Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: • **Unknown messages received**—Number of received packets that do not fall into any category. • **Asynchronous updates received**—Number of link status peer changes received. • **Out-of-sequence packets received**—Number of packets for which the sequence of the packets received is different from the expected sequence. • **Keepalive responses timedout**—Number of keepalive responses that timed out when no LMI packet was reported for**n392dte** or **n393dce** intervals. (See **LMI settings**).	**detail extensive** none
Nonmatching DCE-end DLCIs	(Frame Relay, displayed only from the DTE) Number of DLCIs configured from the DCE.	**detail extensive** none
LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—LCP is not configured on the interface. • **Opened**—LCP negotiation is successful.	**detail extensive** none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Chal-received**—Challenge was received but response not yet sent. • **Chap-Chal-sent**—Challenge was sent. • **Chap-Resp-received**—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response was sent for the challenge received. • **Closed**—CHAP authentication is incomplete. • **Failure**—CHAP authentication failed. • **Not-configured**—CHAP is not configured on the interface. • **Success**—CHAP authentication was successful.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
CoS Queues	Number of CoS queues configured.	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Giants**—Number of frames received that are larger than the giant threshold. • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then either the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **MTU errors**—Number of packets larger than the MTU threshold. • **Resource errors**—Sum of transmit drops.	**extensive**
DS1 alarms **DS1 defects**	E1 media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. The following lists all possible alarms and defects. For complete explanations of most of these alarms and defects, see *Bellcore Telcordia GR-499-CORE*. • **LOS**—Loss of signal. • **LOF**—Loss of frame. • **AIS**—Alarm indication signal. • **YLW**—Yellow alarm. Indicates errors at the remote site receiver.	**detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
E1 media	Active alarms and defects, plus counts of specific E1 errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than OK indicates a problem. The E1 media-specific error types can be: • **SEF**—Severely errored framing • **BEE**—Bit error • **AIS**—Alarm indication signal • **LOF**—Loss of frame • **LOS**—Loss of signal • **YELLOW**—Errors at the remote site receiver • **BPV**—Bipolar violation • **EXZ**—Excessive zeros • **LCV**—Line code violation • **PCV**—Pulse code violation • **CS**—Carrier state • **FEBE**—Far-end block error • **LES**—Line error seconds • **ES**—Errored seconds • **BES**—Bursty errored seconds • **SES**—Severely errored seconds • **SEFS**—Severely errored framing seconds • **UAS**—Unavailable seconds	**extensive**
HDLC configuration	Information about the HDLC configuration. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware. • **Timeslots**—Configured time slots for the interface. • **Line encodingHDB3**—Line encoding used.	**extensive**
Interface transmit queues	Names of the transmit queues and their associated statistics for each DS0 channel on the Channelized E1 to DS0 PIC. • **B/W**—Queue bandwidth as a percentage of the total interface bandwidth. • **WRR**—Weighted round robin (in percent). • **Packets**—Number of packets transmitted. • **Bytes**—Number of bytes transmitted. • **Drops**—Number of packets dropped. • **Errors**—Number of packet errors.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DS*x* BERT configuration	BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface. • **BERT time period**—Configured total time period that the BERT is to run. • **Elapsed**—Actual time elapsed since the start of the BERT (in seconds). • **Induced error rate**—Configured rate at which the bit errors are induced in the BERT pattern. • **Algorithm**—Type of algorithm selected for the BERT.	**detail extensive** none
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.	**extensive**
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Input packets	Number of packets received on the logical interface.	None specified

Copyright © 2018, Juniper Networks, Inc.

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	Number and rate of bytes and packets received and transmitted on the logical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Local statistics	(Frame Relay) Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than one second) for this counter to stabilize.	**detail extensive**
Transit statistics	(Frame Relay) Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, **mpls**.	**detail extensive** none
Multilink bundle	(Multilink) Interface name for the multilink bundle, if configured.	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: **Flags**, **Total down time**, **Last down**, and **Traffic statistics**. **Flags** is one or more of the following: • **Active**—Set when the link is active and the DTE and DCE are exchanging information. • **Down**—Set when link is active, but no information is received from the DCE. • **Unconfigured**—Set when the corresponding DLCI in the DCE is not configured. • **Configured**—Set when the corresponding DLCI in the DCE is configured. • **Dce-configured**—Displayed when the command is issued from the DTE.	**detail extensive** none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. • **Active DLCI**—Number of active DLCIs. • **Inactive DLCI**—Number of inactive DLCIs.	**detail extensive** none

show interfaces (Channelized OC12 IQ and IQE)

Syntax

show interfaces (*type-fpc/pic/port*<:*channel*><:*channel*><:*channel*>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified channelized OC12 IQ and IQE interface.

Options

type-fpc/pic/port*:*channel*:*channel*:*channel—Interface type with optional corresponding channel levels.

For SONET mode, the interface type can be one of the following:

- ***type-fpc/pic/port***—For the physical channelized OC12 IQ or IQE interface, ***type*** is **coc12**. For the clear channel, ***type*** is **so** (for OC12).
- ***type-fpc/pic/port*:*channel***—At the first level of channelization, ***type*** can be **coc1**(channelized OC1), **ct3** (from **coc1)**, **so** (for OC3), or **t3.**
- ***type-fpc/pic/port*:*channel*:*channel***—At the second level of channelization, ***type*** can be **ct1** (from **ct3**or **coc1)** or **t1** (from **ct3** or **coc1)**.
- ***type-fpc/pic/port*:*channel*:*channel*:*channel***—At the third level of channelization, ***type*** is **ds** (from **ct1**).

For SDH mode, the interface type can be one of the following:

- ***type-fpc/pic/port***—For the physical channelized OC12 IQ or IQE interface, ***type*** is **cstm4**. For the clear channel, ***type*** is **so** (for SONET/SDH (vc-4-4c)).
- ***type-fpc/pic/port*:*channel***—At the first level of channelization,***type*** can be **so** (from **cstm4)** or **cau4** (from **cstm4)**.
- ***type-fpc/pic/port*:*channel*:*channel***—At the second level of channelization, ***type*** can be **ct3**or **t3** (from or **cau4)**.
- ***type-fpc/pic/port*:*channel*:*channel*:*channel***—At the third level of channelization, ***type*** is **ct1** or **t1** (from **ct3**).
- ***type-fpc/pic/port*:*channel*:*channel*:*channel***—At the fourth level of channelization, ***type*** is **ds** (from **ct1**).

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

Copyright © 2018, Juniper Networks, Inc.

snmp-index ***snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level view

show interfaces (Channelized OC12)

Syntax

show interfaces t3-*fpc/pic/port*:*t3channel*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified channelized OC12 interface.

Options

t3-*fpc/pic/port*:*t3channel*—Display standard information about the specified channelized OC12 interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

List of Sample Output

show interfaces extensive (Channelized OC12) on page 1266

Output Fields

See the output field table for the show interfaces (Channelized OC3 IQ and IQE) command.

Sample Output

show interfaces extensive (Channelized OC12)

```
user@host> show interfaces t3-0/3/0:0 extensive
Physical interface: t3-0/3/0:0, Enabled, Physical link is Up
  Interface index: 32, SNMP ifIndex: 21, Generation: 2719
  Link-level type: Frame-Relay, PPP, MTU: 4474, Clocking: Internal, SONET mode,
  Speed: T3, Loopback: None, SONET Loopback: None, FCS: 16, Mode: C/Bit parity
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link flags     : Keepalives DTE
  ANSI LMI settings: n391dte 6, n392dte 3, n393dte 4, t391dte 10 seconds
  LMI: Input: 51700 (00:00:02 ago), Output: 51701 (00:00:02 ago)
  DTE statistics:
    Enquiries sent                    : 43186
    Full enquiries sent               : 8515

show interfaces (Channelized OC3 IQ and IQE)

Syntax

show interfaces (*type-fpc/pic/port* <:*channel*><:*channel*><:*channel*>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized OC3 IQ or IQE interface.

Options

type-fpc/pic/port*:*channel*:*channel*:*channel—Interface type with optional corresponding channel levels. The interface type can be one of the following:

- ***type-fpc/pic/port***—For the physical interface, ***type*** is **coc3**. For the clear channel, ***type*** is **so** (for OC3)**.**
- ***type-fpc/pic/port*:*channel***—At the first level of channelization, ***type*** can be **coc1** (channelized OC1), **ct3** (from **coc1)**, or **t3** (from **coc1**).
- ***type-fpc/pic/port*:*channel*:*channel***—At the second level of channelization, ***type*** can be **ct1** (from **coc1** or **ct3)** or **t1** (from **coc1** or **ct3)**.
- ***type-fpc/pic/port*:*channel*:*channel*:*channel***—At the third level of channelization, ***type*** can be **ds** (from **ct1**).

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

view

Output Fields Table 62 on page 1271 lists the output fields for the **show interfaces** (all Channelized OC interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 62: Channelized OC show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Description	Interface description.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	SONET/SDH reference clock source. It can be **Internal** or **External**. Clocking is configured and displayed only for channel 0.	All levels
***Framing* mode**	Framing mode: **SONET** or **SDH**.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (**local** or **remote**).	All levels
SONET loopback	Whether loopback is enabled on a SONET/SDH interface, and the type of loopback (**local** or **remote**).	All levels
FCS	Frame check sequence on the interface (either **16** or **32**). The default is **16-bit**.	All levels
Payload scrambler	Whether payload scrambling is enabled.	All levels
Parent	Name and interface index of the interface to which a particular child interface belongs. **None** indicates that this interface is the top level.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
ANSI or ITU LMI settings	(Frame Relay) Settings for Local Management Interface (LMI). The format is **(ANSI or ITU) LMI settings:** ***value***, ***value***... ***nn*** seconds, where ***value*** can be: • **n391dte**—DTE full status polling interval (1–255) • **n392dce**—DCE error threshold (1–10) • **n392dte**—DTE error threshold (1–10) • **n393dce**—DCE monitored event count (1–10) • **n393dte**—DTE monitored event count (1–10) • **t391dte**—DTE polling timer (5–30 seconds) • **t392dce**—DCE polling verification timer (5–30 seconds)	All levels
LMI statistics	(Frame Relay) Statistics about the link management. • **Input**—Number of packets coming in on the interface (*nn*) and how much time has passed since the last packet arrived. The format is **Input:** ***nn*** **(last sent** ***hh:mm:ss*** **ago)**. • **Output**—Number of packets sent out on the interface (*nn*) and how much time has passed since the last packet was sent. The format is **Output:** ***nn*** **(last sent** ***hh:mm:ss*** **ago)**.	**detail extensive**
DTE statistics	(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data circuit-terminating equipment (DCE): • **Enquiries sent**—Number of link status enquiries sent from the DTE to the DCE. • **Full enquiries sent**—Number of full enquiries sent from the DTE to the DCE. • **Enquiry responses received**—Number of enquiry responses received by the DTE from the DCE. • **Full enquiry responses received**—Number of full enquiry responses sent from the DTE to the DCE.	**detail extensive** none
DCE statistics	(Frame Relay) Statistics about messages transmitted from the DCE to the DTE: • **Enquiries received**—Number of enquiries received by the DCE from the DTE. • **Full enquiries received**—Number of full enquiries received by the DCE from the DTE. • **Enquiry responses sent**—Number of enquiry responses sent from the DCE to the DTE. • **Full enquiry responses sent**—Number of full enquiry responses sent from the DCE to the DTE.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: • **Unknown messages received**—Number of received packets that do not fall into any category. • **Asynchronous updates received**—Number of link status peer changes received. • **Out-of-sequence packets received**—Number of packets for which the sequence of the packets received is different from the expected sequence. • **Keepalive responses timedout**—Number of keepalive responses that timed out when no LMI packet was reported for **n392dte** or **n393dce** intervals. (See **LMI settings**.)	**detail extensive** none
Nonmatching DCE-end DLCIs	(Frame Relay) Number of DLCIs configured from the DCE, displayed only from the DTE.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hh:mm:ss timezone year-month-day*** **(*hh:mm:ss* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
CoS Queues	Number of CoS queues configured.	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
DS1 alarms **DS1 defects**	E1or T1 media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. See the following list for all possible alarms and defects. For complete explanations of most of these alarms and defects, see *Bellcore Telcordia GR-499-CORE*. • **LOS**—Loss of signal. • **LOF**—Loss of frame. • **AIS**—Alarm indication signal. • **YLW**—Yellow alarm. Indicates errors at the remote site receiver.	**detail extensive** none

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
T1 media	Counts of T1 or E1 media-specific errors. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. The T1 or E1 media-specific error types are: • **SEF**—Severely errored framing • **BEE**—Bit error • **AIS**—Alarm indication signal • **LOF**—Loss of frame • **LOS**—Loss of signal • **YELLOW**—Errors at the remote site receiver • **BPV**—Bipolar violation • **EXZ**—Excessive zeros • **LCV**—Line code violation • **PCV**—Pulse code violation • **CS**—Carrier state • **FEBE**—Far-end block error (E1 only) • **LES**—Line error seconds • **ES**—Errored seconds • **BES**—Bit error seconds • **SES**—Severely errored seconds • **SEFS**—Severely errored framing seconds • **UAS**—Unavailable seconds	**extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Bucket Drops**—Drops caused by traffic load exceeding the interface transmit/receive leaky bucket configuration. The default is off. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **SRAM errors**—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value of this field increments, the PIC is malfunctioning. • **HS link FIFO overflows**—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions** —Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **HS link FIFO underflows**—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeds the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface.	**detail extensive**
Queue counters	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
Active alarms **Active defects**	Defects that can prevent the interface from passing packets: • **None**—There are no active defects or alarms. • **LOF**—Loss of frame.	**detail extensive**
SONET alarms **SONET defects**	Media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: **SONET PHY**, **SONET section**, **SONET line**, and **SONET path**.	All levels

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SONET vt	SONET virtual-tributary (VT) alarms and defects: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-V**—Remote error indication (near-end VT) • **LOP-V**—Loss of pointer (near-end VT) • **AIS-V**—Alarm indication signal (near-end VT) • **RDI-V**—Remote defect indication (near-end VT) • **UNEQ-V**—Unequipped (near-end VT) • **PLM-V**—Payload label mismatch (near-end VT) • **ES-V**—Errored seconds (near-end VT) • **SES-V**—Severely errored seconds (near-end VT) • **UAS-V**—Unavailable seconds (near-end VT) • **ES-VFE**—Errored seconds (far-end VT) • **SES-VFE**—Severely errored seconds (far-end VT) • **UAS-VFE**—Unavailable seconds (far-end VT)	**extensive**
SONET PHY	Counts of specific SONET errors with detailed information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **PLL Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**
SONET section	Counts of specific SONET errors with detailed information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOS**—Loss of signal • **LOL**—Loss of light • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • **SES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)	**extensive**

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SONET line	Active alarms and defects, plus counts of specific SONET errors with detailed information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State** —State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)	**extensive**
SONET path	Active alarms and defects, plus counts of specific SONET errors with detailed information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B3**—Bit interleaved parity for SONET section overhead • **REI-P**—Remote error indication • **LOP-P**—Loss of pointer (path) • **AIS-P**—Path alarm indication signal • **RDI-P**—Path remote defect indication • **UNEQ-P**—Path unequipped • **PLM-P**—Path payload (signal) label mismatch • **ES-P**—Errored seconds (near-end STS path) • **SES-P**—Severely errored seconds (near-end STS path) • **UAS-P**—Unavailable seconds (near-end STS path) • **ES-PFE**—Errored seconds (far-end STS path) • **SES-PFE**—Severely errored seconds (far-end STS path) • **UAS-PFE**—Unavailable seconds (far-end STS path)	**extensive**

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Received SONET overhead **Transmitted SONET overhead**	Values of the received and transmitted SONET/SDH overhead: **F1**—Section user channel byte. This byte is set aside for the purposes of users. **S1**—Synchronization Status (S1). The S1 byte is located in the first STS-1 of an STS-*N*. Bits 5 through 8 convey the synchronization status of the network element. **Z3** and **Z4**—Path overhead. **V5**—Virtual Tributary (VT) path overhead byte.	**extensive**
SDH alarms **SDH defects**	SDH media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: SDH PHY, SDH regenerator section, SDH multiplex section, and SDH path. NOTE: For controller based SONET PICs, the SDH alarms and SDH defects output in the **show interface coc3 extensive** command output only shows the section and line level defects. The path level defects can be found under the SONET (so) interface output.	All levels
SDH PHY	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **PLL Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**
SDH regenerator section	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **RS-BIP8**—24-bit BIP for multiplex section overhead (B2 bytes) • **OOF**—Out of frame • **LOS**—Loss of signal • **LOF**—Loss of frame • **RS-ES**—Errored seconds (near-end regenerator section) • **RS-SES**—Severely errored seconds (near-end regenerator section) • **RS-SEFS**—Severely errored framing seconds (regenerator section)	**extensive**

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH multiplex section	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **MS-BIP24**—8-bit BIP for high-order path overhead (B3 byte) • **MS-FEBE**—Far-end block error (multiplex section) • **MS-FERF**—Far-end remote fail (multiplex section) • **MS-AIS**—alarm indication signal (multiplex section) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **MS-ES**—Errored seconds (near-end multiplex section) • **MS-SES**—Severely errored seconds (near-end multiplex section) • **MS-UAS**—Unavailable seconds (near-end multiplex section) • **MS-ES-FE**—Errored seconds (far-end multiplex section) • **MS-SES-FE**—Severely errored seconds (far-end multiplex section) • **MS-UAS-FE**—Unavailable seconds (far-end multiplex section	**extensive**
SDH path	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **HP-BIP8**—8-bit BIP for regenerator section overhead (B1 byte) • **HP-FEBE**—Far-end block error (high-order path) • **HP-LOP**—Loss of pointer (high-order path) • **HP-AIS**—High-order-path alarm indication signal • **HP-FERF**—Far-end remote fail (high-order path) • **HP-UNEQ**—Unequipped (high-order path) • **HP-PLM**—Payload label mismatch (high-order path) • **HP-ES**—Errored seconds (near-end high-order path) • **HP-SES**—Severely errored seconds (near-end high-order path) • **HP-UAS**—Unavailable seconds (near-end high-order path) • **HP-ES-FE**—Errored seconds (far-end high-order path) • **HP-SES-FE**—Severely errored seconds (far-end high-order path) • **HP-UAS-FE**—Unavailable seconds (far-end high-order path)	**extensive**

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Received SDH overhead **Transmitted SDH overhead**	Values of the received and transmitted SONET overhead: • **C2**—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • **F1**—Section user channel byte. This byte is set aside for the purposes of users. • **K1** and **K2**—These bytes are allocated for APS signaling for the protection of the multiplex section. • **J0**—Section trace. This byte is defined for STS-1 number 1of an STS-*N* signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • **S1**—Synchronization status. The S1 byte is located in the first STS-1 of an STS-*N*. • **Z3** and **Z4**—Allocated for future use.	**extensive**
Received path trace **Transmitted path trace**	Channelized OC12 interfaces allow path trace bytes to be sent inband across the SONET/SDH link. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits. This information is specific to each of the 12 channelized OC12 interfaces.	**extensive**
DS3 media	Counts of T3 media-specific errors. For detailed definitions of the T3 (DS-3) error events (BPV, EXZ, LCV, PCV, and CCV) and performance parameters (LES, PES, PSES, CES, CSES, SEFS, and UAS), see RFC 2496. The DS3 or E3 media-specific error types can be: • **PLL Lock**—Phase-locked loop out of lock • **Reframing**—Frame alignment recovery time • **AIS**—Alarm indication signal • **LOF**—Loss of frame • **LOS**—Loss of signal • **IDLE**—Idle code detected • **YELLOW**—Errors at the remote site receiver • **BPV**—Bipolar violation • **EXZ**—Excessive zeros • **LCV**—Line code violation • **PCV**—(DS3 only) Pulse code violation • **CCV**—(DS3 only) C-bit coding violation • **FEBE**—(DS3 only) Far-end block error • **LES**—Line error seconds • **PES**—(DS3 only) P-bit errored seconds • **PSES**—(DS3 only) P-bit errored seconds (section) • **CES**—(DS3 only) C-bit errored seconds • **CSES**—(DS3 only) C-bit severely errored seconds • **SEFS**—Severely errored framing seconds • **UAS**—Unavailable seconds	**extensive**

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
HDLC configuration	Information about the HDLC configuration. • **Policing bucket**—Configured state of the receiving policer. • **Shaping bucket**—Configured state of the transmitting shaper. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware. • **Timeslots**—Configured time slots for the interface. • **Line encoding**—Line encoding used. It is always **HDB3**. • **Byte encoding**—(T1 only) Byte encoding used: **Nx64K** or **Nx56K**. • **Line encoding**—Line encoding used. For T1, the value can be **B8ZS** or **AMI**. For E1, the value is **HDB3**. • **Data inversion**—HDLC data inversion setting: **Enabled** or **Disabled**. • **Idle cycle flag**—Idle cycle flags. • **Start end flag**—Start and end flag.	**extensive**
Interface transmit queues	Name of the transmit queues and their associated statistics for each DS3 channel on the Channelized OC12 PIC. • **B/W**—Queue bandwidth as a percentage of the total interface bandwidth. • **WRR**—Weighted round-robin (in percent). • **Packets**—Number of packets transmitted. • **Bytes**—Number of bytes transmitted. • **Drops**—Number of packets dropped. • **Errors**—Number of packet errors.	**extensive**
DSU configuration	Information about the DSU configuration. The last three lines (**Bit count**, **Error bit count**, and **LOS information**) are displayed only if a BERT has ever been run on the interface. • **Compatibility mode**—CSU/DSU compatibility mode: **None**, **Larscom**, **Kentrox**, or **Digital-Link**. • **Scrambling**—Payload scrambling. It can be **Enabled** or **Disabled**. • **Subrate**—Configured subrate setting. Applies only when**Digital-Link** compatibility mode is used. It can be **Disabled** or display units in kbps. • **FEAC loopback**—(T3) Whether a far-end alarm and control (FEAC) loopback is **Active** or **Inactive**. This feature is used to send alarm or status information from the far-end terminal back to the near-end terminal and to initiate T3 loopbacks at the far-end terminal from the near-end terminal. • **Response**—Whether the FEAC signal is **Enabled** or **Disabled**. • **Count**—Number of FEAC loopbacks.	**extensive**
BERT configuration	(DS interfaces) BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface. • **BERT time period**—Configured total time period that the BERT is to run. • **Elapsed**—Actual time elapsed since the start of the BERT (in seconds). • **Induced error rate**—Configured rate at which the bit errors are induced in the BERT pattern. • **Algorithm**—Type of algorithm selected for the BERT.	**detail extensive** none

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.	**extensive**
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. • **Input rate**—Rate of bits and packets received on the interface. • **Output rate**—Rate of bits and packets transmitted on the interface.	**detail extensive**
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, or **mpls**.	**detail extensive** none
Multilink bundle	(If the logical interface is configured as part of a multilink bundle.) Interface name for the multilink bundle.	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: **Flags**, **Total down time**, **Last down**, and **Traffic statistics**. **Flags** is one or more of the following: • **Active**—Set when the link is active and the DTE and DCE are exchanging information. • **Down**—Set when the link is active, but no information is received from the DCE. • **Unconfigured**—Set when the corresponding DLCI in the DCE is not configured. • **Configured**—Set when the corresponding DLCI in the DCE is configured. • **Dce-configured**—Displayed when the command is issued from the DTE.	**detail extensive** none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. • **Active DLCI**—Number of active DLCIs. • **Inactive DLCI**—Number of inactive DLCIs.	**detail extensive** none

show interfaces (Channelized STM1 IQ)

Syntax

show interfaces (*type-fpc/pic /port* <:*channel*><:*channel*>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized STM1 IQ interface.

Options

type-fpc/pic/port*:*channel*:*channel—Interface type with optional corresponding channel levels. The interface type can be one of the following types:

- ***type-fpc/pic/port*:*channel***—For the physical channelized STM1 IQ interface, ***type*** is **cstm1.** For the clear channel, ***type*** is **so**. For channelization, the STM1 IQ interface must be converted to interface type **cau4**.
- ***type-fpc/pic/port*:*channel***—At the first level of channelization, ***type*** can be **ce1** or **e1 (** clear channel or fractional channel from **cau4)**.
- ***type-fpc/pic/port*:*channel*:*channel***—At the second level of channelization, ***type*** is **ds** (from **ce1**).

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

show interfaces (Channelized STM1)

Syntax

show interfaces e1-*fpc/pic/port*:*e1channel*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized STM1 interface.

Options

e1-*fpc/pic/port*:*e1channel*—Display standard status information about the specified channelized STM1 interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

List of Sample Output

show interfaces extensive (Channelized STM1, SDH) on page 1303

Output Fields

Table 63 on page 1292 lists the output fields for the **show interfaces** (all Channelized STM1 interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 63: Channelized STM1 show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be **Internal** or **External**.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (**local** or **remote**).	All levels
FCS	Frame check sequence on the interface (either **16** or **32**). The default is **16** bits.	All levels
Framing	Physical layer framing format used on the link. It can be **G704**, **G704-NO-CRC4**, or **Unframed**. The default is **G704**.	All levels
Parent	(Channelized STM1 IQ interfaces only) Name and interface index of the interface to which a particular child interface belongs. **None** indicates that this interface is the top level.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. • **interval***seconds*—The time in seconds between successive keepalive requests. The range is **10** seconds through **32,767** seconds, with a default of **10** seconds. • **down-count** *number*—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is**1** through **255**, with a default of **3**. • **up-count** *number*—The number of keepalive packets a destination must receive to change a link’s status from down to up. The range is **1** through **255**, with a default of **1**.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output

Keepalive statistics	(PPP and HDLC) Information about keepalive packets.
	• **Input**—Number of keepalive packets received by PPP.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was received, in the format*hh:mm:ss*.
	• **Output**—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was sent, in the format *hh:mm:ss*.
		detail extensive none

ANSI LMI settingsor **ITU LMI settings**	(Frame Relay) Local Management Interface settings. The format is **(ANSI or ITU) LMI settings:** ***value*****,** ***value*****...** ***xx*** seconds, where ***value*** can be: • **n391dte**—DTE full status polling interval (1- 255) • **n392dce**—DCE error threshold (1-10) • **n392dte**—DTE error threshold (1-10) • **n393dce**—DCE monitored event count (1-10) • **n393dte**—DTE monitored event count (1-10) • **t391dte**—DTE polling timer (5-30 seconds) • **t392dce**—DCE polling verification timer (5-30 seconds)	**detail extensive** none
LMI	(Frame Relay) Statistics about the link management. • **Input**—Number of packets coming in on the interface (*nn*) and how much time has passed since the last packet arrived. The format is **Input:** ***nn*** **(last seen** ***hh*****:*****mm*****:*****ss*** **ago)**. • **Output**—Number of packets sent out on the interface (*nn*) and how much time has passed since the last packet was sent. The format is **Output:** ***nn*** **(last seen** ***hh*****:*****mm*****:*****ss*** **ago)**.	**detail extensive** none
DTE statistics	(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data circuit-terminating equipment (DCE): • **Enquiries sent**—Number of link status enquiries sent from the DTE to the DCE. • **Full enquiries sent**—Number of full enquiries sent from the DTE to the DCE. • **Enquiry responses received**—Number of enquiry responses received by the DTE from the DCE. • **Full enquiry responses received**—Number of full enquiry responses sent from the DTE to the DCE.	**detail extensive** none
DCE statistics	(Frame Relay) Statistics about messages transmitted from the DCE to the DTE: • **Enquiries received**—Number of enquiries received by the DCE from the DTE. • **Full enquiries received**—Number of full enquiries received by the DCE from the DTE. • **Enquiry responses sent**—Number of enquiry responses sent from the DCE to the DTE. • **Full enquiry responses sent**—Number of full enquiry responses sent from the DCE to the DTE.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: • **Unknown messages received**—Number of received packets that do not fall into any category. • **Asynchronous updates received**—Number of link status peer changes received. • **Out-of-sequence packets received**—Number of packets for which the sequence of the packets received is different from the expected sequence. • **Keepalive responses timedout**—Number of keepalive responses that timed out when no LMI packet was reported for **n392dte** or **n393dce** intervals. (See **LMI settings**.)	**detail extensive** none
Nonmatching DCE-end DLCIs	(Frame Relay, displayed only from the DTE) Number of DLCIs configured from the DCE.	**detail extensive** none
LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgment was received. • **Conf-ack-sent**—Acknowledgment was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—LCP is not configured on the interface. • **Opened**—LCP negotiation is successful.	**detail extensive** none
NCP state	(PPP) Network Control Protocol state. • **Conf-ack-received**—Acknowledgment was received. • **Conf-ack-sent**—Acknowledgment was sent. • **Conf-req-sent**—Request was sent. • **Down**—NCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—NCP is not configured on the interface. • **Opened**—NCP negotiation is successful.	**detail extensive** none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Chal-received**—Challenge was received but response not yet sent. • **Chap-Chal-sent**—Challenge was sent. • **Chap-Resp-received**—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response was sent for the challenge received. • **Closed**—CHAP authentication is incomplete. • **Failure**—CHAP authentication failed. • **Not-configured**—CHAP is not configured on the interface. • **Success**—CHAP authentication was successful.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **SRAM errors**—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value of this field increments, the PIC is malfunctioning.	**extensive**

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.	**extensive**
DS1 alarms **DS1 defects**	E1 media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. The following lists all possible alarms and defects. For complete explanations of most of these alarms and defects, see *Bellcore Telcordia GR-499-CORE*. • **LOS**—Loss of signal. • **LOF**—Loss of frame. • **AIS**—Alarm indication signal. • **YLW**—Yellow alarm. Indicates errors at the remote site receiver.	**detail extensive** none
SDH alarms **SDH defects**	SDH media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: SDH PHY, SDH regenerator section, SDH multiplex section, and SDH path. NOTE: For controller-based SONET PICs, the SDH alarms and SDH defects output in the **show interface cstm1 extensive** command output only shows the section and line level defects. The path level defects can be found under the SONET (so) interface output.	All levels

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
E1 media	Active alarms and defects, plus counts of specific E1 errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Error types can be: • **AIS**—Alarm indication signal • **BEE**—Bit error • **BES**—Bit error seconds • **BPV**—Bipolar violation • **CS**—Carrier state • **ES**—Errored seconds • **EXZ**—Excessive zeros • **FEBE**—Far-end block error • **LCV**—Line code violation • **LES**—Line error seconds • **LOF**—Loss of frame • **LOS**—Loss of signal • **PCV**—Pulse code violation • **SEF**—Severely errored framing • **SEFS-S**—Severely errored framing seconds (section) • **SES**—Severely errored seconds • **UAS**—Unavailable seconds • **YELLOW**—Errors at the remote site receiver	**extensive**
Interface transmit queues	Names of the transmit queues and their associated statistics for each E1 channel on the Channelized STM1-to-E1 PIC. • **B/W**—Queue bandwidth as a percentage of the total interface bandwidth. • **WRR**—Weighted round-robin (in percent). • **Packets**—Number of packets transmitted. • **Bytes**—Number of bytes transmitted. • **Drops**—Number of packets dropped. • **Errors**—Number of packet errors.	**extensive**
HDLC configuration	Information about the HDLC configuration. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware. • **Timeslots**—Configured time slots for the interface. • **Line encoding**—Line encoding used. It is always **HDB3**.	**extensive**

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DS1 BERT configuration	BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface. • **BERT time period**—Configured total time period that the BERT is to run. • **Elapsed**—Actual time elapsed since the start of the BERT (in seconds). • **Induced error rate**—Configured rate at which the bit errors are induced in the BERT pattern. • **Algorithm**—Type of algorithm selected for the BERT.	**detail extensive** none
SDH PHY	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **PLL Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**
SDH regenerator section	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **RS-BIP8**—24-bit BIP for multiplex section overhead (B2 bytes) • **OOF**—Out of frame • **LOS**—Loss of signal • **LOF**—Loss of frame • **RS-ES**—Errored seconds (near-end regenerator section) • **RS-SES**—Severely errored seconds (near-end regenerator section) • **RS-SEFS**—Severely errored framing seconds (regenerator section)	**extensive**

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH multiplex section	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **MS-BIP24**—8-bit BIP for high-order path overhead (B3 byte) • **MS-FEBE**—Far-end block error (multiplex section) • **MS-FERF**—Far-end remote fail (multiplex section) • **MS-AIS**—alarm indication signal (multiplex section) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **MS-ES**—Errored seconds (near-end multiplex section) • **MS-SES**—Severely errored seconds (near-end multiplex section) • **MS-UAS**—Unavailable seconds (near-end multiplex section) • **MS-ES-FE**—Errored seconds (far-end multiplex section) • **MS-SES-FE**—Severely errored seconds (far-end multiplex section) • **MS-UAS-FE**—Unavailable seconds (far-end multiplex section)	**extensive**
SDH path	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **HP-BIP8**—8-bit BIP for regenerator section overhead (B1 byte) • **HP-FEBE**—Far-end block error (high-order path) • **HP-LOP**—Loss of pointer (high-order path) • **HP-AIS**—High-order-path alarm indication signal • **HP-FERF**—Far-end remote fail (high-order path) • **HP-UNEQ**—Unequipped (high-order path) • **HP-PLM**—Payload label mismatch (high-order path) • **HP-ES**—Errored seconds (near-end high-order path) • **HP-SES**—Severely errored seconds (near-end high-order path) • **HP-UAS**—Unavailable seconds (near-end high-order path) • **HP-ES-FE**—Errored seconds (far-end high-order path) • **HP-SES-FE**—Severely errored seconds (far-end high-order path) • **HP-UAS-FE**—Unavailable seconds (far-end high-order path)	**extensive**

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH tu	Active alarms and defects, plus counts of specific SDH tributary unit (TU) errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **TU-BIP-2**—Bit interleaved parity for SONET line overhead • **TU-FEBE**—(near-end TU) • **TU-LOP**—Loss of pointer (near-end TU) • **TU-AIS**—Alarm indication signal (near-end TU) • **TU-FERF**—(near-end TU) • **TU-UNEQ**—Unequipped (near-end TU) • **TU-PLM**—Payload label mismatch (near-end TU) • **TU-ES**—Errored seconds (near-end TU) • **TU-SES**—Severely errored seconds (near-end TU) • **TU-UAS**—Unavailable seconds (near-end TU) • **TU-ES-FE**—Errored seconds (far-end TU) • **TU-SES-FE**—Severely errored seconds (far-end TU) • **TU-UAS-FE**—Unavailable seconds (far-end TU)	**extensive**
Received SDH overhead **Transmitted SDH overhead**	Values of the received and transmitted SONET overhead: • **C2**—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • **F1**—Section user channel byte. This byte is set aside for the purposes of users. • **K1** and **K2**—These bytes are allocated for APS signaling for the protection of the multiplex section. • **J0**—Section trace. This byte is defined for STS-1 number 1 of an STS-*N* signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • **S1**—Synchronization status. The S1 byte is located in the first STS-1 of an STS-*N* signal. • **Z3** and **Z4**—Allocated for future use.	**extensive**
Received path trace **Transmitted path trace**	Channelized OC12 interfaces allow path trace bytes to be sent inband across the SONET/SDH link. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits. This information is specific to each of the 12 channelized OC12 interfaces.	**extensive**
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.	**extensive**

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, or **mpls**.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: **Flags**, **Total down time**, **Last down**, and **Traffic statistics**. **Flags** is one or more of the following: • **Active**—Set when the link is active and the DTE and DCE are exchanging information. • **Down**—Set when the link is active, but no information is received from the DCE. • **Unconfigured**—Set when the corresponding DLCI in the DCE is not configured. • **Configured**—Set when the corresponding DLCI in the DCE is configured. • **Dce-configured**—Displayed when the command is issued from the DTE.	**detail extensive** none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. • **Active DLCI**—Number of active DLCIs. • **Inactive DLCI**—Number of inactive DLCIs.	**detail extensive** none

Sample Output

show interfaces extensive (Channelized STM1, SDH)

show interfaces (Channelized T1 IQ)

Syntax

show interfaces (ct1-*fpc/pic/port* | *type-fpc/pic/port*<:*channel*><:*channel*>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced in Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized T1 IQ interface.

Options

type-fpc/pic/port*:*channel—Interface type. With optional corresponding channel levels, the interface type can be one of the following:

- ***type-fpc/pic/port***—For the physical channelized T1 IQ interface, ***type*** is **ct1.**
- ***type-fpc/pic/port*:*channel***—For the clear channel, ***type*** is **t1**. At the first level of channelization, ***type*** can be **ct1** or **t1.**
- ***type-fpc/pic/port*:*channel*:*channel***—At the second level of channelization, ***type*** can be **ds**.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

view

List of Sample Output

show interfaces extensive (CT1) on page 1315
show interfaces extensive (T1) on page 1316
show interfaces extensive (DS0) on page 1317

Output Fields

Table 64 on page 1308 lists the output fields for the **show interfaces** (Channelized T1 IQ and T3 IQ interfaces) command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be **Internal** or **External**.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (**local** or **remote**).	All levels
FCS	Frame check sequence on the interface (either **16** or **32**). The default is **16** bits.	All levels
Framing	Physical layer framing format used on the link. It can be **ESF** or **SF**. The default is **ESF**.	All levels
Parent	Name and interface index of the interface to which a particular child interface belongs. **None** indicates that this interface is the top level.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Keepalive settings	Configured settings for keepalives. • **interval** ***seconds***—The time in seconds between successive keepalive requests. The range is **10** seconds through **32,767** seconds, with a default of **10** seconds. • **down-count** ***number***—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is **1** through **255**, with a default of **3**. • **up-count** ***number***—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is **1** through **255**, with a default of **1**.	**detail extensive** none

Keepalive statistics	Information about keepalive packets.
	• **Input**—Number of keepalive packets received by PPP.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was received, in the format ***hh:mm:ss***.
	• **Output**—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was sent, in the format ***hh:mm:ss***.
		detail extensive none

LMI settings	(Frame Relay) Settings for Local Management Interface (LMI) can be either **ANSI LMI settings** or **ITU LMI settings**. ANSI LMI settings is the default. The format is **(ANSI or ITU) LMI settings:** ***value*****,** ***value...*** ***xx seconds***, where ***value*** can be: • **n391dte**—DTE full status polling interval (1–255) • **n392dce**—DCE error threshold (1–10) • **n392dte**—DTE error threshold (1–10) • **n393dce**—DCE monitored event count (1–10) • **n393dte**—DTE monitored event count (1–10) • **t391dte**—DTE polling timer (5–30 seconds) • **t392dce**—DCE polling verification timer (5–30 seconds)	**detail extensive** none
LMI	(Frame Relay) LMI packet statistics: • **Input**—Number of packets coming in on the interface (***nn***) and how much time has passed since the last packet arrived. The format is **Input:** ***nn*** **(last seen** ***hh:mm:ss*** **ago)**. • **Output**—Number of packets sent out on the interface (***nn***) and how much time has passed since the last packet was sent. The format is **Output:** ***nn*** **(last sent** ***hh:mm:ss*** **ago)**.	**detail extensive** none
DTE statistics	(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data communication equipment (DCE): • **Enquiries sent**—Number of link status enquiries sent from the DTE to the DCE. • **Full enquiries sent**—Number of full enquiries sent from the DTE to the DCE. • **Enquiry responses received**—Number of enquiry responses received by the DTE from the DCE. • **Full enquiry responses received**—Number of full enquiry responses sent from the DTE to the DCE.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DCE statistics	(Frame Relay) Statistics about messages transmitted from the DCE to the DTE: • **Enquiries received**—Number of enquiries received by the DCE from the DTE. • **Full enquiries received**—Number of full enquiries received by the DCE from the DTE. • **Enquiry responses sent**—Number of enquiry responses sent from the DCE to the DTE. • **Full enquiry responses sent**—Number of full enquiry responses sent from the DCE to the DTE.	**detail extensive** none
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: • **Unknown messages received**—Number of received packets that do not fall into any category. • **Asynchronous updates received**—Number of link status peer changes received. • **Out-of-sequence packets received**—Number of packets for which the sequence of the packets received is different from the expected sequence. • **Keepalive responses timedout**—Number of keepalive responses that timed out when no LMI packet was reported for **n392dte** or **n393dce** intervals. (See **LMI settings**.)	**detail extensive** none
Nonmatching DCE-end DLCIs	(Frame Relay) Number of DLCIs configured from the DCE, displayed only from the DTE.	**detail extensive** none
LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—LCP is not configured on the interface. • **Opened**—LCP negotiation is successful.	**detail extensive** none
NCP state	(PPP) Network Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—NCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—NCP is not configured on the interface. • **Opened**—NCP negotiation is successful.	**detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Chal-received**—Challenge was received but response not yet sent. • **Chap-Chal-sent**—Challenge was sent. • **Chap-Resp-received**—Response was received for the challenge sent, but CHAP has not yet moved into the**Success** state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response was sent for the challenge received. • **Closed**—CHAP authentication is incomplete. • **Failure**—CHAP authentication failed. • **Not-configured**—CHAP is not configured on the interface. • **Success**—CHAP authentication was successful.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
CoS queues	Number of CoS queues configured.	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface. • **Input packets, Output packets**—Number of packets received and transmitted on the interface.	**detail extensive**

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Giants**—Number of frames received that are larger than the giant threshold. • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • **L2 channel errors**—Counter increments when the software could not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Count of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Count of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **SRAM errors**—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value in this field increments, the PIC is malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **MTU errors**—Number of packets whose size exceeds the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Queue counters	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
DS1 alarms DS1 defects	Media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. • **LOS**—Loss of signal. • **LOF**—Loss of frame. • **AIS**—Alarm indication signal. • **YLW**—Yellow alarm. Indicates errors at the remote site receiver.	**detail extensive** none
T1 media	Counts of T1 media-specific errors. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. The T1 media-specific error types can be: • **AIS**—Alarm indication signal • **BEE**—Bit error event • **BES**—Bit error seconds • **BPV**—Bipolar violation • **CS**—Carrier state • **ES**—Errored seconds • **EXZ**—Excessive zeros • **FEBE**—Far-end block error • **LCV**—Line code violation • **LES**—Line error seconds • **LOF**—Loss of frame • **LOS**—Loss of signal • **PCV**—Pulse code violation • **SEF**—Severely errored framing • **SEFS**—Severely errored framing seconds (section) • **SES**—Severely errored seconds • **UAS**—Unavailable seconds • **YELLOW**—Errors at the remote site receiver	**extensive**
Line encoding	Line encoding used: **B8ZS** or **AMI**.	All levels
Buildout	Buildout setting.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
HDLC configuration	Information about the HDLC configuration. • **Policing bucket**—Configured state of the receiving policer. • **Shaping bucket**—Configured state of the transmitting shaper. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware. • **Timeslots**—Configured time slots for the interface. • **Line encoding**—Line encoding used: **B8ZS** or **AMI**. • **Byte encoding**—Byte encoding used: **Nx64K** or **Nx56K**. • **Data inversion**—HDLC data inversion setting: **Enabled** or **Disabled**. • **Idle cycle Flag**—Idle cycle flags. • **Start end Flag**—Start and end flag.	**extensive**
DS0 or DS1 BERT configuration	BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface. • **BERT time period**—Configured total time period that the BERT is to run. • **Elapsed**—Actual time elapsed since the start of the BERT (in seconds). • **Induced error rate**—Configured rate at which the bit errors are induced in the BERT pattern. • **Algorithm**—Type of algorithm selected for the BERT.	**detail extensive** none
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface; values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1110.	**All levels**
Encapsulation	Encapsulation on the logical interface.	**All levels**
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, or **mpls**.	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: **Flags**, **Total down time**, **Last down**, and **Traffic statistics**. **Flags** is one or more of the following: • **Active**—Set when the link is active and the DTE and DCE are exchanging information. • **Down**—Set when the link is active, but no information is received from the DCE. • **Unconfigured**—Set when the corresponding DLCI in the DCE is not configured. • **Configured**—Set when the corresponding DLCI in the DCE is configured. • **Dce-configured**—Displayed when the command is issued from the DTE.	**detail extensive** none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. • **Active DLCI**—Number of active DLCIs. • **Inactive DLCI**—Number of inactive DLCIs.	**detail extensive** none

show interfaces (Channelized T3 IQ)

Syntax

show interfaces (ct3-*fpc/pic/port* | *type-fpc/pic/port*<:*channel*><:*channel*>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified channelized T3 IQ interface.

Options

type-fpc/pic/port*:*channel—Interface type. With optional corresponding channel levels, the interface type can be one of the following:

- ***type-fpc/pic/port***—For the physical channelized T3 IQ interface, ***type*** is **ct3**.
- ***type-fpc/pic/port*:*channel***—For the clear channel, ***type*** is **t3**. At the first level of channelization, ***type*** can be **ct1** or **t1**.
- ***type-fpc/pic/port*:*channel*:*channel***—At the second level of channelization, ***type*** is **ds**.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

show interfaces (Discard)

Syntax
show interfaces dsc
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information Command introduced before Junos OS Release 7.4.

Description Display status information about the specified discard interface.

Options

dsc—Display standard information about the specified discard interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—This option is not relevant for the discard interface and always shows a value of 0.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) This option is not relevant for the discard interface and always shows a value of 0.

show interfaces dsc detail on page 1324
show interfaces dsc extensive on page 1325

Output Fields Table 65 on page 1321 lists the output fields for the **show interfaces** (discard) command. Output fields are listed in the approximate order in which they appear.

Table 65: Discard show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		

Table 65: Discard show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface, whether the interface is enabled, and the state of the physical interface: **Up** or **Down**.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Type	Type of interface. **Software-Pseudo** indicates a standard software interface with no associated hardware device.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be **Internal** or **External**.	**brief detail extensive**
Speed	Speed at which the interface is running.	**brief detail extensive**
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link type	Encapsulation being used on the physical interface.	**detail extensive**
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive**
Physical info	Information about the physical interface.	**detail extensive**
Hold-times	Current interface hold-time up and hold-time down. Value is in milliseconds.	**detail extensive**
Current address, Hardware address	Configured MAC address and hardware MAC address.	**detail extensive**
Alternate link address	Backup address of the link.	**detail extensive**
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour*:*minute*:*second timezone*** **(*hour*:*minute*:*second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 65: Discard show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface. • **Input packets, Output packets**—Number of packets received and transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface: • **Errors**—Sum of incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **Resource errors**—Sum of transmit drops.	**detail extensive**
Output errors	(Extensive only) Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**detail extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive**
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 65: Discard show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, or **mpls**.	**All levels**
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**

show interfaces (Fast Ethernet)

Syntax

show interfaces *interface-type*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified Fast Ethernet interface.

Options

interface-type—On M Series and T Series routers, the interface type is **fe-*fpc/pic/port***.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

Output Fields

Table 66 on page 1326 lists the output fields for the **show interfaces** (Fast Ethernet) command. Output fields are listed in the approximate order in which they appear.

Table 66: show interfaces Fast Ethernet Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Link-mode	Type of link connection configured for the physical interface: **Full-duplex** or **Half-duplex**	**extensive**
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: **Enabled** or **Disabled** for parent interface; **Rx-only** or **Tx-only** for child interfaces.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: **Enabled** or **Disabled**.	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the “Links Flags” section under “Common Output Fields Description” on page 1110.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none
Schedulers	(GigabitEthernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	**extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Hardware MAC address.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour*:*minute*:*second*:*timezone*** **(*hour*:*minute*:*second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface. Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes. For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces command.	**detail extensive**

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface. NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the **show interfaces** command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenorio, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs	**detail extensive**
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	**extensive**
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
OTN FEC statistics	The forward error correction (FEC) counters provide the following statistics:. • **Corrected Errors**—The count of corrected errors in the last second. • **Corrected Error Ratio**—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.	
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. • **Bit errors**—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • **Errored blocks**—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following: • **Total octets** and **total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the show interfaces command. • **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets. • **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • **MAC control frames**—Number of MAC control frames. • **MAC pause frames**—Number of MAC control frames with **pause** operational code. • **Oversized frames**—Number of frames that exceed 1518 octets. • **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • **Code violations**—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."	**extensive**
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	**extensive**
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	**extensive**

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.	**extensive**
PMA PHY	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **PHY Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
WIS section	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOL**—Loss of light • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • **SES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)	**extensive**
WIS line	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)	**extensive**

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner:**
	  ◦ **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	• **Local resolution**—Information from the link partner:
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.	**extensive**
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (**Out**) VLAN tag or for both the outer and inner (**In**) VLAN tags. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **pop**—The outer VLAN tag of the incoming frame is removed. • **swap**—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **push-push**—Two VLAN tags are pushed in from the incoming frame. • **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. • **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.	**brief detail extensive** none
Demux:	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: • Source Family Inet • Destination Family Inet	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set • **Input packets, Output packets**—Number of packets received and transmitted on the interface set.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	**extensive**
Local statistics	Number and rate of bytes and packets destined to the routing device.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	**extensive**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive**
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	**detail extensive** none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	**detail extensive**
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	**detail extensive**
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about address flag (possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none

Release Information

Command introduced before Junos OS Release 7.4 for Gigabit interfaces.
Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.
Command modified in Junos OS Release 9.5 for SRX Series devices.

Copyright © 2018, Juniper Networks, Inc.

Command introduced in Junos OS Release 18.1 for Gigabit interfaces.

Description Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

NOTE: On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Options For Gigabit interfaces:

ge-*fpc/pic/port*—Display standard information about the specified Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

xe-*fpc/pic/port*—Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For SRX interfaces:

Copyright © 2018, Juniper Networks, Inc.

- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
  - **at-** ***pim/0/port***—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **ce1-*pim/0/ port***—Channelized E1 interface.
  - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-*pim/0/port***—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-*pim/0/port***—E1 interface.
  - **e3-*pim/0/port***—E3 interface.
  - **fe-*pim/0/port***—Fast Ethernet interface.
  - **ge-*pim/0/port***—Gigabit Ethernet interface.
  - **se-*pim/0/port***—Serial interface.
  - **t1-*pim/0/port***—T1 (also called DS1) interface.
  - **t3-*pim/0/port***—T3 (also called DS3) interface.
  - **wx-*slot*/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
  - **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace pim with the PIM slot and port with the port number.
    - **at-** ***pim/0/port***—ATM-over-ADSL or ATM-over-SHDSL interface.
    - **ce1-*pim/0/ port***—Channelized E1 interface.
    - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
    - **ct1-*pim/0/port***—Channelized T1 interface.
    - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
    - **e1-*pim/0/port***—E1 interface.
    - **e3-*pim/0/port***—E3 interface.
    - **fe-*pim/0/port***—Fast Ethernet interface.
    - **ge-*pim/0/port***—Gigabit Ethernet interface.
    - **se-*pim/0/port***—Serial interface.
    - **t1-*pim/0/port***—T1 (also called DS1) interface.

- **t3-*pim*/0/*port***—T3 (also called DS3) interface.
- **wx-*slot*/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

Additional Information

In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

Output Fields Table 56 on page 1123 describes the output fields for the **show interfaces** (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see Table 57 on page 1152.

Table 67: show interfaces (Gigabit Ethernet) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: **Enabled** or **Disabled** for parent interface; **Rx-only** or **Tx-only** for child interfaces.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: **Enabled** or **Disabled**.	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under "Common Output Fields Description" on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the "Links Flags" section under "Common Output Fields Description" on page 1110.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Schedulers	(Gigabit Ethernet intelligent queuing 2 [IQ2] interfaces only) Number of CoS schedulers configured.	**extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds (ms).	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Hardware MAC address.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second:timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Egress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	**detail extensive**
Ingress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Output bytes**—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface. Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes. For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces command.	**detail extensive**

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the **Drops** field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface. NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the **show interfaces** command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs	**detail extensive**

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism. NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the **Dropped packets** field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.	**detail extensive**
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	**extensive**
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
Interface transmit statistics	(On MX Series devices) Status of the **interface-transmit-statistics** configuration: Enabled or Disabled. • **Enabled**—When the **interface-transmit-statistics** statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface. • **Disabled**—When the **interface-transmit-statistics** statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface.	**detail extensive**
OTN FEC statistics	The forward error correction (FEC) counters provide the following statistics: • **Corrected Errors**—Count of corrected errors in the last second. • **Corrected Error Ratio**—Corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. • **Bit errors**—Number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • **Errored blocks**—Number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.	**detail extensive**

Link Degrade	Shows the link degrade status of the physical link and the estimated bit error rates (BERs). This field is available only for the PICs supporting the physical link monitoring feature.
	• **Link Monitoring**—Indicates if physical link degrade monitoring is enabled on the interface.
	  ◦ **Enable**—Indicates that link degrade monitoring has been enabled (using the **link-degrade-monitor** statement) on the interface.
	  ◦ **Disable**—Indicates that link degrade monitoring has not been enabled on the interface. If link degrade monitoring has not been enabled, the output does not show any related information, such as BER values and thresholds.
	• **Link Degrade Set Threshold**—The BER threshold value at which the link is considered degraded and a corrective action is triggered.
	• **Link Degrade Clear Threshold**—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted.
	• **Estimated BER**—The estimated bit error rate.
	• **Link-degrade event**—Shows link degrade event information.
	  ◦ **Seconds**—Time (in seconds) elapsed after a link degrade event occurred.
	  ◦ **Count**—The number of link degrade events recorded.
	  ◦ **State**—Shows the link degrade status (example: **Defect Active**).
		detail extensive

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output

MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following:
	• **Total octets** and **total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the show interfaces command.
	• **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets.
	• **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
	• **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.
	• **MAC control frames**—Number of MAC control frames.
	• **MAC pause frames**—Number of MAC control frames with **pause** operational code.
	• **Oversized frames**—There are two possible conditions regarding the number of oversized frames:
	  ◦ Packet length exceeds 1518 octets, or
	  ◦ Packet length exceeds MRU
	• **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.
	• **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.
	• **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.
	NOTE: The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the **VLAN tagged frames** field displays 0 when the **show interfaces** command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.
	• **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet may enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.	**extensive**
PMA PHY	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **PHY Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
WIS section	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOL**—Loss of light • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • **SES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)	**extensive**
WIS line	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)	**extensive**

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner**—Information from the remote Ethernet device:
	  ◦ **Link mode**—Depending on the capability of the link partner, either **Full-duplex** or **Half-duplex**.
	  ◦ **Flow control**—Types of flow control supported by the link partner. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), **Symmetric/Asymmetric** (link partner supports **PAUSE** on receive and transmit or only **PAUSE** on transmit), and **None** (link partner does not support flow control).
	  ◦ **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	• **Local resolution**—Information from the local Ethernet device:
	  ◦ **Flow control**—Types of flow control supported by the local device. For Gigabit Ethernet interfaces, advertised capabilities are **Symmetric/Asymmetric** (local device supports **PAUSE** on receive and transmit or only **PAUSE** on receive) and **None** (local device does not support flow control). Depending on the result of the negotiation with the link partner, local resolution flow control type will display **Symmetric** (local device supports **PAUSE** on receive and transmit), **Asymmetric** (local device supports **PAUSE** on receive), and **None** (local device does not support flow control).
	  ◦ **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.	**extensive**
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (**Out**) VLAN tag or for both the outer and inner (**In**) VLAN tags. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **pop**—The outer VLAN tag of the incoming frame is removed. • **swap**—The outer VLAN tag of the incoming frame is overwritten with the user-specified VLAN tag information. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **push-push**—Two VLAN tags are pushed in from the incoming frame. • **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user-specified VLAN tag value. • **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.	**brief detail extensive** none
Demux	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: • Source Family Inet • Destination Family Inet	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	All levels
ACI VLAN	Information displayed for agent circuit identifier (ACI) interface set configured with the **agent-circuit-id** autoconfiguration stanza. **Dynamic Profile**—Name of the dynamic profile that defines the ACI interface set. If configured, the ACI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ACI information. NOTE: The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the **line-identity** autoconfiguration stanza.	**brief detail extensive** none
Line Identity	Information displayed for access-line-identifier (ALI) interface sets configured with the **line-identity** autoconfiguration stanza. • **Dynamic Profile**—Name of the dynamic profile that defines the ALI interface set. • Trusted option used to create the ALI interface set: **Circuit-id**, **Remote-id**, or **Accept-no-ids**. More than one option can be configured. If configured, the ALI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ALI information. NOTE: The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the **agent-circuit-id** autoconfiguration stanza.	**detail**

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Neighbor Discovery Protocol (NDP)Queue Statistics	NDP statistics for protocol **inet6** under logical interface statistics. • **Max nh cache**—Maximum interface neighbor discovery nexthop cache size. • **New hold nh limit**—Maximum number of new unresolved nexthops. • **Curr nh cnt**—Current number of resolved nexthops in the NDP queue. • **Curr new hold cnt**—Current number of unresolved nexthops in the NDP queue. • **NH drop cnt**—Number of NDP requests not serviced.	All levels
Dynamic Profile	Name of the dynamic profile that was used to create this interface configured with a Point-to-Point Protocol over Ethernet (PPPoE) family.	**detail extensive** none
Service Name Table	Name of the service name table for the interface configured with a PPPoE family.	**detail extensive** none
Max Sessions	Maximum number of PPPoE logical interfaces that can be activated on the underlying interface.	**detail extensive** none
Duplicate Protection	State of PPPoE duplicate protection: **On** or **Off**. When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client.	**detail extensive** none
Direct Connect	State of the configuration to ignore DSL Forum VSAs: **On** or **Off**. When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	**detail extensive** none
AC Name	Name of the access concentrator.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets, Output packets**—Number of packets received and transmitted on the interface set.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	**extensive**
Local statistics	Number and rate of bytes and packets destined to the router.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	**extensive**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive**
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	**detail extensive** none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	**detail extensive**
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	**detail extensive**
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about the address flag. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Broadcast	Broadcast address of the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

The following table describes the output fields for the **show interfaces** (10–Gigabit Ethernet) command.

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: **Enabled** or **Disabled** for parent interface; **Rx-only** or **Tx-only** for child interfaces.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: **Enabled** or **Disabled**.	All levels

Copyright © 2018, Juniper Networks, Inc.

Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under "Common Output Fields Description" on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the "Links Flags" section under "Common Output Fields Description" on page 1110.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none
Schedulers	(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	**extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Hardware MAC address.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second:timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Egress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	**detail extensive**
Ingress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Output bytes**—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface. NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the **show interfaces** command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenorio, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs	**detail extensive**
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
OTN alarms	Active OTN alarms identified on the interface.	**detail extensive**
OTN defects	OTN defects received on the interface.	**detail extensive**
OTN FEC Mode	The FECmode configured on the interface. • **efec**—Enhanced forward error correction (EFEC) is configured to defect and correct bit errors. • **gfec**—G.709 Forward error correction (GFEC) mode is configured to detect and correct bit errors. • **none**—FEC mode is not configured.	**detail extensive**
OTN Rate	OTN mode. • **fixed-stuff-bytes**—Fixed stuff bytes 11.0957 Gbps. • **no-fixed-stuff-bytes**—No fixed stuff bytes 11.0491 Gbps. • **pass-through**—Enable OTN passthrough mode. • **no-pass-through**—Do not enable OTN passthrough mode.	**detail extensive**
OTN Line Loopback	Status of the line loopback, if configured for the DWDM OTN PIC. Its value can be: **enabled** or **disabled**.	**detail extensive**
OTN FEC statistics	The forward error correction (FEC) counters for the DWDM OTN PIC. • **Corrected Errors**—The count of corrected errors in the last second. • **Corrected Error Ratio**—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.	**detail extensive**
OTN FEC alarms	OTN FEC excessive or degraded error alarms triggered on the interface. • **FEC Degrade**—OTU FEC Degrade defect. • **FEC Excessive**—OTU FEC Excessive Error defect.	**detail extensive**

OTN OC	OTN OC defects triggered on the interface. • **LOS**—OC Loss of Signal defect. • **LOF**—OC Loss of Frame defect. • **LOM**—OC Loss of Multiframe defect. • **Wavelength Lock**—OC Wavelength Lock defect.	**detail extensive**
OTN OTU	OTN OTU defects detected on the interface • **AIS**—OTN AIS alarm. • **BDI**—OTN OTU BDI alarm. • **IAE**—OTN OTU IAE alarm. • **TTIM**—OTN OTU TTIM alarm. • **SF**—OTN ODU bit error rate fault alarm. • **SD**—OTN ODU bit error rate defect alarm. • **TCA-ES**—OTN ODU ES threshold alarm. • **TCA-SES**—OTN ODU SES threshold alarm. • **TCA-UAS**—OTN ODU UAS threshold alarm. • **TCA-BBE**—OTN ODU BBE threshold alarm. • **BIP**—OTN ODU BIP threshold alarm. • **BBE**—OTN OTU BBE threshold alarm. • **ES**—OTN OTU ES threshold alarm. • **SES**—OTN OTU SES threshold alarm. • **UAS**—OTN OTU UAS threshold alarm.	**detail extensive**
Received DAPI	Destination Access Port Interface (DAPI) from which the packets were received.	**detail extensive**
Received SAPI	Source Access Port Interface (SAPI) from which the packets were received.	**detail extensive**
Transmitted DAPI	Destination Access Port Interface (DAPI) to which the packets were transmitted.	**detail extensive**
Transmitted SAPI	Source Access Port Interface (SAPI) to which the packets were transmitted.	**detail extensive**
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. • **Bit errors**—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • **Errored blocks**—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following: • **Total octets** and **total packets**—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets. • **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • **MAC control frames**—Number of MAC control frames. • **MAC pause frames**—Number of MAC control frames with **pause** operational code. • **Oversized frames**—Number of frames that exceed 1518 octets. • **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.	extensive
PMA PHY	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem.	extensive

 Copyright © 2018, Juniper Networks, Inc.

WIS section	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOL**—Loss of light • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • S**ES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)	**extensive**
WIS line	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)	**extensive**

WIS path	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. Any state other than **OK** indicates a problem. Subfields are: • **BIP-B3**—Bit interleaved parity for SONET section overhead • **REI-P**—Remote error indication • **LOP-P**—Loss of pointer (path) • **AIS-P**—Path alarm indication signal • **RDI-P**—Path remote defect indication • **UNEQ-P**—Path unequipped • **PLM-P**—Path payload label mismatch • **ES-P**—Errored seconds (near-end STS path) • **SES-P**—Severely errored seconds (near-end STS path) • **UAS-P**—Unavailable seconds (near-end STS path) • **SES-PFE**—Severely errored seconds (far-end STS path) • **UAS-PFE**—Unavailable seconds (far-end STS path)	**extensive**

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner:**
	  ◦ **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	• **Local resolution**—Information from the link partner:
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.	**extensive**
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels

VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (**Out**) VLAN tag or for both the outer and inner (**In**) VLAN tags. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **pop**—The outer VLAN tag of the incoming frame is removed. • **swap**—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **push-push**—Two VLAN tags are pushed in from the incoming frame. • **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. • **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.	**brief detail extensive** none
Demux:	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: • Source Family Inet • Destination Family Inet	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets, Output packets**—Number of packets received and transmitted on the interface set.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	**extensive**
Local statistics	Number and rate of bytes and packets destined to the routing device.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	**extensive**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive**
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	**detail extensive** none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	**detail extensive**
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	**detail extensive**
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about address flag (possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit **.50** (VLAN 50).

Table 68: Gigabit and 10 Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type

Interface Type	Sample Command	Byte and Octet Counts Include	Comments
Inbound physical interface	**show interfaces ge-0/3/0 extensive**	Traffic statistics: Input bytes: 496 bytes per packet, representing the Layer 2 packet MAC statistics: Received octets: 500 bytes per packet, representing the Layer 2 packet + 4 bytes	The additional 4 bytes are for the CRC.
Inbound logical interface	**show interfaces ge-0/3/0.50 extensive**	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	
Outbound physical interface	**show interfaces ge-0/0/0 extensive**	Traffic statistics: Input bytes: 490 bytes per packet, representing the Layer 3 packet + 12 bytes MAC statistics: Received octets: 478 bytes per packet, representing the Layer 3 packet	For input bytes, the additional 12 bytes include 6 bytes for the destination MAC address plus 4 bytes for VLAN plus 2 bytes for the Ethernet type.
Outbound logical interface	**show interfaces ge-0/0/0.50 extensive**	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	

Table 58 on page 1153 lists the output fields for the **show interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 69: show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Link-level type	Encapsulation being used on the physical interface.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
MTU	Maximum transmission unit size on the physical interface.	All levels
Link mode	Link mode: Full-duplex or Half-duplex.	
Speed	Speed at which the interface is running.	All levels
BPDU error	Bridge protocol data unit (BPDU) error: Detected or None	
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: **Enabled** or **Disabled**.	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: • **Online**—Autonegotiation is manually configured as online. • **Offline**—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the physical link.	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none
Current address	Configured MAC address.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second:timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None
Output Rate	Output rate in bps and pps.	None
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface. • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** . • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**
Output errors	Output errors on the interface. • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface.	**extensive**
Queue counters and queue number	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**

MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following:
	• **Total octets** and **total packets**—Total number of octets and packets.
	• **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets.
	• **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).
	• **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.
	• **MAC control frames**—Number of MAC control frames.
	• **MAC pause frames**—Number of MAC control frames with **pause** operational code.
	• **Oversized frames**—There are two possible conditions regarding the number of oversized frames:
	  ◦ Packet length exceeds 1518 octets, or
	  ◦ Packet length exceeds MRU
	• **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.
	• **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.
	• **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.
	• **Code violations**—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."
		extensive

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.	**extensive**

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
		extensive

Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Interface transmit statistics	Status of the **interface-transmit-statistics** configuration: Enabled or Disabled.	**detail extensive**
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • **Input packets, Output packets**—Number of packets received and transmitted on the interface set.	**detail extensive**

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Local statistics	Number and rate of bytes and packets destined to the device.	**extensive**
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the **Output bytes** and **Output packets** interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	**extensive**
Security	Security zones that interface belongs to.	**extensive**
Flow Input statistics	Statistics on packets received by flow module.	**extensive**
Flow Output statistics	Statistics on packets sent by flow module.	**extensive**
Flow error statistics (Packets dropped due to)	Statistics on errors in the flow module.	**extensive**
Protocol	Protocol family.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. .	**detail extensive**
Addresses, Flags	Information about the address flags..	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

```

NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics displayed in the **show interfaces** command output might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the interface counters. For detailed information, see the description of the logical interface **Transit statistics** fields in Table 56 on page 1123.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.

Description

(M Series, T Series, TX Matrix Plus, and PTX Series devices only) Display status information about the management Ethernet and internal Ethernet interfaces.

Options

em0 | fxp0—(M Series, MX Series, T Series, and PTX Series) Display standard information about the management Ethernet interface. For supported Ethernet interface by chassis and Routing Engine, see “Supported Routing Engines by Router” on page 17.

bcm0 | em0 | em1 | fxp1 | fxp2 | ixgbe0 | ixgbe1—(M Series, MX Series, T Series, and PTX Series) Display standard information about the internal Ethernet interfaces. See “Supported Routing Engines by Router” on page 17 for the internal Ethernet interface names for each Routing Engine by hardware platform.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Output Fields Table 70 on page 1423 lists the output fields for the **show interfaces** (management) command on the M Series routers, T Series routers, TX Matrix Plus routers, and PTX Series. Output fields are listed in the approximate order in which they appear.

