Discarded Bytes**—Number of discarded bytes.

Sample Output

show interfaces mac-database (All MAC Addresses on a Port)

`user@host>` **show interfaces mac-database xe-0/3/3**

show interfaces mc-ae

Syntax

show interfaces mc-ae
extensive
revertive-info
<id *identifier* unit *number*>

Release Information

Command introduced in Junos OS Release 9.6.
revertive-info statement introduced in Junos OS Release 13.3
extensive statement introduced in Junos OS Release 16.1R1

Description

On MX Series routers with multichassis aggregated Ethernet (**ae*X***) interfaces, displays information about the **ae*X*** interfaces.

Options

extensive—(Optional) Display extensive information for multichassis aggregated Ethernet interface.

revertive-info—(Optional) Display revertive mode information for multichassis aggregated Ethernet interface.

identifier—(Optional) Identifier of the multichassis aggregated Ethernet interface.

number—(Optional) Specify the logical interface by unit number.

Required Privilege Level

view

show interfaces mc-ae (Active/Active Bridging and VRRP over IRB on MX Series Routers) on page 1992
show interfaces mc-ae revertive-info on page 1992
show interfaces mc-ae extensive on page 1992
show interfaces mc-ae extensive (MX Series Router after a configuration exchange error) on page 1993

Output Fields

Table 134 on page 1990 lists the output fields for the **show interfaces mc-ae** command. Output fields are listed in the approximate order in which they appear.

Table 134: show interfaces mc-ae Output Fields

Output Field Name	Field Description
Member Link	Identifiers of the configured multichassis link aggregate interfaces configured interfaces.
Local Status	Status of the local link: **active** or **standby**.

Table 134: show interfaces mc-ae Output Fields (continued)

Output Field Name	Field Description
Peer Status	Status of the peer link: **active** or **standby**.
Local State	Up or down state of the local device.
Peer State	Status of the local and peer links in an **active/active** bridge or VRRP over integrated routing and bridging (IRB) configuration on MX Series routers, including: **Logical Interface**—Aggregated Ethernet (AE) aggregate number and unit number. **Topology Type**—The bridge or VRRP topology type configured on the AE. **Local State**—Up or down state of the local device. **Peer State**—Up or down state of the peer device. **Peer Ip/ICL-PL/State**—Address, interface and state of the peer device.
Logical Interface	Identifier and unit of the multichassis aggregated Ethernet interface.
Core Facing Interface	Label: **pseudowire interface** or **Ethernet interface**.
ICL-PL	Label: **pseudowire interface** or **Ethernet interface**.
switchover mode	The configured switchover mode for the multichassis aggregated Ethernet interface: **revertive** or **non-revertive**.
switchover status	Status of the switchover if the **revert-time** statement is configured at the **[edit interfaces ae*x* mc-ae]** hierarchy level.
revert time	Revert time configured for the multichassis aggregated Ethernet interface.
switchover time remaining	Seconds left to trigger the switchover if the switchover is in progress.
Configuration Error Status	Reason for the configuration error.

show interfaces transport pm

Syntax

show interfaces transport pm (all | optics | otn) (all | current | currentday | interval | previousday) (all |*interface-name*)

Release Information

Command introduced in Junos OS Release 14.2 on the PTX Series.
Command introduced in Junos OS Release 16.1 on the MX Series.

Description

Display diagnostic data, warnings, and alarms for transport performance monitoring interfaces.

Options

(all | optics | otn)—Display both optics and OTN information or either only optics or only OTN information.

(all | current | currentday | interval | previousday)—Display information for the current 15-minute interval, the current day, the ninety-six 15-minute intervals, and the previous day; information only for the current 15-minute interval; information only for the current 24 hours; information only for the ninety-six 15-minute intervals; information only for the previous day.

(all | *interface-name*)—Display information for all interfaces or only for the specified interface (for example, *et-fpc/pic/port*).

Output Fields

Table 135 on page 1995 lists the output fields for the **show interfaces transport pm optics** command. Fields are listed in the approximate order in which they appear.

Table 135: show interfaces transport pm Output Fields

Field Name	Field Description
Physical interface	Name of the physical interface.
Interval	The 15 minute interval for performance monitoring.
Suspect Flag	TRUE if the performance monitoring data for the interval appears to
Reason	Reason for setting the suspect flag.
COUNT	Measured value.
THRESHOLD	Threshold value set.
TCA-ENABLED	Threshold crossing alert. Set to TRUE if enabled.
TCA-RAISED	TRUE if enabled and the value crosses the threshold.
Near End PM	Near end threshold crossing defect trigger. For more information abo
Far End PM	Far end threshold crossing defect trigger. For more information abou
FEC PM	Forwarding equivalence class threshold crossing defect trigger. For m see tca.
BER PM	Bit error rate threshold crossing defect trigger. For more information a
CURRENT	Current value measured.
PM	Performance monitor.
MIN	Minimum value measured.
MAX	Maximum value measured.
AVG	Average value.
Lane Chromatic dispersion	Residual chromatic dispersion measured.
Lane differential group delay	Measured differential group delay.
q Value	Measured Quality factor value.
SNR	Signal to noise ratio.
Tx output power	The transmit laser output power.

Table 135: show interfaces transport pm Output Fields (continued)

Field Name	Field Description
Rx input power	The laser's received optical power.
Module temperature (Celsius)	The laser's temperature.
Tx Laser bias current (0.1mA)	Magnitude of the laser bias power setting current. The laser bias prov and modulates currents.
Rx Laser bias current (0.1mA)	Magnitude of the laser bias power setting current.
Carrier frequency offset (MHz)	Measured carrier frequency offset.

show l2-learning instance

Syntax **show l2-learning instance**

Release Information (MX Series routers only) Command introduced in Junos OS Release 8.4.

Description Display Layer 2 learning properties for all the configured routing instances.

Options This command has no options.

Required Privilege Level view

List of Sample Output show l2-learning instance on page 2001

Output Fields Table 136 on page 2000 describes the output fields for the **show l2-learning instance** command. Output fields are listed in the approximate order in which they appear.

Table 136: show l2-learning instance Output Fields

Field Name	Field Description
Routing Instance	Name of routing instance.
Bridging Domain	Name of bridging domain. On MX Series routers you can use the **show l2-learning instance <extensive>** command option to display the Bridge Service-id information which includes the Config Service ID and the Active Service ID.
Index	Number associated with the routing instance or bridging domain.
Logical System	Name of logical system or **Default** if no logical system is configured.
Routing instance flags	Status of Layer 2 learning properties for each routing instance: • **DL**—MAC learning is disabled. • **SE**—MAC accounting is enabled. • **AD**—Packets are dropped after MAC address limit is reached. • **LH**—The maximum number of MAC addresses has been learned on the routing instance. The routing instance is not able to learn any additional MAC addresses.
MAC limit	Maximum number of MAC addresses that can be learned from each interface in the routing instance or bridging domain.

Sample Output

show l2-learning instance

```
user@host> show l2-learning instance
Information for routing instance:

Routing Instance flags (DL -disable learning, SE -stats enabled,
                        AD -packet action drop, LH -mac limit hit)

Routing              Bridging     Index   Logical        Routing      MAC
Instance             Domain               System         flags        limit

show l2-learning redundancy-groups

Syntax

show l2-learning redundancy-groups
logical-system [*system-name* | all]
<redundancy-group-id [0 to 4294967294]>
arp-statistics
nd-statistics
remote-macs

Release Information

Command introduced in Junos OS Release 13.2.
Support for logical systems added in Junos OS Release 14.1.
Command introduced in Junos OS Release 15.1R1 for EX Series switches

Description

(MX Series routers only) Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch or logical systems on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.

Options

logical-system [*system-name* | all]—(Optional) Display information for a specified logical system or all systems.

redundancy-group-id—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.

arp-statistics—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.

nd-statistics—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.

remote-macs —(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.

Output Fields Output fields are listed in the approximate order in which they appear.

Table 137: show l2-learning redundancy-groups arp-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ARP Statistics Group ID	ARP statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ARP Rx Count From Line	Total number of ARPs received from the Line.
ARP Tx Count To Peer	Total number of ARPs sent to the peer.
ARP Rx Count From Peer	Total number of ARPs received from the peer.
ARP Drop Count received from line	Total number of ARPs sent by the peer that were received.
ARP Drop Count received from peer	Total number of ARPs sent by the peer that were dropped
Service-id	Service ID (configured at the routing instance level).

Table 138: show l2-learning redundancy-groups nd-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ND Statistics Group ID	Neighbor Discovery statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ND Rx Count From Line	Total number of Neighbor Discovery packets received from the Line.
ND Tx Count To Peer	Total number of Neighbor Discovery packets sent to the peer.
ND Rx Count From Peer	Total number of Neighbor Discovery packets received from the peer.
ND Drop Count received from line	Total number of Neighbor Discovery packets sent by the peer that were received.

Table 138: show l2-learning redundancy-groups nd-statistics Output Fields (continued)

Field Name	Field Description
ND Drop Count received from peer	Total number of Neighbor Discovery packets sent by the peer that were dropped
Service-id	Service ID (configured at the routing instance level).

Table 139: show l2-learning redundancy-groups remote-macs Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
Peer-Addr	IP address of the remote peer.
VLAN	Virtual LAN identifier associated with the redundancy group.
MAC	Hardware media access control address associated with the redundancy group.
MCAE-ID	ID number of the MC-AE used by the redundancy group.
Flags	Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected.
Status	Installation state: Installed or Not Installed.

Sample Output

show l2-learning redundancy-groups arp-statistics

```
user@host> show l2-learning redundancy-groups arp-statistics
Logical System : default
 Redundancy Group ID : 1     Flags : Local Connect, Remote Connect

MCLAG ARP Statistics
Group ID                                 : 1
ARP Rx Count From Line                   : 52

show lacp interfaces

Syntax

show lacp interfaces
<*interface-name*>
extensive

Release Information

Command introduced in Junos OS Release 7.6.
extensive statement introduced in Junos OS Release 16.1R1
Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Command introduced in Junos OS Release 14.2R3

Description

Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet, Fast Ethernet, or Gigabit Ethernet interface.

Options

none—Display LACP information for all interfaces.

interface-name—(Optional) Display LACP information for the specified interface:

- Aggregated Ethernet—**ae*number***
- Fast Ethernet—**fe-*fpc/pic/port***
- Gigabit Ethernet—**ge-*fpc/pic/port***
- 10 Gigabit Ethernet—**xe-*fpc/pic/port***

extensive—Display LACP information for the interface in detail.

NOTE: The show lacp interfaces command returns the following error message if your system is not configured in either active or passive LACP mode:

“Warning: lacp subsystem not running – not needed by configuration”

show lacp interfaces (Gigabit Ethernet) on page 2010
show lacp interfaces (10 Gigabit Ethernet) on page 2011

Output Fields

Table 140 on page 2008 lists the output fields for the **show lacp interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 140: show lacp interfaces Output Fields

Field Name	Field Description	Level of Output
LACP State	For a child interface configured with the force-up statement, LACP state displays FUP along with the interface name.	All Levels
Aggregated interface	Aggregated interface value.	All Levels

LACP State	LACP state information for each aggregated interface:
	• **Role**—Role played by the interface. It can be one of the following:
	  ◦ **Actor**—Local device participating in LACP negotiation.
	  ◦ **Partner**—Remote device participating in LACP negotiation.
	• **Exp**—Expired state. **Yes** indicates the actor or partner is in an expired state. **No** indicates the actor or partner is not in an expired state.
	• **Def**—Default. **Yes** indicates that the actor's receive machine is using the default operational partner information, administratively configured for the partner. **No** indicates the operational partner information in use has been received in an LACP PDU.
	• **Dist**—Distribution of outgoing frames. **No** indicates distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is **Yes**.
	• **Col**—Collection of incoming frames. **Yes** indicates collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is **No**.
	• **Syn**—Synchronization. If the value is **Yes**, the link is considered synchronized. It has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is **No**, the link is not synchronized. It is currently not in the right aggregation.
	• **Aggr**—Ability of aggregation port to aggregate (**Yes**) or to operate only as an individual link (**No**).
	• **Timeout**—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or fast transmission rate, depending upon the expressed LACP timeout preference (**Long Timeout** or **Short Timeout**).
	• **Activity**—Actor or partner's port activity. **Passive** indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is **Active**. **Active** indicates the port's preference to participate in the protocol regardless of the partner's control value.
		All Levels

Table 140: show lacp interfaces Output Fields (continued)

Field Name	Field Description	Level of Output

LACP Protocol	LACP protocol information for each aggregated interface:
	• Link state (active or standby) indicated in parentheses next to the interface when link protection is configured.
	• **Receive State**—One of the following values:
	  ◦ **Current**—The state machine receives an LACP PDU and enters the **Current** state.
	  ◦ **Defaulted**—If no LACP PDU is received before the timer for the **Current** state expires a second time, the state machine enters the **Defaulted** state.
	  ◦ **Expired**—If no LACP PDU is received before the timer for the **Current** state expires once, the state machine enters the **Expired** state.
	  ◦ **Initialize**—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the **Initialize** state.
	  ◦ **LACP Disabled**—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to **LACP Disabled**. This state is similar to the **Defaulted** state, except that the port is forced to operate as an individual port.
	  ◦ **Port Disabled**—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the **Port Disabled** state.
	• **Transmit State**—Transmit state of state machine. One of the following values:
	  ◦ **Fast Periodic**—Periodic transmissions are enabled at a fast transmission rate.
	  ◦ **No Periodic**—Periodic transmissions are disabled.
	  ◦ **Periodic Timer**—Transitory state entered when the periodic timer expires.
	  ◦ **Slow Periodic**—Periodic transmissions are enabled at a slow transmission rate.
	• **Mux State**—State of the multiplexer state machine for the aggregation port. The state is one of the following values:
	  ◦ **Attached**—Multiplexer state machine initiates the process of attaching the port to the selected aggregator.
	  ◦ **Collecting**—**Yes** indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. **No** indicates the receive function of this link is not enabled.
	  ◦ **Collecting Distributing**—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution.
	  ◦ **Detached**—Process of detaching the port from the aggregator is in progress.
	  ◦ **Distributing**—**Yes** indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames may be passed down from the aggregator's distribution function for transmission. **No** indicates the transmit function of this link is not enabled.
	  ◦ **Waiting**—Multiplexer state machine is in a holding process, awaiting an outcome.
		All Levels

Table 140: show lacp interfaces Output Fields (continued)

Field Name	Field Description	Level of Output

LACP info	• **Role** can be one of the following:
	  ◦ **Actor**—Local device participating in LACP negotiation.
	  ◦ **Partner**—Remote device participating in LACP negotiation.
	• **System priority**—Priority assigned to the system (by management or administrative policy), encoded as an unsigned integer.
	• **System identifier**—Actor or partner system ID, encoded as a MAC address.
	• **Port priority**—Priority assigned to the port by the actor or partner (by management or administrative policy), encoded as an unsigned integer.
	• **Port number**—Port number assigned to the port by the actor or partner, encoded as an unsigned integer.
	• **Port key**—Operational key value assigned to the port by the actor or partner, encoded as an unsigned integer.

show lldp on page 2014
show lldp detail on page 2014

Output Fields

Table 141 on page 2012 describes the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

Table 141: show lldp Output Fields

Field Name	Field Description
LLDP	Status of LLDP: **Enabled** or **Disabled**.
Advertisement interval	Value of the advertisement interval parameter.
Transmit delay	Value of the transmit delay parameter.
Hold timer	Value of the hold timer parameter.
Notification interval	Value of the notification interval parameter.
Config Trap Interval	Value of the configuration trap parameter.
Connection Hold timer	Value of the connection hold timer parameter.
Port ID TLV subtype	• *interface-name*—Indicates the interface name as the port information for the local device. • **locally-assigned**—Indicates that the sub-type for port ID TLV generation is locally assigned value of SNMP index of the interface. For more information about port ID TLV subtype, see port-id-subtype..

