 [edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name*  
**neighbor** *address*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer.

**NOTE:** The `as-override` statement is specific to a particular BGP group. This statement does not affect peers from the same remote AS configured in different groups.

Enabling the AS override feature allows routes originating from an AS to be accepted by a router residing in the same AS. Without AS override enabled, the routing device refuses the route advertisement once the AS path shows that the route originated from its own AS. This is done by default to prevent route loops. The **as-override** statement overrides this default behavior.

Note that enabling the AS override feature may result in routing loops. Use this feature only for specific applications that require this type of behavior, and in situations with strict network control. One application is the IGP protocol between the provider edge routing device and the customer edge routing device in a virtual private network.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify the router and route authentication to mitigate the risk of being attacked by a machine or router that has been configured to share incorrect routing information with another router. Router and route authentication enables routers to share information only if they can verify that they are talking to a trusted source, based on a password (key). In this method, a hashed key is sent along with the route being sent to another router. The receiving router compares the sent key to its own configured key. If they are the same, the receiving router accepts the route.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information** Statement introduced in Junos OS Release 7.6.  
 Statement introduced for BGP in Junos OS Release 8.0.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 12.3X50 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.3.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure an authentication algorithm type.

**NOTE:** Keep the following points in mind when you configure the authentication algorithm in an IPsec proposal:

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, an error occurs and the tunnel is not established in this scenario. For example, if one end of the tunnel contains router 1 configured with the authentication algorithm as hmac-sha-256-128 and the other end of the tunnel contains router 2 configured with the authentication algorithm as hmac-md5-96, the VPN tunnel is not established.

- When both ends of an IPsec VPN tunnel contain the same IKE proposal but different IPsec proposals, and when one end of the tunnel contains two IPsec proposals to check whether a less secure algorithm is selected or not, an error occurs and the tunnel is not established. For example, if you configure two authentication algorithms for an IPsec proposal as `hmac-sha-256-128` and `hmac-md5-96` on one end of the tunnel, router 1, and if you configure the algorithm for an IPsec proposal as `hmac-md5-96` on the other end of the tunnel, router 2, the tunnel is not established and the number of proposals mismatch.
  - When you configure two IPsec proposals at both ends of a tunnel, such as the `authentication-algorithm hmac-sha-256-128` and `authentication-algorithm hmac-md5-96` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 1 (with the algorithms in two successive statements to specify the order), and the `authentication-algorithm hmac-md5-96` and `authentication-algorithm hmac-sha-256-128` statements at the `[edit services ipsec-vpn ipsec proposal proposal-name]` hierarchy level on one of the tunnel, router 2 (with the algorithms in two successive statements to specify the order, which is the reverse order of router 1), the tunnel is established in this combination as expected because the number of proposals is the same on both ends and they contain the same set of algorithms. However, the authentication algorithm selected is `hmac-md5-96` and not the stronger algorithm of `hmac-sha-256-128`. This method of selection of the algorithm occurs because the first matching proposal is selected. Also, for a default proposal, regardless of whether the router supports the Advanced Encryption Standard (AES) encryption algorithm, the `3des-cbc` algorithm is chosen and not the `aes-cfb` algorithm, which is because of the first algorithm in the default proposal being selected. In the sample scenario described here, on router 2, if you reverse the order of the algorithm configuration in the proposal so that it is the same order as the one specified on router 1, `hmac-sha-256-128` is selected as the authentication method.
  - You must be aware of the order of proposals in an IPsec policy at the time of configuration if you want the matching of proposals to happen in a certain order of preference, such as the strongest algorithm to be considered first when a match is made when both policies from the two peers have a proposal.
-

**Options** *algorithm*—Specify one of the following types of authentication algorithms:

- **aes-128-cmac-96**—Cipher-based message authentication code (AES128, 96 bits).
- **hmac-sha-1-96**—Hash-based message authentication code (SHA1, 96 bits).
- **md5**—Message digest 5.

**Default:** hmac-sha-1-96

**NOTE:** The default is not displayed in the output of the `show bgp bmp` command unless a key or key-chain is also configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure an MD5 authentication key (password). Neighboring routing devices use the same password to verify the authenticity of BGP packets sent from this system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>key</b>—Authentication password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Release Information** Statement introduced in Junos OS Release 8.0.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.  
 Statement introduced for BMP in Junos OS Release 13.3.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Apply and enable an authentication keychain to the routing device. Note that the referenced key chain must be defined. When configuring the authentication key update feature for BGP, you cannot commit the **0.0.0.0/allow** statement with authentication keys or key chains. The CLI issues a warning and fails to commit the configuration.

**Options** *key-chain*—Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

**NOTE:** For BGP, you must also configure an authentication algorithm by including the **authentication-algorithm** *algorithm* statement.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4R2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Enable the router to process only the autodiscovery network layer reachability information (NLRI) update messages for VPWS and LDP-based Layer 2 VPN and VPLS update messages (BGP_L2VPN_AD_NLRI) (FEC 129).</p> <p>Specifically, the <b>auto-discovery-only</b> statement notifies the routing process (rpd) to expect autodiscovery-related NLRI messages so that information can be deciphered and used by LDP, VPLS, and VPWS.</p> <p>The <b>auto-discovery-only</b> statement must be configured on all provider edge (PE) routers in a VPLS or in a VPWS. If you configure route reflection, the <b>auto-discovery-only</b> statement is also required on provider (P) routers that act as the route reflector in supporting FEC 129-related updates.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | <p>Specify the routing device's AS number.</p> <p>An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (<a href="http://www.isi.edu">http://www.isi.edu</a>).</p> <p>If you are using BGP on the routing device, you must configure an AS number.</p> <p>The AS path attribute is modified when a route is advertised to an EBGp peer. Each time a route is advertised to an EBGp peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.</p> <p>In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p> |

**Options** *autonomous-system*—AS number. Use a number assigned to you by the NIC.

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
routing-options {
 autonomous-system 65546;
}
```

**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
routing-options {
 autonomous-system 1.10;
}
```

**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
routing-options {
 autonomous-system 60000;
}
```

**asdot-notation**—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

**Default:** Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**Range:** 1 through 10

**Default:** 1

**NOTE:** When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the **loops** statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the **independent-domain** option if the **loops** statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately. See [CLI Explorer](#).

**Release Information** Statement introduced in Junos OS Release 8.1.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
**detection-time threshold** and **transmit-interval threshold** options introduced in Junos OS  
 Release 8.2  
 Support for logical routers introduced in Junos OS Release 8.3.  
 Support for IBGP and multihop EBGP sessions introduced in Junos OS Release 8.3.  
**holddown-interval** statement introduced in Junos OS Release 8.5. You can configure this  
 statement only for EBGP peers at the [edit protocols bgp group *group-name* neighbor  
*address*] hierarchy level.  
**no-adaptation** statement introduced in Junos OS Release 9.0.  
 Support for BFD authentication introduced in Junos OS Release 9.6.

Support for BFD on IPv6 interfaces with BGP introduced in Junos OS Release 11.2.

Statement introduced in Junos OS Release 12.1 for the QFX Series.

Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure bidirectional failure detection (BFD) timers and authentication for BGP.

For IBGP and multihop EBGP support, configure the **bfd-liveness-detection** statement at the global **[edit bgp protocols]** hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.

**Options** **authentication algorithm** *algorithm-name* (Optional)—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**.

**authentication key-chain** *key-chain-name* (Optional)—Associate a security key with the specified BFD session using the name of the security keychain. The keychain name must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold** *milliseconds* (Optional)—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**holddown-interval** *milliseconds* (Optional)—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. When you configure the hold-down interval for the BFD protocol for EBG, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes it is down and does not send a state change notification. The **holddown-interval** statement is supported only for EBG peers at the **[edit protocols bgp group group-name neighbor address]** hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBG peers. If you configure the hold-down interval for a multihop EBG session, you must also configure a local IP address by including the **local-address** statement at the **[edit protocols bgp group group-name]** hierarchy level.

**Range:** 0 through 255,000

**Default:** 0

**minimum-interval** *milliseconds* (Required)—Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately (using the **minimum-receive-interval** and **transmit-interval minimal-interval** statements).

**Range:** 1 through 255,000

**minimum-receive-interval** *milliseconds* (Optional)—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**multiplier *number*** (Optional)—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation** (Optional)—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable to not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds*** (Optional)—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds*** (Optional)—Configure only the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**version** (Optional)—Configure the BFD version to detect.

**Range:** 1 or **automatic** (autodetect the BFD version)

**Default:** **automatic**

The remaining statements are explained separately. See [CLI Explorer](#).

**Release Information** Statement introduced in Junos OS Release 9.2.  
 Statement introduced in Junos OS Release 9.2 for EX Series switches.  
 Support for the BGP group and neighbor hierarchy levels introduced in Junos OS Release 9.2.  
 Support for the BGP group and neighbor hierarchy levels introduced in Junos OS Release 9.3 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Enable interoperability with routing devices that use the vendor-specific outbound route filter compatibility code of 130 and code type of 128.

**NOTE:** To enable interoperability for all BGP peers configured on the routing device, include the statement at the [edit routing-options outbound-route-filter] hierarchy level.

**Default** Disabled

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Example: Configuring BGP Prefix-Based Outbound Route Filtering on page 325](#)

## bgp-static

**Syntax**

```
bgp-static {
 route destination-prefix/prefix-length {
 as-path <as-path> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator
 as-number in-address>;
 community [community-ids];
 (metric | metric2 | metric3 | metric4) value <type type>;
 (preference | preference2 | color | color2) preference <type type>;
 (tag | tag2) metric type number;
 }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-options],  
[edit logical-systems *logical-system-name* routing-options rib *routing-table-name*],  
[edit routing-options],  
[edit routing-options rib *routing-table-name*]

**Release Information** Statement introduced in Junos OS Release 14.2.

**Description** Specify a BGP-static route. You can specify any number of routes within a single BGP-static statement, and you can specify any number of BGP-static options in the configuration.

**Options** **route *destination-prefix/prefix-length***—*destination-prefix* is the network portion of the IP address, and *prefix-length* is the destination prefix length.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Hierarchy Level** [edit routing-options]  
 [edit logical-systems *logical-system-name* routing-options],  
 [edit logical-systems *logical-system-name* protocols **bgp**],  
 [edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],  
 [edit logical-systems *logical-system-name* protocols bgp group *group-name* **neighbor** *address*],  
 [edit protocols **bgp**],  
 [edit protocols bgp **group** *group-name*],  
 [edit protocols bgp group *group-name* **neighbor** *address*],

**NOTE:** 1. Complete BMP configuration, as mentioned in the syntax, can be done under the first two hierarchy levels only

2. Under other hierarchy levels, only the following configurations are supported:

- Either we can inherit or not inherit the configuration data
- Enable/disable monitoring
- Control route monitoring settings

**Release Information** Statement introduced in Junos OS Release 9.5.  
 Statement introduced in Junos OS Release 9.5 for EX Series switches.  
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.  
 Support for BMP version 3 introduced in Junos OS Release 13.3.

**Description** Configure the BGP Monitoring Protocol (BMP), which enables the routing device to collect data from the BGP Adjacency-RIB-In routing tables and periodically send that data to a monitoring station.

**NOTE:** When BMP is configured at multiple hierarchy levels, the order of preference from highest to lowest is as follows:

1. [edit protocols bgp group *group-name* neighbor *address*]
2. [edit protocols bgp group *group-name*]
3. [edit protocols bgp bmp]
4. [edit routing-options bmp-station *station-name*]
5. [edit routing-options bmp]

For example, if BMP is configured at both [edit routing-options] and [edit protocols bgp] hierarchy levels, the configuration at the protocols BGP level takes precedence over the routing options configuration.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

 [edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify the cluster identifier to be used by the route reflector cluster in an internal BGP group.

### CAUTION:

If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same AS number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an IBGP group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.

**NOTE:** If you change the address family specified in the [edit protocols bgp family] hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.

**Options**    *cluster-identifier*—4-byte number (such as an IPv4 address).

**Required Privilege**    routing—To view this statement in the configuration.

**Level**    routing-control—To add this statement to the configuration.

The <b><i>community-ids</i></b> format varies according to the type of attribute that you use.</p> <p>The BGP community attribute format is <b><i>as-number:community-value</i></b>:</p> <ul style="list-style-type: none"> <li><b><i>as-number</i></b>—AS number of the community member. It can be a value from 1 through 65,535. The AS number can be a decimal or hexadecimal value.</li> <li><b><i>community-value</i></b>—Identifier of the community member. It can be a number from 0 through 65,535.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

For more information about BGP community attributes, see the “Configuring the Extended Communities Attribute” section in the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

For specifying the BGP community attribute only, you also can specify **community-ids** as one of the following well-known community names defined in RFC 1997:

- **no-advertise**—Routes containing this community name are not advertised to other BGP peers.
- **no-export**—Routes containing this community name are not advertised outside a BGP confederation boundary.
- **no-export-subconfed**—Routes containing this community are advertised to IBGP peers with the same AS number, but not to members of other confederations.
- **llgr-stale**—Adds a community to a long-lived stale route when it is readvertised.
- **no-llgr**—Marks routes which a BGP speaker does not want to be retained by LLGR. The Notification message feature does not have any associated configuration parameters.