Table 70: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Physical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Type	Type of interface.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 70: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Link-level type	Encapsulation type used on the physical interface.	All levels
MTU	Maximum transmission unit (MTU)—Size of the largest packet to be transmitted.	All levels
Clocking	Reference clock source of the interface.	All levels
Speed	Network speed on the interface.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link type	Data transmission type.	**detail extensive** none
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive**
Physical info	Information about the physical interface.	**detail extensive**
Hold-times	Current interface hold-time up and hold-time down. Value is in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Media access control (MAC) address of the interface.	**detail extensive** none
Alternate link address	Backup link address.	**detail extensive**
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour*:*minute*:*second timezone*** **(*hour*:*minute*:*second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Input packets	Number of packets received on the physical interface.	None specified
Output packets	Number of packets transmitted on the physical interface.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the logical and physical interface. • **Input bytes**, **Output bytes**—Number of bytes received and transmitted on the interface. • **Input packets**, **Output packets**—Number of packets received and transmitted on the interface.	**detail extensive**

Table 70: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Input errors	• **Errors**—Input errors on the interface. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Frames received smaller than the runt threshold. • **Giants**—Frames received larger than the giant threshold. • **Policed Discards**—Frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos does not support. • **Resource errors**—Sum of transmit drops.	**extensive**
Output errors	• **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning. • **Errors**—Sum of outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC RED mechanism. • **Resource errors**—Sum of transmit drops.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface; values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	**detail extensive** none
inet	IP address of the logical interface.	**brief**
Protocol	Protocol family configured on the logical interface (such as **iso** or **inet6**).	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

Table 70: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Route table	Route table in which this address exists. For example, **Route table:0** refers to inet.0.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Addresses, Flags	Information about address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

Sample Output

show interfaces brief (Management Ethernet)

```
user@host> show interfaces fxp0 brief
Physical interface: fxp0, Enabled, Physical link is Up
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps

  Logical interface fxp0.0
    Flags: SNMP-Traps Encapsulation: ENET2
    inet  192.168.70.143/21
```

show interfaces (Management Ethernet)

```
user@host> show interfaces fxp0
Physical interface: fxp0, Enabled, Physical link is Up
  Interface index: 1, SNMP ifIndex: 1

show interfaces (PPPoE)

Syntax

show interfaces pp0.*logical*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.

Options

pp0.*logical*—Display standard status information about the PPPoE interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about PPPoE interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display PPPoE interface statistics.

Required Privilege Level

view

List of Sample Output

show interfaces (PPPoE) on page 1444
show interfaces (PPPoE over Aggregated Ethernet) on page 1444
show interfaces brief (PPPoE) on page 1445
show interfaces detail (PPPoE) on page 1445
show interfaces extensive (PPPoE on M120 and M320 Routers) on page 1446

Output Fields

Table 71 on page 1438 lists the output fields for the **show interfaces** (PPPoE) command. Output fields are listed in the approximate order in which they appear.

Table 71: show interfaces (PPPoE) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the "Enabled Field" section under "Common Output Fields Description" on page 1110.	All levels
Interface index	Physical interface index number, which reflects its initialization sequence.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Type	Physical interface type (PPPoE).	All levels
Link-level type	Encapsulation on the physical interface (PPPoE).	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be **Internal** or **External**.	All levels
Speed	Speed at which the interface is running.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under "Common Output Fields Description" on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Link type	Physical interface link type: **full duplex** or **half duplex**.	All levels
Link flags	Information about the interface. Possible values are described in the "Link Flags" section under "Common Output Fields Description" on page 1110.	All levels
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Physical Info	Physical interface information.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive**
Hardware address	MAC address of the hardware.	**detail extensive**
Alternate link address	Backup address of the link.	**detail extensive**
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. NOTE: These fields include dropped traffic and exception traffic, as those fields are not separately defined. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface: • **Errors**—Sum of incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **Resource errors**—Sum of B chip Tx drops and IXP Tx net transmit drops.	**extensive**
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions** —Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of B chip Tx drops and IXP Tx net transmit drops.	**extensive**
Logical Interface		

 Copyright © 2018, Juniper Networks, Inc.

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number (which reflects its initialization sequence).	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Encapsulation	Type of encapsulation configured on the logical interface.	All levels
PPP parameters	PPP status: • LCP restart timer—Length of time (in milliseconds) between successive Link Control Protocol (LCP) configuration requests. • NCP restart timer—Length of time (in milliseconds) between successive Network Control Protocol (NCP) configuration requests.	**detail**
PPPoE	PPPoE status: • **State**—State of the logical interface (**up** or **down**). • **Session ID**—PPPoE session ID. • **Service name**—Type of service required. Can be used to indicate an Internet service provider (ISP) name or a class or quality of service. • **Configured AC name**—Configured access concentrator name. • **Auto-reconnect timeout**—Time after which to try to reconnect after a PPPoE session is terminated, in seconds. • **Idle Timeout**—Length of time (in seconds) that a connection can be idle before disconnecting. • **Underlying interface**—Interface on which PPPoE is running.	All levels
Link	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.	**detail extensive**

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.	**detail extensive**
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize. NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.	**detail extensive**
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. • **interval** ***seconds***—The time in seconds between successive keepalive requests. The range is **10** seconds through **32,767** seconds, with a default of **10** seconds. • **down-count*number***—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is **1** through **255**, with a default of **3**. • **up-count** ***number***—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is **1** through **255**, with a default of **1**.	**detail extensive**

Keepalive statistics	(PPP and HDLC) Information about keepalive packets.
	
	• **Input**—Number of keepalive packets received by PPP.
	  ◦ **(last seen 00:00:00 ago)**—Time the last keepalive packet was received, in the format ***hh*:*mm*:*ss***.
	• **Output**—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received.
	  ◦ **(last seen 00:00:00 ago)**—Time the last keepalive packet was sent, in the format ***hh*:*mm*:*ss***.
	
	(MX Series routers with MPCs/MICs) When an MX Series router with MPCs/MICs is using PPP fast keepalive for a PPP link, the display does not include the number of keepalive packets received or sent, or the amount of time since the router received or sent the last keepalive packet.
		detail extensive

Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—LCP is not configured on the interface. • **Opened**—LCP negotiation is successful.	none **detail extensive**
NCP state	(PPP) Network Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—NCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—NCP is not configured on the interface. • **Opened**—NCP negotiation is successful.	**detail extensive** none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Chal-received**—Challenge was received but response not yet sent. • **Chap-Chal-sent**—Challenge was sent. • **Chap-Resp-received**—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response was sent for the challenge received. • **Closed**—CHAP authentication is incomplete. • **Failure**—CHAP authentication failed. • **Not-configured**—CHAP is not configured on the interface. • **Success**—CHAP authentication was successful.	none **detail extensive**
Protocol	Protocol family configured on the logical interface.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about the protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the addresses configured for the protocol family. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none

Sample Output

show interfaces (PPPoE)

```
user@host> show interfaces pp0
Physical interface: pp0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 24
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link type      : Full-Duplex
  Link flags     : None
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)

  Logical interface pp0.0 (Index 72) (SNMP ifIndex 72)
    Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE

show interfaces (PTX Series Packet Transport Routers)

Syntax

show interfaces et-*fpc/pic/port*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Routers.

Description

(PTX Series Packet Transport Routers only) Display status information about the specified Ethernet interface.

Options

et-*fpc/pic/port*—Display standard information about the specified Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media —(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

view

List of Sample Output

show interfaces brief (PTX5000 Packet Transport Router) on page 1458
show interfaces extensive (PTX5000 Packet Transport Router) on page 1458
show interfaces terse (PTX5000 Packet Transport Router) on page 1459

Output Fields

See Table 72 on page 1449 for the output fields for the **show interfaces** (PTX Series Packet Transport Routers) command.

Table 72: show interfaces PTX Series Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
BPDU Error	Bridge protocol data unit (BPDU) errors (if any).	All levels
MAC-Rewrite	MAC Rewrite errors (if any).	All levels
Loopback	Loopback status: **Enabled** or **Disabled**. If loopback is enabled, type of loopback: **Local** or **Remote**.	All levels
Source filtering	Source filtering status: **Enabled** or **Disabled**.	All levels
Flow control	Flow control status: **Enabled** or **Disabled**.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the “Links Flags” section under “Common Output Fields Description” on page 1110.	All levels
CoS queues	Number of CoS queues configured.	**detail extensive** none
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive** none
Hardware address	Hardware MAC address.	**detail extensive** none

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second:timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface. NOTE: **Input bytes** and **output bytes** are counted as Layer 3 packet length.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the **ignore-l3-incompletes** statement. NOTE: The L3 incompletes field is *not* supported on PTX Series Packet Transport Routers. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **FIFO errors**—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Collisions**—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **FIFO errors**—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues	Total number of egress queues supported on the specified interface.	**detail extensive**
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
Ingress queues	Total number of ingress queues supported on the specified interface.	**extensive**
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value **None** or **Link**. • **None**—There are no active defects or alarms. • **Link**—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. • **LOCAL-FAULT**—Link fault signaling operates between the remote PHY RS (Reconciliation sub-layer) and the local RS. A Local Fault is used to signal a detected fault between the remote RS and the local RS to the local Ethernet interface. • **REMOTE-FAULT**—When the Local Fault status reaches an RS, the RS stops sending MAC data and continuously generates the Remote Fault status on the transmit data path .	**detail extensive** none
MAC statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC subsystem, including the following: • **Total octets** and **total packets**—Total number of octets and packets. • **Unicast packets, Broadcast packets,** and **Multicast packets**—Number of unicast, broadcast, and multicast packets. • **CRC/Align errors**—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • **FIFO error**—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • **MAC control frames**—Number of MAC control frames. • **MAC pause frames**—Number of MAC control frames with **pause** operational code. • **Oversized frames**—Number of frames that exceed 1518 octets. • **Jabber frames**—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • **Fragment frames**—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • **VLAN tagged frames**—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • **Code violations**—Number of times an event caused the PHY to indicate “Data reception error” or “invalid data symbol error.”	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	**Receive** and **Transmit** statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected. • **Input packet count**—Number of packets received from the MAC hardware that the filter processed. • **Input packet rejects**—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • **Input DA rejects**—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting). • **Input SA rejects**—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • **Output packet count**—Number of packets that the filter has given to the MAC hardware. • **Output packet pad count**—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • **Output packet error count**—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • **CAM destination filters, CAM source filters**—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.	**extensive**

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output

Autonegotiation information	Information about link autonegotiation.
	• **Negotiation status:**
	  ◦ **Incomplete**—Ethernet interface has the speed or link mode configured.
	  ◦ **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
	  ◦ **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
	• **Link partner:**
	  ◦ **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
	• **Local resolution**—Information from the link partner:
	  ◦ **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
	  ◦ **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).
		extensive

Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (**Out**) VLAN tag or for both the outer and inner (**In**) VLAN tags. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **pop**—The outer VLAN tag of the incoming frame is removed. • **swap**—The outer VLAN tag of the incoming frame is overwritten with the user-specified VLAN tag information. • **push**—An outer VLAN tag is pushed in front of the existing VLAN tag. • **push-push**—Two VLAN tags are pushed in from the incoming frame. • **swap-push**—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • **swap-swap**—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user-specified VLAN tag value. • **pop-swap**—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • **pop-pop**—Both the outer and inner VLAN tags of the incoming frame are removed.	**brief detail extensive** none
Demux	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: • Source Family Inet • Destination Family Inet	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. • **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set • **Input packets, Output packets**—Number of packets received and transmitted on the interface set. NOTE: **Input bytes** and **output bytes** are counted as Layer 3 packet length.	**detail extensive**
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	**extensive**
Local statistics	Number and rate of bytes and packets destined to the router.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch.	**extensive**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive** none
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive**
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	**detail extensive** none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	**detail extensive** none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	**detail extensive**
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	**detail extensive**
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Flags	Information about flags (possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

show interfaces (SONET/SDH)

Syntax

show interfaces so-*fpc/pic/port*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(M Series and T Series routers only) Display status information about the specified SONET/SDH interface.

Options

so-*fpc/pic/port*—Display standard information about the specified SONET/SDH interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

Output Fields

Table 73 on page 1463 lists the output fields for the **show interfaces** (SONET/SDH) command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 73: SONET/SDH show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	SONET/SDH reference clock source: **Internal** or **External**. Clocking is configured and displayed only for channel 0.	All levels
***Framing* mode**	Framing mode: **SONET** or **SDH**.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (**local** or **remote**).	All levels
FCS	Frame check sequence on the interface (either **16** or **32**). The default is **16** bits.	All levels
Payload scrambler	Whether payload scrambling is enabled.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Shared-interface	Indicates whether the routing domain is the owner or non-owner of the shared interface. If the routing domain is the Root System Domain (RSD), the value is **Owner**. If the routing domain is a Protected System Domain (PSD) under the RSD, the value is **Non-owner**.	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	All levels

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
ANSI or ITU LMI settings	(Frame Relay) Settings for Local Management Interface (LMI). The format is **(ANSI or ITU) LMI settings:** *value*, *value*... *xx* seconds, where *value* can be: • **n391dte**—DTE full status polling interval (1-255) • **n392dce**—DCE error threshold (1-10) • **n392dte**—DTE error threshold (1-10) • **n393dce**—DCE monitored event count (1-10) • **n393dte**—DTE monitored event count (1-10) • **t391dte**—DTE polling timer (5-30 seconds) • **t392dce**—DCE polling verification timer (5-30 seconds)	All levels
LMI	**Input:** ***value*** **(*hh*:*mm*:*ss* ago)**, **Output:** ***value*** **(*hh*:*mm*:*ss* ago)**	**brief** none
LMI statistics	(Frame Relay) LMI packet statistics: • **Input**—Number of packets coming in on the interface (*nn*) and how much time has passed since the last packet arrived. The format is **Input:** ***nn*** **(last seen *hh*:*mm*:*ss* ago)**. • **Output**—Number of packets sent out on the interface (*nn*) and how much time has passed since the last packet was sent. The format is **Output:** ***nn*** **(last sent *hh*:*mm*:*ss* ago)**.	**detail extensive**
DTE statistics	(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data circuit-terminating equipment (DCE): • **Enquiries sent**—Number of link status enquiries sent from the DTE to the DCE. • **Full enquiries sent**—Number of full enquiries sent from the DTE to the DCE. • **Enquiry responses received**—Number of enquiry responses received by the DTE from the DCE. • **Full enquiry responses received**—Number of full enquiry responses sent from the DTE to the DCE.	**detail extensive** none
DCE statistics	(Frame Relay) Statistics about messages transmitted from the DCE to the DTE: • **Enquiries received**—Number of enquiries received by the DCE from the DTE. • **Full enquiries received**—Number of full enquiries received by the DCE from the DTE. • **Enquiry responses sent**—Number of enquiry responses sent from the DCE to the DTE. • **Full enquiry responses sent**—Number of full enquiry responses sent from the DCE to the DTE.	**detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: • **Unknown messages received**—Number of received packets that do not fall into any category. • **Asynchronous updates received**—Number of link status peer changes received. • **Out-of-sequence packets received**—Number of packets for which the sequence of the packets received is different from the expected sequence. • **Keepalive responses timedout**—Number of keepalive responses that timed out when no LMI packet was reported for **n392dte** or **n393dce** intervals. (See **LMI settings**.)	**detail extensive** none
Nonmatching DCE-end DLCIs	(Frame Relay. Displayed only from the DTE) Number of DLCIs configured from the DCE.	**detail extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. • **interval** ***seconds***—The time in seconds between successive keepalive requests. The range is **10** seconds through **32,767** seconds, with a default of **10** seconds. • **down-count** ***number***—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is **1** through **255**, with a default of **3**. • **up-count** ***number***—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is **1** through **255**, with a default of **1**.	All levels

Keepalive or **Keepalive statistics**	(PPP and HDLC) Information about keepalive packets.
	• **Input**—Number of keepalive packets received by PPP.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was received, in the format ***hh:mm:ss***.
	• **Output**—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was sent, in the format ***hh:mm:ss***.
		All levels

LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—LCP is not configured on the interface. • **Opened**—LCP negotiation is successful.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
NCP state	(PPP) Network Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—NCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—NCP is not configured on the interface. • **Opened**—NCP negotiation is successful.	**detail extensive** none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Chal-received**—Challenge was received but response not yet sent. • **Chap-Chal-sent**—Challenge was sent. • **Chap-Resp-received**—Response was received for the challenge sent, but CHAP has not yet moved into the **Success** state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response was sent for the challenge received. • **Closed**—CHAP authentication is incomplete. • **Failure**—CHAP authentication failed. • **Not-configured**—CHAP is not configured on the interface. • **Success**—CHAP authentication was successful.	**detail extensive** none
CoS queues	Number of CoS queues configured.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour*:*minute*:*second timezone*** **(*hour*:*minute*:*second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number of bytes and packets received and transmitted on the physical interface, and the traffic rate in bits per seconds (bps). • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Label-switched interface (LSI) traffic statistics	(Frame Relay) LSI traffic statistics: • **Input bytes**—Number of bytes and speed, in bits per second (bps), received on the interface. • **Output packets**—Number of packets and speed, in bps, transmitted on the interface.	**extensive**
Input errors	Input errors on the interface whose definitions are as follows: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Bucket Drops**—Drops resulting from the traffic load exceeding the interface transmit/receive leaky bucket configuration. The default is **off**. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **HS link FIFO overflows**—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **HS link FIFO underflows**—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces. • **MTU errors**—Number of packets whose size exceeds the MTU of the interface.	**extensive**
IPv6 transit statistics	Number of transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Egress queues	Total number of egress queues supported on the specified interface.	**detail extensive**
Queue counters	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**extensive**
SONET alarms **SONET defects**	(SONET) SONET media-specific alarms and defects that prevents the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: **SONET PHY**, **SONET section**, **SONET line**, and **SONET path**.	All levels
Link	(For 4-port OC192c PIC operating in OC768-over-4xOC192 mode) The link number. Errors and alarms are displayed for each link.	**extensive**

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SONET PHY	Counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **PLL Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**
SONET section	Counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B1**—Bit interleaved parity for SONET section overhead • **SEF**—Severely errored framing • **LOL**—Loss of light • **LOF**—Loss of frame • **ES-S**—Errored seconds (section) • **SES-S**—Severely errored seconds (section) • **SEFS-S**—Severely errored framing seconds (section)	**extensive**
SONET line	Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **BIP-B2**—Bit interleaved parity for SONET line overhead • **REI-L**—Remote error indication (near-end line) • **RDI-L**—Remote defect indication (near-end line) • **AIS-L**—Alarm indication signal (near-end line) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **ES-L**—Errored seconds (near-end line) • **SES-L**—Severely errored seconds (near-end line) • **UAS-L**—Unavailable seconds (near-end line) • **ES-LFE**—Errored seconds (far-end line) • **SES-LFE**—Severely errored seconds (far-end line) • **UAS-LFE**—Unavailable seconds (far-end line)	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SONET path	Active alarms and defects, plus counts of specific SONET errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than**OK** indicates a problem. Subfields are: • **BIP-B3**—Bit interleaved parity for SONET section overhead • **REI-P**—Remote error indication • **LOP-P**—Loss of pointer (path) • **AIS-P**—Path alarm indication signal • **RDI-P**—Path remote defect indication • **UNEQ-P**—Path unequipped • **PLM-P**—Path payload (signal) label mismatch • **ES-P**—Errored seconds (near-end STS path) • **SES-P**—Severely errored seconds (near-end STS path) • **UAS-P**—Unavailable seconds (near-end STS path) • **ES-PFE**—Errored seconds (far-end STS path) • **SES-PFE**—Severely errored seconds (far-end STS path) • **UAS-PFE**—Unavailable seconds (far-end STS path)	**extensive**
Received SONET overhead **Transmitted SONET overhead**	Values of the received and transmitted SONET overhead: • **C2**—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • **F1**—Section user channel byte. This byte is set aside for the purposes of users. • **K1** and **K2**—These bytes are allocated for APS signaling for the protection of the multiplex section. • **J0**—Section trace. This byte is defined for STS-1 number 1 of an STS-*N* signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • **S1**—Synchronization status. The S1 byte is located in the first STS-1 of an STS-*N*. • **Z3** and **Z4**—Allocated for future use.	**extensive**
SDH alarms **SDH defects**	SDH media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: **SDH PHY**, **SDH regenerator section**, **SDH multiplex section**, and **SDH path**.	All levels

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH PHY	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **PLL Lock**—Phase-locked loop • **PHY Light**—Loss of optical signal	**extensive**
SDH regenerator section	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **RS-BIP8**—24-bit BIP for multiplex section overhead (B2 bytes) • **OOF**—Out of frame • **LOS**—Loss of signal • **LOF**—Loss of frame • **RS-ES**—Errored seconds (near-end regenerator section) • **RS-SES**—Severely errored seconds (near-end regenerator section) • **RS-SEFS**—Severely errored framing seconds (regenerator section)	**extensive**
SDH multiplex section	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **MS-BIP24**—8-bit BIP for high-order path overhead (B3 byte) • **MS-FEBE**—Far-end block error (multiplex section) • **MS-FERF**—Far-end remote fail (multiplex section) • **MS-AIS**—Alarm indication signal (multiplex section) • **BERR-SF**—Bit error rate fault (signal failure) • **BERR-SD**—Bit error rate defect (signal degradation) • **MS-ES**—Errored seconds (near-end multiplex section) • **MS-SES**—Severely errored seconds (near-end multiplex section) • **MS-UAS**—Unavailable seconds (near-end multiplex section) • **MS-ES-FE**—Errored seconds (far-end multiplex section) • **MS-SES-FE**—Severely errored seconds (far-end multiplex section) • **MS-UAS-FE**—Unavailable seconds (far-end multiplex section)	**extensive**

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH path	Active alarms and defects, plus counts of specific SDH errors with detailed information. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. Subfields are: • **HP-BIP8**—8-bit BIP for regenerator section overhead (B1 byte) • **HP-FEBE**—Far-end block error (high-order path) • **HP-LOP**—Loss of pointer (high-order path) • **HP-AIS**—High-order-path alarm indication signal • **HP-FERF**—Far-end remote fail (high-order path) • **HP-UNEQ**—Unequipped (high-order path) • **HP-PLM**—Payload label mismatch (high-order path) • **HP-ES**—Errored seconds (near-end high-order path) • **HP-SES**—Severely errored seconds (near-end high-order path) • **HP-UAS**—Unavailable seconds (near-end high-order path) • **HP-ES-FE**—Errored seconds (far-end high-order path) • **HP-SES-FE**—Severely errored seconds (far-end high-order path) • **HP-UAS-FE**—Unavailable seconds (far-end high-order path)	**extensive**
Received SDH overhead **Transmitted SDH overhead**	Values of the received and transmitted SONET overhead: • **C2**—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • **F1**—Section user channel byte. This byte is set aside for the purposes of users. • **K1** and **K2**—These bytes are allocated for APS signaling for the protection of the multiplex section. • **J0**—Section trace. This byte is defined for STS-1 number 1 of an STS-*N* signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • **S1**—Synchronization status. The S1 byte is located in the first STS-1 of an STS-*N*. • **Z3** and **Z4**—Allocated for future use.	**extensive**
Received path trace **Transmitted path trace**	SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.	**extensive**

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
HDLC configuration	Information about the HDLC configuration. • **Policing bucket**—Configured state of the receiving policer. • **Shaping bucket**—Configured state of the transmitting shaper. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware.	**extensive**
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
PPP parameters	The PPP loopback clear timer value.	**extensive**

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Shared interface	Provides the following information: • **shared with**—(RSD only) Indicates which PSD owns the logical shared interface. For example, **psd3**. • **peer interface**—(PSD only) Lists the logical tunnel interface that peers with the logical shared interface. For example, **ut-2/1/0.2**. • **tunnel token**—Specifies the receive (RX) and transmit (TX) tunnel tokens. For example, **Rx: 5.519, Tx: 13.514**.	All levels
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, or **mpls**.	**detail extensive none**
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the IP address of the interface is also displayed.	**brief**
Multilink bundle	(If the logical interface is configured as part of a multilink bundle.) Interface name for the multilink bundle.	**detail extensive** none
AS bundle	(If the logical interface is configured as part of an aggregated SONET bundle.) AS bundle number.	**detail extensive**
MTU	MTU size on the logical interface.	**detail extensive none**
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the interface.	**detail extensive** none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: **Flags**, **Total down time**, **Last down**, and **Traffic statistics**. **Flags** is one or more of the following: • **Active**—Set when the link is active and the DTE and DCE are exchanging information. • **Down**—Set when the link is active, but no information is received from the DCE. • **Unconfigured**—Set when the corresponding DLCI in the DCE is not configured. • **Configured**—Set when the corresponding DLCI in the DCE is configured. • **Dce-configured**—Displayed when the command is issued from the DTE.	**detail extensive**
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. • **Active DLCI**—Number of active DLCIs. • **Inactive DLCI**—Number of inactive DLCIs.	**detail extensive** none

show interfaces (Serial)

Syntax

show interfaces *interface-type*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about serial interfaces, including RS-232, RS-422/449, EIA-530, X.21, and V.35.

Options

interface-type—On M Series and T Series routers, the interface type is **se-*fpc/pic/port***.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

view

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Type	Type of interface.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit (MTU) size on the physical interface.	All levels
Maximum speed	Maximum speed. The nonconfigurable value is 16,384 kbps.	**detail extensive** none
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Keepalive settings	(PPP and HDLC) Configured settings for keepalive packets. • **Interval** ***seconds***—Time between successive keepalive requests. The range of values, in seconds, is 10 to 32,767. The default value is 10. • **Up-count** ***number***—Number of keepalive packets a destination must receive to change a link's status from down to up. The range of values is 1 to 255. The default value is 1. • **Down-count** ***number***—Number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 to 255. The default value is 3.	All levels
Keepalive	(PPP and HDLC) Information about keepalive packets. • **Input:** ***number*** **(*hh*:*mm*:*ss* ago)**—Number of keepalive packets received by PPP and the time since the last keepalive packet was received. • **Output:** ***number*** **(*hh*:*mm*:*ss* ago)**—Number of keepalive packets sent by PPP and the time since the last keepalive packet was sent.	**brief** none

Copyright © 2018, Juniper Networks, Inc.

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
Keepalive statistics	(PPP and HDLC) Information about keepalive packets. • **Input:** ***number*** **(last seen** ***hh:mm:ss*****ago)**—Number of keepalive packets received by PPP and the time since the last keepalive packet was received. • **Output:** ***number*****(last seen** ***hh:mm:ss*** **ago)**—Number of keepalive packets sent by PPP and the time since the last keepalive packet was sent.	**detail extensive**
LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—LCP is not configured on the interface. • **Opened**—LCP negotiation is successful.	**detail extensive** none
NCP state	(PPP) Network Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—NCP negotiation is incomplete (not yet completed or has failed). • **Not-configured**—NCP is not configured on the interface. • **Opened**—NCP negotiation is successful.	**detail extensive** none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Chal-received**—Challenge was received but response not yet sent. • **Chap-Chal-sent**—Challenge was sent. • **Chap-Resp-received**—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response was sent for the challenge received. • **Closed**—CHAP authentication is incomplete. • **Failure**—CHAP authentication failed. • **Not-configured**—CHAP is not configured on the interface. • **Success**—CHAP authentication was successful.	**detail extensive** none
CoS queues	Number of CoS queues configured.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second timezone*** **(*****hour:minute:second*** **ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified

 Copyright © 2018, Juniper Networks, Inc.

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **Resource errors**—Sum of transmit drops.	**extensive**
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets whose size exceeds the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Egress queues supported	Total number of egress queues supported on the specified interface. Displayed with the **statistics** option.	**detail extensive**
Egress queues in use	Total number of egress queues in use on the specified interface. Displayed with the **statistics** option.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
Queue counters	CoS queue number and its associated user-configured forwarding class name. Displayed with the **statistics** option. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**

Serial media information	Information about the physical media:
	• **Line protocol**—**eia530**, **eia530a**, **rs232**, **rs449**, **v.35**, or **x.21**..
	• **Resync history**—Information about resynchronization events:
	  ◦ **Sync loss count**—Number of times the synchronization was lost.
	• **Data signal**—(X.21 and V.35) Information about the data signal:
	  ◦ **Rx Clock**—Receive clock status: OK (DTE is receiving the receive clock signal) or Not detected (receive clock signal is not being received).
	• **Control signals**—Information about modem control signals:
	  ◦ **Local mode:DCE** (data communication equipment) or **DTE** (data terminal equipment)
	  ◦ **To DCE**—Control signals that the Serial PIC sent to the DCE: DTR (Data Terminal Ready:**up** or **down**) or RTS (Request To Send: **up** or **down**.)
	  ◦ **From DC**—Control signals that the Serial PIC received from the DCE: CTS (Clear To Send: **up** or **down**), DCD (Data Carrier Detect: **up** or **down**), **DSR** (Data Set Ready: **up** or **down**), or TM (Test Mode: **up** or **down**).
	• **Clocking mode**—Clocking used for the transmit clock:
	  ◦ **dte**—Transmit clock is generated by DTE.
	  ◦ **dce**—Transmit clock is generated by the DCE and is looped back as the transmit clock.
	  ◦ **loop-timed**—Receive clock from the DCE is looped back as the transmit clock.
	• **Clock rate**—Rate, in megahertz (MHz), at which the clock is configured.
	• **Loopback**—Configured loopback mode for the interface: **dce-remote**, **dce-local**, **liu**, **local**, or **none**.
	• **Tx clock**—Clocking phase of the transmit clock: **invert** (transmit clock polarity is inverted) or **non-invert** (transmit clock polarity is not inverted).
	• **Line encoding**—Type of line encoding used: **nrz** (nonreturn to zero) or **nrzi** (return to zero inverted).
		detail extensive

Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface: • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
protocol-family	Protocol family configured on the logical interface. If the protocol is **inet**, the source and destination address are also displayed.	**brief**
Protocol	Protocol family configured on the logical interface, such as iso, inet6, mpls.	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route Table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address of the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**

show interfaces (T1, E1, or DS)

Syntax

show interfaces *interface-type*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information Command introduced before Junos OS Release 7.4.

Description Display status information about the specified T1, E1, or DS interface.

Options

interface-type—On ACX Series, M Series, MX Series, and T Series routers, the T1 interface type is **t1-*fpc/pic/port***, whereas the E1 interface type is **e1-*fpc/pic/port***, and DS interface type is **ds-*fpc/pic/port*:<channel>**.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level view

List of Sample Output

Output Fields Table 75 on page 1504 lists the output fields for the **show interfaces** (T1 or E1) command. Output fields are listed in the approximate order in which they appear.

Table 75: T1 or E1 show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source: **Internal** or **External**.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (**local** or **remote**).	All levels
FCS	Frame check sequence on the interface (either **16** or **32**). The default is **16** bits.	All levels
Framing	Physical layer framing format used for the E1 interface on the link: **G704**, **G704-NO-CRC4**, or **Unframed**. The default is **G704**. Physical layer framing format used for the T1 interface on the link: **SF** and **ESF**. The default is **ESF**.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
IMA Link alarms	Current active IMA link alarms, including the following: • **LIF** • **LODS** • **RFI-IMA** • **Tx-Mis-Connected** • **Tx-Unusable-FE** • **Rx-Unusable-FE** • **Link Fault**	**detail extensive** none
IMA Link defects	Current active IMA link defects, including the following: • **LIF** • **LODS** • **RFI-IMA** • **Tx-Mis-Connected** • **Tx-Unusable-FE** • **Rx-Unusable-FE** • **Link Fault**	**detail extensive** none

IMA Link state	Current active IMA link status, including the following:
	• **Line:** synchronized or not synchronized
	• **Near end:**—Status of near-end receive and transmit links
	  ◦ **Rx:** Usable or Unusable
	  ◦ **Tx:** Usable or Unusable
	• **Far end:**—Status of far-end receive and transmit links
	  ◦ **Rx:** Usable or Unusable
	  ◦ **Tx:** Usable or Unusable
		detail extensive none

Copyright © 2018, Juniper Networks, Inc.

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
IMA link media	IMA Link Media Status, which provides the seconds and count state for the following link media parameters: • LIF • LODS • Err-ICP • IV • Rx-FC • Tx-FC • FE-Defects • FE-Rx-FC • FE-Tx-FC • Rx-ICP • Rx-Stuff • Tx-ICP • Tx-Stuff • Rx-SES • Rx-UAS • Rx-UUS • Tx-UUS • FE-Rx-SES • FE-Rx-UAS • FE-Rx-UUS • FE-Tx-UUS	**detail extensive** none
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. • **interval** ***seconds***—The time in seconds between successive keepalive requests. The range is **10** seconds through **32,767** seconds, with a default of **10** seconds. • **down-count** ***number***—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is **1** through **255**, with a default of **3**. • **up-count** ***number***—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is **1** through **255**, with a default of **1**.	**detail extensive** none

Keepalive statistics	(PPP and HDLC) Information about keepalive packets. (When no level of output is specified, the word **statistics** is not part of the field name and the **last seen** text is not displayed.)
	• **Input**—Number of keepalive packets received by PPP.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was received, in the format ***hh:mm:ss***.
	• **Output**—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was sent, in the format ***hh:mm:ss***.
		detail extensive none

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LMI settings	(Frame Relay) Settings for Local Management Interface (LMI) which can be either ANSI LMI settings or ITU LMI settings. ANSI LMI settings is the default. The format is **(ANSI or ITU) LMI settings: *value*, *value*... *xx*** seconds, where *value* can be: • **n391dte**—DTE full status polling interval (1–255) • **n392dce**—DCE error threshold (1–10) • **n392dte**—DTE error threshold (1–10) • **n393dce**—DCE monitored event count (1–10) • **n393dte**—DTE monitored event count (1–10) • **t391dte**—DTE polling timer (5–30 seconds) • **t392dce**—DCE polling verification timer (5–30 seconds)	**detail extensive** none
LMI	(Frame Relay) Local Management Interface (LMI) packet statistics: • **Input**—Number of packets coming in on the interface (*nn*) and how much time has passed since the last packet arrived. The format is **Input: *nn* (last seen *hh*:*mm*:*ss* ago)**. • **Output**—Number of packets sent out on the interface (*nn*) and how much time has passed since the last packet was sent. The format is **Output: *nn* (last sent *hh*:*mm*:*ss* ago)**.	**detail extensive** none
DTE statistics	(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data communications equipment (DCE): • **Enquiries sent**—Number of link status enquiries sent from the DTE to the DCE. • **Full enquiries sent**—Number of full enquiries sent from the DTE to the DCE. • **Enquiry responses received**—Number of enquiry responses received by the DTE from the DCE. • **Full enquiry responses received**—Number of full enquiry responses sent from the DTE to the DCE.	**detail extensive** none
DCE statistics	(Frame Relay) Statistics about messages transmitted from the DCE to the DTE: • **Enquiries received**—Number of enquiries received by the DCE from the DTE. • **Full enquiries received**—Number of full enquiries received by the DCE from the DTE. • **Enquiry responses sent**—Number of enquiry responses sent from the DCE to the DTE. • **Full enquiry responses sent**—Number of full enquiry responses sent from the DCE to the DTE.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: • **Unknown messages received**—Number of received packets that do not fall into any category. • **Asynchronous updates received**—Number of link status peer changes received. • **Out-of-sequence packets received**—Number of packets for which the sequence of the packets received is different from the expected sequence. • **Keepalive responses timedout**—Number of keepalive responses that timed out when no Local Management Interface (LMI) packet was reported for **n392dte** or **n393dce** intervals. (See **LMI settings**.)	**detail extensive** none
Nonmatching DCE-end DLCIs	(Frame Relay. Displayed only from the DTE.) Number of DLCIs configured from the DCE.	**detail extensive** none
LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Not configured**—LCP is not configured on the interface. • **Opened**—LCP negotiation is successful.	**detail extensive** none
NCP state	(PPP) Network Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—NCP negotiation is incomplete (not yet completed or has failed). • **Not configured**—NCP is not configured on the interface. • **Opened**—NCP negotiation is successful.	**detail extensive** none
CHAP state	(PPP) State of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Chal-received**—Challenge was received but response is not yet sent. • **Chap-Chal-sent**—Challenge was sent. • **Chap-Resp-received**—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response was sent for the challenge received. • **Down**—CHAP authentication is incomplete (not yet completed or has failed). • **Not-configured**—CHAP is not configured on the interface. • **Opened**—CHAP authentication was successful.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second timezone*** **(*hour:minute:second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS Queues	Number of CoS queues configured.	**detail extensive** none
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **SRAM errors**—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC or PIM. If the value of this field increments, the PIC or PIM is malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Aged packets**—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Queue counters	CoS queue number and its associated user-configured forwarding class name. • **Queued packets**—Number of queued packets. • **Transmitted packets**—Number of transmitted packets. • **Dropped packets**—Number of packets dropped by the ASIC's RED mechanism.	**detail extensive**
DS1 alarms **DS1 defects**	E1 media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. The following lists all possible alarms and defects. For complete explanations of most of these alarms and defects, see *Bellcore Telcordia GR-499-CORE*. • **AIS**—Alarm indication signal. • **LOF**—Loss of frame. • **LOS**—Loss of signal. • **YLW**—Yellow alarm. Indicates errors at the remote site receiver.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
T1 media or **E1 media**	Counts of T1 or E1 media-specific errors. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than **OK** indicates a problem. The T1 or E1 media-specific error types are: • **SEF**—Severely errored framing • **BEE**—Bit error • **AIS**—Alarm indication signal • **LOF**—Loss of frame • **LOS**—Loss of signal • **YELLOW**—Errors at the remote site receiver • **CRC Major**—Cyclic redundancy check major alarm threshold exceeded • **CRC Minor**—Cyclic redundancy check minor alarm threshold exceeded • **BPV**—Bipolar violation • **EXZ**—Excessive zeros • **LCV**—Line code violation • **PCV**—Pulse code violation • **CS**—Carrier state • **CRC**—Cyclic redundancy check • **FEBE**—Far-end block error (E1 only) • **LES**—Line error seconds • **ES**—Errored seconds • **BES**—Bursty errored seconds • **SES**—Severely errored seconds • **SEFS**—Severely errored framing seconds • **UAS**—Unavailable seconds	**extensive**
SAToP Configuration	Information about the SAToP configuration. • **payload-size**—Configure the payload size, in bytes (from 32 through 1024 bytes). • **idle-pattern**—An 8-bit hexadecimal pattern to replace TDM data in a lost packet (from 0 through 255). • **jitter-buffer-packets**—Number of packets in the jitter buffer (from 1 through 64 packets). • **jitter-buffer-latency**—Time delay in the jitter buffer (from 1 through 1000 milliseconds). • **excessive-packet-loss-rate**—Set packet loss options. The options are **groups**, **sample-period**, and **threshold**. • **sample-period**—Time required to calculate excessive packet loss rate (from 1000 through 65,535 milliseconds). • **threshold**—Percentile designating the threshold of excessive packet loss rate (1–100 percent).	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CESoPSN Configuration	Information about the CESoPSN configuration. • **packetization-latency**—Time required to create packets (from 1000 through 8000 microseconds). • **idle-pattern**—An 8-bit hexadecimal pattern to replace TDM data in a lost packet (from 0 through 255). • **jitter-buffer-packets**—Number of packets in the jitter buffer (from 1 through 64 packets). • **jitter-buffer-latency**—Time delay in the jitter buffer (from 1 through 1000 milliseconds). • **excessive-packet-loss-rate**—Set packet loss options. The options are **sample-period** and **threshold**. • **sample-period**—Time required to calculate excessive packet loss rate (from 1000 through 65,535 milliseconds). • **threshold**—Percentile designating the threshold of excessive packet loss rate (1–100 percent).	**extensive**
HDLC configuration	Information about the HDLC configuration. • **Policing bucket**—Configured state of the receiving policer. • **Shaping bucket**—Configured state of the transmitting shaper. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware. • **Timeslots**—Time slots configured on the interface. • **Buildout**—(T1 only) Buildout setting: 0-132, 133-265, 266-398, 399-531, or 532-655 feet. • **Timeslots**—Configured time slots for the interface. • **Byte encoding**—(T1 only) Byte encoding used: **Nx64K** or **Nx56K**. • **Line encoding**—Line encoding used. For T1, the value can be **B8ZS** or **AMI**. For E1, the value is **HDB3**. • **Data inversion**—HDLC data inversion setting: **Enabled** or **Disabled**. • **Idle cycle flag**—Idle cycle flags. • **Start end flag**—Start and end flag.	**extensive**
DS1 BERT configuration	BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface. • **BERT time period**—Configured total time period that the BERT is to run. • **Elapsed**—Actual time elapsed since the start of the BERT (in seconds). • **Induced error rate**—Configured rate at which the bit errors are induced in the BERT pattern. • **Algorithm**—Type of algorithm selected for the BERT.	**detail extensive** none
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the interface. Possible values are described in the "Interface Flags" section under "Common Output Fields Description" on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	(Frame Relay) Number and rate of bytes and packets received and transmitted on the logical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Local statistics	(Frame Relay) Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes a while (generally, less than 1 second) for this counter to stabilize.	**detail extensive**

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	(Frame Relay) Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter normally stabilizes in less than 1 second.	**detail extensive**
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, **mlfr**, or **mpls**.	**detail extensive** none
Multilink bundle	Interface name for the multilink bundle, if configured.	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive** none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: **Flags**, **Total down time**, **Last down**, and **Traffic statistics** or (**Input packets, Output packets**). **Flags** can be one or more of the following: • **Active**—Set when the link is active and the DTE and DCE are exchanging information. • **Down**—Set when the link is active, but no information is received from the DCE. • **DCE-Unconfigured**—Set when the corresponding DLCI in the DCE is not configured. • **Configured**—Set when the corresponding DLCI in the DCE is configured. • **DCE-configured**—Displayed when the command is issued from the DTE.	**detail extensive** none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. • **Active DLCI**—Number of active DLCIs. • **Inactive DLCI**—Number of inactive DLCIs.	**detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CE Info	Information related to the circuit emulation statistics. • **CE Tx**—Number of transmitted packets and bytes (TDM to PSN flow). • **CE Rx**—Number of received packets and bytes and forward bytes (PSN to TDM flow). • **CE Rx Forwarded**—Number of forwarded bytes. • **CE Strayed**—Number of stray packets. • **CE Lost**—Number of lost packets. • **CE Malformed**—Number of malformed packets • **CE Misinserted**—Number of misinserted packets. • **CE AIS dropped**—Number of dropped bytes due to buffer overrun (PSN to TDM). • **CE Dropped**—Number of dropped packets during resynchronization • **CE Overrun Events**—Number of overrun events. • **CE Underrun Events**—Number of underrun events.	**extensive**

show interfaces (T3 or E3)

Syntax

show interfaces *interface-type*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified T3 or E3 interface.

Options

interface-type—On M Series and T Series routers, the T3 interface type is **t3-*fpc/pic/port***, whereas the E3 interface type is **e3-*fpc/pic/port***.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

view

Output Fields

Table 76 on page 1528 lists the output fields for the **show interfaces** (T3 or E3) command. Output fields are listed in the approximate order in which they appear.

Table 76: T3 or E3 show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	All levels

 Copyright © 2018, Juniper Networks, Inc.

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Interface index	Physical interface's index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be **Internal** or **External**.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (**local** or **remote**).	All levels
FCS	Frame check sequence on the interface (either **16** or **32**). The default is **16** bits.	All levels
Mode	(T3 only) Whether C-bit parity mode or M13 mode is enabled.	All levels
Long buildout	(T3 only) Buildout setting: less than 255 feet (68 meters) or greater than 255 feet and shorter than 450 feet (137 meters).	All levels
Framing	(E3 only) Physical layer framing format used on the link. It can be **G751** or **Unframed**. The default is **G751.**	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1110.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. • **interval** ***seconds***—Time in seconds between successive keepalive requests. The range is **10** seconds through **32,767** seconds, with a default of **10** seconds. • **down-count** ***number***—Number of keepalive packets a destination must fail to receive before the network takes a link down. The range is **1** through **255**, with a default of **3**. • **up-count** ***number***—Number of keepalive packets a destination must receive to change a link's status from down to up. The range is **1** through **255**, with a default of **1**.	**detail extensive** none

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output

Keepalive statistics or **Keepalive**	(PPP and HDLC) Information about keepalive packets.
	• **Input**—Number of keepalive packets received by PPP.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was received, in the format ***hh*:*mm*:*ss***.
	• **Output**—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received.
	  ◦ **(last seen 00:00:00 ago)**—Time since the last keepalive packet was sent, in the format ***hh*:*mm*:*ss***.
		detail extensive none

LMI settings	(Frame Relay) Local Management Interface (LMI) settings (ANSI or ITU). ANSI LMI settings is the default. The format is **LMI settings: *value*, *value*... *xx*** seconds, where ***value*** can be: • **n391dte**—DTE full status polling interval (1–255) • **n392dce**—DCE error threshold (1–10) • **n392dte**—DTE error threshold (1–10) • **n393dce**—DCE monitored event count (1–10) • **n393dte**—DTE monitored event count (1–10) • **t391dte**—DTE polling timer (5–30 seconds) • **t392dce**—DCE polling verification timer (5–30 seconds)	**detail extensive** none
LMI	(Frame Relay) LMI statistics: • **Input**—Number of packets coming in on the interface (*nn*) and how much time has passed since the last packet arrived. The format is **Input: *nn* (last seen *hh*:*mm*:*ss* ago)**. • **Output**—Number of packets sent out on the interface (*nn*) and how much time has passed since the last packet was sent. The format is **Output: *nn* (last sent *hh*:*mm*:*ss* ago)**.	**detail extensive** none
DTE statistics	(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data communications equipment (DCE): • **Enquiries sent**—Number of link status enquiries sent from the DTE to the DCE. • **Full enquiries sent**—Number of full enquiries sent from the DTE to the DCE. • **Enquiry responses received**—Number of enquiry responses received by the DTE from the DCE. • **Full enquiry responses received**—Number of full enquiry responses sent from the DTE to the DCE.	**detail extensive** none
DCE statistics	(Frame Relay) Statistics about messages transmitted from the DCE to the DTE: • **Enquiries received**—Number of enquiries received by the DCE from the DTE. • **Full enquiries received**—Number of full enquiries received by the DCE from the DTE. • **Enquiry responses sent**—Number of enquiry responses sent from the DCE to the DTE. • **Full enquiry responses sent**—Number of full enquiry responses sent from the DCE to the DTE.	**detail extensive** none

Copyright © 2018, Juniper Networks, Inc.

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: • **Unknown messages received**—Number of received packets that do not fall into any category. • **Asynchronous updates received**—Number of link status peer changes received. • **Out-of-sequence packets received**—Number of packets for which the sequence of the packets received is different from the expected sequence. • **Keepalive responses timedout**—Number of keepalive responses that timed out when no LMI packet was reported for **n392dte** or **n393dce** intervals. (See **LMI settings**.)	**detail extensive** none
Nonmatching DCE-end DLCIs	(Frame Relay. Displayed only from the DTE.) Number of DLCIs configured from the DCE.	**detail extensive** none
LCP state	(PPP) Link Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—LCP negotiation is incomplete (not yet completed or has failed). • **Opened**—LCP negotiation is successful.	**detail extensive** none
NCP state	(PPP) Network Control Protocol state. • **Conf-ack-received**—Acknowledgement was received. • **Conf-ack-sent**—Acknowledgement was sent. • **Conf-req-sent**—Request was sent. • **Down**—NCP negotiation is incomplete (not yet completed or has failed). • **Opened**—NCP negotiation is successful.	**detail extensive** none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. • **Chap-Resp-received**—Response received for the challenge sent, but CHAP not yet moved into the Success state. (Most likely with RADIUS authentication.) • **Chap-Resp-sent**—Response sent for the challenge received. • **Chap-Chal-sent**—Challenge sent. • **Chap-Chal-received**—Challenge received but response not yet sent. • **Down**—CHAP authentication is incomplete (not yet completed or has failed). • **Not-configured**—CHAP is not configured on the interface. • **Opened**—CHAP authentication was successful.	**detail extensive** none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour:minute:second timezone*** **(*year-month-day hour:minute:second* ago)** . For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)**.	**detail extensive** none
CoS queues	Number of CoS queues configured.	**detail extensive** none

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface • **Output packets**—Number of packets received on the interface.	**detail extensive**
Input errors	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—(T3 only) Number of frames received that are smaller than the runt threshold. • **Giants**—(T3 only) Number of frames received that are larger than the giant threshold. • **Bucket Drops**—Drops resulting from the traffic load exceeding the interface transmit/receive leaky bucket configuration. The default is **off**. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **L3 incompletes**—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • **L2 channel errors**—Number of times the software did not find a valid logical interface for an incoming frame. • **L2 mismatch timeouts**—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • **HS link CRC errors**—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • **SRAM errors**—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC or PIM. If the value of this field increments, the PIC or PIM is malfunctioning. • **Resource errors**—Sum of transmit drops.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 76: T3 or E3 show interfaces Output Fields (continued)

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Level of Output</th></tr>
<tr><td>Output errors</td><td>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:
Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.
Errors—Sum of the outgoing frame aborts and FCS errors.
Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.
Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.
MTU errors—Number of packets whose size exceeded the MTU of the interface.
Resource errors—Sum of transmit drops.</td><td>extensive</td></tr>
<tr><td>Queue counters</td><td>CoS queue number and its associated user-configured forwarding class name.
Queued packets—Number of queued packets.
Transmitted packets—Number of transmitted packets.
Dropped packets—Number of packets dropped by the ASIC's RED mechanism.</td><td>detail extensive</td></tr>
<tr><td>Active alarms

Active defects</td><td>E3 media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface.
AIS—Alarm indication signal
EXZ—Excessive zeros
FERF—Far-end receive failures
IDLE—Idle code detected
LCD—Loss of cell delineation
LCV—Line code violation
LOF—Loss of frame
LOS—Loss of signal
PLL—Phase-locked loop
YLW—Remote defect indication</td><td>detail extensive none</td></tr>
</table>

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DS3 media or **E3 media**	Counts of DS3 (T3) or E3 media-specific errors. • **Seconds**—Number of seconds the defect has been active. • **Count**—Number of times that the defect has gone from inactive to active. • **State**—State of the error. State other than OK indicates a problem. The DS3 or E3 media-specific error types can be: ◦ **PLL Lock**—Phase-locked loop out of lock ◦ **Reframing**—Frame alignment recovery time ◦ **AIS**—Alarm indication signal ◦ **LOF**—Loss of frame ◦ **LOS**—Loss of signal ◦ **IDLE**—Idle code detected ◦ **YELLOW**—Errors at the remote site receiver ◦ **BPV**—Bipolar violation ◦ **EXZ**—Excessive zeros ◦ **LCV**—Line code violation ◦ **PCV**—(DS3 only) Pulse code violation ◦ **CCV**—(DS3 only) C-bit coding violation ◦ **FEBE**—(DS3 only) Far-end block error ◦ **LES**—Line error seconds ◦ **PES**—(DS3 only) P-bit errored seconds ◦ **PSES**—(DS3 only) P-bit errored seconds (section) ◦ **CES**—(DS3 only) C-bit errored seconds ◦ **CSES**—(DS3 only) C-bit severely errored seconds ◦ **SEFS**—Severely errored framing seconds ◦ **UAS**—Unavailable seconds	**extensive**
HDLC configuration	Information about the HDLC configuration. • **Policing bucket**—Configured state of the receiving policer. • **Shaping bucket**—Configured state of the transmitting shaper. • **Giant threshold**—Giant threshold programmed into the hardware. • **Runt threshold**—Runt threshold programmed into the hardware. • **Idle cycle flag**—Idle cycle flags. • **Start end flag**—Start and end flag.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DSU configuration	Information about the DSU configuration. The last three lines (**Bit count**, **Error bit count**, and **LOS information**) are displayed only if a BERT has ever been run on the interface. • **Compatibility mod**—CSU/DSU compatibility mode: **None**, **Larscom**, **Kentrox**, or **Digital-Link**. • **Scrambling**—Payload scrambling: **Enabled** or **Disabled**. • **Subrate**—Configured subrate setting. Applies only when **Digital-Link** compatibility mode is used. The subrate can be **Disabled** or display units in Kbps. • **FEAC loopbac**—(T3) Whether a far-end alarm and control (FEAC) loopback is **Active** or **Inactive**. This feature is used to send alarm or status information from the far-end terminal back to the near-end terminal and to initiate T3 loopbacks at the far-end terminal from the near-end terminal. • **Response**—Whether the FEAC signal is **Enabled** or **Disabled**. • **Count**—Number of FEAC loopbacks.	**extensive**
DS3 (or **E3**) **BERT configuration**	BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface. • **BERT time period**—Configured total time period that the BERT is to run. • **Elapsed**—Actual time elapsed since the start of the BERT (in seconds). • **Induced error rate**—Configured rate at which the bit errors are induced in the BERT pattern. • **Algorithm**—Type of algorithm selected for the BERT.	**detail extensive** none
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: • **Destination slot**—FPC slot number. • **PLP byte**—Packet Level Protocol byte.	**extensive**
CoS information	Information about the CoS queue for the physical interface. • **CoS transmit queue**—Queue number and its associated user-configured forwarding class name. • **Bandwidth %**—Percentage of bandwidth allocated to the queue. • **Bandwidth bps**—Bandwidth allocated to the queue (in bps). • **Buffer %**—Percentage of buffer space allocated to the queue. • **Buffer usec**—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • **Priority**—Queue priority: **low** or **high**. • **Limit**—Displayed if rate limiting is configured for the queue. Possible values are **none** and **exact**. If **exact** is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If **none** is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	**extensive**

Logical Interface

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Logical interface	Name of the logical interface.	**detail extensive** none
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	Logical interface SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**extensive**
Flags	Information about the interface. Possible values are described in the "Interface Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Encapsulation	Encapsulation on the logical interface.	**detail extensive** none
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	(Frame Relay) Number and rate of bytes and packets received and transmitted on the logical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Local statistics	(Frame Relay) Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Transit statistics	(Frame Relay) Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter normally stabilizes in less than 1 second.	**detail extensive**
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, **mlfr**, or **mpls**.	**detail extensive** none
Multilink bundle	(Multilink) Interface name for the multilink bundle.	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Routing table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive** none
Local	IP address of the logical interface.	**detail extensive** none
Broadcast	Broadcast address.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive** none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: **Flags**, **Total down time**, **Last down**, and **Traffic statistics** (or **Input packets**, **Output packets**). **Flags** is one or more of the following: • **Active**—Set when the link is active and the DTE and DCE are exchanging information. • **Down**—Set when the link is active, but no information is received from the DCE. • **DCE Unconfigured**—Set when the corresponding DLCI in the DCE is not configured. • **Configured**—Set when the corresponding DLCI in the DCE is configured. • **DCE-configured**—Displayed when the command is issued from the DTE.	**detail extensive** none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. • **Active DLCI**—Number of active DLCIs. • **Inactive DLCI**—Number of inactive DLCIs.	**detail extensive** none

Sample Output

show interfaces (T3, PPP)

```
user@host> show interfaces t3-0/2/0
Physical interface: t3-0/2/0, Enabled, Physical link is Up
  Interface index: 139, SNMP ifIndex: 35
  Link-level type: PPP, MTU: 4474, Clocking: Internal, Speed: T3,
  Loopback: None, FCS: 16, Mode: C/Bit parity,
  Long buildout: Shorter than 255 feet
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
  Link flags     : Keepalives
  Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
  Keepalive: Input: 0 (never), Output: 0 (never)
  LCP state: Down
  NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,

show interfaces demux0 (Demux Interfaces)

Syntax

show interfaces demux0.*logical-interface-number*
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced in Junos OS Release 9.0.

Description

(MX Series and M Series routers only) Display status information about the specified demux interface.

Options

none—Display standard information about the specified demux interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index ***snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level

Output Fields

Table 77 on page 1545 lists the output fields for the **show interfaces** demux0 (Demux Interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface.	**brief detail extensive** none
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**brief detail extensive** none
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1110.	**brief detail extensive** none
Physical link	Status of the physical link (**Up** or **Down**).	**detail extensive** none
Admin	Administrative state of the interface (**Up** or **Down**).	**terse**
Interface index	Index number of the physical interface, which reflects its initialization sequence.	**detail extensive** none
Link	Status of the physical link (**Up** or **Down**).	**terse**
Targeting summary	Status of aggregated Ethernet links that are configured with targeted distribution (**primary** or **backup**)	**extensive**
Bandwidth	Bandwidth allocated to the aggregated Ethernet links that are configured with targeted distribution.	**extensive**
Proto	Protocol family configured on the interface.	**terse**
SNMP ifIndex	SNMP index number for the physical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Type	Type of interface. **Software-Pseudo** indicates a standard software interface with no associated hardware device.	**brief detail extensive** none
Link-level type	Encapsulation being used on the physical interface.	**brief detail extensive**
MTU	Maximum transmission unit size on the physical interface.	**brief detail extensive**
Clocking	Reference clock source: **Internal** (1) or **External** (2).	**brief detail extensive**
Speed	Speed at which the interface is running.	**brief detail extensive**
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1110.	**brief detail extensive** none
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1110.	**brief detail extensive** none
Link type	Data transmission type.	**detail extensive** none

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the "Link Flags" section under "Common Output Fields Description" on page 1110.	**detail extensive** none
Physical info	Information about the physical interface.	**detail extensive**
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	**detail extensive**
Current address	Configured MAC address.	**detail extensive**
Hardware address	Hardware MAC address.	**detail extensive**
Alternate link address	Backup address of the link.	**detail extensive**
Last flapped	Date, time, and how long ago the interface went from down to up. The format is **Last flapped:** ***year-month-day hour*:*minute*:*second*:*timezone*** **(*hour*:*minute*:*second* ago)**. For example, **Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago).**	**detail extensive** none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	**detail extensive**
Traffic statistics	Number and rate of bytes and packets received and transmitted on the physical interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface. • **IPv6 transit statistics**—Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. NOTE: These fields include dropped traffic and exception traffic, as those fields are not separately defined. ◦ **Input bytes**—Number of bytes received on the interface ◦ **Output bytes**—Number of bytes transmitted on the interface. ◦ **Input packets**—Number of packets received on the interface. ◦ **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface whose definitions are as follows: • **Errors**—Sum of the incoming frame aborts and FCS errors. • **Drops**—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **Framing errors**—Number of packets received with an invalid frame checksum (FCS). • **Runts**—Number of frames received that are smaller than the runt threshold. • **Giants**—Number of frames received that are larger than the giant packet threshold. • **Policed discards**—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • **Resource errors**—Sum of transmit drops.	**extensive**
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	none
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: • **Carrier transitions**—Number of times the interface has gone from **down** to **up**. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • **Errors**—Sum of the outgoing frame aborts and FCS errors. • **Drops**—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • **MTU errors**—Number of packets whose size exceeded the MTU of the interface. • **Resource errors**—Sum of transmit drops.	**extensive**
Output Rate	Output rate in bps and pps.	none
Logical Interface		
Logical interface	Name of the logical interface.	**brief detail extensive** none
Index	Index number of the logical interface, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number for the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail**
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1110.	**brief detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Encapsulation	Encapsulation on the logical interface.	**brief extensive** none
ACI VLAN: Dynamic Profile	Name of the dynamic profile that defines the agent circuit identifier (ACI) interface set. If configured, the ACI interface set enables the underlying demux interface to create dynamic VLAN subscriber interfaces based on ACI information.	**brief detail extensive** none
Demux	Specific IP demultiplexing (demux) values: • **Underlying interface**—The underlying interface that the demux interface uses. • **Index**—Index number of the logical interface. • **Family**—Protocol family configured on the logical interface. • **Source prefixes, total**—Total number of source prefixes for the underlying interface. • **Destination prefixes, total**—Total number of destination prefixes for the underlying interface. • **Prefix**—**inet** family prefix.	**detail extensive** none
protocol-family	Protocol family configured on the logical interface.	**brief**

Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set.
	• **Input bytes, Output bytes**—Number of bytes received and transmitted on the interface set.
	• **Input packets, Output packets**—Number of packets received and transmitted on the interface set.
	• **IPv6 transit statistics**—Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.
	NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.
	  ◦ **Input bytes**—Number of bytes received on the interface.
	  ◦ **Output bytes**—Number of bytes transmitted on the interface.
	  ◦ **Input packets**—Number of packets received on the interface.
	  ◦ **Output packets**—Number of packets transmitted on the interface.
		detail extensive

Local statistics	Number of transit bytes and packets received and transmitted on the local interface. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
IPv6 Transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router. • **Input bytes**—Number of bytes received on the interface. • **Output bytes**—Number of bytes transmitted on the interface. • **Input packets**—Number of packets received on the interface. • **Output packets**—Number of packets transmitted on the interface.	**detail extensive**
Input packets	Number of packets received on the interface.	none
Output packets	Number of packets transmitted on the interface.	none
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
MTU	Maximum transmission unit size on the logical interface.	**detail extensive** none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Route table	Route table in which the logical interface address is located. For example, **0** refers to the routing table inet.0.	**detail extensive**
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	**detail extensive** none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none
Destination	IP address of the remote side of the connection.	**detail extensive statistics** none

 Copyright © 2018, Juniper Networks, Inc.

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Local	IP address of the logical interface.	**detail extensive terse** none
Remote	IP address of the remote interface.	**terse**
Broadcast	Broadcast address of the logical interlace.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Link	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	**detail extensive** none
Dynamic-profile	Name of the PPPoE dynamic profile assigned to the underlying interface.	**detail extensive** none
Service Name Table	Name of the PPPoE service name table assigned to the PPPoE underlying interface.	**detail extensive** none
Max Sessions	Maximum number of dynamic PPPoE logical interfaces that the router can activate on the underlying interface.	**detail extensive** none
Duplicate Protection	State of duplicate protection: **On** or **Off**. Duplicate protection prevents the activation of another dynamic PPPoE logical interface on the same underlying interface when a dynamic PPPoE logical interface for a client with the same MAC address is already active on that interface.	**detail extensive** none
Direct Connect	State of the configuration to ignore DSL Forum VSAs: **On** or **Off**. When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	**detail extensive** none
AC Name	Name of the access concentrator.	**detail extensive** none

Sample Output

show interfaces demux0 (Demux)

```

show interfaces extensive

Syntax show interfaces extensive

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 17.2 for PT1000 and PTX10008 Packet Transport Routers.

Description Display extensive information about all interfaces configured on the router.

Copyright © 2018, Juniper Networks, Inc.

NOTE:

- At some times, the cumulative byte counters displayed with the **show interfaces extensive** command on the 10-Gigabit Ethernet MPC with SFP+ is not always increasing and cumulative and does not give the correct results. There is a time lag in collecting these statistics, during which the display might decrease or go from a nonzero number to zero. Eventually, the counter will display the correct result.
- When the **show interfaces extensive** command is executed on a router with an MPC or a T4000 Type 5 FPC, the **Input packet rejects** counter of the **Filter statistics** field also displays statistics related to the following packet errors:
  - Invalid VLAN range
  - Tagged packet received on an untagged interface
- When the **show interfaces extensive** command is executed on an interface that is configured on a T4000 Type 5 FPC, the **IPv6 transit statistics** field displays:
  - Total statistics (sum of transit and local statistics) at the physical interface level
  - Transit statistics at the logical interface level
- When the **show interfaces extensive** command is executed on an aggregate interface in a T1600 Core Router, the IPv6 **Input bytes** is displayed for an aggregate interface. However, the IPv6 **Input bytes** is always zero on a member link of an aggregated bundle even when there is IPv6 transit traffic on the member link. This is because the logical interface index of the aggregate logical interface is updated but not the logical interface of the member links in the channel lookup table.
- The **Output packets** field under the **Traffic statistics** section in the output of the **show interfaces extensive** command includes both IPv4 and IPv6 packets. For example, in a scenario in which both IPv4 and IPv6 packets are being mirrored on the same interface and when you deactivate an IPv4 port-mirroring instance on the chassis, the output of the **show interfaces extensive** command shows a value in the Output packets field of the Traffic statistics section, which is the value of IPv6 packets that are mirrored and not of the IPv4 packets. This behavior is expected.
- For IQ2 PIC interfaces, the output of the **show interfaces extensive** command displays byte statistics that includes Layer 2 headers.
- If there are active OTN defects when an ISSU is performed, and the defect persists after the upgrade completes, the OTN alarm count is incremented by 1. For example, if an OTN alarm is active with a count of 1 and the defect remains after ISSU, the alarm count is incremented to 2. This behavior is expected.

Options This command has no options.

Required Privilege Level view

List of Sample Output

Output Fields For more information, see the output fields table for the particular interface type in which you are interested. For information about destination class and source class statistics, see the “Destination Class Field” section and the “Source Class Field” section under “Common Output Fields Description” on page 1110. For sample output for specific interfaces, see the other topics in this collection.

Sample Output

show interfaces extensive (Circuit Emulation)

If a Circuit Emulation (CE) PIC is configured for SAToP pseudowire, then pseudowire statistics are displayed in the CE information section of the **show interface extensive** output. If SAToP pseudowire is not configured on the CE PIC, then all CE information counters display 0 (zero).

show interfaces lsi (Label-Switched Interface)

Syntax

show interfaces *interface-type*
<brief | detail | extensive | terse>
<descriptions>
<media>
<routing-instance *instance-name*>
<snmp-index *snmp-index*>
<statistics>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display status information about the specified label-switched interface (LSI).

Options

interface-type—On most routers, the interface type is **lt-*fpc/pic/port***.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

routing-instance *instance-name*—(Optional) Display information for the specified routing instance.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Output Fields

Table 78 on page 1599 lists the output fields for the **show interfaces** (logical tunnel) command. Output fields are listed in the approximate order in which they appear.

Table 78: Logical Tunnel show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Logical Interface		

Table 78: Logical Tunnel show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	**detail extensive** none
SNMP ifIndex	SNMP interface index number.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1110.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. • **Input bytes**—Rate of bytes received on the interface. • **Output bytes**—Rate of bytes transmitted on the interface. • **Input packets**—Rate of packets received on the interface. • **Output packets**—Rate of packets transmitted on the interface.	**detail extensive**
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	**detail extensive**
Protocol	Protocol family configured on the logical interface, such as **iso**, **inet6**, **mpls**.	**detail extensive** none
MTU	MTU size on the logical interface.	**detail extensive** none
Generation	Unique number for use by Juniper Networks technical support only.	**detail extensive**
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1110.	**detail extensive** none

show interfaces media

Syntax show interfaces media

Release Information Command introduced before Junos OS Release 7.4.
Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.

Description Display media-specific information about all configured network interfaces.

NOTE: **show interfaces media** lists details for all interfaces, whereas **show interfaces media** ***interface-name*** lists details only for the specified interface.

Options This command has no options.

Additional Information Output from both the **show interfaces** ***interface-name*** **detail** and the **show interfaces** ***interface-name*** **extensive** commands includes all the information displayed in the output from the **show interfaces media** command.

Required Privilege Level view

List of Sample Output
show interfaces media (SONET/SDH) on page 1603
show interfaces media (MX Series Routers) on page 1603
show interfaces media (PTX Series Packet Transport Routers) on page 1604

Output Fields The output from the **show interfaces media** command includes fields that display interface media-specific information. These fields are also included in the **show interfaces** ***interface-name*** command for each particular interface type, and the information provided in the fields is unique to each interface type.

One field unique to the **show interfaces media** command is **interface-type** errors (for example, **SONET errors**). This field appears for channelized E3, channelized T3, channelized OC, E1, E3, SONET, T1, and T3 interfaces. The information provided in this output field is also provided in the output from the **show interfaces** ***interface-name*** command. (For example, for SONET interfaces, these fields are **SONET section**, **SONET line**, and **SONET path**). For a description of errors, see the chapter with the particular interface type in which you are interested.

Sample Output

show interfaces media (SONET/SDH)

The following example displays the output fields unique to the **show interfaces media** command for a SONET interface (with no level of output specified):

```
user@host> show interfaces media so-4/1/2
Physical interface: so-4/1/2, Enabled, Physical link is Up
  Interface index: 168, SNMP ifIndex: 495
  Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
  Loopback: None, FCS: 16, Payload scrambler: Enabled
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps 16384
  Link flags     : Keepalives
  Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
  Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
  LCP state: Opened
  NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
  mpls: Not-configured
  CHAP state: Not-configured
  CoS queues     : 8 supported
  Last flapped   : 2005-06-15 12:14:59 PDT (04:31:29 ago)
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)
  SONET alarms   : None
  SONET defects  : None
  SONET errors:
     BIP-B1: 121, BIP-B2: 916, REI-L: 0, BIP-B3: 137, REI-P: 16747, BIP-BIP2: 0
  Received path trace: routerb so-1/1/2
  Transmitted path trace: routera so-4/1/2
```

show interfaces media (MX Series Routers)

```
user@host>show interfaces media xe-0/0/0
Physical interface: xe-0/0/0, Enabled, Physical link is Up
  Interface index: 145, SNMP ifIndex: 592
  Link-level type: Ethernet, MTU: 1514, LAN-PHY mode, Speed: 10Gbps, BPDU Error:
 None,
  Loopback: None, Source filtering: Disabled, Flow control: Enabled
  Pad to minimum frame size: Enabled
  Device flags   : Present Running
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  Link flags     : None
  CoS queues     : 8 supported, 8 maximum usable queues
  Current address: 08:81:f4:82:a3:f0, Hardware address: 08:81:f4:82:a3:f0
  Last flapped   : 2013-10-26 03:20:40 test (1w6d 00:19 ago)
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)
  Active alarms  : LINK
  Active defects : LINK
  PCS statistics                     Seconds
    Bit errors                           78
    Errored blocks                       78
  MAC statistics:
    Input bytes: 0, Input packets: 0, Output bytes: 0, Output packets: 0
  Filter statistics:
    Filtered packets: 0, Padded packets: 0, Output packet errors: 0
  Interface transmit statistics: Disabled

show interfaces terse

Syntax show interfaces terse

Release Information Command introduced before Junos OS Release 7.4.
Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.

Description Display summary information about interfaces.

Options This command has no options.

Additional Information Interfaces are always displayed in numerical order, from the lowest to the highest FPC slot number. Within that slot, the lowest PIC slot is shown first. On an individual PIC, the lowest port number is always first.

Required Privilege Level view

show interfaces terse on page 1606
show interfaces terse (TX Matrix Plus Router) on page 1606
show interfaces terse (PTX Series Packet Transport Routers) on page 1607

Output Fields Table 79 on page 1605 lists the output fields for the **show interfaces terse** command. Output fields are listed in the approximate order in which they appear.

Table 79: show interfaces terse Output Fields

Field Name	Field Description
Interface	Interface name.
Admin	Whether the interface is turned on (up) or off (down).
Link	Link state: **up** or **down**.
Proto	Protocol family configured on the logical interface. A logical interface on a router that supports Ethernet OAM always shows the multiservice protocol.
Local	Local IP address of the logical interface.
Remote	Remote IP address of the logical interface.

CHAPTER 15

ANCP Operational Commands

clear ancp neighbor

Syntax

clear ancp neighbor
<ip-address *ip-address*>
<system-name *mac-address*>

Release Information

Command introduced in Junos OS Release 9.4.

Description

Clear the ANCP agent connection with all ANCP neighbors or with the specified ANCP neighbor. This command deletes information for subscribers associated with the neighbor, causing the adjusted traffic rates to revert to the configured rate for the subscriber interfaces. The neighbor remains configured (its administrative state is *enabled*) and can reestablish adjacencies.

This command initiates logout of ANCP-triggered dynamic VLAN sessions on the physical interface associated with the specified neighbor; conventionally autosensed dynamic VLAN sessions and their associated logical interfaces are not affected.

Options

none—Clear all ANCP neighbors.

ip-address *ip-address*—(Optional) Clear the ANCP neighbor specified by the IP address.

system-name *mac-address*—(Optional) Clear the ANCP neighbor specified by the MAC address.

Required Privilege Level

clear

Related Documentation

clear ancp statistics

Syntax

clear ancp statistics
<ip-address *ip-address*>
<system-name *mac-address*>

Release Information Command introduced in Junos OS Release 13.3.

Description Clear current statistics accumulated by the ANCP agent for all ANCP neighbors or the specified neighbor.

Options **none**—Clear all ANCP statistics.

ip-address *ip-address*—(Optional) Clear statistics for the ANCP neighbor specified by the IP address.

system-name *mac-address*—(Optional) Clear statistics for the ANCP neighbor specified by the MAC address.

Required Privilege Level clear

clear ancp subscriber

Syntax

clear ancp subscriber
<identifier *identifier*>
<ip-address *ip-address*>
<system-name *mac-address*>

Release Information Command introduced in Junos OS Release 11.4.

Description Clear the ANCP agent connection with all ANCP subscribers or with the specified ANCP subscriber. This command deletes information for the subscribers, causing the adjusted traffic rate to revert to the configured rate for the subscriber interface, but otherwise has no affect on ANCP neighbors.

Options **none**—Clear all ANCP subscribers.

identifier *identifier-string*—(Optional) Clear the ANCP subscriber identified by the access loop ID.

ip-address *ip-address*—(Optional) Clear all ANCP subscribers on the neighbor specified by the IP address.

system-name *mac-address*—(Optional) Clear all ANCP subscribers on the neighbor specified by the MAC address.

Required Privilege Level clear

request ancp oam interface

Syntax

request ancp oam interface
(*interface-name* | interface-set *set-name*)
<count *count*>
<timeout *duration*>

Release Information Command introduced in Junos OS Release 11.4.

Description Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify either an ANCP interface or an ANCP interface set. The access node responds to the NAS with the results of the test.

Options

interface-name—Name of the ANCP interface on whose local loop the loopback test is run.

interface-set *set-name*—Name of the ANCP interface set on whose local loop the loopback test is run.

count *count*—(Optional) Number of times a loopback message is sent on the local loop.
Range: **1** through **32**. Default: **1**.

timeout *duration*—(Optional) Period of time in seconds that the NAS waits for a response to the OAM request.
Range**: 0** through **255**. Default: **5**.

Output Fields

Table 80 on page 1619 lists the output fields for the **show ancp cos** command. Output fields are listed in the approximate order in which they appear.

Table 80: show ancp cos Output Fields

Field Name	Field Description
Per-DSL CoS adjustment	Adjustment values applied by the ANCP agent to the actual downstream rates and frame overhead for frame-mode DSL types. The agent then reports the adjusted rates to CoS to establish a shaping rate for the CoS node that corresponds to the subscriber access line.
QoS Adjust Flag	State of QoS adjust: • **TRUE**—The ANCP agent is enabled to adjust the actual downstream data rates and frame overhead and report the adjusted values to CoS. • **FALSE**—The ANCP agent is not enabled to adjust and report values to CoS.

Copyright © 2018, Juniper Networks, Inc.

Table 80: show ancp cos Output Fields (continued)

Field Name	Field Description
ADSL bytes	Number of bytes by which the actual ADSL downstream cell overhead is adjusted before reporting it to CoS.
ADSL2 bytes	Number of bytes by which the actual ADSL2 downstream cell overhead is adjusted before reporting it to CoS.
ADSL2-PLUS bytes	Number of bytes by which the actual ADSL2+ downstream cell overhead is adjusted before reporting it to CoS.
SDSL overhead adjusted	Percentage by which the actual SDSL downstream rate is adjusted before reporting it to CoS.
SDSL bytes	Number of bytes by which the actual SDSL downstream frame overhead is adjusted before reporting it to CoS.
OTHER overhead adjusted	Percentage by which the actual OTHER downstream rate is adjusted before reporting it to CoS.
OTHER bytes	Number of bytes by which the actual OTHER downstream frame overhead is adjusted before reporting it to CoS.
VDSL overhead adjusted	Percentage by which the actual VDSL downstream rate is adjusted before reporting it to CoS.
VDSL bytes	Number of bytes by which the actual VDSL downstream frame overhead is adjusted before reporting it to CoS.
VDSL2 overhead adjusted	Percentage by which the actual VDSL2 downstream rate is adjusted before reporting it to CoS.
VDSL2 bytes	Number of bytes by which the actual VDSL2 downstream frame overhead is adjusted before reporting it to CoS.
Per-DSL adjustment for reporting	Adjustment values applied by the ANCP agent to the actual downstream rates for individual DSL types to account for traffic overhead. The agent then reports the adjusted rates to AAA.
ADSL adjustment factor	Percentage by which the actual ADSL downstream rate is adjusted before reporting it to AAA.
ADSL2 adjustment factor	Percentage by which the actual ADSL2 downstream rate is adjusted before reporting it to AAA.
ADSL2+ adjustment factor	Percentage by which the actual ADSL2+ downstream rate is adjusted before reporting it to AAA.
VDSL adjustment factor	Percentage by which the actual VDSL downstream rate is adjusted before reporting it to AAA.

Copyright © 2018, Juniper Networks, Inc.

Table 80: show ancp cos Output Fields (continued)

Field Name	Field Description
VDSL2 adjustment factor	Percentage by which the actual VDSL2 downstream rate is adjusted before reporting it to AAA.
SDSL adjustment factor	Percentage by which the actual SDSL downstream rate is adjusted before reporting it to AAA.
OTHER adjustment factor	Percentage by which the actual OTHER downstream rate is adjusted before reporting it to AAA.
Keepalive Timer	Interval between the keepalive messages that the ANCP agent sends to CoS.
Cos State	State of the interaction between the ANCP agent and CoS: • ANCPD_COS_CONNECT_NEEDED • ANCPD_COS_CONNECT_PENDING • ANCPD_COS_CONNECT_DONE • ANCPD_COS_SESSION_SENT • ANCPD_COS_WRITE_READY
Connect Time	Time at which the ANCP agent connected to CoS; useful for debugging.
Session Time	Time at which the ANCP agent sent a session connect message to CoS; useful for debugging.
Routing Instance Time	Time at which the ANCP agent sent the routing instance to CoS; useful for debugging.
Keepalive Time	Time at which the last keepalive message was sent.
Update Time	Time at which the shaping rate was last updated.
Type	Subscriber access type: **ifl** indicates that a single VLAN carries subscriber traffic and **iflset** indicates that a set of VLANs carries subscriber traffic.
Name	System-wide name of the particular subscriber access.
Index	Access identifier.
Pending Update	Actual downstream data rate to be applied next to this local loop, in Kbps.
Last Update	Adjusted downstream data rate last reported to CoS by the ANCP agent for this local loop, in Kbps.

Sample Output

show ancp cos

`user@host>` **show ancp cos**

```
Per-DSL CoS adjustment:
  Qos Adjust Flag:         TRUE
  ADSL bytes:              20

show ancp neighbor

Syntax

show ancp neighbor
<brief | detail>
<ip-address *ip-address*
<system-name *mac-address*>

Release Information Command introduced in Junos OS Release 9.4.