Table 141: show lldp Output Fields (continued)

Field Name	Field Description
Port Description TLV type	Following value used for port description TLV: • **interface-alias (ifAlias)**—Indicates that the *ifAlias* MIB object value is used to generate the port description TLV. • **interface-description (ifDescr)**—Indicates that the *ifDescr* MIB object value is used to generate the port description TLV. For more information about port description TLV type, see port-description-type.
Interface	Name of the interface for which LLDP configuration information is being reported For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs.
LLDP	LLDP operating state. The state can be Enabled or Disabled.
LLDP-MED	LLDP-MED operating state. The state can be Enabled or Disabled.
Power Negotiation	LLDP power negotiation operating state. The state can be Enabled or Disabled.
LLDP basic TLVs supported	List of basic LLDP TLVs supported by this device (**detail** only).
LLDP 802 TLVs supported	List of IEEE 802.1 LLDP TLVs supported by this device (**detail** only).

Sample Output

show lldp

```

Basic Management TLVs supported:
End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name,
 System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:
Port VLAN tag, VLAN Name, MAC/PHY Configuration/Status, Link Aggregation,Maximum
 Frame Size
```

show lldp local-information

Syntax show lldp local-information

Release Information Command introduced in Junos OS Release 9.6.

Description Display local Link Layer Discovery Protocol (LLDP) information.

Options This command has no options.

Required Privilege Level view

List of Sample Output
show lldp local-information(Management Information Address Subtype is IPv4) on page 2017
show lldp local-information(Management Information Address Subtype is IPv6) on page 2017

Output Fields Table 142 on page 2015 describes the output fields for the **show lldp local-information** command. Output fields are listed in the approximate order in which they appear.

Table 142: show lldp local-information Output Fields

Field Name	Field Description
LLDP Local Information details	Information that follows pertains to the local system.
Chassis ID	List of chassis identifiers for local information.
System name	Local system name reported by LLDP.
System descr	Local system description reported by LLDP.
System Capabilities	Capabilities (such as **Bridge** or **Router**) that are **Supported** or **Enabled** by system on the interface.
Management Information	Listed by **Interface Name**, **Address Subtype** (such as **ipv4**, **ipv6**), **Address** (such as **192.168.168.229**, **1fd::1a10**), **Interface Number**, and **Interface Numbering Subtype**.
Interface Name	List of local interfaces. For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.
Parent Interface	Name of the **ae** interface to which the interface belongs
Interface ID	List of local interface identifiers.

Table 142: show lldp local-information Output Fields (continued)

Field Name	Field Description
Interface Description	List of local interface descriptions.
Status	List of interface conditions: **UP** or **DOWN**.

Sample Output

show lldp local-information(Management Information Address Subtype is IPv4)

```
user@host> show lldp local-information
LLDP Local Information details

```

show lldp neighbors

Syntax

show lldp neighbors
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 9.6.

Description

Display information about LLDP neighbors.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports* .

Options

interface ***interface-name***—(Optional) Display the neighbor information about a particular physical interface.

NOTE: Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

Output Fields

Table 143 on page 2018 describes the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 143: show lldp neighbors Output Fields

Field Name	Field Description
LLDP Remote Devices Information	Information about remote devices.

Table 143: show lldp neighbors Output Fields (continued)

Field Name	Field Description
LocalInterface	List of local interfaces for which neighbor information is available.
ChassisId	List of chassis identifiers for neighbors.
PortInfo	List of port information gathered from neighbors. This could be the port identifier or port description.
SysName	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both local and neighbor systems on the interface (appears when the **interface** option is used).
Local Information	Information about local systems on the interface (appears when the **interface** option is used).
Neighbor Information	Information about both local and neighbor system on the interface (appears when the **interface** option is used).
Index	Local interface index (appears when the **interface** option is used).
Time Mark	Date and timestamp of information (appears when the **interface** option is used).
Time To Live	Number of seconds for which this information is valid (appears when the **interface** option is used).
Local Interface	Name of the local physical interface (appears when the **interface** option is used).
Parent Interface	Name of the **ae** interface to which the interface belongs
Local Port ID	Local port identifier (appears when the interface option is used).
Neighbor Information	Information about neighbor systems on the interface (appears when the **interface** option is used).
Chassis type	Type of chassis identifier supplied, such as **MAC address** (appears when the **interface** option is used).
Chassis ID	Chassis identifier of type listed (appears when the **interface** option is used).
Port type	Type of port identifier supplied, such as **local** (appears when the **interface** option is used).
Port ID	Port identifier of type listed (appears when the **interface** option is used).
Port description	Port description (appears when the **interface** option is used).

Table 143: show lldp neighbors Output Fields (continued)

Field Name	Field Description
System name	Name supplied by the system on the interface (appears when the **interface** option is used).
System Description	Description supplied by the system on the interface (appears when the **interface** option is used).
System Capabilities	Capabilities (such as **bridge** or **router**) that are **Supported** or **Enabled** by the system on the interface (appears when the **interface** option is used).
Management address	Details of the management address: **Address Type** (such as **ipv4** and **ipv6**), **Address** (such as **10.204.34.35**, **1fd::1a10**), **Interface Number**, **Interface Subtype**, and Organization Identifier (**OID**) (appears when the **interface** option is used).
Organization Info	One or more entries listing remote information by Organizationally Unique Identifier (**OUI**), **Subtype**, **Index**, and **Info** (appears when the **interface** option is used).

show lldp remote-global-statistics

Syntax show lldp remote-global-statistics

Release Information Command introduced in Junos OS Release 9.6.

Description Display remote Link Layer Discovery Protocol (LLDP) global statistics.

Options This command has no options.

Required Privilege Level view

List of Sample Output show lldp remote-global-statistics on page 2025

Output Fields Table 144 on page 2024 describes the output fields for the **show lldp remote-global-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 144: show lldp remote-global-statistics Output Fields

Field Name	Field Description
LLDP Remote Database Table Counters	Information about remote database table counters.
LastchangeTime	Time elapsed between LLDP agent startup and the last change to the remote database table information.
Inserts	Number of insertions made in the remote database table.
Deletes	Number of deletions made in the remote database table.
Drops	Number of LLDP frames dropped from the remote database table because of errors.
Ageouts	Number of remote database table entries that have aged out of the table.

Sample Output

show lldp remote-global-statistics

```
user@host> show lldp remote-global-statistics
user@host> show lldp remote-global-statistics
   LLDP Remote Database Table Counters
   LastchangeTime          Inserts    Deletes    Drops    Ageouts

show oam ethernet connectivity-fault-management delay-statistics

Syntax

show oam ethernet connectivity-fault-management delay-statistics
<count *entry-count*>
<local-mep *mep-id*>
<maintenance-association *ma-name*>
<maintenance-domain *md-name*>
<remote-mep *remote-mep-id*>

Release Information

Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 11.4 for EX Series switches.

Description

On MX Series routers with Ethernet interfaces on Dense Port Concentrators (DPCs), display ETH-DM delay statistics.

On EX Series switches, display delay measurement results.

Options

count *entry-count*—(Optional) Number of entries to display from the statistics table. The range of values is **1** through **100**. The default value is **100** entries.

local-mep *mep-id*—(Optional) Numeric identifier of the local MEP. On MX Series routers, the range of values is **1** through **8192**. On EX Series switches, the range of values is **1** through **8191**.

maintenance-association *ma-name*—Name of an existing CFM maintenance association.

maintenance-domain *md-name*—Name of an existing connectivity fault management (CFM) maintenance domain.

remote-mep *remote-mep-id*—(Optional) Numeric identifier of the remote MEP. On MX Series routers, the range of values is **1** through **8192**. On EX Series switches, the range of values is **1** through **8191**.

show oam ethernet connectivity-fault-management delay-statistics remote-mep on page 2031

Output Fields Table 146 on page 2030 lists the output fields for the **show oam ethernet connectivity-fault-management delay-statistics** command and the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 146: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the **remote-mep** option).
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-DM entry in the CFM database.
One-way delay (usec)	For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP. For a detailed description of one-way Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.
Two-way delay (usec)	For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP. For a detailed description of two-way Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.
Average one-way delay	Average one-way frame delay for the statistics displayed.
Average one-way delay variation	Average one-way “frame jitter” for the statistics displayed.
Best-case one-way delay	Lowest one-way frame delay for the statistics displayed.
Worst-case one-way delay	Highest one-way frame delay for the statistics displayed.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Best-case two-way delay	Lowest two-way frame delay for the statistics displayed.
Worst-case two-way delay	Highest two-way frame delay calculated in this session.

Sample Output

show oam ethernet connectivity-fault-management delay-statistics

```
user@switch> show oam ethernet connectivity-fault-management delay-statistics
maintenance-domain md6 maintenance-association ma6
MEP identifier: 100, MAC address: 00:05:85:73:7b:39

show oam ethernet connectivity-fault-management forwarding-state

Syntax

show oam ethernet connectivity-fault-management forwarding-state
interface ***interface-name*** **| instance** ***instance-name***
<brief | detail | extensive>

Release Information

Command introduced in Junos OS Release 8.4.

Description

On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.

Options

interface ***interface-name***—Display forwarding state information for the specified Ethernet interface only.

instance ***instance-name***—Display forwarding state information for the specified forwarding instance only.

brief | detail | extensive—(Optional) Display the specified level of output.

show oam ethernet connectivity-fault-management interfaces

Syntax

show oam ethernet connectivity-fault-management interfaces
<*ethernet-interface-name*>
<level *md-level*>
<brief | detail | extensive>

Release Information

Command introduced in Junos OS Release 8.4.
Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.
Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for ACX Series and MX Series routers.

Description

On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for Ethernet interfaces.

In addition, for Ethernet interfaces on MX Series routers , also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts when **detail** or **extensive** mode is specified.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

Options

brief | detail | extensive—(Optional) Specified level of output.

ethernet-interface-name—(Optional) CFM information only for CFM entities attached to the specified Ethernet interface.

level *md-level*—(Optional) CFM information for CFM identities enclosed within a maintenance domain of the specified level.

Output Fields

Table 148 on page 2038 lists the output fields for the **show oam ethernet connectivity-fault-management interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 148: show oam ethernet connectivity-fault-management interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Interface identifier.	All levels
Interface status	Local interface status.	All levels
Link status	Local link status. **Up**, **down**, or **oam-down**.	All levels
Maintenance domain name	Maintenance domain name.	**detail extensive**
Format (Maintenance domain)	Maintenance domain name format configured.	**detail extensive**
Level	Maintenance domain level configured.	All levels
Maintenance association name	Maintenance association name.	**detail extensive**
Format (Maintenance association)	Maintenance association name format configured.	**detail extensive**
Continuity-check status	Continuity-check status.	**detail extensive**
Ethernet-ais status	Status of alarm indication signal (AIS). **active** or **in-active**.	**detail extensive**
Interval	Continuity-check message interval.	**detail extensive**
Loss-threshold	Lost continuity-check message threshold.	**detail extensive**
Interface status TLV	Status of the interface status TLV, if configured on the MEP interface: **none**, **up**, **down**, **testing**, **unknown**, **dormant**, **notPresent**, **lowerLayerDown**	**detail extensive**
Port status TLV	Status of the port status TLV, if configured on the MEP interface: **none**, **no**, **yes**	**detail extensive**

Table 148: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Connection Protection TLV	Status of the connection protection TLV if configured on the MEP interface: **no**, **yes** If **yes**, then the transmitted connection protection TLV is decoded and the following three fields are displayed: **Prefer me**, **Protection in use**, **FRR Flag**	**detail extensive**
Prefer me	If set to **yes**, the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to the remote side. Its value can be **yes** or **no**.	**detail extensive**
Protection in use	Used for protection decision coordination. Its value is set to **yes** if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path. Its value can be **yes** or **no**.	**detail extensive**
FRR Flag	LSR/LER forwarding the CCM Frame into a bypass tunnel is set. Its value can be **yes** or **no**.	**detail extensive**
MEP identifier	Maintenance association end point (MEP) identifier.	All levels
Neighbors	Number of MEP neighbors.	All levels
Direction	MEP direction configured.	**detail extensive**
MAC address	MAC address configured for the MEP.	**detail extensive**
MEP status	Indicates the status of the connectivity fault management (CFM) protocol running on the MEP: **Running**, **inactive**, **disabled**, or **unsupported**.	**detail extensive**
Remote MEP not receiving CCM	Whether the remote MEP is not receiving connectivity check messages (CCMs).	**detail extensive**
Erroneous CCM received	Whether erroneous CCMs have been received.	**detail extensive**
Cross-connect CCM received	Whether cross-connect CCMs have been received.	**detail extensive**
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.	**detail extensive**
Some remote MEP's MAC in error state	Indicates whether the remote MEP’s MAC is in error state.	**detail extensive**
Alarm Indication Signal	Indicates whether the AIS is triggered or is cleared.	**detail extensive**

Table 148: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CCMs sent	Number of CCMs transmitted.	**detail extensive**
CCMs received out of sequence	Number of CCMs received out of sequence.	**detail extensive**
LBMs sent	Number of loopback request messages (LBMs) sent.	**detail extensive**
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.	**detail extensive**
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.	**detail extensive**
LBRs received with corrupted data	Number of LBRs received that were corrupted.	**detail extensive**
LBRs sent	Number of LBRs transmitted.	**detail extensive**
LTMs sent	Linktrace messages (LTMs) transmitted.	**detail extensive**
LTMs received	Linktrace messages received.	**detail extensive**
LTRs sent	Linktrace responses (LTRs) transmitted.	**detail extensive**
LTRs received	Linktrace responses received.	**detail extensive**
Sequence number of next LTM request	Sequence number of next LTM request to be transmitted.	**detail extensive**
1DMs sent	If the interface is attached to an initiator MEP for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.	**detail extensive**
Valid 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays **0**.	**detail extensive**
Invalid 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays **0**.	**detail extensive**
Out of sync 1DMs received	If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.	**detail extensive**

Table 148: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DMMs sent	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.	**detail extensive**
Valid DMMs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid two-way delay measurement request packets received.	**detail extensive**
Invalid DMMs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid two-way delay measurement request packets received.	**detail extensive**
DMRs sent	If the interface is attached to a responder MEP for a two-way ETH-DM session: Number of delay measurement reply (DMR) frames sent. For all other cases, this field displays **0**.	**detail extensive**
Valid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays **0**.	**detail extensive**
Invalid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays **0**.	**detail extensive**
LMM sent	If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.	**detail extensive**
Valid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.	**detail extensive**
Invalid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid loss measurement request packets received.	**detail extensive**
LMR sent	If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.	**detail extensive**
Valid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid LMR frames received.	**detail extensive**
Invalid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.	**detail extensive**
Valid AIS frames transmitted	Number of valid AIS frames transmitted to the peer MEPs.	**detail extensive**
Valid AIS frames received	Number of valid AIS frames received from the peer MEPs.	**detail extensive**

Table 148: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SLM sent	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session.	**detail extensive**
Valid SLM received	If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.	**detail extensive**
Invalid SLM received	If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.	**detail extensive**
SLR sent	If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.	**detail extensive**
Valid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.	**detail extensive**
Invalid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.	**detail extensive**
Remote MEP count	Number of remote MEPs.	**extensive**
Identifier (remote MEP)	MEP identifier of the remote MEP.	**extensive**
MAC address (remote MEP)	MAC address of the remote MEP.	**extensive**
State (remote MEP)	State of the remote MEP.	**extensive**
Interface (remote MEP)	Interface of the remote MEP.	**extensive**

show oam ethernet connectivity-fault-management linktrace path-database

Syntax

show oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association *ma-name* maintenance-domain *md-name*

Release Information

Command introduced in Junos OS Release 9.0.

Description

On M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.

Options

mac-address—Display connectivity fault management path database information for the specified MAC address of the remote host.

maintenance-association *ma-name*—Display connectivity fault management path database information for the specified maintenance association.

maintenance-domain *md-name*—Display connectivity fault management path database information for the specified maintenance domain.