**NOTE:** Extended community attributes are not supported at the [edit routing-options] hierarchy level. You must configure extended communities at the [edit policy-options] hierarchy level. For information about configuring extended communities, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*.

As defined in RFC 8092, BGP large community uses 12-byte encoding and the format for BGP large **community-ids** is:

**large:** *global-administrator:assigned-number:assigned-number*

**large** indicates BGP large community.

**global-administrator** is the administrator. It is a 4-byte AS number.

**assigned-number** is a 4-byte value used to identify the local provider. BGP large community uses two 4-byte assigned number to identify the local provider.

|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>              | <p>Enable route flap damping. BGP route flapping describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. Flap damping reduces the number of update messages sent between BGP peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.</p> <p>You typically apply flap damping to external BGP (EBGP) routes (that is, to routes in different ASs). You can also apply it within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level. When you apply flap damping at the address family level, it works for both IBGP and EBGP.</p> |
| <b>Default</b>                  | Flap damping is disabled on the routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b> | Statement introduced in Junos OS Release 18.1R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | <p>Defer initial multipath calculation until all BGP routes are received. When multipath is enabled, BGP inserts the route into the multipath queue each time a new route is added or whenever an existing route changes. When multiple paths are received through BGP add-path feature, BGP might calculate one multipath route multiple times. This slows down the BGP RIB (also known as the routing table) learning rate. With this feature enabled the router does not start BGP multipath calculation until end-of-RIB marker is received. Configure this option to delay multipath calculation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Alternatively to delay the multipath calculation the BGP multipath job priority can be modified using [multipath-build-priority](#) configuration statement at [\[edit protocols bgp\]](#) hierarchy level.

**Options**    **maximum-delay**— Specify a value in seconds to indicate the maximum time that a device must delay the multipath calculation after a peer is up.  
**Range:** 1 through 3600 seconds

**Required Privilege Level**    routing

| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1F6 for the MX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>         | <p>Configure this option to delay route updates for a specified family until the forwarding table is synchronized. When a device starts up, BGP establishes peering sessions with its neighbors and receives route updates. These route updates are then readvertised as more specific BGP routes or less specific aggregates. Advertising routes prematurely, that is, before all the available routes are installed in the forwarding table, might result in traffic loss.</p> <p>In multihomed networks, this behavior might cause unnecessary loss of service when a BGP session at the primary provider edge comes up. This problem is more pronounced when the primary provider edge device advertises route aggregates, because few aggregate prefixes can be announced more quickly to the network peers than a full routing table with thousands of more specific prefixes to the forwarding table. In order to avoid this problem, the device must delay a BGP route advertisement until the associated forwarding state is installed into the forwarding table. This feature allows a Junos OS device to do so, and allows you to configure the minimum and maximum delay periods.</p> |
| <b>Options</b>             | <p><b>minimum-delay</b>—(Optional) Specify a minimum delay, in seconds, in advertising the routes.</p> <p><b>inbound-convergence <i>inbound-convergence</i></b>—(Optional) Specify a minimum delay in route advertisement after the source peer has sent all route updates. The device waits at least for the configured duration after inbound convergence has completed at the source of the route. For BGP routes, the source peer sends the initial route updates, for example after end-of-rib is received.</p> <p><b>Default:</b> 120 seconds</p> <p><b>Range:</b> 1 through 36000 seconds</p> <p><b>routing-uptime <i>routing-uptime</i></b>—(Optional) Specify the minimum delay, in seconds, before sending a route advertisement after the routing protocol process (rpd) starts.</p>                                                                                                                                                                                                                                                                                                                                                                                                   |

The device waits for at least the configured duration before sending out route advertisements to its peers.

**Default:** 0 seconds

**Range:** 1 through 36000 seconds

**maximum-delay**—(Optional) Specify a maximum delay, in seconds, before advertising routes to peers.

**route-age *routing-age***—(Optional) Specify a maximum delay in sending a route advertisement after route aggregates have been created, that is, the route age. The device suspends waiting for the routes to be downloaded to the forwarding table at the configured route age and starts sending route advertisements to its peers.

**Default:** 0 seconds

**Range:** 1 through 36000 seconds

**routing-uptime *routing-uptime***—(Optional) Specify the maximum delay in seconds before sending a route advertisement after the routing protocol process (rpd) starts. The device does not wait more than the configured duration before sending out route advertisements to its peers.

**Default:** 0 seconds

**Range:** 1 through 36000 seconds

| <b>Description</b>         | <p>Enable BFD failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

The remaining statement is explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <div>  <p><b>NOTE:</b> When you disable graceful restart at one level in the configuration statement hierarchy, it is also disabled at lower levels in the same hierarchy. For example, if you disable graceful restart at the [edit protocols bgp group <i>group-name</i>] hierarchy level, it is disabled for all the peers in the group. Therefore, if you want to enable graceful restart for some peers in a group and disable it for others, enable graceful restart at the [edit protocols bgp group <i>group-name</i>] hierarchy level and disable graceful restart for each peer at the [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>] hierarchy level.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>routing—To view this statement in the configuration.<br/>         routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## disable (Long-Lived Graceful Restart for BGP Restarter)

**Syntax**    disable;

**Hierarchy Level**    [edit logical-systems *logical-system-name* protocols bgp **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter]

**NOTE:** Each routing table is identified by the protocol family or address family indicator (AFI) and a subsequent address family identifier (SAFI). The AFI parameter can be one of the (l2vpn | inet | route-target) protocols and the SAFI parameter can be either of the (flow | labeled-unicast) protocols for inet family and one of the (auto-discovery-mspw | auto-discovery-only | signaling) protocols for L2VPN family..

Configuring LLGR does not require that BGP graceful restart also be configured. The long-lived-graceful-restart section is visible only for families l2vpn, inet labeled-unicast, inet flow and route-target. It is prohibited for inet-mvpn, inet6-mvpn and inet-mdt. It is hidden for other families.

**Release Information**    Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>              | <p>Disable the long-lived graceful restart capability for BGP sessions on the restarting router. A hidden <b>enable</b> attribute can be used to override an inherited disable attribute. Configuring graceful-restart long-lived restarter at the neighbor level (when it is not configured at the containing group level or globally) causes an internal group to be split.</p> <p>When LLGR restarter is enabled or disabled for a family or the stale- time is changed, the session is reset so that the new capability can be sent to the neighbor.</p> <p>The stanzas in the per-family graceful-restart long-lived restarter configuration section enables LLGR restarter mode negotiation for BGP globally, or for a group or neighbor. The values are inherited by groups from the global configuration, and by neighbors from the group configuration. The disable attribute is used to override configuration inherited from a higher level. It does not disable LLGR receiver mode; you must disable LLGR receiver mode explicitly for all families as necessary.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | <p>Disables the transmission of the N flag in the graceful restart capability negotiation, but in addition, it disables the new rules for invoking graceful restart receiver mode as specified in the IETF bgp-gr-notification draft, and disables the transmission of the Hard Reset subcode. The Hard Reset subcode is continued to be observed when received in a Notify or a Cease message. The BGP protocol sends a notification NOTIFICATION message and reset the peering session to handle the error condition. BGP graceful restart that permits the operational procedures to be performed when the BGP speaker receives a notification message.</p> <p>You can define this setting at the [edit protocols bgp graceful-restart], [edit protocols bgp <b>group</b> <i>group-name</i> graceful-restart], or [edit protocols bgp <b>group</b> <i>group-name</i> <b>neighbor</b> <i>neighbor-address</i> graceful-restart] hierarchy level.</p>                                                                                                                                     |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.<br/> routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Disables the transmission of the notification (N) flag in the graceful restart capability negotiation. The BGP protocol sends a notification NOTIFICATION message and reset the peering session to handle the error condition. BGP graceful restart that permits the operational procedures to be performed when the BGP speaker receives a notification message. This behavior permits the BGP speaker to avoid flapping reachability and continue forwarding while the BGP speaker restarts the session to handle errors detected in the BGP protocol. You can define this setting at the [edit protocols bgp graceful-restart], [edit protocols bgp group <i>group-name</i> graceful-restart], or [edit protocols bgp group <i>group-name</i> neighbor <i>neighbor-address</i> graceful-restart] hierarchy level.</p> <p>Disables the transmission of the N flag in the graceful restart capability negotiation, but in addition, it disables the new rules for invoking graceful restart receiver mode as specified in the IETF bgp-gr-notification draft, and disables the transmission of the Hard Reset subcode. The Hard Reset subcode is continued to be observed when received in a Notify or a Cease message.</p> |

**Release Information** Statement introduced in Junos OS Release 17.3R1 on the MX Series.

**Description** Configure dynamic IPv4-over-IPv6 tunnels and define their attributes to forward IPv4 traffic over an IPv6-only network. IPv4 traffic is tunneled from customer premises equipment to IPv4-over-IPv6 gateways. You must also configure [extended-nexthop](#) option at [edit protocols bgp family inet unicast] hierarchy level to allow BGP to route IPv4 address families over an IPv6 session.

**Options** **gre**—Enable dynamic generic routing encapsulation type tunnel mode for IPv4  
**Values:**

- **next-hop-based-tunnel**—Enable next hop base dynamic-tunnel for steering IPv4 traffic with IPv6 next hop address.

**source-address**—Specify the source address of the tunnel.

The remaining statements are explained separately. See [CLI Explorer](#).

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2R4 for the MX Series and PTX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Enable egress peer engineering to direct core service traffic such as MPLS RSVP to a specific single-hop egress BGP peer. The ingress BGP peer can traffic-engineer the core inet unicast and inet6 unicast service traffic using BGP labeled unicast towards a specific egress BGP peer, which is also the AS boundary router.</p> <p>You can enable MPLS fast reroute (FRR) on the egress BGP peer, which has traffic engineering enabled. The AS boundary router switches to the backup path when the primary link fails. Specify a predefined template with one or more backup paths. You can define a template using the <a href="#">egress-te-backup-paths</a> configuration statement and configure one or more backup path for MPLS FRR. The backup paths specified in the template must belong to the same address family as the BGP peer.</p>                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>none</b>—Enable traffic engineering on the egress peer.</p> <p><b>backup-path <i>backup-path</i></b> —(Optional) Specify a predefined template that has the configured backup path for MPLS fast reroute.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b> | Statement introduced in Junos OS Release 14.2 R4 for the MX Series and PTX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | <p>Specify backup paths for MPLS fast reroute (FRR) on an egress peer, which has traffic engineering enabled. Egress peer engineering directs core service traffic such as MPLS RSVP to a specific egress BGP peer. The ingress BGP peer can traffic-engineer the core inet unicast and inet6 unicast service traffic using BGP labeled unicast towards a specific egress BGP peer, which is also the AS boundary router.</p> <p>Specify a backup path through another directly connected external BGP peer. The configured backup path provides MPLS fast reroute when the primary link fails, and the AS boundary router redirects the traffic received from the core to the this backup path. You can configure more than one backup path on the egress BGP peer. The specified backup paths are automatically installed into the MPLS forwarding table of the egress BGP peer configured with the egress traffic engineering feature.</p> |
| <b>Options</b>             | <p><b>template <i>path-name</i></b>—Define a template that can be reused by multiple BGP groups or peers. All addresses listed in one template must belong to the same IP address family as the protected device that is the egress BGP peer.</p> <p><b>ip-forward <i>rti-name</i></b>—(Optional) Configure this option if you want the egress peer to perform an IP look up in the <b>inet6.0</b> table for backup path that egress BGP peer must use for faster reroute. You can optionally specify a routing instance. If you do not specify a routing instance, the device configures the backup path for the master instance.</p> <p>You cannot use this option with the <b>remote-nexthop</b> option.</p>                                                                                                                                                                                                                               |

**CAUTION:** **ip-forward** option might cause forwarding loops if the IP route chooses an internal path. To avoid forwarding loops configure a virtual routing and forwarding (VRF) instance with leaked external routes only, and use this VRF instance with the **ip-forward** option.

**peer *peer-addr***—(Optional) Specify another directly connected external BGP peer that the device must use for faster reroute when the primary link fails. Each template can specify one or more external BGP peers.