Description Display information about all ANCP neighbors or the specified ANCP neighbor, regardless of operational state.

Options

brief | detail—(Optional) Display the specified level of detail.

ip-address ***ip-address*** —(Optional) Display information about the neighbor (access node) specified by the IP address.

system-name ***mac-address***—(Optional) Display information about the neighbor (access node) specified by the MAC address.

Required Privilege Level view

Output Fields Table 81 on page 1624 lists the output fields for the **show ancp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 81: show ancp neighbor Output Fields

Field Name	Field Description	Level of Output
Version	Version of the ANCP implementation: • **0x31**—General Switch Management Protocol (GSMP) version 3, sub-version 1; ANCP version before *RFC 6320, Protocol for Access Node Control Mechanism in Broadband Networks*. • **0x32**—ANCP version 1, defined in *RFC 6320, Protocol for Access Node Control Mechanism in Broadband Networks*.	**brief detail** none
IP Address	IP address of the ANCP neighbor.	**brief detail** none

Copyright © 2018, Juniper Networks, Inc.

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
PartId	Number that associates the ANCP message with a specific partition.	**brief** none
State	Operational state of the ANCP adjacency: • Configured—The neighbor has been configured, but has never been in the **Established** state. An asterisk (*) is prefixed to the neighbor entry for this state. • Establishing—Adjacency negotiations are in progress for the neighbor. An asterisk (*) is prefixed to the neighbor entry for this state. This state is rarely seen because the adjacency is established so quickly. • **Established**—Adjacency negotiations have succeeded for the neighbor and an ANCP session has been established. • Not Estblshed—Not Established; adjacency negotiations are ready to begin. Indicates that this neighbor previously had been in the **Established** state; that is, it has lost a previously established adjacency. An asterisk (*) is prefixed to the neighbor entry for this state.	All levels
Time	How long the adjacency has been up in one of the following formats: • *nwndnh*—number of weeks, days, and hours • *nd hh:mm:ss*—number of days, hours, minutes, and seconds	**brief detail** none
Subscriber Count	Number of subscribers associated with the ANCP neighbor (access local loop).	**brief** none
Capabilities	Negotiated ANCP capability: • **Topo**—Topology discovery. • **OAM**—Performance of local Operations Administration Maintenance (OAM) procedures on an access loop controlled by the router.	All levels
System Name	MAC address of the ANCP neighbor.	**detail**
TCP Port	TCP port on which ANCP messages are exchanged.	**detail**
System Instance	Number identifying the ANCP link instance from the edge device's perspective.	**detail**
Peer Instance	Number identifying the ANCP instance from the access node's perspective. This number is unique and changes when the node or link comes back up after going down.	**detail**
Timer	Adjacency timer value advertised by the ANCP peer in 100 ms increments; the interval between ANCP ACK messages. This value remains constant for the duration of an ANCP session.	**detail**
Partition Type	Number that identifies whether partitions are used and how the ID is negotiated: • **0**—No partition. • **1**—Fixed partition requested. • **2**—Fixed partition assigned.	**detail**

Copyright © 2018, Juniper Networks, Inc.

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
Partition Flag	Number that specifies the type of partition requested: **1** (new adjacency) or **2** (recovered adjacency).	**detail**
Partition Identifier	Number that identifies a logical partition of an access node with which the ANCP agent has formed an adjacency. A value of zero indicates that the agent supports each neighbor on an IP address over a single TCP session with a partition ID of zero. This is the default support case. A nonzero value indicates that the agent supports each neighbor on an IP address over a single TCP session with a nonzero partition ID.	**detail**
Partition Adjacencies	Number of adjacencies that share the partition.	**detail**
Dead Timer	Remaining period that the edge device waits for adjacency packets from a neighbor before declaring the neighbor to be down. The maximum dead time value is three times the configured adjacency timer value. This field displays the current value based on the time that the last adjacency packet was received.	**detail**
Received Syn Count	Number of synchronization messages received from neighbors to maintain adjacencies.	**detail**
Received Synack Count	Number of synchronization acknowledgment messages received from neighbors in response to the node’s synchronization messages.	**detail**
Received Rstack Count	Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.	**detail**
Received Ack Count	Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.	**detail**
Received Port Up Count	Number of status messages received from neighbors indicating that a port has transitioned to the up state.	**detail**
Received Port Down Count	Number of status messages received from neighbors indicating that a port has transitioned to the down state.	**detail**
Received Generic Resp Count	Number of generic response messages received from neighbors.	**detail**
Received Adjacency Update Count	Number of adjacency update messages received from neighbors.	**detail**
Received OAM Count	Number of OAM responses received from neighbors in reply to **request** commands.	**detail**
Received Other Count	Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.	**detail**
Sent Syn Count	Number of synchronization messages sent to neighbors to maintain adjacencies.	**detail**

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
Sent Synack Count	Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.	**detail**
Sent Rstack Count	Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.	**detail**
Sent Ack Count	Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.	**detail**
Sent Generic Resp Count	Number of generic response messages sent to neighbors.	**detail**
Sent OAM Count	Number of OAM **request** commands sent to neighbors.	**detail**
Max Discovery Limit Exceed Count	Number of times that the maximum number of discovery table entries accepted from the neighbor has been exceeded.	**detail**
Result Codes	Number of generic response messages sent to neighbors that include each of the following result codes: • **Invalid Request Message Count**—A properly formed request message violated the protocol because of timing (such as a race condition) or direction of transmission. • **Specified Port(s) Down Count**—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application. • **Out of Resources Count**—ANCP is out of resources, probably not related to the access lines. This result code is sent only by an access node. • **Request Msg Not Implemented Count**— • **Malformed Msg Count**—Message is malformed because it was corrupted in transit or there was an implementation error at either end of the connection. • **TLV Missing Count**—One or more mandatory TLVs was missing from a request. • **Invalid TLV Contents Count**—The contents of one or more TLVs in the request do not match its required specification. • **Non-Existent Port(s) Count**—One or more of the ports specified in a request do not exist, possibly because of a configuration mismatch between the access node and the router or AAA.	**detail**

show ancp statistics

Syntax

show ancp statistics
<ip-address *ip-address*>
<system-name *mac-address*>

Release Information

Command introduced in Junos OS Release 13.3.

Description

Display statistics for all ANCP neighbors (access nodes) or the specified ANCP neighbor.

Options

none—Display statistics for all ANCP neighbors, including global statistics not show for individual neighbors.

ip-address *ip-address*—(Optional) Display statistics for only the neighbor with the specified IP address.

system-name *mac-address*—(Optional) Display statistics for only the neighbor with the specified MAC address.

Required Privilege Level

show ancp statistics system-name on page 1635

Output Fields

Table 82 on page 1632 lists the output fields for the **show ancp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 82: show ancp statistics Output Fields

Field Name	Field Description
Number of neighbors	Total count of ANCP neighbors.
Number of subscribers	Total count of ANCP subscribers.
Accept Count	Number of neighbor TCP/IP sessions accepted on listener socket.

 Copyright © 2018, Juniper Networks, Inc.

Table 82: show ancp statistics Output Fields (continued)

Field Name	Field Description
Accept Fail Count	Number of neighbor TCP/IP sessions that failed due to one of the following causes: session already exists, maximum number of ANCP connections exceeded, creation of session or neighbor failed, or protocol start failed.
No Config Accept Deny Count	Number of neighbor TCP/IP sessions that failed because the neighbor was not configured.
Received Syn Count	Number of synchronization messages received from neighbors to maintain adjacencies.
Received Synack Count	Number of synchronization acknowledgment messages received from neighbors in response to the node's synchronization messages.
Received Rstack Count	Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.
Received Ack Count	Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.
Received Port Up Count	Number of status messages received from neighbors indicating that a port has transitioned to the up state.
Received Port Down Count	Number of status messages received from neighbors indicating that a port has transitioned to the down state.
Received Generic Resp Count	Number of generic response messages received from neighbors.
Received Adjacency Update Count	Number of adjacency update messages received from neighbors.
Received OAM Count	Number of OAM responses received from neighbors in reply to **request** commands.
Received Other Count	Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.
Sent Syn Count	Number of synchronization messages sent to neighbors to maintain adjacencies.
Sent Synack Count	Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.
Sent Rstack Count	Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.
Sent Ack Count	Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.
Sent Generic Resp Count	Number of generic response messages sent to neighbors.

Copyright © 2018, Juniper Networks, Inc.

Table 82: show ancp statistics Output Fields (continued)

Field Name	Field Description
Sent OAM Count	Number of OAM **request** commands sent to neighbors.
Result Codes	Number of generic response messages sent to neighbors that include each of the following result codes: • **Invalid Request Message Count**—A properly formed request messages violated the protocol because of timing (such as a race condition) or direction of transmission. • **Specified Port(s) Down Count**—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application. • **Out of Resources Count**—the ANCP agent is out of resources, probably not related to the access lines. This result code is sent only by an access node. • **Request Msg Not Implemented Count**— • **Malformed Msg Count**—Message is malformed because it was corrupted in transit or there was an implementation error at either end of the connection. • **TLV Missing Count**—One or more mandatory TLVs was missing from a request. • **Invalid TLV Contents Count**—The contents of one or more TLVs in the request do not match its required specification. • **Non-Existent Port(s) Count**—One or more of the ports specified in a request do not exist, possibly because of a configuration mismatch between the access node and the router or AAA.

Sample Output

show ancp statistics

```
user@host> show ancp statistics

show ancp subscriber

Syntax

show ancp subscriber
<brief | detail>
<identifier *identifier*>
<ip-address *ip-address*>
<system-name *mac-address*>

Release Information

Command introduced in Junos OS Release 9.4.
neighbor option replaced with **ip-address** in Junos OS Release 16.1.
system-name option introduced in Junos OS Release 16.1.

Description

Display information about active subscribers regardless of the subscriber's operational state, for all subscribers (local access loops), the subscriber associated with the access line specified by an ACI, or the subscriber associated with the specified ANCP neighbor (access node).

After an ancpd restart, this command displays orphaned entries (marked with an **o**) for subscriber sessions that were established before the restart but which have not yet been reestablished. As sessions are reestablished, the number of orphaned entries displayed by the command decreases. The number reaches zero when all sessions are reestablished or when the orphaned-interface timer expires.

Options

none—Display information about all subscribers.

brief | detail—(Optional) Display the specified level of detail.

identifier *identifier*—(Optional) Display information about the subscriber associated with the access line (ACI) specified by the access identifier.

ip-address *ip-address* —(Optional) Display information about the subscribers connected to the access node specified by the IP address.

system-name *mac-address*—(Optional) Display information about the subscribers connected to the access node specified by the MAC address.

Output Fields Table 83 on page 1638 lists the output fields for the **show ancp subscriber** command. Output fields are listed in the approximate order in which they appear.

Table 83: show ancp subscriber Output Fields

Field Name	Field Description	Level of Output
Loop Identifier	Access loop identifier as sent by the access node and configured to map the subscriber to an interface. An asterisk (*) indicates that the information might be stale due to receiving a Port Down message with a DSL Line State of Idle. Two asterisks (**) indicate that the neighbor associated with the subscriber has lost its adjacency. In this case, the DSL Line State might be Established. An **o** indicates that the entry is for an orphaned interface and represents a previously established subscriber session that has not been reestablished after an ancpd restart. The number of orphaned entries decreases as the ANCP neighbors reestablish adjacencies and the protocol subscriber sessions are reestablished. The command output indicates this by removing the **o** marker. Eventually the number of orphaned entries reaches zero, because either all the adjacencies and subscriber sessions have been reestablished or any remaining orphaned entries are removed when the orphaned-interface timer expires.	**brief** none
DSL Line State	State of the DSL line: **Idle**, **Showtime**, or **Silent**.	**brief detail**
Access Type	Type of access line employed by the access node: **ADSL1**, **ADSL2**, **ADSL2+**, **VDSL1**, **VDSL2**, **SDSL**, **G.fast**, **VDSL2 Annex Q**, **SDSL bonded**, **VDSL2 bonded**, **G.fast bonded VDSL2 Annex Q bonded** or **OTHER**.	**brief detail** none
Interface	Name of the interface set or logical interface.	**brief detail** none
Rate Kbps	Actual downstream data rate for this local loop.	**brief** none
Neighbor	IP address of ANCP neighbor (access node).	**brief** none

 Copyright © 2018, Juniper Networks, Inc.

Table 83: show ancp subscriber Output Fields (continued)

Field Name	Field Description	Level of Output
Access Loop Circuit Identifier	Access loop circuit identifier as sent by the access node and configured to map the subscriber to an interface. An asterisk (*) indicates that the information might be stale due to receiving a Port Down message with a DSL Line State of Idle. Two asterisks (**) indicate that the neighbor associated with the subscriber has lost its adjacency. In this case, the DSL Line State might be Established.	**detail**
Neighbor IP Address	IP address of the ANCP neighbor (access node).	**detail**
Aggregate Circuit Identifier Binary	Binary identifier for the VLAN circuit ID.	**detail**
Tech Type	Type of technology employed by the subscriber. Currently Junos OS supports **DSL** technology type only.	**detail**
DSL Line Data Link	Data link protocol employed on the access loop: **AAL5** or **Ethernet**.	**detail**
DSL Line Encapsulation	Encapsulation type on the access loop, for Ethernet only: • **0**—NA, type not conveyed • **1**—Untagged Ethernet • **2**—Single-tagged Ethernet	**detail**
DSL Line Encapsulation Payload	Payload carried across the access loop: • **0**—NA, type not conveyed • **1**—PPPoA LLC • **2**—PPPoA null • **3**—IPoA LLC • **4**—IPoA null • **5**—Ethernet over AAL5 LLC with FCS • **6**—Ethernet over AAL5 LLC without FCS • **7**—Ethernet over AAL5 null with FCS • **8**—Ethernet over AAL5 null without FCS	**detail**
Interface Type	Type of interface employed for subscriber traffic: **ifl** for a single VLAN or **interface-set** for a configured group of VLANs.	**detail**
Actual Net Data Upstream	Actual upstream data rate for this local loop, in Kbps.	**detail**
Actual Net Data Downstream	Actual downstream data rate for this local loop, in Kbps.	**detail**

Copyright © 2018, Juniper Networks, Inc.

Table 83: show ancp subscriber Output Fields (continued)

Field Name	Field Description	Level of Output
Minimum Net Data Upstream	Minimum upstream data rate desired by the operator for this local loop, in Kbps.	**detail**
Minimum Net Data Downstream	Minimum downstream data rate desired by the operator for this local loop, in Kbps.	**detail**
Maximum Net Data Upstream	Maximum upstream data rate desired by the operator for this local loop, in Kbps.	**detail**
Maximum Net Data Downstream	Maximum downstream data rate desired by the operator for this local loop, in Kbps.	**detail**
Attainable Net Data Upstream	Maximum attainable upstream data rate for this local loop, in Kbps.	**detail**
Attainable Net Data Downstream	Maximum attainable downstream data rate for this local loop, in Kbps.	**detail**
Minimum Low Power Data Downstream	Minimum downstream data rate desired by the operator for this local loop in low power state, in Kbps.	**detail**
Minimum Low Power Data Upstream	Minimum upstream data rate desired by the operator for this local loop in low power state, in Kbps.	**detail**
Maximum Interleave Delay Downstream	Maximum interleaving delay for downstream data, in milliseconds.	**detail**
Maximum Interleave Delay Upstream	Maximum interleaving delay for upstream data, in milliseconds.	**detail**
Actual Interleave Delay Downstream	Actual interleaving delay for downstream data, in milliseconds.	**detail**
Actual Interleave Delay Upstream	Actual interleaving delay for upstream data, in milliseconds.	**detail**

List of Sample Output show ancp summary on page 1644

Output Fields Table 84 on page 1643 lists the output fields for the **show ancp summary** command. Output fields are listed in the approximate order in which they appear.

Table 84: show ancp summary Output Fields

Field Name	Field Description
Configured	Number of ANCP neighbors in the **Configured** state; that is, that have been configured but never established.
Establishing	Number of ANCP neighbors in the **Establishing** state; that is, where negotiations are in progress.
Established	Number of ANCP neighbors in the **Established** state; that is, where negotiations have succeeded and the ANCP session has been established.
Not Estblshd	Number of ANCP neighbors in the **Not Estblshd** state; that is, that have lost a previously established adjacency and are ready to begin negotiations.
Total	Total number of ANCP neighbors; sum of neighbors in the **Configured**, **Establishing**, **Established**, and **Not Estblshd** states.
Showtime	Number of DSL lines in **Showtime** state.
Idle	Number of DSL lines in **Idle** state.
Silent	Number of DSL lines in **Silent** state.

Copyright © 2018, Juniper Networks, Inc.

Table 84: show ancp summary Output Fields (continued)

Field Name	Field Description
Unknown	Number of DSL lines where the state is not **Showtime**, **Idle**, or **Silent**.
Total	Total number of DSL lines (ANCP subscribers); sum of DSL lines in the **Showtime**, **Idle**, **Silent**, and **Unknown** states.

Sample Output

show ancp summary

```
user@host> show ancp summary

Neighbors Summary:

show ancp summary neighbor

Syntax

show ancp summary neighbor
<**ip-address** *ip-address* | **system-name** *mac-address*>

Release Information

Command introduced in Junos OS Release 13.1.

Description

Display a summary of the counts and states for all ANCP neighbors and of the neighbor's subscribers when you specify a particular neighbor.

Options

ip-address *ip-address*—(Optional) IP address of the ANCP neighbor (access node).

system-name *mac-address*—(Optional) MAC address of the ANCP neighbor (access node).

CHAPTER 16

BFD Operational Commands

clear bfd adaptation

Syntax

```
clear bfd adaptation
<all>
<address session-address>
<discriminator discr-number>
```

Release Information Command introduced before Junos OS Release 7.4.

Description Clear adaptation for Bidirectional Forwarding Detection (BFD) sessions. BFD is a simple hello mechanism that detects failures in a network. Configured BFD interval timers can change, adapting to network situations. Use this command to return BFD interval timers to their configured values.

The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

Options **all**—Clear adaptation for all BFD sessions.

address ***session-address***—(Optional) Clear adaptation for all BFD sessions matching the specified address.

discriminator ***discr-number***—(Optional) Clear adaptation for the local BFD session matching the specified discriminator.

Additional Information For more information, see the description of the **bfd-liveness-detection** configuration statement in the *Junos Routing Protocols Configuration Guide*.

clear bfd session

List of Syntax

Syntax on page 1651
Syntax (EX Series Switch and QFX Series) on page 1651

Syntax

clear bfd session
<all>
<address *session-address*>
<discriminator *discr-number*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and QFX Series)

clear bfd session
<all>
<address *session-address*>
<discriminator *discr-number*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Drop one or more Bidirectional Forwarding Detection (BFD) sessions.

Options

all—Drop all BFD sessions.

address *session-address*—(Optional) Drop all BFD sessions matching the specified address.

discriminator *discr-number*—(Optional) Drop the local BFD session matching the specified discriminator.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

<address *address*>
<client rsvp-oam (brief | detail | extensive | summary) | vpls-oam (brief | detail | extensive |
instance *instance-name* | summary)>
<discriminator *discriminator*>
<prefix *address*>

Release Information

Command introduced before Junos OS Release 7.4.
Options **discriminator** and **address** introduced in Junos OS Release 8.2.
Option **prefix** introduced in Junos OS Release 9.0.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Option **client** introduced in Junos OS Release 12.3R3.
Option **subscriber** introduced in Junos OS Release 15.1 for the MX Series.

Description

Display information about active Bidirectional Forwarding Detection (BFD) sessions.

Options

none—(Same as **brief**) Display information about active BFD sessions.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

address *address*—(Optional) Display information about the BFD session for the specified neighbor address.

client rsvp-oam
(brief | detail | extensive | summary)
| vpls-oam
(brief | detail | extensive | instance *instance-name* | summary)—(Optional) Display information about RSVP-OAM or VPLS-OAM BFD sessions in the specified level of output. For VPLS-OAM, display the specified level of output or display information about all of the BFD sessions for the specified VPLS routing instance.

discriminator *discriminator*—(Optional) Display information about the BFD session using the specified local discriminator.

 Copyright © 2018, Juniper Networks, Inc.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

<subscriber (address *destination-address* | discriminator *discriminator* | extensive)>—(Optional) Display information about all BFD sessions for subscribers, or for a single BFD subscriber session with a particular destination address, or with a particular denominator.

List of Sample Output

Output Fields

Table 87 on page 1654 describes the output fields for the **show bfd session** command. Output fields are listed in the approximate order in which they appear.

Table 87: show bfd session Output Fields

Field Name	Field Description	Level of Output
Address	Address on which the BFD session is active.	**brief detail extensive** none
State	State of the BFD session: **Up**, **Down**, **Init** (initializing), or **Failing**.	**brief detail extensive** none
Interface	Interface on which the BFD session is active.	**brief detail extensive** none
Detect Time	Negotiated time interval, in seconds, used to detect BFD control packets.	**brief detail extensive** none
Transmit Interval	Time interval, in seconds, used by the transmitting system to send BFD control packets.	**brief detail extensive** none
Multiplier	Negotiated multiplier by which the time interval is multiplied to determine the detection time for the transmitting system.	**detail extensive**
Session up time	How long a BFD session has been established.	**detail extensive**
Client	Protocol or process for which the BFD session is active: **ISIS**, **OSPF**, **DHCP**, **Static**, or **VGD**.	**detail extensive**
TX interval	Time interval, in seconds, used by the host system to transmit BFD control packets.	**brief detail extensive** none
RX interval	Time interval, in seconds, used by the host system to receive BFD control packets.	**brief detail extensive** none
Authenticate	Indicates that BFD authentication is configured.	**detail extensive**
keychain	Name of the security authentication keychain being used by a specific client. BFD authentication information for a client is provided in a single line and includes the **keychain**, **algo**, and **mode** parameters. Multiple clients can be configured on a BFD session.	**extensive**
algo	BFD authentication algorithm being used for a specific client: **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**. BFD authentication information for a client is provided in a single line and includes the **keychain**, **algo**, and **mode** parameters. Multiple clients can be configured on a BFD session.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 87: show bfd session Output Fields (continued)

Field Name	Field Description	Level of Output
mode	Level of BFD authentication enforcement being used by a specific client: **strict** or **loose**. Strict enforcement indicates that authentication is configured at both ends of the session (the default). Loose enforcement indicates that one end of the session might not be authenticated. BFD authentication information for a client is provided in a single line and includes the **keychain**, **algo**, and **mode** parameters. Multiple clients can be configured on a BFD session.	**extensive**
Local diagnostic	Local diagnostic information about failing BFD sessions. Following are the expected values for Local Diagnostic output field: • **None**—No diagnostic • **CtlExpire**—Control detection time expired • **EchoExpire**—Echo detection time expired • **NbrSignal**—Neighbor signalled session down • **FwdPlaneReset**—Forwarding plane reset • **PathDown**—Path down • **ConcatPathDown**—Concatenated path down • **AdminDown**—Administratively down	**detail extensive**
Remote diagnostic	Remote diagnostic information about failing BFD sessions. Following are the expected values for Remote Diagnostic output field: • **None**—No diagnostic • **CtlExpire**—Control detection time expired • **EchoExpire**—Echo detection time expired • **NbrSignal**—Neighbor signalled session down • **FwdPlaneReset**—Forwarding plane reset • **PathDown**—Path down • **ConcatPathDown**—Concatenated path down • **AdminDown**—Administratively down	**detail extensive**
Remote state	Reports whether the remote system's BFD packets have been received and whether the remote system is receiving transmitted control packets.	**detail extensive**
Version	BFD version: **0** or **1**.	**extensive**
Replicated	The **replicated** flag appears when nonstop routing or graceful Routing Engine switchover is configured and the BFD session has been replicated to the backup Routing Engine.	**detail extensive**
Min async interval	Minimum amount of time, in seconds, between asynchronous control packet transmissions across the BFD session.	**extensive**
Min slow interval	Minimum amount of time, in seconds, between synchronous control packet transmissions across the BFD session.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 87: show bfd session Output Fields (continued)

Field Name	Field Description	Level of Output
Adaptive async TX interval	Transmission interval being used because of adaptation.	extensive
RX interval	Minimum required receive interval.	extensive
Local min TX interval	Minimum amount of time, in seconds, between control packet transmissions on the local system.	extensive
Local min RX interval	Minimum amount of time, in seconds, between control packet detections on the local system.	extensive
Remote min TX interval	Minimum amount of time, in seconds, between control packet transmissions on the remote system.	extensive
Remote min TX interval	Minimum amount of time, in seconds, between control packet detections on the remote system.	extensive
Threshold transmission interval	Threshold for notification if the transmission interval increases.	extensive
Threshold for detection time	Threshold for notification if the detection time increases.	extensive
Local discriminator	Authentication code used by the local system to identify that BFD session.	extensive
Remote discriminator	Authentication code used by the remote system to identify that BFD session.	extensive
Echo mode	Information about the state of echo transmissions on the BFD session.	extensive
Prefix	LDP FEC address associated with the BFD session.	All levels
Egress, Destination	Displays the LDP FEC destination address. This field is displayed only on a router at the egress of an LDP FEC, where the BFD session has an LDP Operation, Administration, and Maintenance (OAM) client.	All levels
Remote is control-plane independent	The BFD session on the remote peer is running on its Packet Forwarding Engine. In this case, when the remote node undergoes a graceful restart, the local peer can help the remote peer with the graceful restart. The following BFD sessions are not distributed to the Packet Forwarding Engine: tunnel-encapsulated sessions, and sessions over integrated routing and bridging (IRB) interfaces.	extensive

 Copyright © 2018, Juniper Networks, Inc.

Table 87: show bfd session Output Fields (continued)

Field Name	Field Description	Level of Output
Authentication	Summary status of BFD authentication: • **status—enabled/active** indicates authentication is configured and active. **enabled/inactive** indicates authentication is configured but not active. This only occurs when the remote end of the session does not support authentication and loose checking is configured. • **keychain**—Name of the security authentication keychain associated with the specified BFD session. • **algo**—BFD authentication algorithm being used: **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**, or **simple-password**. • **mode**—Level of BFD authentication enforcement: **strict** or **loose**. Strict enforcement indicates authentication is configured at both ends of the session (the default). Loose enforcement indicates that one end of the session might not be authenticated. This information is only shown if BFD authentication is configured.	**extensive**
Session ID	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).	**detail extensive**
sessions	Total number of active BFD sessions.	All levels
clients	Total number of clients that are hosting active BFD sessions.	All levels
Cumulative transmit rate	Total number of BFD control packets transmitted per second on all active sessions.	All levels
Cumulative receive rate	Total number of BFD control packets received per second on all active sessions.	All levels
Multi-hop, min-recv-TTL	Minimum time to live (TTL) accepted if the session is configured for multihop.	**extensive**
route table	Route table used if the session is configured for multihop.	**extensive**
local address	Local address of the source used if the session is configured for multihop. The source IP address for outgoing BFD packets from the egress side of an MPLS BFD session is based on the outgoing interface IP address.	**extensive**

Sample Output

show bfd session

```
user@host> show bfd session
                                                      Transmit
Address              State     Interface     Detect Time  Interval  Multiplier
10.9.1.33            Up        so-7/1/0.0         0.600     0.200      3
10.9.1.29            Up        ge-4/0/0.0         0.600     0.200      3
```

```
2 sessions, 2 clients
Cumulative transmit rate 10.0 pps, cumulative receive rate 10.0 pps
```

show bfd session brief

The output for the **show bfd session brief** command is identical to that for the **show bfd session** command.

show bfd session detail

```
user@host> show bfd session detail
                                                     Transmit
Address              State     Interface     Detect Time  Interval  Multiplier
10.9.1.33            Up        so-7/1/0.0          0.600     0.200      3

BGP Operational Commands

clear bgp damping

List of Syntax

Syntax on page 1664
Syntax (EX Series Switch and QFX Series) on page 1664

Syntax

clear bgp damping
<logical-system (all | *logical-system-name*)>
<*prefix*>

Syntax (EX Series Switch and QFX Series)

clear bgp damping
<*prefix*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear BGP route flap damping information.

Options

none—Clear all BGP route flap damping information.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix—(Optional) Clear route flap damping information for only the specified destination prefix.

Required Privilege Level

clear

Related Documentation

clear bgp neighbor

List of Syntax

Syntax on page 1665
Syntax (EX Series Switch and QFX Series) on page 1665

Syntax

clear bgp neighbor
<all>
<as *as-number*>
<gracefully>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<malformed-route>
<*neighbor*>
<soft | soft-inbound>
<soft-minimum-igp>
<stale-routes>

Syntax (EX Series Switch and QFX Series)

clear bgp neighbor
<all>
<as *as-number*>
<instance *instance-name*>
<malformed-route>
<*neighbor*>
<soft | soft-inbound>
<soft-minimum-igp>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
malformed-route option introduced in Junos OS Release 13.2.
all option introduced in Junos OS Release 14.2.
gracefully and **stale-routes** options introduced in Junos OS Release 15.1.

Description

Perform one of the following tasks:

- Change the state of one or more BGP neighbors to **IDLE**. For neighbors in the **ESTABLISHED** state, this command drops the TCP connection to the neighbors and then reestablishes the connection.
- (**soft** keyword only) Reapply export policies and send refresh updates to one or more BGP neighbors without changing their state.
- (**soft-inbound** keyword only) Send a route-refresh message to one or more BGP neighbors without changing their state, and reapply import policies on the received updates.

Options

all—Change the state of all BGP neighbors to **IDLE**.

as ***as-number***—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).

gracefully—(Optional) Enable the BGP peer to start graceful-restart receiving-speaker mode. The receiving speaker also sends its own routes to the restarted speaker, and sends an End-of-RIB marker when it completes the update. The **clear bgp neighbor** ***neighbor-address*** **gracefully** command is the same as **clear bgp neighbor hard** (the default for **clear bgp neighbor**), but it does not use the new Hard Reset subcode on the Notify and Cease messages that are sent. This allows the neighbor to enter GR or LLGR helper mode, if negotiated. The session is still cleared on this router, and this router does not enter GR or LLGR helper mode.

instance ***instance-name***—(Optional) Apply this command only to neighbors for the specified routing instance.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

malformed-route—(Optional) Remove malformed routes. If a specific neighbor is provided, Junos OS removes malformed routes for that particular neighbor. Otherwise, Junos OS removes malformed routes for all BGP neighbors. To find routes that have malformed attributes, run the **show route hidden** command, and look for routes marked with **MalformedAttr** in the AS path field.

neighbor—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

soft—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

soft-inbound—(Optional) Send a route-refresh message to BGP neighbors and reapply import policies on the route updates received from the BGP neighbors without clearing the BGP state.

soft-minimum-igp—(Optional) Provide soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

stale-routes—(Optional) Any stale route currently being held for the specified neighbor because of BGP graceful restart (GR) or long-lived graceful restart (LLGR) receiver mode operations.

Required Privilege Level clear

Related Documentation

List of Sample Output clear bgp neighbor on page 1667

Output Fields When you enter this command, you are provided feedback on the status of your request.

 Copyright © 2018, Juniper Networks, Inc.

Sample Output

clear bgp neighbor

`user@host>` **clear bgp neighbor**

clear bgp table

Syntax

clear bgp table ***table-name***
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and QFX Series)

clear bgp table ***table-name***

Release Information

Command introduced in Junos OS Release 9.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Request that BGP refresh routes in a specified routing table.

Options

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table-name—Request that BGP refresh routes in the specified table.

Additional Information

In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the **clear bgp table** command to request that BGP refresh routes in a VPN instance table.

Required Privilege Level

clear

List of Sample Output

clear bgp table private.inet.0 on page 1668
clear bgp table inet.6 logical-system all on page 1668

show bgp bmp

Syntax

show bgp bmp

Release Information

Command introduced in Junos OS Release 9.5.
Command introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about the BGP Monitoring Protocol (BMP).

Options

This command has no options.

Required Privilege Level

view

List of Sample Output

show bgp bmp on page 1670

Output Fields

Table 88 on page 1670 lists the output fields for the **show bgp bmp** command. Output fields are listed in the approximate order in which they appear.

Table 88: show bgp bmp Output Fields

Field Name	Field Description
BMP station address/port	IP address and port number of the monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.
BMP session state	Status of the BMP session: **UP** or **DOWN**.
Memory consumed by BMP	Memory used by the active BMP session.
Statistics timeout	Amount of time, in seconds, between transmissions of BMP data to the monitoring station.
Memory limit	Threshold, in bytes, at which the routing device stops collecting BMP data.
Memory-connect retry timeout	Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded.

Sample Output

show bgp bmp

```
user@host> show bgp bmp
  BMP station address/port: 172.24.24.157+5454
  BMP session state: DOWN
```

Copyright © 2018, Juniper Networks, Inc.

```
Memory consumed by BMP: 0
Statistics timeout: 15
Memory limit: 10485760
Memory connect retry timeout: 600
```

show bgp group

List of Syntax

Syntax on page 1672
Syntax (EX Series Switch and QFX Series) on page 1672

Syntax

show bgp group
<brief | detail | summary>
<*group-name*>
<exact-instance *instance-name*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<rtf>

Syntax (EX Series Switch and QFX Series)

show bgp group
<brief | detail | summary>
<*group-name*>
<exact-instance *instance-name*>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
exact-instance option introduced in Junos OS Release 11.4.

Description

Display information about the configured BGP groups.

Options

none—Display group information about all BGP groups.

brief | detail | summary—(Optional) Display the specified level of output.

group-name—(Optional) Display group information for the specified group.

exact-instance *instance-name*—(Optional) Display information for the specified instance only.

instance *instance-name*—(Optional) Display information about BGP groups for all routing instances whose name begins with this string (for example, **cust1**, **cust11**, and **cust111** are all displayed when you run the **show bgp group instance cust1** command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

rtf—(Optional) Display BGP group route targeting information.

Required Privilege Level

Output Fields

Table 89 on page 1673 describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

Table 89: show bgp group Output Fields

Field Name	Field Description	Level of Output
Group Type or **Group**	Type of BGP group: **Internal** or **External**.	All levels
group-index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.	**rtf detail**
AS	AS number of the peer. For internal BGP (IBGP), this number is the same as **Local AS**.	**brief detail** none
Local AS	AS number of the local routing device.	**brief detail** none
Name	Name of a specific BGP group.	**brief detail** none
Options	The Network Layer Reachability Information (NLRI) format used for BGP VPN multicast.	**none** none
Index	Unique index number of a BGP group.	**brief detail** none
Flags	Flags associated with the BGP group. This field is used by Juniper Networks customer support.	**brief detail** none
BGP-Static Advertisement Policy	Policies configured for the BGP group with the **advertise-bgp-static policy** statement.	**brief** none
Remove-private options	Options associated with the **remove-private** statement.	**brief detail** none
Holdtime	Maximum number of seconds allowed to elapse between successive keepalive or update messages that BGP receives from a peer in the BGP group, after which the connection to the peer is closed and routing devices through that peer become unavailable.	**brief detail** none
Export	Export policies configured for the BGP group with the **export** statement.	**brief detail** none

Copyright © 2018, Juniper Networks, Inc.

Table 89: show bgp group Output Fields (continued)

Field Name	Field Description	Level of Output
Optimal Route Reflection	Client nodes (primary and backup) configured in the BGP group.	**brief detail** none
MED tracks IGP metric update delay	Time, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire	All levels
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.	**brief detail** none
Total peers	Total number of peers in the group.	**brief detail** none
Established	Number of peers in the group that are in the established state.	All levels

Active/Received/Accepted/Damped	Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established in the main routing device or in a routing instance.
	• If a peer is not established, the field shows the state of the peer session: **Active**, **Connect**, or **Idle**.
	• If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the **inet.0** (main) and **inet.2** (multicast) routing tables. For example, **8/10/10/2 and 2/4/4/0** indicate the following:
	  ◦ 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the **inet.0** routing table.
	  ◦ 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the **inet.2** routing table.
		summary

ip-addresses	List of peers who are members of the group. The address is followed by the peer's port number.	All levels
Route Queue Timer	Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.	**detail**
Route Queue	Number of prefixes that are queued up for sending to the peers in the group.	**detail**
inet.*number*	Number of active, received, accepted, and damped routes in the routing table. For example, **inet.0: 7/10/9/0** indicates the following: • 7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the **inet.0** routing table.	none

Table 89: show bgp group Output Fields (continued)

Field Name	Field Description	Level of Output
Table inet.*number*	Information about the routing table. • **Received prefixes**—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • **Active prefixes**—Number of prefixes received from the peer that are active in the routing table. • **Suppressed due to damping**—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. • **Advertised prefixes**—Number of prefixes advertised to a peer. • **Received external prefixes**—Total number of prefixes from the external BGP (EBGP) peers, both active and inactive, that are in the routing table. • **Active external prefixes**—Number of prefixes received from the EBGP peers that are active in the routing table. • **Externals suppressed**—Number of routes received from EBGP peers currently inactive because of damping or other reasons. • **Received internal prefixes**—Total number of prefixes from the IBGP peers, both active and inactive, that are in the routing table. • **Active internal prefixes**—Number of prefixes received from the IBGP peers that are active in the routing table. • **Internals suppressed**—Number of routes received from IBGP peers currently inactive because of damping or other reasons. • **RIB State**—Status of the graceful restart process for this routing table: **BGP restart is complete**, **BGP restart in progress**, **VPN restart in progress**, or **VPN restart is complete**.	**detail**
Groups	Total number of groups.	All levels
Peers	Total number of peers.	All levels
External	Total number of external peers.	All levels
Internal	Total number of internal peers.	All levels
Down peers	Total number of unavailable peers.	All levels
Flaps	Total number of flaps that occurred.	All levels
Table	Name of a routing table.	**brief**, none
Tot Paths	Total number of routes.	**brief**, none
Act Paths	Number of active routes.	**brief**, none
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	**brief**, none

Copyright © 2018, Juniper Networks, Inc.

Table 89: show bgp group Output Fields (continued)

Field Name	Field Description	Level of Output
History	Number of withdrawn routes stored locally to keep track of damping history.	**brief**, none
Damp State	Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.	**brief**, none
Pending	Routes being processed by the BGP import policy.	**brief**, none
Group	Group the peer belongs to in the BGP configuration.	**detail**
Receive mask	Mask of the received target included in the advertised route.	**detail**
Entries	Number of route entries received.	**detail**
Target	Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer.	**detail**
Mask	Mask which specifies that the peer receive routes with the given route target.	**detail**

show bgp group traffic-statistics

Syntax

show bgp group traffic-statistics
<brief | detail>
<*group-name*>
<labeled-path label *label*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.
labeled-path option introduced in Junos OS Release 18.1R1 for the MX Series.

Description

Display the traffic statistics for configured Border Gateway Protocol (BGP) groups.

Options

none—Display traffic statistics for all BGP groups.

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Display BGP traffic statistics for only the specified group.

label-path—(Optional) Display labeled unicast traffic statistics at the ingress.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show bgp group traffic-statistics (Per-Group-Label Not Configured) on page 1681
show bgp group traffic-statistics (Per-Group-Label Configured) on page 1681
show bgp group traffic-statistics labeled-path (Labeled Unicast) on page 1682

Output Fields

Table 90 on page 1680 describes the output fields for the **show bgp group traffic-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 90: show bgp group traffic-statistics Output Fields

Field Name	Field Description
Group name	Name of a specific BGP group.
Group Index	Index number for the BGP group.
NLRI	Network layer reachability information (NLRI) indicating the source of the traffic statistics for the BGP group.
FEC	Forwarding equivalence classes (FECs) associated with the BGP group.
Packets	Number of packets sent through each FEC.
Bytes	Number of bytes transmitted through each FEC.

Copyright © 2018, Juniper Networks, Inc.

Table 90: show bgp group traffic-statistics Output Fields (continued)

Field Name	Field Description
EgressAS	Autonomous system (AS) number of the egress router.
AdvLabel	Label associated with each FEC.

show bgp neighbor

List of Syntax

Syntax on page 1683
Syntax (EX Series Switch, QFX Series, and OCX Series) on page 1683

Syntax

show bgp neighbor
<exact-instance *instance-name*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor-address*>
<output-queue>
<orf (detail | *neighbor-address*)

Syntax (EX Series Switch, QFX Series, and OCX Series)

show bgp neighbor
<instance *instance-name*>
<exact-instance *instance-name*>
<*neighbor-address*>
<orf (*neighbor-address* | detail)

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1x53-D20 for the OCX Series.
orf option introduced in Junos OS Release 9.2.
exact-instance option introduced in Junos OS Release 11.4.
output-queue option introduced in Junos OS Release 16.1

Description

Display information about BGP peers.

Options

none—Display information about all BGP peers.

exact-instance ***instance-name***—(Optional) Display information for the specified instance only.

instance ***instance-name***—(Optional) Display information about BGP peers for all routing instances whose name begins with this string (for example, **cust1**, **cust11**, and **cust111** are all displayed when you run the **show bgp neighbor instance cust1** command).

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor-address—(Optional) Display information for only the BGP peer at the specified IP address.

orf (detail | ***neighbor-address*****)**—(Optional) Display outbound route-filtering information for all BGP peers or only for the BGP peer at the specified IP address. The default is to display brief output. Use the **detail** option to display detailed output.

output-queue—(Optional) Display information regarding the number of routes currently queued in the 17 prioritized BGP output queues.

List of Sample Output

Output Fields Table 91 on page 1684 describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 91: show bgp neighbor Output Fields

Field Name	Field Description
Peer	Address of the BGP neighbor. The address is followed by the neighbor port number.
AS	AS number of the peer.
Local	Address of the local routing device. The address is followed by the peer port number.
Type	Type of peer: **Internal** or **External**.
State	Current state of the BGP session: • **Active**—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • **Connect**—BGP is waiting for the transport protocol connection to be completed. • **Established**—The BGP session has been established, and the peers are exchanging update messages. • **Idle**—This is the first stage of a connection. BGP is waiting for a Start event. • **OpenConfirm**—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer. • **route reflector client**—The BGP session is established with a route reflector client.

 Copyright © 2018, Juniper Networks, Inc.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Flags	Internal BGP flags: • **Aggregate Label**—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label. • **CleanUp**—The peer session is being shut down. • **Delete**—This peer has been deleted. • **Idled**—This peer has been permanently idled. • **ImportEval**—At the last commit operation, this peer was identified as needing to reevaluate all received routes. • **Initializing**—The peer session is initializing. • **SendRtn**—Messages are being sent to the peer. • **Sync**—This peer is synchronized with the rest of the peer group. • **RSync**—This peer in the backup Routing Engine is synchronized with the BGP peer in the master Routing Engine for nonstop active routing. • **TryConnect**—Another attempt is being made to connect to the peer. • **Unconfigured**—This peer is not configured. • **WriteFailed**—An attempt to write to this peer failed.
Last state	Previous state of the BGP session: • **Active**—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • **Connect**—BGP is waiting for the transport protocol connection to be completed. • **Established**—The BGP session has been established, and the peers are exchanging update messages. • **Idle**—This is the first stage of a connection. BGP is waiting for a Start event. • **OpenConfirm**—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • **OpenSent**—BGP has sent an open message and is waiting to receive an open message from the peer.
Last event	Last activity that occurred in the BGP session: • **Closed**—The BGP session closed. • **ConnectRetry**—The transport protocol connection failed, and BGP is trying again to connect. • **HoldTime**—The session ended because the hold timer expired. • **KeepAlive**—The local routing device sent a BGP keepalive message to the peer. • **Open**—The local routing device sent a BGP open message to the peer. • **OpenFail**—The local routing device did not receive an acknowledgment of a BGP open message from the peer. • **RecvKeepAlive**—The local routing device received a BGP keepalive message from the peer. • **RecvNotify**—The local routing device received a BGP notification message from the peer. • **RecvOpen**—The local routing device received a BGP open message from the peer. • **RecvUpdate**—The local routing device received a BGP update message from the peer. • **Start**—The peering session started. • **Stop**—The peering session stopped. • **TransportError**—A TCP error occurred.

Copyright © 2018, Juniper Networks, Inc.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Last error	Last error that occurred in the BGP session: • **Cease**—An error occurred, such as a version mismatch, that caused the session to close. • **Finite State Machine Error**—In setting up the session, BGP received a message that it did not understand. • **Hold Time Expired**—The session's hold time expired. • **Message Header Error**—The header of a BGP message was malformed. • **Open Message Error**—A BGP open message contained an error. • **None**—No errors occurred in the BGP session. • **Update Message Error**—A BGP update message contained an error.
Export	Name of the export policy that is configured on the peer.
Import	Name of the import policy that is configured on the peer.
Options	Configured BGP options: • **AddressFamily**—Configured address family: inet or inet-vpn. • **AdvertiseBGPStatic**—Configured BGP static routes are advertised. • **AutheKeyChain**—Authentication key change is enabled. • **DropPathAttributes**—Certain path attributes are configured to be dropped from neighbor updates during inbound processing. • **GracefulRestart**—Graceful restart is configured. • **HoldTime**—Hold time configured with the **hold-time** statement. The hold time is three times the interval at which keepalive messages are sent. • **IgnorePathAttributes**—Certain path attributes are configured to be ignored in neighbor updates during inbound processing. • **Local Address**—Address configured with the **local-address** statement. • **LLGR**—BGP long-lived graceful restart capability is configured. • **LLGRHelperDisabled**—BGP long-lived graceful restart is completely disabled for a neighbor. • **Multihop**—Allow BGP connections to external peers that are not on a directly connected network. • **NLRI**—Configured MBGP state for the BGP group: **multicast**, **unicast**, or both if you have configured **nlri any**. • **Peer AS**—Configured peer autonomous system (AS). • **Preference**—Preference value configured with the **preference** statement. • **Refresh**—Configured to refresh automatically when the policy changes. • **Rib-group**—Configured routing table group. • **RFC6514CompliantSafi129**—Configured SAFI 129 according to RFC 6514 (BGP VPN multicast used to use SAFI 128).
Path-attributes dropped	Path attribute codes that are dropped from neighbor updates.
Path-attributes ignored	Path attribute codes that are ignored during neighbor updates.
Peer does not support LLGR Restarter or Receiver functionality	BGP neighbor does not support long-lived graceful restart (LLGR) restarter mode completely.

Copyright © 2018, Juniper Networks, Inc.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Peer does not support LLGR Restarter functionality	BGP neighbor does not support long-lived graceful restart (LLGR) restarter mode for any family.
Authentication key change	(Appears only if the **authentication-keychain** statement has been configured) Name of the authentication keychain enabled.
Authentication algorithm	(Appears only if the **authentication-algorithm** statement has been configured) Type of authentication algorithm enabled: **hmac** or **md5**.
Address families configured	Names of configured address families for the VPN.
BGP-Static Advertisement Policy	Name of the BGP static policy that is configured on the peer.
Local Address	Address of the local routing device.
Remove-private options	Options associated with the **remove-private** statement.
Holdtime	Hold time configured with the **hold-time** statement. The hold time is three times the interval at which keepalive messages are sent.
Flags for NLRI inet-label-unicast	Flags related to labeled-unicast: • **TrafficStatistics**—Collection of statistics for labeled-unicast traffic is enabled.
Traffic statistics	Information about labeled-unicast traffic statistics: • **Options**—Options configured for collecting statistics about labeled-unicast traffic. • **File**—Name and location of statistics log files. • **size**—Size of all the log files, in bytes. • **files**—Number of log files.
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.
Preference	Preference value configured with the **preference** statement.
Outbound Timer	Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the **out-delay** parameter is configured to a non-zero value.
Number of flaps	Number of times the BGP session has gone down and then come back up.
Peer ID	Router identifier of the peer.
Group index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.

Copyright © 2018, Juniper Networks, Inc.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Peer index	Index that is unique within the BGP group to which the peer belongs.
Local ID	Router identifier of the local routing device.
Local Interface	Name of the interface on the local routing device.
Active holdtime	Hold time that the local routing device negotiated with the peer.
Keepalive Interval	Keepalive interval, in seconds.
BFD	Status of BFD failure detection.
Local Address	Name of directly connected interface over which direct EBGP peering is established.
NLRI and times for LLGR configured on peer	Names of address families and stale time for BGP long-lived graceful restart configured on the BGP peer or neighbor. Times are displayed using the routing protocol daemon (rpd) %#0T format: **<weeks>w<days>d <hours>:<minutes>:<seconds>** Zero leading elements are omitted, for example, a value less than one week do not include the weeks.
NLRI and times that peer supports LLGR Restarter for	Names of address families and stale time that the BGP peer supports for restarter mode for BGP long-lived graceful restart. Times are displayed using the routing protocol daemon (rpd) %#0T format: **<weeks>w<days>d <hours>:<minutes>:<seconds>** Zero leading elements are omitted, for example, a value less than one week do not include the weeks.
NLRI that peer saved LLGR forwarding for	Name of the address family for which the BGP peer saved BGP long-lived graceful restart forwarding.
Graceful Restart Details	Amount of time that is remaining until LLGR expires and the time remaining on the GR stale timer, along with RIB details, are displayed while LLGR receiver mode is active (a peer that negotiated LLGR has disconnected and not yet reconnected).
NLRI we are holding stale routes for	Names of address families (NLRIs) for which that stale routes are held or preserved when BGP graceful restart receiver mode is active for a neighbor.
Time until end-of-rib is assumed for stale routes	Amount of time remaining on the stale timer until which end-of-RIB (EoR) markers are assumed when BGP graceful restart receiver mode is active for a neighbor. Time is displayed in Coordinated Universal Time (UTC) format (YYYY-MM-DD-HH:MM:SS). Note that the stale timer display (‘Time until end-of-rib is assumed’) is also present when a session is active, but the neighbor as not yet sent all of the end-of-rib indications.
Time until stale routes are deleted or become long-lived stale	Amount of time up to which stale routes are deleted or become long-lived stale routes when BGP graceful restart receiver mode is active for a neighbor.

 Copyright © 2018, Juniper Networks, Inc.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
NLRI for restart configured on peer	Names of address families configured for restart.
NLRI advertised by peer	Address families supported by the peer: **unicast** or **multicast**.
NLRI for this session	Address families being used for this session.
Peer supports Refresh capability	Remote peer's ability to send and request full routing table readvertisement (route refresh capability). For more information, see RFC 2918, *Route Refresh Capability for BGP-4*.
Restart time configured on peer	Configured time allowed for restart on the neighbor.
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Peer does not support Restarter functionality	Graceful restart restarter-mode is disabled on the peer.
Peer does not support Receiver functionality	Graceful restart helper-mode is disabled on the peer.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the **end-of-rib** marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Peer supports 4 byte AS extension (peer-as 1)	Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.

Copyright © 2018, Juniper Networks, Inc.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
NLRIs for which peer can receive multiple paths	Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route. Possible value is inet-unicast.
NLRIs for which peer can send multiple paths: inet-unicast	Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route. Possible value is inet-unicast.
Table inet.*number*	Information about the routing table: • **RIB State**—BGP is in the graceful restart process for this routing table: **restart is complete** or **restart in progress**. • **Bit**—Number that represents the entry in the routing table for this peer. • **Send state**—State of the BGP group: **in sync**, **not in sync**, or **not advertising**. • **Active prefixes**—Number of prefixes received from the peer that are active in the routing table. • **Received prefixes**—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • **Accepted prefixes**—Total number of prefixes from the peer that have been accepted by a routing policy. • **Suppressed due to damping**—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Input dropped path attributes	Information about dropped path attributes: • Code—Path attribute code. • Count—Path attribute count.
Input ignored path attributes	Information about ignored path attributes: • Code—Path attribute code. • Count—Path attribute count.

 Copyright © 2018, Juniper Networks, Inc.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Output queue	Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue **0** is for unicast NLRIs, and queue **1** is for multicast NLRIs. It also specifies the routing table name and the NLRI that the table was advertised through, in the format **(*routing table name*, *NLRI*)**. NOTE: The output queue of routing tables that are not advertised, will only show up at **extensive** output level.
Trace options	Configured tracing of BGP protocol packets and operations.
Trace file	Name of the file to receive the output of the tracing operation.
Filter Updates recv	(**orf** option only) Number of outbound-route filters received for each configured address family. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Immediate	(**orf** option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Filter	(**orf** option only) Type of prefix filter received: **prefix-based** or **extended-community**.
Received filter entries	(**orf** option only) List of received filters displayed.
seq	(**orf** option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
prefix	(**orf** option only) Address for the prefix entry that matches the filter.
minlength	(**orf** option only) Minimum prefix length, in bits, required to match this prefix.
maxlength	(**orf** option only) Maximum prefix length, in bits, required to match this prefix.
match	(**orf** option only) For this prefix match, whether to **permit** or **deny** route updates.

Sample Output

show bgp neighbor

`user@host >` **show bgp neighbor**

For M Series, MX Series, and T Series routers running Junos OS Release 16.1 or later, the **show bgp neighbor** output includes the BGP group the peer belongs to, the routing instance (if any) that the peer is configured in, and the routing instance that the peer is using for the forwarding context (if applicable). An example follows.

```
Peer: 10.255.7.250+179 AS 10   Local: 10.255.7.248+63740 AS 10
  Group: toAsbr2               Routing-Instance: master
  Forwarding routing-instance: toAs2
    Type: Internal    State: Established    Flags: <Sync>
  Last State: OpenConfirm   Last Event: RecvKeepAlive
  Last Error: None
  Export: [ redist_static ]

show bgp replication

Syntax **show bgp replication**

Release Information Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for **logical-system** option introduced in Junos OS Release 13.3

Description Displays the status of BGP state replication between the master and backup Routing Engines on devices that have nonstop active routing configured on them.

CAUTION: Before attempting nonstop active routing switchover, check the output of **show bgp replication** to confirm that BGP routing table synchronization has completed on the backup Routing Engine. The **complete** status in the output of **show task replication** only indicates that the socket replication has completed and the BGP synchronization is in progress.

To determine whether BGP synchronization is complete, you must check the **Protocol state** and **Synchronization state** fields in the output of **show bgp replication** on the master Routing Engine. The **Protocol state** must be **idle** and the **Synchronization state** must be **complete**. If you perform NSR switchover before the BGP synchronization has completed, the BGP session might flap.

Options This command has no options.

Required Privilege Level view

Related Documentation
- *show bgp replication logical-system*

List of Sample Output
show bgp replication (for Master) on page 1703
show bgp replication (for Master) on page 1703
show bgp replication (for Backup) on page 1703

Output Fields Table 92 on page 1702 lists the output fields for the **show bgp replication** command. Output fields are listed in the approximate order in which they appear.

Table 92: show bgp replication Output Fields

Field Name	Field Description
Precision timer registration	State of BGP precision timer feature in the kernel. • **Registered**—BGP registers with the precision-timer feature in the kernel for auto keepalive generation after switchover. • **NotRegistered**—Keepalive format of BGP is not registered.
session state	State of the current internal BGP state replication session, Up or Down, and the duration for which the session has been in the indicated state.
flaps	Total number of flaps that occurred.
protocol state	Current state of the protocol operation, Active, Connect, Idle, and the duration for which the protocol has been in the indicated state.
synchronization state	Synchronization state at the time of executing the command. The states can be: • **Idle** • **Neighbor**—Indicates that the neighbor state synchronization is in progress. • **AckWait**—Indicates that the request processing is over. • **ORF**—Indicates that the outbound routing filter synchronization is in progress. • **RIB**—Indicates that the routing table synchronization is in progress. • **Complete**
number of peers waiting	Total number of peers waiting for various messages: • **AckWait**—Number of peers waiting for a connection establishment or completed acknowledgment messages. • **SoWait**—Number of peers waiting for TCP socket-related operations. • **Scheduled**—Number of peers being synchronized.
messages sent	Number of various types of messages that have been sent since internal replication session became active: • **Open**—Number of Open messages sent. • **Establish**—Number of connection establishment acknowledgment messages sent. • **Update**—Number of update messages sent. • **Error**—Number of error messages sent. • **Complete**—Number of connection complete acknowledgment messages sent.

messages received	Total number of messages received:
	• **Open**—Number of Open messages received.
	• **Request**—Number of request messages received:
	  ◦ **Wildcard**—Number of requests received that used wildcards in the target address.
	  ◦ **Targeted**—Number of requests received that used a specific address.
	• **EstablishAck**—Number of connection establishment acknowledgement messages received.
	• **CompleteAck**—Number of connection completed acknowledgement messages received.

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
exact-instance option introduced in Junos OS Release 11.4.
group option introduced in Junos OS Release 13.3.

Description

Display BGP summary information.

Options

none—Display BGP summary information for all routing instances.

exact-instance ***instance-name***—(Optional) Display information for the specified instance only.

group—Display overview of bgp information for a particular group

instance ***instance-name***—(Optional) Display information for all routing instances whose name begins with this string (for example, **cust1**, **cust11**, and **cust111** are all displayed when you run the **show bgp summary instance cust1** command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields Table 93 on page 1705 describes the output fields for the **show bgp summary** command. Output fields are listed in the approximate order in which they appear.

Table 93: show bgp summary Output Fields

Field Name	Field Description
Groups	Number of BGP groups.
Peers	Number of BGP peers.
Down peers	Number of down BGP peers.
Table	Name of routing table.
Tot Paths	Total number of paths.
Act Paths	Number of active routes.
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
History	Number of withdrawn routes stored locally to keep track of damping history.
Damp State	Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.
Pending	Routes in process by BGP import policy.
Peer	Address of each BGP peer. Each peer has one line of output.
AS	Peer's AS number.
InPkt	Number of packets received from the peer.
OutPkt	Number of packets sent to the peer.
OutQ	Number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is **0** because the queue usually is emptied quickly.
Flaps	Number of times the BGP session has gone down and then come back up.
Last Up/Down	Last time since the neighbor transitioned to or from the established state.

Copyright © 2018, Juniper Networks, Inc.

Table 93: show bgp summary Output Fields (continued)

Field Name	Field Description
State|#Active /Received/Accepted /Damped	Multipurpose field that displays information about BGP peer sessions. The field’s contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance. • If a peer is not established, the field shows the state of the peer session: **Active**, **Connect**, or **Idle**. In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: **Idle (Removal in progress)** or **Idle (LicenseFailure)**. • If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the **inet.0** (main) and **inet.2** (multicast) routing tables. For example, **8/10/10/2 and 2/4/4/0** indicate the following: ◦ 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the **inet.0** routing table. ◦ 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the **inet.2** routing table. • If a BGP session is established in a routing instance, the field indicates the established **(Establ)** state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, **Establ VPN-AB.inet.0: 2/4/0** indicates the following: ◦ The BGP session is established. ◦ Routes are received in the **VPN-AB.inet.0** routing table. ◦ The local routing device has two active routes, four received routes, and no damped routes from a BGP peer. When a BGP session is established, the peers are exchanging update messages. NOTE: When graceful restart or LLGR helper mode is active, the RIB information is now displayed by the **show bgp summary** command. If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the inet.0 (main) and inet.2 (multicast) routing tables. For example, 8/10/10/2 and 2/4/4/0 indicate the following: • 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the inet.0 routing table. • 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the inet.2 routing table.

Syntax (EX Series Switch and QFX Series)

show policy damping

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about BGP route flap damping parameters.

Options

none—Display information about BGP route flap damping parameters.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.

Required Privilege Level

List of Sample Output

show policy damping on page 1711

Output Fields

Table 94 on page 1711 describes the output fields for the **show policy damping** command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 94: show policy damping Output Fields

Field Name	Field Description
Halflife	Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes.
Reuse merit	Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.
Suppress/cutoff merit	Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.
Maximum suppress time	Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.
Computed values	• **Merit ceiling**—Maximum merit that a flapping route can collect. • **Maximum decay**—Maximum decay half-life, in minutes.

Sample Output

show policy damping

```
user@host> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453
```

<instance *instance-name*>
<interface *interface-name*)>

Release Information Command introduced before Junos OS Release 7.4.

Description Display End System-to-Intermediate System (ES-IS) adjacencies.

Options

none—(Same as **brief**) Display all ES-IS adjacencies.

brief | detail | extensive—(Optional) Display the specified level of output.

esis-neighbor-id—(Optional) Display adjacencies for the specified neighbor's network service access point (NSAP) only.

instance *instance-name*—(Optional) Display adjacencies for the specified routing instance only.

interface *interface-name*—(Optional) Display adjacencies for the specified interface only.

Required Privilege Level view

List of Sample Output

show esis adjacency on page 1717
show esis adjacency brief on page 1717
show esis adjacency detail on page 1717
show esis adjacency extensive on page 1717

Output Fields Table 95 on page 1716 describes the output fields for the **show esis adjacency** command. Output fields are listed in the approximate order in which they appear.