Required Privilege Level

view

List of Sample Output

show oam ethernet connectivity-fault-management linktrace path-database on page 2049
show oam ethernet connectivity-fault-management linktrace path-database (Two traceroute Commands) on page 2049

Output Fields

Table 149 on page 2048 lists the output fields for the **show oam ethernet connectivity-fault-management linktrace path-database** command. Output fields are listed in the approximate order in which they appear.

Table 149: show oam ethernet connectivity-fault-management linktrace path-database Output Fields

Field Name	Field Description
Linktrace to	MAC address of the 802.1ag node to which the linktrace message is targeted.
Interface	Interface used by the local MEP to send the linktrace message (LTM).
Maintenance Domain	Maintenance domain identifier specified in the traceroute command.
Maintenance Association	Maintenance association identifier specified in the traceroute command.
Level	Maintenance domain level configured for the maintenance domain.
Local Mep	MEP identifier of the local MEP originating the linktrace.

Table 149: show oam ethernet connectivity-fault-management linktrace path-database Output Fields (continued)

Field Name	Field Description
Hop	Sequential hop count of the linktrace path.
TTL	Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.
Source MAC address	MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.
Next hop MAC address	MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.
Transaction Identifier	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktrace responses (LTR), with a previously sent LTM.

Sample Output

show oam ethernet connectivity-fault-management linktrace path-database

```
user@host> show oam ethernet connectivity-fault-management linktrace path-database
maintenance-domain MD1 maintenance-association MA1 00:01:02:03:04:05

show oam ethernet connectivity-fault-management loss-statistics

Syntax

show oam ethernet connectivity-fault-management loss-statistics
maintenance-domain ***md-name***
maintenance-association ***ma-name***
<count ***entry-count*****>**
<local-mep ***local-mep-id*****>**
<remote-mep ***remote-mep-id*****>**

Release Information

Command introduced in Junos OS Release 11.1.

Description

On MX Series and ACX series routers with Ethernet interfaces, display ETH-LM statistics for on-demand mode only.

Options

maintenance-domain ***md-name***—Name of an existing CFM maintenance domain.

maintenance-association ***ma-name***—Name of an existing CFM maintenance association.

count ***entry-count***—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.

local-mep ***local-mep-id***—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8191.

remote-mep ***remote-mep-id***—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8191.

Output Fields

Table 150 on page 2051 lists the output fields for the **show oam ethernet connectivity-fault-management loss-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 150: show oam ethernet connectivity-fault-management loss-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the **remote-mep** option).
Remote MEP identifier	Numeric identifier of the remote MEP.

Table 150: show oam ethernet connectivity-fault-management loss-statistics Output Fields (continued)

Output Field Name	Field Description
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-LM entry in the CFM database.
Near-end frame loss	Count of frame loss associated with ingress data frames.
Far-end frame loss	Count of frame loss associated with egress data frames.
Near-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
Far-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
Average near-end frame loss	Average frame loss measured in this session associated with ingress data frames.
Average near-end loss ratio	Average frame loss ratio measured in this session associated with ingress data frames.
Average far-end frame loss	Average frame loss measured in this session associated with egress data frames.
Average far-end loss ratio	Average frame loss ratio measured in this session associated with egress data frames.
Near-end best case loss	Lowest frame loss measured in this session associated with ingress data frames.
Near-end best case loss ratio	Lowest frame loss ratio measured in this session associated with ingress data frames.
Near-end worst case loss	Highest frame loss measured in this session associated with ingress data frames.
Near-end worst case loss ratio	Highest frame loss ratio measured in this session associated with ingress data frames.
Far-end best case frame loss	Lowest frame loss measured in this session associated with egress data frames.
Far-end best case loss ratio	Lowest frame loss ratio measured in this session associated with egress data frames.
Far-end worst case loss	Highest frame loss measured in this session associated with egress data frames.
Far-end worst case loss ratio	Highest frame loss ratio measured in this session associated with egress data frames.

show oam ethernet connectivity-fault-management mep-database

Syntax

show oam ethernet connectivity-fault-management mep-database
maintenance-domain ***domain-name***
maintenance-association ***ma-name***
<local-mep ***local-mep-id*****>**
<remote-mep ***remote-mep-id*****>**

Release Information

Command introduced in Junos OS Release 8.4.
Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.
Support for ITU-T Y.1731 synthetic frame loss measurement added in Junos OS Release 13.2 for MX Series routers.

Description

On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, M120, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

In addition, on M120, M320, and MX series routers, also display port status TLV, interface status TLV, and action profile information.

In addition, for Ethernet interfaces on MX Series routers , also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

Options

maintenance-association ***ma-name***—Name of the maintenance association.

maintenance-domain ***domain-name***—Name of the maintenance domain.

local-mep-id—(Optional) Numeric identifier of local MEP.

remote-mep-id—(Optional) Numeric identifier of the remote MEP.

Output Fields Table 151 on page 2056 lists the output fields for the **show oam ethernet connectivity-fault-management mep-database** command. Output fields are listed in the approximate order in which they appear.

Table 151: show oam ethernet connectivity-fault-management mep-database Output Fields

Field Name	Field Description
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.
Maintenance association name	Maintenance association name.
Format (Maintenance association)	Maintenance association name format configured.
Continuity-check status	Continuity-check status.
Interval	Continuity-check message interval.
Loss-threshold	Lost continuity-check message threshold.
Connection Protection TLV	Status of the connection protection TLV, if configured on the MEP interface: **no**, **yes** If **yes**, then the transmitted connection protection TLV is decoded and the following three fields are displayed: **Prefer me**, **Protection in use**, **FRR Flag**
Prefer me	If set to **yes**, the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to remote side. Its value can be **yes** or **no**.
Protection in use	Used for protection decision coordination. Its value is set to **yes** if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path. Its value can be **yes** or **no**.

Table 151: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
FRR Flag	LSR/LER forwarding the CCM Frame into a bypass tunnel is set. Its value can be **yes** or **no**.
MEP identifier	Maintenance association end point (MEP) identifier.
Direction	MEP direction configured.
MAC address	MAC address configured for the MEP.
Auto-discovery	Whether automatic discovery is enabled or disabled.
Priority	Priority used for CCMs and linktrace messages transmitted by the MEP.
Interface name	Interface identifier.
Interface status	Local interface status.
Link status	Local link status.
Remote MEP not receiving CCM	Whether the remote MEP is not receiving CCMs.
Erroneous CCM received	Whether erroneous CCMs have been received.
Cross-connect CCM received	Whether cross-connect CCMs have been received.
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.
CCMs sent	Number of CCMs transmitted.
CCMs received out of sequence	Number of CCMs received out of sequence.
LBMs sent	Number of loopback messages (LBMs) sent.
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.
1DMs sent	If the MEP is an initiator for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.

Table 151: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
Valid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays **0**.
Invalid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays **0**.
Out of sync 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.
DMMs sent	If the MEP is an initiator for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays **0**.
Valid DMMs received	If the MEP is an initiator for a two-way ETH-DM session: Number of valid two-way delay measurement packets received.
Invalid DMMs received	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid two-way delay measurement packets received.
DMRs sent	If the MEP is a responder for a ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent. For all other cases, this field displays **0**.
Valid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays **0**.
Invalid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays **0**.
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.
LBRs received with corrupted data	Number of LBRs received that were corrupted.
LBRs sent	Number of LBRs transmitted.
LTMs sent	Linktrace messages (LTMs) transmitted.
LTMs received	Linktrace messages received.
LTRs sent	Linktrace responses (LTRs) transmitted.
LTRs received	Linktrace responses received.

Table 151: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
Sequence number of next LTM request	Sequence number of the next linktrace message request to be transmitted.
LMM sent	If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.
Valid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.
Invalid LMM received	If the interface is attached to an initiator MEP for a ETH LM session: Number of invalid loss measurement request packets received.
LMR sent	If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.
Valid LMR received	If the interface is attached to an initiator MEP for a ETH LM session: Number of valid LMR frames received.
Invalid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.
SLM sent	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session.
Valid SLM received	If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.
Invalid SLM received	If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.
SLR sent	If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.
Valid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.
Invalid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.
Remote MEP identifier	MEP identifier of the remote MEP.
State (remote MEP)	State of the remote MEP: **idle**, **start**, **ok**, or **failed**.
MAC address	MAC address of the remote MEP.
Type	Whether the remote MEP MAC address was learned using automatic discovery or configured.

Table 151: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
Interface	Interface of the remote MEP. A seven-digit number is appended if CFM is configured to run on a routing instance of type VPLS.
Last flapped	Date, time, and how long ago the remote MEP interface went from down to up. The format is **Last flapped:** ***year-month-day hours*:*minutes*:*seconds timezone*** **(*hours*:*minutes*:*seconds* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.
Remote defect indication	Whether the remote defect indication (RDI) bit is set in messages that have been received or transmitted.
Port status TLV	• In the Maintenance domain section, displays the last transmitted port status TLV value. • In the Remote MEP section, displays the last value of port status TLV received from the remote MEP. In the Action profile section, displays, the last occurred event **port-status-tlv blocked** event. This event occurred due to the reception of **blocked** value in the port status TLV from remote MEP.
Interface status TLV	• In the Maintenance domain section, displays the last transmitted interface status TLV value. • In the Remote MEP section, displays the last value of interface status TLV received from the remote MEP. In the Action profile section, if displays, the last occurred event interface-status-tlv event (either **lower-layer-down** or **down**). This event occurred due to the reception of either lower or **down** value in the interface status TLV from remote MEP.
Action profile	Name of the action profile occurrence associated with a remote MEP.
Last event	When an action profile occurs, displays the last event that triggered it.
Last event cleared	When all the configured and occurred events (under action profile) are cleared, then the action taken gets reverted (such as down interface is made up) and the corresponding time is noted and displayed.
Action	Action taken and the corresponding time of the action occurrence.

show oam ethernet connectivity-fault-management mep-database (Connection Protection TLV Configured)

user@host>**show oam ethernet connectivity-fault-management mep-database maintenance-domain md5 maintenance-association ma5**

If connection-protection is not enabled on down MEPs, but connection-protection TLV is used, MX always sets the protection-in-use flag in connection-protection tlv, while CCMs are sent out. During reversion, this is an indicator to the receiver that protect-path is in use, otherwise the peer (receiver) assumes working is active and reversion does not work as expected. Setting this bit does not affect protection-switching/traffic-loss.

Release Information

Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 11.4 for EX Series switches.
Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for MX Series routers.

Description

On MX Series and ACX Series routers and EX Series switches with Ethernet interfaces, display ETH-DM statistics and ETH-DM frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

Options

maintenance-domain ***md-name***—Name of an existing CFM maintenance domain.

maintenance-association ***ma-name***—Name of an existing CFM maintenance association.

mep ***mep-id***—(Optional) Numeric identifier of the local MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.

remote-mep ***remote-mep-id***—(Optional) Numeric identifier of the remote MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.

count ***entry-count***—(Optional) Number of entries to display from the statistics table. The range of values is 1 through 100. The default value is 100 entries.

Output Fields

Table 152 on page 2067 lists the output fields for the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 152: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the **remote-mep** option).
CCMs sent	Number of continuity check messages (CCMs) sent.
CCMs received	Number of continuity check messages (CCMs) received for a specific remote MEP and maintenance association.
CCMs received out of sequence	Number of continuity check messages (CCMs) received that were not in sequence.
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-DM entry in the CFM database.
One-way delay (usec)	For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP. For a detailed description of one-way Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.
Two-way delay (usec)	For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP. For a detailed description of two-way Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.
Average one-way delay	Average one-way frame delay for the statistics displayed.

Table 152: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields (continued)

Output Field Name	Field Description
Average one-way delay variation	Average one-way “frame jitter” for the statistics displayed.
Best-case one-way delay	Lowest one-way frame delay for the statistics displayed.
Worst-case one-way delay	Highest one-way frame delay for the statistics displayed.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Best-case two-way delay	Lowest two-way frame delay for the statistics displayed.
Worst-case two-way delay	Highest two-way frame delay calculated in this session.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

show oam ethernet connectivity-fault-management path-database

Syntax

show oam ethernet connectivity-fault-management path-database
<*host-mac-address*>
<maintenance-association *ma-name*>
<maintenance-domain *domain-name*>

Release Information

Command introduced in Junos OS Release 8.4.

Description

On M7i and M10i with Enhanced CFEB (CFEB-E), M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management path database information for a host configured with an MEP.

Options

host-mac-address—(Optional) Display connectivity fault management path database information for a specified Ethernet host.

maintenance-association *ma-name*—(Optional) Display connectivity fault management path database information for the specified maintenance association.

maintenance-domain *domain-name*—(Optional) Display connectivity fault management path database information for the specified maintenance domain.

Output Fields

Table 153 on page 2078 lists the output fields for the **show oam ethernet connectivity-fault-management path-database** command. Output fields are listed in the approximate order in which they appear.

Table 153: show oam ethernet connectivity-fault-management path-database Output Fields

Field Name	Field Description
Linktrace to	MAC address of the remote MEPs in the path.
Interface	Interface identifier.
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.

Table 153: show oam ethernet connectivity-fault-management path-database Output Fields (continued)

Field Name	Field Description
Maintenance association name	Maintenance association name.
Local Mep	Local MEP identifier.

Sample Output

show oam ethernet connectivity-fault -management path-database

```
user@host> show oam ethernet connectivity–fault-management path-database
maintenance-domain md1 maintenance-association ma1 00:05:85:79:39:ef
Linktrace to 00:05:85:79:39:ef, Interface : ge-3/0/0
      Maintenance Domain: md1, Level: 7
      Maintenance Association: ma1, Local Mep: 201
```

show oam ethernet connectivity-fault-management policer

Syntax **show oam ethernet connectivity-fault-management policer <maintenance-domain** ***md-name*****> <maintenance-association** ***ma-name*****>**

Release Information Command introduced in Junos OS Release 10.0.

Description On M120, M320, MX Series, T320, and T640 routers displays connectivity-fault-management policer statistics.

Options This command has the following options:

maintenance-domain ***md-name***—Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are displayed for all maintenance associations for all maintenance domains.

maintenance-association ***ma-name***—Name of an existing CFM maintenance association. If this option is not specified, policer statistics are displayed for all maintenance associations for given maintenance domain. This option cannot be specified without specifying maintenance-domain name.

Output Fields Table 154 on page 2080 lists the output fields for the **show oam ethernet connectivity-fault-management policer** command. Output fields are listed in the approximate order in which they appear.

Table 154: show oam ethernet connectivity-fault-management policer Output Fields

Field Name	Field Description
Legend for Policer	Describes the symbols used under the **Scope** and **Type** headings: • G - Global scope • S - Service scope • cc - Continuity check (Type)
Maintenance Domain	Displays the maintenance domain name.

Table 154: show oam ethernet connectivity-fault-management policer Output Fields (continued)

Field Name	Field Description
Level	Displays the maintenance domain level configured.
Maintenance association	Displays the maintenance association name.
Policer	Displays the policer name.
Type	Policer type. Value **cc** means this policer is used only to police continuity check CFM messages. Value **other** means this policer is used only to police non-continuity check CFM messages. Value **all** means this policer is used to police all CFM messages.
Scope	Policer scope. Displays whether the *global* (G) policer configuration is applicable or the session (S) specific policer config is applicable.
Drop count	Displays the number of packets dropped by the indicated policer.

Sample Output

show oam ethernet connectivity-fault -management policer

Displays the policer information for all maintenance associations and their maintenance domains.

```
show oam ethernet connectivity-fault-management policer

show oam ethernet connectivity-fault-management sla-iterator-statistics

Syntax

show oam ethernet connectivity-fault-management sla-iterator-statistics
maintenance-domain *md-name*
maintenance-association *ma-name*
sla-iterator *sla-iterator*
<**local-mep** *local-mep-id*>
<**remote-mep** *remote-mep-id*>

Release Information

Command introduced in Junos OS Release 11.4 for EX Series switches.
Command introduced in Junos OS Release 9.6.
Command introduced in Junos OS Release 12.2 for ACX Series routers.
Command introduced in Junos OS Release 13.2 for MX Series routers (not on MPC3E Hyperion cards).