**remote-nexthop *remote-nh-addr***—(Optional) Specify a remote next-hop address if transit peering is not available locally to tunnel traffic to another AS boundary router in the local AS that has transit connectivity. The specified remote next-hop address must have the ability to forward this redirected traffic to its destination. This option does not support multiple routing instances; therefore, do not use this option with the **ip-forward** option.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for the M Series, MX Series, T Series, and PTX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Enforce that the first (left-most) autonomous system number (ASN) in AS-path is the previous neighbor's ASN. When configured, this statement enforces that as the domain is transited, the routes received from an EBGp peer have the peer's ASN in the left-most position of the AS path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1.<br>Statement introduced in Junos OS Release 17.2R1 for QFX10000 Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | Insert the entropy label into the BGP labeled unicast LSP packets, which assists the transit router in load-balancing BGP traffic across equal-cost multipaths or link aggregation groups. The ingress label edge router inspects the flow information of a packet and maps it to an entropy label, which is inserted into the BGP label stack. LSRs in the core use this entropy label as the key to hash the packet and direct it to the correct path.                                                                                                                                                   |
| <b>Options</b>                  | <p><b>import <i>policy-name</i></b>— (Optional) Specify a policy that lists the routes that allow the use of entropy labels.</p> <p><b>no-next-hop-validation</b>— (Optional) Do not validate the next-hop field in the entropy label capability attribute against the route next hop.</p>                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Apply one or more policies to routes being exported from the routing table into BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.3R1 on the MX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Configure extended next-hop encoding for BGP groups with IPv6 peers to route IPv4 address families over an IPv6 session. Configure dynamic IPv4-over-IPv6 tunnels and define their attributes to forward IPv4 traffic over an IPv6-only network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>         | <p>Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

- Options**
- any**—Configure the family type to be both unicast and multicast.
  - evpn**—Configure NLRI parameters for Ethernet VPNs (EVPNs).
  - inet**—Configure NLRI parameters for IPv4.
  - inet6**—Configure NLRI parameters for IPv6.
  - inet-mdt**—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.
  - inet-mvpn**—Configure NLRI parameters for IPv4 for multicast VPNs.
  - inet6-mvpn**—Configure NLRI parameters for IPv6 for multicast VPNs.
  - inet-vpn**—Configure NLRI parameters for IPv4 for Layer 3 VPNs.
  - inet6-vpn**—Configure NLRI parameters for IPv6 for Layer 3 VPNs.
  - inet6-vpn**—Configure NLRI parameters for IPv6 for Layer 3 VPNs.
  - iso-vpn**—Configure NLRI parameters for IS-IS for Layer 3 VPNs.
  - l2vpn**—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.
  - labeled-unicast**—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with **inet** and **inet6**.
  - multicast**—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.
  - unicast**—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes. The default family type is unicast.
  - segment-routing-te**—Configure the family type to be segment routing traffic engineering. This means that BGP peers only carry segment routing policies for traffic steering.
- The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the file settings for tracing resource public key infrastructure (RPKI) BGP route validation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b><i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b><i>files number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached (<b><i>xk</i></b> to specify KB, <b><i>xm</i></b> to specify MB, or <b><i>xg</i></b> to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b><i>size</i></b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 3 files</p> <p><b><i>no-world-readable</i></b>—(Optional) Restrict file access to the user who created the file.</p> <p><b><i>size size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b><i>files</i></b> option.</p> <p><b>Syntax:</b> <b><i>xk</i></b> to specify KB, <b><i>xm</i></b> to specify MB, or <b><i>xg</i></b> to specify GB</p> <p><b>Range:</b> 10 KB through 1 GB</p> <p><b>Default:</b> 128 KB</p> <p><b><i>world-readable</i></b>—(Optional) Enable unrestricted file access.</p> |

**Hierarchy Level** [edit routing-options rib inet6.0],  
[edit routing-instances *routing-instance-name* routing-options rib inet6.0]

**Release Information** Statement introduced in Junos OS Release 16.1 for the MX Series.

**Description** Configure the BGP flow specification for the IPv6 address family to automate coordination of traffic filtering rules and to allow propagation of traffic flow specification rules for IPv6 and IPv6 VPN in order to mitigate distributed denial-of-service attacks. Flow specification provides protection against denial-of-service attacks and restricts bad traffic that consumes bandwidth and stops it near the source.

.....

**NOTE:** To propagate IPv6 flow specification routes through BGP, enable family `inet6 flow` or `inet6-vpn flow` at the `[edit protocols bgp family]` hierarchy level on BGP routers in the network.

.....

**Options** **destination** *ipv6-prefix*—IP destination address field.

**destination-port** *destination-port-names*—TCP or User Datagram Protocol (UDP) destination port field. You cannot specify both the **port** and **destination-port** match conditions in the same term.

In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): **afs** (1483), **bgp** (179), **biff** (512), **bootpc** (68), **bootps** (67), **cmd** (514), **cvspserver** (2401), **dhcp** (67), **domain** (53), **eklogin** (2105), **ekshell** (2106), **exec** (512), **finger** (79), **ftp** (21), **ftp-data** (20), **http** (80), **https** (443), **ident** (113), **imap** (143), **kerberos-sec** (88), **klogin** (543), **kpasswd** (761), **krb-prop** (754), **krbupdate** (760), **kshell** (544), **ldap** (389), **login** (513), **mobileip-agent** (434), **mobilip-mn** (435), **msdp** (639), **netbios-dgm** (138), **netbios-ns** (137), **netbios-ssn** (139), **nfsd** (2049), **nntp** (119), **ntalk** (518), **ntp** (123), **pop3** (110), **pptp** (1723), **printer** (515), **radacct** (1813), **radius** (1812), **rip** (520), **rkinit** (2108), **smtp** (25), **snmp** (161), **snmptrap** (162), **snpp** (444), **socks** (1080), **ssh** (22), **sunrpc** (111), **syslog** (514), **tacacs-ds** (65), **talk** (517), **telnet** (23), **tftp** (69), **timed** (525), **who** (513), **xdmcp** (177), **zephyr-clt** (2103), or **zephyr-hm** (2104).

**dscp value**—Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.

**Range:** You can specify DSCP in hexadecimal or decimal form from 0 through 63.

**flow-label** *numeric-expression*—The value of this field ranges from 0 through 1048575.

This match condition is supported only on Junos Trio chipset-based devices that are configured for **enhanced-ip** mode.

**fragment** *fragment-value*—The keywords are grouped by the fragment type with which they are associated:

- **first-fragment**
- **is-fragment**
- **last-fragment**
- **not-a-fragment**

This match condition is supported only on Junos Trio chipset-based devices that are configured for **enhanced-ip** mode.

**icmp6-code** *icmp6-code-value*—ICMP6 code field. This value or keyword provides more specific information than **icmp6-type**. Because the value's meaning depends on the associated **icmp6-type** value, you must specify **icmp6-type** along with **icmp6-code**.

In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:

- parameter-problem: **ip-header-bad** (0), **required-option-missing** (1)
- redirect: **redirect-for-host** (1), **redirect-for-network** (0), **redirect-for-tos-and-host** (3), **redirect-for-tos-and-net** (2)
- time-exceeded: **ttl-eq-zero-during-reassembly** (1), **ttl-eq-zero-during-transit** (0)
- unreachable: **communication-prohibited-by-filtering** (13), **destination-host-prohibited** (10), **destination-host-unknown** (7), **destination-network-prohibited** (9), **destination-network-unknown** (6), **fragmentation-needed** (4), **host-precedence-violation** (14), **host-unreachable** (1), **host-unreachable-for-TOS** (12), **network-unreachable** (0), **network-unreachable-for-TOS** (11), **port-unreachable** (3), **precedence-cutoff-in-effect** (15), **protocol-unreachable** (2), **source-host-isolated** (8), **source-route-failed** (5)

**icmp6-type** *icmp6-type-value*—ICMP6 packet type field. Normally, you specify this match in conjunction with the **protocol** match statement to determine which protocol is being used on the port.

In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): **echo-reply** (0), **echo-request** (8), **info-reply** (16), **info-request** (15), **mask-request** (17), **mask-reply** (18), **parameter-problem** (12), **redirect** (5), **router-advertisement** (9), **router-solicit** (10), **source-quench** (4), **time-exceeded** (11), **timestamp** (13), **timestamp-reply** (14), or **unreachable** (3).

**packet-length** *packet-length*—Total IP packet length value can range from 0 through 65535.

**port** *port-names*—TCP or UDP source or destination port field. You cannot specify both the **port** match condition and either the **destination-port** or **source-port** match condition in the same term.

In place of the numeric value, you can specify one of the text synonyms listed under **destination-port**.

**prefix-offset** *number*—(Optional) Specify the number of bits that must be skipped before Junos OS starts matching the prefix.

This match condition is supported only on Junos Trio chipset-based devices that are configured for **enhanced-ip** mode.

**protocol *number***—For IPv6, the IP protocol field is supported only on Junos Trio chipset-based devices that are configured for **enhanced-ip** mode. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): **ah** (51), **egp** (8), **esp** (50), **gre** (47), **icmp** (1), **igmp** (2), **ipip** (4), **ipv6** (41), **ospf** (89), **pim** (103), **rsvp** (46), **tcp** (6), or **udp** (17).

**source *ipv6-prefix***—IP source address field.

**source-port *source-port-names***—TCP or UDP source port field. You cannot specify the **port** and **source-port** match conditions in the same term.

In place of the numeric field, you can specify one of the text synonyms listed under **destination-port**.

**tcp-flags *tcp-flags***—TCP header format.

**accept**—Accept a packet. This is the default value.

**community *name***—Replace any communities in the route with the specified communities.

**discard**—Discard a packet silently, without sending an Internet Control Message Protocol (ICMP) message.

**mark *value***—Set a DSCP value for traffic that matches this flow. Specify a value from 0 through 63.

This action is supported only on Junos Trio chipset-based devices that are configured for **enhanced-ip** mode.

**NOTE:** Junos OS supports traffic marking extended BGP community filtering action. For IPv4 traffic, Junos OS modifies the DiffServ code point (DSCP) bits of a transiting IPv4 packet to the corresponding value of the extended community. For IPv6 packets, Junos OS modifies the first six bits of the traffic class field of the transmitting IPv6 packet to the corresponding value of the extended community.

**next-term**—Continue to the next match condition for evaluation.

**rate-limit *rate-limit***—Limit the bandwidth on the flow route. Express the limit in bits per second (bps).

**routing-instance *route-target-extended-community***—Specify a routing instance to which packets are forwarded.

**sample**—Sample the traffic on the flow route.

**Release Information** Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.

**Description** Configure the forwarding-state bit flag negotiation for BGP for individual address families. In addition to the global setting for the Forwarding State bit, the Forwarding State bit behavior can be specified for individual families. Changing the forwarding-state-bit setting has no effect on any existing sessions. Per-family BGP configuration options are added to control the Forwarding State bit in graceful restart and long-lived graceful restart capability advertisements. They can be specified for the default logical system or for a specific logical system, and for the master routing instance or a specific routing instance. The **per-family forwarding-state-bit** attribute overrides the default rules or the global configuration for setting the Forwarding State bit.

The setting of the F bit (and the "Forwarding State" bit of the accompanying GR capability) depends in part on deployment considerations. The F bit can be interpreted to indicate the helper router needs to flush associated routes (if the bit is left clear). An important scenario in which LLGR is used is for routes that are more similar to configuration than to traditional routing (hop-by-hop forwarding instead of tunnel-based routing). For such routes, it might be useful to always set the F bit, regardless of other considerations. Similarly, for control-plane-only entities such as dedicated route reflectors, that do not participate in the forwarding plane, it is preferred that the F bit be always set. Overall, the guideline to be adopted is that if loss of state on the restarting router can reasonably be expected to cause a forwarding loop or black hole, the F bit must be set judiciously, depending on whether state has been retained. You can determine whether the F bit needs to be set or not, based on your deployment needs and configured settings. It might be necessary to advertise stale routes to a CE in some VPN deployments, even if the CE does not support this specification. In such a scenario, the network operator configuring

their PE to advertise such routes must notify the operator of the CE receiving the routes, and the CE must be configured to deprefer the routes. Typically, BGP implementations perform this behavior by matching on the LLGR\_STALE community, and setting the LOCAL\_PREF for matching routes to zero.

**Options**    **set**—Causes the value to be set according to the state of the associated FIB. Changing the per-family forwarding-state-bit setting has no effect on any existing sessions.

**from-fib**—Forces the Forwarding State bit to be set to 1.

**Required Privilege**    routing—To view this statement in the configuration.  
**Level**    routing-control—To add this statement to the configuration.

**NOTE:** Each routing table is identified by the protocol family or address family indicator (AFI) and a subsequent address family identifier (SAFI).