Table 95: show esis adjacency Output Fields

Field Name	Field Description	Level of Output
Nbr Type	Type of network service access point (NSAP) of this neighbor.	**brief** none
NSAP/NET	NSAP of this neighbor.	All levels
Type	Type of NSAP of this neighbor.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 95: show esis adjacency Output Fields (continued)

Field Name	Field Description	Level of Output
Hold (secs)	Holdtime interval advertised by this neighbor.	**brief** none
Interface	Interface through which the neighbor is reachable.	All levels
Advertised holdtime	Holdtime interval advertised by this neighbor.	**detail extensive**
Expires in	How long until the adjacency expires, in seconds.	**detail extensive**
SNPA	Subnetwork point of attachment (MAC address of the neighbor).	**detail extensive**
Transition log	List of recent transitions. • **When**—Time of advertisement from this neighbor. • **State**—State of the adjacency: **Up**, **Down**, **New**, **One-way**, **Initializing**, or **Rejected**. • **Event**—Event causing the state. • **Down reason**—Reason the adjacency is down.	**extensive**

Sample Output

show esis adjacency

```
user@host> show esis adjacency
Nbr  NSAP/NET                                          Hold  Interface
Type                                                  (secs)
IS   47.0005.80ff.f800.0000.0108.0001.0102.5501.6008    135 fe-0/0/0.0
```

show esis adjacency brief

The output for the **show esis adjacency brief** command is identical to that for the **show esis adjacency** command. For sample output, see show esis adjacency on page 1717.

show esis adjacency detail

```
user@host> show esis adjacency detail
NSAP/NET: 47.0005.80ff.f800.0000.0108.0001.0102.5501.6008, Type: IS
  Interface: fe-0/0/0.0, Advertised hold time: 180 secs, Expires in: 173 secs
  SNPA: 0:5:85:c1:73:71
```

show esis adjacency extensive

```

show esis interface

Syntax

show esis interface
<brief | detail | extensive>
<instance *instance-name*>
<interface *interface-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display End System-to-Intermediate System (ES-IS) interface information.

Options

none—(Same as **brief**) Display information for all configured ES-IS interfaces.

brief | detail | extensive—(Optional) Display the specified level of output.

instance ***instance-name***—(Optional) Display configured interfaces for the specified routing instance only.

interface ***interface-name***—(Optional) Display information about the specified interface only.

Required Privilege Level

view

List of Sample Output

show esis interface on page 1720
show esis interface brief on page 1720
show esis interface detail on page 1720
show esis interface extensive on page 1720

Output Fields

Table 96 on page 1719 describes the output fields for the **show esis interface** command. Output fields are listed in the approximate order in which they appear.

Table 96: show esis interface Output Fields

Field Name	Field Description	Level of Output
Interface	Interface through which the adjacency is made.	All levels
Receives	Types of hello messages that are received.	All levels
Sends	Types of hello messages that are sent.	All levels
Hello interval	Interface's hello interval, in seconds.	All levels
Adjacencies or **Num Adj**	Number of adjacencies established on this interface.	All levels
Holdtime	Interface's hold time, in seconds.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 96: show esis interface Output Fields (continued)

Field Name	Field Description	Level of Output
State	Internal implementation information.	**detail extensive**
End system configuration timer	Time, in seconds, for the end system to configure itself for ES-IS.	**detail extensive**
Interface index	Index value.	**detail extensive**
NET used in hello	Network entity title used in hello messages.	**detail extensive**

Sample Output

show esis interface

```
user@host> show esis interface
Interface                Receives     Sends  Hello Interval  Num Adj
fe-0/0/0.0                    ISH       ISH           60.00        1
lo0.0                         ISH         -           60.00        0
```

show esis interface brief

The output for the **show esis interface brief** command is identical to that for the **show esis interface** command. For sample output, see show esis interface on page 1720.

show esis interface detail

```
user@host> show esis interface detail
Interface: fe-0/0/0.0
  Receives: ISH, Sends: ISH, Hello interval: 60.00
  Adjacencies: 1, Holdtime: 180, End system configuration timer: 180
  Interface index: 68, State: 0x2
  NET used in hello: 47.0005.80ff.f800.0000.0108.0001.0102.5501.6007

Interface: lo0.0
  Receives: ISH, Sends:  - , Hello interval: 60.00
  Adjacencies: 0, Holdtime: 180, End system configuration timer: 180
  Interface index: 64, State: 0x2
  NET used in hello: 47.0005.80ff.f800.0000.0108.0001.0102.5501.6007
```

show esis interface extensive

The output for the **show esis interface extensive** command is identical to that for the **show esis interface detail** command. For sample output, see show esis interface detail on page 1720.

show esis statistics

Syntax

show esis statistics
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display End System-to-Intermediate System (ES-IS) packet statistics.

Options

none—Display ES-IS packet statistics for all routing instances.

instance *instance-name*—(Optional) Display ES-IS statistics for the specified routing instance only.

Required Privilege Level

view

List of Sample Output

show esis statistics on page 1722

Output Fields

Table 97 on page 1721 describes the output fields for the **show esis statistics** command. Output fields are listed in the approximate order in which they appear.

Table 97: show esis statistics Output Fields

Field Name	Field Description
PDU type	Protocol data unit type.
Received	Number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	Number of PDUs received less the number dropped.
Drops	Number of PDUs dropped.
Sent	Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Total packets received/sent	Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.

Sample Output

show esis statistics

```
user@host> show esis statistics
PDU type  Received Processed Drops    Sent
ESH              3         3     0       8
ISH             11        10     1       4
RD               0         0     0       0
Unknown          0         0     0       0
Totals          14        13     1      12
Total packets received: 14 sent: 0
```

clear amt statistics

Syntax

clear amt statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information Command introduced in JUNOS Release 10.2.

Description Clear Automatic Multicast Tunneling (AMT) statistics.

Options

none—Clear the multicast statistics for all AMT tunnel interfaces.

instance *instance-name*—(Optional) Clear AMT multicast statistics for the specified instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level clear

Related Documentation

clear amt tunnel

Syntax

clear amt tunnel
<gateway *gateway-ip-addr*> <port *port-number*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<statistics>
<tunnel-interface *interface-name*>

Release Information

Command introduced in JUNOS Release 10.2.

Description

Clear the Automatic Multicast Tunneling (AMT) multicast state. Optionally, clear AMT protocol statistics.

Options

none—Clear multicast state for all AMT tunnel interfaces.

gateway *gateway-ip-addr* port *port-number*—(Optional) Clear the AMT multicast state for the specified gateway address. If no port is specified, clear the AMT multicast state for all AMT gateways with the given IP address.

instance *instance-name*—(Optional) Clear the AMT multicast state for the specified instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

statistics—(Optional) Clear multicast statistics for all AMT tunnels or for specified tunnels.

tunnel-interface *interface-name*—(Optional) Clear the AMT multicast state for the specified AMT tunnel interface.

Required Privilege Level

clear

clear igmp membership

List of Syntax

Syntax on page 1729
Syntax (EX Series Switch and the QFX Series) on page 1729

Syntax

clear igmp membership
<all>
<group *address-range*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)

clear igmp membership
<group *address-range*>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear Internet Group Management Protocol (IGMP) group members.

Options

all—Clear IGMP members for groups and interfaces in the master instance.

group ***address-range***—(Optional) Clear all IGMP members that are in a particular address range. An example of a range is **233.252/16**. If you omit the destination prefix length, the default is **/32**.

interface ***interface-name***—(Optional) Clear all IGMP group members on an interface.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

clear

Related Documentation

clear igmp snooping membership

Syntax

clear igmp snooping membership
<vlan *vlan-name*>
<group | source *address*>
<instance *instance-name*>
<interface *interface-name*>
<learning-domain *learning-domain-name*>
<logical-system *logical-system-name*>
<vlan-id *vlan-identifier*>

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 18.1R1 for the SRX1500 devices.

Description

Clear IGMP snooping dynamic membership information from the multicast forwarding table.

Options

none—Clear IGMP snooping membership for all supported address families on all interfaces.

vlan *vlan-name* —(Optional) Clear dynamic membership information for the specified VLAN.

group | source *address*—(Optional) Clear IGMP snooping membership for the specified multicast group or source address.

instance *instance-name*—(Optional) Clear IGMP snooping membership for the specified instance.

interface *interface-name*—(Optional) Clear IGMP snooping membership on a specific interface.

learning-domain *learning-domain-name*—(Optional) Perform this operation on all learning domains or on a particular learning domain.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or for all logical systems.

vlan-id *vlan-identifier*—(Optional) Perform this operation on a particular VLAN.

clear igmp snooping statistics

Syntax

clear igmp snooping statistics
<instance *instance-name*>
<interface *interface-name*>
<learning-domain (all | *learning-domain-name*)>
<logical-system *logical-system-name*>

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 18.1R1 for the SRX1500 devices.

Description

Clear IP IGMP snooping statistics.

Options

none—Clear IGMP snooping statistics for all supported address families on all interfaces.

instance *instance-name*—(Optional) Clear IGMP snooping statistics for the specified instance.

interface *interface-name*—(Optional) Clear IGMP snooping statistics on a specific interface.

learning-domain (all | *learning-domain-name*)—(Optional) Perform this operation on all learning domains or on a particular learning domain.

logical-system *logical-system-name*—(Optional) Delete the IGMP snooping statistics for a given logical system or for all logical systems.

clear msdp cache

Syntax

clear msdp cache
<all>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<peer *peer-address*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear the entries in the Multicast Source Discovery Protocol (MSDP) source-active cache.

Options

all— Clear all MSDP source-active cache entries in the master instance.

instance *instance-name*—(Optional) Clear entries for a specific MSDP instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

peer *peer-address*—(Optional) Clear the MSDP source-active cache entries learned from a specific peer.

clear multicast bandwidth-admission

Syntax

clear multicast bandwidth-admission
<group *group-address*>
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<source *source-address*>

Release Information

Command introduced in Junos OS Release 8.3.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Reapply IP multicast bandwidth admissions.

Options

none—Reapply multicast bandwidth admissions for all IPv4 forwarding entries in the master routing instance.

group *group-address*—(Optional) Reapply multicast bandwidth admissions for the specified group.

inet—(Optional) Reapply multicast bandwidth admission settings for IPv4 flows.

inet6—(Optional) Reapply multicast bandwidth admission settings for IPv6 flows.

instance *instance-name*—(Optional) Reapply multicast bandwidth admission settings for the specified instance. If you do not specify an instance, the command applies to the master routing instance.

interface *interface-name*—(Optional) Examines the corresponding outbound interface in the relevant entries and acts as follows:

- If the interface is congested, and it was admitted previously, it is removed.
- If the interface was rejected previously, the **clear multicast bandwidth-admission** command enables the interface to be admitted as long as enough bandwidth exists on the interface.
- If you do not specify an interface, issuing the **clear multicast bandwidth-admission** command readmits any previously rejected interface for the relevant entries as long as enough bandwidth exists on the interface.

To manually reject previously admitted outbound interfaces, you must specify the interface.

source *source-address*—(Optional) Use with the **group** option to reapply multicast bandwidth admission settings for the specified (source, group) entry.

clear multicast forwarding-cache

Syntax

clear multicast forwarding-cache
<all>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced in Junos OS Release 12.2.

Description

Clear IP multicast forwarding cache entries.

This command is not supported for next-generation multiprotocol BGP multicast VPNs (MVPNs).

Options

all—Clear all multicast forwarding cache entries in the master instance.

inet—(Optional) Clear multicast forwarding cache entries for IPv4 family addresses.

inet6—(Optional) Clear multicast forwarding cache entries for IPv6 family addresses.

instance *instance-name*—(Optional) Clear multicast forwarding cache entries on a specific routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Syntax (EX Series Switch and the QFX Series)

clear pim join
<all>
<*group-address*>
<dense | sparse>
<exact>
<inet | inet6>
<instance *instance-name*>
<rp *ip-address/prefix* | source *ip-address/prefix*>
<sg | star-g>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Multiple new filter options introduced in Junos OS Release 13.2.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear the Protocol Independent Multicast (PIM) join and prune states.

Options

all—To clear PIM join and prune states for all groups and family addresses in the master instance, you must specify “all”..

group-address—(Optional) Clear the PIM join and prune states for a group address.

bidirectional | dense | sparse—(Optional) Clear PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

exact—(Optional) Clear only the group that exactly matches the specified group address.

inet | inet6—(Optional) Clear the PIM entries for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear the entries for a specific PIM-enabled routing instance.

Copyright © 2018, Juniper Networks, Inc.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

rp *ip-address/prefix* | source *ip-address/prefix*—(Optional) Clear the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

sg | star-g—(Optional) Clear PIM (S,G) or (*,G) entries.

Additional Information The **clear pim join** command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level clear

clear pim join-distribution

Syntax

clear pim join-distribution
<all>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced in Junos OS Release 10.0.

Description

Clear the PIM **join-redistribute** states.

Use the **show pim source** command to find out if there are multiple paths available for a source (for example, an RP).

When you include the **join-load-balance** statement in the configuration, the PIM join states are distributed evenly on available equal-cost multipath links. When an upstream neighbor link fails, Junos OS redistributes the PIM join states to the remaining links. However, when new links are added or the failed link is restored, the existing PIM joins are not redistributed to the new link. New flows will be distributed to the new links. However, in a network without new joins and prunes, the new link is not used for multicast traffic. The **clear pim join-distribution** command redistributes the existing flows to the new upstream neighbors. Redistributing the existing flows causes traffic to be disrupted, so we recommend that you run the **clear pim join-distribution** command during a maintenance window.

Options

all— (Optional) Clear the PIM **join-redistribute** states for all groups and family addresses in the master instance.

none— Automatically clear all PIM join/prune states.

instance *instance-name*—(Optional) Redistribute the join states for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The **clear pim join-distribution** command cannot be used to redistribute the PIM join states on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level

clear

inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear Protocol Independent Multicast (PIM) register message counters.

Options

all—Required to clear the PIM register message counters for all groups and family addresses in the master instance.

inet | inet6—(Optional) Clear PIM register message counters for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear register message counters for a specific PIM-enabled routing instance.

interface *interface-name*—(Optional) Clear PIM register message counters for a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The **clear pim register** command cannot be used to clear the PIM register state on a backup Routing Engine when nonstop active routing is enabled.

clear pim snooping join

Syntax

clear pim snooping join
<instance *instance-name*>
<logical-system *logical-system-name*>
<vlan-id *vlan-id*>

Release Information

Command introduced in Junos OS Release 12.3 for MX Series 3D Universal Edge devices.
Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.

Description

Clear information about Protocol Independent Multicast (PIM) snooping joins.

Options

none—Display detailed information.

instance ***instance-name***—(Optional) Clear PIM snooping join information for the specified routing instance.

logical-system ***logical-system-name***—(Optional) Delete the IGMP snooping statistics for a given logical system or for all logical systems.

vlan-id ***vlan-identifier***—(Optional) Clear PIM snooping join information for the specified VLAN.

request pim multicast-tunnel rebalance

List of Syntax

Syntax on page 1763
Syntax (EX Series Switches) on page 1763

Syntax

request pim multicast-tunnel rebalance
<instance *instance-name*>
<logical-system (all | *logical-system-name*>

Syntax (EX Series Switches)

request pim multicast-tunnel rebalance
<instance *instance-name*>

Release Information

Command introduced in Junos OS Release 10.2.
Command introduced in Junos OS Release 10.2 for EX Series switches.

Description

Rebalance the assignment of multicast tunnel encapsulation interfaces across available tunnel-capable PICs or across a configured list of tunnel-capable PICs. You can determine whether a rebalance is necessary by running the **show pim interfaces instance *instance-name*** command.

Options

none—Re-create and rebalance all tunnel interfaces for all routing instances.

instance *instance-name*—Re-create and rebalance all tunnel interfaces for a specific instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

maintenance

Related Documentation

- show pim interfaces on page 1889
- *Load Balancing Multicast Tunnel Interfaces Among Available PICs*

Output Fields

This command produces no output. To verify the operation of the command, run the **show pim interface instance *instance-name*** before and after running the **request pim multicast-tunnel rebalance** command.

show amt statistics

Syntax

show amt statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced in JUNOS Release 10.2.

Description

Display information about the Automatic Multicast Tunneling (AMT) protocol tunnel statistics.

Options

none—Display summary information about all AMT Protocol tunnels.

instance *instance-name*—(Optional) Display information for the specified instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

List of Sample Output

show amt statistics on page 1765

Output Fields

Table 98 on page 1764 describes the output fields for the **show amt statistics** command. Output fields are listed in the approximate order in which they appear.

Table 98: show amt statistics Output Fields

Field Name	Field Description
AMT receive message count	Summary of AMT statistics for messages received on all interfaces. • **AMT relay discovery**—Number of AMT relay discovery messages received. • **AMT membership request**—Number of AMT membership request messages received. • **AMT membership update**—Number of AMT membership update messages received.
AMT send message count	Summary of AMT statistics for messages sent on all interfaces. • **AMT relay advertisement**—Number of AMT relay advertisement messages sent. • **AMT membership query**—Number of AMT membership query messages sent.

Copyright © 2018, Juniper Networks, Inc.

Table 98: show amt statistics Output Fields (continued)

Field Name	Field Description
AMT error message count	Summary of AMT statistics for error messages received on all interfaces. • **AMT incomplete packet**—Number of messages received with length errors so severe that further classification could not occur. • **AMT invalid mac**—Number of messages received with an invalid message authentication code (MAC). • **AMT unexpected type**—Number of messages received with an unknown message type specified. • **AMT invalid relay discovery address**—Number of AMT relay discovery messages received with an address other than the configured anycast address. • **AMT invalid membership request address**—Number of AMT membership request messages received with an address other than the configured AMT local address. • **AMT invalid membership update address**—Number of AMT membership update messages received with an address other than the configured AMT local address. • **AMT incomplete relay discovery messages**—Number of AMT relay discovery messages received that are not fully formed. • **AMT incomplete membership request messages**—Number of AMT membership request messages received that are not fully formed. • **AMT incomplete membership update messages**—Number of AMT membership update messages received that are not fully formed. • **AMT no active gateway**—Number of AMT membership update messages received for a tunnel that does not exist for the gateway that sent the message. • **AMT invalid inner header checksum**—Number of AMT membership update messages received with an invalid IP checksum. • **AMT gateways timed out**—Number of gateways that timed out because of inactivity.

Sample Output

show amt statistics

```
user@host> show amt statistics

AMT receive message count
AMT relay advertisement                      :          2
AMT membership request                       :          5
AMT membership update                        :          5

AMT send message count
AMT relay advertisement                      :          2
AMT membership query                         :          5

AMT error message count
AMT incomplete packet                        :          0
AMT invalid mac                              :          0
AMT unexpected type                          :          0
AMT invalid relay discovery address          :          0
AMT invalid membership request address       :          0

Output Fields

Table 99 on page 1767 describes the output fields for the **show amt summary** command. Output fields are listed in the approximate order in which they appear.

Table 99: show amt summary Output Fields

Field Name	Field Description	Level of Output
AMT anycast prefix	Prefix advertised by unicast routing protocols to route AMT discovery messages to the router from nearby AMT gateways.	All levels
AMT anycast address	Anycast address configured from which the anycast prefix is derived.	All levels
AMT local address	Local unique AMT relay IP address configured. Used to send AMT relay advertisement messages, it is the IP source address of AMT control messages and the source address of the data tunnel encapsulation.	All levels
AMT tunnel limit	Maximum number of AMT tunnels that can be created.	All levels
active tunnels	Number of active AMT tunnel interfaces.	All levels

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show amt summary

```
user@host> show amt summary
 AMT anycast prefix : 20.0.0.4/32
 AMT anycast address : 20.0.0.4
 AMT local address : 20.0.0.4
 AMT tunnel limit : 1000, active tunnels : 2
```

Output Fields

Table 100 on page 1770 describes the output fields for the **show amt tunnel** command. Output fields are listed in the approximate order in which they appear.

Table 100: show amt tunnel Output Fields

Field Name	Field Description	Level of Output
AMT gateway address	Address of the AMT gateway that is being connected by the AMT tunnel.	All levels
port	Client port used by the AMT tunnel.	All levels
AMT tunnel interface	Dynamically created AMT logical interfaces used by the AMT tunnel in the format **ud-FPC/PIC/Port.unit**.	All levels
AMT tunnel state	State of the AMT tunnel. The state is normally **Active**. • **Active**—The tunnel is active. • **Pending**—The tunnel creation is pending. This is a transient state. • **Down**—The tunnel is in the down state. • **Graceful restart pending**—Graceful restart is in progress. • **Reviving**—The routing protocol daemon or Routing Engine was restarted (not gracefully). The tunnel remains in the reviving state until the AMT gateway sends a control message. When the message is received the tunnel is moved to the **Active** state. If no message is received before the AMT tunnel inactivity timer expires, the tunnel is deleted.	All levels
AMT tunnel inactivity timeout	Number of seconds since the most recent control message was received from an AMT gateway. If no message is received before the AMT tunnel inactivity timer expires, the tunnel is deleted.	All levels
Number of groups	Number of multicast groups using the tunnel.	All levels
Group	Multicast group address or addresses using the tunnel.	**detail**
Include Source	Multicast source address for each IGMPv3 group using the tunnel.	**detail**
AMT message count	Statistics for AMT messages: • **AMT Request**—Number of AMT relay tunnel request messages received. • **AMT membership update**—Number of AMT membership update messages received.	All levels

Sample Output

show dvmrp interfaces

Syntax

show dvmrp interfaces
<logical-system (all | *logical-system-name*)>

Release Information

NOTE: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

Description

Display information about Distance Vector Multicast Routing Protocol (DVMRP)–enabled interfaces.

Options

none—(Same as **logical-system all**) Display information about DVMRP-enabled interfaces.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show dvmrp interfaces on page 1775

Output Fields

Table 101 on page 1773 describes the output fields for the **show dvmrp interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 101: show dvmrp interfaces Output Fields

Field Name	Field Description
Interface	Name of the interface.
State	State of the interface: **up** or **down**.
Leaf	Whether the interface is a leaf (that is, whether it has no neighbors) or whether it has neighbors.
Metric	Interface metric: a value from **1** through **31**.
Announce	Number of routes the interface is announcing.

Copyright © 2018, Juniper Networks, Inc.

Table 101: show dvmrp interfaces Output Fields (continued)

Field Name	Field Description
Mode	DVMRP mode: • **Forwarding**—DVMRP does both the routing and the multicast data forwarding. • **Unicast-routing**—DVMRP does only the routing. Forwarding of the multicast data packets can be done by enabling PIM on the interface.

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show dvmrp interfaces

```
user@host> show dvmrp interfaces
Interface State Leaf Metric Announce Mode
fxp0.0    Up    N    1    4 Forwarding
fxp1.0    Up    N    1    4 Forwarding
fxp2.0    Up    N    1    3 Forwarding
lo0.0     Up    Y    1    0 Unicast-routing
```

show dvmrp neighbors

Syntax

show dvmrp neighbors
<logical-system (all | *logical-system-name*)>

Release Information

NOTE: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

Description

Display information about Distance Vector Multicast Routing Protocol (DVMRP) neighbors.

Options

none—(Same as **logical-system all**) Display information about DVMRP neighbors.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

List of Sample Output

show dvmrp neighbors on page 1777

Output Fields

Table 102 on page 1776 describes the output fields for the **show dvmrp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 102: show dvmrp neighbors Output Fields

Field Name	Field Description
Neighbor	Address of the neighboring DVMRP router.
Interface	Interface through which the neighbor is reachable.
Version	Version of DVMRP that the neighbor is running, in the format ***majorminor***.
Flags	Information about the neighbor: • **1**—One way. The local router has seen the neighbor, but the neighbor has not seen the local router. • **G**—Neighbor supports generation ID. • **L**—Neighbor is a leaf router. • **M**—Neighbor supports mtrace. • **N**—Neighbor supports netmask in prune messages and graft messages. • **P**—Neighbor supports pruning. • **S**—Neighbor supports SNMP.

Copyright © 2018, Juniper Networks, Inc.

Table 102: show dvmrp neighbors Output Fields (continued)

Field Name	Field Description
Routes	Number of routes learned from the neighbor.
Timeout	How long until the DVMRP neighbor information times out, in seconds.
Transitions	Number of generation ID changes that have occurred since the local router learned about the neighbor.

Sample Output

show dvmrp neighbors

```
user@host> show dvmrp neighbors
Neighbor         Interface        Version Flags   Routes Timeout Transitions
192.168.1.1     ipip.0             3.255  PGM          3      28           1
```

show dvmrp prefix

Syntax

show dvmrp prefix
<brief | detail>
<logical-system (all | *logical-system-name*)>
<*prefix*>

Release Information

NOTE: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

Description

Display information about Distance Vector Multicast Routing Protocol (DVMRP) prefixes.

Options

none—Display standard information about all DVMRP prefixes.

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix—(Optional) Display information about specific prefixes.

Output Fields

Table 103 on page 1778 describes the output fields for the **show dvmrp prefix** command. Output fields are listed in the approximate order in which they appear.

Table 103: show dvmrp prefix Output Fields

Field Name	Field Description	Level of Output
Prefix	DVMRP route.	All levels
Next hop	Next hop from which the route was learned.	All levels
Age	Last time that the route was refreshed.	All levels
multicast-group	Multicast group address.	**detail**

 Copyright © 2018, Juniper Networks, Inc.

Table 103: show dvmrp prefix Output Fields (continued)

Field Name	Field Description	Level of Output
Prunes sent	Number of prune messages sent to the multicast group.	**detail**
Grafts sent	Number of grafts sent to the multicast group.	**detail**
Cache lifetime	Lifetime of the group in the multicast cache, in seconds.	**detail**
Prune lifetime	Lifetime remaining and total lifetime of prune messages, in seconds.	**detail**

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show dvmrp prefix

```
user@host> show dvmrp prefix
Prefix                  Next hop          Age
10.38.0.0       /30 10.38.0.1         00:06:17

Output Fields

Table 105 on page 1784 describes the output fields for the **show igmp group** command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 105: show igmp group Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface that received the IGMP membership report. A name of **local** indicates that the local routing device joined the group itself.	All levels
Group	Group address.	All levels
Group Mode	Mode the SSM group is operating in: **Include** or **Exclude**.	All levels
Source	Source address.	All levels
Source timeout	Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.	**detail**
Last reported by	Address of the host that last reported membership in this group.	All levels
Timeout	Time remaining until the group membership is removed.	**brief none**
Group timeout	Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.	**detail**
Type	Type of group membership: • **Dynamic**—Host reported the membership. • **Static**—Membership is configured.	All levels

Sample Output

show igmp group (Include Mode)

```
user@host> show igmp group
Interface: t1-0/1/0.0

Output Fields

Table 106 on page 1788 describes the output fields for the **show igmp interface** command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 106: show igmp interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface.	All levels
Querier	Address of the routing device that has been elected to send membership queries.	All levels
State	State of the interface: **Up** or **Down**.	All levels
SSM Map Policy	Name of the source-specific multicast (SSM) map policy that has been applied to the IGMP interface.	All levels
Timeout	How long until the IGMP querier is declared to be unreachable, in seconds.	All levels
Version	IGMP version being used on the interface: **1** , **2** , or **3**.	All levels
Groups	Number of groups on the interface.	All levels
Group limit	Maximum number of groups allowed on the interface. Any joins requested after the limit is reached are rejected.	All levels
Group threshold	Configured threshold at which a warning message is generated. This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.	All levels
Group log-interval	Time (in seconds) between consecutive log messages.	All levels
Immediate Leave	State of the immediate leave option: • **On**—Indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface. • **Off**—Indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.	All levels
Promiscuous Mode	State of the promiscuous mode option: • **On**—Indicates that the router can accept IGMP reports from subnetworks that are not associated with its interfaces. • **Off**—Indicates that the router can accept IGMP reports only from subnetworks that are associated with its interfaces.	All levels
Distributed	State of IGMP, which, by default, takes place on the Routing Engine for MX Series routers but can be distributed to the Packet Forwarding Engine to provide faster processing of join and leave events. • **On**—distributed IGMP is enabled.	All levels

 Copyright © 2018, Juniper Networks, Inc.

Table 106: show igmp interface Output Fields (continued)

Field Name	Field Description	Level of Output
Passive	State of the passive mode option: • **On**—Indicates that the router can run IGMP on the interface but not send or receive control traffic such as IGMP reports, queries, and leaves. • **Off**—Indicates that the router can run IGMP on the interface and send or receive control traffic such as IGMP reports, queries, and leaves. The **passive** statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the **on** state declaration: • **send-general-query**—The interface sends general queries. • **send-group-query**—The interface sends group-specific and group-source-specific queries. • **allow-receive**—The interface receives control traffic.	All levels
OIF map	Name of the OIF map (if configured) associated with the interface.	All levels
SSM map	Name of the source-specific multicast (SSM) map (if configured) used on the interface.	All levels
Configured Parameters	Information configured by the user: • **IGMP Query Interval**—Interval (in seconds) at which this router sends membership queries when it is the querier. • **IGMP Query Response Interval**—Time (in seconds) that the router waits for a report in response to a general query. • **IGMP Last Member Query Interval**—Time (in seconds) that the router waits for a report in response to a group-specific query. • **IGMP Robustness Count**—Number of times the router retries a query.	All levels
Derived Parameters	Derived information: • **IGMP Membership Timeout**—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed. • **IGMP Other Querier Present Timeout**—Time (in seconds) that the router waits for the IGMP querier to send a query.	All levels

Sample Output

show igmp snooping interface

Syntax

show igmp snooping interface *interface-name*
<brief | detail>
<bridge-domain *bridge-domain-name*>
<logical-system *logical-system-name*>
<virtual-switch *virtual-switch-name*>
<vlan-id *vlan-identifier*>

Release Information

Command introduced in Junos OS Release 8.5.

Description

Display IGMP snooping interface information.

Options

none —Display detailed information.

brief | detail—(Optional) When applicable, this option lets you choose the how much detail to display.

bridge-domain *bridge-domain-name*—(Optional) Display information about a particular bridge domain.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type ’all’.

virtual-switch *virtual-switch-name*—(Optional) Display information about a particular virtual switch.

vlan-id *vlan-identifier*—(Optional) Display information about a particular VLAN.

List of Sample Output

show igmp snooping interface on page 1792
show igmp snooping interface (logical systems) on page 1793
show igmp snooping interface (Group Limit Configured) on page 1795

Output Fields

Table 107 on page 1791 lists the output fields for the **show igmp snooping interface** command. Output fields are listed in the approximate order in which they appear.

Table 107: show igmp snooping interface Output Fields

Field Name	Field Description	Level of Output
Routing-instance	Routing instance for IGMP snooping.	All levels

Table 107: show igmp snooping interface Output Fields (continued)

Field Name	Field Description	Level of Output
Learning Domain	Learning domain for snooping.	All levels
IGMP Query Interval	Frequency (in seconds) with which this router sends membership queries when it is the querier.	All levels
IGMP Query Response Interval	Time (in seconds) that the router waits for a response to a general query.	All levels
IGMP Last Member Query Interval	Time (in seconds) that the router waits for a report in response to a group-specific query.	All levels
IGMP Robustness Count	Number of times the router retries a query.	All levels
immediate-leave	State of immediate leave: **On** or **Off**.	All levels
router-interface	Router interfaces that are part of this learning domain.	All levels
Group limit	Maximum number of (source,group) pairs allowed per interface. When a group limit is not configured, this field is not shown.	All levels
interface	Interfaces that are being snooped in this learning domain.	All levels
Groups	Number of groups on the interface.	All levels
State	State of the interface: **Up** or **Down**.	All levels
Up Groups	Number of active multicast groups attached to the logical interface.	All levels
IGMP Membeship Timeout	Timeout for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.	All levels
IGMP Other Querier Present Timeout	Time that the router waits for the IGMP querier to send a query.	All levels

Sample Output

show igmp snooping interface

```
user@host> show igmp snooping interface ge-0/1/4
Instance: default-switch

Bridge-Domain: sample

Learning-Domain: default
Interface: ge-0/1/4.0
State: Up Groups: 0
Immediate leave: Off
Router interface: no
```

show igmp snooping membership

Syntax

show igmp snooping membership
<brief | detail>
<interface *interface-name*>
<vlan (*vlan-id* | *vlan-name*)>
<bridge-domain *bridge-domain-name*>
<group *group-name*>
<logical-system *logical-system-name*>
<virtual-switch *virtual-switch-name*>
<vlan-id *vlan-identifier*>

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 18.1R1 for the SRX1500 devices.

Description

Display the multicast group membership information maintained by IGMP snooping.

Options

none—Display the multicast group membership information about all VLANs on which IGMP snooping is enabled.

brief | detail—(Optional) Display the specified level of output. The default is **brief**.

interface *interface-name*—(Optional) Display the multicast group membership information about the specified interface.

vlan (*vlan-id* | *vlan-name*)—(Optional) Display the multicast group membership for the specified VLAN.

bridge-domain *bridge-domain-name*—(Optional) Display information about a particular bridge domain.

group *group-name* —(Optional) Display information about this group address.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

virtual-switch *virtual-switch-name*—(Optional) Display information about a particular virtual switch.

vlan-id *vlan-identifier*—(Optional) Display information about a particular VLAN.

List of Sample Output

Output Fields

Table 108 on page 1797 lists the output fields for the **show igmp snooping membership** command. Output fields are listed in the approximate order in which they appear.

Table 108: show igmp snooping membership Output Fields

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
Instance	Routing instance for IGMP snooping.	All levels
Learning Domain	Learning domain for snooping.	All levels
Interface	Interface on which this router is a proxy.	**detail**
Up Groups	Number of active multicast groups attached to the logical interface.	All levels
Group	Multicast group address in the membership database.	All levels
Group Mode	Mode the SSM group is operating in: **Include** or **Exclude**.	All levels
Source	Source address used on queries.	**detail**
Last reported by	Address of source last replying to the query.	**detail**
Group Timeout	Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.	All levels
Timeout	Length of time (in seconds) left until the entry is purged.	**detail**
Type	Way that the group membership information was learned: • **Dynamic**—Group membership was learned by the IGMP protocol. • **Static**—Group membership was learned by configuration.	**detail**
Include receiver	Source address of receiver included in membership with timeout (in seconds).	**detail**

Sample Output

Output Fields

Table 109 on page 1802 lists the output fields for the **show igmp snooping statistics** command. Output fields are listed in the approximate order in which they appear.

Table 109: show igmp snooping statistics Output Fields

Field Name	Field Description	Level of Output
Routing-instance	Routing instance for IGMP snooping.	All levels
IGMP packet statistics	Heading for IGMP snooping statistics for all interfaces or for the specified interface.	All levels
learning-domain	Appears at end of “IGMP packets statistics” line.	All levels
IGMP Message type	Summary of IGMP statistics: • **Membership Query**—Number of membership queries sent and received. • **V1 Membership Report**—Number of version 1 membership reports sent and received. • **DVMRP**—Number of DVMRP messages sent or received. • **PIM V1**—Number of PIM version 1 messages sent or received. • **Cisco Trace**—Number of Cisco trace messages sent or received. • **V2 Membership Report**—Number of version 2 membership reports sent or received. • **Group Leave**—Number of group leave messages sent or received. • **Domain Wide Report**—Number of domain-wide reports sent or received. • **V3 Membership Report**—Number of version 3 membership reports sent or received. • **Other Unknown types**—Number of unknown message types received. • **IGMP v3 unsupported type**—Number of messages received with unknown and unsupported IGMP version 3 message types. • **IGMP v3 source required for SSM**—Number of IGMP version 3 messages received that contained no source. • **IGMP v3 mode not applicable for SSM**—Number of IGMP version 3 messages received that did not contain a mode applicable for source-specific multicast (SSM).	All levels
Received	Number of messages received.	All levels
Sent	Number of messages sent.	All levels
Rx errors	Number of received packets that contained errors.	All levels
IGMP Global Statistics	Summary of IGMP snooping statistics for all interfaces. • **Bad Length**—Number of messages received with length errors so severe that further classification could not occur. • **Bad Checksum**—Number of messages received with a bad IP checksum. No further classification was performed. • **Rx non-local**—Number of messages received from senders that are not local.	All levels

show igmp statistics

List of Syntax

Syntax on page 1806
Syntax (EX Series Switch and the QFX Series) on page 1806

Syntax

show igmp statistics
<brief | detail>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)

show igmp statistics
<brief | detail>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display Internet Group Management Protocol (IGMP) statistics.

Options

none—Display IGMP statistics for all interfaces.

brief | detail—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display IGMP statistics about the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

List of Sample Output

show igmp statistics on page 1808
show igmp statistics interface on page 1808

Output Fields

Table 110 on page 1806 describes the output fields for the **show igmp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 110: show igmp statistics Output Fields

Field Name	Field Description
IGMP packet statistics	Heading for IGMP packet statistics for all interfaces or for the specified interface name.

Copyright © 2018, Juniper Networks, Inc.

Table 110: show igmp statistics Output Fields (continued)

Field Name	Field Description
IGMP Message type	Summary of IGMP statistics: • **Membership Query**—Number of membership queries sent and received. • **V1 Membership Report**—Number of version 1 membership reports sent and received. • **DVMRP**—Number of DVMRP messages sent or received. • **PIM V1**—Number of PIM version 1 messages sent or received. • **Cisco Trace**—Number of Cisco trace messages sent or received. • **V2 Membership Report**—Number of version 2 membership reports sent or received. • **Group Leave**—Number of group leave messages sent or received. • **Mtrace Response**—Number of Mtrace response messages sent or received. • **Mtrace Request**—Number of Mtrace request messages sent or received. • **Domain Wide Report**—Number of domain-wide reports sent or received. • **V3 Membership Report**—Number of version 3 membership reports sent or received. • **Other Unknown types**—Number of unknown message types received. • **IGMP v3 unsupported type**—Number of messages received with unknown and unsupported IGMP version 3 message types. • **IGMP v3 source required for SSM**—Number of IGMP version 3 messages received that contained no source. • **IGMP v3 mode not applicable for SSM**—Number of IGMP version 3 messages received that did not contain a mode applicable for source-specific multicast (SSM). Beginning with certain releases, this type includes records received for groups in the SSM range of addresses and in which the mode is MODE_IS_EXCLUDE or CHANGE_TO_EXCLUDE_MODE. This includes records with a non-empty source list.
Received	Number of messages received.
Sent	Number of messages sent.
Rx errors	Number of received packets that contained errors.
Max Rx rate (pps)	Maximum number of IGMP packets received during 1 second interval.
IGMP Global Statistics	Summary of IGMP statistics for all interfaces. • **Bad Length**—Number of messages received with length errors so severe that further classification could not occur. • **Bad Checksum**—Number of messages received with a bad IP checksum. No further classification was performed. • **Bad Receive If**—Number of messages received on an interface not enabled for IGMP. • **Rx non-local**—Number of messages received from senders that are not local. • **Timed out**—Number of groups that timed out as a result of not receiving an explicit leave message. • **Rejected Report**—Number of reports dropped because of the IGMP group policy. • **Total Interfaces**—Number of interfaces configured to support IGMP.

show mld group

Syntax

show mld group
<brief | detail>
<*group-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display information about Multicast Listener Discovery (MLD) group membership.

Options

none—Display standard information about all MLD groups.

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Display MLD information about the specified group.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 111 on page 1809 describes the output fields for the **show mld group** command. Output fields are listed in the approximate order in which they appear.

Table 111: show mld group Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface that received the MLD membership report; **local** means that the local router joined the group itself.	All levels
Group	Group address.	All levels
Source	Source address.	All levels
Group Mode	Mode the SSM group is operating in: **Include** or **Exclude**.	All levels
Last reported by	Address of the host that last reported membership in this group.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 111: show mld group Output Fields (continued)

Field Name	Field Description	Level of Output
Source timeout	Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.	**detail**
Timeout	Time remaining until the group membership is removed.	**brief none**
Group timeout	Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.	**detail**
Type	Type of group membership: • **Dynamic**—Host reported the membership. • **Static**—Membership is configured.	All levels

Sample Output

show mld group (Include Mode)

```
user@host> show mld group

show mld interface

Syntax

show mld interface
<brief | detail>
<*interface-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display information about multipoint Listener Discovery (MLD)-enabled interfaces.

Options

none—Display standard information about all MLD-enabled interfaces.

brief | detail—(Optional) Display the specified level of output.

interface-name—(Optional) Display information about the specified interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show mld interface brief on page 1816
show mld interface detail on page 1816
show mld interface <interface-name> on page 1816

Output Fields

Table 112 on page 1813 describes the output fields for the **show mld interface** command. Output fields are listed in the approximate order in which they appear.

Table 112: show mld interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface.	All levels
Querier	Address of the router that has been elected to send membership queries.	All levels
State	State of the interface: **Up** or **Down**.	All levels
SSM Map Policy	Name of the source-specific multicast (SSM) map policy that has been applied to the interface.	All levels
SSM Map Policy	Name of the source-specific multicast (SSM) map policy at the MLD interface.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 112: show mld interface Output Fields (continued)

Field Name	Field Description	Level of Output
Timeout	How long until the MLD querier is declared to be unreachable, in seconds.	All levels
Version	MLD version being used on the interface: **1** or **2**.	All levels
Groups	Number of groups on the interface.	All levels
Passive	State of the passive mode option: • **On**—Indicates that the router can run IGMP or MLD on the interface but not send or receive control traffic such as IGMP or MLD reports, queries, and leaves. • **Off**—Indicates that the router can run IGMP or MLD on the interface and send or receive control traffic such as IGMP or MLD reports, queries, and leaves. The **passive** statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the **on** state declaration: • **send-general-query**—The interface sends general queries. • **send-group-query**—The interface sends group-specific and group-source-specific queries. • **allow-receive**—The interface receives control traffic	All levels
OIF map	Name of the OIF map associated to the interface.	All levels
SSM map	Name of the source-specific multicast (SSM) map used on the interface, if configured.	All levels
Group limit	Maximum number of groups allowed on the interface. Any memberships requested after the limit is reached are rejected.	All levels
Group threshold	Configured threshold at which a warning message is generated. This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.	All levels
Group log-interval	Time (in seconds) between consecutive log messages.	All levels
Immediate Leave	State of the immediate leave option: • **On**—Indicates that the router removes a host from the multicast group as soon as the router receives a multicast listener done message from a host associated with the interface. • **Off**—Indicates that after receiving a multicast listener done message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.	All levels

 Copyright © 2018, Juniper Networks, Inc.

Table 112: show mld interface Output Fields (continued)

Field Name	Field Description	Level of Output
Distributed	State of MLD, which, by default, takes place on the Routing Engine for MX Series routers but can be distributed to the Packet Forwarding Engine to provide faster processing of join and leave events. • **On**—distributed MLD is enabled.	All levels
Configured Parameters	Information configured by the user. • **MLD Query Interval (.1 secs)**—Interval at which this router sends membership queries when it is the querier. • **MLD Query Response Interval (.1 secs)**—Time that the router waits for a report in response to a general query. • **MLD Last Member Query Interval (.1 secs)**—Time that the router waits for a report in response to a group-specific query. • **MLD Robustness Count**—Number of times the router retries a query.	All levels
Derived Parameters	Derived information. • **MLD Membership Timeout (.1 secs)**—Timeout period for group membership. If no report is received for these groups before the timeout expires, the group membership will be removed. • **MLD Other Querier Present Timeout (.1 secs)**—Time that the router waits for the IGMP querier to send a query.	All levels

Sample Output

show mld interface

```
user@host> show mld interface
Interface: fe-0/0/0
    Querier: None

Output Fields

Table 113 on page 1817 describes the output fields for the **show mld statistics** command. Output fields are listed in the approximate order in which they appear.

Table 113: show mld statistics Output Fields

Field Name	Field Description
Received	Number of received packets.
Sent	Number of transmitted packets.
Rx errors	Number of received packets that contained errors.

Table 113: show mld statistics Output Fields (continued)

Field Name	Field Description
MLD Message type	Summary of MLD statistics. • **Listener Query (v1/v2)**—Number of membership queries sent and received. • **Listener Report (v1)**—Number of version 1 membership reports sent and received. • **Listener Done (v1/v2)**—Number of Listener Done messages sent and received. • **Listener Report (v2)**—Number of version 2 membership reports sent and received. • **Other Unknown types**—Number of unknown message types received. • **MLD v2 source required for SSM**—Number of MLD version 2 messages received that contained no source. • **MLD v2 mode not applicable for SSM**—Number of MLD version 2 messages received that did not contain a mode applicable for source-specific multicast (SSM).
MLD Global Statistics	Summary of MLD statistics for all interfaces. • **Bad Length**—Number of messages received with length errors so severe that further classification could not occur. • **Bad Checksum**—Number of messages received with an invalid IP checksum. No further classification was performed. • **Bad Receive If**—Number of messages received on an interface not enabled for MLD. • **Rx non-local**—Number of messages received from nonlocal senders. • **Timed out**—Number of groups that timed out as a result of not receiving an explicit leave message. • **Rejected Report**—Number of reports dropped because of the MLD group policy. • **Total Interfaces**—Number of interfaces configured to support IGMP.

Sample Output

show mld statistics

```
user@host> show mld statistics
MLD packet statistics for all interfaces
MLD Message type            Received       Sent  Rx errors
Listener Query (v1/v2)             0          2          0
Listener Report (v1)               0          0          0
Listener Done (v1/v2)              0          0          0
Listener Report (v2)               0          0          0
Other Unknown types                                      0
MLD v2 source required for SSM     2
MLD v2 mode not applicable for SSM 0

MLD Global Statistics
Bad Length                         0
Bad Checksum                       0
Bad Receive If                     0

Output Fields

Table 114 on page 1820 describes the output fields for the **show msdp** command. Output fields are listed in the approximate order in which they appear.

Table 114: show msdp Output Fields

Field Name	Field Description	Level of Output
Peer address	IP address of the peer.	All levels
Local address	Local address of the peer.	All levels

 Copyright © 2018, Juniper Networks, Inc.

Table 114: show msdp Output Fields (continued)

Field Name	Field Description	Level of Output
State	Status of the MSDP connection: **Listen**, **Established**, or **Inactive**.	All levels
Last up/down	Time at which the most recent peer-state change occurred.	All levels
Peer-Group	Peer group name.	All levels
SA Count	Number of source-active cache entries advertised by each peer that were accepted, compared to the number that were received, in the format *number-accepted/number-received*.	All levels
Peer Connect Retries	Number of peer connection retries.	**detail**
State timer expires	Number of seconds before another message is sent to a peer.	**detail**
Peer Times out	Number of seconds to wait for a response from the peer before the peer is declared unavailable.	**detail**
SA accepted	Number of entries in the source-active cache accepted from the peer.	**detail**
SA received	Number of entries in the source-active cache received by the peer.	**detail**

Sample Output

show msdp

```
user@host> show msdp
Peer address    Local address    State       Last up/down Peer-Group SA Count

Output Fields

Table 115 on page 1824 describes the output fields for the **show msdp source** command. Output fields are listed in the approximate order in which they appear.

Table 115: show msdp source Output Fields

Field Name	Field Description
Source address	IP address of the source.
/Len	Length of the prefix for this IP address.
Type	Discovery method for this multicast source: • **Configured**—Source-active limit explicitly configured for this source. • **Dynamic**—Source-active limit established when this source was discovered.
Maximum	Source-active limit applied to this source.
Threshold	Source-active threshold applied to this source.
Exceeded	Number of source-active messages received from this source exceeding the established maximum.

Sample Output

show msdp source

```
user@host> show msdp source
Source address /Len   Type       Maximum   Threshold    Exceeded
0.0.0.0        /0     Configured       5       none        0

Output Fields

Table 116 on page 1826 describes the output fields for the **show msdp source-active** command. Output fields are listed in the approximate order in which they appear.

Table 116: show msdp source-active Output Fields

Field Name	Field Description
Global active source limit exceeded	Number of times all peers have exceeded configured active source limits.
Global active source limit maximum	Configured number of active source messages accepted by the device.
Global active source limit threshold	Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.
Global active source limit log-warning	Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).
Global active source limit log interval	Time (in seconds) between consecutive log messages.
Group address	Multicast address of the group.
Source address	IP address of the source.
Peer address	IP address of the peer.
Originator	Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured.
Flags	Flags: **Accept**, **Reject**, or **Filtered**.

Sample Output

show msdp source-active

```
user@host> show msdp source-active
Group address    Source address  Peer address    Originator      Flags
230.0.0.0        192.168.195.46  local           10.255.14.30    Accept

show msdp statistics

Syntax

show msdp statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<peer *peer-address*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display statistics about Multicast Source Discovery Protocol (MSDP) peers.

Options

none—Display statistics about all MSDP peers for all routing instances.

instance *instance-name*—(Optional) Display statistics about a specific MSDP instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

peer *peer-address*—(Optional) Display statistics about a particular MSDP peer.

Required Privilege Level

List of Sample Output

show msdp statistics on page 1830
show msdp statistics peer on page 1830

Output Fields

Table 117 on page 1828 describes the output fields for the **show msdp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 117: show msdp statistics Output Fields

Field Name	Field Description
Global active source limit exceeded	Number of times all peers have exceeded configured active source limits.
Global active source limit maximum	Configured number of active source messages accepted by the device.
Global active source limit threshold	Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.
Global active source limit log-warning	Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).

Copyright © 2018, Juniper Networks, Inc.

Table 117: show msdp statistics Output Fields (continued)

Field Name	Field Description
Global active source limit log interval	Time (in seconds) between consecutive log messages.
Peer	Address of peer.
Last State Change	How long ago the peer state changed.
Last message received from the peer	How long ago the last message was received from the peer.
RPF Failures	Number of reverse path forwarding (RPF) failures.
Remote Closes	Number of times the remote peer closed.
Peer Timeouts	Number of peer timeouts.
SA messages sent	Number of source-active messages sent.
SA messages received	Number of source-active messages received.
SA request messages sent	Number of source-active request messages sent.
SA request messages received	Number of source-active request messages received.
SA response messages sent	Number of source-active response messages sent.
SA response messages received	Number of source-active response messages received.
SA messages with zero Entry Count received	Entry Count is a field within SA message that defines how many source/group tuples are present in the SA message. The counter is incremented each time an SA with an Entry Count of zero is received.
Active source exceeded	Number of times this peer has exceeded configured source-active limits.
Active source Maximum	Configured number of active source messages accepted by this peer.
Active source threshold	Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.
Active source log-warning	Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device).
Active source log-interval	Time (in seconds) between consecutive log messages on this peer.

show multicast backup-pe-groups

Syntax

show multicast backup-pe-groups
<address *pe-address*>
<group *group-name*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced in Junos OS Release 9.0.

Description

Display backup PE router group information when ingress PE redundancy is configured. Ingress PE redundancy provides a backup resource when point-to-multipoint LSPs are configured for multicast distribution.

Options

none—Display standard information about all backup PE groups.

address ***pe-address***—(Optional) Display the groups that a PE address is associated with.

group ***group***—(Optional) Display the backup PE group information for a particular group.

instance ***instance-name***—(Optional) Display backup PE group information for a specific multicast instance.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

List of Sample Output

show multicast backup-pe-groups on page 1833

Output Fields

Table 118 on page 1832 describes the output fields for the **show multicast backup-pe-groups** command. Output fields are listed in the approximate order in which they appear.

Table 118: show multicast backup-pe-groups Output Fields

Field Name	Field Description
Backup PE Group	Group name.
Designated PE	Primary PE router. Address of the PE router that is currently forwarding traffic on the static route.
Transitions	Number of times that the designated PE router has transitioned from the most eligible PE router to a backup PE router and back again to the most eligible PE router.
Last Transition	Time of the most recent transition.
Local Address	Address of the local PE router.
Backup PE List	List of PE routers that are configured to be backups for the group.

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show multicast backup-pe-groups

```
user@host> show multicast backup-pe-groups
Instance: master

Backup PE group: b1
    Designated PE:   10.255.165.7
    Transitions:     1
    Last Transition: 03:15:01
    Local Address:   10.255.165.7
    Backup PE List:
                     10.255.165.8

Backup PE group: b2
    Designated PE:   10.255.165.7
    Transitions:     2
    Last Transition: 02:58:20
    Local Address:   10.255.165.7
    Backup PE List:
                     10.255.165.9
                     10.255.165.8
```

Output Fields

Table 119 on page 1834 describes the output fields for the **show multicast flow-map** command. Output fields are listed in the approximate order in which they appear.

Table 119: show multicast flow-map Output Fields

Field Name	Field Description	Levels of Output
Name	Name of the flow map.	All levels
Policy	Name of the policy associated with the flow map.	All levels
Cache-timeout	Cache timeout value assigned to the flow map.	All levels
Bandwidth	Bandwidth setting associated with the flow map.	All levels
Adaptive	Whether or not adaptive mode is enabled for the flow map.	none

 Copyright © 2018, Juniper Networks, Inc.

Table 119: show multicast flow-map Output Fields (continued)

Field Name	Field Description	Levels of Output
Flow-map	Name of the flow map.	**detail**
Adaptive Bandwidth	Whether or not adaptive mode is enabled for the flow map.	**detail**
Redundant Sources	Redundant sources defined for the same destination group.	**detail**

Sample Output

show multicast flow-map

```
user@host> show multicast flow-map
Instance: master
Name            Policy                  Cache timeout        Bandwidth Adaptive
map2            policy2                         never          2000000 no
map1            policy1                    60 seconds          2000000 no
```

Sample Output

show multicast flow-map detail

```
user@host> show multicast flow-map detail
Instance: master
Flow-map: map1
    Policy:             policy1
    Cache Timeout:      600 seconds
    Bandwidth:          2000000

show multicast forwarding-cache statistics

Syntax

show multicast forwarding-cache statistics
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced in Junos OS Release 12.2.
Starting in Junos OS Release 16.1, output includes general and rendezvous-point tree (RPT) suppression states.

Description

Display IP multicast forwarding cache statistics.

Options

none—Display multicast forwarding cache statistics for all supported address families for all routing instances.

inet | inet6—(Optional) Display multicast forwarding cache statistics for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display multicast forwarding cache statistics for a specific routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

List of Sample Output

show multicast forwarding cache statistics instance on page 1837
show multicast forwarding cache statistics instance (Forwarding-cache suppression is disabled) on page 1837

Output Fields

Table 120 on page 1836 describes the output fields for the **show multicast forwarding-cache statistics** command. Output fields are listed in the approximate order in which they appear.

Table 120: show multicast forwarding-cache statistics Output Fields

Field Name	Field Description
Instance	Name of the routing instance for which multicast forwarding cache statistics are displayed.
Family	Protocol family for which multicast forwarding cache statistics are displayed: **ALL**, **INET**, or **INET6**.

Copyright © 2018, Juniper Networks, Inc.

Table 120: show multicast forwarding-cache statistics Output Fields (continued)

Field Name	Field Description
General (or MVPN RPT) Suppression Active	Indicates whether suppression is configured.
General (or MVPN RPT) Entries Used	Number of currently used multicast forwarding cache entries.
General (or MVPN RPT) Suppress Threshold	Maximum number of multicast forwarding cache entries that can be added to the cache. When the number of entries reaches the configured threshold, the device suspends adding new multicast forwarding cache entries.
General (or MVPN RPT) Reuse Value	Number of multicast forwarding cache entries that must be reached before the device creates new multicast forwarding cache entries. When the total number of multicast forwarding cache entries is below the reuse value, the device resumes adding new multicast forwarding cache entries.

Sample Output

show multicast forwarding cache statistics instance

```
user@host> show multicast forwarding-cache statistic instance mvpn1 intet6
  Instance: mvpn1 Family: INET6
General Suppression Active                      Yes
General Entries Used                              0
General Suppress Threshold                      200
General Reuse Value                             200
MVPN RPT Suppression Active                     Yes
MVPN RPT Entries Used                             0
MVPN RPT Suppress Threshold                     200
MVPN RPT Reuse Value                            200
```

show multicast forwarding cache statistics instance (Forwarding-cache suppression is disabled)

```

Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display bandwidth information about IP multicast interfaces.

Options

none—Display all interfaces that have multicast configured.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show multicast interface on page 1839

Output Fields

Table 121 on page 1838 describes the output fields for the **show multicast interface** command. Output fields are listed in the approximate order in which they appear.

Table 121: show multicast interface Output Fields

Field Name	Field Description
Interface	Name of the multicast interface.
Maximum bandwidth (bps)	Maximum bandwidth setting, in bits per second, for this interface.
Remaining bandwidth (bps)	Amount of bandwidth, in bits per second, remaining on the interface.

Copyright © 2018, Juniper Networks, Inc.

Table 121: show multicast interface Output Fields (continued)

Field Name	Field Description
Mapped bandwidth deduction (bps)	Amount of bandwidth, in bits per second, used by any flows that are mapped to the interface. NOTE: Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface. This field does not appear in the output when the no QoS adjustment feature is disabled.
Local bandwidth deduction (bps)	Amount of bandwidth, in bits per second, used by any mapped flows that are traversing the interface. NOTE: Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface. This field does not appear in the output when the no QoS adjustment feature is disabled.
Reverse OIF mapping	State of the reverse OIF mapping feature (**on** or **off**). NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
Reverse OIF mapping no QoS adjustment	State of the no QoS adjustment feature (**on** or **off**) for interfaces that are using reverse OIF mapping. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
Leave timer	Amount of time a mapped interface remains active after the last mapping ends. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.
No QoS adjustment	State (**on**) of the no QoS adjustment feature when this feature is enabled. NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.

Sample Output

show multicast interface

```
user@host> show multicast interface
Interface              Maximum bandwidth (bps) Remaining bandwidth (bps)
fe-0/0/3                              10000000                         0
fe-0/0/3.210                          10000000                  -2000000
fe-0/0/3.220                         100000000                 100000000
fe-0/0/3.230                          20000000                  18000000
fe-0/0/2.200                         100000000                 100000000
```

show multicast mrinfo

Syntax

show multicast mrinfo
<*host*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display configuration information about IP multicast networks, including neighboring multicast router addresses.

Options

none—Display configuration information about all multicast networks.

host—(Optional) Display configuration information about a particular host. Replace *host* with a hostname or IP address.

Required Privilege Level

view

List of Sample Output

show multicast mrinfo on page 1842

Output Fields

Table 122 on page 1841 describes the output fields for the **show multicast mrinfo** command. Output fields are listed in the approximate order in which they appear.

Table 122: show multicast mrinfo Output Fields

Field Name	Field Description
source-address	Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.
ip-address-1—>ip-address-2	Queried router interface address and directly attached neighbor interface address, respectively.
(*name* or *ip-address*)	Name or IP address of neighbor.

[*metric/threshold/type/flags*]	Neighbor's multicast profile:
	• *metric*—Always has a value of **1**, because **mrinfo** queries the directly connected interfaces of a device.
	• *threshold*—Multicast threshold time-to-live (TTL). The range of values is **0** through **255**.
	• *type*—Multicast connection type: **pim** or **tunnel**.
	• *flags*—Flags for this route:
	  ◦ **querier**—Queried router is the designated router for the neighboring session.
	  ◦ **leaf**—Link is a leaf in the multicast network.
	  ◦ **down**—Link status indicator.

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show multicast mrinfo

```
user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
  192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
  0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```

show multicast next-hops

List of Syntax

Syntax on page 1843
Syntax (EX Series Switch and the QFX Series) on page 1843

Syntax

show multicast next-hops
<brief | detail | terse>
<*identifier-number*>
<inet | inet6>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)

show multicast next-hops
<brief | detail>
<*identifier-number*>
<inet | inet6>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 option introduced in Junos OS Release 10.0 for EX Series switches.
detail option display of next-hop ID number introduced in Junos OS Release 11.1 for M Series and T Series routers and EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
terse option introduced in Junos OS Release 16.1 for the MX Series.

Description

Display the entries in the IP multicast next-hop table.

Options

none—Display standard information about all entries in the multicast next-hop table for all supported address families.

brief | detail | terse—(Optional) Display the specified level of output. Use **terse** to display the total number of outgoing interfaces (as opposed to listing them) When you include the **detail** option on M Series and T Series routers and EX Series switches, the downstream interface name includes the next-hop ID number in parentheses, in the form **fe-0/1/2.0-(1048574),** where **1048574** is the next-hop ID number.

Starting in Junos OS release 16.1, the **show multicast next-hops** statement shows the hierarchical next hops contained in the top-level next hop.

identifier-number—(Optional) Show a particular next hop by ID number. The range of values is **1** through **65,535**.

inet | inet6—(Optional) Display entries for IPv4 or IPv6 family addresses, respectively.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show multicast next-hops detail on page 1845

Output Fields Table 123 on page 1844 describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

Table 123: show multicast next-hops Output Fields

Field Name	Field Description
Family	Protocol family (such as **INET**).
ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.
Refcount	Number of cache entries that are using this next hop.
KRefcount	Kernel reference count for the next hop.
Downstream interface	Interface names associated with each multicast next-hop ID.
Incoming interface list	List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.

Sample Output

show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID       Refcount  KRefcount Downstream interface
262142          4          2 so-1/0/0.0
262143          2          1 mt-1/1/0.49152
262148          2          1 mt-1/1/0.32769
```

show multicast next-hops (Ingress Router, Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs)

```

show multicast pim-to-igmp-proxy

List of Syntax

Syntax on page 1847
Syntax (EX Series Switch and the QFX Series) on page 1847

Syntax

show multicast pim-to-igmp-proxy
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)

show multicast pim-to-igmp-proxy
<instance *instance-name*>

Release Information

Command introduced in Junos OS Release 9.6.
Command introduced in Junos OS Release 9.6 for EX Series switches.
instance option introduced in Junos OS Release 10.3.
instance option introduced in Junos OS Release 10.3 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display configuration information about PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy.

Options

none—Display configuration information about PIM-to-IGMP message translation for all routing instances.

instance *instance-name*—(Optional) Display configuration information about PIM-to-IGMP message translation for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

List of Sample Output

show multicast pim-to-igmp-proxy on page 1848
show multicast pim-to-igmp-proxy instance on page 1848

Output Fields

Table 124 on page 1848 describes the output fields for the **show multicast pim-to-igmp-proxy** command. Output fields are listed in the order in which they appear.

Table 124: show multicast pim-to-igmp-proxy Output Fields

Field Name	Field Description
Instance	Routing instance. Default instance is **master** (inet.0 routing table).
Proxy state	State of PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy, on the configured upstream interfaces: **enabled** or **disabled**.
interface-name	Name of upstream interface (no more than two allowed) on which PIM-to-IGMP message translation is configured.

Sample Output

show multicast pim-to-igmp-proxy

```
user@host> show multicast pim-to-igmp-proxy
Instance: master Proxy state: enabled
ge-0/1/0.1
ge-0/1/0.2
```

show multicast pim-to-igmp-proxy instance

```
user@host> show multicast pim-to-igmp-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/1/0.1
```

show multicast route

List of Syntax

Syntax on page 1851
Syntax (EX Series Switch and the QFX Series) on page 1851

Syntax

show multicast route
<brief | detail | extensive | summary>
<active | all | inactive>
<group *group*>
<inet | inet6>
<instance *instance name*>
<logical-system (all | *logical-system-name*)>
<oif-count>
<*regular-expression*>
<source-prefix *source-prefix*>

Syntax (EX Series Switch and the QFX Series)

show multicast route
<brief | detail | extensive | summary>
<active | all | inactive>
<group *group*>
<inet | inet6>
<instance *instance name*>
<*regular-expression*>
<source-prefix *source-prefix*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
oif-count option introduced in Junos OS Release 16.1 for the MX Series.
xxxSupport for PIM NSR support for VXLAN added in Junos OS Release 16.2.

Description

Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

NOTE: On all SRX Series devices, when a multicast route is not available, pending sessions are not torn down, and subsequent packets are queued. If no multicast route resolve comes back, then the traffic flow has to wait for the pending session to timed out. Then packets can trigger new pending session create and route resolve.

Options

none—Display standard information about all entries in the multicast forwarding table for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

active | all | inactive—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

group ***group***—(Optional) Display the cache entries for a particular group.

inet | inet6—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

instance ***instance-name***—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

oif-count —(Optional) Display a count of outgoing interfaces rather than listing them.

regular-expression—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.

source-prefix ***source-prefix***—(Optional) Display the cache entries for a particular source prefix.

List of Sample Output

Output Fields

Table 126 on page 1853 describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

 Copyright © 2018, Juniper Networks, Inc.

Table 126: show multicast route Output Fields

Field Name	Field Description	Level of Output
family	IPv4 address family (**INET**) or IPv6 address family (**INET6**).	All levels
Group	Group address. For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.	All levels
Source	Prefix and length of the source as it is in the multicast forwarding table.	All levels
Incoming interface list	List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.	All levels
Upstream interface	Name of the interface on which the packet with this source prefix is expected to arrive.	All levels
Upstream rpf interface list	When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request.	All levels
Downstream interface list	List of interface names to which the packet with this source prefix is forwarded. **distributed-gmp**— Added in Junos OS Release 17.4R1 to indicate that line cards with *distributed* IGMP interfaces are receiving multicast traffic for a given (s,g).	All levels
Number of outgoing interfaces	Total number of outgoing interfaces for each (S,G) entry.	**extensive**
Session description	Name of the multicast session.	**detail extensive**
Statistics	Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays **Forwarding statistics are not available**. NOTE: On QFX Series switches and OCX Series switches, this field does not report valid statistics.	**detail extensive**
Next-hop ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the **show multicast nexthops** command.	**detail extensive**
Incoming interface list ID	For bidirectional PIM, incoming interface list identifier. Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.	**detail extensive**

Table 126: show multicast route Output Fields (continued)

Field Name	Field Description	Level of Output
Upstream protocol	The protocol that maintains the active multicast forwarding route for this group or source. When the **show multicast route extensive** command is used with the **display-origin-protocol** option, the field name is only **Protocol** and not **Upstream Protocol**. However, this field also displays the protocol that installed the active route.	**detail extensive**
Route type	Type of multicast route. Values can be (S,G) or (*,G).	**summary**
Route state	Whether the group is **Active** or **Inactive**.	**summary extensive**
Route count	Number of multicast routes.	**summary**
Forwarding state	Whether the prefix is pruned or forwarding.	**extensive**
Cache lifetime/timeout	Number of seconds until the prefix is removed from the multicast forwarding table. A value of **never** indicates a permanent forwarding entry. A value of **forever** indicates routes that do not have keepalive times.	**extensive**
Wrong incoming interface notifications	Number of times that the upstream interface was not available.	**extensive**
Uptime	Time since the creation of a multicast route.	**extensive**

Sample Output

Starting in Junos OS Release16.1, **show multicast route** displays the top-level hierarchical next hop.

show multicast rpf

List of Syntax

Syntax on page 1862
Syntax (EX Series Switch and the QFX Series) on page 1862

Syntax

show multicast rpf
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*prefix*>
<summary>

Syntax (EX Series Switch and the QFX Series)

show multicast rpf
<inet | inet6>
<instance *instance-name*>
<*prefix*>
<summary>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about multicast reverse-path-forwarding (RPF) calculations.

Options

none—Display RPF calculation information for all supported address families.

inet | inet6—(Optional) Display the RPF calculation information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about multicast RPF calculations for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix—(Optional) Display the RPF calculation information for the specified prefix.

summary—(Optional) Display a summary of all multicast RPF information.

Required Privilege Level

Output Fields Table 127 on page 1863 describes the output fields for the **show multicast rpf** command. Output fields are listed in the approximate order in which they appear.

Table 127: show multicast rpf Output Fields

Field Name	Field Description
Instance	Name of the routing instance. (Displayed when multicast is configured within a routing instance.)
Source prefix	Prefix and length of the source as it exists in the multicast forwarding table.
Protocol	How the route was learned.
Interface	Upstream RPF interface. NOTE: The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the **show multicast rpf** command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the **show pim join extensive** command when bidirectional PIM is configured.
Neighbor	Upstream RPF neighbor. NOTE: The displayed neighbor information does not apply to bidirectional PIM. This is because the **show multicast rpf** command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the **show pim join extensive** command when bidirectional PIM is configured.

show multicast snooping next-hops

Syntax

show multicast snooping next-hops
<brief | detail>
<identifier *next-hop-ID*>
<inet>
<inet6>
<logical-system *logical-system-name*>

Release Information

Command introduced in Junos OS Release 11.2.

Description

Display information about the IP multicast snooping next-hops.

Options

brief | detail—(Optional) Display the specified level of output.

inet—(Optional) Display information for IPv4 multicast next hops only. If a family is not specified, both IPv4 and IPv6 results will be shown.

inet6—(Optional) Display information for IPv6 multicast next hops only. If a family is not specified, both IPv4 and IPv6 results will be shown.

logical-system ***logical-system-name***—(Optional) Display information about a particular logical system, or type 'all'.

Required Privilege Level

view

List of Sample Output

show multicast snooping next-hops on page 1870
show multicast snooping next-hops (IGMP snooping enabled on a VPLS) on page 1870

Output Fields

Table 129 on page 1868 describes the output fields for the **show multicast snooping next-hops** command. Output fields are listed in the approximate order in which they appear.

Table 129: show multicast snooping next-hops Output Fields

Field Name	Field Description
Family	Protocol family for which multicast snooping next hops are displayed: **INET** or **INET6**.
Refcount	Number of cache entries that are using this next hop.
KRefcount	Kernel reference count for the next hop.
Downstream interface	Interface names associated with each multicast next-hop ID.

Copyright © 2018, Juniper Networks, Inc.

Table 129: show multicast snooping next-hops Output Fields (continued)

Field Name	Field Description
Nexthop Id	Identifier for the next-hop. NOTE: To see the next-hop ID for a given PE mesh group, **igmp-snooping** must be enabled for the relevant VPLS routing instance. (Junos OS creates a default CE and VE mesh groups for each VPLS routing instance. The next hop of the VE mesh group is the set of VE mesh-group interfaces of the remaining PEs in the same VPLS routing instance.)

Sample Output

show multicast snooping next-hops

```
user@host> show multicast snooping next-hops

show multicast snooping next-hops (IGMP snooping enabled on a VPLS)

In thIS example, ID 1048585 is the VE next-hop ID created for the VE next hop that is holding VE interfaces for the routing instance. It only appears if igmp snooping is enabled on the VPLS.

```
user@host> show multicast snooping next-hops
Family: INET

<logical-system (all | *logical-system-name*)>
<*regular-expression*>

Syntax (EX Series Switch and the QFX Series)

show multicast sessions
<brief | detail | extensive>
<*regular-expression*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about announced IP multicast sessions.

NOTE: On all SRX Series devices, only 100 packets can be queued during pending (S, G) route. However, when multiple multicast sessions enter the route resolve process at the same time, buffer resources are not sufficient to queue 100 packets for each session.

Options

none— Display standard information about all multicast sessions for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

regular-expression—(Optional) Display information about announced sessions that match a UNIX-style regular expression.

<logical-system *logical-system-name*>
<mesh-group *mesh-group-name*>
<qualified-vlan *vlan-id*>
<source-prefix *source-prefix*>
<vlan *vlan-id*>

Release Information

Command introduced in Junos OS Release 8.5.
Support for **control**, **data**, **qualified-vlan** and **vlan** options introduced in Junos OS Release 13.3 for EX Series switches.

Description

Display the entries in the IP multicast snooping forwarding table. You can display some of this information with the **show route table inet.1** command.

Options

none—Display standard information about all entries in the multicast snooping table for all virtual switches and all bridge domains.

active | all | inactive —(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast snooping table.

bridge-domain *bridge-domain*—(Optional) Display the entries for a particular bridge domain.

brief | detail | extensive—(Optional) Display the specified level of output.

control—(Optional) Display control route entries.

data—(Optional) Display data route entries.

group *group*—(Optional) Display the entries for a particular group.

inet—(Optional) Display IPv4 information.

inet6—(Optional) Display IPv6 information.

instance *instance-name*—(Optional) Display the entries for a multicast instance.

Copyright © 2018, Juniper Networks, Inc.

logical-system ***logical-system-name***—(Optional) Display information about a particular logical system, or type 'all'.

mesh-group ***mesh-group-name***—(Optional) Display the entries for a particular mesh group.

qualified-vlan ***vlan-id***—(Optional) Display the entries for a particular qualified VLAN.

regexp—(Optional) Display information about the multicast forwarding table entries that match a UNIX-style regular expression.

source-prefix ***source-prefix***—(Optional) Display the entries for a particular source prefix.

vlan ***vlan-id***—(Optional) Display the entries for a particular VLAN.

show multicast snooping route bridge-domain on page 1877
show multicast snooping route instance vs on page 1877
show multicast snooping route extensive on page 1877

Output Fields Table 131 on page 1876 describes the output fields for the **show multicast snooping route** command. Output fields are listed in the approximate order in which they appear.

Table 131: show multicast snooping route Output Fields

Field Name	Field Description	Level of Output
Nexthop Bulking	Displays whether next-hop bulk updating is **ON** or **OFF** (only for routing-instance type of **virtual switch** or **vpls**).	All levels
Family	IPv4 address family (**INET**) or IPv6 address family (**INET6**).	All levels
Group	Group address.	All levels
Source	Prefix and length of the source as it is in the multicast forwarding table. For (*,G) entries, this field is set to "*".	All levels
Routing-instance	Name of the routing instance to which this routing information applies. (Displayed when multicast is configured within a routing instance.)	All levels
Learning Domain	Name of the learning domain to which this routing information applies.	**detail extensive**
Statistics	Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix.	**detail extensive**
Next-hop ID	Next-hop identifier of the prefix. The identifier is returned by the router's Packet Forwarding Engine and is also displayed in the output of the **show multicast nexthops** command.	**detail extensive**
Route state	Whether the group is **Active** or **Inactive**.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 131: show multicast snooping route Output Fields (continued)

Field Name	Field Description	Level of Output
Forwarding state	Whether the prefix is **Pruned** or **Forwarding**.	**extensive**
Cache lifetime/timeout	Number of seconds until the prefix is removed from the multicast forwarding table. A value of **never** indicates a permanent forwarding entry.	**extensive**

show multicast statistics

Syntax

show multicast statistics
<inet | inet6>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.
interface option introduced in Junos OS Release 16.1 for the MX Series.

Description

Display IP multicast statistics.

Options

none—Display multicast statistics for all supported address families for all routing instances.

inet | inet6—(Optional) Display multicast statistics for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display statistics for a specific routing instance.

interface *interface-name*—(Optional) Display statistics for a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

The input and output interface multicast statistics are consistent, but not timely. They are constructed from the forwarding statistics, which are gathered at 30-second intervals. Therefore, the output from this command always lags the true count by up to 30 seconds.

Output Fields

Table 132 on page 1879 describes the output fields for the **show multicast statistics** command. Output fields are listed in the approximate order in which they appear.

Table 132: show multicast statistics Output Fields

Field Name	Field Description
Family	Protocol family for which multicast statistics are displayed: **INET** or **INET6**.

Copyright © 2018, Juniper Networks, Inc.

Table 132: show multicast statistics Output Fields (continued)

Field Name	Field Description
Interface	Name of the interface for which statistics are being reported.
Routing Protocol	Primary multicast protocol on the interface: **PIM**, **DVMRP for INET**, or **PIM for INET6**.
Mismatch	Number of multicast packets that did not arrive on the correct upstream interface.
Kernel Resolve	Number of resolve requests processed by the primary multicast protocol on the interface.
Resolve No Route	Number of resolve requests that were ignored because there was no route to the source.
In Kbytes	Total accumulated incoming packets (in KB) since the last time the **clear multicast statistics** command was issued.
Out Kbytes	Total accumulated outgoing packets (in KB) since the last time the **clear multicast statistics** command was issued.
Mismatch error	Number of mismatches that were ignored because of internal errors.
Mismatch No Route	Number of mismatches that were ignored because there was no route to the source.
Routing Notify	Number of times that the multicast routing system has been notified of a new multicast source by a multicast routing protocol .
Resolve Error	Number of resolve requests that were ignored because of internal errors.
In Packets	Total number of incoming packets since the last time the **clear multicast statistics** command was issued.
Out Packets	Total number of outgoing packets since the last time the **clear multicast statistics** command was issued.
Resolve requests on interfaces not enabled for multicast *n*	Number of resolve requests on interfaces that are not enabled for multicast that have accumulated since the **clear multicast statistics** command was last issued.
Resolve requests with no route to source *n*	Number of resolve requests with no route to the source that have accumulated since the **clear multicast statistics** command was last issued.
Routing notifications on interfaces not enabled for multicast *n*	Number of routing notifications on interfaces not enabled for multicast that have accumulated since the **clear multicast statistics** command was last issued.
Routing notifications with no route to source *n*	Number of routing notifications with no route to the source that have accumulated since the **clear multicast statistics** command was last issued.
Interface Mismatches on interfaces not enabled for multicast *n*	Number of interface mismatches on interfaces not enabled for multicast that have accumulated since the **clear multicast statistics** command was last issued.

Copyright © 2018, Juniper Networks, Inc.

Table 133: show multicast usage Output Fields

Field Name	Field Description
Instance	Name of the routing instance. (Displayed when multicast is configured within a routing instance.)
Group	Group address.
Sources	Number of sources.
Packets	Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays **unavailable**.
Bytes	Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays **unavailable**.
Prefix	IP address.
/len	Prefix length.
Groups	Number of multicast groups.

Sample Output

show multicast usage

```
user@host> show multicast usage
Group              Sources  Packets               Bytes

show pim bootstrap

List of Syntax

Syntax on page 1887
Syntax (EX Series Switch and the QFX Series) on page 1887

Syntax

show pim bootstrap
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)

show pim bootstrap
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
instance option introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

For sparse mode only, display information about Protocol Independent Multicast (PIM) bootstrap routers.