Description

Display the Ethernet Operation, Administration, and Maintenance (OAM) service-level agreement (SLA) iterator statistics.

Options

maintenance-domain *md-name*—Name of an existing connectivity fault management (CFM) maintenance domain.

maintenance-association *ma-name*—Name of an existing CFM maintenance association.

sla-iterator *sla-iterator*— Name of the iterator profile.

local-mep *local-mep-id*—(Optional) Numeric identifier of the local MEP. The range of values is **1** through **8191**.

remote-mep *remote-mep-id*—(Optional) Numeric identifier of the remote MEP. The range of values is **1** through **8192**.

Output Fields

Table 155 on page 2084 lists the output fields for the **show oam ethernet connectivity-fault-management sla-iterator-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 155: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields

Output Field Name	Output Field Description
Maintenance domain	Name of the maintenance domain.
Level	Level of the maintenance domain level configured.
Maintenance association	Name of the maintenance association.
Local MEP id	Numeric identifier of the local MEP.
Remote MEP id	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Iterator name	Name of iterator.
Iterator Id	Numeric identifier of the iterator.
Iterator cycle time	Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection
Iteration period	Maximum number of cycles per iteration
Iterator status	Current status of iterator whether running or stopped.
Infinite iterations	Status of iteration as infinite or finite.
Counter reset time	Date and time when the counter was reset.
Reset reason	Reason to reset counter.
Delay weight	Calculation weight of delay.
Delay variation weight	Calculation weight of delay variation.
DMM sent	Delay measurement message (DMM) PDU frames sent to the peer MEP in this session.
DMM skipped for threshold hit	Number of DMM frames sent to the peer MEP in this session skipped during threshold hit.
DMM skipped for threshold hit window	Number of DMM frames sent to the peer MEP in this session skipped during the last threshold hit window.
DMR received	Number of delay measurement reply (DMR) frames received.
DMR out of sequence	Total number of DMR out of sequence packets received.
DMR received with invalid time stamps	Total number of DMR frames received with invalid timestamps.

Table 155: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (continued)

Output Field Name	Output Field Description
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Average one-way forward delay variation	Average one-way forward delay variation for the statistics displayed in microseconds.
Average one-way backward delay variation	Average one-way backward delay variation for the statistics displayed in microseconds.
Weighted average two-way delay	Weighted average two-way delay for the statistics displayed in microseconds.
Weighted average two-way delay variation	Weighted average two-way delay variation for the statistics displayed in microseconds.
Weighted average one-way backward delay variation	Weighted average one-way backward delay variation for the statistics displayed in microseconds.
Weighted average one-way forward delay variation	Weighted average one-way forward delay variation for the statistics displayed in microseconds.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.

Table 155: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (continued)

Output Field Name	Output Field Description
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

show oam ethernet connectivity-fault-management synthetic-loss-statistics

Syntax

show oam ethernet connectivity-fault-management synthetic-loss-statistics
<local-mep *local-mep-id*>
maintenance-association *ma-name*
<count *entry-count*>
maintenance-domain *md-name*
<remote-mep *remote-mep-id*>

Release Information

Command introduced in Junos OS Release 13.2 for MX Series routers.

Description

On MX Series routers with Modular Port Concentrators (MPCs) with Ethernet interfaces, display the on-demand ETH-SLM statistics.

Options

count *entry-count*—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.

local-mep *local-mep-id*—(Optional) Numeric identifier of the local MEP. The range of values is from **1** through **8192**.

maintenance-association *ma-name*—Name of an existing CFM maintenance association.

maintenance-domain *md-name*—Name of an existing connectivity fault management (CFM) maintenance domain.

remote-mep *remote-mep-id*—(Optional) Numeric identifier of the remote MEP. The range of values is from **1** through **8192**.

Output Fields

Table 156 on page 2089 lists the output fields for the **show oam ethernet connectivity-fault-management synthetic-loss-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 156: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the **remote-mep** option).
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TxFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCl at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCl at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

Sample Output

```

show oam ethernet evc

Syntax **show oam ethernet evc <*evc-id*>**

Release Information Command introduced in Junos OS Release 9.5.

Description On MX Series routers with OAM Ethernet Virtual Connection (EVC) configurations, displays the EVC configuration and status information.

Options This command has no options.

Required Privilege Level View

Output Fields Table 157 on page 2091 lists the output fields for the **show oam ethernet evc** command. Output fields are listed in the approximate order in which they appear.

Table 157: show oam ethernet evc Output Fields

Field Name	Field Description
EVC identifier	Header for the EVC information showing the EVC name, configuration, and active/inactive status.
UNI count	Number of configured and active UNIs.
Protocol	Protocol configured between the UNIs.
Local UNIs	Heading for the list of local UNIs
UNI Identifier	Name of the UNI.
Interface	Interface type-dpc/pic/port.unit-number.
Status	Status operational or not operational.

Sample Output

show oam ethernet evc

```
user@host> show oam ethernet evc
EVC identifier: evc1, Point-to-Point, Active
  UNI count: Configured(2), Active(2)
  Protocol: cfm, Management domain: md, Management association: ma
  Local UNIs:
    UNI Identifier      Interface     Status
    uni1                ge-1/1/1      Operational
    uni2                ge-1/1/1      Not Operational
```

show oam ethernet fnp interface

Syntax

show oam ethernet fnp interface
<*ethernet-interface-name*>
<routing-instance *routing-instance-name*>

Release Information

Command introduced in Junos OS Release 11.4.

Description

On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) information for Ethernet interfaces.

Options

interface-name—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

routing-instance-name—(Optional) Display FNP for the specified routing instance.

Output Fields

Table 159 on page 2094 lists the output fields for the **show oam ethernet fnp messages** command. Output fields are listed in the approximate order in which they appear.

Table 159: show oam ethernet fnp messages Output Fields

Field Name	Field Description
Message from source MAC address	The source MAC address of the message.
Originating port number	Port number of the original message.
Time since last message	Elapsed time in hours, minutes, and seconds since the last message was received.
Time since last message update	Elapsed time in hours, minutes, and seconds since the last message was updated.
Total messages received	Number of messages received.
Domain ID	Domain ID of the message.
STP Root ID	The spanning tree Root ID of the message.
Trigger Reason	The reason why the message was triggered.
Effected VLANs	Number of VLANs that are affected.

Table 159: show oam ethernet fnp messages Output Fields (continued)

Field Name	Field Description
Disabled interfaces	Name of the interfaces that are disabled.

Sample Output

show oam ethernet fnp messages

```
user@host> show oam ethernet fnp messages
  Active FNP messages on interface lsi.1054465
  Message source MAC: a0:aa:aa:aa:aa:aa
    Originating port number: 141077
    Time since last message: 00:00:00
    Time since last message update: 00:00:00
    Total messages received: 1
    Domain ID: 0
    STP Root ID: 0.f0:ff:ff:ff:ff:ff
    Trigger reason: todo
    Effected VLANs: 10
    Disabled interfaces:
      Interface VLAN
      ge-0/0/0.10 10
```

Output Fields

Table 161 on page 2098 lists the output fields for the **show oam ethernet link-fault-management** command. Output fields are listed in the approximate order in which they appear.

Table 161: show oam ethernet link-fault-management Output Fields

Field Name	Field Description	Level of Output
Status	Indicates the status of the OAM discovery state mechanism . • **Down**—Discovery mechanism is not running.. • **Running**—Discovery mechanism is running.	All levels
Discovery state	State of the discovery mechanism. If the status of the discovery mechanism is Down then the state of discovery mechanism is Fault. However, if the status of the discovery mechanism is Running then the state can be any one of the following: • **Passive Wait** • **Active Send Local** • **Send Any** • **Send Local Remote** • **Send Local Remote Ok** • **Fault**	All levels

Table 161: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
ISSU	Specifies that the local end is undergoing a unified in-service software upgrade (ISSU).	All levels
Peer address	Address of the OAM peer.	All levels
Flags	Information about the interface. Possible values are described in the “Link Flags” section under *Common Output Fields Description*. • **Remote-Stable**—Indicates remote OAM client acknowledgment of and satisfaction with local OAM state information. **False** indicates that remote DTE either has not seen or is unsatisfied with local state information.**True** indicates that remote DTE has seen and is satisfied with local state information. • **Local-Stable**—Indicates local OAM client acknowledgment of and satisfaction with remote OAM state information. **False** indicates that local DTE either has not seen or is unsatisfied with remote state information. **True** indicates that local DTE has seen and is satisfied with remote state information. • **Remote-State-Valid**—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. **False** indicates that OAM client has not seen remote state information. **True** indicates that the OAM client has seen remote state information.	All levels
Remote loopback status	Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).	All levels
Remote entity information	Remote entity information. • **Remote MUX action**—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs. • **Remote parser action**—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs. • **Discovery mode**—Indicates whether discovery mode is active or inactive. • **Unidirectional mode**—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes. • **Remote loopback mode**—Indicates whether remote loopback is supported or unsupported. • **Link events**—Indicates whether interpreting link events is supported or unsupported on the remote peer. • **Variable requests**—Indicates whether variable requests are supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer. • **Remote in ISSU**—Indicates that the remote end is undergoing a unified in-service software upgrade (ISSU).	All levels
Loopback Tracking	Indicates that loopback detection is enabled or disabled.	All levels

Table 161: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
Loop Status	Indicates that a loopback issue is either found, not found, or unknown when loopback tracking is enabled.	All levels
Detect LOC	Indicates that loss-of-continuity (LOC) detection is enabled or disabled.	All levels
LOC status	Indicates that a LOC issue is either found, not found, or unknown when Detect LOC is enabled. Status is unknown when LOC detection is disabled.	All levels
OAM Receive Statistics		
Information	The total number of information PDUs received.	**detail**
Event	The total number of loopback control PDUs received.	**detail**
Variable request	The total number of variable request PDUs received.	**detail**
Variable response	The total number of variable response PDUs received.	**detail**
Loopback control	The total number of loopback control PDUs received.	**detail**
Organization specific	The total number of vendor organization specific PDUs received.	**detail**
OAM Transmit Statistics		
Information	The total number of information PDUs transmitted.	**detail**
Event	The total number of event notification PDUs transmitted.	**detail**
Variable request	The total number of variable request PDUs transmitted.	**detail**
Variable response	The total number of variable response PDUs transmitted.	**detail**
Loopback control	The total number of loopback control PDUs transmitted.	**detail**
Organization specific	The total number of vendor organization specific PDUs transmitted.	**detail**
OAM Received Symbol Error Event information		
Events	The number of symbol error event TLVs that have been received since the OAM sublayer was reset.	**detail**
Window	The symbol error event window in the received PDU. The protocol default value is the number of symbols that can be received in one second on the underlying physical layer.	**detail**
Threshold	The number of errored symbols in the period required for the event to be generated.	**detail**

Table 161: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
Errors in period	The number of symbol errors in the period reported in the received event PDU.	**detail**
Total errors	The number of errored symbols that have been reported in received event TLVs since the OAM sublayer was reset. Symbol errors are coding symbol errors.	**detail**
OAM Received Frame Error Event Information		
Events	The number of errored frame event TLVs that have been received since the OAM sublayer was reset.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of detected errored frames in the period.	**detail**
Total errors	The number of errored frames that have been reported in received event TLVs since the OAM sublayer was reset. A frame error is any frame error on the underlying physical layer.	**detail**
OAM Received Frame Period Error Event Information		
Events	The number of frame seconds errors event TLVs that have been received since the OAM sublayer was reset.	**detail**
Window	The duration of the frame seconds window.	**detail**
Threshold	The number of frame seconds errors in the period.	**detail**
Errors in period	The number of frame seconds errors in the period.	**detail**
Total errors	The number of frame seconds errors that have been reported in received event TLVs since the OAM sublayer was reset.	**detail**
OAM Transmitted Symbol Error Event Information		
Events	The number of symbol error event TLVs that have been transmitted since the OAM sublayer was reset.	**detail**
Window	The symbol error event window in the transmitted PDU.	**detail**
Threshold	The number of errored symbols in the period required for the event to be generated.	**detail**
Errors in period	The number of symbol errors in the period reported in the transmitted event PDU.	**detail**

Table 161: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
Total errors	The number of errored symbols reported in event TLVs that have been transmitted since the OAM sublayer was reset.	**detail**
OAM Current Symbol Error Event Information		
Events	The number of symbol error TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	**detail**
Window	The symbol error event window in the transmitted PDU.	**detail**
Threshold	The number of errored symbols in the period required for the event to be generated.	**detail**
Errors in period	The total number of symbol errors in the period reported.	**detail**
Total errors	The number of errored symbols reported in event TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	**detail**
OAM Transmitted Frame Error Event Information		
Events	The number of errored frame event TLVs that have been transmitted since the OAM sublayer was reset.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of detected errored frames in the period.	**detail**
Total errors	The number of errored frames that have been detected since the OAM sublayer was reset.	**detail**
OAM Current Frame Error Event Information		
Events	The number of errored frame event TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	**detail**
Window	The duration of the window in terms of the number of 100 ms period intervals.	**detail**
Threshold	The number of detected errored frames required for the event to be generated.	**detail**
Errors in period	The number of errored frames in the period.	**detail**
Total errors	The number of errored frames detected regardless of whether the threshold for transmitting event TLVs has been crossed.	**detail**

show oam ethernet lmi

Syntax **show oam ethernet lmi (interface <*interface-name*>)**

Release Information Command introduced in Junos OS Release 9.5.

Description On routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet, and OAM Ethernet Local Management Interface (E-LMI) configuration, display the LMI information for the configured interfaces or optionally for a specified interface.

NOTE: On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

Options **interface**—(Optional) Display LMI information for a specified interface.

interface-name—(Optional) Display Ethernet LMI information for the specified interface only.

Required Privilege Level View

Output Fields Table 162 on page 2106 lists the output fields for the **show oam ethernet lmi** command. Output fields are listed in the approximate order in which they appear.

Table 162: show oam ethernet lmi Output Fields

Field Name	Field Description
Physical Interface	Header for the EVC information showing the Ethernet virtual circuit (EVC) name, configuration, and active/inactive status.
UNI Identifier	Name of the UNI.
EVC map type	EVC configuration.
Polling verification timer	Polling verification timer status.
E-LMI state	Operational status of the E-LMI configuration in the interfaces or specified interface.
Priority/Untagged VLAN ID	To be provided.
Default EVC	The EVC set as the default EVC.
Associated EVCs	Heading for the list of configured EVCs.

Table 162: show oam ethernet lmi Output Fields (continued)

Field Name	Field Description
EVC Indentifier	EVC name.
Reference ID	To be provided.
Status	Status active or not active.
CE VLAN IDs	Customer edge VLAN ID numbers.

Sample Output

show oam ethernet lmi interface

```
user@host> show oam ethernet lmi interface ge-1/1/1
Physical interface: ge-1/1/1, Physical link is Up
  UNI identifier: uni-ce1, EVC map type: Bundling
  Polling verification timer: Enabled, E-LMI state: Operational
  Priority/Untagged VLAN ID: 20, Default EVC: evc1
  Associated EVCs:
    EVC         Reference     Status           CE VLAN IDs
    Identifier  ID
    evc1            1        Active (New)        1-2048
    evc2             2        Not Active          2049-4096
```

show oam ethernet lmi statistics

Syntax **show oam ethernet lmi statistics <interface *interface-name*>**

Release Information Command introduced in Junos OS Release 9.5.

Description On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Local Management Interface (LMI) statistics.

Options **interface**—(Optional) Display LMI statistics for a specified interface.

interface-name—(Optional) Display Ethernet LMI information for the specified Ethernet interface only.

Required Privilege Level view

List of Sample Output show oam ethernet lmi statistics on page 2109

Output Fields Table 163 on page 2108 lists the output fields for the **show oam ethernet lmi statistics** command. Output fields are listed in the approximate order in which they appear.

Table 163: show oam ethernet lmi statistics Output Fields

Field Name	Field Description
Physical interface	Name of the interface for the displayed statistics.
Reliability errors	Number of E-LMI reliability errors logged.
Protocol errors	Number of E-LMI protocol errorse.
Status check received	Number of E-LMI status check receive errors.
Status check sent	Number of E-LMI status check sent errors.
Full status received	Number of E-LMI full status receive errors.
Full status sent	Number of E-LMI full status sent errors.
Full status continued received	Number of E-LMI status continued received errors.
Full status continued sent	Number of E-LMI full status continued sent errors.
Asynchronous status sent	Number of E-LMI asynchronous status sent errors.

Sample Output

show oam ethernet lmi statistics