Configuring LLGR does not require that BGP graceful restart also be configured. The long-lived-graceful-restart section is visible only for families l2vpn, inet labeled-unicast, inet flow and route-target. It is prohibited for inet-mvpn, inet6-mvpn and inet-mdt. It is hidden for other families.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1 for the M Series, MX Series, and T Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Routing instance used for data forwarding and transport session. Use this statement in conjunction with <b>mpls-forwarding</b>, to protect against label spoofing across AS boundary routers in the context of Inter-AS VPN Option B AS boundary routers. If <b>forwarding-context</b> is not set for a VPN BGP peer, both the routing instance and forwarding context are provided by the master routing instance.</p> <p>Setting a neighbor interface as a forwarding context can be useful, for example, when configuring a common AS boundary router so that it only accepts MPLS packets from a peer AS boundary router whose labels were explicitly advertised to the common AS boundary router. The action creates a special routing instance (MFI) that is used to form a transport session with peer and to perform forwarding functions for traffic from the peer. Spoof checking is performed for peers with different MFI forwarding contexts. Because peers with the same forwarding context share the same <b>MFI.mpls.0</b> table, there is no need for spoof checking on these peers. Thus, in <b>foo.mpls.0</b>, BGP installs only VPN labels that have been advertised to the VPN AS boundary router peers using the MFI <b>foo</b> as the forwarding context. This ensures that only MPLS packets from the VPN AS boundary router that also have the advertised label are accepted.</p> |

| <b>Description</b>         | <p>Configure graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default. However, helper mode, the ability to assist a neighboring router attempting a graceful restart, is enabled by default.</p> <p>To configure the duration of the BGP graceful restart period, include the <b>restart-time</b> statement at the <b>[edit protocols bgp graceful-restart]</b> hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the <b>stale-routes-time</b> statement at the <b>[edit protocols bgp graceful-restart]</b> hierarchy level.</p> <hr/> <div>  <p><b>NOTE:</b> If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</p> </div> <hr/> <p>Enable graceful restart mode for BGP (and other protocols) by configuring graceful-restart at the routing-options level. Note that you cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally.</p> <p>For example, this configuration is required to enable graceful restart:</p> <pre>routing-options {   graceful-restart }</pre> |

If you want to disable graceful restart for some protocols, you can do this at the protocol's graceful-restart command. The following configuration along with the configuration above will keep graceful restart for all protocols but BGP.

```
protocols{
 bgp{
 graceful-restart; {
 disable;
 }
 }
}
```

The remaining statements are explained separately. See [CLI Explorer](#).

 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow)],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow)],

**NOTE:** Each routing table is identified by the protocol family or address family indicator (AFI) and a subsequent address family identifier (SAFI). The AFI parameter can be one of the (l2vpn | inet | route-target) protocols and the SAFI parameter can be either of the (flow | labeled-unicast) protocols for inet family and one of the (auto-discovery-mspw | auto-discovery-only | signaling) protocols for L2VPN family..

Configuring LLGR does not require that BGP graceful restart also be configured. The long-lived-graceful-restart section is visible only for families l2vpn, inet labeled-unicast, inet flow and route-target. It is prohibited for inet-mvpn, inet6-mvpn and inet-mdt. It is hidden for other families.

---

**Release Information** Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.

**Description** Configure the graceful restart capability for long-lived BGP sessions on the restarting router to enable BGP routing details to be retained for a longer period. It is important to retain BGP data for a longer period when the BGP control plane fails for some reason for slowly-restarting routers for a longer duration. You can define the time period for which the stale routes need to be maintained.

You can also configure the BGP long-lived graceful restarter mode negotiation mechanism for a particular address family instead of configuring this capability for all address families in a system, logical system, or routing instance.

When LLGR restarter is enabled or disabled for a family or the stale- time is changed, the session is reset so that the new capability can be sent to the neighbor.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

```

**Release Information** Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.

**Description** Configure the graceful restart capability for long-lived BGP sessions to enable BGP routing details to be retained for a longer period. It is important to retain BGP data for a longer period when the BGP control plane fails for some reason for slowly-restarting routers for a longer duration. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.

When nonstop routing (NSR) and long-lived graceful restart (LLGR) are configured together, the router negotiates the LLGR capability in the usual, regular manner, including a long-lived stale time to trigger LLGR receiver mode in its peers. However, full LLGR restarter functionality (delaying the transmission of End of RIB (EoR) markers until EoRs are received from all peers) does not function under NSR. During a full system (both Routing Engines) restart, the routing protocol daemon (rpd) does not wait for EoRs from other peers before sending its own EoR. It transmits the EoR as soon as it has transmitted the current RIB contents. This condition can cause transient outages when the network reconverges. NSR is considered to be adequate to handle all single-Routing Engine restart scenarios. The restarter mode restriction affects only scenarios where both Routing Engines (or both copies of rpd) restart simultaneously. Ordinary restarter mode configuration is not enabled with NSR. Long-lived graceful restart receiver mode is enabled by default, unless ordinary graceful restart receiver mode is disabled.

**NOTE:** If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.

Configure graceful restart globally at the **[edit routing-options]** or **[edit routing-instances *instance-name* routing-options]** hierarchy level to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.

The remaining statements are explained separately. See [CLI Explorer](#).

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Define a BGP peer group. BGP peer groups share a common type, peer autonomous system (AS) number, and cluster ID, if present. To configure multiple BGP groups, include multiple **group** statements.

By default, the group's options are identical to the global BGP options. To override the global options, include group-specific options within the **group** statement.

The **group** statement is one of the statements you must include in the configuration to run BGP on the routing device.

Each group must contain at least one peer.

**Options** *group-name*—Name of the BGP group.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>If the connection to a BMP station flaps and the <b>hold-down</b> statement is configured, the station is prevented from reconnecting to the device for the specified period of time. A flap is when the TCP session unexpectedly switches from established to non-established. If you alter the configuration of the <b>hold-down</b> statement, the hold down timer and flap counter are reset.</p> <p>You can effectively disable the <b>hold-down</b> statement by setting the <b>flaps</b> option to 10 and the <b>period</b> option to 30 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>seconds</b>—Specify the time in seconds to wait before allowing the BMP station to reconnect to the device.</p> <p><b>Default:</b> 600 seconds</p> <p><b>Range:</b> 30 through 65,535 seconds</p> <p><b>flaps <i>number</i></b>—Specify the number of BMP station flaps allowed before terminating the connection to the BMP station and triggering the hold down timer.</p> <p><b>Default:</b> 3 flaps</p> <p><b>Range:</b> 2 to 10 flaps</p> <p><b>period <i>seconds</i></b>—Specify the time in seconds for the BGP station flaps (specified using the <b>flaps</b> option) to occur before triggering the hold down timer. Every time a flap occurs, the number of flaps in the last time period is checked to see if the criteria is met.</p> <p>For example, if you defined the <b>period</b> as 60 seconds and the <b>flaps</b> as 4 and the BGP station flaps just 2 times in a 60 second period, the hold down timer would not be triggered. However, if the BGP station flaps 4 times in a 60 second period, the hold down timer would be triggered.</p> <p><b>Default:</b> 300 seconds</p> <p><b>Range:</b> 30 through 65,535 seconds</p> |

| <b>Description</b>         | <p>Configure an interval specifying how long a BFD session must remain up before a state change notification is sent.</p> <p>When you configure the hold-down interval for the BFD protocol for EBGp, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes the BGP session is down and does not send a state change notification. The <b>holddown-interval</b> statement is supported only for EBGp peers at the <b>[edit protocols bgp group <i>group-name</i> neighbor <i>address</i>]</b> hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGp peers. If you configure the hold-down interval for a multihop EBGp session, you must also configure a local IP address by including the <b>local-address</b> statement at the <b>[edit protocols bgp group <i>group-name</i>]</b> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | <p>Specify the length of time in seconds that the session between the routing device and the cache server is to be considered operational without any activity. After the hold time expires, the session is dropped.</p> <p>Reception of any protocol data unit (PDU) from the cache server resets the hold timer. The hold time must be configured to be at least 2 x the <a href="#">refresh-time</a>. If the hold time expires, the session is considered to be down. This, in turn, triggers a session restart event. During a session restart, the routing device attempts to start a session with the cache server that has the numerically highest <a href="#">preference</a>.</p> |
| <b>Options</b>                  | <p><b>seconds</b>—Time after which the session is declared down.</p> <p><b>Range:</b> 10 through 3600</p> <p><b>Default:</b> 600</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>         | <p>Specify the hold-time value to use when negotiating a connection with the peer. The hold-time value is advertised in open packets and indicates to the peer the length of time that it should consider the sender valid. If the peer does not receive a keepalive, update, or notification message within the specified hold time, the BGP connection to the peer is closed and routing devices through that peer become unavailable.</p> <p>The hold time is three times the interval at which keepalive messages are sent.</p> <p>BGP on the local routing device uses the smaller of either the local hold-time value or the peer's hold-time value received in the open message as the hold time for the BGP connection between the two peers.</p> <p>Starting in Junos OS Release 12.3, the BGP hold-time value can be zero (0). This implies that the speaker does not expect keepalive messages from its peer to maintain the BGP session. When negotiating between two peers, if one side requests a nonzero hold time and the other requests a zero hold time, the negotiation settles on the nonzero value and keepalive intervals are determined accordingly. Both sides must be set to zero for keepalive messages to stop being sent.</p> |
| <b>Options</b>             | <p><b>seconds</b>—Hold time.</p> <p><b>Range:</b> 3 through 65,535 seconds (or 0 for infinite hold time)</p> <p><b>Range:</b> 10 through 65,535 seconds for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Default:** 90 seconds

**TIP:** When you set a hold-time value of 3 through 19 seconds, we recommend that you also configure the BGP `precision-timers` statement. The `precision-timers` statement ensures that if scheduler slip messages occur, the routing device continues to send keepalive messages. When the `precision-timers` statement is included, keepalive message generation is performed in a dedicated kernel thread, which helps to prevent BGP session flaps.

Starting in Junos OS Release 17.3R1, the `precision-timers` statement is supported on QFX Series switches.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                 routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Configure the routing device so that it does not automatically reestablish BGP peer sessions after a nonstop active routing (NSR) switchover. This feature is particularly useful if you are using dynamic routing policies because the dynamic database is not synchronized with the backup Routing Engine when NSR is enabled.                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>forever</b>—Do not reestablish a BGP peer session after an non-stop routing switchover until the <b>clear bgp neighbor</b> command is issued.</p> <p><b>seconds</b>—Do not reestablish a BGP peer session after an non-stop routing switchover until after the specified period.</p> <p><b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>)</p>                                                                                                                                                |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>         | <p>Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p> <p>It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.</p> <p>Hidden routes can be viewed by using the <b>show route receive-protocol bgp neighbor-address hidden</b> command. The hidden routes can then be retained or dropped from the routing</p> |

table by configuring the **keep all | none** statement at the **[edit protocols bgp]** or **[edit protocols bgp group *group-name*]** hierarchy level.

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the **keep all** statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the **keep none** statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

**Options**    *policy-names*—Name of one or more policies.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                         routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>(Optional) Allows you to specify an initiation message for a type 0 TLV to be sent to the BMP station. The message is transmitted when a BMP station establishes a connection to the device. You can provide some information to the BMP station system administrator (for example, a contact phone number). The initiation message includes a type 1 TLV containing the SNMP sysDescr value specified in RFC 1213 <i>Management Information Base for Network Management of TCP/IP-based internets: MIB-II</i> and a type 2 TLV containing the SNMP sysName value also from RFC 1213. The string in the initiation-message message is UTF-8.</p> <p>The normal time for sending an initiation message is when the BMP session is first established. However, an initiation message change also triggers the transmission of an initiation message to current BMP sessions.</p> <p>Another event that triggers the transmission of an initiation message is when you change in the sysName or sysDescr values in the SNMP configuration. The initiation message is sent to current BMP sessions.</p> |
| <b>Options</b>                  | <b>text</b> —Specify a character string for a type 0 TLV to send with the initiation message.<br><b>Range:</b> 1 through 255 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Specify a security association to BGP peers. You can apply the security association globally for all BGP peers, to a group of peers, or to an individual peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <i>ipsec-sa</i> —Security association name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | Configure filter options for a traffic engineering policy to filter traffic based on IPv4 prefix addresses. You can specify additional parameters, such as autonomous system (AS), prefix, router ID, and system ID for filtering IPv4 traffic. If you do not specify the additional parameters, the policy matches all IPv4-prefix network layer reachability information (NLRI) subtypes. You cannot apply these filters along with other NLRI filters. |
| <b>Options</b>                  | <p><b>as <i>as</i></b>—Specify an AS to filter traffic.</p> <p><b>router-id <i>router-id</i></b>—Specify an IP prefix to match the router-ID against.</p> <p><b>prefix</b>—Specify an IPv4 prefix to match against.</p> <p><b>system-id <i>system-id</i></b>—Specify an ISO address for the node.</p>                                                                                                                                                     |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Control whether or not Junos OS keeps in memory and hides certain routes.

If the **keep none** statement is used, Junos OS does not retain in memory and hide routes that are rejected because of a BGP import policy. Nor does BGP keep in memory and hide routes that are declared unfeasible due to BGP sanity checks. The **keep none** statement causes Junos OS to discard from memory the routes that are rejected due to BGP-specific logic or BGP evaluation. When a route is rejected because of some non-BGP-specific reason, the **keep none** statement has no effect on this route. This rejected route is retained in memory and hidden even though **keep none** is configured. An example of this type of hidden route is a route for which the protocol nexthop is unresolved.

The routing table can retain the route information learned from BGP in one of the following ways:

- Default (omit the **keep** statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.
- **keep all**—Keep all route information that was learned from BGP.
- **keep none**—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure **keep none** for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.

In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and **keep all**.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.

This can happen in the following cases:

- Another vendor's routing device advertises the routes back to the sending peer.
- The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring **advertise-peer-as**.
- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When **keep all** is configured, the behavior of discarding routes received in the above scenarios is overridden.

**CAUTION:** If you add or remove **keep all** or **keep none** and the peer does not support session restart, the associated BGP sessions are restarted (flapped). To determine if a peer supports refresh, check for **Peer supports Refresh capability** in the output of the **show bgp neighbor** command.

**Default** By default, BGP retains incoming rejected routes in memory and hides them. If you do not include the **keep** statement, most routes are retained in the routing table. BGP keeps all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.

**Options** **all**—Retain all routes.

**none**—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking. When **keep none** is configured for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Associate a security key with the specified BFD session using the name of the security keychain. Each key has a unique start time within the keychain. Keychain authentication allows you to change the password information periodically without bringing down peering sessions. This keychain authentication method is referred to as <i>hitless</i> because the keys roll over from one to the next without resetting any peering sessions or interrupting the routing protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <b><i>key-chain-name</i></b> —Name of the authentication keychain. The keychain name must match one of the keychains configured with the <b>key-chain <i>key-chain-name</i></b> statement at the [edit security authentication-key-chain] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## local-address (Origin Validation for BGP)

**Syntax** `local-address local-ip-address;`

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *instance-name* routing-options validation group *group-name* session *server-ip-address*],  
[edit logical-systems *logical-system-name* routing-options validation group *group-name* session *server-ip-address*],  
[edit routing-instances *instance-name* routing-options validation group *group-name* session *server-ip-address*],  
[edit routing-options validation group *group-name* session *server-ip-address*]

**Release Information** Statement introduced in Junos OS Release 12.2.

**Description** Configure a local IP address of the session. If the local cache server has inbound firewall filtering, it might be necessary to specify a local IP address to use for this session.

**Options** *local-ip-address*—Local IP address to be used for the outgoing connection to the cache server.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Specify the address of the local end of a BGP session. This address is used to accept incoming connections to the peer and to establish connections to the remote peer. When none of the operational interfaces are configured with the specified local address, a session with a BGP peer is placed in the idle state.</p> <p>You generally configure a local address to explicitly configure the system's IP address from BGP's point of view. This IP address can be either an IPv6 or IPv4 address. Typically, an IP address is assigned to a loopback interface, and that IP address is configured here.</p> <p>For internal BGP (IBGP) peering sessions, generally the loopback interface (lo0) is used to establish connections between the IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus, the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.</p> <p>When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The <b>local-address</b> statement enables you to specify the source information in BGP update messages. If you omit the <b>local-address</b> statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally result in the egress interface address being the expected</p> |

source of update messages. When this happens, the peering session is not established because a mismatch exists between the expected source address (the egress interface of the peer) and the actual source (the loopback interface of the peer). To ensure that the expected source address matches the actual source address, specify the loopback interface address in the **local-address** statement.

**NOTE:** Although a BGP session can be established when only one of the paired routing devices has **local-address** configured, we strongly recommend that you configure **local-address** on both paired routing devices for IBGP and multihop EBGP sessions. The **local-address** statement ensures that deterministic fixed addresses are used for the BGP session end-points.

If you include the **default-address-selection** statement in the configuration, the software chooses the system default address as the source for most locally generated IP packets. For protocols in which the local address is unconstrained by the protocol specification, for example IBGP and multihop EBGP, if you do not configure a specific local address when configuring the protocol, the local address is chosen using the same methods as other locally generated IP packets.

**Default** If you do not configure a local address, BGP uses the routing device's source address selection rules to set the local address.

**Options** **address**—IPv6 or IPv4 address of the local end of the connection.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>(Optional) Specifies the IPv4 or IPv6 address for the BMP connection on the device. We recommend that you configure a local address. For both active and passive modes, configure a loopback local address. This provides a consistent local endpoint, is useful for debugging, and assures greater reliability for the BMP connection since it is not tied to a single router interface.</p> <p>For passive mode, specifying a local address is required. It also provides some security against a malicious BMP connection. For active mode, we also recommend configuring a local address to help ensure reliability.</p> <p>If you change the local address, the BMP station connection flaps when you commit the configuration.</p> |
| <b>Options</b>                  | <b><i>address</i></b> —Specify the IPv4 or IPv6 address for the BMP connection on the local device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
*alias* option introduced in Junos OS Release 9.5.  
*no-prepend-global-as* option introduced in Junos OS Release 9.6.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify the local autonomous system (AS) number. An AS is a set of routing devices that are under a single technical administration and generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices.

Internet service providers (ISPs) sometimes acquire networks that belong to a different AS. When this occurs, there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. In this case, it might not be desirable to modify peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a *local AS*.

**NOTE:** If you are using BGP on the routing device, you must configure an AS number before you specify the local as number.

In Junos OS Release 9.1 and later, the AS numeric range in plain-number format is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65546 in plain-number format is represented as 1.10 in the AS-dot notation format.

The auto route target feature does not support the local AS number for BGP neighbors associated with the Ethernet Virtual Private Network Instance (EVI).

.....

**Options** **alias**—(Optional) Configure the local AS as an alias of the global AS number configured for the router at the **[edit routing-options]** hierarchy level. As a result, a BGP peer considers any local AS to which it is assigned as equivalent to the primary AS number configured for the routing device. When you use the **alias** option, only the AS (global or local) used to establish the BGP session is prepended in the AS path sent to the BGP neighbor.

**autonomous-system**—AS number.

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format

**Range:** 0.0 through 65535.65535 in AS-dot notation format

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**NOTE:** If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the EBGP or IBGP peer is the same as the current AS, do not use the **local-as** statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the **local-as** statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

**Range:** 1 through 10

**Default:** 1

**no-prepend-global-as**—(Optional) Specify to strip the global AS and to prepend only the local AS in AS paths sent to external peers.

**private**—(Optional) Configure to use the local AS only during the establishment of the BGP session with a BGP neighbor but to hide it in the AS path sent to external BGP peers. Only the global AS is included in the AS path sent to external peers.

**NOTE:** The **private** and **alias** options are mutually exclusive. You cannot configure both options with the same **local-as** statement.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## local-interface (IPv6)

**Syntax** `local-interface interface-name;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols bgp **group** *group-name* **neighbor** *ipv6-link-local-address*],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *ipv6-link-local-address*],  
[edit protocols bgp group *group-name* **neighbor** *ipv6-link-local-address*],  
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *ipv6-link-local-address*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Specify the interface name of the EBGp peer that uses IPv6 link-local addresses. This peer is link-local in scope.

**TIP:** Configure a local interface only if you need to use the IPv6 link-local addresses as BGP endpoints for an IPv6 BGP session.

**NOTE:** The local interface option does not work if you have configured the `allow` option at the [edit protocols bgp group *group-name*] hierarchy level. You need to configure a BGP neighbor with an IPv6 link-local address if you have implicitly allowed peer connections from specified networks or hosts.

**Options** *interface-name*—Interface name of the EBGp IPv6 peer.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Modify the value of the <b>LOCAL_PREF</b> path attribute, which is a metric used by IBGP sessions to indicate the degree of preference for an external route. The route with the highest local preference value is preferred.</p> <p>The <b>LOCAL_PREF</b> path attribute always is advertised to internal BGP peers and to neighboring confederations. It is never advertised to external BGP peers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>                  | If you omit this statement, the <b>LOCAL_PREF</b> path attribute, if present, is not modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>local-preference</b>—Preference to assign to routes learned from BGP or from the group or peer.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> If the <b>LOCAL_PREF</b> path attribute is present, do not modify its value. If a BGP route is received without a <b>LOCAL_PREF</b> attribute, the route is handled locally (it is stored in the routing table and advertised by BGP) as if it were received with a <b>LOCAL_PREF</b> value of 100. By default, non-BGP routes that are advertised by BGP are advertised with a <b>LOCAL_PREF</b> value of 100.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1 for the MX Series, PTX Series, and T Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specify the local IPv4 address of a device that is also configured with an IPv6 address in a dual-stack environment. This enables BGP to advertise IPv4 unicast reachability with IPv4 next hop to remote IPv4 hosts over an IPv6 BGP session.</p> <p>BGP advertises IPv4 unicast reachability with IPv4 next hop over an IPv6 BGP session only where IPv4 is configured at both endpoints. You cannot configure this feature for the inet6 unicast, inet6 multicast, or inet6 labeled-unicast address families because BGP already has the capability to advertise these address families over an IPv6 BGP session.</p> <p>The configured <b>local-ipv4-address</b> is used only when BGP advertises routes with self-next hop. When IBGP advertises routes learned from EBGp peers, or the route reflector advertises BGP routes to its clients, BGP does not change the route next hop and ignores the configured <b>local-ipv4-address</b> and uses the original IPv4 next hop.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## long-lived (Graceful Restart for BGP Restarter)

**Syntax**