Options

none—Display PIM bootstrap router information for all routing instances.

instance *instance-name*—(Optional) Display information about bootstrap routers for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show pim bootstrap instance on page 1888

Output Fields

Table 134 on page 1887 describes the output fields for the **show pim bootstrap** command. Output fields are listed in the approximate order in which they appear.

Table 134: show pim bootstrap Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
BSR	Bootstrap router.
Pri	Priority of the routing device as elected to be the bootstrap router.

Copyright © 2018, Juniper Networks, Inc.

Table 134: show pim bootstrap Output Fields (continued)

Field Name	Field Description
Local address	Local routing device address.
Pri	Local routing device address priority to be elected as the bootstrap router.
State	Local routing device election state: **Candidate**, **Elected**, or **Ineligible**.
Timeout	How long until the local routing device declares the bootstrap router to be unreachable, in seconds.

Sample Output

show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master

BSR                     Pri Local address           Pri State      Timeout

show pim interfaces

List of Syntax

Syntax on page 1889
Syntax (EX Series Switch and the QFX Series) on page 1889

Syntax

show pim interfaces
<inet | inet6>
<instance (*instance-name* | all)>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)

show pim interfaces
<inet | inet6>
<instance (*instance-name* | all)>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Commmand introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Support for the **instance all** option added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about the interfaces on which Protocol Independent Multicast (PIM) is configured.

Options

none—Display interface information for all family addresses for the main instance.

inet | inet6—(Optional) Display interface information for IPv4 or IPv6 family addresses, respectively.

instance (*instance-name* | all)—(Optional) Display information about interfaces for a specific PIM-enabled routing instance or for all routing instances.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

List of Sample Output

show pim interfaces on page 1891

Output Fields

Table 135 on page 1889 describes the output fields for the **show pim interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 135: show pim interfaces Output Fields

Field Name	Field Description
Instance	Name of the routing instance.

Copyright © 2018, Juniper Networks, Inc.

Table 135: show pim interfaces Output Fields (continued)

Field Name	Field Description
Name	Interface name.
State	State of the interface. The state also is displayed in the **show interfaces** command.
Mode	PIM mode running on the interface: • **B**—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers. • **S**—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic. • **Dense**—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.) • **Sparse-Dense**—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as **dense** is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as **sparse** is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. When sparse-dense mode is configured, the output includes both **S** and **D**. When bidirectional-sparse mode is configured, the output includes **S** and **B**. When bidirectional-sparse-dense mode is configured, the output includes **B**, **S**, and **D**.
IP	Version number of the address family on the interface: **4** (IPv4) or **6** (IPv6).
V	PIM version running on the interface: **1** or **2**.
State	State of PIM on the interface: • **Active**—Bidirectional mode is enabled on the interface and on all PIM neighbors. • **DR**—Designated router. • **NotCap**—Bidirectional mode is not enabled on the interface. This can happen when bidirectional PIM is not configured locally, when one of the neighbors is not configured for bidirectional PIM, or when one of the neighbors has not implemented the bidirectional PIM protocol. • **NotDR**—Not the designated router. • **P2P**—Point to point.
NbrCnt	Number of neighbors that have been seen on the interface.
JoinCnt(sg)	Number of (s,g) join messages that have been seen on the interface.
JointCnt(*g)	Number of (*g) join messages that have been seen on the interface.
DR address	Address of the designated router.

 Copyright © 2018, Juniper Networks, Inc.

Sample Output

show pim interfaces

```
user@host> show pim interfaces
Stat = Status, V = Version, NbrCnt = Neighbor Count,
S = Sparse, D = Dense, B = Bidirectional,
DR = Designated Router, P2P = Point-to-point link,
Active = Bidirectional is active, NotCap = Not Bidirectional Capable

Name               Stat Mode IP V State        NbrCnt JoinCnt(sg/*g) DR address
ge-0/3/0.0         Up   S     4 2 NotDR,NotCap      1 0/0            40.0.0.3
ge-0/3/3.50        Up   S     4 2 DR,NotCap         1 9901/100       50.0.0.2

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
summary option introduced in Junos OS Release 9.6.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Multiple new filter options introduced in Junos OS Release 13.2.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
downstream-count option introduced in Junos OS Release 16.1.
Support for PIM NSR support for VXLAN added in Junos OS Release 16.2
Support for RFC 5496 (via **rpf-vector**) added in Junos OS Release 17.3R1.

Description

Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.

For bidirectional PIM, display information about PIM group ranges (*,G-range) for each active bidirectional RP group range, in addition to each of the joined (*,G) routes.

Options

none—Display the standard information about PIM groups for all supported family addresses for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

 Copyright © 2018, Juniper Networks, Inc.

bidirectional | dense | sparse—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

downstream-count—(Optional) Display the downstream count instead of a list.

exact—(Optional) Display information about only the group that exactly matches the specified group address.

inet | inet6—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

range—(Optional) Address range of the group, specified as ***prefix/prefix-length***.

rp *ip-address/prefix* | source *ip-address/prefix*—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

sg | star-g—(Optional) Display information about PIM (S,G) or (*,G) entries.

show pim join extensive (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 1905

Output Fields Table 136 on page 1894 describes the output fields for the **show pim join** command. Output fields are listed in the approximate order in which they appear.

Table 136: show pim join Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	**brief detail extensive summary** none
Family	Name of the address family: **inet** (IPv4) or **inet6** (IPv6).	**brief detail extensive summary** none
Route type	Type of multicast route: (S,G) or (*,G).	**summary**
Route count	Number of (S,G) routes and number of (*,G) routes.	**summary**
R	Rendezvous Point Tree.	**brief detail extensive** none
S	Sparse.	**brief detail extensive** none
W	Wildcard.	**brief detail extensive** none
Group	Group address.	**brief detail extensive** none
Bidirectional group prefix length	For bidirectional PIM, length of the IP prefix for RP group ranges.	All levels
Source	Multicast source: • ***** (wildcard value) • ***ipv4-address*** • ***ipv6-address***	**brief detail extensive** none
RP	Rendezvous point for the PIM group.	**brief detail extensive** none
Flags	PIM flags: • **bidirectional**—Bidirectional mode entry. • **dense**—Dense mode entry. • **rptree**—Entry is on the rendezvous point tree. • **sparse**—Sparse mode entry. • **spt**—Entry is on the shortest-path tree for the source. • **wildcard**—Entry is on the shared tree.	**brief detail extensive** none

 Copyright © 2018, Juniper Networks, Inc.

Table 136: show pim join Output Fields (continued)

Field Name	Field Description	Level of Output
Upstream interface	RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*,G). For bidirectional PIM, **RP Link** means that the interface is directly connected to a subnet that contains a phantom RP address. A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.	**brief detail extensive** none
Upstream neighbor	Information about the upstream neighbor: **Direct**, **Local**, **Unknown**, or a specific IP address. For bidirectional PIM, **Direct** means that the interface is directly connected to a subnet that contains a phantom RP address. The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.	**extensive**
Upstream rpf-vector	Information about the upstream Reverse Path Forwarding (RPF) vector; appears in conjunction with the **rpf-vector** command.	**extensive**
Active upstream interface	When multicast-only fast reroute (MoFRR) is configured in a PIM domain, the upstream interface for the active path. A PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. Preference is given to two paths that do not converge to the same immediate upstream router. PIM installs appropriate multicast routes with upstream neighbors as RPF next hops with two (primary and backup) interfaces.	**extensive**
Active upstream neighbor	On the MoFRR primary path, the IP address of the neighbor that is directly connected to the active upstream interface.	**extensive**
MoFRR Backup upstream interface	The MoFRR upstream interface that is used when the primary path fails. When the primary path fails, the backup path is upgraded to primary, and traffic is forwarded accordingly. If there are alternate paths available, a new backup path is calculated and the appropriate multicast route is updated or installed.	**extensive**
MoFRR Backup upstream neighbor	IP address of the MoFRR upstream neighbor.	extensive

Copyright © 2018, Juniper Networks, Inc.

Table 136: show pim join Output Fields (continued)

Field Name	Field Description	Level of Output
Upstream state	Information about the upstream interface: • **Join to RP**—Sending a join to the rendezvous point. • **Join to Source**—Sending a join to the source. • **Local RP**—Sending neither join messages nor prune messages toward the RP, because this routing device is the rendezvous point. • **Local Source**—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device. • **No Prune to RP**—Automatically sent to RP when SPT and RPT are on the same path. • **Prune to RP**—Sending a prune to the rendezvous point. • **Prune to Source**—Sending a prune to the source. NOTE: RP group range entries have **None** in the **Upstream state** field because RP group ranges do not trigger actual PIM join messages between routing devices.	**extensive**
Downstream neighbors	Information about downstream interfaces: • **Interface**—Interface name for the downstream neighbor. A pseudo PIM-SM interface appears for all IGMP-only interfaces. A pseudo multipoint LDP (Pseudo-MLDP) interface appears on ingress root nodes in M-LDP point-to-multipoint LSPs with inband signaling. • **Interface address**—Address of the downstream neighbor. • **State**—Information about the downstream neighbor: **join** or **prune**. • **Flags**—PIM join flags: **R (RPtree)**, **S (Sparse)**, **W (Wildcard)**, or **zero**. • **Uptime**—Time since the downstream interface joined the group. • **Time since last Join**—Time since the last join message was received from the downstream interface. • **Time since last Prune**—Time since the last prune message was received from the downstream interface. • **rpf-vector**—IP address of the RPF vector TLV .	**extensive**
Number of downstream interfaces	Total number of outgoing interfaces for each (S,G) entry.	**extensive**
Assert Timeout	Length of time between assert cycles on the downstream interface. Not displayed if the assert timer is null.	**extensive**
Keepalive timeout	Time remaining until the downstream join state is updated (in seconds). If the downstream join state is not updated before this keepalive timer reaches zero, the entry is deleted. If there is a directly connected host, **Keepalive timeout** is **Infinity**.	**extensive**
Uptime	Time since the creation of (S,G) or (*,G) state. The uptime is not refreshed every time a PIM join message is received for an existing (S,G) or (*,G) state.	**extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 136: show pim join Output Fields (continued)

Field Name	Field Description	Level of Output
Bidirectional accepting interfaces	Interfaces on the routing device that forward bidirectional PIM traffic. The reasons for forwarding bidirectional PIM traffic are that the interface is the winner of the designated forwarder election (**DF Winner**), or the interface is the reverse path forwarding (RPF) interface toward the RP (**RPF**).	**extensive**

show pim mdt

Syntax

show pim mdt instance *instance-name*
<brief | detail | extensive>
data-mdt-joins
data-mdt-limit
inet
inet6
<incoming | outgoing>
<logical-system (all | logical-system-name)>
<*range*>

Release Information

Command introduced before Junos OS Release 7.4.
Support for IPv6 added in Junos OS Release 17.3R1.

Description

Display information about Protocol Independent Multicast (PIM) default multicast distribution tree (MDT) and the data MDTs in a Layer 3 VPN environment for a routing instance.

Options

instance ***instance-name***—Display information about data-MDTs for a specific PIM-enabled routing instance.

brief | detail | extensive—(Optional) Display the specified level of output.

data-mdt-joins— Show received PIM data-mdt-joins.

data-mdt-limits— Show received PIM data-mdt-limits.

incoming | outgoing—(Optional) Display incoming or outgoing multicast data tunnels, respectively.

inet | inet6—Display IPv4 or IPv6 multicast data tunnels.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

range—(Optional) Display information about an IP address with optional prefix length representing a particular multicast group.

Required Privilege Level

view

List of Sample Output

show pim mdt <variables> instance on page 1908
show pim mdt instance detail on page 1909
show pim mdt instance extensive on page 1909
show pim mdt instance incoming on page 1910
show pim mdt instance outgoing on page 1910
show pim mdt instance (SSM Mode) on page 1910

Output Fields Table 137 on page 1908 describes the output fields for the **show pim mdt** command. Output fields are listed in the approximate order in which they appear.

Table 137: show pim mdt Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels
Tunnel direction	Direction the tunnel faces, from the router's perspective: **Outgoing** or **Incoming**.	All levels
Tunnel mode	Mode the tunnel is operating in: **PIM-SSM** or **PIM-ASM**.	All levels
Default group address	Default multicast group address using this tunnel.	All levels
Default source address	Default multicast source address using this tunnel.	All levels
Default tunnel interface	Default multicast tunnel interface.	All levels
Default tunnel source	Address used as the source address for outgoing PIM control messages.	All levels
C-Group	Customer-facing multicast group address using this tunnel. If you enable dynamic reuse of data MDT group addresses, more than one group address can use the same data MDT.	**detail**
C-Source	IP address of the multicast source in the customer's address space. If you enable dynamic reuse of data MDT group addresses, more than one source address can use the same data MDT.	**detail**
P-Group	Service provider-facing multicast group address using this tunnel.	**detail**
Data tunnel interface	Multicast data tunnel interface that set up the data-MDT tunnel.	**detail**
Last known forwarding rate	Last known rate, in kilobits per second, at which the tunnel was forwarding traffic.	**detail**
Configured threshold rate	Rate, in kilobits per second, above which a data-MDT tunnel is created and below which it is deleted.	**detail**
Tunnel uptime	Time that this data-MDT tunnel has existed. The format is ***hours:minutes:seconds***.	**detail**

Sample Output

show pim mdt <variables> instance

Use this command to display MDT information for default MDT and data-MDT for IPv4 and/or IPv6 traffic.)

show pim mdt data-mdt-joins

Syntax

show pim mdt data-mdt-joins
<logical-system (all | *logical-system-name*)> instance *instance-name*

Release Information

Command introduced in Junos OS Release 11.2.

Description

In a draft-rosen Layer 3 multicast virtual private network (MVPN) configured with service provider tunnels, display the advertisements of new multicast distribution tree (MDT) group addresses cached by the provider edge (PE) routers in the specified VPN routing and forwarding (VRF) instance that is configured to use the Protocol Independent Multicast (PIM) protocol.

Options

instance *instance-name*—Display data MDT join packets cached by PE routers in a specific PIM instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

NOTE: **Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.**

Required Privilege Level

List of Sample Output

show pim mdt data-mdt-joins on page 1912

Output Fields

Table 138 on page 1912 describes the output fields for the **show pim mdt data-mdt-joins** command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 138: show pim mdt data-mdt-joins Output Fields

Field Name	Field Description
C-Group	IPv4 group address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic destination. This 32-bit value is carried in the C-group field of the MDT join TLV packet.
C-Source	IPv4 address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic source. This 32-bit value is carried in the C-source field of the MDT join TLV packet.
P-Group	IPv4 group address in the service provider's address space of the new data MDT that the PE router will use to encapsulate the VPN multicast traffic flow (C-Source, C-Group). This 32-bit value is carried in the P-group field of the MDT join TLV packet.
P-Source	IPv4 address of the PE router.
Timeout	Timeout, in seconds, remaining for this cache entry. When the cache entry is created, this field is set to 180 seconds. After an entry times out, the PE router deletes the entry from its cache and prunes itself off the data MDT.

Sample Output

show pim mdt data-mdt-joins

```
user@host show pim mdt data-mdt-joins instance VPN-A
C-Source        C-Group         P-Source        P-Group         Timeout
20.2.15.9       225.1.1.2       20.0.0.5        239.10.10.0     172
20.2.15.9       225.1.1.3       20.0.0.5        239.10.10.1     172
```

show pim mdt data-mdt-limit

Syntax

show pim mdt data-mdt-limit instance *instance-name*
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced in Junos OS Release 12.2.

Description

Display the maximum number configured and the currently active data multicast distribution trees (MDTs) for a specific VPN routing and forwarding (VRF) instance.

Options

instance ***instance-name***—Display data MDT information for the specified VRF instance.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

NOTE: Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

Output Fields

Table 139 on page 1913 describes the output fields for the **show pim mdt data-mdt-limit** command. Output fields are listed in the approximate order in which they appear.

Table 139: show pim mdt data-mdt-limit Output Fields

Field Name	Field Description
Maximum Data Tunnels	Maximum number of data MDTs created in this VRF instance. If the number is 0, no data MDTs are created for this VRF instance.
Active Data Tunnels	Active number of data MDTs in this VRF instance.

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show pim mdt data-mdt-limit

```
user@host show pim mdt data-mdt-limit instance VPN-A
Maximum Data Tunnels                 10
Active Data Tunnels                   2
```

show pim neighbors

List of Syntax

Syntax on page 1915
Syntax (EX Series Switch and the QFX Series) on page 1915

Syntax

show pim neighbors
<brief | detail>
<inet | inet6>
<instance (*instance-name* | all)>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)

show pim neighbors
<brief | detail>
<inet | inet6>
<instance (*instance-name* | all)>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Support for the **instance all** option added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Support for RFC 5496 (via **rpf-vector**) added in Junos OS Release 17.3R1.

Description

Display information about Protocol Independent Multicast (PIM) neighbors.

Options

none—(Same as **brief**) Display standard information about PIM neighbors for all supported family addresses for the main instance.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display information about PIM neighbors for IPv4 or IPv6 family addresses, respectively.

instance (*instance-name* | all)—(Optional) Display information about neighbors for the specified PIM-enabled routing instance or for all routing instances.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields Table 140 on page 1916 describes the output fields for the **show pim neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 140: show pim neighbors Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels
Interface	Interface through which the neighbor is reachable.	All levels
Neighbor addr	Address of the neighboring PIM routing device.	All levels
IP	IP version: **4** or **6**.	All levels
V	PIM version running on the neighbor: **1** or **2**.	All levels
Mode	PIM mode of the neighbor: **Sparse**, **Dense**, **SparseDense**, or **Unknown**. When the neighbor is running PIM version 2, this mode is always **Unknown**.	All levels
Option	Can be one or more of the following: • **B**—Bidirectional Capable. • **G**—Generation Identifier. • **H**—Hello Option Holdtime. • **L**—Hello Option LAN Prune Delay. • **P**—Hello Option DR Priority. • **T**—Tracking bit. • **A**—Join attribute; used in conjunction with **pim rpf-vector**.	**brief** none
Uptime	Time the neighbor has been operational since the PIM process was last initialized. Starting in Junos OS release 17.3R1, **uptime** is not reset during ISSU.The time format is as follows: ***dd*:*hh*:*mm*:*ss* ago** for less than a week and ***nwnd*:*hh*:*mm*:*ss* ago** for more than a week.	All levels
Address	Address of the neighboring PIM routing device.	**detail**
BFD	Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: **Enabled**, **Operational state is up**, or **Disabled**.	**detail**
Hello Option Holdtime	Time for which the neighbor is available, in seconds. The range of values is **0** through **65,535.**	**detail**
Hello Default Holdtime	Default holdtime and the time remaining if the **holdtime** option is not in the received hello message.	**detail**
Hello Option DR Priority	Designated router election priority. The range of values is **0** through **255**.	**detail**
Hello Option Join Attribute	Appears in conjunction with the **rpf-vector** command. The Join attribute is included in the PIM join messages of PIM routers that can receive type 1 Encoded-Source Address.	**detail**

 Copyright © 2018, Juniper Networks, Inc.

Table 140: show pim neighbors Output Fields (continued)

Field Name	Field Description	Level of Output
Hello Option Generation ID	9-digit or 10-digit number used to tag hello messages.	**detail**
Hello Option Bi-Directional PIM supported	Neighbor can process bidirectional PIM messages.	**detail**
Hello Option LAN Prune Delay	Time to wait before the neighbor receives prune messages, in the format **delay** ***nnn*** **ms override** ***nnnn*** **ms**.	**detail**
Join Suppression supported	Neighbor is capable of join suppression.	**detail**
Rx Join	Information about joins received from the neighbor. • **Group**—Group addresses in the join message. • **Source**—Address of the source in the join message. • **Timeout**—Time for which the join is valid.	**detail**

Sample Output

show pim rps

List of Syntax

Syntax on page 1919
Syntax (EX Series Switch and the QFX Series) on page 1919

Syntax

show pim rps
<brief | detail | extensive>
<*group-address*>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)

show pim rps
<brief | detail | extensive>
<*group-address*>
<inet | inet6>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Support for bidirectional PIM added in Junos OS Release 12.1.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about Protocol Independent Multicast (PIM) rendezvous points (RPs).

Options

none—Display standard information about PIM RPs for all groups and family addresses for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

group-address—(Optional) Display the RPs for a particular group. If you specify a group address, the output lists the routing device that is the RP for that group.

inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about RPs for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

List of Sample Output

Output Fields

Table 141 on page 1920 describes the output fields for the **show pim rps** command. Output fields are listed in the approximate order in which they appear.

Table 141: show pim rps Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels
Family or Address family	Name of the address family: **inet** (IPv4) or **inet6** (IPv6).	All levels
RP address	Address of the rendezvous point.	All levels
Type	Type of RP: • **auto-rp**—Address of the RP known through the Auto-RP protocol. • **bootstrap**—Address of the RP known through the bootstrap router protocol (BSR). • **embedded**—Address of the RP known through an embedded RP (IPv6). • **static**—Address of RP known through static configuration.	**brief** none
Holdtime	How long to keep the RP active, with time remaining, in seconds.	All levels
Timeout	How long until the local routing device determines the RP to be unreachable, in seconds.	All levels
Groups	Number of groups currently using this RP.	All levels
Group prefixes	Addresses of groups that this RP can span.	**brief** none
Learned via	Address and method by which the RP was learned.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 141: show pim rps Output Fields (continued)

Field Name	Field Description	Level of Output
Mode	The PIM mode of the RP: bidirectional or sparse. If a sparse and bidirectional RPs are configured with the same RP address, they appear as separate entries in both formats.	All levels
Time Active	How long the RP has been active, in the format ***hh:mm:ss***.	**detail extensive**
Device Index	Index value of the order in which Junos OS finds and initializes the interface. For bidirectional RPs, the **Device Index** output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	**detail extensive**
Subunit	Logical unit number of the interface. For bidirectional RPs, the **Subunit** output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	**detail extensive**
Interface	Either the encapsulation or the de-encapsulation logical interface, depending on whether this routing device is a designated router (DR) facing an RP router, or is the local RP, respectively. For bidirectional RPs, the **Interface** output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	**detail extensive**
Group Ranges	Addresses of groups that this RP spans.	**detail extensive** *group-address*
Active groups using RP	Number of groups currently using this RP.	**detail extensive**
total	Total number of active groups for this RP.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 141: show pim rps Output Fields (continued)

Field Name	Field Description	Level of Output
Register State for RP	Current register state for each group: • **Group**—Multicast group address. • **Source**—Multicast source address for which the PIM register is sent or received, depending on whether this router is a designated router facing an RP router, or is the local RP, respectively: • **First Hop**—PIM-designated routing device that sent the Register message (the source address in the IP header). • **RP Address**—RP to which the Register message was sent (the destination address in the IP header). • **State**: On the designated router: ◦ **Send**—Sending Register messages. ◦ **Probe**—Sent a null register. If a Register-Stop message does not arrive in 5 seconds, the designated router resumes sending Register messages. ◦ **Suppress**—Received a Register-Stop message. The designated router is waiting for the timer to resume before changing to **Probe** state. • On the RP: ◦ **Receive**—Receiving Register messages.	**extensive**
Anycast-PIM rpset	If anycast RP is configured, the addresses of the RPs in the set.	**extensive**
Anycast-PIM local address used	If anycast RP is configured, the local address used by the RP.	**extensive**
Anycast-PIM Register State	If anycast RP is configured, the current register state for each group: • **Group**—Multicast group address. • **Source**—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively. • **Origin**—How the information was obtained: ◦ **DIRECT**—From a local attachment ◦ **MSDP**—From the Multicast Source Discovery Protocol (MSDP) ◦ **DR**—From the designated router	**extensive**
RP selected	For sparse mode and bidirectional mode, the identity of the RP for the specified group address.	*group-address*

show pim snooping interfaces

Syntax

show pim snooping interfaces
<brief | detail>
<instance *instance-name*>
<interface *interface-name*>
<logical-system *logical-system-name*>
<vlan-id *vlan-identifier*>

Release Information

Command introduced in Junos OS Release 12.3 for MX Series 3D Universal Edge devices.
Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.

Description

Display information about PIM snooping interfaces.

Options

none—Display detailed information.

brief | detail—(Optional) Display the specified level of output.

instance *<instance-name>*—(Optional) Display PIM snooping interface information for the specified routing instance.

interface *<interface-name>*—(Optional) Display PIM snooping information for the specified interface only.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

vlan-id *<vlan-identifier>*—(Optional) Display PIM snooping interface information for the specified VLAN.

Required Privilege Level

List of Sample Output

show pim snooping interfaces on page 1928
show pim snooping interfaces instance vpls1 on page 1928
show pim snooping interfaces interface <interface-name> on page 1929
show pim snooping interfaces vlan-id <vlan-id> on page 1929

Output Fields

Table 142 on page 1927 lists the output fields for the **show pim snooping interface** command. Output fields are listed in the approximate order in which they appear.

Table 142: show pim snooping interface Output Fields

Field Name	Field Description	Level of Output
Instance	Routing instance for PIM snooping.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 142: show pim snooping interface Output Fields (continued)

Field Name	Field Description	Level of Output
Learning-Domain	Learning domain for snooping.	All levels
Name	Router interfaces that are part of this learning domain.	All levels
State	State of the interface: **Up**, or **Down**.	All levels
IP-Version	Version of IP used: **4** for IPv4, or **6** for IPv6.	All levels
NbrCnt	Number of neighboring routers connected through the specified interface.	All levels
DR address	IP address of the designated router.	All levels

Sample Output

show pim snooping interfaces

```

show pim snooping join

Syntax

show pim snooping join
<brief | detail | extensive>
<instance *instance-name*>
<logical-system *logical-system-name*>
<vlan-id *vlan-id*>

Release Information

Command introduced in Junos OS Release 12.3 for MX Series 3D Universal Edge devices.
Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.

Description

Display information about Protocol Independent Multicast (PIM) snooping joins.

Options

none—Display detailed information.

brief | detail | extensive—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display PIM snooping join information for the specified routing instance.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

vlan-id *vlan-identifier*—(Optional) Display PIM snooping join information for the specified VLAN.

Required Privilege Level

List of Sample Output

show pim snooping join on page 1932
show pim snooping join extensive on page 1932
show pim snooping join instance on page 1932
show pim snooping join vlan-id on page 1933

Output Fields

Table 143 on page 1930 lists the output fields for the **show pim snooping join** command. Output fields are listed in the approximate order in which they appear.

Table 143: show pim snooping join Output Fields

Field Name	Field Description	Level of Output
Instance	Routing instance for PIM snooping.	All levels
Learning-Domain	Learning domain for PIM snooping.	All levels
Group	Multicast group address.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 143: show pim snooping join Output Fields (continued)

Field Name	Field Description	Level of Output
Source	Multicast source address: • * (wildcard value) • *<ipv4-address>* • *<ipv6-address>*	All levels
Flags	PIM flags: • **bidirectional**—Bidirectional mode entry. • **dense**—Dense mode entry. • **rptree**—Entry is on the rendezvous point tree. • **sparse**—Sparse mode entry. • **spt**—Entry is on the shortest-path tree for the source. • **wildcard**—Entry is on the shared tree.	All levels
Upstream state	Information about the upstream interface: • **Join to RP**—Sending a join to the rendezvous point. • **Join to Source**—Sending a join to the source. • **Local RP**—Sending neither join messages nor prune messages toward the RP, because this router is the rendezvous point. • **Local Source**—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device. • **Prune to RP**—Sending a prune to the rendezvous point. • **Prune to Source**—Sending a prune to the source. NOTE: RP group range entries have **None** in the **Upstream state** field because RP group ranges do not trigger actual PIM join messages between routers.	All levels
Upstream neighbor	Information about the upstream neighbor: **Direct**, **Local**, **Unknown**, or a specific IP address. For bidirectional PIM, **Direct** means that the interface is directly connected to a subnet that contains a phantom RP address.	All levels
Upstream port	RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*,G). For bidirectional PIM, **RP Link** means that the interface is directly connected to a subnet that contains a phantom RP address.	All levels
Downstream port	Information about downstream interfaces.	**extensive**
Downstream neighbors	Address of the downstream neighbor.	**extensive**
Timeout	Time remaining until the downstream join state is updated (in seconds).	**extensive**

Sample Output

show pim snooping join

```
user@host> show pim snooping join
Instance: vpls1

 Copyright © 2018, Juniper Networks, Inc.

Table 144: show pim snooping neighbors Output Fields

Field Name	Field Description	Level of Output
Instance	Routing instance for PIM snooping.	All levels
Learning-Domain	Learning domain for PIM snooping.	All levels
Interface	Router interface for which PIM snooping neighbor details are displayed.	All levels
Option	PIM snooping options available on the specified interface: • H = Hello Option Holdtime • P = Hello Option DR Priority • L = Hello Option LAN Prune Delay • G = Generation Identifier • T = Tracking Bit	All levels
Uptime	Time the neighbor has been operational since the PIM process was last initialized, in the format ***dd*:*hh*:*mm*:*ss* ago** for less than a week and ***nwnd*:*hh*:*mm*:*ss* ago** for more than a week.	All levels
Neighbor addr	IP address of the PIM snooping neighbor connected through the specified interface.	All levels
Address	IP address of the specified router interface.	All levels
Hello Option Holdtime	Time for which the neighbor is available, in seconds. The range of values is **0** through **65,535**.	**detail**
Hello Option DR Priority	Designated router election priority. The range of values is **0** through **4294967295**. NOTE: By default, every PIM interface has an equal probability (priority 1) of being selected as the DR.	**detail**
Hello Option Generation ID	9-digit or 10-digit number used to tag hello messages.	**detail**
Hello Option LAN Prune Delay	Time to wait before the neighbor receives prune messages, in the format **delay *nnn* ms override *nnnn* ms**.	**detail**

Sample Output

show pim snooping statistics

Syntax

show pim snooping statistics
<instance *instance-name*>
<interface *interface-name*>
<logical-system *logical-system-name*>
<vlan-id *vlan-id*>

Release Information

Command introduced in Junos OS Release 12.3 for MX Series 3D Universal Edge devices.
Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.

Description

Display Protocol Independent Multicast (PIM) snooping statistics.

Options

none—Display PIM statistics.

instance *instance-name*—(Optional) Display statistics for a specific routing instance enabled by Protocol Independent Multicast (PIM) snooping.

interface *interface-name*—(Optional) Display statistics about the specified interface for PIM snooping.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

vlan-id *vlan-identifier*—(Optional) Display PIM snooping statistics information for the specified VLAN.

Output Fields

Table 145 on page 1939 lists the output fields for the **show pim snooping statistics** command. Output fields are listed in the approximate order in which they appear.

Table 145: show pim snooping statistics Output Fields

Field Name	Field Description	Level of Output
Instance	Routing instance for PIM snooping.	All levels
Learning-Domain	Learning domain for PIM snooping.	All levels

Table 145: show pim snooping statistics Output Fields (continued)

Field Name	Field Description	Level of Output
Tx J/P messages	Total number of transmitted join/prune packets.	All levels
RX J/P messages	Total number of received join/prune packets.	All levels
Rx J/P messages -- seen	Number of join/prune packets seen but not received on the upstream interface.	All levels
Rx J/P messages -- received	Number of join/prune packets received on the downstream interface.	All levels
Rx Hello messages	Total number of received hello packets.	All levels
Rx Version Unknown	Number of packets received with an unknown version number.	All levels
Rx Neighbor Unknown	Number of packets received from an unknown neighbor.	All levels
Rx Upstream Neighbor Unknown	Number of packets received with unknown upstream neighbor information.	All levels
Rx Bad Length	Number of packets received containing incorrect length information.	All levels
Rx J/P Busy Drop	Number of join/prune packets dropped while the router is busy.	All levels
Rx J/P Group Aggregate 0	Number of join/prune packets received containing the aggregate group information.	All levels
Rx Malformed Packet	Number of malformed packets received.	All levels
Rx No PIM Interface	Number of packets received without the interface information.	All levels
Rx No Upstream Neighbor	Number of packets received without upstream neighbor information.	All levels
Rx Unknown Hello Option	Number of hello packets received with unknown options.	All levels

show pim source

List of Syntax

Syntax on page 1944
Syntax (EX Series Switch and the QFX Series) on page 1944

Syntax

show pim source
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*source-prefix*>

Syntax (EX Series Switch and the QFX Series)

show pim source
<brief | detail>
<inet | inet6>
<instance *instance-name*>
<*source-prefix*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about the Protocol Independent Multicast (PIM) source reverse path forwarding (RPF) state.

Options

none—Display standard information about the PIM RPF state for all supported family addresses for all routing instances.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about the RPF state for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

source-prefix—(Optional) Display the state for source RPF states in the given range.

show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 1946

Output Fields Table 146 on page 1945 describes the output fields for the **show pim source** command. Output fields are listed in the approximate order in which they appear.

Table 146: show pim source Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
Source	Address of the source or reverse path.
Prefix/length	Prefix and prefix length for the route used to reach the RPF address.
Upstream Protocol	Protocol toward the source address.
Upstream interface	RPF interface toward the source address. A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.
Upstream Neighbor	Address of the RPF neighbor used to reach the source address. The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.

Sample Output

show pim source

```
user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
    Prefix 10.255.14.144/32
    Upstream interface Local
    Upstream neighbor Local

Source 10.255.70.15
    Prefix 10.255.70.15/32
    Upstream interface so-1/0/0.0
    Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6
```

show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see show pim source on page 1945.

show pim source detail

```
user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
    Prefix 10.255.14.144/32
    Upstream interface Local
    Upstream neighbor Local
    Active groups:233.252.0.0
        233.252.0.1
        233.252.0.1

Source 10.255.70.15
    Prefix 10.255.70.15/32
    Upstream interface so-1/0/0.0
    Upstream neighbor 10.111.10.2
    Active groups:233.252.0.1

Instance: PIM.master Family: INET6
```

show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs)

```
user@host> show pim source
Instance: PIM.master Family: INET

Source 10.1.1.1
    Prefix 10.1.1.1/32
    Upstream interface Local
    Upstream neighbor Local

Source 10.2.7.7
    Prefix 10.2.7.0/24
    Upstream protocol MLDP
    Upstream interface Pseudo MLDP
    Upstream neighbor MLDP LSP root <10.1.1.2>

Source 192.168.219.11
    Prefix 192.168.219.0/28
    Upstream protocol MLDP
    Upstream interface Pseudo MLDP
    Upstream neighbor via MLDP-inband
   Upstream interface fe-1/3/0.0
    Upstream neighbor 192.168.140.1
    Upstream neighbor MLDP LSP root <10.1.1.2>

Instance: PIM.master Family: INET6
Source 2001:db8::1:2:7:7
    Prefix 2001:db8::1:2:7:0/120
    Upstream protocol MLDP
    Upstream interface Pseudo MLDP
    Upstream neighbor via MLDP-inband
   Upstream interface fe-1/3/0.0
    Upstream neighbor 192.168.140.1
Upstream neighbor MLDP LSP root <10.1.1.2>

Output Fields

Table 147 on page 1948 describes the output fields for the **show pim statistics** command. Output fields are listed in the approximate order in which they appear.

Table 147: show pim statistics Output Fields

Field Name	Field Description
Instance	Name of the routing instance. This field only appears if you specify an interface, for example: • **inet interface** ***interface-name*** • **inet6 interface** ***interface-name*** • **interface** ***interface-name***
Family	Output is for IPv4 or IPv6 PIM statistics. **INET** indicates IPv4 statistics, and **INET6** indicates IPv6 statistics. This field only appears if you specify an interface, for example: • **inet interface** ***interface-name*** • **inet6 interface** ***interface-name*** • **interface** ***interface-name***
PIM statistics	PIM statistics for all interfaces or for the specified interface.
PIM message type	Message type for which statistics are displayed.
Received	Number of received statistics.
Sent	Number of messages sent of a certain type.
Rx errors	Number of received packets that contained errors.
V2 Hello	PIM version 2 hello packets.
V2 Register	PIM version 2 register packets.
V2 Register Stop	PIM version 2 register stop packets.
V2 Join Prune	PIM version 2 join and prune packets.
V2 Bootstrap	PIM version 2 bootstrap packets.
V2 Assert	PIM version 2 assert packets.
V2 Graft	PIM version 2 graft packets.
V2 Graft Ack	PIM version 2 graft acknowledgment packets.
V2 Candidate RP	PIM version 2 candidate RP packets.

Copyright © 2018, Juniper Networks, Inc.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
V2 State Refresh	PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh. State refresh is an extension to PIM-DM. It not supported in Junos OS.
V2 DF Election	PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.
V1 Query	PIM version 1 query packets.
V1 Register	PIM version 1 register packets.
V1 Register Stop	PIM version 1 register stop packets.
V1 Join Prune	PIM version 1 join and prune packets.
V1 RP Reachability	PIM version 1 RP reachability packets.
V1 Assert	PIM version 1 assert packets.
V1 Graft	PIM version 1 graft packets.
V1 Graft Ack	PIM version 1 graft acknowledgment packets.
AutoRP Announce	Auto-RP announce packets.
AutoRP Mapping	Auto-RP mapping packets.
AutoRP Unknown type	Auto-RP packets with an unknown type.
Anycast Register	Auto-RP announce packets.
Anycast Register Stop	Auto-RP announce packets.
Global Statistics	Summary of PIM statistics for all interfaces.
Hello dropped on neighbor policy	Number of hello packets dropped because of a configured neighbor policy.
Unknown type	Number of PIM control packets received with an unknown type.
V1 Unknown type	Number of PIM version 1 control packets received with an unknown type.
Unknown Version	Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.

Copyright © 2018, Juniper Networks, Inc.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
Neighbor unknown	Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.
Bad Length	Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.
Bad Checksum	Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet.
Bad Receive If	Number of PIM control packets received on an interface that does not have PIM configured.
Rx Bad Data	Number of PIM control packets received that contain data for TCP Bad register packets.
Rx Intf disabled	Number of PIM control packets received on an interface that has PIM disabled.
Rx V1 Require V2	Number of PIM version 1 control packets received on an interface configured for PIM version 2.
Rx V2 Require V1	Number of PIM version 2 control packets received on an interface configured for PIM version 1.
Rx Register not RP	Number of PIM register packets received when the routing device is not the RP for the group.
Rx Register no route	Number of PIM register packets received when the RP does not have a unicast route back to the source.
Rx Register no decap if	Number of PIM register packets received when the RP does not have a de-encapsulation interface.
Null Register Timeout	Number of NULL register timeout packets.
RP Filtered Source	Number of PIM packets received when the routing device has a source address filter configured for the RP.
Rx Unknown Reg Stop	Number of register stop messages received with an unknown type.
Rx Join/Prune no state	Number of join and prune messages received for which the routing device has no state.
Rx Join/Prune on upstream if	Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.
Rx Join/Prune for invalid group	Number of join or prune messages received for invalid multicast group addresses.

Copyright © 2018, Juniper Networks, Inc.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
Rx Join/Prune messages dropped	Number of join and prune messages received and dropped.
Rx sparse join for dense group	Number of PIM sparse mode join messages received for a group that is configured for dense mode.
Rx Graft/Graft Ack no state	Number of graft and graft acknowledgment messages received for which the router or switch has no state.
Rx Graft on upstream if	Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.
Rx CRP not BSR	Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.
Rx BSR when BSR	Number of BSR messages received in which the PIM message type is Bootstrap.
Rx BSR not RPF if	Number of BSR messages received on an interface that is not the RPF interface.
Rx unknown hello opt	Number of PIM hello packets received with options that Junos OS does not support.
Rx data no state	Number of PIM control packets received for which the routing device has no state for the data type.
Rx RP no state	Number of PIM control packets received for which the routing device has no state for the RP.
Rx aggregate	Number of PIM aggregate MDT packets received.
Rx malformed packet	Number of PIM control packets received with a malformed IP unicast or multicast address family.
No RP	Number of PIM control packets received with no RP address.
No register encap if	Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.
No route upstream	Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP.
Nexthop Unusable	Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.
RP mismatch	Number of PIM control packets received for which the routing device has an RP mismatch.

Copyright © 2018, Juniper Networks, Inc.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
RP mode mismatch	RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.
RPF neighbor unknown	Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.
Rx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Tx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Embedded-RP invalid addr	Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.
Embedded-RP limit exceed	Number of times the limit configured with the **maximum-rps** statement is exceeded. The **maximum-rps** statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.
Embedded-RP added	Number of packets in which the embedded RP for IPv6 is added. The following receive events trigger extraction of an IPv6 embedded RP address on the routing device: • Multicast Listener Discovery (MLD) report for an embedded RP multicast group address • PIM join message with an embedded RP multicast group address • Static embedded RP multicast group address associated with an interface • Packets sent to an embedded RP multicast group address received on the DR An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.
Embedded-RP removed	Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.
Rx Register msgs filtering drop	Number of received register messages dropped because of a filter configured for PIM register messages.
Tx Register msgs filtering drop	Number of register messages dropped because of a filter configured for PIM register messages.
Rx Bidir Join/Prune on non-Bidir if	Error counter for join and prune messages received on non-bidirectional PIM interfaces.

 Copyright © 2018, Juniper Networks, Inc.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
Rx Bidir Join/Prune on non-DF if	Error counter for join and prune messages received on non-designated forwarder interfaces.
V4 (S,G) Maximum	Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.
V4 (S,G) Accepted	Number of accepted (S,G) IPv4 multicast routes.
V4 (S,G) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv4 multicast routes accepted by the device).
V4 (S,G) Log Interval	Time (in seconds) between consecutive log messages.
V6 (S,G) Maximum	Maximum number of (S,G) IPv6 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.
V6 (S,G) Accepted	Number of accepted (S,G) IPv6 multicast routes.
V6 (S,G) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv6 multicast routes accepted by the device).
V6 (S,G) Log Interval	Time (in seconds) between consecutive log messages.
V4 (grp-prefix, RP) Maximum	Maximum number of group-to-rendezvous point (RP) IPv4 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.
V4 (grp-prefix, RP) Accepted	Number of accepted group-to-RP IPv4 multicast mappings.
V4 (grp-prefix, RP) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv4 multicast mappings accepted by the device).
V4 (grp-prefix, RP) Log Interval	Time (in seconds) between consecutive log messages.
V6 (grp-prefix, RP) Maximum	Maximum number of group-to RP IPv6 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.
V6 (grp-prefix, RP) Accepted	Number of accepted group-to-RP IPv6 multicast mappings.

Copyright © 2018, Juniper Networks, Inc.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
V6 (grp-prefix, RP) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv6 multicast mappings accepted by the device).
V6 (grp-prefix, RP) Log Interval	Time (in seconds) between consecutive log messages.
V4 Register Maximum	Maximum number of IPv4 PIM registers accepted for the VRF routing instance. If this number is met, additional PIM registers are not accepted. You configure the register limits on the RP.
V4 Register Accepted	Number of accepted IPv4 PIM registers.
V4 Register Threshold	Threshold at which a warning message is logged (percentage of the maximum number of IPv4 PIM registers accepted by the device).
V4 Register Log Interval	Time (in seconds) between consecutive log messages.
V6 Register Maximum	Maximum number of IPv6 PIM registers accepted for the VRF routing instance. If this number is met, additional PIM registers are not accepted. You configure the register limits on the RP.
V6 Register Accepted	Number of accepted IPv6 PIM registers.
V6 Register Threshold	Threshold at which a warning message is logged (percentage of the maximum number of IPv6 PIM registers accepted by the device).
V6 Register Log Interval	Time (in seconds) between consecutive log messages.
(*,G) Join drop due to SSM range check	PIM join messages that are dropped because the multicast addresses are outside of the SSM address range of 232.0.0.0 through 232.255.255.255. You can extend the accepted SSM address range by configuring the **ssm-groups** statement.

Sample Output

show pim statistics

```
user@host> show pim statistics
PIM Message type        Received       Sent  Rx errors
V2 Hello                      15         32          0
V2 Register                    0        362          0
V2 Register Stop             483          0          0
V2 Join Prune                 18        518          0
V2 Bootstrap                   0          0          0
V2 Assert                      0          0          0
V2 Graft                       0          0          0
```

show sap listen

Syntax

show sap listen
<brief | detail>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display the addresses that the router is listening to in order to receive multicast Session Announcement Protocol (SAP) session announcements.

Options

none—Display standard information about the addresses that the router is listening to in order to receive multicast SAP session announcements.

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show sap listen on page 1960
show sap listen brief on page 1961
show sap listen detail on page 1961

Output Fields

Table 148 on page 1960 describes the output fields for the **show sap listen** command. Output fields are listed in the approximate order in which they appear.

Table 148: show sap listen Output Fields

Field Name	Field Description
Group address	Address of the group that the local router is listening to for SAP messages.
Port	UDP port number used for SAP.

Sample Output

show sap listen

```
user@host> show sap listen
Group address   Port
224.2.127.254   9875
239.255.255.255 9875
```

Copyright © 2018, Juniper Networks, Inc.

show sap listen brief

The output for the **show sap listen brief** command is identical to that for the **show sap listen** command. For sample output, see show sap listen on page 1960.

show sap listen detail

The output for the **show sap listen detail** command is identical to that for the **show sap listen** command. For sample output, see show sap listen on page 1960.

test msdp

Syntax

test msdp (dependent-peers *prefix* | rpf-peer *originator*)
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Find Multicast Source Discovery Protocol (MSDP) peers.

Options

dependent-peers *prefix*—Find downstream dependent MSDP peers.

rpf-peer *originator*—Find the MSDP reverse-path-forwarding (RPF) peer for the originator.

instance *instance-name*—(Optional) Find MDSP peers for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

test msdp dependent-peers on page 1962

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

test msdp dependent-peers

```
user@host> test msdp dependent-peers 10.0.0.1/24
```

CHAPTER 20

IPv6 Operational Commands

clear ipv6 neighbors

Syntax

clear ipv6 neighbors
<all | host *hostname*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.3 for EX Series switches.
Command introduced in Junos OS Release 12.2 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear IPv6 neighbor cache information.

Options

none—Clear all IPv6 neighbor cache information.

all—(Optional) Clear all IPv6 neighbor cache information.

host *hostname*—(Optional) Clear the information for the specified IPv6 neighbors.

Required Privilege Level

view

clear ipv6 router-advertisement

Syntax

clear ipv6 router-advertisement
<interface *interface*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Clear IPv6 router advertisement counters.

Options

none—Clear IPv6 router advertisement counters for all interfaces.

interface *interface*—(Optional) Clear IPv6 router advertisement counters for the specified interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show ipv6 neighbors

Syntax show ipv6 neighbors

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.3 for EX Series switches.
Command introduced in Junos OS Release 12.2 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display information about the IPv6 neighbor cache.

NOTE: Starting with Junos OS Release 16.1, **show ipv6 neighbors** command does not display the underlying ifl information if **enhanced-convergence** statement at **[edit irb unit *unit-number*]** hierarchy level and **enhanced-ip** statement at **[edit chassis network-services]** hierarchy level is configured for the destination interface IRB.

Options This command has no options.

Required Privilege Level view

Output Fields Table 149 on page 1966 describes the output fields for the **show ipv6 neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 149: show ipv6 neighbors Output Fields

Field Name	Field Description
IPv6 Address	Name of the IPv6 interface.
Linklayer Address	Link-layer address.
State	State of the link: **up**, **down**, **incomplete**, **reachable**, **stale**, or **unreachable**.
Exp	Number of seconds until the entry expires.
Rtr	Whether the neighbor is a routing device: **yes** or **no**.

 Copyright © 2018, Juniper Networks, Inc.

Table 149: show ipv6 neighbors Output Fields (continued)

Field Name	Field Description
Secure	Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: **yes** or **no**.
Interface	Name of the interface.

Sample Output

show ipv6 neighbors

```
user@host> show ipv6 neighbors
IPv6 Address                 Linklayer Address  State       Exp Rtr Secure
Interface
2001:db8:0:1:2a0:a514:0:24c  00:05:85:8f:c8:bd  stale       546 yes no
fe-1/2/0.1

show ipv6 router-advertisement

Syntax

show ipv6 router-advertisement
<conflicts>
<interface *interface*>
<logical-system (all | *logical-system-name*)>
<prefix *prefix/prefix length*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.2 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers.

Options

none—Display all IPv6 router advertisement information for all interfaces.

conflicts—(Optional) Display only the IPv6 router advertisement information that is conflicting.

interface *interface*—(Optional) Display IPv6 router advertisement information for the specified interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix *prefix/prefix length*—(Optional) Display IPv6 router advertisement information for the specified prefix.

Additional Information

The display identifies conflicting information by enclosing the value the router is advertising in brackets.

Required Privilege Level

Output Fields

Table 150 on page 1969 describes the output fields for the **show ipv6 router-advertisement** command. Output fields are listed in the approximate order in which they appear.

 Copyright © 2018, Juniper Networks, Inc.

Table 150: show ipv6 router-advertisement Output Fields

Field Name	Field Description
Interface	Name of the interface.
Advertisements sent	Number of router advertisements sent and the elapsed time since they were sent.
Solicits received	Number of solicitation messages received.
Advertisements received	Number of router advertisements received.
Advertisements from	Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received.
Managed	Managed address configuration flag: **0** (stateless) or **1** (stateful).
Other configuration	Other stateful configuration flag: **0** (stateless) or **1** (stateful).
Reachable time	Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.
Default lifetime	Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router.
Retransmit timer	Time between retransmitted Neighbor Solicitation messages, in milliseconds.
Current hop limit	Configured current hop limit.
Prefix	Name and length of the prefix.
Valid lifetime	How long the prefix remains valid for onlink determination.
Preferred lifetime	How long the prefix generated by stateless autoconfiguration remains preferred.
On link	Onlink flag: **0** (not onlink) or **1** (onlink).
Autonomous	Autonomous address configuration flag: **0** (not autonomous) or **1** (autonomous).

Sample Output

IS-IS Operational Commands

clear isis adjacency

List of Syntax

Syntax on page 1972
Syntax (EX Series Switches and QFX Series) on page 1972

Syntax

clear isis adjacency
<all>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor*>

Syntax (EX Series Switches and QFX Series)

clear isis adjacency
<all>
<instance *instance-name*>
<interface *interface-name*>
<*neighbor*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
all option introduced in Junos OS Release 14.2.

Description

Remove entries from the IS-IS adjacency database.

Options

all—Remove all entries from the adjacency database.

instance *instance-name*—(Optional) Clear all adjacencies for the specified routing instance only.

interface *interface-name*—(Optional) Clear all adjacencies for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear adjacencies for the specified neighbor only.

Required Privilege Level

clear

clear isis overload

List of Syntax
Syntax on page 1976
Syntax (EX Series Switches and QFX Series) on page 1976

Syntax
clear isis overload
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches and QFX Series)
clear isis overload
<instance *instance-name*>

Release Information
Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description
Reset the IS-IS dynamic overload bit. This command can appear to not work, continuing to display **overload** after execution. The bit is reset only if the root cause is corrected by configuration remotely or locally.

When other routers detect that the overload bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes.

Options
none—Reset the IS-IS dynamic overload bit.

instance *instance-name*—(Optional) Reset the IS-IS dynamic overload bit for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

Syntax (EX Series Switches and QFX Series)

clear isis statistics
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Set statistics about IS-IS traffic to zero.

Options

none—Set IS-IS traffic statistics to zero for all routing instances.

instance *instance-name*—(Optional) Set IS-IS traffic statistics to zero for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields Table 151 on page 1981 describes the output fields for the **show isis adjacency** command. Output fields are listed in the approximate order in which they appear.

Table 151: show isis adjacency Output Fields

Field Name	Field Description	Level of Output
Interface	Interface through which the neighbor is reachable.	All levels
System	System identifier (**sysid**), displayed as a name, if possible.	**brief**
L or Level	Level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2 An exclamation point (**!**) preceding the level number indicates that the adjacency is missing an IP address.	All levels
State	State of the adjacency: **Up**, **Down**, **New**, **One-way**, **Initializing**, or **Rejected**.	All levels
Hold (secs)	Remaining hold time of the adjacency.	**brief**
SNPA	Subnetwork point of attachment (MAC address of the next hop).	**brief**
Expires in	How long until the adjacency expires, in seconds.	**detail**
Priority	Priority to become the designated intermediate system.	**detail extensive**
Up/Down transitions	Count of adjacency status changes from **Up** to **Down** or from **Down** to **Up**.	**detail**
Last transition	Time of the last **Up/Down** transition.	**detail**
Circuit type	Bit mask of levels on this interface: **1**=Level 1 router; **2**=Level 2 router; **3**=both Level 1 and Level 2 router.	**detail**
Speaks	Protocols supported by this neighbor.	**detail extensive**
MAC address	MAC address of the interface.	**detail extensive**
Topologies	Supported topologies.	**detail extensive**
Restart capable	Whether a neighbor is capable of graceful restart: **Yes** or **No**.	**detail extensive**
Adjacency advertisement: Advertise	This routing device has signaled to advertise this interface to its neighbors in their link-state PDUs.	**detail extensive**
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise the interface in the routing device's outbound link-state PDUs.	**detail extensive**

Table 151: show isis adjacency Output Fields (continued)

Field Name	Field Description	Level of Output
IP addresses	IP address of this neighbor.	**detail extensive**
IPV6 Address	IPv6 address of the neighbor.	**detail extensive**
Level 1 IPv4 Adj-SID	Level 1 IPv4 node-SID of the adjacent neighbor.	**detail extensive**
Level 1 IPv6 Adj-SID	Level 1 IPv6 node-SID of the adjacent neighbor.	
Level 2 IPv4 Adj-SID	Level 2 IPv4 node-SID of the adjacent neighbor.	**detail extensive**
Level 2 IPv6 Adj-SID	Level 2 IPv6 node-SID of the adjacent neighbor.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 151: show isis adjacency Output Fields (continued)

Field Name	Field Description	Level of Output

Transition log	List of recent transitions, including:
	• **When**—Time at which an IS-IS adjacency transition occurred.
	• **State**—Current state of the IS-IS adjacency (**up**, **down**, or **rejected**).
	  ◦ **Up**—Adjacency is up and operational.
	  ◦ **Down**—Adjacency is down and not available.
	  ◦ **Rejected**—Adjacency has been rejected.
	• **Event**—Type of transition that occurred.
	  ◦ **Seenself**—Possible routing loop has been detected.
	  ◦ **Interface down**—IS-IS interface has gone down and is no longer available.
	  ◦ **Error**—Adjacency error.
	• **Down reason**—Reason that an IS-IS adjacency is down:
	  ◦ **3-Way Handshake Failed**—Connection establishment failed.
	  ◦ **Address Mismatch**—Address mismatch caused link failure.
	  ◦ **Aged Out**—Link expired.
	  ◦ **ISO Area Mismatch**—IS-IS area mismatch caused link failure.
	  ◦ **Bad Hello**—Unacceptable hello message caused link failure.
	  ◦ **BFD Session Down**—Bidirectional failure detection caused link failure.
	  ◦ **Interface Disabled**—IS-IS interface is disabled.
	  ◦ **Interface Down**—IS-IS interface is unavailable.
	  ◦ **Interface Level Disabled**—IS-IS level is disabled.
	  ◦ **Level Changed**—IS-IS level has changed on the adjacency.
	  ◦ **Level Mismatch**—Levels on adjacency are not compatible.
	  ◦ **MPLS LSP Down**—Label-switched path (LSP) is unavailable.
	  ◦ **MT Topology Changed**—IS-IS topology has changed.
	  ◦ **MT Topology Mismatch**—IS-IS topology is mismatched.
	  ◦ **Remote System ID Changed**—Adjacency peer system ID changed.
	  ◦ **Protocol Shutdown**—IS-IS protocol is disabled.
	  ◦ **CLI Command**—Adjacency brought down by user.
	  ◦ **Unknown**—Unknown.
		extensive

Sample Output

show isis adjacency

Output Fields

Table 154 on page 1989 lists the output fields for the **show isis backup label-switched-path** command. Output fields are listed in the approximate order in which they appear.

Table 154: show isis backup label-switched-path Output Fields

Field Name	Field Description
Backup MPLS LSPs	List of MPLS LSPs designated as backup paths for IS-IS routes.
Egress	IP address of the egress routing device for the LSP.

Copyright © 2018, Juniper Networks, Inc.

Table 154: show isis backup label-switched-path Output Fields (continued)

Field Name	Field Description

Status	State of the LSP:
	• **Up**—The routing device can detect RSVP hello messages from the neighbor.
	• **Down**—The routing device has received one of the following indications:
	  ◦ Communication failure from the neighbor.
	  ◦ Communication from IGP that the neighbor is unavailable.
	  ◦ Change in the sequence numbers in the RSVP hello messages sent by the neighbor.
	• **Deleted**—LSP is no longer available as a backup path.

Last change	Time elapsed since the neighbor state changed either from up to down or from down to up. The format is *hh:mm:ss*.
TE-metric	Configured traffic engineering metric.
Metric	Configured metric.

Sample Output

show isis backup label-switched-path

```
user@host> show isis backup label-switched-path
 Backup MPLS LSPs:
 f-to-g, Egress: 192.168.1.4, Status: up, Last change: 06:12:03
    TE-metric: 9, Metric: 0
```

Output Fields Table 155 on page 1992 lists the output fields for the **show isis backup spf results** command. Output fields are listed in the approximate order in which they appear.

Table 155: show isis backup spf results Output Fields

Field Name	Field Description
node-name	Name of the destination node.
Address	Address of the destination node.
Primary next-hop	Interface and name of the node of the primary next hop to reach the destination.
Root	Name of the next-hop neighbor.
Metric	Metric to the node.
Eligible	Indicates that the next-hop neighbor has been designated as a backup path to the destination node.
Backup next-hop	Name of the interface of the backup next hop.
SNPA	Subnetwork point of attachment (MAC address of the next hop).
LSP	Name of the MPLS label-switched path (LSP) designated as a backup path.
Not eligible	Indicates that the next-hop neighbor cannot function as a backup path to the destination.
Reason	Describes why the next-hop neighbor is designated as **Not eligible** as a backup path.

Sample Output

show isis backup spf results

```
user@host> show isis backup spf results

IS-IS level 1 SPF results:
  0 nodes

 IS-IS level 2 SPF results:
banff.00
  Primary next-hop: so-6/0/0.0, IPV4, olympic

show isis context-identifier

Syntax

show isis context-identifier
<brief | detail | extensive>
<*identifier name*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced in Junos OS Release 10.4.

Description

Display IS-IS context identifier information.

Options

brief | detail | extensive—(Optional) Display the specified level of output.

identifier name—(Optional) Display information about the specified context identifier.

instance *instance-name*—(Optional) Display entries for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Display the context identifier information for all logical systems or for a particular logical system.

Required Privilege Level

View

Output Fields

Table 156 on page 1995 lists the output fields for the **show isis context-identifier** command. Output fields are listed in the approximate order in which they appear.

Table 156: show isis context-identifier Output Fields

Field Name	Field Description	Level of Output
Context	IPv4 address that defines a protection pair. The context is manually configured on both primary and protector PEs.	**detail**
Owner	Protocol that requires the context.	**detail**
Role	Role of the PE, which is either primary or protector.	**detail**
Primary	Name of the primary PE.	**detail**
Metric	Advertised interior gateway protocol (IGP) metric.	**detail**

Sample Output

```
user@host> show isis context-identifier detail

IS-IS context database:
Context                 Owner     Role       Primary      Metric
2.2.4.3                MPLS      Primary    pro3-e        1
```

```
Advertiser pro3-e, Router ID 10.255.245.198, Metric 1, Level 1
Advertiser pro3-e, Router ID 10.255.245.198, Metric 1, Level 2
Advertiser pro3-c, Router ID 10.255.245.196, Metric 11, Level 2
```

<level (1 | 2)>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches and QFX Series)

show isis database
<system-id>
<brief | detail | extensive>
<level (1 | 2)>
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Command introduced in Junos OS Release 15.1X53-D30 for the QFX10002 switch.

Description

Display the entries in the Intermediate System-to-Intermediate System (IS-IS) link-state database, which contains data about PDU packets.

Options

none—Display standard information about IS-IS link-state database entries for all routing instances.

system id—(Optional) Display IS-IS link-state database entries for the specified intermediate system.

brief | detail | extensive—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display IS-IS link-state database entries for the specified routing instance.

level (1 | 2)—(Optional) Display IS-IS link-state database entries for the specified IS-IS level.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 157 on page 1998 describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

Table 157: show isis database Output Fields

Field Name	Field Description	Level of Output
Interface name	Name of the interface on which the link-state PDU has been received; always **IS-IS** for this command.	All levels
level	Level of intermediate system: • **1**—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system. • **2**—Intermediate system routes between areas and toward other ASs.	All levels
LSP ID	Link-state PDU identifier.	All levels
Sequence	Sequence number of the link-state PDU.	All levels
Checksum	Checksum value of the link-state PDU.	All levels
Lifetime (secs)	Remaining lifetime of the link-state PDU, in seconds.	All levels
Attributes	Attributes of the specified database: **L1**, **L2**, **Overload**, or **Attached** (L1 only).	none **brief**
# LSPs	Total number of link-state PDUs in the specified link-state database.	none **brief**
IP prefix	Prefix advertised by this link-state PDU.	**detail extensive**
IS neighbor	IS-IS neighbor of the advertising system.	**detail extensive**
IP prefix	IPv4 prefix advertised by this link-state PDU.	**detail extensive**
V6 prefix	IPv6 prefix advertised by this link-state PDU.	**detail extensive**
Metric	Metric of the prefix or neighbor.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 157: show isis database Output Fields (continued)

Field Name	Field Description	Level of Output
Header	• **LSP ID**—Link state PDU identifier of the header. • **Length**—Header length. • **Allocated Length**—Amount of length available for the header. • **Router ID**—Address of the local routing device. • **Remaining Lifetime**—Remaining lifetime of the link-state PDU, in seconds.	**extensive**
Packet	• **LSP ID**—The identifier for the link-state PDU. • **Length**—Packet length. • **Lifetime**—Remaining lifetime, in seconds. • **Checksum**—The checksum of the link-state PDU. • **Sequence**—The sequence number of the link-state PDU. Every time the link-state PDU is updated, this number increments. • **Attributes**—Packet attributes. • **NLPID**—Network layer protocol identifier. • **Fixed length**—Specifies the set length for the packet.	**extensive**
TLVs	• **Area Address**—Area addresses that the routing device can reach. • **Speaks**—Supported routing protocols. • **IP router id**—ID of the routing device (usually the IP address). • **IP address**—IPv4 address. • **Hostname**—Assigned name of the routing device. • **IP prefix**—IP prefix of the routing device. • **Metric**—IS-IS metric that measures the cost of the adjacency between the originating routing device and the advertised routing device. • **IP extended prefix**—Extended IP prefix of the routing device. • **IS neighbor**—Directly attached neighbor's name and metric. • **IS extended neighbor**—Directly attached neighbor's name, metric, IP address, local interface index, and remote interface index. The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205. • **Router Capability**—ID of the routing device and flag. NOTE: Router capability also specifies SPRING capability and SPRING algorithm when segment routing is enabled on the routing device.	**extensive**
Extended IS Reachability TLV	Type and length of the TLV is useful to identify the IS extended neighbors packed in this TLV.	**extensive**
SubTLV len	The length of the SubTLV of IS extended neighbor.	**extensive**

show isis hostname

List of Syntax

Syntax on page 2012
Syntax (EX Series Switches and QFX Series) on page 2012

Syntax

show isis hostname
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches and QFX Series)

show isis hostname

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display IS-IS hostname database information.

This command displays the system ID-to-name cache. The output shows if the mapping has been learned by receipt of a Hostname TLV #137 (type dynamic) configured in Junos OS with the **set system host-name** command, or a static mapping defined in Junos OS with the **set system static-host-mapping *hostname* sysid** command (type static). The local router always has its type set to static even if **static-host-mapping** is not configured.

Options

none—Display IS-IS hostname database information.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show isis hostname on page 2013

Output Fields

Table 158 on page 2012 describes the output fields for the **show isis hostname** command. Output fields are listed in the approximate order in which they appear.

Table 158: show isis hostname Output Fields

Field Name	Field Description
System Id	System identifier mapped to the hostname.
Hostname	Hostname mapped to the system identifier.

 Copyright © 2018, Juniper Networks, Inc.

Table 158: show isis hostname Output Fields (continued)

Field Name	Field Description
Type	Type of mapping between system identifier and hostname. • **Dynamic**—Hostname mapping determined as described in RFC 2763, *Dynamic Hostname Exchange Mechanism for IS-IS*. • **Static**—Hostname mapping configured by user.

Sample Output

show isis hostname

```
user@host> show isis hostname
   IS-IS hostname database:
   System Id      Hostname                                       Type
   1921.6800.4201 isis1                                          Dynamic
   1921.6800.4202 isis2                                          Static
   1921.6800.4203 isis3                                          Dynamic
```

show isis interface
<brief | detail | extensive>
<interface-name>
<logical-system (all | logical-system-name)>
```

Syntax (EX Series Switches and QFX Series)

```
show isis interface
<brief | detail | extensive>
<interface-name>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.

Description

Display status information about Intermediate System-to-Intermediate System (IS-IS)-enabled interfaces.

NOTE: If the configured metric for an IS-IS level is above 63, and the **wide-metrics-only** statement is not configured, the **show isis interface detail** command and the **show isis interface extensive** command display 63 as the metric value for that level. Configure the **wide-metrics-only** statement to generate metric values greater than 63 on a per IS-IS level basis.

The **show isis interface** command displays the configured metric value for an IS-IS level irrespective of whether is configured or not.

Options

none—Display standard information about all IS-IS-enabled interfaces.

brief | detail | extensive—(Optional) Display the specified level of output.

interface-name—(Optional) Display information about the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 159 on page 2015 describes the output fields for the **show isis interface** command. Output fields are listed in the approximate order in which they appear.

Table 159: show isis interface Output Fields

Field Name	Field Description	Level of Output
interface-name	Name of the interface.	**detail**
Designated router	Routing device selected by other routers that is responsible for sending link-state advertisements that describe the network. Used only on broadcast networks.	**detail**
Index	Interface index assigned by the Junos OS kernel.	**detail**
State	Internal implementation information.	**detail**
Circuit id	Circuit identifier. NOTE: Each IS-IS interface is assigned a circuit ID value to identify the interface within the linkstate database. All interfaces (loopback, broadcast, and so on) and all point-to-point links share the locally significant value of 0x01, and this value is not incremented.	**detail**
Circuit type	Circuit type: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2	**detail**
LSP interval	Interval between link-state PDUs sent from the interface.	**detail**
CSNP interval	Interval between complete sequence number PDUs sent from the interface.	**detail extensive**
Sysid	System identifier.	**detail**
Interface	Interface through which the adjacency is made.	none **brief**
L or Level	Level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2 NOTE: The default IS-IS level on loopback interfaces are always same as the IS-IS level configured on other IS-IS interfaces in a router. You can also configure IS-IS level on loopback interfaces per your requirement.	All levels
CirID	Circuit identifier.	none **brief**

Copyright © 2018, Juniper Networks, Inc.