```
user@host> show oam ethernet lmi statistics interface ge-1/1/1
Physical interface: ge-1/1/1
  Reliability errors                      4  Protocol errors
 0
  Status check received                   0  Status check sent
 0
  Full status received                  694  Full status sent
694
  Full status continued received          0  Full status continued sent
 0
  Asynchronous status sent                0
```

show pppoe interfaces

Syntax

show pppoe interfaces
<brief | detail
<pp0.*logical*>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display session-specific information about PPPoE interfaces.

Options

none—Display interface information for all PPPoE interfaces.

brief | detail—(Optional) Display the specified level of output.

pp0.*logical*—(Optional) Name of an interface. The logical unit number for static interfaces can be a value from 0 through 16385. The logical unit number for dynamic interfaces can be a value from 1073741824 through the maximum number of logical interfaces supported on your router.

show pppoe interfaces detail on page 2113
show pppoe interfaces (PPPoE Subscriber Interface with ACI Interface Set) on page 2113

Output Fields

Table 164 on page 2110 lists the output fields for the **show pppoe interfaces** command. Output fields are listed in the approximate order in which they appear. Not all fields are displayed for PPPoE interfaces on M120 and M320 routers in server mode.

Table 164: show pppoe interfaces Output Fields

Field Name	Field Description	Level of Output
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
State	State of the logical interface: **up** or **down**.	All levels
Session ID	Session ID.	All levels

Table 164: show pppoe interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Type	Origin of the logical interface: **Static** or **Dynamic**. Indicates whether the interface was statically or dynamically created.	**detail extensive** none
Service name	Type of service required (can be used to indicate an ISP name or a class or quality of service).	**detail extensive** none
Configured AC name	Configured access concentrator name.	**detail extensive** none
Session AC name	Name of the access concentrator.	**detail extensive** none
Remote MAC address or **Remote MAC**	MAC address of the remote side of the connection, either the access concentrator or the PPPoE client.	All levels
Session uptime	Length of time the session has been up, in *hh:mm:ss*.	**detail extensive** none
Dynamic Profile	Name of the dynamic profile that was used to create this interface. If the interface was statically created, this field is not displayed.	**detail extensive** none
Underlying interface	Interface on which PPPoE is running.	All levels
Agent Circuit ID	Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. If the agent circuit ID is not configured, this field is not displayed.	**detail extensive** none
Agent Remote ID	Agent remote identifier that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. If the agent remote ID is not configured, this field is not displayed.	**detail extensive** none
ACI Interface Set	Internally-generated name of the dynamic ACI interface set, if configured, and the set index number of the ACI entry in the session database.	**detail extensive** none

Table 164: show pppoe interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Packet Type	Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors: • **PADI**—PPPoE Active Discovery Initiation packets. • **PADO**—PPPoE Active Discovery Offer packets. • **PADR**—PPPoE Active Discovery Request packets. • **PADS**—PPPoE Active Discovery Session-Confirmation packets. • **PADT**—PPPoE Active Discovery Termination packets. • **Service name error**—Packets for which the Service-Name request could not be honored. • **AC system error**—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit. • **Generic error**—Packets that indicate an unrecoverable error occurred. • **Malformed packets**—Malformed or short packets that caused the packet handler to discard the frame as unreadable. • **Unknown packets**—Unrecognized packets.	**extensive**

Sample Output

show pppoe interfaces

```

List of Sample Output

show pppoe service-name-tables on page 2115
show pppoe service-name-tables (For the Specified Table Name) on page 2115

Output Fields

Table 165 on page 2114 lists the output fields for the **show pppoe service-name-tables** command. Output fields are listed in the approximate order in which they appear.

Table 165: show pppoe service-name-tables Output Fields

Field Name	Field Description	Level of Output
Service Name Table	Name of the PPPoE service name table.	none
Service Name	Name of a configured service in the PPPoE service name table: • **<empty>**—Service of zero length that represents an unspecified service • **<any>**—Default service for non-empty service entries that do not match the configured empty or named service entries • ***service-name***—Named service entry	none
Action	Action taken when the PPPoE underlying interface interface receives a PPPoE Active Discovery Initiation (PADI) packet with the specified named service, **empty** service, **any** service, or ACI/ARI pair: • **Delay *seconds***—Number of seconds that the interface delays before responding with a PPPoE Active Discovery Offer (PADO) packet • **Drop**—Interface drops (ignores) the packet. • **Terminate**—Interface responds immediately with a PADO packet	none

Table 165: show pppoe service-name-tables Output Fields (continued)

Field Name	Field Description	Level of Output
Dynamic Profile	Name of the dynamic profile with which the router creates a dynamic PPPoE subscriber interface. A dynamic profile can be assigned to a named service, **empty** service, **any** service, or ACI/ARI pair.	none
Routing Instance	Name of the routing instance in which to instantiate the dynamic PPPoE subscriber interface. A routing instance can be assigned to a named service, **empty** service, **any** service, or ACI/ARI pair.	none
Max Sessions	Maximum number of active PPPoE sessions that the router can establish with the specified named service, **empty** service, or **any** service.	none
Active Sessions	Current count of active PPPoE sessions created using the specified named service, **empty** service, or **any** service. The Active Sessions value cannot exceed the Max Sessions value.	none
ACI	Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. An ACI can be configured as part of an ACI/ARI pair for a named service, **empty** service, or **any** service.	none
ARI	Agent remote identifier (ARI) that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. An ARI can be configured as part of an ACI/ARI pair for a named service, **empty** service, or **any** service.	none
Static Interface	Name of the static PPPoE interface reserved for exclusive use by the PPPoE client with matching ACI/ARI information. A static interface can be configured only for an ACI/ARI pair.	none

Sample Output

show pppoe service-name-tables

```
user@host> show pppoe service-name-tables
Service Name Table: test1
Service Name Table: test2
Service Name Table: test3
```

show pppoe service-name-tables (For the Specified Table Name)

Service Name: Wholesale
  Action: Terminate
  Dynamic Profile: WholesalePppoeProfile
  Routing Instance: WholesaleRI
  Max Sessions: 16000
  Active Sessions: 4
```

show pppoe sessions

Syntax

show pppoe sessions
<aci *circuit-id-string*>
<ari *remote-id-string*>
<service *service-name*>

Release Information

Command introduced in Junos OS Release 10.2.

Description

Display information about all active PPPoE sessions on the router, or about the active PPPoE sessions established for a specified service name, agent circuit identifier (ACI), or agent remote identifier (ARI).

Options

none—Display information for all active PPPoE sessions on the router.

aci *circuit-id-string*—(Optional) Display information only for active PPPoE sessions established with the specified agent circuit identifier. The agent circuit identifier corresponds to the DSLAM interface that initiated the service request.

ari *remote-id-string*—(Optional) Display information only for active PPPoE sessions established with the specified agent remote identifier. The agent remote identifier corresponds to the subscriber associated with the DSLAM interface that initiated the service request.

service *service-name*—(Optional) Display information only for active PPPoE sessions established with the specified service, where *service-name* can be **empty**, **any**, or a named service.

Output Fields

Table 167 on page 2119 lists the output fields for the **show pppoe statistics** command. Output fields are listed in the approximate order in which they appear.

Table 167: show pppoe statistics Output Fields

Field Name	Field Description
Active PPPoE sessions	Total number of active PPPoE sessions and the number of packets sent and received during the PPPoE session, categorized by packet type and packet errors: • **PADI**—PPPoE Active Discovery Initiation packets. • **PADO**—PPPoE Active Discovery Offer packets. • **PADR**—PPPoE Active Discovery Request packets. • **PADS**—PPPoE Active Discovery Session-Confirmation packets. • **PADT**—PPPoE Active Discovery Termination packets. • **Service name error**—Packets for which the Service-Name request could not be honored. • **AC system error**—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit. • **Generic error**—Packets that indicate an unrecoverable error occurred. • **Malformed packets**—Malformed or short packets that caused the packet handler to discard the frame as unreadable. • **Unknown packets**—Unrecognized packets.

Table 167: show pppoe statistics Output Fields (continued)

Field Name	Field Description
Timeouts	Information about timeouts that occurred during the PPPoE session (not displayed for M120, M320, and MX Series routers): • **PADI**—No PADR packet has been received within the timeout period. (This value is always zero and is not supported.) • **PADO**—No PPPoE Active Discovery Offer packet has been received within the timeout period. • **PADR**—No PADS packet has been received within the timeout period.

Sample Output

show pppoe statistics

```
user@host> show pppoe statistics
Active PPPoE sessions: 1
  PacketType          Sent      Received
  PADI                   0             0
  PADO                   0             0
  PADR                   0             0
  PADS                   0             0
  PADT                   0             0
  Service name error     0             0
  AC system error        0             0
  Generic error          0             0

    Generic error                 0                0
    Malformed packets             0                0
    Unknown packets               0                0
```

show pppoe underlying-interfaces

Syntax

show pppoe underlying-interfaces
<brief | detail | extensive>
<lockout>
<*logical-interface-name*>

Release Information

Command introduced in Junos OS Release 10.0.
lockout option added in Junos OS Release 11.4.

Description

Display information about PPPoE underlying interfaces.

Options

brief | detail | extensive—(Optional) Display the specified level of output.

lockout—(Optional) Display summary information about the lockout condition and the lockout grace period for PPPoE clients on the PPPoE underlying interface.

logical-interface-name—(Optional) Name of a PPPoE underlying logical interface.

Required Privilege Level

List of Sample Output

Output Fields

Table 168 on page 2122 lists the output fields for the **show pppoe underlying-interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 168: show pppoe underlying-interfaces Output Fields

Field Name	Field Description	Level of Output
Underlying Interface	Name of the PPPoE underlying logical interface.	All levels
Service Name Table	Name of the service name table.	All levels
Dynamic Profile	Name of the dynamic profile that was used to create this interface. If the interface was statically created, then the value is **none**.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive**
State	Origin of the logical interface: **Static** or **Dynamic**. Indicates whether the interface was statically or dynamically created.	**detail extensive**
Operational States	Fields in this block are actual operational values rather than simply the configured values. The operational values can be the result of RADIUS-initiated changes.	**detail extensive**
Max Sessions	Maximum number of PPPoE logical interfaces that can be activated on the underlying interface. When this number of logical interfaces has been established, all subsequent PPPoE Active Discovery Initiation (PADI) packets are dropped and all subsequent PPPoE Active Discovery Request (PADR) packets trigger PPPoE Active Discovery Session (PADS) error responses.	**detail extensive**
Max Sessions VSA Ignore	Whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configure with the **max-sessions** statement: **Off** (default) or **On**.	**detail extensive** none
Active Sessions	Number of active PPPoE sessions on the underlying interface. If a dynamic profile is listed, then it is the number of active PPPoE sessions on the underlying interface that are using this profile. The Active Sessions value must not exceed the Max Sessions value.	**detail extensive**
Agent Circuit Identifier	Whether the underlying interface is configured with the **agent-circuit-identifier** statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on agent circuit identifier (ACI) information. **Autosensing** indicates that creation of ACI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ACI-based dynamic VLANs is not configured on the underlying interface, this field does not appear. NOTE: The Agent Circuit Identifier field is replaced with the Line Identity field when an ALI interface set is configured with the **line-identity** autoconfiguration stanza.	**detail extensive** none

Table 168: show pppoe underlying-interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Line Identity	Whether the underlying interface is configured with the **line-identity** statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on the specified trusted option: ACI, ARI, both, or neither. **Autosensing** indicates that creation of ALI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ALI dynamic VLANs based on trusted options is not configured on the underlying interface, this field does not appear. NOTE: The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the **agent-circuit-id** autoconfiguration stanza.	**detail extensive** none
Duplicate Protection	State of PPPoE duplicate protection: **On** or **Off**. When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client. The uniqueness of the PPPoE client is determined by the client's MAC address.	**detail extensive**
Short Cycle Protection	State of PPPoE short cycle protection: **mac-address**, **circuit-id**, or **Off**. Enabling short cycle protection, also known as PPPoE lockout, on the PPPoE underlying interface temporarily prevents (locks out) a failed or short-lived (short-cycle) PPPoE subscriber session from reconnecting to the router for a default or configurable period of time. PPPoE client sessions are identified by their unique media access control (MAC) source address or agent circuit identifier (ACI) value.	**detail extensive**
Direct Connect	State of the configuration to ignore DSL Forum VSAs: **On** or **Off**. When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	**detail extensive** none
AC Name	Name of the access concentrator.	**detail extensive**
PacketType	Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors: • **PADI**—PPPoE Active Discovery Initiation packets. • **PADO**—PPPoE Active Discovery Offer packets. • **PADR**—PPPoE Active Discovery Request packets. • **PADS**—PPPoE Active Discovery Session-Confirmation packets. • **PADT**—PPPoE Active Discovery Termination packets. • **Service name error**—Packets for which the Service-Name request could not be honored. • **AC system error**—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit. • **Generic error**—Packets that indicate an unrecoverable error occurred. • **Malformed packets**—Malformed or short packets that caused the packet handler to discard the frame as unreadable. • **Unknown packets**—Unrecognized packets.	**detail extensive**

Table 168: show pppoe underlying-interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Lockout Time (sec)	The PPPoE lockout time range, the number of PPPoE clients in lockout condition, and the number of PPPoE clients in a lockout grace period if **Short Cycle Protection** is enabled (**On**): • **Min**—Minimum lockout time, in seconds, configured on the PPPoE underlying interface. • **Max**—Maximum lockout time, in seconds, configured on the PPPoE underlying interface. • **Total clients in lockout**—Number of PPPoE clients currently undergoing lockout. • **Total clients in lockout grace period**—Number of PPPoE clients currently in a lockout grace period. A *lockout grace period* occurs when the time between lockout events is greater than either 15 minutes or the maximum lockout time.	**extensive**
Client Address	MAC source address of the PPPoE client.	**extensive**
Current	Current lockout time, in seconds; displays **0** (zero) if the PPPoE client is not undergoing lockout.	**extensive**
Elapsed	Time elapsed into the lockout period, in seconds; displays **0** if the PPPoE client is not undergoing lockout	**extensive**
Next	Lockout time, in seconds, that the router uses for the next lockout event; displays a nonzero value if the PPPoE client is currently in a lockout grace period.	**extensive**

show pppoe version

Syntax show pppoe version

Release Information Command introduced before Junos OS Release 7.4.

Description (M120 routers and M320 routers only) Display version information about PPPoE.

Options This command has no options.

Required Privilege Level view

List of Sample Output show pppoe version on page 2128

Output Fields Table 169 on page 2128 lists the output fields for the **show pppoe version** command. Output fields are listed in the approximate order in which they appear.

Table 169: show pppoe version Output Fields

Field Name	Field Description
version *n*	PPPoE version number and RFC. For example, **version 1, rfc 2516**.
PPPoE protocol	State of the PPPoE protocol: **enabled** or **disabled**.
Maximum Sessions	Maximum active sessions supported per router. The default is 256 sessions.
PADI resend timeout	Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Offer (PADO) packet for the PPoE Active Discovery Initiation (PADI) packet sent. This timeout doubles for each successive PADI packet sent. Not displayed for M120 and M320 routers.
PADR resend timeout	Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Session Confirmation (PADS) packet for the PPoE Active Discovery Request (PADR) packet sent. This timeout doubles for each successive PADR packet sent. Not displayed for M120 and M320 routers.
Max resend timeout	Maximum value, in seconds, that the PADI or PADR resend timer can accept. The maximum value is 64. Not displayed for M120 and M320 routers.
Max Configured AC timeout	Time, in seconds, during which the configured access concentrator must respond. Not displayed for M120 and M320 routers.

Sample Output

show pppoe version

```
user@host> show pppoe version
Point-to-Point Protocol Over Ethernet, version 1. rfc2516
   PPPoE protocol               = Enabled
   Maximum Sessions             = 256
```

```

show protection-group ethernet-ring aps

Syntax **show protection-group ethernet-ring aps**

Release Information Command introduced in Junos OS Release 9.4.
Command introduced in Junos OS Release 12.1 for EX Series switches.
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

Description Display the status of the Automatic Protection Switching (APS) and Ring APS (RAPS) messages on an Ethernet ring.