```
long-lived {
 restarter {
 disable;
 stale-time interval;
 }
}
```

**Hierarchy Level**

[edit logical-systems *logical-system-name* protocols bgp **family** inet (labeled-unicast | unicast | multicast) graceful-restart],  
 [edit logical-systems *logical-system-name* protocols bgp group *group-name* **family** inet (labeled-unicast | unicast | multicast) graceful-restart],

 [edit protocols bgp **family** inet (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit protocols bgp group *group-name* **family** inet (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit protocols bgp group *group-name* neighbor *address* **family** inet (labeled-unicast | flow) graceful-restart long-lived restarter]

**Release Information** Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.

**Description** Configure the long-lived graceful restart mechanism on the restarter router to preserve BGP routing details for a longer period from a failed BGP peer than the duration for which such routing information is maintained using the BGP graceful restart functionality. Long-lived graceful restart restarter mode is enabled by default, unless ordinary graceful restart on the restarter router is disabled.

**NOTE:** If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.

Configure graceful restart globally at the [edit routing-options] or [edit routing-instances *instance-name* routing-options] hierarchy level to enable the feature. You cannot enable

graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.

The remaining statements are explained separately. See [CLI Explorer](#).

| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | <p>Configure the long-lived graceful restart mechanism to preserve BGP routing details for a longer period from a failed BGP peer than the duration for which such routing information is maintained using the BGP graceful restart functionality. Long-lived graceful restart receiver or helper mode is enabled by default, unless ordinary graceful restart receiver or helper mode is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**NOTE:** If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.

Configure graceful restart globally at the [edit routing-options] or [edit routing-instances *instance-name* routing-options] hierarchy level to enable the feature. You cannot enable

graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.

The remaining statements are explained separately. See [CLI Explorer](#).

## loops (BGP Address Family)

**Syntax** `loops number;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols bgp family *address-family*],  
[edit logical-systems *logical-system-name* protocols bgp group *group-name* family  
*address-family*],  
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address*  
family *address-family*],  
[edit protocols bgp family *address-family*],  
[edit protocols bgp group *group-name* family *address-family*],  
[edit protocols bgp group *group-name* neighbor *address* family *address-family*]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** For the specified BGP address family, allow the local device's AS number in the received AS paths and specify the number of times the detection of the local device's AS in the AS\_PATH attribute is allowed. If the count exceeds the specified loop count, the system discards this route. For example, if you configure **loops 1**, the route is discarded if the neighbor's local AS is detected in the path more than once. This prevents routing loops and is the default behavior. If you configure **loops 2**, the route is discarded if the neighbor's local AS is detected more than 2 times.

For debugging, you can configure the **keep all** option. If you want to hide this route.

Some examples of BGP address families are as follows:

- **inet unicast**
- **inet-vpn multicast**
- **inet6 any**
- **l2vpn auto-discovery-only**
- ...

This list is truncated for brevity. For a complete list of protocol families for which you can specify the **loops** statement, enter the **help apropos loops** configuration command at the **[edit protocols bgp]** hierarchy level on your device.