Table 159: show isis interface Output Fields (continued)

Field Name	Field Description	Level of Output
Level 1 DR	Level 1 designated intermediate system.	none **brief**
Level 2 DR	Level 2 designated intermediate system.	none **brief**
L1/L2 Metric	Interface's metric for Level 1 and Level 2. If there is no information, the metric is **0**.	none **brief**
Flood-group Area-ID	Flood-group is configured on a specific IS-IS interface NOTE: Seen only when Flood-group is configured.	**detail extensive**
Adjacency advertisement: Advertise	This routing device has signaled to advertise this interface to its neighbors in their label-switched paths (LSPs).	**detail extensive**
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise this interface in the routing device's outbound LSPs.	**detail extensive**
Adjacencies	Number of adjacencies established on this interface.	**detail**
Priority	Priority value for this interface.	**detail**
Metric	Metric value for this interface.	**detail**
Hello(s) / Hello Interval	Interface's hello interval.	**detail extensive**
Hold(s) / Hold Time	Interface's hold time.	**detail extensive**
Designated Router	Router responsible for sending network link-state advertisements, which describe all the routing devices attached to the network.	**detail**
Hello padding	Type of hello padding: • **Adaptive**—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state TLV. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. • **Loose**—(Default) The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. • **Strict**—Padding is performed on all interface types and for all adjacency states, and is continuous.	**extensive**
LDP sync state	Current LDP synchronization state: **in sync**, **in holddown**, or **not supported**.	**extensive**
reason	Reason for being in the LDP sync state.	**extensive**

Table 159: show isis interface Output Fields (continued)

Field Name	Field Description	Level of Output
config holdtime	Configured value of the hold timer.	**extensive**
remaining	If the state is not in sync and the hold time is not infinity, then this field displays the remaining hold time in seconds.	**extensive**
IIH max size	Configured value of IS-IS hello packets	extensive

Sample Output

show isis interface

```
user@host> show isis interface
IS-IS interface database:
Interface             L CirID Level 1 DR        Level 2 DR        L1/L2 Metric
at-2/3/0.0            3   0x1 Point to Point    Point to Point         10/10
lo0.0                 3   0x1 Passive           Passive                 0/0
```

show isis interface brief

The output for the **show isis interface brief** command is identical to that for the **show isis interface** command. For sample output, see show isis interface on page 2017.

show isis interface detail

```
user@host> show isis interface detail

show isis overview

Syntax

show isis overview
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches and QFX Series)

show isis overview
<instance *instance-name*>

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display IS-IS overview information.

Options

none—Display standard overview information about IS-IS for all routing instances.

instance *instance-name*—(Optional) Display overview information for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show isis overview on page 2021

Output Fields

Table 160 on page 2019 lists the output fields for the **show isis overview** command. Output fields are listed in the approximate order in which they appear.

Table 160: show isis overview Output Fields

Field Name	Field Description
Hostname	Name of the router.
Sysid	Part of the ISO address of the routing device.
Areaid	The area number of the routing device.
Instance	IS-IS routing instance.
Router ID	Router ID of the routing device.
Adjacency holddown	Adjacency holddown capability: **enabled** or **disabled**.

Copyright © 2018, Juniper Networks, Inc.

Table 160: show isis overview Output Fields (continued)

Field Name	Field Description
Maximum Areas	Maximum number of IS-IS areas advertised by the routing device.
LSP life time	Lifetime of the link-state PDU, in seconds.
Filter low life time LSPs up to	LSPs with a lifetime lower than this value are filtered out.
Attached bit evaluation	Attached bit capability: **enabled** or **disabled**.
SPF delay	Delay before performing consecutive shortest-path-first (SPF) calculations.
SPF holddown	Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached.
SPF rapid runs	Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.
Overload bit at startup is set	Overload bit capability is enabled.
Overload high metrics	Overload high metrics capability: **enabled** or **disabled**.
Overload timeout	Time period after which overload is reset and the time that remains before the timer is set to expire.
Traffic engineering	Traffic engineering capability: **enabled** or **disabled**.
Restart	Graceful restart capability: **enabled** or **disabled**.
Restart duration	Time period for complete reacquisition of IS-IS neighbors.
Helper mode	Graceful restart helper capability: **enabled** or **disabled**.
Level	IS-IS level: • **1**—Level 1 information • **2**—Level 2 information
IPv4 is enabled	IP Protocol version 4 capability is enabled.
IPv6 is enabled	IP Protocol version 6 capability is enabled.
Micro-loop avoidance	Micro-loop avoidance is enabled. Generally adjacent nodes converge faster than neighboring nodes causing traffic to loop. A route convergence delay is configured to avoid such micro loops.
Internal route preference	Preference value of internal routes.

 Copyright © 2018, Juniper Networks, Inc.

Table 160: show isis overview Output Fields (continued)

Field Name	Field Description
External route preference	Preference value of external routes.
Prefix export limit	Number of prefixes allowed to be exported, as configured by the **prefix-export-limit** statement.
Prefix export count	Number of prefixes exported.
Wide area metrics are enabled	Wide area metrics capability is enabled.
Narrow metrics are enabled	Narrow metrics capability is enabled.
Adjacency holddown is active	IS-IS adjacencies come up one after another when adjacency holddown is enabled.

Sample Output

show isis overview

```
user@host> show isis overview
Instance: master
  Router ID: 10.255.107.183

show isis route

List of Syntax

Syntax on page 2023
Syntax (EX Series Switches and QFX Series) on page 2023

Syntax

show isis route
<*destination*>
<inet | inet6>
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Syntax (EX Series Switches and QFX Series)

show isis route
<*destination*>
<inet | inet6>
<instance *instance-name*>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the routes in the IS-IS routing table.

Options

none—Display all routes in the IS-IS routing table for all supported address families for all routing instances.

destination—(Optional) Destination address for the route.

inet | inet6—(Optional) Display inet (IPv4) or inet6 (IPv6) routes, respectively.

instance *instance-name*—(Optional) Display routes for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display routes for the specified topology only, or use unicast to display information, if available, for both IPv4 and IPv6 unicast topologies.

Required Privilege Level

List of Sample Output

show isis route logical-system on page 2024
show isis route floodgroup on page 2024
show isis route (CLNS) on page 2025
show isis route on page 2025

Output Fields Table 161 on page 2024 describes the output fields for the **show isis route** command. Output fields are listed in the approximate order in which they appear.

Table 161: show isis route Output Fields

Field Name	Field Description
Current version	Number of the current version of the IS-IS routing table.
L1	Version of Level 1 SPF that was run.
L2	Version of Level 2 SPF that was run.
Prefix or **Label**	Destination of the route.
L	IS-IS level: • **1**—Level 1 only • **2**—Level 2 only • **3**—Level 1 and Level 2
Version	Version of SPF that generated the route.
Metric	Metric value associated with the route.
Type	Metric type: **int** (internal) or **ext** (external).
Interface	Interface to the next hop.
Via	System identifier of the next hop, displayed as a name if possible.
ISO Routes	ISO routing table entries.
snpa	MAC address.

Sample Output

show isis route logical-system

```
user@host> show isis route logical-system ls1

show isis spf

List of Syntax

Syntax on page 2027
Syntax (EX Series Switches) on page 2027

Syntax

show isis spf (brief | log | results)
<instance *instance-name*>
<level (1 | 2)>
<logical-system (all | *logical-system-name*)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Syntax (EX Series Switches)

show isis spf (brief | log | results)
<instance *instance-name*>
<level (1 | 2)>
<topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display information about IS-IS shortest-path-first (SPF) calculations.

Options

brief—Display an overview of SPF calculations.

log—Display the log of SPF calculations.

results—Display the results of SPF calculations.

instance *instance instance-name*—(Optional) Display SPF calculations for the specified routing instance.

level (1 | 2)—(Optional) Display SPF calculations for the specified IS-IS level.

log—Display the log of SPF calculations.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

results—Display the results of SPF calculations.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display SPF calculations for the specified topology only.

List of Sample Output

show isis spf log on page 2028
show isis spf results logical-system on page 2029
show isis spf results (CLNS) on page 2030

Output Fields

Table 162 on page 2028 describes the output fields for the **show isis spf** command. Output fields are listed in the approximate order in which they appear.

Table 162: show isis spf Output Fields

Field Name	Field Description
Node	System ID of a node.
Metric	Metric to the node.
Interface	Interface of the next hop.
Via	System ID of the next hop.
SNPA	Subnetwork point of attachment (MAC address of the next hop).
Start time	(**log** option only) Time that the SPF computation started.
Elapsed (secs)	(**log** option only) Length of time, in seconds, required to complete the SPF computation.
Count	(**log** option only) Number of times the SPF was triggered.
Reason	(**log** option only) Reason that the SPF computation was completed.

Sample Output

show isis spf log

```
user@host> show isis spf log logical-system lsl
 IS-IS level 1 SPF log:
Start time          Elapsed (secs) Count Reason

Syntax (EX Series Switches and QFX Series) on page 2032

Syntax

show isis statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches and QFX Series)

show isis statistics
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display statistics about IS-IS traffic.

Options

none—Display IS-IS traffic statistics for all routing instances.

instance *instance-name*—(Optional) Display statistics for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 163 on page 2033 describes the output fields for the **show isis statistics** command. Output fields are listed in the approximate order in which they appear.

 Copyright © 2018, Juniper Networks, Inc.

Table 163: show isis statistics Output Fields

Field Name	Field Description
PDU type	PDU type: • **CSNP**—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU. • **IIH**—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems. • **LSP**—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area. • **PSNP**—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device. • **Unknown**—The PDU type is unknown.
Received	Number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	Number of PDUs received less the number dropped.
Drops	Number of PDUs dropped.
Sent	Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Rexmit	Number of PDUs retransmitted since IS-IS started or since the statistics were set to zero.
Total packets received/sent	Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.
SNP queue length	Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always **0**.
LSP queue length	Number of link-state PDUs waiting in the queue for processing. This value is almost always **0**.
SPF runs	Number of shortest-path-first (SPF) calculations that have been performed. If this number is incrementing rapidly, it indicates that the network is unstable.
Fragments rebuilt	Number of link-state PDU fragments that the local system has computed.
LSP regenerations	Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.
Purges initiated	Number of purges that the system initiated. A purge is initiated if the software decides that a link-state PDU must be removed from the network.

CHAPTER 22

LLDP Operational Commands

clear lldp neighbors

Syntax

clear lldp neighbor
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 9.6.

Description

Clear information regarding all Link Layer Discovery Protocol (LLDP) neighbors or LLDP neighbors of the specified interface.

For information about interface names, see "Interface Naming Overview" on page 32. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about interface names in the Junos Fusion technology, see *Understanding Junos Fusion Ports* .

Options

interface *interface-name*—(Optional) Clear the LLDP neighbors on the specified interface.

Required Privilege Level

clear

clear lldp statistics

Syntax

clear lldpp neighbor
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 9.6.

Description

Clear all Link Layer Discovery Protocols (LLDP) statistics or LLDP statistics associated with the specified interface.

For information about interface names, see "Interface Naming Overview" on page 32. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about interface names in the Junos Fusion technology, see *Understanding Junos Fusion Ports* .

Options

interface *interface-name*—(Optional) Clear LLDP statistics on the specified interface.

Required Privilege Level

clear

```

clear lldp statistics interface ge-0/1/1.0

```
user@switch> clear lldp statistics interface ge-0/1/1.0
```

show lldp

Syntax

show lldp
<detail>

Release Information

Command introduced in Junos OS Release 9.6.

Description

Display information about the Link Layer Discovery Protocol (LLDP).

Options

detail—(Optional) Display the detailed output level.

Required Privilege Level

view

List of Sample Output

show lldp on page 2040
show lldp detail on page 2040

Output Fields

Table 164 on page 2038 describes the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

Table 164: show lldp Output Fields

Field Name	Field Description
LLDP	Status of LLDP: **Enabled** or **Disabled**.
Advertisement interval	Value of the advertisement interval parameter.
Transmit delay	Value of the transmit delay parameter.
Hold timer	Value of the hold timer parameter.
Notification interval	Value of the notification interval parameter.
Config Trap Interval	Value of the configuration trap parameter.
Connection Hold timer	Value of the connection hold timer parameter.
Port ID TLV subtype	• *interface-name*—Indicates the interface name as the port information for the local device. • **locally-assigned**—Indicates that the sub-type for port ID TLV generation is locally assigned value of SNMP index of the interface. For more information about port ID TLV subtype, see *port-id-subtype*..

Copyright © 2018, Juniper Networks, Inc.

Table 164: show lldp Output Fields (continued)

Field Name	Field Description
Port Description TLV type	Following value used for port description TLV: • **interface-alias (ifAlias)**—Indicates that the *ifAlias* MIB object value is used to generate the port description TLV. • **interface-description (ifDescr)**—Indicates that the *ifDescr* MIB object value is used to generate the port description TLV. For more information about port description TLV type, see *port-description-type*.
Interface	Name of the interface for which LLDP configuration information is being reported For information about interface names, see "Interface Naming Overview" on page 32. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs.
LLDP	LLDP operating state. The state can be Enabled or Disabled.
LLDP-MED	LLDP-MED operating state. The state can be Enabled or Disabled.
Power Negotiation	LLDP power negotiation operating state. The state can be Enabled or Disabled.
LLDP basic TLVs supported	List of basic LLDP TLVs supported by this device (**detail** only).
LLDP 802 TLVs supported	List of IEEE 802.1 LLDP TLVs supported by this device (**detail** only).

Sample Output

show lldp

```
user@host> show lldp

```

show lldp neighbors

Syntax

show lldp neighbors
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 9.6.

Description

Display information about LLDP neighbors.

For information about interface names, see "Interface Naming Overview" on page 32. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports* .

Options

interface ***interface-name***—(Optional) Display the neighbor information about a particular physical interface.

NOTE: Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

Output Fields

Table 166 on page 2044 describes the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 166: show lldp neighbors Output Fields

Field Name	Field Description
LLDP Remote Devices Information	Information about remote devices.

Copyright © 2018, Juniper Networks, Inc.

Table 166: show lldp neighbors Output Fields (continued)

Field Name	Field Description
LocalInterface	List of local interfaces for which neighbor information is available.
ChassisId	List of chassis identifiers for neighbors.
PortInfo	List of port information gathered from neighbors. This could be the port identifier or port description.
SysName	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both local and neighbor systems on the interface (appears when the **interface** option is used).
Local Information	Information about local systems on the interface (appears when the **interface** option is used).
Neighbor Information	Information about both local and neighbor system on the interface (appears when the **interface** option is used).
Index	Local interface index (appears when the **interface** option is used).
Time Mark	Date and timestamp of information (appears when the **interface** option is used).
Time To Live	Number of seconds for which this information is valid (appears when the **interface** option is used).
Local Interface	Name of the local physical interface (appears when the **interface** option is used).
Parent Interface	Name of the **ae** interface to which the interface belongs
Local Port ID	Local port identifier (appears when the interface option is used).
Neighbor Information	Information about neighbor systems on the interface (appears when the **interface** option is used).
Chassis type	Type of chassis identifier supplied, such as **MAC address** (appears when the **interface** option is used).
Chassis ID	Chassis identifier of type listed (appears when the **interface** option is used).
Port type	Type of port identifier supplied, such as **local** (appears when the **interface** option is used).
Port ID	Port identifier of type listed (appears when the **interface** option is used).
Port description	Port description (appears when the **interface** option is used).

CHAPTER 23

MVRP Operational Commands

show mvrp

Syntax show mvrp

Release Information Command introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 10.1 for MX Series routers.
Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.

Description Display Multiple VLAN Registration Protocol (MVRP) configuration information.

Required Privilege Level view

Related Documentation

- *Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches*
- *Verifying That MVRP Is Working Correctly on Switches*
- show mvrp statistics on page 2067

List of Sample Output show mvrp (EX Series switches and MX Series routers) on page 2057
show mvrp (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320) on page 2057
show mvrp (EX Series switches) on page 2058

Output Fields Table 169 on page 2056 lists the output fields for the **show mvrp** command. Output fields are listed in the approximate order in which they appear.

Table 169: show mvrp Output Fields

Field Name	Field Description
MVRP dynamic VLAN creation	Displays whether global MVRP dynamic VLAN creation is **Enabled** or **Disabled**.

 Copyright © 2018, Juniper Networks, Inc.

Table 169: show mvrp Output Fields (continued)

Field Name	Field Description
Global MVRP configuration	Displays global MVRP information: • **MVRP status**—Displays whether MVRP is **Enabled** or **Disabled**. • **MVRP dynamic vlan creation**—Displays whether global MVRP dynamic VLAN creation is **Dnabled** or **Disabled**.
MVRP BPDU MAC address	Displays the multicast media access control (MAC) address for MVRP. If configured, the provider MVRP multicast MAC address is used; otherwise, the customer MVRP multicast MAC address is used.
MVRP timers (ms)	Displays MVRP timer information: • **Interface**—The interface on which MVRP is configured. • **Join**—The maximum number of milliseconds the interfaces must wait before sending VLAN advertisements. • **Leave**—The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message. • **LeaveAll**— The interval at which LeaveAll messages are sent on interfaces. LeaveAll messages maintain current MVRP VLAN membership information in the network.
Interface based configuration	Displays interface-specific MVRP information: • **Interface**—The interface on which MVRP is configured. • **Status**—Displays whether MVRP is **Enabled** or **Disabled**. • **Registration**—Displays whether registration for the interface is **Forbidden** or **Normal**. • **Dynamic VLAN Creation**—Displays whether interface dynamic VLAN creation is **Enabled** or **Disabled**.

Sample Output

show mvrp (EX Series switches and MX Series routers)

```
user@host> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)
  Interface       Join   Leave  LeaveAll
  ge-11/2/8        200     800     10000
  ge-11/0/9        200     800     10000
  ge-11/3/0        200     800     10000
```

Sample Output

show mvrp (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320)

```
user@host> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (00-00-5E-00-53-00)
MVRP timers (ms)
  Interface       Join   Leave  LeaveAll
  ge-0/0/1        200     800     60
```

Sample Output

show mvrp (EX Series switches)

```
user@switch> show mvrp

Global MVRP configuration
  MVRP status               : Enabled
  MVRP dynamic vlan creation: Enabled
  MVRP Timers (ms):
   Interface        Join   Leave   LeaveAll
   --------------   ----   -----   --------
   all              200    600     10000
   xe-0/1/1.0       200    600     10000

  Interface based configuration:
   Interface        Status     Registration   Dynamic VLAN Creation
   --------------   --------   ------------   ---------------------
   all       Disabled   Normal     Enabled
   xe-0/1/1.0     Enabled    Normal         Enabled
```

show mvrp applicant-state (EX Series and MX Series) on page 2060
show mvrp applicant-state on page 2060

Output Fields Table 170 on page 2059 lists the output fields for the **show mvrp applicant-state** command. Output fields are listed in the approximate order in which they appear.

Table 170: show mvrp applicant-state Output Fields

Field Name	Field Description
VLAN Id	Displays the VLAN ID number.
Interface	Displays the interface number associated with the VLAN ID.

Copyright © 2018, Juniper Networks, Inc.

Table 170: show mvrp applicant-state Output Fields (continued)

Field Name	Field Description
State	Displays one of the following MVRP registrar states: • VO— Very anxious observer. • VP —Very anxious passive. • VA —Very anxious new. • AN —Anxious new. • AA —Anxious active. • QA —Quiet active. • LA —Leaving active. • AO —Anxious observer. • QO —Quiet observer. • LO —Leaving observer. • AP —Anxious passive. • QA —Quiet passive.

Sample Output (EX Series and MX Series)

show mvrp applicant-state (EX Series and MX Series)

```
user@host> show mvrp applicant-state
MVRP applicant state for routing instance 'default-switch'
 (VO) Very anxious observer, (VP) Very anxious passive, (VA) Very anxious new,
 (AN) Anxious new, (AA) Anxious active, (QA) Quiet active, (LA) Leaving active,
 (AO) Anxious observer, (QO) Quiet observer, (LO) Leaving observer,
 (AP) Anxious passive, (QP) Quiet passive

VLAN Id      Interface          State
    100      ge-11/3/0          Declaring (QA)
    200      ge-11/3/0          Declaring (QA)
    300      ge-11/3/0          Declaring (QA)
```

Sample Output (SRX1500, SRX300, SRX550M, SRX345, SRX340, and SRX320)

show mvrp applicant-state

```
user@host> show mvrp applicant-state
MVRP applicant state for routing instance 'default-switch'
 (VO) Very anxious observer, (VP) Very anxious passive, (VA) Very anxious new,
 (AN) Anxious new, (AA) Anxious active, (QA) Quiet active, (LA) Leaving active,
 (AO) Anxious observer, (QO) Quiet observer, (LO) Leaving observer,
 (AP) Anxious passive, (QP) Quiet passive

VLAN Id      Interface          State
    1        ge-0/0/1          Idle (VO)
    30       ge-0/0/1          Idle (VO)
    40       ge-0/0/1          Idle (VO)
    50       ge-0/0/1          Idle (VO)
    100      ge-0/0/1          Idle (VO)
```

show mvrp dynamic-vlan-memberships (EX Series) on page 2062
show mvrp dynamic-vlan-memberships on page 2062

Output Fields Table 171 on page 2061 lists the output fields for the **show mvrp dynamic-vlan-memberships** command on MX Series routers and EX Series switches. Output fields are listed in the approximate order in which they appear.

Table 171: show mvrp dynamic-vlan-memberships Output Fields

Field Name	Field Description
VLAN Id	The VLAN ID of the dynamically created VLAN.
Interfaces	The interface or interfaces that are bound to the dynamically created VLAN.

Sample Output (MX Series Routers and EX Series Switches)

show mvrp dynamic-vlan-

memberships (MX Series and EX Series)

```
user@host> show mvrp dynamic-vlan-memberships
MVRP dynamic vlans for routing instance 'default-switch'
 (s) static vlan, (f) fixed registration

VLAN Id            Interfaces
    100 (s)        ge-11/3/0
    200 (s)        ge-11/3/0
    300 (s)
```

Sample Output (EX Series Switches)

show mvrp dynamic-vlan-memberships (EX Series)

```
user@switch> show mvrp dynamic-vlan-memberships
VLAN Name             Interfaces
-------------------       ----------------
__mvrp_100__              xe-0/1/1.0
                          xe-0/1/0.0
__mvrp_200__              xe-0/1/1.0
                          xe-0/1/0.0
__mvrp_300__              xe-0/1/1.0
```

Sample Output (SRX1500, SRX300, SRX550M, SRX345, SRX340, SRX320)

show mvrp dynamic-vlan-memberships

```
user@host> show mvrp dynamic-vlan-memberships
MVRP dynamic vlans for routing instance 'default-switch'
 (s) static vlan, (f) fixed registration

VLAN Id            Interfaces
    1  (s)
    30 (s)
    40 (s)        ge-0/0/1
    50 (s)        ge-0/0/1
   100 (s)        ge-0/0/1 (f)
```

show mvrp registration-state (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320) on page 2066

Output Fields Table 173 on page 2065 lists the output fields for the **show mvrp registration-state** command. Output fields are listed in the approximate order in which they appear.

Table 173: show mvrp registration-state Output Fields

Field Name	Field Description
VLAN Id	Displays the VLAN ID number.
Interface	Displays the interface number associated with the VLAN ID.
Registrar State	Displays whether the registrar state is Registered or Empty.
Forced State	Displays whether the forced state is Registered or Empty.
Managed State	Displays one of the following states: • **fixed**—VLANs always stay in a registered state and are declared as such on all other forwarding ports. • **normal** —VLANs participate in the MVRP protocol and honor incoming join requests normally. • **forbidden** —VLANs ignore the incoming join requests and always stay in an unregistered state.
STP State	Displays whether the Spanning Tree Protocol (STP) is Blocking or Forwarding.

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show mvrp registration-state (EX Series and MX Series)

```
user@host> show mvrp registration-state
MVRP registration state for routing instance 'default-switch'

VLAN Id   Interface   Registrar   Forced      Managed    STP
                      State       State       State      State
    100   ge-11/2/8   Empty       Registered  Fixed      Forwarding
          ge-11/0/9   Empty       Empty       Normal     Forwarding
          ge-11/3/0   Registered  Registered  Normal     Forwarding
    101   ge-11/2/8   Empty       Registered  Fixed      Forwarding
          ge-11/0/9   Empty       Empty       Normal     Forwarding
          ge-11/3/0   Registered  Registered  Normal     Forwarding
```

Output Fields

Table 171 on page 2061 lists the output fields for the **show mvrp statistics** command on EX Series switches. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 174: show mvrp statistics Output Fields

Field Name	Field Description
MRPDU received	Number of MRPDU messages received on the switch.
Invalid PDU received	Number of invalid MRPDU messages received on the switch.
New received	Number of new messages received on the switch.
Join Empty received	Number of MRP JoinEmpty messages received on the switch. Either this value or the value for *JoinIn received* should increase when the value for *MRPDU received* increases. If this value is not incrementing when it should, you might have a Junos OS release version compatibility issue. To fix a version compatibility issue, see *Configuring Multiple VLAN Registration Protocol (MVRP) on Switches* .
Join In received	Number of MRP JoinIn messages received on the switch. Either this value or the value for *JoinEmpty received* should increase when the value for *MRPDU received* increases. If this value is not incrementing when it should, you might have a Junos OS release version compatibility issue. To fix a version compatibility issue, see *Configuring Multiple VLAN Registration Protocol (MVRP) on Switches* .
Empty received	Number of MRP Empty messages received on the switch.
In received	Number of MRP In messages received on the switch.
Leave received	Number of MRP Leave messages received on the switch.
LeaveAll received	Number of LeaveAll messages received on the switch.
MRPDU transmitted	Number of MRPDU messages transmitted from the switch.
MRPDU transmit failures	Number of MRPDU transmit failures from the switch.
New transmitted	Number of new messages transmitted from the switch.
Join Empty transmitted	Number of JoinEmpty messages sent from the switch.
Join In transmitted	Number of MRP JoinIn messages sent from the switch.
Empty transmitted	Number of MRP Empty messages sent from the switch.
In transmitted	Number of MRP In messages sent from the switch.
Leave transmitted	Number of MRP Leave Empty messages sent from the switch.
LeaveAll transmitted	Number of MRP LeaveAll messages sent from the switch.

Table 175: show mvrp statistics Output Fields

Field Name	Field Description
Interface name	Interface for which MVRP statistics are displayed.
VLAN IDs registered	Number of Virtual LAN (VLAN) IDs registered.
Sent MVRP PDUs	Number of MRPDU messages transmitted from the switch.
Received MVRP PDUs without error	Number of MRPDU messages received on the switch.
Received MVRP PDUs with error	Number of invalid MRPDU messages received on the switch.
Transmitted Join Emply	Number of JoinEmpty messages sent from the switch.
Transmitted Leave All	Number of MRP LeaveAll messages sent from the switch.
Received Join In	Number of MRP JoinIn messages received on the switch. Either this value or the value for **Received Join Empty** should increase when the value for **Received MVRP PDUs without error** increases. If this value is not incrementing when it should, you might have a Junos OS release compatibility issue. To resolve the issue, see *Configuring Multiple VLAN Registration Protocol (MVRP) on Switches* .
Transmitted Join In	Number of MRP JoinIn messages sent from the switch.
Transmitted Empty	Number of MRP Empty messages sent from the switch.
Transmitted Leave	Number of MRP LeaveEmpty messages sent from the switch.
Transmitted In	Number of MRP In messages sent from the switch.
Transmitted New	Number of New messages transmitted from the switch.
Received Leave All	Number of LeaveAll messages received on the switch.
Received Leave	Number of MRP Leave messages received on the switch.
Received In	Number of MRP In messages received on the switch.
Received Empty	Number of MRP Empty messages received on the switch.
Received Join Empty	Number of MRP JoinEmpty messages received on the switch. Either this value or the value for **Received Join In** should increase when the value for **Received MVRP PDUs without error** increases. If this value is not incrementing when it should, you might have a Junos OS release compatibility issue. To resolve the issue, see *Configuring Multiple VLAN Registration Protocol (MVRP) on Switches* .
Received New	Number of New messages received on the switch.

CHAPTER 24

OSPF Operational Commands

clear (ospf | ospf3) database

List of Syntax

Syntax on page 2074
Syntax (EX Series Switch and QFX Series) on page 2074

Syntax

clear (ospf | ospf3) database
<all>
<advertising-router (*router-id* | self)>
<area *area-id*>
<asbrsummary>
<external>
<instance *instance-name*>
<inter-area-prefix>
<inter-area-router>
<intra-area-prefix>
<link-local>
<logical-system (all | *logical-system-name*)>
<lsa-id *lsa-id*>
<netsummary>
<network>
<nssa>
<opaque-area>
<purge>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>
<router>

Syntax (EX Series Switch and QFX Series)

clear (ospf | ospf3) database
<all>
<advertising-router (*router-id* | self)>
<area *area-id*>
<asbrsummary>
<external>
<instance *instance-name*>
<inter-area-prefix>
<inter-area-router>
<intra-area-prefix>
<link-local>
<lsa-id *lsa-id*>
<netsummary>
<network>
<nssa>
<opaque-area>
<purge>
<router>

Release Information

Command introduced before Junos OS Release 7.4.
advertising-router ***router-id***, **netsummary**, **network**, **nssa**, **opaque-area**, and **router** options added in Junos OS Release 8.3. You must use the **purge** command with these options.
area ***area-id*** option added in Junos OS Release 8.3.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option added in Junos OS Release 9.2.
advertising-router (***router-id*** | **self**) option added in Junos OS Release 9.5.

Copyright © 2018, Juniper Networks, Inc.

advertising-router (*router-id* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
purge option (and all options that are dependent on the **purge** option) hidden in Junos OS Release 13.3.

Description With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine.

CAUTION: You can also use the purge command with any of the options to discard rather than delete the specified LSA entries. This command is useful only for testing. Use it with care, because it causes significant network disruption.

Options **all**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

advertising-router (*router-id* | self)—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

area *area-id*—(Optional) Discard entries for the LSAs in the specified area.

asbrsummary—(Optional) Discard summary AS boundary router LSA entries.

external—(Optional) Discard external LSAs.

instance *instance-name*—(Optional) Delete or discard entries for the specified routing instance only.

inter-area-prefix—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

inter-area-router—(OSPFv3 only) (Optional) Discard interarea router LSAs.

intra-area-prefix—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

link-local—(Optional) Delete link-local LSAs.

lsa-id *lsa-id*—(Optional) Discard the LSA entries with the specified LSA identifier.

netsummary—(Optional) Discard summary network LSAs.

network—(Optional) Discard network LSAs.

Copyright © 2018, Juniper Networks, Inc.

nssa—(Optional) Discard not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Discard opaque area-scope LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Discard router LSAs.

purge—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

clear (ospf | ospf3) io-statistics

List of Syntax

Syntax on page 2077
Syntax (EX Series Switch and QFX Series) on page 2077

Syntax

clear (ospf | osfp3) io-statistics
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and QFX Series)

clear (ospf | osfp3) io-statistics

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear Open Shortest Path First (OSPF) input and output statistics.

Options

none—Clear OSPF input and output statistics.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

clear

```
user@host> clear ospf io-statistics
```

clear (ospf | ospf3) neighbor

List of Syntax

Syntax on page 2078
Syntax (EX Series Switch and QFX Series) on page 2078

Syntax

clear (ospf | ospf3) neighbor
<all>
<area *area-id*>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<neighbor>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (EX Series Switch and QFX Series)

clear (ospf | ospf3) neighbor
<all>
<area *area-id*>
<instance *instance-name*>
<interface *interface-name*>
<neighbor>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Tear down Open Shortest Path First (OSPF) neighbor connections.

Options

all—Tear down OSPF connections with all neighbors for all routing instances.

area *area-id*—(Optional) Tear down neighbor connections for the specified area only.

instance *instance-name*—(Optional) Tear down neighbor connections for the specified routing instance only.

interface *interface-name*—(Optional) Tear down neighbor connections for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear the state of the specified neighbor only.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Clear the state of the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

show (ospf | ospf3) backup coverage

Syntax

show (ospf | ospf3) backup coverage
<instance *instance-name*>
< logical-system (all | *logical-system-name*)>
<realm (ipv4-unicast | ipv46-unicast>
<topology *topology-name*>

Syntax (QFX Series)

show (ospf | ospf3) backup coverage
<instance *instance-name*>
<topology *topology-name*>

Release Information

Command introduced in Junos OS Release 10.0.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about the level of backup coverage available for all the nodes and prefixes in the network.

Options

none—Display information about the level backup coverage for all OSPF routing instances in all logical systems.

logical-system (all | *logical-system-name*)—(Optional) Display information about the level of backup coverage for all logical systems or for a specific logical system.

instance *instance-name*—(Optional) Display information about the level of backup coverage for a specific OSPF routing instance.

realm (ipv4-unicast | ipv6-unicast)—(Optional) (OSPFv3 only) Display information about the level of backup coverage for the specific OSPFv3 realm, or address family.

topology (default | *topology-name*)—(Optional) (OSPFv2 only) Display information about the level of backup coverage for the specific OSPF topology.

Required Privilege Level

show ospf3 backup coverage on page 2085

Output Fields

Table 176 on page 2085 lists the output fields for the **show (ospf | ospf3) backup coverage** command. Output fields are listed in the approximate order in which they appear.

 Copyright © 2018, Juniper Networks, Inc.

Table 176: show (ospf | ospf3) backup coverage Output Fields

Field Name	Field Description
Node Coverage	Information about backup coverage for each OSPF node.
Area	Area number. Area **0.0.0.0** is the backbone.
Covered Nodes	Number of nodes for which backup coverage is available.
Total Nodes	Total number of OSPF nodes.
Route Coverage	Information about backup coverage for each type of OSPF route.
Path Type	Type of OSPF path: **Intra**, **Inter**, **Ext1**, **Ext2**, and **All**.
Covered Routes	For each path type, the number of routes for which backup coverage is available.
Total Routes	For each path type, the total number of configured routes.
Percent Covered	For all nodes and for each path type, the percentage for which backup coverage is available.

Sample Output

show ospf backup coverage

```
user@host> show ospf backup coverage
Topology default coverage:

Node Coverage:

Area                Covered  Total  Percent
                      Nodes  Nodes  Covered
0.0.0.0                   4      5   80.00%

Route Coverage:

Path Type  Covered   Total  Percent
            Routes  Routes  Covered
Intra            8      14   57.14%
Inter            0       0  100.00%
Ext1             0       0  100.00%
Ext2             1       1  100.00%
All              9      15   60.00%

show (ospf | ospf3) backup lsp

Syntax

show (ospf | ospf3) backup lsp
<logical-system (all | *logical-system-name*>
<realm (ipv4-unicast | ipv6-unicast)>

Release Information

Command introduced in Junos OS Release 10.0.

Description

Display information about MPLS label-switched-paths (LSPs) designated as backup routes for OSPF routes.

NOTE: MPLS LSPs can be used as backup routes only for routes in the default OSPFv2 topology and not for any configured topology. Additionally, MPLS LSPs cannot be used as backup routes for nondefault instances either for OSPFv2 or OSPFv3.

Options

none—Display information all MPLS LSPs designated as backup routes.

logical-system (all | ***logical-system-name*****)**—(Optional) Display information about MPLS LSPs designated as backup routes for all logical systems or a specific logical system.

realm (ipv4-unicast | ipv6-unicast)—(Optional) (OSPFv3 only) Display information about MPLS LSPs designated as backup routes for a specific realm, or address family.

Required Privilege Level

List of Sample Output

show ospf backup lsp on page 2088
show ospf3 backup lsp on page 2088

Output Fields

Table 177 on page 2087 lists the output fields for the **show (ospf | ospf3) backup lsp** command. Output fields are listed in the approximate order in which they appear.

Table 177: show (ospf | ospf3) backup lsp Output Fields

Field Name	Field Description
MPLS LSP name	Name of each MPLS LSP designated as a backup path.
Egress	IP address of the egress router for the LSP.

Copyright © 2018, Juniper Networks, Inc.

Table 177: show (ospf | ospf3) backup lsp Output Fields (continued)

Field Name	Field Description

Status	State of the LSP:
	• **Up**—The router can detect RSVP hello messages from the neighbor.
	• **Down**—The router has received one of the following indications:
	  ◦ Communication failure from the neighbor.
	  ◦ Communication from IGP that the neighbor is unavailable.
	  ◦ Change in the sequence numbers in the RSVP hello messages sent by the neighbor.
	• **Deleted**—The LSP is no longer available as a backup path.

Last change	Time elapsed since the neighbor state changed either from **up** or **down** or from **down** to **up**. The format is ***hh:mm:ss***.
TE-metric	Configured traffic engineering metric.
Metric	Configured metric.

Sample Output

show ospf backup lsp

```
user@host> show ospf backup lsp
tobanff
  Egress: 10.255.71.239, Status: up, Last change: 00:00:23
  TE-metric: 0, Metric: 0
```

Sample Output

show ospf3 backup lsp

```
user@host> show ospf3 backup lsp
tobanff
  Egress: 10.255.71.239, Status: up, Last change: 00:00:45
  TE-metric: 0, Metric: 0
```

show (ospf | ospf3) backup neighbor

Syntax

show (ospf | ospf3) backup neighbor
<area *area-id*>
<instance (default | *instance-name*)>
<logical-system (default | ipv4-multicast | *logical-system-name*)>
<topology (default | ipv4-multicast | *topology-name*)>

Syntax (QFX Series)

show (ospf | ospf3) backup neighbor
<area *area-id*>
<instance *instance-name*>
<topology (default | ipv4-multicast | *topology-name*)>

Release Information

Command introduced in Junos OS Release 10.0.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the neighbors through which direct next hops for the backup paths are available.

Options

none—Display all neighbors that have direct next hops for backup paths.

area *area-id*—(Optional) Display the area information.

instance (default | *instance-name*)—(Optional) Display information about the default routing instance or a particular routing instance.

logical-system (default | ipv4-multicast | *logical-system-name*)—(Optional) Display information about the default logical system, IPv4 multicast logical system, or a particular logical system.

topology (default | ipv4-multicast | *topology-name*)—(OSPFv2 only) (Optional) Display information about the default topology, IPv4 multicast topology, or a particular topology.

show (ospf | ospf3) backup spf

Syntax

show (ospf | ospf3) backup spf
<brief | detail>
<area *area-id*>
<instance *instance-name*>
<logical-system (all | *logical-system-name*>
<no-coverage>
<*node-id*>
<realm (ipv4–unicast | ipv6–unicast)>
<topology (default | ipv4-multicast | *topology-name*)>

Syntax (QFX Series)

show (ospf | ospf3) backup spf
<brief | detail>
<area *area-id*>
<instance *instance-name*>
<no-coverage>
<*node-id*>
<topology (default | ipv4-multicast | *topology-name*)>

Release Information

Command introduced in Junos OS Release 10.0.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display information about OSPF shortest-path-first calculations for backup paths.

Options

none—Display information about OSPF shortest-path-first (SPF) calculations for all backup paths for all destination nodes.

brief | detail—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display the area information.

instance *instance-name*—(Optional) Display information about the routing instance.

logical-system (all | *logical-system-name*)—(Optional) Display information about all logical systems or a specific logical system.

no-coverage—(Optional) Display information if there is no backup coverage.

node-id—(Optional) Display information about the node specified.

realm (ipv4–unicast | ipv6–unicast)—(Optional) Display information about the **ipv4** or **ipv6** realm.

topology (default | ipv4-multicast | *topology-name*)—(Optional) (OSPFv2 only) Display information about the default topology, IPv4 multicast topology, or a specifc topology.

List of Sample Output

Output Fields

Table 179 on page 2092 lists the output fields for the **show (ospf |ospf3) backup spf** command. Output fields are listed in the approximate order in which they appear.

Table 179: show (ospf |ospf3) backup spf Output Fields

Field Name	Field Description	Level of Output
Area *area-id* results	Area for which the results are displayed. Area 0.0.0.0 is the backbone area.	All levels
address	Address of the node for which the results are displayed.	All levels
Self to Destination Metric	Metric from the node to the destination.	All levels
Parent Node	Address of the parent node.	All levels
Primary next-hop	Address of the next hop.	All levels
Backup Neighbor	Address of the backup neighbor or LSP endpoint and the following information: • Neighbor to Destination Metric • Neighbor to Self Metric • Self to Neighbor Metric • Status (Eligible, Not Eligible, Not Evaluated) and the reason for the status. NOTE: If the backup neighbor is an LSP endpoint, it is indicated as such after the neighbor address.	All levels

Sample Output

show ospf backup spf

```
user@host> show ospf backup spf
Topology default results:

Area 0.0.0.0 results:

Release Information

Command introduced in Junos OS Release 10.4.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the context identifier information processed and advertised by Open Shortest Path First (OSPF) for egress protection.

Options

none—Display information about all context identifiers.

brief | detail—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display information about the context identifier for the specified area.

context-id—(Optional) Display information about the specified context identifier.

instance *instance-name*—(Optional) Display information about the context identifier for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields Table 180 on page 2099 lists the output fields for the **show ospf context-identifier** command. Output fields are listed in the approximate order in which they appear.

Table 180: show ospf context-identifier Output Fields

Field Name	Field Description	Level of Output
Context	IPv4 address that defines a protection pair. The context is manually configured on both primary and protector provider edge (PE) devices.	All levels
Status	State of the path: **active** or **inactive**.	All levels
Metric	Advertised OSPF metric.	All levels
Area	OSPF area number.	All levels
Other Advertisements	Other advertisements received by the OSPF node: • **Advertising router**– Address of the device that sent the advertisement. • **Type**–Type of OSPF path: **inter-area** and **stub**. • **Metric**–Advertised OSPF metric. • **None**–No additional advertisements were received by the OSPF node.	**detail**

Sample Output

show ospf context-identifier

```
user@host> show ospf context-identifier
Context-id: 2.2.4.3
  Status: active, Metric: 65534, PE role: protector, Area: 0.0.0.0
```

show ospf context-identifier detail

```
user@host> show ospf context-identifier detail
Context-id: 88.24.13.1
                Status: inactive, Metric: 0, PE role: protector, Area: 0.0.0.13
                Other Advertisements:
                  Advertising router: 8.8.8.103
                    Type: stub link
                    Metric: 65534
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
advertising-router self (***address*** | **self**) option introduced in Junos OS Release 9.5.
advertising-router self (***address*** | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the entries in the OSPF version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

Options

none—Display standard information about entries in the OSPFv2 link-state database for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

 Copyright © 2018, Juniper Networks, Inc.

advertising-router (*address* | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area *area-id*—(Optional) Display the LSAs in a particular area.

asbrsummary—(Optional) Display summary AS boundary router LSA entries.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

netsummary—(Optional) Display summary network LSAs.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Display opaque area-scope LSAs.

router—(Optional) Display information about router LSAs.

Output Fields Table 181 on page 2101 describes the output fields for the **show ospf database** command. Output fields are listed in the approximate order in which they appear.

Table 181: show ospf database Output Fields

Field Name	Field Description	Level of Output
area	Area number. Area **0.0.0.0** is the backbone area.	All levels

Table 181: show ospf database Output Fields (continued)

Field Name	Field Description	Level of Output
Type	Type of link advertisement: **ASBRSum**, **Extern**, **Network**, **NSSA**, **OpaqArea**, **Router**, or **Summary**.	All levels
ID	LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.	All levels
Adv Rtr	Address of the routing device that sent the advertisement.	All levels
Seq	Link sequence number of the advertisement.	All levels
Age	Time elapsed since the LSA was originated, in seconds.	All levels
Opt	Optional OSPF capabilities associated with the LSA.	All levels
Cksum	Checksum value of the LSA.	All levels
Len	Length of the advertisement, in bytes.	All levels
Router	Router link-state advertisement information: • **bits**—Flags describing the routing device that generated the LSP. • **link count**—Number of links in the advertisement. • **id**—ID of a routing device or subnet on the link. • **data**—For stub networks, the subnet mask. Otherwise, the IP address of the routing device that generated the LSP. • **type**—Type of link. It can be **PointToPoint**, **Transit**, **Stub**, or **Virtual**. • **TOS count**—Number of type-of-service (ToS) entries in the advertisement. • **TOS 0 metric**—Metric for ToS 0. • **TOS**—Type-of-service (ToS) value. • **metric**—Metric for the ToS.	**detail extensive**
Network	Network link-state advertisement information: • **mask**—Network mask. • **attached router**—ID of the attached neighbor.	**detail extensive**
Summary	Summary link-state advertisement information: • **mask**—Network mask. • **TOS**—Type-of-service (ToS) value. • **metric**—Metric for the ToS.	**detail extensive**
Gen timer	How long until the LSA is regenerated.	**extensive**
Aging timer	How long until the LSA expires.	**extensive**
Installed ***hh:mm:ss*** **ago**	How long ago the route was installed.	**extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 181: show ospf database Output Fields (continued)

Field Name	Field Description	Level of Output
expires in *hh:mm:ss*	How long until the route expires.	**extensive**
sent *hh:mm:ss* ago	How long ago the LSA was sent.	**extensive**
Last changed *hh:mm:ss* ago	How long ago the route was changed.	**extensive**
Change count	Number of times the route has changed.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
Router LSAs	Number of router link-state advertisements in the link-state database.	**summary**
Network LSAs	Number of network link-state advertisements in the link-state database.	**summary**
Summary LSAs	Number of summary link-state advertisements in the link-state database.	**summary**
NSSA LSAs	Number of not-so-stubby area link-state advertisements in the link-state database.	**summary**

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
advertising-router (***address*** | **self**) option introduced in Junos Relase 9.5.
advertising-router (***address*** | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description

Display the entries in the OSPF version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.

Options

none—Display standard information about all entries in the OSPFv3 link-state database.

Copyright © 2018, Juniper Networks, Inc.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (*address* | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area *area-id*—(Optional) Display the LSAs in a particular area.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

inter-area-prefix—(Optional) Display information about interarea-prefix LSAs.

inter-area-router—(Optional) Display information about interarea-router LSAs.

intra-area-prefix—(Optional) Display information about intra-area-prefix LSAs.

link—(Optional) Display information about link LSAs.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

router—(Optional) Display information about router LSAs.

Output Fields

Table 182 on page 2113 lists the output fields for the **show ospf3 database** command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 182: show ospf3 database Output Fields

Field Name	Field Description	Level of Output
OSPF link state database, area ***area-number***	Entries in the link-state database for this area.	**brief detail extensive**
OSPF AS SCOPE link state database	Entries in the AS scope link-state database.	**brief detail extensive**
OSPF Link-Local link state database, interface ***interface-name***	Entries in the link-local link-state database for this interface.	**brief detail extensive**
area	Area number. Area **0.0.0.0** is the backbone area.	All levels
Type	Type of link advertisement: **Extern**, **InterArPfx**, **InterArRtr**, **IntraArPrx** , **Link**, **Network**, **NSSA**, or **Router**.	**brief detail extensive**
ID	Link identifier included in the advertisement. An asterisk (*) preceding the identifier marks database entries that originated from the local routing device.	**brief detail extensive**
Adv Rtr	Address of the routing device that sent the advertisement.	**brief detail extensive**
Seq	Link sequence number of the advertisement.	**brief detail extensive**
Age	Time elapsed since the LSA was originated, in seconds.	**brief detail extensive**
Cksum	Checksum value of the LSA.	**brief detail extensive**
Len	Length of the advertisement, in bytes.	**brief detail extensive**
Router (Router Link-State Advertisements)		
bits	Flags describing the routing device that generated the LSP.	**detail extensive**
Options	Option bits carried in the router LSA.	**detail extensive**
For Each Router Link		
Type	Type of interface. The value of all other output fields describing a routing device interface depends on the interface's type: • **PointToPoint (1)**—Point-to-point connection to another routing device. • **Transit (2)**—Connection to a transit network. • **Virtual (4)**—Virtual link.	**detail extensive**
Loc-if-id	Local interface ID assigned to the interface that uniquely identifies the interface with the routing device.	**detail extensive**
Nbr-if-id	Interface ID of the neighbor's interface for this routing device link.	**detail extensive**

Table 182: show ospf3 database Output Fields (continued)

Field Name	Field Description	Level of Output
Nbr-rtr-id	Router ID of the neighbor routing device (for type 2 interfaces, the attached link's designated router).	**detail extensive**
Metric	Cost of the router link.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn*:*nn*:*nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn*:*nn*:*nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn*:*nn*:*nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
Network (Network Link-State Advertisements)		
Options	Option bits carried in the network LSA.	**detail extensive**
Attached Router	Router IDs of each of the routing devices attached to the link. Only routing devices that are fully adjacent to the designated router are listed. The designated router includes itself in this list.	**detail extensive**
InterArPfx (Interarea-Prefix Link-State Advertisements)		
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn*:*nn*:*nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn*:*nn*:*nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn*:*nn*:*nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**

Table 182: show ospf3 database Output Fields (continued)

Field Name	Field Description	Level of Output
Ours	Indicates that this is a local advertisement.	**extensive**
InterArRtr (Interarea-Router Link-State Advertisements)		
Dest-router-id	Router ID of the routing device described by the LSA.	**detail extensive**
options	Optional capabilities supported by the routing device.	**detail extensive**
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	**detail extensive**
Prefix	IPv6 address prefix.	**extensive**
Prefix-options	Option bit associated with the prefix.	**extensive**
Extern (External Link-State Advertisements)		
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of the route, which depends on the value of **Type**.	**detail extensive**
Type ***n***	Type of external metric: **Type 1** or **Type 2**.	**detail extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed ***nn:nn:nn*** **ago**	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in ***nn:nn:nn***	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent ***nn:nn:nn*** **ago**	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Link (Link-State Advertisements)		
IPv6-Address	IPv6 link-local address on the link for which this link LSA originated.	**detail extensive**
Options	Option bits carried in the link LSA.	**detail extensive**
priority	Router priority of the interface attaching the originating routing device to the link.	**detail extensive**
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	**detail extensive**
Prefix	IPv6 address prefix.	**detail extensive**

Table 182: show ospf3 database Output Fields (continued)

Field Name	Field Description	Level of Output
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *nn:nn:nn* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *nn:nn:nn*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *nn:nn:nn* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Ours	Indicates that this is a local advertisement.	**extensive**
IntraArPfx (Intra-Area-Prefix Link-State Advertisements)		
Ref-lsa-type	LSA type of the referenced LSA. • **Router**—Address prefixes are associated with a router LSA. • **Network**—Address prefixes are associated with a network LSA.	**detail extensive**
Ref-lsa-id	Link-state ID of the referenced LSA.	**detail extensive**
Ref-router-id	Advertising router ID of the referenced LSA.	**detail extensive**
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	**detail extensive**
Prefix	IPv6 address prefix.	**detail extensive**
Prefix-options	Option bit associated with the prefix.	**detail extensive**
Metric	Cost of this prefix. Expressed in the same units as the interface costs in the router LSAs.	**detail extensive**
Gen timer	How long until the LSA is regenerated, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Aging timer	How long until the LSA expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
Installed *hh:mm:ss* ago	How long ago the route was installed, in the format ***hours*:*minutes*:*seconds***.	**extensive**
expires in *hh:mm:ss*	How long until the route expires, in the format ***hours*:*minutes*:*seconds***.	**extensive**
sent *hh:mm:ss* ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format ***hours*:*minutes*:*seconds***.	**extensive**

<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
area option introduced in Junos OS Release 9.2.
area option introduced in Junos OS Release 9.2 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the status of OSPF interfaces.

Options

none—Display standard information about the status of all OSPF interfaces for all routing instances

brief | detail | extensive—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display information about the interfaces that belong to the specified area.

interface-name—(Optional) Display information for the specified interface.

instance *instance-name*—(Optional) Display all OSPF interfaces under the named routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display information about the interfaces for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields Table 183 on page 2123 lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

Table 183: show (ospf | ospf3) interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface running OSPF version 2 or OSPF version 3.	All levels
State	State of the interface: **BDR**, **Down**, **DR**, **DRother**, **Loop**, **PtToPt**, or **Waiting**.	All levels
Area	Number of the area that the interface is in.	All levels
DR ID	Address of the area's designated router.	All levels
BDR ID	Backup designated router for a particular subnet.	All levels
Nbrs	Number of neighbors on this interface.	All levels
Type	Type of interface: **LAN**, **NBMA**, **P2MP**, **P2P**, or **Virtual**.	**detail extensive**
Address	IP address of the neighbor.	**detail extensive**
Mask	Netmask of the neighbor.	**detail extensive**
Prefix-length	(OSPFv3) IPv6 prefix length, in bits.	**detail extensive**
OSPF3-Intf-Index	(OSPFv3) OSPF version 3 interface index.	**detail extensive**
MTU	Interface maximum transmission unit (MTU).	**detail extensive**
Cost	Interface cost (metric).	**detail extensive**
DR addr	Address of the designated router.	**detail extensive**
BDR addr	Address of the backup designated router.	**detail extensive**
Adj count	Number of adjacent neighbors.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 183: show (ospf | ospf3) interface Output Fields (continued)

Field Name	Field Description	Level of Output
Secondary	Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area.	**detail extensive**
Flood Reduction	Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the **DoNotAge** bit set. As a result, LSAs are refreshed only when a change occurs.	**extensive**
Priority	Router priority used in designated router (DR) election on this interface.	**detail extensive**
Flood list	List of link-state advertisements (LSAs) that might be about to flood this interface.	**extensive**
Ack list	Acknowledgment list. List of pending acknowledgments on this interface.	**extensive**
Descriptor list	List of packet descriptors.	**extensive**
Hello	Configured value for the hello timer.	**detail extensive**
Dead	Configured value for the dead timer.	**detail extensive**
Auth type	(OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: • **MD5**—The MD5 mechanism is configured in accordance with RFC 2328. • **None**—No authentication method is configured. • **Password**—A simple password (RFC 2328) is configured.	**detail extensive**
Topology	(Multiarea adjacency) Name of topology: **default** or ***name***.	
LDP sync state	(OSPFv2 and LDP synchronization) Current state of LDP synchronization: **in sync**, **in holddown**, and **not supported**.	**extensive**
reason	(OSPFv2 and LDP synchronization) Reason for the current state of LDP synchronization. The LDP session might be up or down, or adjacency might be up or down.	**extensive**
config holdtime	(OSPFv2 and LDP synchronization) Configured value of the hold timer. If the state is not synchronized, and the hold time is not infinity, the **remaining** field displays the number of seconds that remain until the configured hold timer expires.	**extensive**
IPSec SA name	(OSPFv2) Name of the IPSec security association name.	**detail extensive**
Active key ID	(OSPFv2 and MD5) Number from **0** to **255** that uniquely identifies an MD5 key.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 183: show (ospf | ospf3) interface Output Fields (continued)

Field Name	Field Description	Level of Output
Start time	(OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as **Start time 1970 Jan 01 00:00:00 PST.**	**detail extensive**
ReXmit	Configured value for the Retransmit timer.	**detail extensive**
Stub, **Not Stub**, or **Stub NSSA**	Type of area.	**detail extensive**

Output Fields

Table 184 on page 2128 lists the output fields for the **show ospf io-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 184: show (ospf | ospf3) io-statistics Output Fields

Field Name	Field Description
Packets read	Number of OSPF packets read since the last time the routing protocol was started.
average per run	Total number of packets divided by the total number of times the OSPF read operation is scheduled to run.
max run	Maximum number of packets for a given run among all scheduled runs.
Receive errors	Number of faulty packets received with errors.

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show ospf io-statistics

user@host> **show ospf io-statistics**

```
Packets read: 7361, average per run: 1.00, max run: 1
Receive errors:
  None
```

<topology *topology-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
topology option introduced in Junos OS Release 9.0.
topology option introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the entries in the Open Shortest Path First (OSPF) log of SPF calculations.

Options

none—Display entries in the OSPF log of SPF calculations for all routing instances.

instance *instance-name*—(Optional) Display entries for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology *topology-name*—(Optional) (OSPFv2 only) Display entries for the specified topology.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

show (ospf | ospf3) neighbor

List of Syntax

Syntax on page 2133
Syntax (EX Series Switches and QFX Series) on page 2133

Syntax

show (ospf | ospf3) neighbor
<brief | detail | extensive>
<area *area-id*>
<instance (all | *instance-name*)>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<*neighbor*>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (EX Series Switches and QFX Series)

show (ospf | ospf3) neighbor
<brief | detail | extensive>
<area *area-id*>
<instance (all | *instance-name*)>
<interface *interface-name*>
<*neighbor*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
instance all option introduced in Junos OS Release 9.1.
instance all option introduced in Junos OS Release 9.1 for EX Series switches.
area, **interface**, and **realm** options introduced in Junos OS Release 9.2.
area and **interface** options introduced in Junos OS Release 9.2 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about OSPF neighbors.

CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the **show (ospf | ospf3) neighbor** command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the **show (ospf | ospf3) neighbor** command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.

Options

none—Display standard information about all OSPF neighbors for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

area ***area-id***—(Optional) Display information about the OSPF neighbors for the specified area.

instance (all | ***instance-name*****)**—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

Copyright © 2018, Juniper Networks, Inc.

interface ***interface-name***—(Optional) Display information about OSPF neighbors for the specified logical interface.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Display information about the specified OSPF neighbor.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields Table 186 on page 2134 lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 186: show (ospf | ospf3) neighbor Output Fields

Field Name	Field Description	Level of Output
Address	Address of the neighbor.	All levels
Interface	Interface through which the neighbor is reachable.	All levels

 Copyright © 2018, Juniper Networks, Inc.

Table 186: show (ospf | ospf3) neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
State	State of the neighbor: • **Attempt**—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor. • **Down**—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the **Down** state, although at a reduced frequency. • **Exchange**—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged. • **ExStart**—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number. • **Full**—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements. • **Init**—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state may occur, for example, because the routing device itself did not appear in the neighbor's hello packet. • **Loading**—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the **Exchange** state. • **2Way**—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state **2Way** or greater.	All levels
ID	Router ID of the neighbor.	All levels
Pri	Priority of the neighbor to become the designated router.	All levels
Dead	Number of seconds until the neighbor becomes unreachable.	All levels
Link state acknowledgment list	Number of link-state acknowledgments received.	**extensive**
Link state retransmission list	Total number of link-state advertisements retransmitted. For **extensive** output only, the following information is also displayed: • **Type**—Type of link advertisement: **ASBR**, **Sum**, **Extern**, **Network**, **NSSA**, **OpaqArea**, **Router**, or **Summary**. • **LSA ID**—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device. • **Adv rtr**—Address of the routing device that sent the advertisement. • **Seq**—Link sequence number of the advertisement.	**detail extensive**

Table 186: show (ospf | ospf3) neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
Neighbor-address	(OSPFv3 only) If the neighbor uses virtual links, the **Neighbor-address** is the site-local, local, or global address. If the neighbor uses a physical interface, the **Neighbor-address** is an IPv6 link-local address.	**detail extensive**
area	Area that the neighbor is in.	**detail extensive**
OSPF3-Intf-Index	(OSPFv3 only) Displays the OSPFv3 interface index.	**detail extensive**
opt	Option bits received in the hello packets from the neighbor.	**detail extensive**
DR or **DR-ID**	Address of the designated router.	**detail extensive**
BDR or **BDR-ID**	Address of the backup designated router.	**detail extensive**
Up	Length of time since the neighbor came up.	**detail extensive**
adjacent	Length of time since the adjacency with the neighbor was established.	**detail extensive**
SPRING Adjacency Labels	Segment routing in networking adjacency labels. NOTE: Displayed only when segment routing is enabled	**detail extensive**
Label	Segment routing label.	**detail extensive**
Flags	Segment routing flags. Flags VL indicate *value* and *local*.	**detail extensive**

Output Fields Table 187 on page 2141 lists the output fields for the **show ospf overview** command. Output fields are listed in the approximate order in which they appear.

Table 187: show ospf overview Output Fields

Field name	Field Description	Level of Output
Instance	OSPF routing instance.	All levels
Router ID	Router ID of the routing device.	All levels
Route table index	Route table index.	All levels
Configured overload	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
Topology	Topology identifier.	All levels
Prefix export count	Number of prefixes exported into OSPF.	All levels
Full SPF runs	Number of complete Shortest Path First calculations.	All levels
SPF delay	Delay before performing consecutive Shortest Path First calculations.	All levels
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.	All levels
LSA refresh time	Refresh period for link-state advertisement (in minutes).	All levels
SPRING	Source protocol routing in networking: **enable** or **disable**.	All levels
Node Segments	Nodes of source protocol routing in networking:**enable** or **disable**.	All levels
Ipv4 Index	Ipv4 Index.	All levels
Index Range	Ipv4 Index range.	All levels
Node Segment Blocks Allocated	Details about node segment blocks.	All levels
Database protection state	Current state of database protection.	All levels
Warning threshold	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
Non self-generated LSAs	Number of LSAs whose router ID is not equal to the local router ID: **Current**, **Warning** (threshold), and **Allowed**.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 187: show ospf overview Output Fields (continued)

Field name	Field Description	Level of Output
Ignore time	How long the database has been in the ignore state.	All levels
Reset time	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
Ignore count	Number of times the database has been in the ignore state: **Current** and **Allowed**.	All levels
Restart	Graceful restart capability: **enabled** or **disabled**.	All levels
Restart duration	Time period for complete reacquisition of OSPF neighbors.	All levels
Restart grace period	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels
Graceful restart helper mode	(OSPFv2) Standard graceful restart helper capability (based on RFC 3623): **enabled** or **disabled**.	All levels
Restart-signaling helper mode	(OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): **enabled** or **disabled**.	All levels
Helper mode	(OSPFv3) Graceful restart helper capability: **enabled** or **disabled**.	All levels
Trace options	OSPF-specific trace options.	**extensive**
Trace file	Name of the file to receive the output of the tracing operation.	**extensive**
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: **Normal Stub**, **Not Stub**, or **Not so Stubby Stub**.	All levels
Authentication Type	Type of authentication: **None**, **Password**, or **MD5**. NOTE: The **Authentication Type** field refers to the authentication configured at the **[edit protocols ospf area *area-id*]** level. Any authentication configured for an interface in this area will not affect the value of this field.	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

<transit>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
topology option introduced in Junos OS Release 9.0.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the entries in the Open Shortest Path First (OSPF) routing table.

Options

none—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.

destination—Display routes to the specified IP address (with optional destination prefix length).

brief | detail | extensive—(Optional) Display the specified level of output.

abr—(Optional) Display routes to area border routers.

asbr—(Optional) Display routes to autonomous system border routers.

extern—(Optional) Display external routes.

Copyright © 2018, Juniper Networks, Inc.

inter—(Optional) Display interarea routes.

intra—(Optional) Display intra-area routes.

instance (default | ipv4-multicast | *instance-name*)—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

logical-system (default | ipv4-multicast | *logical-system-name*)—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

network—(Optional) Display routes to networks.

no-backup-coverage—(Optional) Display routes with no backup coverage.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Display routes to all routers.

topology (default | ipv4-multicast | *topology-name*)—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

transit—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

Required Privilege Level

show ospf route topology voice on page 2150

Output Fields

Table 188 on page 2146 list the output fields for the **show (ospf | ospf3) route** command. Output fields are listed in the approximate order in which they appear.

Table 188: show (ospf | ospf3) route Output Fields

Field Name	Field Description	Output Level
Topology	Name of the topology.	All levels
Prefix	Destination of the route.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 188: show (ospf | ospf3) route Output Fields (continued)

Field Name	Field Description	Output Level
Path type	How the route was learned: • **Inter**—Interarea route • **Ext1**—External type 1 route • **Ext2**—External type 2 route • **Intra**—Intra-area route	All levels
Route type	The type of routing device from which the route was learned: • **AS BR**—Route to AS border router. • **Area BR**—Route to area border router. • **Area/AS BR**—Route to router that is both an **Area BR** and **AS BR**. • **Network**—Network router. • **Router**—Route to a router that is neither an **Area BR** nor an **AS BR**. • **Transit**—(OSPFv3 only) Route to a pseudonode representing a transit network, LAN, or nonbroadcast multiaccess (NBMA) link. • **Discard**—Route to a summary discard.	All levels
NH Type	Next-hop type: **LSP** or **IP**.	All levels
Metric	Route's metric value.	All levels
NH-interface	(OSPFv3 only) Interface through which the route's next hop is reachable.	All levels
NH-addr	(OSPFv3 only) IPv6 address of the next hop.	All levels
NextHop Interface	(OSPFv2 only) Interface through which the route's next hop is reachable.	All levels
Nexthop addr/label	(OSPFv2 only) If the **NH Type** is **IP**, then it is the address of the next hop. If the **NH Type** is **LSP**, then it is the name of the label-switched path.	All levels
Area	Area ID of the route.	**detail**
Origin	Router from which the route was learned.	**detail**
Type 7	Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).	**detail**
P-bit	Route was learned through NSSA LSA and the propagate bit was set.	**detail**
Fwd NZ	Forwarding address is nonzero. **Fwd NZ** is only displayed if the route is learned through an NSSA LSA.	**detail**

Table 188: show (ospf | ospf3) route Output Fields (continued)

Field Name	Field Description	Output Level
optional-capability	Optional capabilities propagated in the router LSA. This field is in the output for intra-area router routes only (when **Route Type** is **Area BR**, **AS BR**, **Area/AS BR**, or **Router**), not for interarea router routes or network routes. Three bits in this field are defined as follows: • **0x4 (V)**—Routing device is at the end of a virtual active link. • **0x2 (E)**—Routing device is an autonomous system boundary router. • **0x1 (B)**—Routing device is an area border router.	**detail**
priority	The priority assigned to the prefix: • **high** • **medium** • **low** NOTE: The **priority** field applies only to routes of type **Network**.	**detail**
BGP-ORR Generation-ID	Display the BGP-ORR generation identifier of the main OSPF route. This field is shown only for non-zero values.	**extensive**

show (ospf | ospf3) statistics

List of Syntax

Syntax on page 2151
Syntax (EX Series Switch and QFX Series) on page 2151

Syntax

show (ospf | ospf3) statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>

Syntax (EX Series Switch and QFX Series)

show (ospf | ospf3) statistics
<instance *instance-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display OSPF statistics.

Options

none—Display OSPF statistics for all routing instances.

instance *instance-name*—(Optional) Display all statistics for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Display all statistics for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields

Table 189 on page 2152 lists the output fields for the **show (ospf | ospf3) statistics** command. Output fields are listed in the approximate order in which they appear.

Table 189: show (ospf | ospf3) statistics Output Fields

Field Name	Field Description
Packet type	Type of OSPF packet.
Total Sent/Total Received	Total number of packets sent and received.
Last 5 seconds Sent/Last 5 seconds Received	Total number of packets sent and received in the last 5 seconds.
DBDs retransmitted	Total number of database description packets retransmitted, and number retransmitted in the last 5 seconds.
LSAs flooded	Total number of link-state advertisements flooded, and number flooded in the last 5 seconds.
LSAs flooded high-prio	Total number of high priority link-state advertisements flooded, and number flooded in the last 5 seconds. A link-state advertisement is deemed a high priority if it has changed since it was last sent.
LSAs retransmitted	Total number of link-state advertisements retransmitted, and number retransmitted in the last 5 seconds.
LSAs transmitted to nbr	Total number of link-state advertisements transmitted to a neighbor, and number transmitted in the last 5 seconds.
LSAs requested	Total number of link-state advertisements requested by neighboring devices, and number requested in the last 5 seconds.
LSAs acknowledged	Total number of link-state advertisements acknowledged, and number acknowledged in the last 5 seconds.
Flood queue depth	Total number of entries in the extended queue.
Total rexmit entries	Total number of retransmission entries waiting to be sent from the OSPF routing instance.
db summaries	Total number of database description summaries waiting to be sent from the OSPF routing instance.
lsreq entries	Total number of link-state request entries waiting to be sent from the OSPF routing instance.

Table 189: show (ospf | ospf3) statistics Output Fields (continued)

Field Name	Field Description
Receive errors	Number and type of receive errors. Some sample receive errors include: • **mtu mismatches** • **no interface found** • **no virtual link found** • **nssa mismatches** • **stub area mismatches** • **subnet mismatches** If there are no receive errors, the output displays **none**.

Syntax (EX Series Switches)

show as-path
<brief | detail>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the **as-path-prepend** action) or through aggregation.

AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.

Options

none—Display basic information about AS paths that the local routing device is using (same as brief).

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 190 on page 2160 lists the output fields for the **show as-path** command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 190: show as-path Output Fields

Field Name	Field Description	Level of Output
Total AS paths	Total number of AS paths.	**brief** none
Bucket	Bucket number.	All levels
Count	Number of AS path entries in this bucket.	All levels
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. • **Atomic**—Route is an aggregate of several route prefixes. • **Aggregator**—Routing device has summarized a range of prefixes.	All levels
domain	Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain.	**detail**
neighbor as	AS peer address.	**detail**
length	Length of the AS path.	**detail**
segments	Length of the AS segment descriptor.	**detail**
unique-count	Number of unique autonomous systems (ASs) present in the AS path	**detail**
references	Path reference count.	**detail**

show as-path domain

List of Syntax
Syntax on page 2164
Syntax (EX Series Switches) on page 2164

Syntax

show as-path domain
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show as-path domain

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display autonomous system (AS) path domain information.

Options

none—(Optional) Display AS path domain information for all routing instances.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show as-path domain on page 2166

Output Fields

Table 191 on page 2164 lists the output fields for the **show as-path domain** command. Output fields are listed in the approximate order in which they appear

Table 191: show as-path domain Output Fields

Field Name	Field Description
Domain	Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain.
Primary	Primary AS number.
References	Path reference count.
***Number* Paths**	Number of known AS paths.

Copyright © 2018, Juniper Networks, Inc.

Table 191: show as-path domain Output Fields (continued)

Field Name	Field Description
Flags	Information about the AS path: • **ASLoop**—Path contains an AS loop. • **Atomic**—Path includes the ATOMIC_AGGREGATE path attribute. • **Local**—Path was created by local aggregation. • **Master**—Path was created by the master routing instance.
Local AS	AS number of the local routing device.
Loops	How many times this AS number can appear in an AS path.

Sample Output

show as-path domain

```
user@host> show as-path domain
Domain: 1        Primary: 10458
    References:          3 Paths:      30383
    Flags: Master
    Local AS: 10458  Loops: 1
```

show as-path summary

List of Syntax

Syntax on page 2167
Syntax (EX Series Switches) on page 2167

Syntax

show as-path summary
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show as-path summary

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display autonomous system (AS) path summary information.

AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.

Options

none—(Optional) Display AS path summary information for all routing instances.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 192 on page 2167 lists the output fields for the **show as-path summary** command. Output fields are listed in the approximate order in which they appear.

Table 192: show as-path summary Output Fields

Field Name	Field Description
AS Paths	Number of AS paths.
Buckets	Number of hash buckets in use.
Max	Maximum number of AS path entries per bucket.

Table 192: show as-path summary Output Fields (continued)

Field Name	Field Description
Min	Minimum number of AS path entries per bucket.
Avg	Average number of AS path entries per bucket.
Std deviation	Standard deviation of AS path entries per bucket.

Sample Output

show as-path summary

```
user@host> show as-path summary
AS Paths  Buckets      Max     Min     Avg   Std deviation
   30425     1024       95      12      29        6.481419
```

Syntax (EX Series Switches)

show route
<all>
<*destination-prefix*>
<private>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option **private** introduced in Junos OS Release 9.5.
Option **private** introduced in Junos OS Release 9.5 for EX Series switches.
Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.
Option **display-client-data** introduced in Junos OS Release 16.2R1 on MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series routers.
Options **te-ipv4-prefix-ip**, **te-ipv4-prefix-node-ip**, and **te-ipv4-prefix-node-iso** introduced in Junos OS Release 17.2R1 on MX Series and PTX Series.

Description

Display the active entries in the routing tables.