Options This command has no options.

Required Privilege Level view

Output Fields Table 170 on page 2131 lists the output fields for the **show protection-group ethernet-ring aps** command. Output fields are listed in the approximate order in which they appear.

Table 170: show protection-group ethernet-ring aps Output Fields

Field Name	Field Description
Ethernet Ring	Name configured for the Ethernet ring.
Request/State	Status of the Ethernet ring RAPS messages. • **NR**—Indicates that there is no request for APS on the ring. • **SF**—Indicates that there is a signal failure on the ring. • **FS**—Indicates that there are active forced-switch requests in the ring. • **MS**—Indicates that there are active manual-switch requests in the ring. NOTE: Both **FS** and **MS** values are valid only when G.8032v2 is supported.
Ring Protection Link Blocked	Blocking on the ring protection link: **Yes** or **No**.
No Flush	Indicates the value of the Do Not Flush (DNF) flag in the received RAPS PDU. If the value is Yes, then FDB flush is not triggered as part of processing of the received RAPS PDU.
Blocked Port Reference	This parameter is the reference to the blocked ring port. If the east ring port is blocked, the Blocked Port Reference (BPR) value is 0. If the west ring port is blocked, the BPR value is 1. If both ring ports are blocked, this parameter can take any value. If both east and west ports are blocked or not blocked, the value would be 0. This field is valid only when G.8032v2 is supported.
Blocked Port Reference	Reference of the ring port on which traffic is blocked.
Originator	Indicates whether the node is the originator of the RAPS messages.
Remote Node ID	Identifier (in MAC address format) of the remote node.

Sample Output

show protection-group ethernet-ring aps (EX Switches)

```
user@switch>show protection-group ethernet-ring aps
Ring Name     Request/state  No Flush  RPL Blocked  Originator  Remote Node ID
erp1          NR             No        Yes          No          00:1F:12:30:B8:81
```

Sample Output

show protection-group ethernet-ring aps (Owner Node, Normal Operation on ACX and MX Routers)

```
user@host> show protection-group ethernet-ring aps
Ethernet Ring   Request/state  RPL Blocked  No Flush  BPR  Originator  Remote
Node ID
Erp_1           NR             Yes          No        1    No
00:00:00:02:00:01
```

Sample Output

show protection-group ethernet-ring aps detail (Owner Node, Normal Operation on ACX and MX Routers)

```
user@host> show protection-group ethernet-ring aps detail
Ethernet-Ring name              : Erp_1
Request/State                   : NR
Ring Protection Link blocked    : Yes
No Flush Flag                   : No
Blocked Port Reference          : 1
Originator                      : No
Remote Node ID                  : 00:00:00:02:00:01
```

show protection-group ethernet-ring aps (MX RPL Owner Ring Node, Failure condition on non-RPL link of the ring)

```
user@host>show protection-group ethernet-ring aps
Ethernet Ring    Request/state    RPL Blocked  No Flush
pg101            SF               No           No

Originator  Remote Node ID
No          00:01:02:00:00:01
```

show protection-group ethernet-ring aps (MX Interconnection Ring Node, Failure condition in major ring on non-RPL link of the ring)

```
user@host>show protection-group ethernet-ring aps
Ethernet Ring    Request/state  RPL Blocked  No Flush   BPR

```

show protection-group ethernet-ring configuration

Syntax

show protection-group ethernet-ring configuration

Release Information

Command introduced in Junos OS Release 12.1 for EX Series switches.
Command introduced in Junos OS Release 14.1 for MX Series routers.
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

Description

Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.

Required Privilege Level

view

Output Fields

Table 171 on page 2134 lists the output fields for the **show protection-group ethernet-ring configuration** command. Output fields are listed in the approximate order in which they appear.

Table 171: show protection-group ethernet-ring configuration Output Fields

Output Fields	Field Description
G8032 Compatability Version	This is the compatibility version mode of ERP. This parameter always takes the value 1 in the case of G8032v1. This parameter is valid only for MX Series routers.
East Interface	One of the two switch interfaces that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 0.
West Interface	One of the two interfaces in a switch that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 1.

Table 171: show protection-group ethernet-ring configuration Output Fields (continued)

Output Fields	Field Description
Restore Interval	Configured interval of wait time after a link is restored. When a link goes down, the RPL link is activated. When the down link becomes active again, the RPL owner receives a notification. The RPL owner waits for the restore interval before issuing a block on the RPL link. The configured restore interval can be 5 through 12 minutes for ERPv1 and 1 through 12 minutes for ERPv2. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value. NOTE: Wait to Restore (WTR) configuration values on EX2300 and EX3400 switches must be 5-12 minutes.
Wait to Block Interval	Configured interval of wait time for link restoration when a manual command (manual switch or force switch) is cleared. On clearing the manual command, the RPL owner receives NR messages, which starts a timer with interval 'Wait to Block' to restore the RPL link after its expiration. This delay timer is set to be 5 seconds longer than the guard timer. The configured number can be from 5 seconds through 10 seconds. The parameter is valid only for G.8032v2. NOTE: The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.
Guard Interval	Configured number of milliseconds (in 10 millisecond intervals, 10 milliseconds through 2000 milliseconds) that the node does not process any Ethernet ring protection protocol data units (PDUs). This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.
Hold off interval	This is the interval at which the link is held down even before declaring that the link is down. Because the parameter is not supported at present, its value is always considered 0. This parameter is valid only for MX Series routers.
Node ID	Node ID for the switch or router. If the node ID is not configured, it is assigned by default. For EX Series switches, the Node ID value cannot be configured, whereas for MX Series routers, it can be configured.
Ring ID	In G8032v2, the ring ID can be within the range 1–239. All the nodes in a ring should have the same ring ID. In the case of G8032v1, the value of the ring ID is always 1. This parameter is valid only for MX Series routers.
Node Role	Indicates whether the ring node is operating as a normal ring-node or RPL-owner or RPL-neighbor. For G8032v1 RPL-neighbor role is not supported. This parameter is valid only for MX Series routers.

Table 171: show protection-group ethernet-ring configuration Output Fields (continued)

Output Fields	Field Description
Revertive Mode of Operation	This parameter indicates whether the ring is operating in revertive mode or nonrevertive mode. In nonrevertive mode of operation, when all links in the ring and Ethernet Ring Nodes have recovered and no external requests are active, the Ethernet Ring does not automatically revert. G8032v1 supports only revertive mode of operation. This parameter is valid only for MX Series routers.
RAPS Tx Dot1p priority	The RAPS Tx Dot1p priority is a parameter with which the RAPS is transmitted from the ring node. For G8032v1, the value of this parameter is always 0. For G8032v2, the value of this parameter can be within the range 0–7. This parameter is valid only for MX Series routers.
Node type	Indicates whether ring node is a normal ring node having two ring-links or a open ring-node having only a single ring-link or a interconnection ring-node. An interconnection ring node can be connected to major ring in non virtual-channel mode or in virtual channel mode. Ring interconnection is not supported for G8032v1. This parameter is valid only for MX Series routers.
Major ring name	If the node type is interconnection in the ring, this parameter takes the name of the major ring to which the sub-ring node is connected. This parameter is valid only for MX Series routers.
Interconnection mode	Indicates the interconnection mode if the type of the node is interconnection. An interconnection ring node can be connected to major ring in non-virtual channel mode or in virtual channel mode. This parameter is valid only for MX Series routers.
Propagate Topology Change event	When Propagate Topology Change event is set to 1, the change in the topology of sub-ring is propagated to the major ring, enabling the transmission of EVENT FLUSH RAPS PDU in the major ring. When the parameter is set to 0, the topology change in the sub-ring is not propagated to the major ring blocking EVENT FLUSH RAPS PDU transmission in the major ring. This parameter is valid only for MX Series routers.
Control Vlan	The VLAN that transfers ERP PDUs from one node to another.
Physical Ring	Physical ring if the east and west interfaces are nontrunk ports. For MX Series routers, the ring is termed a physical ring if no data channels are defined for the ring and the entire physical port forwarding is controlled by ERP.
Data Channel VLAN(s)	Data VLANs for which forwarding behavior is controlled by the ring instance.

Sample Output

show protection-group ethernet-ring configuration (EX Switch)

```
user@switch>show protection-group ethernet-ring configuration
Ethernet ring configuration parameters for protection group erp1
East Interface   : ge-0/0/3.0
West Interface   : ge-0/0/9.0
Restore Interval : 5 minutes
Guard Interval   : 500 ms
Node Id          : 00:1F:12:30:B8:81
```

```
Control Vlan     : 101

show protection-group ethernet-ring data-channel

Syntax

show protection-group ethernet-ring data-channel
<brief | detail>
<group-name *group-name*>

Release Information

Command introduced in Junos OS Release 10.2.
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

Description

Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.

Options

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Protection group for which to display statistics. If you omit this optional field, all protection group statistics for configured groups will be displayed.

Required Privilege Level

List of Sample Output

show protection-group ethernet-ring data-channel on page 2141
show protection-group ethernet-ring data-channel detail on page 2141
show protection-group ethernet-ring data-channel detail (EX2300 and EX3400 Switches) on page 2142

Output Fields

Table 172 on page 2140 lists the output fields for the **show protection-group ethernet-ring data-channel** command. Output fields are listed in the approximate order in which they appear.

Table 172: show protection-group ethernet-ring data-channel Output Fields

Field Name	Field Description
Interface	Name of the interface configured for the Ethernet ring.

Table 172: show protection-group ethernet-ring data-channel Output Fields (continued)

Field Name	Field Description
STP index	The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior.
Forward State	Forwarding state on the Ethernet ring. • **fowarding**—Indicates packets are being forwarded. • **discarding**—Indicates packets are being discarded.

Sample Output

show protection-group ethernet-ring data-channel

```
user@host> show protection-group ethernet-ring data-channel
Ethernet ring data channel information for protection group pg301

Interface     STP index  Forward State
xe-5/0/2      78         forwarding
xe-2/2/0      79         discarding

Ethernet ring data channel parameters for protection group pg302

Interface     STP index  Forward State
xe-5/0/2      80         forwarding
xe-2/2/0      81         forwarding
```

show protection-group ethernet-ring data-channel detail

List of Sample Output show protection-group ethernet-ring flush-info (ACX and MX Series Routers) on page 2143
show protection-group ethernet-ring flush-info detail (ACX and MX Series Routers) on page 2144

Output Fields Table 173 on page 2143 lists the output fields for the **show protection-group ethernet-ring flush-info** command. Output fields are listed in the approximate order in which they appear.

Table 173: show protection-group ethernet-ring flush-info Output Fields

Field Name	Field Description
Interface	Physical interface configured for the Ethernet ring. This can be an aggregated Ethernet link also.
Originating Node	Node from which RAPS protocol data units originates on the Ethernet Ring.
Blocked Port Reference	Reference of the ring port on which traffic is blocked.

Sample Output

show protection-group ethernet-ring flush-info (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info
```

```
Ethernet ring flush port information for protection group pg100

Interface     Originating Node   Blocked Port Reference
xe-5/0/2.4001 00:00:00:00:00:00   0
xe-2/2/0.4001 00:00:00:00:00:00   0
```

show protection-group ethernet-ring flush-info detail (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info detail
Ethernet ring flush port information for protection group pg100

Interface name                : xe-5/0/2.4001
Originating Node              : 00:00:00:00:00:00
Blocked Port Reference        : 0

Interface name                : xe-2/2/0.4001
Originating Node              : 00:00:00:00:00:00
Blocked Port Reference        : 0
```

show protection-group ethernet-ring interface

Syntax
show protection-group ethernet-ring interface

Release Information
Command introduced in Junos OS Release 9.4.
Command introduced in Junos OS Release 12.3X54 for ACX Series routers.
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

Description
Displays the status of the Automatic Protection Switching (APS) interfaces on an Ethernet ring.

Options
This command has no options.

Required Privilege Level
view

- show protection-group ethernet-ring vlan on page 2159

List of Sample Output

Output Fields
Table 174 on page 2146 lists the output fields for both the EX Series switch, and the ACX Series and MX Series router **show protection-group ethernet-ring interface** commands. Output fields are listed in the approximate order in which they appear.

Table 174: MX Series Routers show protection-group ethernet-ring interface Output Fields

Field Name	Field Description
Ethernet ring port parameters for protection group *group-name*	Output is organized by configured protection group.
Interface	Physical interfaces configured for the Ethernet ring. This can be an aggregated Ethernet link also.
Control Channel	(MX Series router only) Logical unit configured on the physical interface.
Direction	Direction of the traffic.
Forward State	State of the ring forwarding on the interface: **discarding** or **forwarding**.
Ring Protection Link End	Whether this interface is the end of the ring: **Yes** or **No**.
Signal Failure	Whether there a signal failure exists on the link: **Clear** or **Set**.
Admin State	State of the interface: For EX switches, **ready**, **ifl ready**, or **waiting**. For MX routers, **IFF ready** or **IFF disabled**.

Sample Output

show protection-group ethernet-ring interface (EX Series Switch Owner Node)

```
user@host> show protection-group ethernet-ring interface
Ethernet ring port parameters for protection group pg101