```
[edit protocols bgp]
user@host# help apropos loops
set family inet unicast loops
 Allow local AS in received AS paths
set family inet unicast loops <loops>
 AS-Path loop count
set family inet multicast loops
 Allow local AS in received AS paths
set family inet multicast loops <loops>
 AS-Path loop count
set family inet flow loops
 Allow local AS in received AS paths
set family inet flow loops <loops>
```

```

 AS-Path loop count
set family inet any loops
 Allow local AS in received AS paths
set family inet any loops <loops>
 AS-Path loop count
set family inet labeled-unicast loops
 Allow local AS in received AS paths
...

```

**NOTE:** The behavior of this statement is slightly different from the [loops \(Autonomous System\)](#) statement.

**Options** *number*—Maximum number of times that the local device's AS number is allowed in the AS\_PATH attribute to accept the route.

**Range:** 1 through 10

**Default:** None. The system does not take any action unless the [loops \(BGP Address Family\)](#) statement is configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify loose authentication checking on the BFD session. Use loose authentication for transitional periods only when authentication might not be configured at both ends of the BFD session.</p> <p>By default, strict authentication is enabled and authentication is checked at both ends of each BFD session. Optionally, to smooth migration from nonauthenticated sessions to authenticated sessions, you can configure <i>loose checking</i>. When loose checking is configured, packets are accepted without authentication being checked at each end of the session.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | <p>Specify the metric for all routes sent using the multiple exit discriminator (MED, or <b>MULTI_EXIT_DISC</b>) path attribute in update messages. This path attribute is used to discriminate among multiple exit points to a neighboring AS. If all other factors are equal, the exit point with the lowest metric is preferred.</p> <p>You can specify a constant metric value by including the <b>metric</b> option. For configurations in which a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the <b>multihop</b> command—you can specify a variable metric by including the <b>minimum-igp</b> or <b>igp</b> option.</p> <p>You can increase or decrease the variable metric calculated from the IGP metric (either from the <b>igp</b> or <b>minimum-igp</b> statement) by specifying a value for <b>offset</b>. The metric is increased by specifying a positive value for <b>offset</b>, and decreased by specifying a negative value for <b>offset</b>.</p> <p>In Junos OS Release 9.0 and later, you can specify that a BGP group or peer not advertise updates for the MED path attributes used to calculate IGP costs for BGP next hops unless the MED is lower. You can also configure an interval to delay when MED updates are sent by including the <b>med-igp-update-interval</b> <i>minutes</i> statement at the [edit routing-options] hierarchy level.</p> |

**Options** **delay-med-update**—Specify that a BGP group or peer configured with the **metric-out igp** statement not advertise MED updates unless the current MED value is lower than the previously advertised MED value, or another attribute associated with the route has changed, or the BGP peer is responding to a refresh route request.

**NOTE:** You cannot configure the **delay-med-update** statement at the global BGP level.

**igp**—Set the metric to the most recent metric value calculated in the IGP to get to the BGP next hop. Routes learned from an EBGP peer usually have a next hop on a directly connected interface and thus the IGP value is equal to zero. This is the value advertised.

**metric**—Primary metric on all routes sent to peers.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**Default:** No metric is sent.

**minimum-igp**—Set the metric to the minimum metric value calculated in the IGP to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value. When you change a neighbor's export policy from any configuration to a configuration that sets the minimum IGP offset on an exported route, the advertised MED is not updated if the value would increase as a result, even if the previous configuration does not use a minimum IGP-based MED value. This behavior helps to prevent unnecessary route flapping when an IGP cost changes, by not forcing a route update if the metric value increases past the previous lowest known value.

**offset**—Increases or decreases the metric by this value.

**Range:**  $-2^{31}$  through  $2^{31} - 1$

**Default:** None

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure the minimum interval after which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the <a href="#">minimum-interval</a> (specified under the <a href="#">transmit-interval</a> statement) and <a href="#">minimum-receive-interval</a> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Release Information**    Statement introduced in Junos OS Release 8.2.  
                          Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                          Support for BFD authentication introduced in Junos OS Release 9.6.  
                          Statement introduced in Junos OS Release 12.1 for the QFX Series.  
                          Statement introduced in Junos OS Release 13.2 for Layer 2 VPN and VPLS.  
                          Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement at this hierarchy level, you can configure the minimum transmit interval using the [minimum-interval](#) statement at the **bfd-liveness-detection** hierarchy level.

**Options** *milliseconds*—Minimum transmit interval value.  
**Range:** 1 through 255,000

**NOTE:** The threshold value specified in the **threshold** statement must be greater than the value specified in the **minimum-interval** statement for the **transmit-interval** statement.

---

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure the minimum interval after which the local routing device must receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the <b>minimum-interval</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>BMP monitoring is enabled by default. You can explicitly enable BMP monitoring or disable it. You can also selectively enable or disable BMP monitoring at various hierarchy levels (for example, [edit protocols bgp group <i>group-name</i>] or [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>]). If you disable BMP monitoring, withdrawal messages are sent for any previously advertised routes. These are followed by a down message. If you enable BMP monitoring, an up message is sent first and then the route advertisements follow.</p>                                                                                                                                                                                                                                               |

**Release Information**    Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Configure TCP path maximum transmission unit (MTU) discovery.

TCP path MTU discovery enables BGP to automatically discover the best TCP path MTU for each BGP session. In Junos OS, TCP path MTU discovery is disabled by default for all BGP neighbor sessions.

When MTU discovery is disabled, TCP sessions that are not directly connected transmit packets of 512-byte maximum segment size (MSS). These small packets minimize the chances of packet fragmentation at a device along the path to the destination. However, because most links use an MTU of at least 1500 bytes, 512-byte packets do not result in the most efficient use of link bandwidth. For directly connected EBGP sessions, MTU mismatches prevent the BGP session from being established. As a workaround, enable path MTU discovery within the EBGP group.

Path MTU discovery dynamically determines the MTU size on the network path between the source and the destination, with the goal of avoiding IP fragmentation. Path MTU discovery works by setting the Don't Fragment (DF) bit in the IP headers of outgoing packets. When a device along the path has an MTU that is smaller than the packet, the device drops the packet. The device also sends back an ICMP Fragmentation Needed (Type 3, Code 4) message that contains the device's MTU, thus allowing the source to reduce its path MTU appropriately. The process repeats until the MTU is small enough to traverse the entire path without fragmentation.

| <b>Description</b>         | <p>Configure an EBGp multihop session.</p> <p>For Layer 3 VPNs, you configure the EBGp multihop session between the PE and CE routing devices. This allows you to configure one or more routing devices between the PE and CE routing devices.</p> <p>An external confederation peer is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case because multihop behavior is implied.</p> <p>If you have external BGP confederation peer-to-loopback addresses, you still need the multihop configuration.</p>                                                                                                                                                                                                                                                                                                                                                                     |

**NOTE:** You cannot configure the `accept-remote-nexthop` statement at the same time.

**Default** If you omit this statement, all EBGP peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or “regular,” BGP session), and the default time-to-live (TTL) value is 1.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Allow load sharing among multiple EBGP paths and multiple IBGP paths. A path is considered a BGP equal-cost path (and will be used for forwarding) if a tie-break is performed. The tie-break is performed after the BGP route path selection step that chooses the next-hop path that is resolved through the IGP route with the lowest metric. All paths with the same neighboring AS, learned by a multipath-enabled BGP neighbor, are considered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**NOTE:** BGP multiple path options must be consistent for all routes forming a BGP multiple path. If BGP multiple path options differ, the multiple path feature chooses a preference, and the multiple path feature might not function as intended.

**NOTE:** Starting in Junos OS Release 18.1, BGP multipath is supported globally at [edit protocols bgp] hierarchy level. You can selectively disable multipath on some BGP groups and neighbors. Include **disable** at [edit protocols bgp **group** *group-name* multipath] hierarchy level to disable multipath option for a group or a specific BGP neighbor.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1R2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | <p>You can restrict BGP <b>add-path</b> to advertise contributor multiple paths only. Advertising all available multiple paths might result in a large overhead of processing on device memory. Selective advertising of multiple paths facilitates Internet service providers and data centers that use route reflector to build in-path diversity in IBGP. You can limit and configure up to six prefixes that the BGP <b>multipath</b> algorithm selects.</p> <p>For example, if a routing device has four paths to a destination in its routing table and is configured to advertise up to two paths, only contributor paths for load balancing are chosen. The best contributor path is the active path and BGP advertises this path by default. The second best contributor path is selected and this process is repeated until the specified number of paths is reached, in this case two additional paths to the same destination are selected for load balancing.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.1R1.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure a priority for multipath resolution during load balancing. When multipath is enabled on a route reflector, BGP calculates the multipaths each time a new route is added or whenever an existing route is changed, which uses up system resources and slows down the BGP RIB resolution. Configure BGP multipath job priority to delay the multipath calculation and to improve the RIB, also known as the routing table learning rate. |
| <b>Required Privilege Level</b> | routing                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Explicitly configure a neighbor (peer). To configure multiple BGP peers, include multiple **neighbor** statements.

By default, the peer's options are identical to those of the group. You can override these options by including peer-specific option statements within the **neighbor** statement.

The **neighbor** statement is one of the statements you can include in the configuration to define a minimal BGP configuration on the routing device. (You can include an **allow all** statement in place of a **neighbor** statement.)

**NOTE:** On MX Series routers configured with enhanced subscriber management, you can use this statement to statically provision a subscriber's client IP address as the BGP neighbor IP address. This is supported for only LNS subscribers. With enhanced subscriber management, you must also configure the **routing-services** statement at the [edit dynamic-profiles *profile-name* interfaces *interface-name* unit *logical-unit-number*] hierarchy level.

**Options** **address**—IPv6 or IPv4 address of a single peer.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

## nonstop-routing-options

---

**Syntax**    `nonstop-routing-options {  
                  precision-timers-max-period precision-timers-max-period;  
                  }`

**Hierarchy Level**    [edit routing-options]

**Release Information**    Statement introduced in Junos OS Release 15.2 for the M Series, MX Series, and PTX Series.

**Description**    For routing platforms with two Routing Engines, a master Routing Engine is configured to switch over gracefully to a backup Routing Engine. This allows the routing protocol information to be preserved even after failover. Support of precision-timers in the kernel is a feature where the kernel takes over autogeneration of BGP keepalives right after the switchover from backup to master event occurs. The kernel in the Routing Engine continues this autogeneration until RPD is able to take over the session or until a maximum period has elapsed since the switchover event occurred.

**NOTE:** This maximum period configuration applies only when at least one client protocol such as BGP registers for the automatic keepalive generation service provided by the kernel, and the kernel timer generates control plane session keepalives on behalf of that protocol after a switchover event.

---

**Options**    `precision-timers-max-period precision-timers-max-period`— The maximum period for which the kernel auto generates keepalives on behalf of BGP after a switchover event from backup to master.

**NOTE:** You can verify the `precision-timers-max-period` using `show nonstop-routing` command.

---

**Default:** 600 seconds

**Range:** 60 seconds to 1800 seconds

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure BFD sessions not to adapt to changing network conditions. We recommend that you <i>do not</i> disable BFD adaptation unless it is preferable to have BFD adaptation disabled in your network.</p> <p>The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. However, include the **no-adaptation** statement in the configuration if you do not want BFD sessions to adapt to changing network conditions.

You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command does not affect traffic flow on the routing device.

| <b>Description</b>              | <p>Prevent different routing devices within an AS from creating aggregate routes that contain different AS paths.</p> <p>Junos OS performs route aggregation, which is the process of combining the characteristics of different routes so that only a single route is advertised. Aggregation reduces the amount of information that BGP must store and exchange with other BGP systems. When aggregation occurs, the local routing device adds the local AS number and the router ID to the aggregator path attribute. The <b>no-aggregator-id</b> statement causes Junos OS to place a 0 in the router ID field and thus eliminate the possibility of having multiple aggregate advertisements in the network, each with different path information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Default</b>                  | If you omit this statement, the router ID is included in the BGP aggregator path attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | Disable intracluster route redistribution by the system acting as the route reflector. Include this statement when the client cluster is fully meshed to prevent the sending of redundant route advertisements. Route reflection provides a way to decrease BGP control traffic and minimizing the number of update messages sent within the AS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Specify that the BGP next-hop value not be changed. For route advertisements, specify the **no-nexthop-self** option.

An external confederation peer is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case; multihop behavior is implied.

If you have external BGP confederation peer-to-loopback addresses, you still need the multihop configuration.

**NOTE:** You cannot configure the **accept-remote-nexthop** statement at the same time.

**Default** If you omit this statement, all EBGp peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or “regular,” BGP session), and the default time-to-live (TTL) value is 1.

**Options** **no-nexthop-self**— Specify ....

| <b>Description</b>         | <p>When BGP is carrying flow-specification network layer reachability information (NLRI) messages, the <b>no-validate</b> statement omits the flow route validation procedure after packets are accepted by a policy.</p> <p>The receiving BGP-enabled device accepts a flow route if it passes the following criteria:</p> <ul style="list-style-type: none"> <li>• The originator of a flow route matches the originator of the best match unicast route for the destination address that is embedded in the route.</li> <li>• There are no more specific unicast routes, when compared to the destination address of the flow route, for which the active route has been received from a different next-hop autonomous system.</li> </ul> <p>The first criterion ensures that the filter is being advertised by the next-hop used by unicast forwarding for the destination address embedded in the flow route. For example, if a flow route is given as 10.1.1.1, proto=6, port=80, the receiving BGP-enabled device selects the more specific unicast route in the unicast routing table that matches the destination prefix 10.1.1.1/32. On a unicast routing table containing 10.1/16 and 10.1.1/24, the latter is chosen as the unicast route to compare against. Only the active unicast route entry is considered. This follows the concept that a flow route is valid if advertised by the originator of the best unicast route.</p> <p>The second criterion addresses situations in which a given address block is allocated to different entities. Flows that resolve to a best-match unicast route that is an aggregate route are only accepted if they do not cover more specific routes that are being routed to different next-hop autonomous systems.</p> <p>You can bypass the validation process and use your own specific import policy. To disable the validation procedure and use an import policy instead, include the <b>no-validate</b> statement in the configuration.</p> <p>Flow routes configured for VPNs with family <b>inet-vpn</b> are not automatically validated, so the <b>no-validate</b> statement is not supported at the <code>[edit protocols bgp group <i>group-name</i> <b>family</b> <i>inet-vpn</i>]</code> hierarchy level. No validation is needed if the flow routes are configured locally between devices in a single AS.</p> |

**Options**    *policy-name*—Import policy to match NLRI messages.

**Required Privilege**    routing—To view this statement in the configuration.

**Level**    routing-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.

**Description** Cause the no-export BGP community to be prevented from being automatically added to routes advertised to external BGP neighbors (presumed to be CE routers). The no-export routes containing this community name are not advertised outside a BGP confederation boundary. In VPN deployments, for example, BGP is often used as a PE-CE protocol. It might be a practical necessity in such deployments to accommodate interoperation with CEs that cannot easily be upgraded to support specifications such as this one. This requirement causes a problem while ensuring that "stale" routing information does not leak beyond the perimeter of routers that support these procedures where one or more IBGP routers are not upgraded. In the VPN PE-CE case, the protocol in use is EBGp, and the LOCAL\_PREF, an IBGP-only path attribute, is used.

The principal motivation for restricting the propagation of "stale" routing information is the reason to prevent it from spreading without limit once it exits the BGP confederation boundary. VPN deployments are typically topologically constrained, removing this concern. For this reason, an implementation might advertise stale routes over a PE-CE session, when explicitly configured. In such a scenario, the implementation must attach the NO\_EXPORT community to the routes in question by default, as an additional protection against stale routes spreading without limit. Attachment of the NO\_EXPORT community can be disabled explicitly to accommodate exceptional cases. It might be necessary to

advertise stale routes to a CE in some VPN deployments, even if the CE does not support this specification. In that case, if you configure the PE routers to advertise such routes, you must notify the operator of the CE receiving the routes, and the CE must be configured to deprefer the routes. Typical BGP implementations perform this operation by matching on the LLGR\_STALE community, and setting the LOCAL\_PREF for matching routes to zero.

When the **omit-no-export** option is added or removed, the session is reset. This rest of a session enables LLGR stale routes to be readvertised with or without the no- export community (which is added outside of the export policy).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 12.2.

**Description** Configure the legitimate originator autonomous system (AS). This is a required statement.

**Options** *as-number*—Legitimate originator AS number.

The remaining statement is explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 9.2.  
 Statement introduced in Junos OS Release 9.2 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure a BGP peer to accept outbound route filters from a remote peer.

**Options** **accept**—Specify that outbound route filters from a BGP peer be accepted.

**inet**—Specify that IPv4 prefix-based outbound route filters be accepted.

**inet6**—Specify that IPv6 prefix-based outbound route filters be accepted.

**NOTE:** You can specify that both IPv4 and IPv6 outbound route filters be accepted.

**prefix-based**—Specify that prefix-based filters be accepted.

The **bgp-orf-cisco-mode** statement is explained separately.

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Control how often BGP and the routing table exchange route information by specifying how long a route must be present in the Junos OS routing table before it is exported to BGP. Use this time delay to help bundle routing updates and to avoid sending updates too often.