Options

none—Display brief information about all active entries in the routing tables.

all—(Optional) Display information about all routing tables, including private, or internal, routing tables.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

private—(Optional) Display information only about all private, or internal, routing tables.

display-client-data —(Optional) Display client id and cookie information for routes installed by the routing protocol process client applications.

te-ipv4-prefix-ip *te-ipv4-prefix-ip*—(Optional) Display IPv4 address of the traffic-engineering prefix, without the mask length if present in the routing table.

Copyright © 2018, Juniper Networks, Inc.

te-ipv4-prefix-node-ip ***te-ipv4-prefix-node-ip***—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 node addresses from the traffic-engineered routes in the **lsdist.0** table.

te-ipv4-prefix-node-iso ***te-ipv4-prefix-node-iso***—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 routes with the specified ISO circuit ID from the **lsdist.0** table.

List of Sample Output

Output Fields

Table 193 on page 2170 describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

Table 193: show route Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, inet.0).
***number* destinations**	Number of destinations for which there are routes in the routing table.

 Copyright © 2018, Juniper Networks, Inc.

Table 193: show route Output Fields (continued)

Field Name	Field Description
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active). • **holddown** (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly. However, if you have configured advertisement of multiple routes (with the **add-path** or **advertise-inactive** statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong. • **hidden** (routes that are not used because of a routing policy).

destination-prefix	Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:
	• *MPLS-label* (for example, 80001).
	• *interface-name* (for example, ge-1/0/2).
	• *neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id* :*source* (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96):
	  ◦ *neighbor-address*—Address of the neighbor.
	  ◦ *control-word-status*—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**.
	  ◦ *encapsulation type*—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.
	  ◦ *vc-id*—Virtual circuit identifier.
	  ◦ *source*—Source of the advertisement: **Local** or **Remote**.

[*protocol*, *preference* **]**	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
weeks:days hours:minutes:seconds	How long the route been known (for example, **2w4d 13:11:14**, or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).
metric	Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.

Table 193: show route Output Fields (continued)

<table>
<tr><th>Field Name</th><th>Field Description</th></tr>
<tr><td>localpref</td><td>Local preference value included in the route.</td></tr>
<tr><td>from</td><td>Interface from which the route was received.</td></tr>
<tr><td>AS path</td><td>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:
• I—IGP.
• E—EGP.
• ?—Incomplete; typically, the AS path was aggregated.
When AS path numbers are included in the route, the format is as follows:
• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.
• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.
• ( )—Parentheses enclose a confederation.
• ([ ])—Parentheses and brackets enclose a confederation set.
NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</td></tr>
<tr><td>encapsulated</td><td>Extended next-hop encoding capability enabled for the specified BGP community for routing IPv4 traffic over IPv6 tunnels. When BGP receives routes without the tunnel community, IPv4-0ver IPv6 tunnels are not created and BGP routes are resolved without encapsulation.</td></tr>
<tr><td>Route Labels</td><td>Stack of labels carried in the BGP route update.</td></tr>
<tr><td>validation-state</td><td>(BGP-learned routes) Validation status of the route:
• Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.
• Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database.
• Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.
• Valid—Indicates that the prefix and autonomous system pair are found in the database.</td></tr>
<tr><td>to</td><td>Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
If the destination is Discard, traffic is dropped.</td></tr>
</table>

 Copyright © 2018, Juniper Networks, Inc.

Table 193: show route Output Fields (continued)

Field Name	Field Description
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • **Weight**—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • **Balance**—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing. • ***lsp-path-name***—Name of the LSP used to reach the next hop. • ***label-action***—MPLS label and operation occurring at the next hop. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label). For VPNs, expect to see multiple **push** operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).
Private unicast	(Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes *not* managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.
balance	Distribution of the load based on the underlying operational interface bandwidth for equal-cost multipaths (ECMP) across the nexthop gateways in percentages.

Sample Output

show route

show route active-path

List of Syntax

Syntax on page 2190
Syntax (EX Series Switches) on page 2190

Syntax

show route active-path
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route active-path
<brief | detail | extensive | terse>

Release Information

Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display all active routes for destinations. An active route is a route that is selected as the best path. Inactive routes are not displayed.

Options

none—Display all active routes.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show route active-path on page 2190
show route active-path brief on page 2191
show route active-path detail on page 2191
show route active-path extensive on page 2192
show route active-path terse on page 2194

Output Fields

For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

Sample Output

show route active-path

```
user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.70.19/32    *[Direct/0] 21:33:52
```

 Copyright © 2018, Juniper Networks, Inc.

```
                        > via lo0.0
10.255.71.50/32     *[IS-IS/15] 00:18:13, metric 10
                        > to 172.16.100.1 via so-2/1/3.0
172.16.100.1/24       *[Direct/0] 00:18:36
                        > via so-2/1/3.0
172.16.100.1/32       *[Local/0] 00:18:41
                          Local via so-2/1/3.0
192.168.64.0/21     *[Direct/0] 21:33:52
                        > via fxp0.0
192.168.70.19/32    *[Local/0] 21:33:52
                          Local via fxp0.0
```

show route active-path brief

The output for the **show route active-path brief** command is identical to that for the **show route active-path** command. For sample output, see show route active-path on page 2190.

show route active-path detail

```
user@host> show route active-path detail

show route advertising-protocol

Syntax

show route advertising-protocol *protocol neighbor-address*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display the routing information as it has been prepared for advertisement to a particular neighbor of a particular dynamic routing protocol.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor-address—Address of the neighboring router to which the route entry is being transmitted.

protocol—Protocol transmitting the route:

- **bgp**—Border Gateway Protocol
- **dvmrp**—Distance Vector Multicast Routing Protocol
- **msdp**—Multicast Source Discovery Protocol
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation

Additional Information

Routes displayed are routes that the routing table has exported into the routing protocol and that have been filtered by the associated protocol's **export** routing policy statements. Starting with Junos OS Release 13.3, you can display the routing instance table **foo** for any address family, on a VPN route reflector, or a VPN AS boundary router that is advertising local VPN routes. However, If you do not specify the **table** in the command, the output displays each VRF prefix twice.

show route advertising-protocol bgp detail (Labeled Unicast) on page 2199
show route advertising-protocol bgp detail (Layer 2 VPN) on page 2199
show route advertising-protocol bgp detail (Layer 3 VPN) on page 2199
show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address) on page 2200

Output Fields Table 194 on page 2196 lists the output fields for the **show route advertising-protocol** command. Output fields are listed in the approximate order in which they appear.

Table 194: show route advertising-protocol Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table—for example, inet.0.	All levels
number destinations	Number of destinations for which there are routes in the routing table.	All levels
number routes	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active) • **holddown** (routes that are in the pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)	All levels
Prefix	Destination prefix.	**brief** none
destination-prefix **(entry , announced)**	Destination prefix. The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination.	**detail extensive**
BGP group and type	BGP group name and type (**Internal** or **External**).	**detail extensive**
Route Distinguisher	Unique 64-bit prefix augmenting each IP subnet.	**detail extensive**
Advertised Label	Incoming label advertised by the Label Distribution Protocol (LDP). When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label.	**detail extensive**
Label-Base, range	First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router.	**detail extensive**
VPN Label	Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 194: show route advertising-protocol Output Fields (continued)

Field Name	Field Description	Level of Output
Nexthop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route. If the next-hop advertisement to the peer is **Self**, and the RIB-out next hop is a specific IP address, the RIB-out IP address is included in the extensive output. See show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address) on page 2200.	All levels
MED	Multiple exit discriminator value included in the route.	**brief**
Lclpref or **Localpref**	Local preference value included in the route.	All levels
Queued	When BGP route prioritization is enabled and a route is present in a priority queue, this shows which priority queue the route is in.	All levels except **brief**
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if configured on the router, or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.	All levels
Route Labels	Stack of labels carried in the BGP route update.	**detail extensive**
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.	**detail extensive**
Originator ID	(For route reflected output only) Address of routing device that originally sent the route to the route reflector.	**detail extensive**
Communities	Community path attribute for the route. See the output field table for the show route detail command for all possible values for this field.	**detail extensive**
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.	**detail extensive**

Table 194: show route advertising-protocol Output Fields (continued)

Field Name	Field Description	Level of Output
Attrset AS	Number, local preference, and path of the autonomous system (AS) that originated the route. These values are stored in the **Attrset** attribute at the originating router.	**detail extensive**
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).	**detail extensive**
control flags	Control flags: **none** or **Site Down**.	**detail extensive**
mtu	Maximum transmission unit (MTU) of the Layer 2 circuit.	**detail extensive**

Syntax

show route all
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route all

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display information about all routes in all routing tables, including private, or internal, tables.

Options

none—Display information about all routes in all routing tables, including private, or internal, tables.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

Related Documentation

- show route brief on page 2208
- show route detail on page 2220

List of Sample Output

show route all on page 2201

Output Fields

In Junos OS Release 9.5 and later, only the output fields for the **show route all** command display all routing tables, including private, or hidden, routing tables. The output field table of the show route command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later.

Sample Output

show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0                  *[MPLS/0] 2d 02:24:39, metric 1
```

```
                      Receive
1                  *[MPLS/0] 2d 02:24:39, metric 1
                      Receive
2                  *[MPLS/0] 2d 02:24:39, metric 1
                      Receive
800017             *[VPLS/7] 1d 14:00:16
                    > via vt-3/2/0.32769, Pop
800018             *[VPLS/7] 1d 14:00:26
                    > via vt-3/2/0.32772, Pop
```

```

show route aspath-regex

List of Syntax

Syntax on page 2203
Syntax (EX Series Switches) on page 2203

Syntax

show route aspath-regex *regular-expression*
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route aspath-regex *regular-expression*

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.

Options

regular-expression—Regular expression that matches an entire AS path.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

You can specify a regular expression as:

- An individual AS number
- A period wildcard used in place of an AS number
- An AS path regular expression that is enclosed in parentheses

You also can include the operators described in the table of AS path regular expression operators in the *Junos Policy Framework Configuration Guide*. The following list summarizes these operators:

- **{*m*,*n*}**—At least *m* and at most *n* repetitions of the AS path term.
- **{*m*}**—Exactly *m* repetitions of the AS path term.
- **{*m*,}**—*m* or more repetitions of the AS path term.
- *****—Zero or more repetitions of an AS path term.
- ***+***—One or more repetitions of an AS path term.
- ***?***—Zero or one repetition of an AS path term.
- ***aspath_term* | *aspath_term***—Match one of the two AS path terms.

  When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:

show route aspath-regex ".* 234 .*"

Required Privilege Level view

show route best

List of Syntax

Syntax on page 2205
Syntax (EX Series Switches) on page 2205

Syntax

show route best *destination-prefix*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route best *destination-prefix*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the route in the routing table that is the best route to the specified address or range of addresses. The best route is the longest matching route.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

destination-prefix—Address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show route community

List of Syntax

Syntax on page 2211
Syntax (EX Series Switches) on page 2211

Syntax

show route community *as-number:community-value*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route community *as-number:community-value*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.

Options

as-number:community-value—One or more community identifiers. ***as-number*** is the AS number, and ***community-value*** is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.

For example:

user@host> **show route table inet.0 protocol bgp community "12083:6015" community "12083:65551"**

or

user@host> **show route table inet.0 protocol bgp community [12083:6014 12083:65551]**

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information

Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.

Syntax (EX Series Switch and QFX Series) on page 2215

Syntax

show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and QFX Series)

show route damping (decayed | history | suppressed)
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display the BGP routes for which updates might have been reduced because of route flap damping.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

decayed—Display route damping entries that might no longer be valid, but are not suppressed.

history—Display entries that have already been withdrawn, but have been logged.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

suppressed—Display entries that have been suppressed and are no longer being installed into the forwarding table or exported by routing protocols.

Output Fields

Table 195 on page 2216 lists the output fields for the **show route damping** command. Output fields are listed in the approximate order in which they appear.

Table 195: show route damping Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table—for example, **inet.0**.	All levels
destinations	Number of destinations for which there are routes in the routing table.	All levels
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** • **holddown** (routes that are in a pending state before being declared inactive) • **hidden** (the routes are not used because of a routing policy)	All levels
destination-prefix **(entry, announced)**	Destination prefix. The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination.	**detail extensive**
[*protocol***,** *preference***]**	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.	All levels
Next-hop reference count	Number of references made to the next hop.	**detail extensive**
Source	IP address of the route source.	**detail extensive**
Next hop	Network layer address of the directly reachable neighboring system.	**detail extensive**
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**.	**detail extensive**
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.	**detail extensive**
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.	**detail extensive**
State	Flags for this route. For a description of possible values for this field, see the output field table for the show route detail command.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 195: show route damping Output Fields (continued)

Field Name	Field Description	Level of Output
Local AS	AS number of the local routing device.	**detail extensive**
Peer AS	AS number of the peer routing device.	**detail extensive**
Age	How long the route has been known.	**detail extensive**
Metric	Metric for the route.	**detail extensive**
Task	Name of the protocol that has added the route.	**detail extensive**
Announcement bits	List of protocols that announce this route. ***n*-Resolve inet** indicates that the route is used for route resolution for next hops found in the routing table. ***n*** is an index used by Juniper Networks customer support only.	**detail extensive**
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.	All levels
to	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	**brief** none
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word **Selected**.	**brief** none
Communities	Community path attribute for the route. See the output field table for the show route detail command.	**detail extensive**
Localpref	Local preference value included in the route.	All levels
Router ID	BGP router ID as advertised by the neighbor in the open message.	**detail extensive**

Table 195: show route damping Output Fields (continued)

Field Name	Field Description	Level of Output
Merit (last update/now)	Last updated and current figure-of-merit value.	**detail extensive**
damping-parameters	Name that identifies the damping parameters used, which is defined in the damping statement at the **[edit policy-options]** hierarchy level.	**detail extensive**
Last update	Time of most recent change in path attributes.	**detail extensive**
First update	Time of first change in path attributes, which started the route damping process.	**detail extensive**
Flaps	Number of times the route has gone up or down or its path attributes have changed.	**detail extensive**
Suppressed	(**suppressed** keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it.	All levels
Reusable in	(**suppressed** keyword only) Time when a suppressed route will again be available.	All levels
Preference will be	(**suppressed** keyword only) Preference value that will be applied to the route when it is again active.	All levels

show route detail (with BGP Multipath) on page 2237
show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 2238
show route label detail (Multipoint LDP with Multicast-Only Fast Reroute) on page 2238

Output Fields

Table 196 on page 2220 describes the output fields for the **show route detail** command. Output fields are listed in the approximate order in which they appear.

Table 196: show route detail Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, inet.0).
number **destinations**	Number of destinations for which there are routes in the routing table.

Copyright © 2018, Juniper Networks, Inc.

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
number **routes**	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active) • **holddown** (routes that are in the pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)

route-destination **(entry, announced)**	Route destination (for example:10.0.0.1/24). The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:
	• *MPLS-label* (for example, 80001).
	• *interface-name* (for example, ge-1/0/2).
	• *neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id*:*source* (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).
	  ◦ *neighbor-address*—Address of the neighbor.
	  ◦ *control-word-status*—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**.
	  ◦ *encapsulation type*—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.
	  ◦ *vc-id*—Virtual circuit identifier.
	  ◦ *source*—Source of the advertisement: **Local** or **Remote**.
	  ◦ *source*—Source of the advertisement: **Local** or **Remote**.

label stacking	(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels. • **S=0 route** indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed). • If there is no **S=** information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).

Table 196: show route detail Output Fields (continued)

Field Name	Field Description

[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route.
	• **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.
	• **-** —A hyphen indicates the last active route.
	• *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route.
	In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value.
	Preference2 values are signed integers, that is, **Preference2** values can be either positive or negative values. However, Junos OS evaluates **Preference2** values as unsigned integers that are represented by positive values. Based on the **Preference2** values, Junos OS evaluates a preferred route differently in the following scenarios:
	• **Both Signed Preference2 values**
	  ◦ Route A = -101
	  ◦ Route B = -156
	  Where both the **Preference2** values are signed, Junos OS evaluates only the unsigned value of **Preference2** and Route A, which has a lower **Preference2** value is preferred.
	• **Unsigned Preference2 values**
	  Now consider both unsigned **Preference2** values:
	  ◦ Route A = 4294967096
	  ◦ Route B = 200
	  Here, Junos OS considers the lesser **Preference2** value and Route B with a **Preference2** value of 200 is preferred because it is less than 4294967096.
	• **Combination of signed and unsigned Preference2 values**
	  When **Preference2** values of two routes are compared, and for one route the **Preference2** is a signed value, and for the other route it is an unsigned value, Junos OS prefers the route with the positive **Preference2** value over the negative **Preference2** value. For example, consider the following signed and unsigned **Preference2** values:
	  ◦ Route A = -200
	  ◦ Route B = 200
	  In this case, Route B with a **Preference2** value of 200 is preferred although this value is greater than -200, because Junos OS evaluates only the unsigned value of the **Preference2** value.

Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).

Copyright © 2018, Juniper Networks, Inc.

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
Next-hop type	Type of next hop. For a description of possible values for this field, see Table 197 on page 2226.
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.
Label-switched-path ***lsp-path-name***	Name of the LSP used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See Table 198 on page 2228.
Local AS	AS number of the local routing device.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.

Copyright © 2018, Juniper Networks, Inc.

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
Metric*n*	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances. For sample output, see show route table.
Task	Name of the protocol that has added the route.
Announcement bits	The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, ***n*-Resolve inet** indicates that the specified route is used for route resolution for next hops found in the routing table. • ***n***—An index used by Juniper Networks customer support only.
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **Recorded**—The AS path is recorded by the sample process (sampled). • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. • **[ ]**—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.

 Copyright © 2018, Juniper Networks, Inc.

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
validation-state	(BGP-learned routes) Validation status of the route: • **Invalid**—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • **Unknown**—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • **Unverified**—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers. • **Valid**—Indicates that the prefix and autonomous system pair are found in the database.
ORR Generation-ID	Displays the optimal route reflection (ORR) generation identifier. ISIS and OSPF interior gateway protocol (IGP) updates filed whenever any of the corresponding ORR route has its metric valued changed, or if the ORR route is added or deleted.
FECs bound to route	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See Table 199 on page 2230 for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: **none** or **Site Down**.
mtu	Maximum transmission unit (MTU) information.

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.
Accepted LongLivedStaleImport	The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag. Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table
ImportAccepted LongLivedStaleImport	Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

Table 197 on page 2226 describes all possible values for the Next-hop Types output field.

Table 197: Next-hop Types Output Field Values

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.
Deny	Deny next hop.
Discard	Discard next hop.
Dynamic List	Dynamic list next hop

 Copyright © 2018, Juniper Networks, Inc.

Table 197: Next-hop Types Output Field Values (continued)

Next-Hop Type	Description
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.
Reject (rjct)	Discard. An ICMP unreachable message was sent.
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrt)	Regular multicast next hop.
Router	A specific node or set of nodes to which the routing device forwards packets that match the route prefix. To qualify as next-hop type router, the route must meet the following criteria: • Must not be a direct or local subnet for the routing device. • Must have a next hop that is directly connected to the routing device.
Table	Routing table next hop.

Copyright © 2018, Juniper Networks, Inc.

Table 197: Next-hop Types Output Field Values (continued)

Next-Hop Type	Description
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

Table 198 on page 2228 describes all possible values for the State output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

Table 198: State Output Field Values

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.

 Copyright © 2018, Juniper Networks, Inc.

Table 198: State Output Field Values (continued)

Value	Description
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGP path is available.
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.
Pending	Route pending because of a hold-down configured on another route.
Programmed	Route installed programatically by on-box or off-box applications using API.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available
Router ID	Path through a neighbor with lower ID is available.

Table 198: State Output Field Values (continued)

Value	Description
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: • The route is damped. • The route is rejected by an import policy. • The route is unresolved.
Update source	Last tiebreaker is the lowest IP address value.
ProtectionCand	Indicates paths requesting protection.
ProtectionPath	Indicates the route entry that can be used as a protection path.

Table 199 on page 2230 describes the possible values for the Communities output field.

Table 199: Communities Output Field Values

Value	Description
area-number	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is **0**. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
bandwidth: ***local AS number:link-bandwidth-number***	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
domain-id	Unique configurable number that identifies the OSPF domain.
domain-id-vendor	Unique configurable number that further identifies the OSPF domain.
link-bandwidth-number	Link-bandwidth number: from **0** through **4,294,967,295** (bytes per second).
local AS number	Local AS number: from **1** through **65,535**.
options	1 byte. Currently this is only used if the route type is **5** or **7**. Setting the least significant bit in the field indicates that the route carries a type 2 metric.
origin	(Used with VPNs) Identifies where the route came from.
ospf-route-type	1 byte, encoded as **1** or **2** for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); **3** for summary routes; **5** for external routes (area number must be**0**); **7** for NSSA routes; or **129** for sham link endpoint addresses.
route-type-vendor	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute **0x8000**. The format is ***area-number:ospf-route-type:options***.

 Copyright © 2018, Juniper Networks, Inc.

Table 199: Communities Output Field Values (continued)

Value	Description
rte-type	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute **0x0306**. The format is ***area-number:ospf-route-type:options***.
target	Defines which VPN the route participates in; **target** has the format ***32-bit IP address:16-bit number***. For example, 10.19.0.0:100.
unknown IANA	Incoming IANA codes with a value between **0x1** and **0x7fff**. This code of the BGP extended community attribute is accepted, but it is not recognized.
unknown OSPF vendor community	Incoming IANA codes with a value above **0x8000**. This code of the BGP extended community attribute is accepted, but it is not recognized.

show route exact

List of Syntax

Syntax on page 2240
Syntax (EX Series Switches) on page 2240

Syntax

show route exact *destination-prefix*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route exact *destination-prefix*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display only the routes that exactly match the specified address or range of addresses.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

destination-prefix—Address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show route export

List of Syntax

Syntax on page 2242
Syntax (EX Series Switches) on page 2242

Syntax

show route export
<brief | detail>
<instance <*instance-name*> | *routing-table-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route export
<brief | detail>
<instance <*instance-name*> | *routing-table-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.

Options

none—(Same as **brief**.) Display standard information about policy-based export for all instances and routing tables on all systems.

brief | detail—(Optional) Display the specified level of output.

instance <*instance-name*>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

routing-table-name—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the **show route export inet** command).

Required Privilege Level

view

List of Sample Output

show route export on page 2243
show route export detail on page 2243
show route export instance detail on page 2244

Output Fields

Table 200 on page 2243 lists the output fields for the **show route export** command. Output fields are listed in the approximate order in which they appear.

Table 200: show route export Output Fields

Field Name	Field Description	Level of Output
Table or *table-name*	Name of the routing tables that either import or export routes.	All levels
Routes	Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one.	**brief** none
Export	Whether the table is currently exporting routes to other tables: **Y** or **N** (Yes or No).	**brief** none
Import	Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)	**detail**
Flags	(**instance** keyword only) Flags for this feature on this instance: • **config auto-policy**—The policy was deduced from the configured IGP export policies. • **cleanup**—Configuration information for this instance is no longer valid. • **config**—The instance was explicitly configured.	**detail**
Options	(**instance** keyword only) Configured option displays the type of routing tables the feature handles: • **unicast**—Indicates *instance*.inet.0. • **multicast**—Indicates *instance*.inet.2. • **unicast multicast**—Indicates *instance*.inet.0 and *instance*.inet.2.	**detail**
Import policy	(**instance** keyword only) Policy that **route export** uses to construct the import-export matrix. Not displayed if the instance type is **vrf**.	**detail**
Instance	(**instance** keyword only) Name of the routing instance.	**detail**
Type	(**instance** keyword only) Type of routing instance: **forwarding**, **non-forwarding**, or **vrf**.	**detail**

Sample Output

show route export

```
user@host> show route export
Table                             Export          Routes
inet.0                            N                    0
black.inet.0                      Y                    3
red.inet.0                        Y                    4
```

show route export detail

```
user@host>  show route export detail
inet.0                                          Routes:        0
black.inet.0                                    Routes:        3
  Import: [ inet.0 ]
red.inet.0                                      Routes:        4
  Import: [ inet.0 ]
```

show route export instance detail

```
user@host> show route export instance detail
Instance: master                        Type: forwarding
  Flags: <config auto-policy> Options: <unicast multicast>
  Import policy: [ (ospf-master-from-red || isis-master-from-black) ]
Instance: black                         Type: non-forwarding
Instance: red                           Type: non-forwarding
```

show route export vrf-target

Syntax

show route export vrf-target
<brief | detail>
<community *community--regular-expression*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display the VPN routing and forwarding (VRF) target communities for which policy-based route export is currently distributing routes. This command is relevant when there are overlapping virtual private networks (VPNs).

Options

none—Display standard information about all target communities.

brief | detail—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

community *community-regular-expression*—(Optional) Display information about the specified community.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show route export vrf-target on page 2246
show route export vrf-target community on page 2246
show route export vrf-target detail on page 2246

Output Fields

Table 201 on page 2245 lists the output fields for the **show route export vrf-target** command. Output fields are listed in the approximate order in which they appear.

Table 201: show route export vrf-target Output Fields

Field Name	Field Description	Level of Output
Route target	Target communities for which auto-export is currently distributing routes.	**brief** none
Family	Routing table entries for the specified family.	**brief** none
type-of-routing-table(s)	Type of routing tables the feature handles: • **unicast**—Indicates ***instance*.inet.0**. • **multicast**—Indicates ***instance*.inet.2**. • **unicast multicast**—Indicates ***instance*.inet.0** and ***instance*.inet.2**.	**brief** none
Import	Number of routing tables that are currently importing routes with this target community. Omitted for tables that are not importing routes.	**brief** none

Copyright © 2018, Juniper Networks, Inc.

Table 201: show route export vrf-target Output Fields (continued)

Field Name	Field Description	Level of Output
Export	Number of routing tables that are currently exporting routes with this target community. Omitted for tables that are not exporting routes.	**brief** none
Target	Target communities, family, and options for which auto-export is currently distributing routes.	**detail**
Import table(s)	Name of the routing tables that are importing a particular route target.	**detail**
Export table(s)	Name of the routing tables that are exporting a particular route target.	**detail**

Sample Output

show route export vrf-target

```
user@host> show route export vrf-target
Route Target                 Family                  Import     Export
69:1                         inet      unicast            2          2
69:2                         inet      unicast            2          2
```

show route export vrf-target community

```
user@host> show route export vrf-target community target:69:1
Route Target                 Family                  Import     Export
69:1                         inet      unicast            2          2
```

show route export vrf-target detail

```
user@host> show route export vrf-target detail
Target: 1:12                              inet      unicast
  Import table(s): vrf-11.inet.0 vrf-12.inet.0
  Export table(s): vrf-12.inet.0
Target: 1:13                              inet      unicast
  Import table(s): vrf-12.inet.0 vrf-13.inet.0
  Export table(s): vrf-13.inet.0

Syntax on page 2247
Syntax (EX Series Switches) on page 2247

Syntax

show route extensive
<*destination-prefix*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route extensive
<*destination-prefix*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display extensive information about the active entries in the routing tables.

Options

none—Display all active entries in the routing table.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields

Table 202 on page 2247 describes the output fields for the **show route extensive** command. Output fields are listed in the approximate order in which they appear.

Table 202: show route extensive Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, inet.0).
number **destinations**	Number of destinations for which there are routes in the routing table.

Copyright © 2018, Juniper Networks, Inc.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
number routes	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active). • **holddown** (routes that are in the pending state before being declared inactive). • **hidden** (routes that are not used because of a routing policy).

route-destination (entry, announced)	Route destination (for example: 10.0.0.1/24). The **entry** value is the number of route for this destination, and the **announced** value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:
	• ***MPLS-label*** (for example, 80001).
	• ***interface-name*** (for example, ge-1/0/2).
	• ***neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id*:*source*** (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).
	  ◦ ***neighbor-address***—Address of the neighbor.
	  ◦ ***control-word-status***—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**.
	  ◦ ***encapsulation type***—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.
	  ◦ ***vc-id***—Virtual circuit identifier.
	  ◦ ***source***—Source of the advertisement: **Local** or **Remote**.

TSI	Protocol header information.
label stacking	(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels. • **S=0 route** indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed). • If there is no **S=** information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).
[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.

 Copyright © 2018, Juniper Networks, Inc.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
Level	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop. For a description of possible values for this field, see the Output Field table in the show route detail command.
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.
Label-switched-path ***lsp-path-name***	Name of the LSP used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Offset	Whether the metric has been increased or decreased by an offset value.
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.

Copyright © 2018, Juniper Networks, Inc.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
label-operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Indirect next hops	When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved. When BGP PIC Edge is enabled, the output lines that contain **Indirect next hop: weight** follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values: • 0x1 indicates active next hops. • 0x4000 indicates passive next hops.
State	State of the route (a route can be in more than one state). See the Output Field table in the show route detail command.
Session ID	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).
Weight	Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown. For sample output, see show route table.

 Copyright © 2018, Juniper Networks, Inc.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
Inactive reason	If the route is inactive, the reason for its current state is indicated. Typical reasons include: • **Active preferred**—Currently active route was selected over this route. • **Always compare MED**—Path with a lower multiple exit discriminator (MED) is available. • **AS path**—Shorter AS path is available. • **Cisco Non-deterministic MED selection**—Cisco nondeterministic MED is enabled and a path with a lower MED is available. • **Cluster list length**—Path with a shorter cluster list length is available. • **Forwarding use only**—Path is only available for forwarding purposes. • **IGP metric**—Path through the next hop with a lower IGP metric is available. • **IGP metric type**—Path with a lower OSPF link-state advertisement type is available. • **Interior > Exterior > Exterior via Interior**—Direct, static, IGP, or EBGP path is available. • **Local preference**—Path with a higher local preference value is available. • **Next hop address**—Path with a lower metric next hop is available. • **No difference**—Path from a neighbor with a lower IP address is available. • **Not Best in its group**—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed). • **Number of gateways**—Path with a higher number of next hops is available. • **Origin**—Path with a lower origin code is available. • **OSPF version**—Path does not support the indicated OSPF version. • **RIB preference**—Route from a higher-numbered routing table is available. • **Route destinguisher**—64-bit prefix added to IP subnets to make them unique. • **Route metric or MED comparison**—Route with a lower metric or MED is available. • **Route preference**—Route with a lower preference value is available. • **Router ID**—Path through a neighbor with a lower ID is available. • **Unusable path**—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved. • **Update source**—Last tiebreaker is the lowest IP address value.
Local AS	Autonomous system (AS) number of the local routing device.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances. For sample output, see show route table.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
Task	Name of the protocol that has added the route.
Announcement bits	List of protocols that are consumers of the route. Using the following output as an example, **Announcement bits (3): 0-KRT 5-Resolve tree 2 8-BGP RT Background** there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP). The notation ***n*-Resolve inet** indicates that the route is used for route resolution for next hops found in the routing table. ***n*** is an index used by Juniper Networks customer support only.
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **Recorded**—The AS path is recorded by the sample process (sampled). • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.
validation-state	(BGP-learned routes) Validation status of the route: • **Invalid**—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • **Unknown**—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • **Unverified**—Indicates that origin validation is not enabled for the BGP peers. • **Valid**—Indicates that the prefix and autonomous system pair are found in the database.
FECs bound to route	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
AS path: I <Originator>	(For route reflected output only) Originator ID attribute set by the route reflector.

 Copyright © 2018, Juniper Networks, Inc.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
route status	Indicates the status of a BGP route: • **Accepted**—The specified BGP route is imported by the default BGP policy. • **Import**—The route is imported into a Layer 3 VPN routing instance. • **Import-Protect**—A remote instance egress that is protected. • **Multipath**—A BGP multipath active route. • **MultipathContrib**—The route is not active but contributes to the BGP multipath. • **Protect**—An egress route that is protected. • **Stale**—A route that is marked stale due to graceful restart.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See the Output Field table in the show route detail command for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: **none** or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.

Copyright © 2018, Juniper Networks, Inc.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix.
Node path count	Number of nodes in the path.
Forwarding nexthops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

Sample Output

show route extensive

show route flow validation

List of Syntax

Syntax on page 2265
Syntax (EX Series Switches) on page 2265

Syntax

show route flow validation
<brief | detail>
<*ip-prefix*>
<table *table-name*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route flow validation
<brief | detail>
<*ip-prefix*>
<table *table-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display flow route information.

Options

none—Display flow route information.

brief | detail—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

ip-prefix—(Optional) IP address for the flow route.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *table-name*—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the **show route flow validation inet** command).

Required Privilege Level

view

List of Sample Output

show route flow validation on page 2266
show route flow validation (IPv6) on page 2266

Output Fields

Table 203 on page 2265 lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

Table 203: show route flow validation Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table (for example, inet.0).	All levels

Table 203: show route flow validation Output Fields (continued)

Field Name	Field Description	Level of Output
prefix	Route address.	All levels
Active unicast route	Active route in the routing table.	All levels
Dependent flow destinations	Number of flows for which there are routes in the routing table.	All levels
Origin	Source of the route flow.	All levels
Neighbor AS	Autonomous system identifier of the neighbor.	All levels
Flow destination	Number of entries and number of destinations that match the route flow.	All levels
Unicast best match	Destination that is the best match for the route flow.	All levels
Flags	Information about the route flow.	All levels

Sample Output

show route flow validation

```
user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 64501
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent
```

show route flow validation (IPv6)

```
user@host> show route flow validation
inet6.0:
2001:db8::11:11:11:0/120
                Active unicast route
                    Dependent flow destinations: 2
                    Origin: 2001:db8::13:14:2:2, Neighbor AS: 2000
2001:db8::11:11:11:10/128
                Flow destination (1 entries, 1 match origin, next-as)
                    Unicast best match: 2001:db8::11:11:11:0/120
                    Flags: Consistent
2001:db8::11:11:11:30/128
                Flow destination (1 entries, 1 match origin, next-as)
                    Unicast best match: 2001:db8::11:11:11:0/120
                    Flags: Consistent

Release Information

Command introduced before Junos OS Release 7.4.
Option **bridge-domain** introduced in Junos OS Release 7.5

Copyright © 2018, Juniper Networks, Inc.

Option **learning-vlan-id** introduced in Junos OS Release 8.4
Options **all** and **vlan** introduced in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

NOTE: The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

Options **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

detail | extensive | summary—(Optional) Display the specified level of output.

all—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

bridge-domain (all | ***bridge-domain-name*****)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

ccc ***interface-name***—(Optional) Display route entries for the specified circuit cross-connect interface.

destination ***destination-prefix***—(Optional) Destination prefix.

family ***family***—(Optional) Display routing table entries for the specified family: **bridge (ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn)**, **ethernet-switching**, **evpn**, **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mcsnoop-inet**, **mcsnoop-inet6**, **mpls**, **satellite-inet**, **satellite-inet6**, **satellite-vpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

interface-name ***interface-name***—(Optional) Display routing table entries for the specified interface.

label ***name***—(Optional) Display route entries for the specified label.

lcc ***number***—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers,

 Copyright © 2018, Juniper Networks, Inc.

display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

learning-vlan-id *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

matching *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

multicast—(Optional) Display routing table entries for multicast routes.

table —(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the show route instance command.

vlan (all | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

vpn *vpn*—(Optional) Display routing table entries for a specified VPN.

show route forwarding-table table default on page 2281
show route forwarding-table table
logical-system-name/routing-instance-name on page 2282
show route forwarding-table vpn on page 2283

Output Fields

Table 204 on page 2270 lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

Table 204: show route forwarding-table Output Fields

Field Name	Field Description	Level of Output
Logical system	Name of the logical system. This field is displayed if you specify the **table** ***logical-system-name/routing-instance-name*** option on a device that is configured for and supports logical systems.	All levels
Routing table	Name of the routing table (for example, inet, inet6, mpls).	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 204: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Enabled protocols	The features and protocols that have been enabled for a given routing table. This field can contain the following values: • BUM hashing—BUM hashing is enabled. • MAC Stats—Mac Statistics is enabled. • Bridging—Routing instance is a normal layer 2 bridge. • No VLAN—No VLANs are associated with the bridge domain. • All VLANs—The **vlan-id all** statement has been enabled for this bridge domain. • Single VLAN—Single VLAN ID is associated with the bridge domain. • MAC action drop—New MACs will be dropped when the MAC address limit is reached. • Dual VLAN—Dual VLAN tags are associated with the bridge domain • No local switching—No local switching is enabled for this routing instance.. • Learning disabled—Layer 2 learning is disabled for this routing instance. • MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached. • VPLS—The VPLS protocol is enabled. • No IRB l2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance. • ACKed by all peers—All peers have acknowledged this routing instance. • BUM Pruning—BUM pruning is enabled on the VPLS instance. • Def BD VXLAN—VXLAN is enabled for the default bridge domain. • EVPN—EVPN protocol is enabled for this routing instance. • Def BD OVSDB—Open vSwitch Database (OVSDB) is enabled on the default bridge domain. • Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain. • L2 backhaul—Layer 2 backhaul is enabled. • FRR optimize—Fast reroute optimization • MAC pinning—MAC pinning is enabled for this bridge domain. • MAC Aging Timer—The MAC table aging time is set per routing instance. • EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation. • PBBN—This routing instance is configured as a provider backbone bridged network. • PBN—This routing instance is configured as a provider bridge network. • ETREE—The ETREE protocol is enabled on this EVPN routing instance. • ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance. • Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain. • MPLS control word—Control word is enabled for this MPLS routing instance.	All levels
Address family	Address family (for example, **IP**, **IPv6**, **ISO**, **MPLS**, and **VPLS**).	All levels
Destination	Destination of the route.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 204: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Route Type (Type)	How the route was placed into the forwarding table. When the **detail** keyword is used, the route type might be abbreviated (as shown in parentheses): • **cloned** (**clon**)—(TCP or multicast only) Cloned route. • **destination** (**dest**)—Remote addresses directly reachable through an interface. • **destination down** (**iddn**)—Destination route for which the interface is unreachable. • **interface cloned** (**ifcl**)—Cloned route for which the interface is unreachable. • **route down** (**ifdn**)—Interface route for which the interface is unreachable. • **ignore** (**ignr**)—Ignore this route. • **interface** (**intf**)—Installed as a result of configuring an interface. • **permanent** (**perm**)—Routes installed by the kernel when the routing table is initialized. • **user**—Routes installed by the routing protocol process or as a result of the configuration.	All levels
Route Reference (RtRef)	Number of routes to reference.	**detail extensive**
Flags	Route type flags: • **none**—No flags are enabled. • **accounting**—Route has accounting enabled. • **cached**—Cache route. • **incoming-iface** ***interface-number***—Check against incoming interface. • **prefix load balance**—Load balancing is enabled for this prefix. • **rt nh decoupled**—Route has been decoupled from the next hop to the destination. • **sent to PFE**—Route has been sent to the Packet Forwarding Engine. • **static**—Static route.	**extensive**
Next hop	IP address of the next hop to the destination.	**detail extensive**

 Copyright © 2018, Juniper Networks, Inc.

Table 204: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Next hop Type (Type)	Next-hop type. When the **detail** keyword is used, the next-hop type might be abbreviated (as indicated in parentheses): • **broadcast (bcst)**—Broadcast. • **deny**—Deny. • **discard (dscd)** —Discard. • **hold**—Next hop is waiting to be resolved into a unicast or multicast type. • **indexed (idxd)**—Indexed next hop. • **indirect (indr)**—Indirect next hop. • **local (locl)**—Local address on an interface. • **routed multicast (mcrt)**—Regular multicast next hop. • **multicast (mcst)**—Wire multicast next hop (limited to the LAN). • **multicast discard (mdsc)**—Multicast discard. • **multicast group (mgrp)**—Multicast group member. • **receive (recv)**—Receive. • **reject (rjct)**—Discard. An ICMP unreachable message was sent. • **resolve (rslv)**—Resolving the next hop. • **unicast (ucst)**—Unicast. • **unilist (ulst)**—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.	**detail extensive**
Index	Software index of the next hop that is used to route the traffic for a given prefix.	**detail extensive** none
Route interface-index	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	**extensive**
Reference (NhRef)	Number of routes that refer to this next hop.	**detail extensive** none
Next-hop interface (Netif)	Interface used to reach the next hop.	**detail extensive** none
Weight	Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the **Balance** field description).	**extensive**
Balance	Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.	**extensive**
RPF interface	List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when **rpf-check** is configured on the interface.	**extensive**

show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```
so-1/1/0 {
    unit 0 {
        family inet {
            rpf-check;
            address 192.0.2.2/30;
        }
    }
}
```

```
user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
Destination:  192.0.2.3/32
```

```
  Route type: destination
  Route reference: 0                   Route interface-index: 67
  Flags: sent to PFE
  Nexthop: 192.0.2.3
  Next-hop type: broadcast             Index: 328      Reference: 1
  Next-hop interface: so-1/1/0.0
  RPF interface: so-1/1/0.0
```

show route forwarding-table (dynamic list next hop)

The **show route forwarding table** output shows the two next hop elements for a multihomed EVPN destination.

```
user@host> show route forwarding-table label 299952 extensive
MPLS:

Destination:  299952
  Route type: user
  Route reference: 0                   Route interface-index: 0
  Multicast RPF nh index: 0
  P2mpidx: 0
  Flags: sent to PFE, rt nh decoupled
  Next-hop type: indirect              Index: 1048575  Reference: 2
  Nexthop:
  Next-hop type: composite             Index: 601      Reference: 2
  Next-hop type: indirect              Index: 1048574  Reference: 3
  Nexthop: 1.0.0.4
  Next-hop type: Push 301632, Push 299776(top) Index: 600 Reference: 2
  Load Balance Label: None
  Next-hop interface: ge-0/0/1.0
  Next-hop type: indirect              Index: 1048577  Reference: 3
  Nexthop: 1.0.0.4
  Next-hop type: Push 301344, Push 299792(top) Index: 619 Reference: 2
  Load Balance Label: None
  Next-hop interface: ge-0/0/1.0
```

After one of the PE router has been disabled in the EVPN multihomed network, the same **show route forwarding table** output command shows one next hop element and one empty next hop element.

```
user@host> show route forwarding-table label 299952 extensive

show route forwarding-table interface-name

Syntax

show route forwarding-table interface-name *interface-name*
<detail | extensive>
<all>

Release Information

Command introduced in Junos OS Release 9.6.

Description

Display the interfaces in the Routing Engine's forwarding table.

Options

none—Display information for the specified interface.

detail | extensive—(Optional) Display the specified level of output.

all—(Optional) Display all interfaces in the routing table.

Required Privilege Level

view

List of Sample Output

show route forwarding-table interface-name fe-0/1/1 on page 2286
show route forwarding-table interface-name all on page 2286
show route forwarding-table interface-name all detail on page 2287

Output Fields

Table 205 on page 2285 lists the output fields for the **show route forwarding-table interface-name** command. Output fields are listed in the approximate order in which they appear.

Table 205: show route forwarding-table interface-name Output Fields

Field Name	Field Description	Level of Output
Name	Name of the interface (for example **fe-0/1/1**, **lo0**, **ae0**, and so on).	All levels
MTU	Interface’s maximum transmission unit (MTU).	All levels
Afam	Configured address family (for example **inet**, **tnp**, **inet6**, and so on).	**detail extensive**
Network	Network information: • **<Link>**—Physical interface, not a logical interface. • **<PtoP>**—Point-to-point network. • **ipaddress**—Network address.	All levels
Address	Address of the interface. The address can be a MAC address, IPv4 address, IPv6 address, and so on.	All levels
IPkts	Number of packets received on the interface.	All levels
Ierr	Number of packets received on the interface with errors.	All levels

Copyright © 2018, Juniper Networks, Inc.

Table 205: show route forwarding-table interface-name Output Fields (continued)

Field Name	Field Description	Level of Output
Opkts	Number of packets transmitted or sent from the interface.	All levels
Oerr	Number of packets transmitted or sent from the interface with errors.	All levels
Coll	Number of packets that experienced collisions on the interface.	All levels

Sample Output

show route forwarding-table interface-name fe-0/1/1

```
user@host> show route forwarding-table interface-name fe-0/1/1

show route hidden

Syntax

show route hidden
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display only hidden route information. A hidden route is unusable, even if it is the best path.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

Related Documentation

- *Understanding Hidden Routes*

List of Sample Output

show route hidden on page 2288
show route hidden detail on page 2289
show route hidden extensive on page 2289
show route hidden terse on page 2289

Output Fields

For information about output fields, see the output field table for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

Sample Output

show route hidden

```

show route inactive-path

List of Syntax

Syntax on page 2291
Syntax (EX Series Switches) on page 2291

Syntax

show route inactive-path
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route inactive-path
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display routes for destinations that have no active route. An inactive route is a route that was not selected as the best path.

Options

none—Display all inactive routes.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

show route instance

List of Syntax

Syntax on page 2297
Syntax (EX Series Switches and QFX Series) on page 2297

Syntax

show route instance
<brief | detail | summary>
<*instance-name*>
<logical-system (all | *logical-system-name*)>
<operational>

Syntax (EX Series Switches and QFX Series)

show route instance
<brief | detail | summary>
<*instance-name*>
<operational>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display routing instance information.

Options

none—(Same as **brief**) Display standard information about all routing instances.

brief | detail | summary—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**. (These options are not available with the **operational** keyword.)

instance-name—(Optional) Display information for all routing instances whose name begins with this string (for example, **cust1**, **cust11**, and **cust111** are all displayed when you run the **show route instance cust1** command).

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

operational—(Optional) Display operational routing instances.

Output Fields Table 206 on page 2298 lists the output fields for the **show route instance** command. Output fields are listed in the approximate order in which they appear.

Table 206: show route instance Output Fields

Field Name	Field Description	Level of Output
Instance or *instance-name*	Name of the routing instance.	All levels
Operational Routing Instances	(**operational** keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: **forwarding**, **l2vpn**, **no-forwarding**, **vpls**, **virtual-router**, or **vrf**.	All levels
State	State of the routing instance: **active** or **inactive**.	**brief detail** none
Interfaces	Name of interfaces belonging to this routing instance.	**brief detail** none
Restart State	Status of graceful restart for this instance: **Pending** or **Complete**.	**detail**
Path selection timeout	Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is **300**.	**detail**
Tables	Tables (and number of routes) associated with this routing instance.	**brief detail** none
Route-distinguisher	Unique route distinguisher associated with this routing instance.	**detail**
Vrf-import	VPN routing and forwarding instance import policy name.	**detail**
Vrf-export	VPN routing and forwarding instance export policy name.	**detail**
Vrf-import-target	VPN routing and forwarding instance import target community name.	**detail**
Vrf-export-target	VPN routing and forwarding instance export target community name.	**detail**
Vrf-edge-protection-id	Context identifier configured for edge-protection.	**detail**
Fast-reroute-priority	Fast reroute priority setting for a VPLS routing instance: **high**, **medium**, or **low**. The default is **low**.	**detail**
Restart State	Restart state: • **Pending:***protocol-name*—List of protocols that have not yet completed graceful restart for this routing table. • **Complete**—All protocols have restarted for this routing table.	**detail**

 Copyright © 2018, Juniper Networks, Inc.

Table 206: show route instance Output Fields (continued)

Field Name	Field Description	Level of Output
Primary rib	Primary table for this routing instance.	**brief** none **summary**
Active/holddown/hidden	Number of active, hold-down, and hidden routes.	All levels

Sample Output

show route instance

```

show route label

List of Syntax

Syntax on page 2305
Syntax (EX Series Switches) on page 2305

Syntax

show route label *label*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route label *label*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.

Description

Display the routes based on a specified Multiprotocol Label Switching (MPLS) label value.

Options

label—Value of the MPLS label.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show route label extensive

The output for the show route label extensive command is identical to that of the **show route label detail** command. For sample output, see show route label detail on page 2306.

show route label-switched-path

List of Syntax
Syntax on page 2310
Syntax (EX Series Switches) on page 2310

Syntax

show route label-switched-path *path-name*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route label-switched-path *path-name*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.5 for EX Series switches.

Description

Display the routes used in an MPLS label-switched path (LSP).

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output.

path-name—LSP tunnel name.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

show route localization

Syntax show route localization

Release Information Command introduced in Junos OS Release 11.4 for T-Series routers.
Command introduced in Junos OS Release 12.3 for MX Series routers.

Description (T320, T640, and T1600 routers only) Display route localization details.

Options **detail**—Display detailed output.

Required Privilege Level view

Related Documentation
- *Example: Configuring Packet Forwarding Engine FIB Localization*

Output Fields Table 207 on page 2312 lists the output fields for the **show route localization** command. Output fields are listed in the approximate order in which they appear.

Table 207: show route localization Output Fields

Field Name	Field Description
FIB-local	FPCs configured as FIB-local.
FIB-remote	FPCs configured as FIB-remote.
Normal	FPCs neither configured as **FIB-local** or **FIB-remote**.
Protocols	IPv4 (inet) or IPv6 (inet6) traffic configured for route localization.

Sample Output

```
user@R0> show route localization
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
  FIB-local:   FPC2(4,5)
  FIB-remote:  FPC0, FPC1
  Normal:      FPC3, FPC4, FPC5, FPC6, FPC7
```

```
user@R0> show route localization detail
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
  FIB-local:   FPC2(4,5)
  FIB-remote:  FPC0, FPC1
  Normal:      FPC3, FPC4, FPC5, FPC6, FPC7

  FPC6: 13
  FPC7: 15
```

show route martians

List of Syntax

Syntax on page 2314
Syntax (EX Series Switches) on page 2314

Syntax

show route martians
<logical-system (all | *logical-system-name*)>
<table *routing-table-name*>

Syntax (EX Series Switches)

show route martians
<table *routing-table-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the martian (invalid and ignored) entries associated with each routing table.

Options

none—Display standard information about route martians for all routing tables.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *routing-table-name*—(Optional) Display information about route martians for all routing tables whose name begins with this string (for example, **inet.0** and **inet6.0** are both displayed when you run the **show route martians table inet** command).

Syntax (EX Series Switches) on page 2324

Syntax

show route no-community
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route no-community
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the route entries in each routing table that are not associated with any community.

Options

none—(Same as **brief**) Display the route entries in each routing table that are not associated with any community.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show route no-community on page 2324
show route no-community detail on page 2325
show route no-community extensive on page 2325
show route no-community terse on page 2326

Output Fields

For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

show route output

List of Syntax

Syntax on page 2327
Syntax (EX Series Switches) on page 2327

Syntax

show route output (address *ip-address* | interface *interface-name*)
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route output (address *ip-address* | interface *interface-name*)
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the entries in the routing table learned through static routes and interior gateway protocols that are to be sent out the interface with either the specified IP address or specified name.

To view routes advertised to a neighbor or received from a neighbor for the BGP protocol, use the **show route advertising-protocol bgp** and **show route receive-protocol bgp** commands instead.

Options

address ***ip-address***—Display entries in the routing table that are to be sent out the interface with the specified IP address.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

interface ***interface-name***—Display entries in the routing table that are to be sent out the interface with the specified name.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

show route protocol

List of Syntax

Syntax on page 2332
Syntax (EX Series Switches) on page 2332

Syntax

show route protocol *protocol*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route protocol *protocol*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
ospf2 and **ospf3** options introduced in Junos OS Release 9.2.
ospf2 and **ospf3** options introduced in Junos OS Release 9.2 for EX Series switches.
flow option introduced in Junos OS Release 10.0.
flow option introduced in Junos OS Release 10.0 for EX Series switches.

Description

Display the route entries in the routing table that were learned from a particular protocol.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

protocol—Protocol from which the route was learned:

- **access**—Access route for use by DHCP application
- **access-internal**—Access-internal route for use by DHCP application
- **aggregate**—Locally generated aggregate route
- **arp**—Route learned through the Address Resolution Protocol
- **atmvpn**—Asynchronous Transfer Mode virtual private network
- **bgp**—Border Gateway Protocol
- **ccc**—Circuit cross-connect
- **direct**—Directly connected route
- **dvmrp**—Distance Vector Multicast Routing Protocol
- **esis**—End System-to-Intermediate System
- **flow**—Locally defined flow-specification route
- **frr**—Precomputed protection route or backup route used when a link goes down
- **isis**—Intermediate System-to-Intermediate System

Copyright © 2018, Juniper Networks, Inc.

- **ldp**—Label Distribution Protocol
- **l2circuit**—Layer 2 circuit
- **l2vpn**—Layer 2 virtual private network
- **local**—Local address
- **mpls**—Multiprotocol Label Switching
- **msdp**—Multicast Source Discovery Protocol
- **ospf**—Open Shortest Path First versions 2 and 3
- **ospf2**—Open Shortest Path First versions 2 only
- **ospf3**—Open Shortest Path First version 3 only
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation
- **rsvp**—Resource Reservation Protocol
- **rtarget**—Local route target virtual private network
- **static**—Statically defined route
- **tunnel**—Dynamic tunnel
- **vpn**—Virtual private network

NOTE: EX Series switches run a subset of these protocols. See the switch CLI for details.

show route range

List of Syntax

Syntax on page 2345
Syntax (EX Series Switches) on page 2345

Syntax

show route range
<brief | detail | extensive | terse>
<*destination-prefix*>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route range
<brief | detail | extensive | terse>
<*destination-prefix*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display routing table entries using a prefix range.

Options

none—Display standard information about all routing table entries using a prefix range.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

destination-prefix—Destination and prefix mask for the range.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show route range on page 2345
show route range destination-prefix on page 2346
show route range detail on page 2346
show route range extensive on page 2347
show route range terse on page 2348

Output Fields

For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

Sample Output

show route range

```
user@host> show route range

show route receive-protocol

List of Syntax

Syntax on page 2350
Syntax (EX Series Switches) on page 2350

Syntax

show route receive-protocol *protocol neighbor-address*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)

Syntax (EX Series Switches)

show route receive-protocol *protocol neighbor-address*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

protocol neighbor-address—Protocol transmitting the route (**bgp**, **dvmrp**, **msdp**, **pim**, **rip**, or **ripng**) and address of the neighboring router from which the route entry was received.

Additional Information

The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes.

Required Privilege Level

Output Fields Table 209 on page 2351 describes the output fields for the **show route receive-protocol** command. Output fields are listed in the approximate order in which they appear.

Table 209: show route receive-protocol Output Fields

Field Name	Field Description	Level of Output
routing-table-name	Name of the routing table—for example, inet.0.	All levels
number destinations	Number of destinations for which there are routes in the routing table.	All levels
number routes	Number of routes in the routing table and total number of routes in the following states: • **active** • **holddown** (routes that are in pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)	All levels
Prefix	Destination prefix.	none **brief**
MED	Multiple exit discriminator value included in the route.	none **brief**
destination-prefix (entry, announced)	Destination prefix. The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination.	**detail extensive**
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.	**detail extensive**
Accepted LongLivedStaleImport	The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag. Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table	**detail extensive**
ImportAccepted LongLivedStaleImport	Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.	**detail extensive**
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.	**detail extensive**
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 209: show route receive-protocol Output Fields (continued)

Field Name	Field Description	Level of Output
VPN Label	Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.	**detail extensive**
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	All levels
Localpref or Lclpref	Local preference value included in the route.	All levels
AS path	Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893. • **[ ]**—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.	All levels
Route Labels	Stack of labels carried in the BGP route update.	**detail extensive**
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.	**detail extensive**
Originator ID	(For route reflected output only) Address of routing device that originally sent the route to the route reflector.	**detail extensive**
Communities	Community path attribute for the route. See the Output Field table in the show route detail command for all possible values for this field.	**detail extensive**
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.	**detail extensive**
Attrset AS	Number, local preference, and path of the AS that originated the route. These values are stored in the **Attrset** attribute at the originating routing device.	**detail extensive**

Copyright © 2018, Juniper Networks, Inc.

Table 209: show route receive-protocol Output Fields (continued)

Field Name	Field Description	Level of Output
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).	**detail extensive**
control flags	Control flags: **none** or **Site Down**.	**detail extensive**
mtu	Maximum transmission unit (MTU) of the Layer 2 circuit.	**detail extensive**

show route resolution

List of Syntax

Syntax on page 2360
Syntax (EX Series Switches) on page 2360

Syntax

```
show route resolution
<brief | detail | extensive | summary>
<index index>
<logical-system (all | logical-system-name)>
<prefix>
<table routing-table-name>
<unresolved>
```

Syntax (EX Series Switches)

```
show route resolution
<brief | detail | extensive | summary>
<index index>
<prefix>
<table routing-table-name>
<unresolved>
```

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.

Options

none—Display standard information about all entries in the next-hop resolution database.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

index *index*—(Optional) Show the index of the resolution tree.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix* *network/destination-prefix—(Optional) Display database entries for the specified address.

table *routing-table-name*—(Optional) Display information about a particular routing table (for example, **inet.0**) where policy-based export is currently enabled.

unresolved—(Optional) Display routes that could not be resolved.

Required Privilege Level

List of Sample Output

Output Fields Table 210 on page 2362 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

Table 210: show route resolution Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.
Tree index	Tree index identifier.
Nodes	Number of nodes in the tree.
Reference count	Number of references made to the next hop.
Contributing routing tables	Routing tables used for next-hop resolution.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of **inet.0** resolving through **inet.0** and **inet.3**, this field indicates which routing table, **inet.0** or **inet.3**, provided the best path for a particular prefix.
Metric	Metric associated with the forwarding next hop.
Node path count	Number of nodes in the path.
Forwarding next hops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. Merged—Merged next hops when recursive resolution of multipath is configured.

show route snooping

Syntax

show route snooping
<brief | detail | extensive | terse>
<all>
<best *address/prefix*>
<exact *address*>
<logical-system *logical-system-name*>
<range *prefix-range*>
<summary>
<table *table-name*>

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the entries in the routing table that were learned from snooping.

Options

none—Display the entries in the routing table that were learned from snooping.

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

all—(Optional) Display all entries, including hidden entries.

best *address/prefix*—(Optional) Display the longest match for the provided address and optional prefix.

exact *address/prefix*—(Optional) Display exact matches for the provided address and optional prefix.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type ’all’.

range *prefix-range*—(Optional) Display information for the provided address range.

summary—(Optional) Display route snooping summary statisitics.

table *table-name*—(Optional) Display information for the named table.

Required Privilege Level

view

List of Sample Output

show route snooping detail on page 2366
show route snooping logical-system all on page 2366

Output Fields

For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

show route source-gateway

List of Syntax

Syntax on page 2368
Syntax (EX Series Switches) on page 2368

Syntax

show route source-gateway *address*
<brief | detail | extensive | terse>
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route source-gateway *address*
<brief | detail | extensive | terse>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display the entries in the routing table that were learned from a particular address. The **Source** field in the **show route detail** command output lists the source for each route, if known.

Options

brief | detail | extensive | terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

address—IP address of the system.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show route source-gateway on page 2368
show route source-gateway detail on page 2369
show route source-gateway extensive on page 2371

Output Fields

For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

Sample Output

show route source-gateway

```

Syntax (EX Series Switches)

show route summary

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display summary statistics about the entries in the routing table.

CPU utilization might increase while the device learns routes. We recommend that you use the **show route summary** command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the **show route summary** command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).

Options

none—Display summary statistics about the entries in the routing table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *routing-table-name*—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, **inet.0** and **inet6.0** are both displayed when you run the **show route summary table inet** command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.

Output Fields

Table 211 on page 2375 lists the output fields for the **show route summary** command. Output fields are listed in the approximate order in which they appear.

 Copyright © 2018, Juniper Networks, Inc.

Table 211: show route summary Output Fields

Field Name	Field Description
Router ID	Address of the local routing device.
routing-table-name	Name of the routing table (for example, **inet.0**).
destinations	Number of destinations for which there are routes in the routing table.
routes	Number of routes in the routing table: • **active**—Number of routes that are active. • **holddown**—Number of routes that are in the hold-down state before being declared inactive. • **hidden**—Number of routes that are not used because of routing policy.

Restart complete	All protocols have restarted for this routing table.
	Restart state:
	• **Pending:*protocol-name***—List of protocols that have not yet completed graceful restart for this routing table.
	• **Complete**—All protocols have restarted for this routing table.
	For example, if the output shows-
	• `LDP.inet.0: 5 routes (4 active, 1 holddown, 0 hidden)`
	`    Restart Pending: OSPF LDP VPN`
	This indicates that **OSPF**, **LDP**, and **VPN** protocols did not restart for **LDP.inet.0** routing table.
	• `vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)`
	`Restart Complete`
	This indicates that all protocols have restarted for **vpls_1.l2vpn.0** routing table.

Limit/Threshold	Displays the configured route limits for the routing table set with the ***maximum-prefixes*** and the **maximum-paths** statements. If you do not configure route limits for the routing table, the show output does not display this information. • **destinations**—The first number represents the maximum number of route prefixes installed in the routing table. The second number represents the number of route prefixes that trigger a warning message. • **routes**—The first number represents the maximum number of routes. The second number represents the number of routes that trigger a warning message.
Direct	Routes on the directly connected network.
Local	Local routes.
protocol-name	Name of the protocol from which the route was learned. For example, **OSPF**, **RSVP**, and **Static**.

Sample Output

show route summary

```
user@host> show route summary
Autonomous system number: 69
Router ID: 10.255.71.52
Maximum-ECMP: 32
inet.0: 24 destinations, 25 routes (23 active, 0 holddown, 1 hidden)
Restart Complete
              Direct:      6 routes,      5 active
               Local:      4 routes,      4 active
                OSPF:      5 routes,      4 active
              Static:      7 routes,      7 active
                IGMP:      1 routes,      1 active
                 PIM:      2 routes,      2 active

inet.3: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
Restart Complete
                RSVP:      2 routes,      2 active

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
Restart Complete
              Direct:      1 routes,      1 active

mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
                MPLS:      3 routes,      3 active
                VPLS:      4 routes,      2 active

inet6.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
Restart Complete
              Direct:      2 routes,      2 active
                 PIM:      2 routes,      2 active
                 MLD:      1 routes,      1 active

green.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
                 BGP:      2 routes,      2 active
               L2VPN:      2 routes,      2 active

red.l2vpn.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
Restart Complete
                 BGP:      2 routes,      2 active
               L2VPN:      1 routes,      1 active

bgp.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
                 BGP:      4 routes,      4 active
```

show route summary table

```
user@host> show route summary table inet
Router ID: 192.168.0.1

inet.0: 32 destinations, 34 routes (31 active, 0 holddown, 1 hidden)
              Direct:      6 routes,      5 active
               Local:      9 routes,      9 active
                OSPF:      3 routes,      1 active
              Static:     13 routes,     13 active
```

 Copyright © 2018, Juniper Networks, Inc.

```
                IGMP:      1 routes,      1 active
                 PIM:      2 routes,      2 active

inet.1: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
           Multicast:      1 routes,      1 active

inet6.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
               Local:      1 routes,      1 active
                 PIM:      2 routes,      2 active

inet6.1: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
           Multicast:      1 routes,      1 active
```

show route summary table (with Route Limits Configured for the Routing Table)

```
user@host> show route summary table VPN-A.inet.0
Autonomous system number: 100
Router ID: 10.255.182.142

VPN-A.inet.0: 13 destinations, 14 routes (13 active, 0 holddown, 0 hidden)
Limit/Threshold: 2000/200 destinations 20/12 routes
              Direct:      2 routes,      2 active
               Local:      1 routes,      1 active
                OSPF:      4 routes,      3 active
                 BGP:      4 routes,      4 active
                IGMP:      1 routes,      1 active
                 PIM:      2 routes,      2 active
```

Output Fields Table 193 on page 2170 describes the output fields for the **show route table** command. Output fields are listed in the approximate order in which they appear.

Table 212: show route table Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, inet.0).

Restart complete	All protocols have restarted for this routing table.
	
	Restart state:
	
	• **Pending:***protocol-name*—List of protocols that have not yet completed graceful restart for this routing table.
	• **Complete**—All protocols have restarted for this routing table.
	
	For example, if the output shows-
	
	• `LDP.inet.0             : 5 routes (4 active, 1 holddown, 0 hidden)`
	`    Restart Pending: OSPF LDP VPN`
	
	This indicates that **OSPF**, **LDP**, and **VPN** protocols did not restart for the **LDP.inet.0** routing table.
	• `vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)`
	`Restart Complete`
	
	This indicates that all protocols have restarted for the **vpls_1.l2vpn.0** routing table.

number destinations	Number of destinations for which there are routes in the routing table.

Copyright © 2018, Juniper Networks, Inc.

Table 212: show route table Output Fields (continued)

Field Name	Field Description
number routes	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active) • **holddown** (routes that are in the pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)

route-destination (entry, announced)	Route destination (for example:10.0.0.1/24). The **entry** value is the number of routes for this destination, and the **announced** value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:
	• ***MPLS-label*** (for example, 80001).
	• ***interface-name*** (for example, ge-1/0/2).
	• ***neighbor-address*:*control-word-status*:*encapsulation type*:*vc-id*:*source*** (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96).
	  ◦ ***neighbor-address***—Address of the neighbor.
	  ◦ ***control-word-status***—Whether the use of the control word has been negotiated for this virtual circuit: **NoCtrlWord** or **CtrlWord**.
	  ◦ ***encapsulation type***—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.
	  ◦ ***vc-id***—Virtual circuit identifier.
	  ◦ ***source***—Source of the advertisement: **Local** or **Remote**.
	• ***inclusive multicast Ethernet tag route***—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384):
	  ◦ *route distinguisher*—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.
	  ◦ *Ethernet tag ID*—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.
	  ◦ *IP address length*—(1 octet) Length of IP address in bits.
	  ◦ *originating router's IP address*—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.

label stacking	(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels. • **S=0 route** indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed). • If there is no **S=** information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).

 Copyright © 2018, Juniper Networks, Inc.

Table 212: show route table Output Fields (continued)

Field Name	Field Description
[*protocol*, *preference*]	Protocol from which the route was learned and the preference value for the route. • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop. For a description of possible values for this field, see Table 197 on page 2226.
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word **Selected**. This field can also contain the following information: • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.
Label-switched-path *lsp-path-name*	Name of the LSP used to reach the next hop.

Copyright © 2018, Juniper Networks, Inc.

Table 212: show route table Output Fields (continued)

Field Name	Field Description
Label operation	MPLS label and operation occurring at this routing device. The operation can be **pop** (where a label is removed from the top of the stack), **push** (where another label is added to the label stack), or **swap** (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See Table 198 on page 2228.
Local AS	AS number of the local routing devices.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric*n*	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.
Task	Name of the protocol that has added the route.
Announcement bits	The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, ***n*-Resolve inet** indicates that the specified route is used for route resolution for next hops found in the routing table. • *n*—An index used by Juniper Networks customer support only.

 Copyright © 2018, Juniper Networks, Inc.

Table 212: show route table Output Fields (continued)

Field Name	Field Description
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **Recorded**—The AS path is recorded by the sample process (sampled). • **?**—Incomplete; typically, the AS path was aggregated. When AS path numbers are included in the route, the format is as follows: • **[ ]**—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. • **[ ]**—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • **{ }**—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • **( )**—Parentheses enclose a confederation. • **([ ])**—Parentheses and brackets enclose a confederation set. NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.
validation-state	(BGP-learned routes) Validation status of the route: • **Invalid**—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • **Unknown**—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • **Unverified**—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers. • **Valid**—Indicates that the prefix and autonomous system pair are found in the database.
FECs bound to route	Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.

Copyright © 2018, Juniper Networks, Inc.

Table 212: show route table Output Fields (continued)

Field Name	Field Description
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See Table 199 on page 2230 for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: **none** or **Site Down**.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.
Accepted LongLivedStaleImport	The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag. Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table
ImportAccepted LongLivedStaleImport	Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.

 Copyright © 2018, Juniper Networks, Inc.

Table 212: show route table Output Fields (continued)

Field Name	Field Description
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

Table 197 on page 2226 describes all possible values for the Next-hop Types output field.

Table 213: Next-hop Types Output Field Values

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.
Deny	Deny next hop.
Discard	Discard next hop.
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.
Reject (rjct)	Discard. An ICMP unreachable message was sent.

Copyright © 2018, Juniper Networks, Inc.

Table 213: Next-hop Types Output Field Values (continued)

Next-Hop Type	Description
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrt)	Regular multicast next hop.
Router	A specific node or set of nodes to which the routing device forwards packets that match the route prefix. To qualify as a next-hop type router, the route must meet the following criteria: • Must not be a direct or local subnet for the routing device. • Must have a next hop that is directly connected to the routing device.
Table	Routing table next hop.
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

Table 198 on page 2228 describes all possible values for the State output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

Table 214: State Output Field Values

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.

Copyright © 2018, Juniper Networks, Inc.

Table 214: State Output Field Values (continued)

Value	Description
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGP path is available.
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.

Copyright © 2018, Juniper Networks, Inc.

Table 214: State Output Field Values (continued)

Value	Description
Pending	Route pending because of a hold-down configured on another route.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available.
Router ID	Path through a neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: • The route is damped. • The route is rejected by an import policy. • The route is unresolved.
Update source	Last tiebreaker is the lowest IP address value.

Table 199 on page 2230 describes the possible values for the Communities output field.

Table 215: Communities Output Field Values

Value	Description
area-number	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is **0**. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
bandwidth: ***local AS number:link-bandwidth-number***	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
domain-id	Unique configurable number that identifies the OSPF domain.
domain-id-vendor	Unique configurable number that further identifies the OSPF domain.
link-bandwidth-number	Link-bandwidth number: from **0** through **4,294,967,295** (bytes per second).
local AS number	Local AS number: from **1** through **65,535**.

Copyright © 2018, Juniper Networks, Inc.

Table 215: Communities Output Field Values (continued)

Value	Description
options	1 byte. Currently this is only used if the route type is **5** or **7**. Setting the least significant bit in the field indicates that the route carries a type 2 metric.
origin	(Used with VPNs) Identifies where the route came from.
ospf-route-type	1 byte, encoded as **1** or **2** for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); **3** for summary routes; **5** for external routes (area number must be**0**); **7** for NSSA routes; or **129** for sham link endpoint addresses.
route-type-vendor	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute **0x8000**. The format is ***area-number:ospf-route-type:options***.
rte-type	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute **0x0306**. The format is ***area-number:ospf-route-type:options***.
target	Defines which VPN the route participates in; **target** has the format ***32-bit IP address:16-bit number***. For example, 10.19.0.0:100.
unknown IANA	Incoming IANA codes with a value between **0x1** and **0x7fff**. This code of the BGP extended community attribute is accepted, but it is not recognized.
unknown OSPF vendor community	Incoming IANA codes with a value above **0x8000**. This code of the BGP extended community attribute is accepted, but it is not recognized.

show route terse

List of Syntax

Syntax on page 2416
Syntax (EX Series Switches) on page 2416

Syntax

show route terse
<logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches)

show route terse

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.