Interface      Forward State  RPL End  Signal Failure  Admin State

ge-0/0/3.0     discarding     Yes        Clear           ready
ge-0/0/9.0     forwarding     No         Clear           ready
```

show protection-group ethernet-ring interface (Owner Node MX Series Router)

Output Fields Table 175 on page 2149 lists the output fields for the **show protection-group ethernet-ring node-state** command. Output fields are listed in the approximate order in which they appear.

Table 175: show protection-group ethernet-ring node-state Output Fields

Field Name	Field Description
Ring Name/Ethernet Ring	Name configured for the Ethernet ring.

Table 175: show protection-group ethernet-ring node-state Output Fields (continued)

Field Name	Field Description
APS State	State of the Ethernet ring APS. • **idle**—Indicates that the ring is working in normal condition and there is no active or pending protection-switching request in the ring. When the ring is in idle state, it is blocked at the RPL link. • **protected**—Indicates that there is a protection switch on the ring because of a signal failure condition on the ring link. • **MS**—Indicates that the manual switch command is active in the ring. • **FS**—Indicates that the forced switch command is active in the ring. • **pending**—Indicates that the ring is in pending state.
Event	Events on the ring. • **NR-RB**—Indicates that there is no APS request and the ring link is blocked on the ring owner node. • **NR**—Indicates that there is no APS request pending in the ring. • **local SF**—Indicates that there is signal failure on one or both of the ring links of the node. • **remote SF**—Indicates that there is signal failure on one or more ring links of any other node of the ring. • **local FS**—Indicates that there is a forced switched command active on one or both of the ring links of the node. • **remote FS**—Indicates that there is a forced switch command active on one or more ring links of any other node of the ring. • **local MS**—Indicates that there is a manual switch command active on one of the ring links of the node. • **remote MS**—Indicates that there is a manual switch command active on one or more ring links of any other node of the ring. • **WTR running**—Indicates that the wait to restore timer is running on the RPL owner. • **WTB running**—Indicates that the wait to block timer is running on the RPL owner.
RPL Owner / Ring Protection Link Owner	Whether this node is the ring owner: **Yes** or **No**.
WTR Timer / Restore Timer	Restoration timer: **running** or **disabled**.
WTB Timer / Wait to block timer	Wait to block timer: **running** or **disabled**. NOTE: The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.

Table 175: show protection-group ethernet-ring node-state Output Fields (continued)

Field Name	Field Description
Wait to block timer (WTB Timer)	Wait to block interval. NOTE: The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.
Guard Timer	Guard timer: **running** or **disabled**.
Op State / Operational State	State of the node: **Operational** or **any internal wait state.**.

Sample Output

show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state
Ethernet ring   APS State   Event       RPL Owner  WTR Timer  WTB Timer  Guard
Timer  Operation state

show protection-group ethernet-ring statistics

Syntax

show protection-group ethernet-ring statistics group-name ***group-name***

<brief | detail>

Release Information

Command introduced in Junos OS Release 9.4.
Command introduced in Junos OS Release 12.1 for EX Series switches.
Command introduced in Junos OS Release 12.3X54 for ACX Series routers.

Description

Display statistics regarding Automatic Protection Switching (APS) protection groups on an Ethernet ring.

Options

group-name—Display statistics for the protection group. If you omit this option, protection group statistics for all configured groups are displayed.

brief—Display brief statistics for the protection group.

detail—Display detailed statistics for the protection group.

Output Fields

Table 176 on page 2154 lists the output fields for the **show protection-group ethernet-ring statistics** command.

Table 176: show protection-group ethernet-ring statistics Output Fields

Field Name	Field Description
Ethernet Ring Statistics for PG	Name of the protection group for which statistics are displayed.
RAPS event sent	Number of times Ring Automatic Protection Switching (RAPS) message transmission event occurred locally. This field is applicable only to MX Series routers.
RAPS event received	Number of RAPS messages received and processed by ERP state-machine and which resulted in state transition. This field is applicable only to MX Series routers.
Local SF	Number of times a signal failure has occurred locally.
Remote SF	Number of times a signal failure has occurred anywhere else on the ring.
NR event	Number of times a No Request event has occurred on the ring. This field is applicable only to EX Series switches.
NR event sent	Number of times a No Request event has occurred locally. This field is applicable only to MX Series routers.
NR event received	Number of times a No Request event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
NR-RB event	Number of times a No Request, Ring Blocked event has occurred on the ring. This field is applicable only to EX Series switches.
NR-RB event sent	Number of times a No Request, Ring Blocked event has occurred locally. This field is applicable only to MX Series routers.
NR-RB event received	Number of times a No Request, Ring Blocked event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
Flush event sent	Number of times flush-event RAPS message transmission event occurred locally. This field is applicable only to MX Series routers.
Flush event received	Number of flush-event RAPS messages received and processed by the ring instance control process. This field is applicable only to MX Series routers.
Local FS event sent	Number of times a forced switch event has occurred locally. This field is applicable only to MX Series routers.
Remote FS event received	Number of times a forced switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
Local MS event sent	Number of times a manual switch event has occurred locally. This field is applicable only to MX Series routers.

Table 176: show protection-group ethernet-ring statistics Output Fields (continued)

Field Name	Field Description
Remote MS event received	Number of times a manual switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.

Table 177 on page 2155 lists the output fields for the **show protection-group ethernet-ring statistics** command when the **detail** option is used. These fields are valid only for MX Series routers.

Table 177: show protection-group ethernet-ring statistics detail Output Fields (for MX Series Routers)

Field Name	Field Description
Total number of FDB flush	Number of times forwarding database (FDB) flush has happened for the ring instance.
Flush-logic triggered flush	Number of times FDB flush has happened because of flush-logic based on node ID and Blocked Port Reference (BPR).
Remote RAPS PDU received	Number of valid RAPS PDU messages received. This counter counts only RAPS messages generated by other devices on the ring.
Remote RAPS dropped due to guard-timer	Number of RAPS messages dropped by the device because the guard timer is running.
Invalid remote RAPS PDU dropped	Number of RAPS messages dropped by the device because the messages are invalid.
RAPS dropped due to miscellaneous errors	Number of RAPS messages dropped because of any other reason. For example, messages dropped because of unsupported functionality.
Local received RAPS PDU dropped	Number of self-generated RAPS messages received and dropped.

Sample Output

show protection-group ethernet-ring statistics (EX Series Switch)

```
user@switch> show protection-group ethernet-ring statistics
Ring Name Local SF Remote SF NR Event NR-RB Event
erp1       2       1       2        3
```

show protection-group ethernet-ring statistics (MX Series Router)

show protection-group ethernet-ring vlan

Syntax

show protection-group ethernet-ring vlan
<brief | detail>
<group-name *group-name*>

Release Information

Command introduced in Junos OS Release 10.2.
Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

Description

On MX Series routers, display all data channel logical interfaces and the VLAN IDs controlled by a ring instance data channel.

Options

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Protection group for which to display details such as data channel interfaces, vlan, and bridge-domain. If you omit this optional field, details for all configured protection groups will be displayed.

Required Privilege Level

Output Fields

Table 178 on page 2159 lists the output fields for the **show protection-group ethernet-ring vlan** command. Output fields are listed in the approximate order in which they appear.

Table 178: show protection-group ethernet-ring vlan Output Fields

Field Name	Field Description
Interface	Name of the interface configured for the Ethernet protection ring.
Vlan	Name of the VLAN associated with the interface configured for the Ethernet protection ring.

Table 178: show protection-group ethernet-ring vlan Output Fields (continued)

Field Name	Field Description
STP index	The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior.
Bridge Domain	Name of the bridge domain that is associated with the VLAN configured for the Ethernet protection ring.

Sample Output

show protection-group ethernet-ring vlan

```
user@host> show protection-group ethernet-ring vlan
Ethernet ring IFBD parameters for protection group vkm01

Interface     Vlan    STP Index    Bridge Domain

show security macsec connections (MX Series)

Syntax

show security macsec connections
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

Description

Display the status of the active MACsec connections on the router.

Options

none—Display MACsec connection information for all interfaces on the switch.

interface ***interface-name***—(Optional) Display MACsec connection information for the specified interface only.

Required Privilege Level

view

List of Sample Output

show security macsec connections on page 2164
show security macsec connections (MX480 routers with MPC7E-10G) on page 2164
show security macsec connections (MX480 routers with MPC7E-10G) on page 2165

Output Fields

Table 179 on page 2163 lists the output fields for the **show security macsec connections** command. Output fields are listed in the approximate order in which they appear.

Table 179: show security macsec connections Output Fields

Field Name	Field Description
Fields for Interface	
Interface name	Name of the interface.
CA name	Name of the connectivity association. A connectivity association is named using the **connectivity-association** statement when you are enabling MACsec.
Cipher suite	Name of the cipher suite used for encryption.
Encryption	Encryption setting. Encryption is enabled when this output is **on** and disabled when this output is **off**. The encryption setting is set using the **no-encryption** statement in the connectivity association when using static connectivity association key (CAK) security mode and is set using the **encryption** statement in the secure channel when using static secure association key (SAK) or dynamic security mode.

Table 179: show security macsec connections Output Fields (continued)

Field Name	Field Description
Key server offset	The offset value in a packet from which encryption can be performed. The offset is set using the **offset** statement when configuring the connectivity association when using static connectivity association key (CAK) or dynamic security mode or the secure channel when using static secure association key (SAK) security mode.
Include SCI	SCI tagging. The SCI tag is included on packets in a secure channel when this output is **yes**, and not included on packets in a secure channel when this output is **no**. SCI tagging is automatically enabled on MX Series routers. By default, include SCI tag is disabled. You can enable SCI tagging using the **include-sci** statement in the connectivity association configuration.
Replay protect	By default, replay protection is disabled. Replay protection ensures that a snooped packet is not replayed or a packet number is reused. Replay protection is enabled when this output is **on** and disabled when this output is **off**. You can enable replay protection using the **replay-protect** statement in the connectivity association configuration.
Replay window	Number of packets that can be replayed. Must be configured with replay protection. This output is set to **0** when replay protection is disabled, and is the size of the replay window, in number of packets, when replay protection is enabled. The size of the replay window is configured using the **replay-window-size** statement in the connectivity association configuration.

Sample Output

show security macsec connections

```
user@host> show security macsec connections
Interface name: xe-0/1/0
        CA name: CA1
        Cipher suite: GCM-AES-128   Encryption: on
        Key server offset: 0        Include SCI: no
        Replay protect: off         Replay window: 0
```

show security macsec connections (MX480 routers with MPC7E-10G)

```
user@host> show security macsec connections
 Interface name: xe-4/0/18
        CA name: ca1
        Cipher suite: GCM-AES-128   Encryption: on
        Key server offset: 30       Include SCI: no
        Replay protect: off         Replay window: 0
          Outbound secure channels
            SC Id: 54:1E:56:B4:0D:3A/1
            Outgoing packet number: 11

```

show security macsec statistics (MX Series)

Syntax

show security macsec statistics
<brief | detail>
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

Description

Display Media Access Control Security (MACsec) statistics.

Options

none—Display MACsec statistics in brief form for all interfaces on the router.

brief | detail—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** option displays additional fields that are not visible in the **brief** output.

NOTE: The field names that only appear in this command output when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel.

interface interface-name—(Optional) Display MACsec statistics for the specified interface only.

Required Privilege Level

List of Sample Output

show security macsec statistics interface detail on page 2168
show security macsec statistics (MX480 router with MPC7E-10G) on page 2169
show security macsec statistics (MX480 router with MPC7E-10G) on page 2169
show security macsec statistics detail (MX480 router with MPC7E-10G) on page 2170

Output Fields

Table 180 on page 2166 lists the output fields for the **show security macsec statistics** command. Output fields are listed in the approximate order in which they appear.

The field names that appear in this command's output only when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel. Those field names are, therefore, not included in this table.

Table 180: show security macsec statistics Output Fields

Field Name	Field Description	Level of Output
Interface name	Name of the interface.	All levels

Table 180: show security macsec statistics Output Fields (continued)

Field Name	Field Description	Level of Output
Fields for Secure Channel transmitted		
Encrypted packets	Total number of packets transmitted out of the interface in the secure channel that were secured and encrypted using MACsec. Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).	All levels
Encrypted bytes	Total number of bytes transmitted out of the interface in the secure channel that were secured and encrypted using MACsec. Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).	All levels
Protected packets	Total number of packets transmitted out of the interface in the secure channel that were secured but not encrypted using MACsec. Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).	All levels
Protected bytes	Total number of bytes transmitted out of the interface in the secure channel that were secured but not encrypted using MACsec. Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).	All levels
Fields for Secure Association transmitted		
Encrypted packets	Total number of packets transmitted out of the interface in the connectivity association that were secured and encrypted using MACsec. The total includes the data packets transmitted in the secure channel and secured using a SAK and the control packets secured using a connectivity association key (CAK).	All levels
Protected packets	Total number of packets transmitted out of the interface in the connectivity association that were secured but not encrypted using MACsec. The total includes the data packets transmitted in the secure channel and secured using a SAK and the control packets secured using a connectivity association key (CAK).	All levels
Fields for Secure Channel received		
Accepted packets	The number of received packets that have been accepted by the secure channel on the interface. The secure channel is used to send all data plane traffic on a MACsec-enabled link. A packet is considered accepted for this counter when it has been received by this interface and it has passed the MACsec integrity check. This counter increments for traffic that is and is not encrypted using MACsec.	All levels

Table 180: show security macsec statistics Output Fields (continued)

Field Name	Field Description	Level of Output
Validated bytes	The number of bytes that have been validated by the MACsec integrity check and received on the secure channel on the interface. The secure channel is used to send all data plane traffic on a MACsec-enabled link. This counter does not increment when MACsec encryption is disabled.	All levels
Decrypted bytes	The number of bytes received in the secure channel on the interface that have been decrypted. The secure channel is used to send all data plane traffic on a MACsec-enabled link. An encrypted byte has to be decrypted before it can be received on the receiving interface. The decrypted bytes counter is incremented for received traffic that was encrypted using MACsec.	All levels
Fields for Secure Association received		
Accepted packets	The number of received packets that have been accepted in the connectivity association on the interface. The counter includes all control and data plane traffic accepted on the interface. A packet is considered accepted for this counter when it has been received by this interface and it has passed the MACsec integrity check.	All levels
Validated bytes	The number of bytes that have been validated by the MACsec integrity check and received on the connectivity association on the interface. The counter includes all control and data plane traffic accepted on the interface. This counter does not increment when MACsec encryption is disabled.	All levels
Decrypted bytes	The number of bytes received in the connectivity association on the interface that have been decrypted. The counter includes all control and data plane traffic accepted on the interface. An encrypted byte has to be decrypted before it can be received on the receiving interface. The decrypted bytes counter is incremented for received traffic that was encrypted using MACsec.	All levels

show security mka sessions (MX Series)

Syntax

show security mka sessions
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

Description

Display MACsec Key Agreement (MKA) session information for all interfaces. The MKA protocol is responsible for maintaining MACsec on the link, and decides which router on the point-to-point link becomes the key server.

Options

- **interface** *interface-name*—(Optional) Display the MKA session information for the specified interface only.
- none—Display the MKA session information for all interfaces.

Required Privilege Level

view

List of Sample Output

show security mka sessions on page 2172

show security mka sessions (MX480 with MPC7E-10G) on page 2173

Output Fields

Table 181 on page 2171 lists the output fields for the **show security mka sessions** command. Output fields are listed in the approximate order in which they appear.

Table 181: show security mka sessions Output Fields

Field Name	Field Description
Interface name	Name of the interface.
Member identifier	Name of the member identifier.
CAK name	Name of the connectivity association key (CAK). The CAK is configured using the **cak** keyword when configuring the pre-shared key.
Transmit interval	The transmit interval. Both ends of the point-to-point link should be configured to the same value. Default value is 2000 seconds. Possible values: 2000 through 10000 milliseconds.
Outbound SCI	Name of the outbound secure channel identifier.
Message number	Number of the last data message.
Key number	Key number.

Table 181: show security mka sessions Output Fields (continued)

Field Name	Field Description
Key server	Key server status. The router is the key server when this output is **yes**. The router is not the key server when this output is **no**.
Key server priority	Displays the priority of the key server. Lower value indicates higher priority. Use the **key-server-priority** statement to set the priority. Possible values: 0 through 255.
Latest SAK AN	Name of the latest secure association key (SAK) association number.
Latest SAK KI	Name of the latest secure association key (SAK) key identifier.
Fields for Peer list	
Member identifier	Name of the member identifier.
Hold time	Hold time, in seconds.
Message number	Number of the last data message
SCI	Name of the secure channel identifier.
Lowest acceptable PN	Number of the lowest acceptable packet number (PN).

Sample Output

show security mka sessions

show security mka statistics (MX Series)

Syntax

show security mka statistics
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

Description

Display MACsec Key Agreement (MKA) protocol statistics.

The output for this command does not include statistics for MACsec data traffic. For MACsec data traffic statistics, see *show security macsec statistics*.

Options

- **interface** ***interface-name***—(Optional) Display the MKA information for the specified interface only.
- none—Display the MKA information for all interfaces.

Required Privilege Level

view

List of Sample Output

show security mka statistics on page 2175
show security mka statistics (MX480 routers with MPC7E-10G) on page 2175
show security mka statistics (MX480 routers with MPC7E-10G) on page 2176

Output Fields

Table 182 on page 2174 lists the output fields for the **show security mka statistics** command. Output fields are listed in the approximate order in which they appear.

Table 182: show security mka statistics Output Fields

Field Name	Field Description
Received packets	Number of received MKA control packets. This counter increments for received MKA control packets only. This counter does not increment when data packets are received.
Transmitted packets	Number of transmitted MKA packets This counter increments for transmitted MKA control packets only. This counter does not increment when data packets are transmitted.
Version mismatch packets	Number of version mismatch packets.
CAK mismatch packets	Number of Connectivity Association Key (CAK) mismatch packets. This counter increments when the connectivity association key (CAK) and connectivity association key name (CKN), which are user-configured values that have to match to enable MACsec, do not match for an MKA control packet.