Alternatively or in addition, external BGP (EBGP) sessions can also use the route-flap damping mechanism upon the reception of BGP messages coming from an external neighbor.

BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. The **out-delay** statement enables a form of rate limiting. The delay is added to each update for each prefix individually. When a routing device changes its best path to a destination prefix, the device does not inform its peer about the change unless the route has been present in its routing table for the specified **out-delay**. If you use **out-delay** to perform rate-limiting, you can expect a less bursty pattern of updates. You will see a pattern in which updates arrive in a steady flow, and two updates for the same prefix are always spaced by at least the **out-delay** timer value (for example, 30 seconds). Thus, the **out-delay** setting is useful for limiting oscillation (sometimes called *churn*) in a network. Keep in mind that, regardless of the **out-delay** setting, BGP peers exchange routes immediately after neighbor establishment. The **out-delay** setting is only designed to delay the exchange of routes between BGP and the local routing table.

Caution is warranted because an **out-delay** can delay convergence. If your network is configured in a way that avoids oscillation, setting an **out-delay** is not necessary.

When configured, the **out-delay** value displays as **Outbound Timer** when using **show bgp group** or **show bgp group neighbor** commands.

**Default** By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. If you omit this statement, routes are exported to BGP immediately after they have been added to the routing table.

**Options** *seconds*—Output delay time.  
**Range:** 0 through 65,535 seconds  
**Default:** 0 seconds

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| Release Information                          | Statement introduced in Junos OS Release 16.1 for the ACX Series, M Series, MX Series, PTX Series, QFabric systems, and QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description                                  | <p>When configuring the queues for BGP route prioritization, the <b>output-queue-priority</b> statement allows you to specify the number of tokens that are available within each of the 17 BGP output priority queues. This allows you to balance the amount of work that can be done within the route prioritization queues.</p> <p>When implementing BGP route prioritization, the <b>output-queue-priority</b> statement allows you to specify the priority at which a given BGP route or route type is serviced. BGP route prioritization can also be specified per BGP neighbor during BGP configuration, as well as for the sub-family types within the following address families:</p> <ul style="list-style-type: none"> <li>• <b>evpn</b></li> <li>• <b>inet</b></li> <li>• <b>inet-mdt</b></li> <li>• <b>inet-mvpn</b></li> <li>• <b>inet-vpn</b></li> <li>• <b>inet6</b></li> <li>• <b>inet6-mvpn</b></li> <li>• <b>inet6-vpn</b></li> </ul> |

- `iso-vpn`
- `l2vpn`
- `route-target`
- `traffic-engineering`

**Default** By default, each of the 17 BGP route priority queues (or buckets) is assigned 1 work token so that misconfigured queues do not result in starvation.

When implementing BGP route prioritization, the following types of update messages are assigned to the lowest priority queue (1) by default: route refresh, topology change, and route withdraw.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the routing device so that active open messages are not sent to the peer. Once you configure the routing device to be passive, the routing device will wait for the peer to issue an open request before a message is sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | If you omit this statement, all explicitly configured peers are active, and each peer periodically sends open requests until its peer responds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | Configure BGP path selection.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | If the <b>path-selection</b> statement is not included in the configuration, only the multiple exit discriminators (MEDs) of routes that have the same peer ASs are compared.                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <b>always-compare-med</b> —Always compare MEDs whether or not the peer ASs of the compared routes are the same.                                                                                                                                                                                                                                                                                                                                                              |

**NOTE:** We recommend that you configure the **always-compare-med** option.

**as-path-ignore**—In the best-path algorithm, skip the step that compares the autonomous system (AS) path lengths. By default, the best-path algorithm evaluates the length of the AS paths and prefers the route with the shortest AS path length.

**NOTE:** Starting with Junos OS Release 14.1R8, 14.2R7, 15.1R4, 15.1F6, and 16.1R1, the **as-path-ignore** option is supported for routing instances.

**cisco-non-deterministic**—Emulate the Cisco IOS default behavior. This mode evaluates routes in the order that they are received and does not group them according to their neighboring AS. With **cisco-non-deterministic** mode, the active path is always first. All inactive, but eligible, paths follow the active path and are maintained in the order in which they were received, with the most recent path first. Ineligible paths remain at the end of the list.

As an example, suppose you have three path advertisements for the 192.168.1.0 /24 route:

- Path 1—learned through EBGp; AS Path of 65010; MED of 200
- Path 2—learned through IBGP; AS Path of 65020; MED of 150; IGP cost of 5
- Path 3—learned through IBGP; AS Path of 65010; MED of 100; IGP cost of 10

These advertisements are received in quick succession, within a second, in the order listed. Path 3 is received most recently, so the routing device compares it against path 2, the next most recent advertisement. The cost to the IBGP peer is better for path 2, so the routing device eliminates path 3 from contention. When comparing paths 1 and 2, the routing device prefers path 1 because it is received from an EBGp peer. This allows the routing device to install path 1 as the active path for the route.

**NOTE:** We do not recommend using this configuration option in your network. It is provided solely for interoperability to allow all routing devices in the network to make consistent route selections.

---

**external-router-id**—Compare the router ID between external BGP paths to determine the active path.

**igp-multiplier *number***—The multiplier value for the IGP cost to a next-hop address. This option is useful for making the MED and IGP cost comparable.

**Range:** 1 through 1000

**Default:** 1

**med-multiplier *number***—The multiplier value for the MED calculation. This option is useful for making the MED and IGP cost comparable.

**Range:** 1 through 1000

**Default:** 1

**med-plus-igp**—Add the IGP cost to the indirect next-hop destination to the MED before comparing MED values for path selection. This statement only affects best-path selection. It does not affect the advertised MED.

The other option is explained separately.

| <b>Description</b>         | <p>Specify the neighbor (peer) autonomous system (AS) number.</p> <p>For EBGP, the peer is in another AS, so the AS number you specify in the <b>peer-as</b> statement must be different from the local router's AS number, which you specify in the <b>autonomous-system</b> statement. For IBGP, the peer is in the same AS, so the two AS numbers that you specify in the <b>autonomous-system</b> and <b>peer-as</b> statements must be the same.</p> <p>The AS numeric range in plain-number format has been extended in Junos OS Release 9.1 to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p> <p>With the introduction of 4-byte AS numbers, you might have a combination of routers that support 4-byte AS numbers and 2-byte AS numbers. For more information about</p> |

what happens when establishing BGP peer relationships between 4-byte and 2-byte capable routers, see the following topics:

- [Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview](#).

**Options** *autonomous-system*—AS number.  
**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers  
**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)  
**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte AS numbers

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

## port (Origin Validation for BGP)

**Syntax** *port port-number;*

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *instance-name* routing-options validation group *group-name* session *server-ip-address*],  
 [edit logical-systems *logical-system-name* routing-options validation group *group-name* session *server-ip-address*],  
 [edit routing-instances *instance-name* routing-options validation group *group-name* session *server-ip-address*],  
 [edit routing-options validation group *group-name* session *server-ip-address*]

**Release Information** Statement introduced in Junos OS Release 12.2.  
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Configure an alternative TCP port number to be used for the outgoing connection with the cache server. The well-known resource public key infrastructure (RPKI) port is TCP port 2222. For a given deployment, an RPKI cache server might listen on some other TCP port number. If so, configure the alternative port number with this statement.

**Options** *port-number*—TCP port number to be used for the outgoing connection to the cache server.  
**Default:** 2222

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 13.2X51-D15 for the QFX Series.<br>Statement introduced in Junos OS Release 13.3.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                              |
| <b>Description</b>         | For BMP route monitoring, allows you to excludes routes that are non-eligible for the decision process (for example, protocol nexthop not resolved). This represents the view of the BGP routes after running the import policy. If the import policy has rejected the BGP route, the route does not exist in the post policy view.                                 |

**NOTE:** If post-policy is configured the router applies the import policies on the routes received so that BMP can display the routes as follows:

- If an import policy modifies any parameters in the route, the route is displayed by BMP with the new values.
- If an import policy modifies the NH and the NH is unresolved by the local router, the route is displayed by BMP as reachable.
- If an import policy rejects a route, it is displayed as unreachable in BMP update.
- If a route is received with unreachable NH, but the import policy doesn't reject the route, then BMP displays the route as reachable.

---

Using post-policy with **exclude-non-eligible** causes an unreachable BMP update in the following:

- If an import policy modifies the NH and the NH is unresolved by the local router, the route is displayed by BMP as unreachable.
- If a route is received with a NH that is unreachable, and the import policy does not reject this route, it is displayed by BMP as unreachable.

## precision-timers

---

|                            |                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>precision-timers;</code>                                                                                     |
| <b>Hierarchy Level</b>     | <code>[edit logical-systems <i>logical-system-name</i> protocols bgp],</code><br><code>[edit protocols bgp]</code> |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.4.                                                                     |
| <b>Description</b>         | Enable BGP sessions to send frequent keepalive messages with a hold time as short as 10 seconds.                   |

**NOTE:** The hold time is three times the interval at which keepalive messages are sent, and the hold time is the maximum number of seconds allowed to elapse between successive keepalive messages that BGP receives from a peer. When establishing a BGP connection with the local routing device, a peer sends an open message, which contains a hold-time value. BGP on the local routing device uses the smaller of either the local hold-time value or the peer's hold-time value as the hold time for the BGP connection between the two peers.

The default hold-time is 90 seconds, meaning that the default frequency for keepalive messages is 30 seconds. More frequent keepalive messages and shorter hold times might be desirable in large-scale deployments with many active sessions (such as edge or large VPN deployments). To configure the hold time and the frequency of keepalive messages, include the `hold-time` statement at the `[edit protocols bgp]` hierarchy level. You can configure the hold time at a logical system, routing instance, global, group, or neighbor level. When you set a hold time value to less than 20 seconds, we recommend that you also configure the BGP `precision-timers` statement. The `precision-timers` statement ensures that if scheduler slip messages occur, the routing device continues to send keepalive messages. When the `precision-timers` statement is included, keepalive message generation is performed in a dedicated kernel thread, which helps to prevent BGP session flaps.

**NOTE:** Starting with Junos OS Release 15.2, you can register or unregister keepalives of BGP with the automated keepalive precision timer service of the kernel. This service ensures a reliable generation of keepalives for some configurable maximum period after a switchover of the routing engine from backup to master until BGP is able to take over the keepalive generation.

## preference (Origin Validation for BGP)

**Syntax** `preference number;`

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *instance-name* routing-options validation group *group-name* session *server-ip-address*],  
[edit logical-systems *logical-system-name* routing-options validation group *group-name* session *server-ip-address*],  
[edit routing-instances *instance-name* routing-options validation group *group-name* session *server-ip-address*],  
[edit routing-options validation group *group-name* session *server-ip-address*]

**Release Information** Statement introduced in Junos OS Release 12.2.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Each resource public key infrastructure (RPKI) cache server has a static preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.

**Options** *number*—Preference number for the cache server.  
**Range:** 1 through 255  
**Default:** 100

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* **neighbor** *address*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify the preference for routes learned from BGP.

At the BGP global level, the preference statement sets the preference for routes learned from BGP. You can override this preference in a BGP group or peer preference statement.

At the group or peer level, the preference statement sets the preference for routes learned from the group or peer. Use this statement to override the preference set in the BGP global preference statement when you want to favor routes from one group or peer over those of another.

**NOTE:** Do not set `preference2` for BGP route-policy.

**Options** *preference*—Preference to assign to routes learned from BGP or from the group or peer.  
**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )  
**Default:** 170 for the primary preference

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

the session is torn down, it is reestablished in a short time unless you include the **idle-timeout** statement. Then the session can be kept down for a specified amount of time, or forever. If you specify **forever**, the session is reestablished only after you issue a **clear bgp neighbor** command.

**Range:** 1 through 100

**idle-timeout (forever | *timeout-in-minutes*)**—(Optional) If you include the **idle-timeout** statement, the session is torn down for a specified amount of time, or forever. If you specify a period of time, the session is allowed to reestablish after this timeout period. If you specify **forever**, the session is reestablished only after you intervene with a **clear bgp neighbor** command.

**Range:** 1 through 2400

| <b>Description</b>              | <p>Filter the paths to a destination to advertise.</p> <p>Prefix policies enable you to filter routes on a router that is configured to advertise multiple paths to a destination. Prefix policies can only match prefixes. They cannot match route attributes, and they cannot change the attributes of routes.</p> <p>The <b>add-path prefix-policy</b> allows up to 20 BGP add-paths be advertised for a subset of prefixes that match the add-path prefix-policy. To enable this feature for a prefix, the <b>add-path prefix-policy</b> term matching the prefix should have a new <i>then</i> action to set <b>add-path send-count</b> <code>&lt;2...20&gt;</code>. This new action is not applicable if the policy-statement containing it is used in any place other than <b>add-path prefix-policy</b>.</p> |
| <b>Options</b>                  | <b><i>policy-names</i></b> —Name of a policy (or a set of policies) configured at the <b>[edit policy-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | Specify the protocol for a routing instance. You can configure multiple instances of many protocol types. Not all protocols are supported on the switches. See the switch CLI.                                                                                                                                                                                                                              |

- Options**
- bgp**—Specify BGP as the protocol for a routing instance.
  - isis**—Specify IS-IS as the protocol for a routing instance.
  - ldp**—Specify LDP as the protocol for a routing instance or for a virtual router instance.
  - l2vpn**—Specify Layer 2 VPN as the protocol for a routing instance.
  - mpls**—Specify MPLS as the protocol for a routing instance.
  - msdp**—Specify the Multicast Source Discovery Protocol (MSDP) for a routing instance.
  - mstp**—Specify the Multiple Spanning Tree Protocol (MSTP) for a virtual switch routing instance.
  - ospf**—Specify OSPF as the protocol for a routing instance.
  - ospf3**—Specify OSPF version 3 (OSPFv3) as the protocol for a routing instance.

**NOTE:** OSPFv3 supports the **no-forwarding**, **virtual-router**, and **vrf** routing instance types only.

---

- pim**—Specify the Protocol Independent Multicast (PIM) protocol for a routing instance.
- rip**—Specify RIP as the protocol for a routing instance.
- ripng**—Specify RIP next generation (RIPng) as the protocol for a routing instance.
- rstp**—Specify the Rapid Spanning Tree Protocol (RSTP) for a virtual switch routing instance.
- rsvp**—Specify the RSVP for a routing instance.
- vstp**—Specify the VLAN Spanning Tree Protocol (VSTP) for a virtual switch routing instance.
- vpls**—Specify VPLS as the protocol for a routing instance.

- Required Privilege Level**
- routing**—To view this statement in the configuration.
  - routing-control**—To add this statement to the configuration.

- Related Documentation**

| <b>Description</b>              | <p>Enable the long-lived graceful restart mechanism for a BGP receiver or helper router to preserve BGP routing details for a longer period from a failed BGP peer. Long-lived graceful restart receiver or helper mode is enabled by default, unless ordinary graceful restart receiver or helper mode is disabled.</p> <p>The <b>long-lived receiver enable</b> overrides a disable option inherited from a higher level in the configuration. When the LLGR receiver or helper mode is enabled or disabled, the session is reset. This behavior enables the new capability value to be sent to the neighbor.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Configure the network prefix for the route validation (RV) record.</p> <p>An RV record matches any route whose prefix matches the RV prefix, whose prefix length does not exceed the <b>maximum-length</b> given in the RV record, and whose origin AS equals the <b>origin-autonomous-system</b> given in the RV record. RV records are received from the cache server using the protocol defined in Internet draft draft-ietf-sidr-rpki-rtr-19, <i>The RPKI/Router Protocol</i>, and can also be configured statically, as shown here.</p> |
| <b>Options</b>                  | <p><b>destination</b>—Network prefix for the RV record.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                         |

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                               Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                               Statement introduced in Junos OS Release 11.3 for the QFX Series.  
                               Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
                               **no-peer-loop-check** option added in Junos OS Release 15.1.

**Description**    When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.

**NOTE:** As of Junos OS 10.0R2 and higher, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the **as-override** statement instead of the **remove-private** statement.

The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.

Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.

The set of reserved AS numbers is in the range from 64,512 through 65,535.

**Options**    **all**—Remove all private AS numbers from the original path. Do not stop the process of removing private AS numbers, even if a public AS number is encountered.

**nearest**—When you use the **all** and **replace** options, choose the last (right-most) public AS number encountered in the original AS path for the replacement value, as the AS path is processed from left to right. If no public AS number is encountered, the default replacement value is used. (See the **replace** option for information about the default replacement value.)

**replace**—When you use the **all** option, instead of removing private AS numbers, perform a replace operation. The default replacement value for the private AS number is the local AS number at the BGP group level for the BGP peer. If you are unsure about the replacement value, check the local AS value displayed in the output of the **show bgp group group-name** command.

**no-peer-loop-check**—Peer loop check is removed. By default, the **remove-private** statement has a peer loop check restriction. If a private AS in the AS path has the same value as the configured **peer-as** for the neighbor, **remove-private** does not remove or replace this private AS number. This restriction provides peer-as loop protection. However, you can remove this restriction using the **no-peer-loop-check** option.

**Required Privilege**    routing—To view this statement in the configuration.  
**Level**                routing-control—To add this statement to the configuration.

| <b>Description</b>              | Allow labeled routes to be placed in the inet.3 routing table for route resolution. These routes are then resolved for PE router connections where the remote PE is located across another AS. For a PE router to install a route in the VRF, the next hop must resolve to a route stored within the inet.3 table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## restarter (Graceful Restart for BGP Restarter)

**Syntax**