Description

Display a high-level summary of the routes in the routing table.

NOTE: For BGP routes, the **show route terse** command displays the local preference attribute and MED instead of the metric1 and metric2 values. This is mostly due to historical reasons.

To display the metric1 and metric2 value of a BGP route, use the **show route extensive** command.

Options

none—Display a high-level summary of the routes in the routing table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show route terse on page 2418

Output Fields

Table 216 on page 2416 describes the output fields for the **show route terse** command. Output fields are listed in the approximate order in which they appear.

Table 216: show route terse Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table (for example, inet.0).
number destinations	Number of destinations for which there are routes in the routing table.

 Copyright © 2018, Juniper Networks, Inc.

Table 216: show route terse Output Fields (continued)

Field Name	Field Description
number routes	Number of routes in the routing table and total number of routes in the following states: • **active** (routes that are active) • **holddown** (routes that are in the pending state before being declared inactive) • **hidden** (routes that are not used because of a routing policy)
route key	Key for the state of the route: • **+**—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • **-** —A hyphen indicates the last active route. • *****—An asterisk indicates that the route is both the active and the last active route. An asterisk before a **to** line indicates the best subpath to the route.
A	Active route. An asterisk (*) indicates this is the active route.
V	Validation status of the route: • **?**—Not evaluated. Indicates that the route was not learned through BGP. • **I**—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • **N**—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database. • **V**—Valid. Indicates that the prefix and autonomous system pair are found in the database.
Destination	Destination of the route.
P	Protocol through which the route was learned: • **A**—Aggregate • **B**—BGP • **C**—CCC • **D**—Direct • **G**—GMPLS • **I**—IS-IS • **L**—L2CKT, L2VPN, LDP, Local • **K**—Kernel • **M**—MPLS, MSDP • **O**—OSPF • **P**—PIM • **R**—RIP, RIPng • **S**—Static • **T**—Tunnel
Prf	Preference value of the route. In every routing metric except for the BGP **LocalPref** attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the **LocalPref** value in the **Preference2** field. For example, if the **LocalPref** value for Route 1 is 100, the **Preference2** value is -101. If the **LocalPref** value for Route 2 is 155, the **Preference2** value is -156. Route 2 is preferred because it has a higher **LocalPref** value and a lower **Preference2** value.

Copyright © 2018, Juniper Networks, Inc.

Table 216: show route terse Output Fields (continued)

Field Name	Field Description
Metric 1	First metric value in the route. For routes learned from BGP, this is the MED metric.
Metric 2	Second metric value in the route. For routes learned from BGP, this is the IGP metric.
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: • **I**—IGP. • **E**—EGP. • **?**—Incomplete; typically, the AS path was aggregated.

Sample Output

show route terse

```
user@host> show route terse

clear rip statistics
<instance (all | *instance-name*)>
<*neighbor*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Clear RIP statistics.

Options

none—Reset RIP counters for all neighbors for all routing instances.

instance (all | *instance-name*)—(Optional) Clear RIP statistics for all instances or for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear RIP statistics for the specified neighbor only.

peer (all | *address*)—(Optional) Clear RIP statistics for a single peer or all peers.

Required Privilege Level

clear

Syntax

show rip neighbor
<instance (all | *instance-name*)>
<logical-system (all | *logical-system-name*)>
<*name*>

Syntax (EX Series Switches and QFX Series)

show rip neighbor
<instance (all | *instance-name*)>
<*name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

Display information about RIP neighbors.

Options

none—Display information about all RIP neighbors for all instances.

instance (all | *instance-name*)—(Optional) Display RIP neighbor information for all instances or for only the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

name—(Optional) Display detailed information about only the specified RIP neighbor.

Required Privilege Level

show rip neighbor on page 2426
show rip neighbor (With Demand Circuits Configured) on page 2426

Output Fields

Table 218 on page 2426 lists the output fields for the **show rip neighbor** command. Output fields are listed in the approximate order in which they appear.

Copyright © 2018, Juniper Networks, Inc.

Table 218: show rip neighbor Output Fields

Field Name	Field Description
Neighbor	Name of the RIP neighbor. NOTE: Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits. If you configure demand circuits at the **[edit protocols rip group *group-name* neighbor *neighbor-name*]** hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the **[edit protocols rip group *group-name*]** hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.
State	State of the connection: **Up** or **Dn** (Down).
Source Address	Address of the port on the local router.
Destination Address	Address of the port on the remote router.
Send Mode	Send options: **broadcast**, **multicast**, **none**, or **version 1**.
Receive Mode	Type of packets to accept: **both**, **none**, **version 1**, or **version 2**.
In Met	Metric added to incoming routes when advertising into RIP routes that were learned from other protocols.

Sample Output

show rip neighbor

```
user@host> show rip neighbor
                  Local  Source          Destination     Send   Receive  In
Neighbor          State  Address         Address         Mode   Mode     Met
--------          -----  -------         -----------     ----   -------  ---
ge-2/3/0.0           Up  192.168.9.105   192.168.9.107   bcast  both       1
at-5/1/1.42          Dn  (null)          (null)          mcast  v2 only    3
at-5/1/0.42          Dn  (null)          (null)          mcast  both       3
at-5/1/0.0           Up  198.51.100.0    224.0.0.9       mcast  both       3

Output Fields

Table 219 on page 2428 lists the output fields for the **show rip statistics** command. Output fields are listed in the approximate order in which they appear.

Table 219: show rip statistics Output Fields

Field Name	Field Description
RIP info	Information about RIP on the specified interface: • **port**—UDP port number used for RIP. • **update interval**—Interval between routing table updates, in seconds. • **holddown**—Hold-down interval, in seconds. • **timeout**—Timeout interval, in seconds. • **restart in progress**—Graceful restart status. Displayed when RIP is or has been in the process of graceful restart. • **restart time**—Estimated time for the graceful restart to finish, in seconds. • **restart will complete in**—Remaining time for the graceful restart to finish, in seconds. • **rts learned**—Number of routes learned through RIP. • **rts held down**—Number of routes held down by RIP. • **rqsts dropped**—Number of received request packets that were dropped. • **resps dropped**—Number of received response packets that were dropped.
logical-interface	Name of the logical interface and its statistics: • **routes learned**—Number of routes learned on the logical interface. • **routes advertised**—Number of routes advertised by the logical interface.
Counter	List of counter types: • **Updates Sent**—Number of update messages sent. • **Triggered Updates Sent**—Number of triggered update messages sent. • **Responses Sent**—Number of response messages sent. • **Bad Messages**—Number of invalid messages received. • **RIPv1 Updates Received**—Number of RIPv1 update messages received. • **RIPv1 Bad Route Entries**—Number of RIPv1 invalid route entry messages received. • **RIPv1 Updates Ignored**—Number of RIPv1 update messages ignored. • **RIPv2 Updates Received**—Number of RIPv2 update messages received. • **RIPv2 Bad Route Entries**—Number of RIPv2 invalid route entry messages received. • **RIPv2 Updates Ignored**—Number of RIPv2 update messages that were ignored. • **Authentication Failures**—Number of received update messages that failed authentication. • **RIP Requests Received**—Number of RIP request messages received. • **RIP Requests Ignored**—Number of RIP request messages ignored.
Total	Total number of packets for the selected counter.
Last 5 min	Number of packets for the selected counter in the most recent 5-minute period.
Last minute	Number of packets for the selected counter in the most recent 1-minute period.

CHAPTER 28

Firewall Filter Operational Commands

Copyright © 2018, Juniper Networks, Inc.

clear firewall

List of Syntax

Syntax on page 2442
Syntax (EX Series Switches) on page 2442

Syntax

clear firewall (all | counter *counter-name* | filter *filter-name* | log (all | *logical-system-name*) | logical-system *logical-system-name*)

Syntax (EX Series Switches)

clear firewall (all | counter *counter-name* | filter *filter-name* | log (all | *logical-system-name*) | policer counter (all | counter-id *counter-index*))

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
logical-system option introduced in Junos OS Release 9.3.
log option introduced before Junos OS Release 11.4.

Description

Clear statistics about configured firewall filters.

When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.

Subscriber management uses firewall filters to capture and report the volume-based service accounting counters that are used for subscriber billing. The **clear firewall** command also clears the service accounting counters that are reported to the RADIUS accounting server. For this reason, you must be cautious in specifying which firewall statistics you want to clear.

NOTE: The clear firewall command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).

If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the **prefix-action** action on matched packets, wait at least 5 seconds before you enter the **show firewall prefix-action-stats** command. A 5-second pause between issuing the **clear firewall** and **show firewall prefix-action-stats** commands avoids a possible timeout of the **show firewall prefix-action-stats** command.

Options

all—Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.

counter *counter-name*—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.

filter *filter-name*—Clear the packet and byte counts for the specified firewall filter.

 Copyright © 2018, Juniper Networks, Inc.

log (all | *logical-system-name*)—Clear log entries for IPv4 firewall filters that have **then log** as an action. Use **log all** to clear all log entries or **log *logical-system-name*** to clear log entries for the specified logical system.

logical-system *logical-system-name*—Clear the packet and byte counts for the specified logical system.

policer counter (all | counter-id *counter-index*)—(EX8200 switches only) Clear all policer counters using the **policer counter all** command, or clear a specific policer counter using the **policer counter counter-id *counter-index*** command. The value of *counter-index* can be 0, 1, or 2.

Required Privilege Level clear

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Option **logical-system** introduced in Junos OS Release 9.3.
Option **terse** introduced in Junos OS Release 9.4.
Option **policer counters** introduced in Junos OS Release 12.2 for EX Series switches.
Option **detail** introduced in Junos OS Release 12.3 for EX Series switches.
Option **detail** introduced in Junos OS Release 14.1 for MX Series routers.
Option **regex *regular-expression*** introduced in Junos OS Release 14.2.

Description

Display enhanced statistics and counters for all configured firewall filters.

Options

none—(Optional) Display statistics and counters for all configured firewall filters and counters. For EX Series switches, this command also displays statistics about all configured policers.

application (CFM | eswd | RMPS)—(Optional) Show firewall elements owned by the selected software component:

- Connectivity Fault Management (CFM)
- Ethernet switching daemon (eswd)—Shows only on devices that support it.
- Resource Management and Packet Steering (RMPS)

counter *counter-name*—(Optional) Name of a filter counter.

Copyright © 2018, Juniper Networks, Inc.

detail—(EX Series switches and MX Series routers only) (Optional) Display firewall filter statistics and enhanced policer statistics and counters.

filter *filter-name*—(Optional) Name of a configured filter.

filter regex *regular-expression*—(Optional) Regular expression that matches the names of a subset of filters.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

log—(Optional) Display log entries for firewall filters.

log <(detail | interface *interface-name*)>—(EX Series switches only) (Optional) Display detailed log entries of firewall activity or log information about a specific interface.

policer counters <(detail | counter-id *counter-index* <detail>)>—(EX8200 switches only) (Optional) Display enhanced policer counter statistics in brief or in detail.

terse—(Optional) Display firewall filter names only.

Output Fields Table 223 on page 2446 lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

Table 223: show firewall Output Fields

Field Name	Field Description
Filter	Name of a filter that has been configured with the **filter** statement at the **[edit firewall]** hierarchy level. Except on EX Series switches: • When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either **-i** for an input filter or **-o** for an output filter. • When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either **-in** for an input filter or **-out** for an output filter. When a logical system–specific filter is displayed, the name of the filter is prefixed with two underscore (__) characters and the name of the logical system (for example, **__ls1/filter1**). • When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (:). NOTE: For **bridge family filter**, the **ip-protocol** match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset, such as the MX 3D MPC line cards.
Counters	Display filter counter information: • **Name**—Name of a filter counter that has been configured with the **counter** firewall filter action. • **Bytes**—Number of bytes that match the filter term under which the **counter** action is specified. • **Packets**—Number of packets that matched the filter term under which the **counter** action is specified. NOTE: On M and T Series routers, firewall filters cannot count **ip-options** packets on a per option type and per interface basis. A limited work around is to use the **show pfe statistics ip options** command to see **ip-options** statistics on a per Packet Forwarding Engine (PFE) basis. See *show pfe statistics ip* for sample output.
Policers	Display policer information: • **Name**—Name of policer. • **Bytes**—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on interfaces hosted on MICs and MPCs in MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer. For other combinations of policer type, device, and line card type, this field is blank. • **Packets**—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.
Policer Counter Index	(EX8200 switch only) Global management counter ID. The counter ID value (*counter-index*) can be 0, 1, or 2.
Green	(EX8200 switch only) Number of packets within the limits. The number of packets is smaller than the committed information rate (CIR).
Yellow	(EX8200 switch only) Number of packets partially within the limits. The number of packets is greater than the CIR, but the burst size is within the excess burst size (EBS) limit.

Copyright © 2018, Juniper Networks, Inc.

Table 223: show firewall Output Fields (continued)

Field Name	Field Description
Discard	(EX8200 switch only) Number of discarded packets.
Bytes	(EX8200 switch only) Number of green, yellow, red, or discarded packets in bytes.
Packets	(EX8200 switch only) Number of green, yellow, red, or discarded packets.
Filter name	(EX8200 switch only) Name of the filter with a term associated to a policer.
Term name	(EX8200 switch only) Name of the term associated with a policer.
Policer name	(EX8200 switch only) Name of the policer that is associated with a global management counter.
P1-t1	• OOS packet statistics for packets that are marked out-of-specification (out-of-spec) by the policer. Changes to all packets that have out-of-spec actions, such as discard, color marking, or forwarding-class, are included in this counter. • Offered packet statistics for traffic subjected to policing. • Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the in-spec statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.

Sample Output

show firewall filter (MX Series Router and EX Series Switch)

```
user@host> show firewall filter test
Filter: test
Counters:
Name                                Bytes                 Packets
Counter-1                               0                       0
Counter-2                               0                       0
Policers:
Name                                Bytes                 Packets
Policer-1                            2770                      70
```

show firewall filter (non MX Series Router and EX Series Switch)

show firewall filter version

Syntax

show firewall filter version <*filter-name*>

Release Information

Command introduced in Junos OS Release 10.2R2.

Description

Display the version number of the installed firewall filter in the Routing Engine.

Options

none—(Optional) Display the version number of all installed firewall filters.

filter-name—(Optional) Name of a configured filter. If you specify the name of a filter, only the version number of that filter is displayed.

Additional Information

The initial version number is 1. This number increments by one when you modify the firewall filter settings or an associated prefix action. The maximum version number is 4,294,967,295. When the version number reaches 4,294,967,295, this number is reset to 1.

show firewall log

List of Syntax

Syntax on page 2453
Syntax (EX Series Switches) on page 2453

Syntax

show firewall log
<detail>
<extensive>
<interface *interface-name*>
<logical-system (*logical-system-name* | all)>

Syntax (EX Series Switches)

show firewall log
<detail>
<interface *interface-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
extensive option introduced in Junos OS Release 16.1.
logical-system option introduced in Junos OS Release 9.3.

Description

Display log information about firewall filters.

Options

none—Display log information about firewall filters.

detail—(Optional) Display detailed information.

extensive—(Optional) Display hex dump of packet captured by log action.

interface *interface-name*—(Optional) Display log information about a specific interface.

logical-system (*logical-system-name* | all)—(Optional) Perform this operation on all logical systems or on a particular system.

show firewall log detail on page 2454
show firewall log extensive on page 2455

Output Fields

Table 225 on page 2453 lists the output fields for the **show firewall log** command. Output fields are listed in the approximate order in which they appear.

Table 225: show firewall log Output Fields

Field Name	Field Description
Time of Log	Time that the event occurred.

Copyright © 2018, Juniper Networks, Inc.

Table 225: show firewall log Output Fields (continued)

Field Name	Field Description
Filter	• Displays the name of a configured firewall filter or service filter only if the packet hit the filter's **log** action in a kernel filter (in the control plane). For any traffic that reaches the Routing Engine, the packets hit the **log** action in the kernel. • For all other logged packets (packet hit the filter's **log** action in the Packet Forwarding Engine), this field displays **pfe** instead of a configured filter name.
Filter Action	Filter action: • **A**—Accept • **D**—Discard • **R**—Reject
Name of Interface	• Displays a physical interface name if the packet arrived at a port on a line card. • Displays **local** if the packet was generated by the device's internal Ethernet interface, **em1** or **fxp1**, which connects the Routing Engine with the router's packet-forwarding components.
Name of protocol	Packet's protocol name: **egp**, **gre**, **icmp**, **ipip**, **ospf**, **pim**, **rsvp**, **tcp**, or **udp**.
Packet length	Length of the packet.
Source address	Packet's source address.
Destination address	Packet's destination address and port.

Sample Output

show firewall log

```
user@host>show firewall log

show firewall prefix-action-stats filter *filter-name* prefix-action *prefix-action-name*
<from *number* to *number*>
<logical-system (*logical-system-name* | all)>

Syntax (term-specific mode)

show firewall prefix-action-stats filter *filter-name* prefix-action *prefix-action-name-term-name*
<from *number* to *number*>
<logical-system (*logical-system-name* | all)>

Release Information

Command introduced before Junos OS Release 7.4.
logical-system option introduced in Junos OS Release 9.3.

Description

Display prefix action statistics about configured firewall filters.

If you clear statistics for firewall filters that are applied to MPCs and that also use the **prefix-action** action on matched packets, wait at least 5 seconds before you enter the **show firewall prefix-action-stats** command. A 5-second pause between issuing the **clear firewall** and **show firewall prefix-action-stats** commands avoids a possible timeout of the **show firewall prefix-action-stats** command.

By default, policers operate in *term-specific* mode.

See *Filter-Specific Policer Overview* for information about how to configure policers in *filter-specific* mode.

Options

filter *filter-name*—Name of a filter.

prefix-action *prefix-action-name*—Name of a prefix action.

from *number* to *number*—(Optional) Starting and ending counter or policer.

logical-system (*logical-system-name* | all)—(Optional) Perform this operation on all logical systems or on a particular system.

show policer

Syntax

show policer
<detail>
<*policer-name*>

Release Information

Command introduced before Junos OS Release 7.4.
Option **detail** introduced in Junos OS Release 12.3.

Description

Display the number of policed packets for a given policer or an aggregate policer. An aggregate policer is an aggregate of different policers on the same logical interface.

Options

none—Display the number of policed packets for all configured policers.

detail—(Optional) Display enhanced statistics and counters for policers.

policer-name—(Optional) Display the number of policed packets for the specified policer.

Required Privilege Level

view

List of Sample Output

show policer (MX Series) on page 2461
show policer (non MX Series Router) on page 2461
show policer (Aggregate Policer, non MX Series Router) on page 2461
show policer detail on page 2462

Output Fields

Table 228 on page 2460 lists the output fields for the **show policer** command. Output fields are listed in the approximate order in which they appear.

Table 228: show policer Output Fields

Field Name	Field Description
Name	Name of the policer.
Bytes	• (For two-color policers on MX Series routers, and for hierarchical policers on MS-DPC, MIC, and MPC interfaces on MX Series routers)—Total number of bytes policed by the specified policer. For other combinations of policer type, device, and line card type, this field is blank. • (T Series and M10i)—Not applicable. The Bytes information is not displayed.
Packets	Total number of packets policed by the specified policer.

Copyright © 2018, Juniper Networks, Inc.

Table 228: show policer Output Fields (continued)

Field Name	Field Description
Policer detail	• OOS packet statistics for packets that are marked out-of-specification by the policer. Changes to all packets that have out-of-specification actions, such as discard, color marking, or forwarding-class, are included in this counter. • Offered packet statistics for traffic subjected to policing. • Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the within-specification statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.

CHAPTER 29

Layer 2 Bridging and Switching Operational Commands

Copyright © 2018, Juniper Networks, Inc.

clear bridge mac-table

Syntax

clear bridge mac-table
<bridge-domain (all | *bridge-domain-name*)>
<instance *instance-name*>
<interface *interface-name*>
<learning-vlan id (all-vlan | *learning-vlan-id*)>
<*mac-address*>

Release Information

Command introduced in Junos OS Release 8.4.

Description

(MX Series routers only) Clear learned Layer 2 address information from the media access control (MAC) address table.

Options

none—Clear all learned Layer 2 address information from the MAC address table.

bridge-domain (all | *bridge-domain-name*)—(Optional) Clear learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.

instance *instance-name*—(Optional) Clear learned Layer 2 MAC addresses for the specified routing instance.

interface *interface-name*—(Optional) Clear learned Layer 2 MAC addresses for the specified interface.

learning-vlan-id (all-vlan | *learning-vlan-id*)—(Optional) Clears learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.

mac-address—(Optional) Clear the specified learned Layer 2 address from the MAC address table.

Required Privilege Level

clear

List of Sample Output
clear error bpdu interface on page 2465

Output Fields
When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear error bpdu interface

```
user@host> clear error bpdu interface ge-1/1/1
```

clear error mac-rewrite

Syntax

clear error mac-rewrite
<interface *interface-name*>

Release Information

Command introduced in Junos OS Release 9.1.

Description

Clear a MAC rewrite error condition caused by the reception of tunneled protocol packets on an interface with Layer 2 protocol tunneling enabled.

On interfaces with L2PT configured, customer-facing ports should not receive packets with the L2PT MAC address as the destination address unless there is a network tolopogy or configuration error. Any such interface receiving an L2PT packet becomes “Disabled”, and must subsequently be re-enabled by clearing the error with this command.

Options

interface *interface-name*—(Optional) Clear the MAC rewrite error condition for the specified interface.

Required Privilege Level

clear

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear error mac-rewrite interface

```
user@host> clear error mac-rewrite interface ge-1/0/1
```

show bridge domain

Syntax

show bridge domain
<brief | detail | extensive>
<bridge-domain (all | *domain-name*)>
<instance *instance-name*>
<operational>

Release Information

Command introduced in Junos OS Release 8.4.

Description

(MX Series routers only) Display bridge domain information.

Options

none—Display information for all bridge domains.

brief | detail | extensive—(Optional) Display the specified level of output.

bridge-domain (all | *domain-name*)— (Optional) Display information about all bridge domains or the specified bridge domain.

instance *instance-name*—(Optional) Display information for the specified routing instance.

operational—(Optional) Display information for the operational routing instances.

show bridge flood

Syntax

show bridge flood
<brief | detail | extensive>
<bridge-domain *domain-name*>
<event-queue>
<instance *instance-name*>
<route (all-ce-flood | all ve-flood | alt-root-flood | bd-flood | mlp-flood | re-flood)>

Release Information

Command introduced in Junos OS Release 8.4.

Description

(MX Series routers only) Display bridging flooding information.

Options

none—Display all bridging flooding information for all bridging domains.

brief | detail | extensive—(Optional) Display the specified level of output.

bridge-domain *domain-name*—(Optional) Display bridging flooding information for the specified bridge domain.

event-queue—(Optional) Display the queue of pending bridge flood events.

instance *instance-name*—(Optional) Display bridging flooding information for the specified routing instance.

route (all-ce-flood | all ve-flood | alt-root-flood | bd-flood | mlp-flood | re-flood)—(Optional) Display the following:

- **all-ce-flood**—Display the route for flooding traffic to all customer edge routers if **no-local-switching** is enabled.
- **all-ve-flood**—Display the route for flooding traffic to all VPLS edge routers if **no-local-switching** is enabled.
- **alt-root-flood**—Display the Spanning Tree Protocol (STP) alt-root flooding route used for the interface.
- **bd-flood**—Display the route for flooding traffic of a bridge domain if **no-local-switching** is not enabled.
- **mlp-flood**—Display the route for flooding traffic to MAC learning chips.
- **re-flood**—Display the route for Routing Engine flooding to all interfaces.

show bridge mac-table

Syntax

show bridge mac-table
<age>
<brief | count | detail | extensive>
<bridge-domain (all | ***bridge-domain-name*****)>**
<global-count>
<instance ***instance-name*****>**
<interface ***interface-name*****>**
<***mac-address*****>**
<instance ***instance-name*****>**
<vlan-id (all-vlan | ***vlan-id*****)>**

Release Information

Command introduced in Junos OS Release 8.4.
Command introduced in Junos OS Release 15.1
Support for PBB-EVPN instance added in Junos OS Release 16.1
MAC Flag P to indicate a MAC Pinned interface introduced in Junos OS 16.2

Description

(MX Series routers only) Display Layer 2 MAC address information.

Options

none—Display all learned Layer 2 MAC address information.

age— (Optional) Display age of a single mac-address.

brief | count | detail | extensive—(Optional) Display the specified level of output.

bridge-domain (all | ***bridge-domain-name*****)**—(Optional) Display learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.

global-count—(Optional) Display the total number of learned Layer 2 MAC addresses on the system.

instance ***instance-name***—(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.

interface ***interface-name***—(Optional) Display learned Layer 2 MAC addresses for the specified interface.

mac-address—(Optional) Display the specified learned Layer 2 MAC address information.

vlan-id (all-vlan | ***vlan-id*****)**—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.

Additional Information

When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.

show bridge mac-table age (for GE interface) on page 2479
show bridge mac-table age (for AE interface) on page 2479
show bridge mac-table count on page 2479
show bridge mac-table detail on page 2480
show bridge mac-table instance pbb-evpn on page 2480
show bridge mac-table on page 2480

Output Fields Table 229 on page 2477 describes the output fields for the **show bridge mac-table** command. Output fields are listed in the approximate order in which they appear.

Table 229: show bridge mac-table Output Fields

Field Name	Field Description
Age	Age of a single mac-address.
Routing instance	Name of the routing instance.
Bridging domain	Name of the bridging domain.
MAC address	MAC address or addresses learned on a logical interface.
MAC flags	Status of MAC address learning properties for each interface: • **S**—Static MAC address is configured. • **D**—Dynamic MAC address is configured. • **L**—Locally learned MAC address is configured. • **C**—Control MAC address is configured. • **SE**—MAC accounting is enabled. • **NM**—Non-configured MAC. • **R**—Remote PE MAC address is configured. • **P**—MAC Pinned interface is configured
Logical interface	Name of the logical interface.
MAC count	Number of MAC addresses learned on the specific routing instance or interface.
Learning interface	Name of the logical interface on which the MAC address was learned.
Learning VLAN	VLAN ID of the routing instance or bridge domain in which the MAC address was learned.
VXLAN ID/VXLAN	VXLAN Network Identifier (VNI).

Table 229: show bridge mac-table Output Fields (continued)

Field Name	Field Description
Layer 2 flags	Debugging flags signifying that the MAC address is present in various lists.
Epoch	Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.
Sequence number	Sequence number assigned to this MAC address. Used for debugging.
Learning mask	Mask of the Packet Forwarding Engines where this MAC address was learned. Used for debugging.
IPC generation	Creation time of the logical interface when this MAC address was learned. Used for debugging.

Sample Output

show bridge mac-table

```
user@host> show bridge mac-table
MAC flags (S -static MAC, D -dynamic MAC, L -locally learned, C -Control MAC
           SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

Routing instance : default-switch
 Bridging domain : test1, VLAN : 1
   MAC                 MAC      Logical          NH     RTR

show bridge statistics

Syntax

show bridge statistics
<bridge-domain *domain-name*>
<instance *instance-name*>

Release Information

Command introduced in Junos OS Release 8.4.

Description

(MX Series routers only) Display bridge statistics.

Options

none—Display bridge statistics for all bridge domains in all routing instances.

bridge-domain *domain-name*—(Optional) Display statistics for the specified bridge domain.

instance *instance-name*—(Optional) Display statistics for the specified routing instance.

show l2-learning global-information

Syntax **show l2-learning global-information**

Release Information Command introduced in Junos OS Release 8.4.

Description (MX Series routers only) Display Layer 2 learning process-related information for the entire router.

Options This command has no options.

Required Privilege Level view

List of Sample Output show l2-learning global-information on page 2485

Output Fields Table 230 on page 2485 describes the output fields for the **show l2-learning global-information** command. Output fields are listed in the approximate order in which they appear.

Table 230: show l2-learning global-information Output Fields

Field Name	Field Description
MAC aging interval	Configured timeout interval, in seconds, for all MAC table entries.
MAC learning	Status of MAC learning: **Enabled** or **Disabled**.
MAC statistics	Status of MAC accounting: **Enabled** or **Disabled**.
MAC limit Count	Configured maximum limit on the number of MAC addresses that can be learned.
MAC limit hit flag	Status of the learned MAC limit hit flag: **Enabled** (the learned MAC exceeds the global MAC limit) or **Disabled** (the learned MAC does not exceed the global MAC limit).
MAC packet action drop	Status of action to drop packets after the configured MAC address limit is reached: **Enabled** (packets are dropped) or **Disabled** (packets are forwarded).

Sample Output

show l2-learning global-information

```
user@host> show l2-learning global-information
Global Configuration:

MAC aging interval    : 300
MAC learning          : Enabled
```

```
MAC statistics        : Disabled
MAC limit Count       : 393215
MAC limit hit flag    : Disabled
MAC packet action drop: Disabled
```

show l2-learning global-mac-count

Syntax **show l2-learning global-mac-count**

Release Information Command introduced in Junos OS Release 9.3.

Description (MX Series routers only) Display the total number of dynamic and static MAC addresses learned for the entire router.

Options This command has no options.

Required Privilege Level view

List of Sample Output show l2-learning global-mac-count on page 2487

Output Fields Displays the total number of dynamic and static MAC addresses learned for the entire router.

Sample Output

show l2-learning global-mac-count

```
user@host> show l2-learning global-mac-count
100 dynamic and static MAC addresses learned globally
```

Copyright © 2018, Juniper Networks, Inc.

show l2-learning instance

Syntax **show l2-learning instance**

Release Information (MX Series routers only) Command introduced in Junos OS Release 8.4.

Description Display Layer 2 learning properties for all the configured routing instances.

Options This command has no options.

Required Privilege Level view

List of Sample Output show l2-learning instance on page 2489

Output Fields Table 231 on page 2488 describes the output fields for the **show l2-learning instance** command. Output fields are listed in the approximate order in which they appear.

Table 231: show l2-learning instance Output Fields

Field Name	Field Description
Routing Instance	Name of routing instance.
Bridging Domain	Name of bridging domain. On MX Series routers you can use the **show l2-learning instance <extensive>** command option to display the Bridge Service-id information which includes the Config Service ID and the Active Service ID.
Index	Number associated with the routing instance or bridging domain.
Logical System	Name of logical system or **Default** if no logical system is configured.
Routing instance flags	Status of Layer 2 learning properties for each routing instance: • **DL**—MAC learning is disabled. • **SE**—MAC accounting is enabled. • **AD**—Packets are dropped after MAC address limit is reached. • **LH**—The maximum number of MAC addresses has been learned on the routing instance. The routing instance is not able to learn any additional MAC addresses.
MAC limit	Maximum number of MAC addresses that can be learned from each interface in the routing instance or bridging domain.

Copyright © 2018, Juniper Networks, Inc.

Sample Output

show l2-learning instance

```
user@host> show l2-learning instance
Information for routing instance:

Routing Instance flags (DL -disable learning, SE -stats enabled,
                        AD -packet action drop, LH -mac limit hit)

Routing              Bridging      Index   Logical       Routing     MAC

vs1                  vlan200           4   Default                    5120
```

show l2-learning interface

Syntax **show l2-learning interface**

Release Information Command introduced in Junos OS Release 8.4.
Added sample output to indicate an EVPN MAC Pinned interface, introduced in Junos OS 16.2R1.

Description (MX Series routers only) Display Layer 2 learning information for all the interfaces.

Options This command has no options.

Required Privilege Level view

List of Sample Output show l2-learning interface on page 2490
show l2 learning-interface on page 2491

Output Fields Table 232 on page 2490 describes the output fields for the **show l2-learning interface** command. Output fields are listed in the approximate order in which they appear.

Table 232: show l2-learning interfaceOutput Fields

Field Name	Field Description
Logical interface	Name of the logical interface.
Index	Index of the interface.
Routing Instance	Number of the routing instance to which the interface belongs.
Interface device	Value of the order in which the Junos OS finds and initializes the interface.
Logical interface flags	Status of Layer 2 learning properties for each interface: • **DL**—MAC learning is disabled. • **SE**—MAC accounting is enabled. • **AD**—Packets are dropped after the MAC interface limit is reached. • **MAC limit**—Maximum number of MAC addresses that can be learned from the interface. • **MP**—MAC Pinning enabled.

Sample Output

show l2-learning interface

```
user@host> showl2-learning interface
Information for interface family:
```

show mac-rewrite interface

Syntax

show mac-rewrite interface
<brief | detail>
<*interface-name*>

Release Information

Command introduced in Junos OS Release 9.1.
Command introduced in Junos OS Release 14.1X53-D10 for EX4300 switches.
Command introducced in Junos OS Release 15.1X53-D55 for EX2300 and EX3400 switches.
Command introduced in Junos OS Release 17.4R1 for EX4600 switches.

Description

Display Layer 2 protocol tunneling (L2PT) information.

Options

brief | detail—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display L2PT information for the specified interface.

Required Privilege Level

view

clear vpls mac-address

Syntax

clear vpls mac-address
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>
<*mac-address*>

Release Information Command introduced before Junos OS Release 7.4.

Description (T Series and M Series routers, except for the M160 router) Clear media access control (MAC) address entries from the virtual private LAN service (VPLS) table.

Options

none—Clear all MAC address entries from the VPLS table for all routing instances.

instance *instance-name*—(Optional) Clear all MAC address entries for a VPLS instance from the VPLS table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

mac-address—(Optional) Clear a specific MAC address in a VPLS instance from the VPLS table.

Required Privilege Level maintenance

List of Sample Output clear vpls mac-address on page 2496

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear vpls mac-address

```
user@host> clear vpls mac-address
```

clear vpls mac-table

Syntax

clear vpls mac-table
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<*mac-address*>
<*vlan-id*>

Release Information

Command introduced before Junos OS Release 9.5.

Description

(MX Series routers) Clear media access control (MAC) addresses from the virtual private LAN service (VPLS) MAC table.

Options

none—Clear all MAC addresses from the VPLS table for all routing instances.

instance *instance-name*—(Optional) Clear all MAC addresses for a VPLS instance from the VPLS table.

interface *interface-name*—(Optional) Clear all MAC addresses for a VPLS interface from the VPLS table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

mac-address—(Optional) Clear a specific MAC address in a VPLS instance from the VPLS table.

vlan-id—(Optional) Clear MAC addresses on a specified VLAN (0 through 4095).

Required Privilege Level

maintenance

List of Sample Output

clear vpls mac-table on page 2497

Output Fields

When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear vpls mac-table

```
user@host> clear vpls mac-table
```

request l2circuit-switchover

Syntax

request l2circuit-switchover
<logical-system (all | logical-system-name)>
<neighbor *address*>
<virtual-circuit-id *identifier*>

Release Information

Command introduced in Junos OS Release 9.2.
Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.

Description

Manually trigger a switch from the active pseudowire to the redundant pseudowire. This command can be useful when performing network maintenance.

Options

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor *address*—(Optional) Trigger a switch of all of the active pseudowire connections with the specified neighbor to their respective redundant pseudowires.

virtual-circuit-id *identifier*—(Optional) Trigger a switch from the active pseudowire connection of the specified Layer 2 circuit to its redundant pseudowire.

Required Privilege Level

maintenance

Related Documentation

show dynamic-tunnels database

Syntax

show dynamic-tunnels database
<*destination*>
<logical-system (all | *logical-system-name*) >
<table *routing-table-name*>

Release Information

Command introduced before Junos OS Release 7.4.

Description

Display dynamic tunnel database information.

Options

none—Display dynamic tunnel database information for all destinations and routing tables.

destination—(Optional) Display database entries for the specified IP address (with optional destination prefix length) only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *routing-table-name*—(Optional) Display database entries for the specified table only.

Required Privilege Level

view

List of Sample Output

show dynamic-tunnels database (Tunnel Is Up) on page 2500
show dynamic-tunnels database (No Tunnel PIC) on page 2500
show dynamic-tunnels database (Tunnel Is Expiring) on page 2501
show dynamic-tunnels database (Destination Specified) on page 2501
show dynamic-tunnels database (Localization) on page 2501

Output Fields

Table 234 on page 2499 lists the output fields for the **show dynamic-tunnels database** command. Output fields are listed in the approximate order in which they appear.

Table 234: show dynamic-tunnels database Output Fields

Field Name	Field Description
Table	Name of the routing table (for example, **inet.0**).
Destination-network	Destination IP address and subnet.
Tunnel to	Destination IP address and prefix of the tunnel.
State	State of the tunnel: **Up**, **Up (expires in *nn*:*nn*:*nn*seconds)**, or **Dn** (down).
Reference count	Number of routes across the dynamic tunnel that are currently being resolved.

Copyright © 2018, Juniper Networks, Inc.

Table 234: show dynamic-tunnels database Output Fields (continued)

Field Name	Field Description
Next-hop type	Type of tunnel: GRE or UDP (BGP-Signal).
Source address	Source IP address of the tunnel.
Next-hop	IP address of the destination interface.
VPN Label	The label provided by the peer device to identify the VPN through which the packet needs to go. This label is used to identify the VRF for route lookup.
Ingress Route	The IGP route along with the corresponding metric that has been selected for forwarding the tunnel-encapsulated packet.
Localized PFE	Packet Forwarding Engine interface which is the anchor Packet Forwarding Engine for the localized next-hop-based dynamic tunnels. When the anchor Packet Forwarding Engine of the tunnel goes down, it is represented by a **#** near the Packet Forwarding Engine name.
State	State of the destination interface: **Up**, **Dn**, or **Dn (no tunnel pic)**.

Sample Output

show dynamic-tunnels database (Tunnel Is Up)

```
user@host> show dynamic-tunnels database
Table: inet.3

Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32

```

show hfrr profiles

Syntax

show hfrr profiles
<brief |extensive>

Release Information

Command introduced in Junos OS Release 12.2.

Description

Display host fast reroute (HFRR) profile information.

HFRR adds a precomputed protection path into the Packet Forwarding Engine, such that if a link between a provider edge device and a server farm becomes unusable for forwarding, the Packet Forwarding Engine can use another path without having to wait for the router or the protocols to provide updated forwarding information.

Options

none—Display information about HRFF profiles.

brief | extensive—(Optional) Display the specified level of output.

Required Privilege Level

view

Related Documentation

- *Example: Configuring Link Protection with Host Fast Reroute*

List of Sample Output

show hfrr profiles on page 2503

Output Fields

Table 235 on page 2502 describes the output fields for the **show hfrr profiles** command. Output fields are listed in the approximate order in which they appear.

Table 235: show hfrr profiles Output Fields

Field Name	Field Description
HFRR	
HFRR current state	Status of the HFRR profile: HFRR_ACTIVE, HFRR_INACTIVE, HFRR_IFLH-NOT-CONF, and so on.
HFRR Prefix limit blackout timer expiry (in secs)	Time interval between an HFRR profile becoming inactive on exceeding the ARP prefix limit, and the profile starting the SYNC process.
HFRR prefix limit hit count	Number of times that an HFRR profile becomes inactive on exceeding the ARP prefix limit.
HFRR protected IFL name	Interface configured for the HFRR feature.
HFRR protected IFL handle	
HFRR routing instance name	The routing instance in which the HFRR interface is configured.

Copyright © 2018, Juniper Networks, Inc.

Table 235: show hfrr profiles Output Fields (continued)

Field Name	Field Description
HFRR routing instance handle	
HFRR sync BG scheduled	
HFRR RTS filter on	
HFRR delete BG scheduled	
HFRR ARP prefix limit	Configured ARP prefix limit.
HFRR ARP supplementary blackout timeout (in mins)	Supplementary time-out value configured for profile to be inactive when it hits ARP prefix limit.
HFRR number of ARP routes learned	Number of ARP routes learned on the configured interface.
HFRR number of FRR routes created	Number of ARP routes created on the configured interface.

Sample Output

show hfrr profiles

```
user@host> show hfrr profiles
HFRR pointer: 0x9254000
HFRR current state: HFRR_ACTIVE
HFRR Prefix limit blackout timer expiry (in secs): 0
HFRR prefix limit hit count: 0
HFRR protected IFL name: ge-4/1/0.0

show ingress-replication mvpn

Syntax

show ingress-replication mvpn

Release Information

Command introduced in Junos OS Release 10.4.

Description

Display the state and configuration of the ingress replication tunnels created for the MVPN application when using the **mpls-internet-multicast** routing instance type.

Required Privilege Level

View

List of Sample Output

show ingress-replication mvpn on page 2504

Output Fields

Table 236 on page 2504 lists the output fields for the **show ingress-replication mvpn** command. Output fields are listed in the approximate order in which they appear.

Table 236: show ingress-replication mvpn Output Fields

Field Name	Field Description
Ingress tunnel	Identifies the MVPN ingress replication tunnel.
Application	Identifies the application (MVPN).
Unicast tunnels	List of unicast tunnels in use.
Leaf address	Address of the tunnel.
Tunnel type	Identifies the unicast tunnel type.
Mode	Indicates whether the tunnel was created as a new tunnel for the ingress replication, or if an existing tunnel was used.
State	Indicates whether the tunnel is Up or Down.

Sample Output

show ingress-replication mvpn

```
user@host> show ingress-replication mvpn
Ingress Tunnel: mvpn:1
  Application: MVPN
  Unicast tunnels
    Leaf Address       Tunnel-type        Mode        State

show l2circuit connections

Syntax

show l2circuit connections
<brief | extensive | summary>
<down | up | up-down>
<history>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<neighbor *neighbor*>
<status>

Release Information

Command introduced before Junos OS Release 7.4.
Display enhancements in Junos OS Release 9.6.
Display enhancements in Junos OS Release 10.2.
Display enhancements in Junos OS Release 12.1.
Display enhancements in Junos OS Release 13.2.
Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.

Description

Display status information about Layer 2 virtual circuits from the local provider edge (PE) router to its neighbors.

Options

none—Display standard information about Layer 2 virtual circuits on all interfaces for all neighbors.

brief | extensive | summary—(Optional) Display the specified level of output. Use history to display information about connection history. Use status to display information about the connection and interface status.

down | up | up-down—(Optional) Display nonoperational, operational, or both kinds of connections.

history—(Optional) Display information about connection history.

interface *interface-name*—(Optional) Show all Layer 2 virtual circuits on an interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor *neighbor*—(Optional) IP address of a specific neighbor.

status—(Optional) Display information about the connection and interface status.

show l2circuit connections extensive (Pseudowire Redundancy with Hot Standby) on page 2512

Output Fields Table 237 on page 2507 lists the output fields for the **show l2circuit connections** command. Output fields are listed in the approximate order in which they appear.

Table 237: show l2circuit connections Output Fields

Field Name	Field Description
Layer-2 Circuit Connections	Displays the legends for connection and interface status.
Neighbor	Remote PE neighbor.
Interface	Logical PE-to-CE interface on which the virtual circuit is configured.
Type	VC type: **rmt** (remote) or **loc** (local).

Copyright © 2018, Juniper Networks, Inc.

Table 237: show l2circuit connections Output Fields (continued)

Field Name	Field Description
Legend for connection status (St)	Status of the virtual circuit connection: • **EI**—The local virtual circuit interface is configured with an encapsulation that is not supported. • **MM**—The two routers do not agree on an MTU value, which causes an MTU mismatch. • **EM**—The encapsulation type received on this virtual circuit from the neighbor does not match the local virtual circuit interface encapsulation type. • **CM**—The two routers do not agree on a control word, which causes a control word mismatch. • **VM**—The remote and local VLAN IDs do not match across the Layer 2 circuit. • **OL**—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit. • **NC**—The interface is not configured as a CCC or TCC interface. • **BK**—The virtual circuit has switched to a backup connection. • **CB**—The remote PE router is advertising a different cell bundle from that configured on the local PE router. • **LD**—The connection to the local site is signaled down, because the CE-facing interface to the local site is down. • **RD**—The remote neighbor is down. It has signaled a problem using the pseudowire status code. • **NP**—The router detects that interface hardware is not present. The hardware may be offline, a PIC may not be of the desired type, or the interface may be configured in a different routing instance. • **Dn**—The virtual circuit is down. • **VC-Dn**—The virtual circuit is down because there is no tunnel LSP from the local PE router to the neighbor. • **UP**—The virtual circuit is operational. • **CF**—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 circuit bandwidth requirement. • **IB**—The bit rate is incompatible for Time Division Multiplexing (TDM). • **TDM**—TDM is not configured correctly. • **ST**—The virtual circuit has been switched to a standby connection. • **SP**—The virtual circuit connection is using a static pseudowire. • **RS**—The remote site is in a standby state. • **XX**—The virtual circuit is down for an unknown reason. This is a programming error.
Time last up	Date and time the virtual circuit was last operational.
# Up trans	Number of times the virtual circuit came up.
local-interface-name	Name of the local PE-to-CE interface.
Status	Status of the local interface.
Up	Interface is operational.

Copyright © 2018, Juniper Networks, Inc.

Table 237: show l2circuit connections Output Fields (continued)

Field Name	Field Description
Dn	Interface is not operational.
NP	Not present. Interface does not exist.
DS	Disabled. Interface has been administratively disabled.
WE	Wrong encapsulation. The interface is not configured as CCC.
UN	Interface status is initialized.
Encapsulation	Encapsulation of the local interface.
Flow Label Transmit	Flow label transmit status.
Flow Label Receive	Flow label receive status.
Remote PE	Prefix of the remote PE router.
Negotiated control-word	Whether the use of the control word has been negotiated for this virtual circuit: **Yes (Null)** or **No**.
Incoming label	Label used by the remote side of the virtual circuit to send packets destined to the local side. This label is routed to the local virtual circuit interface.
Outgoing label	Label used by the local side of the virtual circuit to send packets to the remote side of the virtual circuit. Packets originated on the local virtual circuit interface are encapsulated with this label before being placed on the tunnel LSP to the neighbor for this virtual circuit. This label is allocated by the neighbor and is used in demultiplexing incoming packets destined for this virtual circuit.
Negotiated PW status TLV	Displays the pseudowire status type, length, and value (TLV). TLVs are a method of encoding variable-length or optional information. If the pseudowire status TLV is used, the corresponding local or neighbor PE router status code is also displayed.
local PW status code	If the pseudowire status TLV is used, displays the local PE router status code.
Neighbor PW status code	If the pseudowire status TLV is used, displays the neighbor PE router status code.
Local interface	Name of the local interface used for the Layer 2 circuit connection.
Status	Status of the local interface (**Up** or **Down**).
Encapsulation	Encapsulation configured for the local interface.
APS-active	Indicates that the interface belongs to the working circuit.

Copyright © 2018, Juniper Networks, Inc.

Table 237: show l2circuit connections Output Fields (continued)

Field Name	Field Description
APS-inactive	Indicates that the interface belongs to the protect circuit.
Connection protection	Whether or not connection protection is configured for the Layer 2 circuit to the neighbor: **Yes** or **No**.
VC bandwidth	Bandwidth requirement of the Layer 2 circuit.
Time	Time at which the event occurred.
Connection History	Event types logged in history. • **loc intf up**—Local virtual circuit interface went up. • **loc intf down**—Local virtual circuit interface went down. • **In lbl Update**—Incoming label has been updated. • **Out lbl Update**—Outgoing label has been updated. • **PE route changed**—Route to PE router has been updated. • **PE route down**—Route to PE router is down. • **rmt side marked**—Remote side is marked. • **VC Dn**—Remote side indicated that its end of the virtual circuit is down (if the tunnel LSP from the remote side to the local side is down). • **status update timer**—Status update timer processing. It computes the state of the virtual circuit, and determines whether it should be advertised to or withdrawn from the remote side.

<summary>

Release Information

Command introduced before Junos OS Release 7.4.
instance-history option introduced in Junos OS Release 12.3R2.

Description

Display Layer 2 virtual private network (VPN) connections.

Options

none—Display all Layer 2 VPN connections for all routing instances.

brief | extensive—(Optional) Display the specified level of output.

down | up | up-down—(Optional) Display nonoperational, operational, or both kinds of connections.

history—(Optional) Display information about connection history.

instance ***instance***—(Optional) Display connections for the specified routing instance only.

instance-history—(Optional) Display information about connection history for a particular instance.

local-site ***local-site***—(Optional) Display connections for the specified Layer 2 VPN local site name or ID only.

logical-system (all | ***logical-system-name*****)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

remote-site ***remote-site***—(Optional) Display connection for the specified Layer 2 VPN remote site ID only.

status—(Optional) Display information about the connection and interface status.

summary—(Optional) Display summary of all Layer 2 VPN connections information.

Output Fields

Table 238 on page 2515 lists the output fields for the **show l2vpn connections** command. Output fields are listed in the approximate order in which they appear.

Table 238: show l2vpn connections Output Fields

Field Name	Field Description
Instance	Name of Layer 2 VPN instance.
L2vpn-id	For BGP autodiscovery, a globally unique Layer 2 VPN community identifier for the instance.
Local-ID	BGP **local-address** assigned to the local routing device.
Local site	Name of local site.
Local source-attachment-id	For FEC 129, the VPWS source attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.
Target-attachment-id	For FEC 129, the VPWS target attachment identifier. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established.
Interface name	Name of interface.
Remote Site ID	Remote site ID.
Label Offset	Numbers within the label block that are skipped to find the next label base.
Label-base	Advertises the first label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.
Range	Advertises the label block size.
status-vector	Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of **0** indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of **1** indicates either one or both are down.
connection-site	Name of the connection site.
Type	Type of connection: **loc** (local) or **rmt** (remote).
St	Status of the connection. (For a list of possible values, see the **Legend for connection status (St)** field.)

Copyright © 2018, Juniper Networks, Inc.

Table 238: show l2vpn connections Output Fields (continued)

Field Name	Field Description
Time last up	Time that the connection was last in the **Up** condition.
# Up trans	Number of transitions from **Down** to **Up** condition.
Local circuit	Address and status of local circuit.
Remote circuit	Address and status of remote circuit.
St	Status of the Layer 2 VPN connection (corresponds with Legend for Connection Status): • **EI**—The local Layer 2 VPN interface is configured with an encapsulation that is not supported. • **EM**—The encapsulation type received on this Layer 2 VPN connection from the neighbor does not match the local Layer 2 VPN connection interface encapsulation type. • **VC-Dn**—The virtual circuit is currently down. • **CM**—The two routers do not agree on a control word, which causes a control word mismatch. • **CN**—The virtual circuit is not provisioned properly. • **OR**—The label associated with the virtual circuit is out of range. • **OL**—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit. • **LD**—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established. • **RD**—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established. • **LN**—The local site has lost path selection to the remote site and therefore no pseduowires can be established from this local site. • **RN**—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site. • **XX**—The Layer 2 VPN connection is down for an unn reason. This is a programming error. • **NC**—The interface encapsulation is not configured as an appropriate CCC, TCC, or Layer 2 VPN encapsulation. • **WE**—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the Layer 2 VPN routing instance. • **NP**—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance. • **->**—Only the outbound connection is up. • **<-**—Only the inbound connection is up. • **Up**—The Layer 2 VPN connection is operational. • **Dn**—The Layer 2 VPN connection is down. • **CF**—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 VPN connection bandwidth requirement.

Copyright © 2018, Juniper Networks, Inc.

Table 238: show l2vpn connections Output Fields (continued)

Field Name	Field Description
	• **SC**—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers. • **LM**—The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site. and the associated local site identifier is not being used to distribute Layer 2 VPN label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state. • **RM**—The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot established a pseduowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state. • **IL**—The incoming packets for the Layer 2 VPN connection have no MPLS label.
Remote PE	Address of the remote provider edge router.
Incoming label	Name of the incoming label.
Outgoing label	Name of the outgoing label.
Egress Protection	Whether the given PVC is protected by connection protection logic using egress protection for BGP signaled layer 2 services.
Flow Label Receive	Capability to pop the flow label in the receive direction to the remote provider edge (PE) router
Flow Label Transmit	Capability to push the flow label in the transmit direction to the provider edge (PE) router
Time	Date and time of Layer 2 VPN connection event.
Event	Type of event.
Interface/Lbl/PE	Interface, label, or PE router.

show mvpn c-multicast

Syntax

show mvpn c-multicast
<extensive | summary>
<instance-name *instance-name*>
<source-pe>

Release Information

Command introduced in Junos OS Release 8.4.
Option to show **source-pe** introduced in Junos OS Release 15.1.

Description

Display the multicast VPN customer multicast route information.

Options

extensive | summary—(Optional) Display the specified level of output.

instance-name *instance-name*—(Optional) Display output for the specified routing instance.

source-pe—(Optional) Display source-pe output for the specified c-multicast entries.

Required Privilege Level

view

List of Sample Output

show mvpn c-multicast on page 2522
show mvpn c-multicast summary on page 2522
show mvpn c-multicast extensive on page 2522
show mvpn c-multicast source-pe on page 2523

Output Fields

Table 239 on page 2521 lists the output fields for the **show mvpn c-multicast** command. Output fields are listed in the approximate order in which they appear.

Table 239: show mvpn c-multicast Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the VPN routing instance.	summary extensive none
C-mcast IPv4 (S:G)	Customer router IPv4 multicast address.	extensive none
Ptnl	Provider tunnel attributes, *tunnel type:tunnel source, tunnel destination group*.	extensive none
St	State: • DS—Represents (S,G) and is created due to (*,G) • RM—Remote VPN route learned from the remote PE router • St display blank—SSM group join	extensive none
MVPN instance	Name of the multicast VPN routing instance	extensive none

Copyright © 2018, Juniper Networks, Inc.

Table 239: show mvpn c-multicast Output Fields (continued)

Field Name	Field Description	Level of Output
C-multicast IPv4 route count	Number of customer multicast IPv4 routes associated with the multicast VPN routing instance.	summary
C-multicast IPv6 route count	Number of customer multicast IPv6 routes associated with the multicast VPN routing instance.	summary

show mvpn instance

Syntax

show mvpn instance
<*instance-name*>
<display-tunnel-name>
<extensive | summary>
<inet | inet6>
<logical-system>

Release Information

Command introduced in Junos OS Release 8.4.
Additional details in output for extensive option introduced in Junos OS Release 15.1.

Description

Display the multicast VPN routing instance information according the options specified.

Options

instance-name—(Optional) Display statistics for the specified routing instance, or press Enter without specifying an instance name to show output for all instances.

display-tunnel-name—(Optional) Display the ingress provider tunnel name rather than the attribute.

extensive | summary—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display output for the specified IP type.

inet | inet6—(Optional) Display output for the specified IP type.

logical-system—(Optional) Display details for the specified logical system, or type “all”.

show vpls connections

Syntax

show vpls connections
<brief | extensive>
<down | up | up-down>
<history>
<instance *instance-name* local-site *local-site-name* remote-site *remote-site-name*>
<instance-history>
<logical-system (all | *logical-system-name*)>
<status>
<summary>

Release Information

Command introduced before Junos OS Release 7.4.
instance-history option introduced in Junos OS Release 12.3R2.

Description

(T Series and M Series routers, except for the M160 router) Display virtual private LAN service (VPLS) connection information.

Options

none—Display information about all VPLS connections for all routing instances.

brief | extensive—(Optional) Display the specified level of output.

down | up | up-down—(Optional) Display nonoperational, operational, or both types of connections.

history—(Optional) Display information about connection history.

instance *instance-name*—(Optional) Display the VPLS connections for the specified routing instance only.

instance-history—(Optional) Display information about connection history for a particular instance.

local-site *local-site-name*—(Optional) Display the VPLS connections for the specified local site name or ID only.

remote-site *remote-site-name*—(Optional) Display the VPLS connections for the specified remote site name or ID only. Label block size information is always shown as 0 when using this option.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

status—(Optional) Display information about the connection and interface status.

summary—(Optional) Display summary of all VPLS connections information.

Required Privilege Level

List of Sample Output

show vpls connections on page 2538
show vpls connections (with FEC128 and FEC129 in the same routing-instance) on page 2540
show vpls connections (with multiple pseudowires) on page 2541
show vpls connections extensive (Static VPLS Neighbors) on page 2542

Output Fields

Table 242 on page 2534 lists the output fields for the **show vpls connections** command. Output fields are listed in the approximate order in which they appear.

Table 242: show vpls connections Output Fields

Field Name	Field Description
Instance	Name of the VPLS instance.
Local site	Name of the local site.
VPLS-id	Identifier for the VPLS site.
Number of local interfaces	Number of interfaces configured for the local site.
Number of local interfaces up	Number of interfaces configured for the local site that are currently up.
IRB interface present	Indicates whether or not an integrated routing and bridging (IRB) interface is present (**yes** or **no**).
Intf	List of all of the interfaces configured for the local site. The types of interfaces can include VPLS virtual loopback tunnel interfaces and label-switched interfaces. Any interface that supports VPLS could be listed here. Virtual loopback tunnel interfaces are displayed using the **vt-*fpc/pic/port.nnnnn*** format. Label-switched interfaces are displayed using the **lsi.*nnnnn*** format. In both cases, ***nnnnn*** is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain. Each interface might include the following information: • Identification as a VPLS interface • Name of the associated VPLS routing instance • Local site number • Remote site number • VPLS neighbor address • VPLS identifier
Interface flags	Flag associated with the interface. Can include the following: • **VC-Down**—The virtual circuit associated with this interface is down.
Label-base	First label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.

 Copyright © 2018, Juniper Networks, Inc.

Table 242: show vpls connections Output Fields (continued)

Field Name	Field Description
Offset	Displays the VPLS Edge (VE) block offset in the Layer 2 VPN NLRI. The VE block offset is used to identify a label block from which a particular label value is selected to setup a pseduowire for a remote site. The block offset value itself indicates the starting VE ID that maps to the label base contained in the VPLS NLRI advertisement.
Size	Label block size. A configurable value that represents the number of label blocks required to cover all the pseudowires for the remote peer. Acceptable configuration values are: **2**, **4**, **8** and **16**. The default value is **2**. A value of **0** will be displayed when using the **remote-site** option.
Range	Label block range. A value that keeps track of the numbers of remote sites discovered within each label block.
Preference	Preference value advertised for a VPLS site. When multiple PE routers are assigned the same VE ID for multihoming, you might need to specify that a particular PE router acts as the designated forwarder by configuring the site preference value. The site preference indicates the degree of preference for a particular customer site. The site preference is one of the tie-breaking criteria used in a designated forwarder election.
status-vector	Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of **0** indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of **1** indicates either one or both are down.
connection-site	Name of the connection site.
Neighbor	IP address and VPLS identifier for the VPLS neighbor. If multiple pseudowires have been configured, the IP address will also show the PW-specific *vpls-id-list*, for example, 203.0.113.144 (vpls-id 200).
Type	Type of connection: **loc** (local) or **rmt** (remote).

Copyright © 2018, Juniper Networks, Inc.

Table 242: show vpls connections Output Fields (continued)

Field Name	Field Description

St	Status of the VPLS connection (corresponds with Legend for Connection Status):
	
	• **EI**—The local VPLS interface is configured with an encapsulation that is not supported.
	• **EM**—The encapsulation type received on this VPLS connection from the neighbor does not match the local VPLS connection interface encapsulation type.
	• **VC-Dn**—The virtual circuit is currently down.
	• **CM**—The two routers do not agree on a control word, which causes a control word mismatch.
	• **CN**—The virtual circuit is not provisioned properly.
	• **OR**—The label associated with the virtual circuit is out of range.
	• **OL**—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit.
	• **LD**—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established.
	• **RD**—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established.
	• **LN**—The local site has lost path selection to the remote site and therefore no pseduowires can be established from this local site.
	• **RN**—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site.
	In a multihoming configuration, one multihomed PE site displays the state **LN**, and the other multihomed PE site displays the state **RN** in the following circumstances:
	  ◦ The multihomed links are both configured to be the backup site.
	  ◦ The two multihomed PE routers have the same site ID, but have a peering relationship with a route reflector (RR) that has a different site ID.
	• **XX**—The VPLS connection is down for an unn reason. This is a programming error.
	• **MM**—The MTU for the local site and the remote site do not match.
	• **BK**—The router is using a backup connection.
	• **PF**—Profile parse failure.
	• **RS**—The remote site is in a standby state.
	• **NC**—The interface encapsulation is not configured as an appropriate CCC, TCC, or VPLS encapsulation.
	• **WE**—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the VPLS routing instance.

 Copyright © 2018, Juniper Networks, Inc.

Table 242: show vpls connections Output Fields (continued)

Field Name	Field Description
	• **NP**—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance. • **-->**—Only the outbound connection is up. • **<-**—Only the inbound connection is up. • **Up**—The VPLS connection is operational. • **Dn**—The VPLS connection is down. • **CF**—The router cannot find enough bandwidth to the remote router to satisfy the VPLS connection bandwidth requirement. • **SC**—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers. • **LM**—The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site. and the associated local site identifier is not being used to distribute VPLS label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state. • **RM**—The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot established a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state. • **IL**—The incoming packets for the VPLS connection have no MPLS label. • **MI**—The configured mesh group identifier is in use by another system in the network. • **ST**—The router has switched to a standby connection. • **PB**—Profile busy. • **SN**—The VPLS neighbor is static.
Time last up	Time connection was last in the **Up** condition.
# Up trans	Number of transitions from **Down** to **Up** condition.
Status	Status of the (local or remote circuit) local interface: • **Up**—Operational • **Dn**—Down • **NP**—Not present • **DS**—Disabled • **WE**—Wrong encapsulation • **UN**—Uninitialized
Encapsulation	Type of encapsulation: **VPLS**.
Remote PE	Address of the remote provider edge router.

Table 242: show vpls connections Output Fields (continued)

Field Name	Field Description
Negotiated control-word	Whether a control word has been negotiated: **Yes** or **No**.
Incoming label	Name of the incoming label.
Outgoing label	Name of the outgoing label.
Negotiated PW status TLV	Indicates whether or not the pseudowire status TLV has been negotiated for the VPLS connection.
Local interface	Provides the following information about the local interface configured for the VPLS neighbor: • Name of the local interface • **Status**—Interface status (**Up** or **Down**) • **Encapsulation**—Interface encapsulation (for example, **ETHERNET**) • **Description**—Includes the VPLS instance name, the VPLS neighbor address, and the VPLS identifier
Time	Date and time of VPLS connection event.
Event	Type of event.
Interface/Lbl/PE	Interface, label, or PE router.
Connection History	Each entry can include the date, time, year, and the connection event. Connection events include any of a variety of events related to VPLS connections, such as route changes, label updates, and interfaces going down or coming up.

Sample Output

show vpls flood event-queue

Syntax show vpls flood event-queue

Release Information Command introduced in Junos OS Release 8.0.

Description Display the pending events in the VPLS flood queue.

Options This command has no options.

Required Privilege Level view

List of Sample Output show vpls flood event-queue on page 2544

Output Fields Table 243 on page 2544 lists the output fields for the **show vpls flood event-queue** command. Output fields are listed in the approximate order in which they appear.

Table 243: show vpls flood event-queue Output Fields

Field Name	Field Description
Current Pending Event	Provides information on the current event in the VPLS flood event queue.
Name	Name of the event.
Owner Name	Name of the interface associated with the flood event.
Pending Op	Pending operation for the event.
Last Error	Name of the last error encountered.
Number of Retries	Number of attempts made to update the event queue.
Pending Event List	List of the events awaiting processing.
Event Name	Name of the event.
Pending Op	Pending operation for the event.
Event Identifier	Name of the interface associated with the flood event.

Sample Output

show vpls flood event-queue

show vpls flood route

Syntax

show vpls flood route
(all-ce-flood instance-name *instance-name* <logical-system-name *logical-system-name*>
  |
ce-flood interface *interface-name*)

Release Information

Command introduced in Junos OS Release 8.0.

Description

Display VPLS route information related to the flood process for either the specified routing instance or the specified interface.

Options

all-ce-flood—Display the flood next-hop route for all customer edge routers for traffic coming from the core of the network.

ce-flood interface ***interface-name***—Display the flood next-hop route for traffic coming from the specified customer edge interface.

instance-name ***instance-name***—Display the flood routes for the specified instance.

logical-system-name ***logical-system-name***—(Optional) Specify the logical system whose flood routes you want to display. You can only specify the default logical system name for VPLS. The default logical system name is **__example_ls1__**\ (the name must be entered in the command with the underscore characters).

Required Privilege Level

view

List of Sample Output

show vpls flood route all-ce-flood on page 2549
show vpls flood route ce-flood on page 2549

Output Fields

Table 245 on page 2548 lists the output for the **show vpls flood route** command. Output fields are listed in the approximate order in which they appear.

Table 245: show vpls flood route Output Fields

Field Name	Field Description
Flood route prefix	Prefix for the flood route.
Flood route type	Type of flood route (either **CE_FLOOD** or **ALL_CE_FLOOD**).
Flood route owner	VPLS routing instance or interface associated with the flood route.
Nexthop type	Next-hop type. For example, **flood** for a flood route.
Nexthop index	Next-hop index number for the route.
Interfaces flooding to	Interfaces to which VPLS routes are being flooded.

Copyright © 2018, Juniper Networks, Inc.

Table 245: show vpls flood route Output Fields (continued)

Field Name	Field Description
Name	Name of the interface.
Type	Type of VPLS router (**CE** or **VE**).
Nh type	Next-hop type.
Index	Index number for the flood route.

Sample Output

show vpls flood route all-ce-flood

`user@host:__example_ls1__>` **show vpls flood route all-ce-flood logical-system-name __example_ls1__instance-name green**

```

show vpls mac-table

Syntax

show vpls mac-table
<age>
<brief | detail | extensive | summary>
<bridge-domain *bridge-domain-name*>
<instance *instance-name*>
<interface *interface-name*>
<logical-system (all | *logical-system-name*)>
<*mac-address*>
<vlan-id *vlan-id-number*>

Release Information

Command introduced in Junos OS Release 8.5.
Command introduced in Junos OS Release 15.1.

Description

Display learned virtual private LAN service (VPLS) media access control (MAC) address information.

Options

none—Display all learned VPLS MAC address information.

age— (Optional) Display age of a single mac-address.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

bridge-domain *bridge-domain-name*—(Optional) Display learned VPLS MAC addresses for the specified bridge domain.

instance *instance-name*—(Optional) Display learned VPLS MAC addresses for the specified instance.

interface *interface-name*—(Optional) Display learned VPLS MAC addresses for the specified instance.

logical-system (all | *logical-system-name*)—(Optional) Display learned VPLS MAC addresses for all logical systems or for the specified logical system.

mac-address—(Optional) Display the specified learned VPLS MAC address information..

vlan-id *vlan-id-number*—(Optional) Display learned VPLS MAC addresses for the specified VLAN.

Output Fields Table 246 on page 2551 describes the output fields for the **show vpls mac-table** command. Output fields are listed in the approximate order in which they appear.

Table 246: show vpls mac-table Output fields

Field Name	Field Description
Age	Age of a single mac-address.
Routing instance	Name of the routing instance.
Bridging domain	Name of the bridging domain.
MAC address	MAC address or addresses learned on a logical interface.
MAC flags	Status of MAC address learning properties for each interface: • **S**—Static MAC address configured. • **D**—Dynamic MAC address learned. • **SE**—MAC accounting is enabled. • **NM**—Nonconfigured MAC.
Logical interface	Name of the logical interface.
MAC count	Number of MAC addresses learned on a specific routing instance or interface.
Learning interface	Logical interface or logical Label Switched Interface (LSI) the address is learned on.
Base learning interface	Base learning interface of the MAC address. This field is introduced in Junos OS Release 14.2.
Learn VLAN ID/VLAN	VLAN ID of the routing instance or bridge domain in which the MAC address was learned.
VXLAN ID/VXLAN	VXLAN Network Identifier (VNI)
Layer 2 flags	Debugging flags signifying that the MAC address is present in various lists.
Epoch	Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.
Sequence number	Sequence number assigned to this MAC address. Used for debugging.
Learning mask	Mask of Packet Forwarding Engines where this MAC address was learned. Used for debugging.
IPC generation	Creation time of the logical interface when this MAC address was learned. Used for debugging.

show vpls statistics

Syntax

show vpls statistics
<instance *instance-name*>
<logical-system (all | *logical-system-name*)>

Release Information

Command introduced before Junos OS Release 7.4.

Description

(T Series and M Series routers, except for the M160 router) Display virtual private LAN service (VPLS) statistics.

Options

none—Display VPLS statistics for all routing instances.

instance *instance-name*—(Optional) Display VPLS statistics for a specific VPLS routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

view

List of Sample Output

show vpls statistics on page 2556
show vpls statistics instance on page 2557

Output Fields

Table 247 on page 2555 lists the output fields for the **show vpls statistics** command. Output fields are listed in the approximate order in which they appear.

Table 247: show vpls statistics Output Fields

Field Name	Field Description
Instance	Name of the VPLS instance.
Local interface	Name of the local VPLS virtual loopback tunnel interface, **vt-*fpc/pic/port.nnnnn***, where ***nnnnn*** is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain.
Index	Number associated with the next hop.
Remote provider edge router	Address of the remote provider edge router.
Multicast packets	Number of multicast packets received.
Multicast bytes	Number of multicast bytes received.
Flood packets	Number of VPLS flood packets received.

Copyright © 2018, Juniper Networks, Inc.

Table 247: show vpls statistics Output Fields (continued)

Field Name	Field Description
Flood bytes	Number of VPLS flood bytes received.
Current MAC count	Number of MAC addresses learned by the interface and the configured maximum limit on the number of MAC addresses that can be learned.

Sample Output

show vpls statistics

user@host> **show vpls statistics**

```
VPLS statistics:

Instance: green

   Local interface: fe-2/2/1.0, Index: 69
     Multicast packets:                     1
     Multicast bytes  :                    60
     Flooded packets  :                    18
     Flooded bytes    :                  2556
     Current MAC count:                     1

   Local interface: lt-0/3/0.2, Index: 72
     Multicast packets:                     3
     Multicast bytes  :                   153
     Flooded packets  :                     1
     Flooded bytes    :                    51
     Current MAC count:                     1

   Local interface: lsi.32769, Index: 75
     Current MAC count:                     0

   Local interface: lsi.32771, Index: 77
   Remote PE: 10.255.14.222
     Current MAC count:                     2

Instance: red

   Local interface: vt-0/3/0.32768, Index: 74
     Multicast packets:                     0
     Multicast bytes  :                     0
     Flooded packets  :                     0
     Flooded bytes    :                     0
     Current MAC count:                     0

   Local interface: vt-0/3/0.32770, Index: 76
     Multicast packets:                     0
     Multicast bytes  :                     0
     Flooded packets  :                     0
     Flooded bytes    :                     0
     Current MAC count:                     0
```