Table 182: show security mka statistics Output Fields (continued)

Field Name	Field Description
ICV mismatch packets	Number of ICV mismatched packets. This counter increments when the connectivity association key (CAK) value does not match on both ends of a MACsec-secured Ethernet link.
Duplicate message identifier packets	Number of duplicate message identifier packets.
Duplicate message number packets	Number of duplicate message number packets.
Duplicate address packets	Number of duplicate source MAC address packets.
Invalid destination address packets	Number of invalid destination MAC address packets.
Formatting error packets	Number of formatting error packets.
Old Replayed message number packets	Number of old replayed message number packets.

Sample Output

show security mka statistics

```
user@host> show security mka statistics

        Received packets:                      1525844
        Transmitted packets:                   1525841
        Version mismatch packets:              0
        CAK mismatch packets:                  0
        ICV mismatch packets:                  0
        Duplicate message identifier packets:  0
        Duplicate message number packets:      0
        Duplicate address packets:             0
        Invalid destination address packets:   0

```

show vrrp

Syntax

show vrrp
<brief | detail | extensive | summary>
<interface *interface-name* <group *number*>>
<logical-system *logical-system-name* >
<nsr>

Release Information

Command introduced before Junos OS Release 7.4.
nsr option added in Junos OS Release 13.2.

Description

Display status information about Virtual Router Redundancy Protocol (VRRP) groups.

Options

none—(Same as **brief**) Display brief status information about all VRRP interfaces.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

interface *interface-name* <group *number*>—(Optional) Display information and status about the specified VRRP interface and, optionally, the group number.

logical-system *logical-system-name*—(Optional) Perform this operation on a particular logical system.

nsr—(Optional) Display state replication information when graceful Routing Engine switchover (GRES) with nonstop active routing (NSR) is configured. Use only on the backup Routing Engine.

Output Fields

Table 183 on page 2178 lists the output fields for the **show vrrp** command. Output fields are listed in the approximate order in which they appear

Table 183: show vrrp Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the logical interface.	**brief extensive** none **summary**
Interface index	Physical interface index number, which reflects its initialization sequence.	**extensive**
Groups	Total number of VRRP groups configured on the interface.	**extensive**
Active	Total number of VRRP groups that are active (that is, whose interface state is either up or down).	**extensive**
Interface VRRP PDU statistics	Non-errored statistics for the logical interface: • **Advertisement sent**—Number of VRRP advertisement protocol data units (PDUs) that the interface has transmitted. • **Advertisement received**—Number of VRRP advertisement PDUs received by the interface. • **Packets received**—Number of VRRP packets received for VRRP groups on the interface. • **No group match received**—Number of VRRP packets received for VRRP groups that do not exist on the interface.	**extensive**
Interface VRRP PDU error statistics	Errored statistics for the logical interface: • **Invalid IPAH next type received**—Number of packets received that use the IP Authentication Header protocol (IPAH) and that do not encapsulate VRRP packets. • **Invalid VRRP ttl value received**—Number of packets received whose IP time- to-live (TTL) value is not 255. • **Invalid VRRP version received**—Number of packets received whose VRRP version is not 2. • **Invalid VRRP pdu type received**—Number of packets received whose VRRP PDU type is not 1. • **Invalid VRRP authentication type received**—Number of packets received whose VRRP authentication is not none, simple, or md5. • **Invalid VRRP IP count received**—Number of packets received whose VRRP IP count exceeds 8. • **Invalid VRRP checksum received**—Number of packets received whose VRRP checksum does not match the calculated one.	**extensive**
Physical interface	Name of the physical interface.	**detail extensive**
Unit	Logical unit number.	All levels
Address	Address of the physical interface.	**brief detail extensive** none
Index	Physical interface index number, which reflects its initialization sequence.	**detail extensive**
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive**

Table 183: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
VRRP-Traps	Status of VRRP traps: **Enabled** or **Disabled**.	**detail extensive**
VRRP-Version	VRRP version: **2** or **3**.	**detail extensive**
Type and Address	Identifier for the address and the address itself: • **lcl**—Configured local interface address. • **mas**—Address of the master virtual router. This address is displayed only when the local interface is acting as a backup router. • **vip**—Configured virtual IP addresses.	**brief** none **summary**
Interface state/Int state/State	State of the physical interface: • **down**—The device is present and the link is unavailable. • **not present**—The interface is configured, but no physical device is present. • **unknown**—The VRRP process has not had time to query the kernel about the state of the interface. • **up**—The device is present and the link is established.	**brief extensive** none **summary**
Group	VRRP group number.	**brief extensive** none **summary**
State	The state of the interface on which VRRP is running: • **backup**—The interface is acting as the backup router interface. • **bringup**—VRRP is just starting and the physical device is not yet present. • **idle**—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established. • **init**—VRRP is initializing. • **master**—The interface is acting as the master router interface. • **master(ISSU)**—The master router interface is going through a unified in-service software upgrade. • **transition**—The interface is changing between being the backup and being the master router.	**extensive**
VRRP Mode	If the interface inherits its state and configuration from the active VRRP group, or if it is part of the active VRRP group. • Active—Part of the active VRRP group • Inherit—Inherits state and configuration from the active VRRP group.	**detail extensive**
Priority	Configured VRRP priority for the interface.	**detail extensive**
Advertisement interval	Configured VRRP advertisement interval.	**detail extensive**
Authentication type	Configured VRRP authentication type: **none**, **simple**, or **md5**.	**detail extensive**

Table 183: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
Advertisement Threshold	A value from 1 through 15, used for setting the time when a peer should be considered down. • The time a peer is considered down is equal to the advertisement-threshold multiplied by the advertisement-interval. • (advertisement-threshold *advertisement-interval) = Peer down.	**detail extensive**
Computed Send Rate	How many protocol data units (PDUs) are generated per second. Based on the number of instances and the advertisement interval.	**detail extensive**
Preempt	Whether preemption is allowed on the interface: **yes** or **no**.	**detail extensive**
Accept-data mode	Whether the interface is configured to accept packets destined for the virtual IP address: **yes** or **no**.	**detail extensive**
VIP count	Number of virtual IP addresses that have been configured on the interface.	**detail extensive**
VIP	List of virtual IP addresses configured on the interface.	**detail extensive**
Advertisement timer	How long, in seconds, until the advertisement timer expires.	**detail extensive**
Master router	IP address of the interface that is acting as the master. If the VRRP interface is down, the output is **N/A**.	**detail extensive**
Virtual router uptime	How long, in seconds, that the virtual router has been up.	**detail extensive**
Master router uptime	How long, in seconds, that the master route has been up.	**detail extensive**
Virtual MAC	MAC address associated with the virtual IP address.	**detail extensive**
Tracking	Whether tracking is **enabled** or **disabled**.	**detail extensive**
Current priority	Current operational priority for being the VRRP master.	**detail extensive**
Configured priority	Configured base priority for being the VRRP master.	**detail extensive**
Priority hold-time	Minimum time interval, in seconds, between successive changes to the current priority. **Disabled** indicates no minimum interval.	**detail extensive**
Remaining-time	(**track** option only) Displays the time remaining in the priority hold-time interval.	detail
Interface tracking	Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.	**detail extensive**
Interface/Tracked interface/Track Int	Name of the tracked interface.	**detail extensive**

Table 183: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
Int state/Interface state/State	Current operational state of the tracked interface: **up** or **down**.	**detail extensive**
Int speed/Speed	Current operational speed, in bits per second, of the tracked interface.	**detail extensive**
Incurred priority cost	Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.	**detail extensive**
Threshold	Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred. An entry of **down** means that the corresponding priority cost is incurred when the interface is down.	**detail extensive**
Route tracking	Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.	**detail extensive**
Route count	The number of routes being tracked.	**detail extensive**
Route	The IP address of the route being tracked.	**detail extensive**
VRF name	The VPN routing and forwarding (VRF) routing instance that the tracked route is in.	**detail extensive**
Route state	The state of the route being tracked: **up**, **down**, or **unknown**.	**detail extensive**
Priority cost	Configured priority cost. This value is incurred when the interface speed drops below the corresponding threshold or when the tracked route goes down.	**detail extensive**
Active	Whether the threshold is active (*). If the threshold is active, the corresponding priority cost is incurred.	**detail extensive**
Group VRRP PDU statistics	Number of VRRP advertisements sent and received by the group.	**extensive**

Table 183: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
Group VRRP PDU error statistics	Errored statistics for the VRRP group: • **Bad authentication type received**—Number of VRRP PDUs received with an invalid authentication type. The received authentication can be **none**, **simple**, or **md5** and must be the same for all routers in the VRRP group. • **Bad password received**—Number of VRRP PDUs received with an invalid key (password). The password for simple authentication must be the same for all routers in the VRRP group • **Bad MD5 digest received**—Number of VRRP PDUs received for which the MD5 digest computed from the VRRP PDU differs from the digest expected by the VRRP instance configured on the router. • **Bad advertisement timer received**—Number of VRRP PDUs received with an advertisement time interval that is inconsistent with the one in use among the routers in the VRRP group. • **Bad VIP count received**—Number of VRRP PDUs whose virtual IP address counts differ from the count that has been configured on the VRRP instance. • **Bad VIPADDR received**—Number of VRRP PDUs whose virtual IP addresses differ from the list of virtual IP addresses configured on the VRRP instance.	**extensive**
Group state transition statistics	State transition statistics for the VRRP group: • **Idle to master transitions**—Number of times that the VRRP instance transitioned from the idle state to the master state. • **Idle to backup transitions**—Number of times that the VRRP instance transitioned from the idle state to the backup state. • **Backup to master transitions**—Number of times that the VRRP instance transitioned from the backup state to the master state. • **Master to backup transitions**—Number of times that the VRRP instance transitioned from the master state to the backup state.	**extensive**
VR state	The state of the VRRP: • **backup**—The interface is acting as the backup router interface. • **bringup**—VRRP is just starting, and the physical device is not yet present. • **idle**—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established. • **init**—VRRP is initializing. • **master**—The interface is acting as the master router interface. • **transition**—The interface is changing between being the backup and being the master router. NOTE: When show vrrp nsr is used on the backup Routing Engine, it displays the current VRRP state on the master Routing Engine, which is the future VRRP state for the backup Routing Engine. Do not use on the master Routing Engine.	**brief** none **summary**

Table 183: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
NSR	VRRP nonstop active routing is enabled for the configured VRRP group: **yes** or **no**. NOTE: A **yes** value means that the new master Routing Engine will immediately start with the VRRP State value from the original master Routing Engine. A **no** value means that the VRRP session will: • Start afresh. • Go through asilent startup period. • Move to a backup state. • Wait for the D Timer to run out before becoming the master (only if the master has not been configured already).	**brief** none
RPD-NSR	The routing options have been set to nonstop active routing: **yes** or **no**.	**brief** none
Timer	VRRP timer information: • **A**—How long, in seconds, until the advertisement timer expires. • **D**—How long, in seconds, until the Master is Down timer expires.	**brief** none

Sample Output

show vrrp

```
user@host> show vrrp

show vrrp nsr

This command is similar to **show vrrp**. Here, the **VR state** column displays the current VRRP state on the master Routing Engine, which is the future VRRP state for the backup Routing Engine. Do not use on the master Routing Engine.

NSR is yes if VRRP nonstop active routing is enabled for the configured VRRP group.

RPD-NSR is yes if the routing options have been set to nonstop active routing.

```

traceroute ethernet

Syntax

traceroute ethernet
local-mep *mep-id*
maintenance-association *ma-name*
maintenance-domain *md-name*
<ttl *value*>
<wait *seconds*>
mac-address* | *mep-id
<detail>

Release Information

Command introduced in Junos OS Release 9.0.
mep-id option introduced in Junos OS Release 9.1.
local-mep option introduced in Junos OS Release 15.1

Description

Triggers the linktrace protocol to trace the route between two maintenance points. The result of the traceroute protocol is stored in the path database. To display the path database, use the **show oam ethernet connectivity-fault-management path-database** command.

Before using the traceroute command, you can verify the remote MEP's MAC address using the **show oam ethernet connectivity-fault-management path-database** command.

Options

local-mep *mep-id*—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

detail—(Optional) Provide detailed information of the responder hostname, ingress port name, egress port name, TTL, and relay action.

mac-address—Destination unicast MAC address of the remote maintenance point.

mep-id—MEP identifier of the remote maintenance point. The range of values is 1 through 8191.

maintenance-association *ma-name*—Specifies an existing maintenance association from the set of configured maintenance associations.

maintenance-domain *md-name*—Specifies an existing maintenance domain from the set of configured maintenance domains.

ttl *value*—Number of hops to use in the linktrace request. The range is 1 to 255 hops. The default is 4.

wait *seconds*—(Optional) Maximum time to wait for a response to the traceroute request. The range is 1 to 255 seconds. The default is 5.

Required Privilege Level

network

List of Sample Output

traceroute ethernet on page 2190

traceroute ethernet detail on page 2190

Output Fields Table 184 on page 2189 lists the output fields for the **traceroute ethernet** command. Output fields are listed in the approximate order in which they appear.

Table 184: traceroute ethernet Output Fields

Field Name	Field Description
Linktrace to	MAC address of the destination maintenance point.
Interface	Local interface used to send the linktrace message (LTM).
Maintenance Domain	Maintenance domain specified in the traceroute command.
Level	Maintenance domain level configured.
Maintenance Association	Maintenance association specified in the traceroute command.
Local Mep	The local maintenance end point identifier.
Transaction Identifier	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all Maintenance Domains. Use the transaction identifier to match an incoming linktrace response (LTR), with a previously sent LTM.
Hop	Sequential hop count of the linktrace path.
TTL	Number of hops remaining in the linktrace message. The time to live (TTL) is decremented at each hop.
Source MAC address	MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.
Next-hop MAC address	MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.
Responder Hostname	The hostname of the responding router. A valid hostname is received only when the responding system is a Juniper Networks router.
Ingress port name	The port name for ingress connections.
Egress port name	The port name for egress connections.

Table 184: traceroute ethernet Output Fields (continued)

Field Name	Field Description
Flags	The configurable flags can include: • H— Hardware only, incoming LT frame has hardware bit set. • T— Terminal MEP, responder is a terminating MEP. • F— FWD yes, LTM frame is relayed further.
Relay Action	The associated relay action. Relay action can be one of the following: • RlyHit— Relay hit; target MAC address matches the MP mac address. • RlyFDB— Relay FDB; output port decided by consulting forwarding database. • RlyMPDB— Relay MIP; output port decided by consulting MIP database.

Sample Output

traceroute ethernet

```
user@host> traceroute ethernet maintenance-domain md1 maintenance-association ma1
00:01:02:03:04:05
 Linktrace to 00:01:02:03:04:05, Interface : ge-5/0/0.0
       Maintenance Domain: MD1, Level: 7
       Maintenance Association: MA1, Local Mep: 1

       Hop     TTL       Source MAC address        Next hop MAC address
       Transaction Identifier:100001
       1       63        00:00:aa:aa:aa:aa         00:00:ab:ab:ab:ab
       2       62        00:00:bb:bb:bb:bb         00:00:bc:bc:bc:bc
       3       61        00:00:cc:cc:cc:cc         00:00:cd:cd:cd:cd
       4       60        00:01:02:03:04:05         00:00:00:00:00:00
```

traceroute ethernet detail

```
user@host> run traceroute ethernet maintenance-domain md6 maintenance-association ma6
mep 101 detail
Linktrace to 00:00:5E:00:53:CC, Interface : ge-1/0/0.1
Maintenance Domain: md6, Level: 6
Maintenance Association: ma6, Local Mep: 201
Transaction Identifier: 2077547465

Legend for RelayAction:
RlyHit  -- Relay hit, Target MAC address matches the MP mac address
RlyFDB  -- Relay FDB, output port decided by consulting FDB database
RlyMPDB -- Relay MIP, output port decided by consulting MIP database

Legend for Flags:
H -- Hardware only,incoming LT frame has hardware bit set
T -- Terminal MEP, responder is a terminating MEP
F -- FWD yes, LTM frame is relayed further