```
restarter {
 disable;
 stale-time interval;
}
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name protocols bgp family (l2vpn | route-target | inet)
(labeled-unicast | flow) graceful-restart long-lived],
[edit logical-systems logical-system-name protocols bgp group group-name family (l2vpn
| route-target | inet) (labeled-unicast | flow) graceful-restart long-lived],
[edit logical-systems logical-system-name protocols bgp group group-name neighbor address
family (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
bgp family (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
bgp group group-name family (l2vpn | route-target | inet) (labeled-unicast | flow)
graceful-restart long-lived],
[edit logical-systems logical-system-name routing-instances routing-instance-name protocols
bgp group group-name neighbor address family (l2vpn | route-target | inet) (labeled-unicast
| flow) graceful-restart long-lived],
[edit routing-instances routing-instance-name protocols bgp family (l2vpn | route-target |
inet) (labeled-unicast | flow) graceful-restart long-lived],
[edit routing-instances routing-instance-name protocols bgp group group-name family (l2vpn
| route-target | inet) (labeled-unicast | flow) graceful-restart long-lived],
[edit routing-instances routing-instance-name protocols bgp group group-name neighbor
address family (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart
long-lived],
[edit protocols bgp family (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart
long-lived],
[edit protocols bgp group group-name family (l2vpn | route-target | inet) (labeled-unicast |
flow) graceful-restart long-lived],
[edit protocols bgp group group-name neighbor address family (l2vpn | route-target | inet)
(labeled-unicast | flow) graceful-restart long-lived]
```

**NOTE:** Each routing table is identified by the protocol family or address family indicator (AFI) and a subsequent address family identifier (SAFI). The AFI parameter can be one of the (l2vpn | inet | route-target) protocols and the SAFI parameter can be either of the (flow | labeled-unicast) protocols for inet family and one of the (auto-discovery-mspw | auto-discovery-only | signaling) protocols for L2VPN family..

Configuring LLGR does not require that BGP graceful restart also be configured. The long-lived-graceful-restart section is visible only for families l2vpn, inet labeled-unicast, inet flow and route-target. It is prohibited for inet-mvpn, inet6-mvpn and inet-mdt. It is hidden for other families.

**Release Information** Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>              | <p>Configure the long-lived graceful restart mechanism for a BGP restarter router to preserve BGP routing details for a longer period from a failed BGP peer. You can also configure the BGP long-lived graceful restarter mode negotiation mechanism for a particular address family instead of configuring this capability for all address families in a system, logical system, or routing instance.</p> <p>The stanzas in the per-family graceful-restart long-lived restarter configuration section enables LLGR restarter mode negotiation for BGP globally, or for a group or neighbor. The values are inherited by groups from the global configuration, and by neighbors from the group configuration. The disable attribute is used to override configuration inherited from a higher level. It does not disable LLGR receiver mode; you must disable LLGR receiver mode explicitly for all families as necessary. A hidden <b>enable</b> attribute can be used to override an inherited disable attribute. Configuring graceful-restart long-lived restarter at the neighbor level (when it is not configured at the containing group level or globally) causes an internal group to be split. When LLGR restarter is enabled or disabled for a family or the stale- time is changed, the session is reset so that the new capability can be sent to the neighbor.</p> |
| <b>Options</b>                  | The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Parse and send BGP VPN multicast traffic according to Subsequent Address Family Identifier (SAFI) 129, as defined in RFC 6514 (that is, <i>length, prefix</i> ). The Network Layer Reachability Information (NLRI) format used for BGP VPN multicast in previous releases of Junos OS was SAFI 128, which was <i>length, label, prefix</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>You can allow both labeled and unlabeled routes to be exchanged in a single session. The labeled routes are placed in the inet.3 or inet6.3 routing table, and both labeled and unlabeled unicast routes can be sent or received by the router.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Specify whether BMP should send pre-policy route monitoring messages, post-policy route monitoring messages, both types of messages, or none at all. The pre-policy can be configured to exclude routes that are non-feasible for the decision process (for example, a route loop). The post-policy can be configured to exclude routes that are not eligible for the decision process (for example, protocol nexthop not resolved).</p> <p>You can also selectively enable or disable BMP route monitoring at various hierarchy levels (for example, [edit protocols bgp group <i>group-name</i>] or [edit protocols bgp group <i>group-name</i> neighbor <i>address</i>]).</p>                                                                                                                     |
| <b>Options</b>                  | <p><b>none</b>—Explicitly disables BMP route monitoring.</p> <p><b>Default:</b> If you configure the <b>route-monitoring</b> statement at the [edit routing-options <b>bmp</b>] hierarchy level, the default option is <b>pre-policy</b>. If you configure the <b>route-monitoring</b> statement at any of the [edit protocols bgp] hierarchy levels, the default option is to inherit the configuration from the <b>route-monitoring</b> statement configured at the [edit routing-options <b>bmp</b>] hierarchy level.</p> <p>The other statements are explained separately.</p>                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.3R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Configure the routing instance name for the routing instance you want the BGP Monitoring Protocol (BMP) to use. This can be any routing instance name. If you want to use the reserved non-default management routing instance <code>mgmt_junos</code>, make sure you configure the <code>management-instance</code> statement.</p> <p>When <code>routing-instance</code> is configured at both hierarchy levels—<code>[edit routing-options bmp station <i>station-name</i>]</code> and <code>[edit routing-options bmp]</code>—the configuration at the <code>[edit routing-options bmp station <i>station-name</i>]</code> hierarchy level takes precedence.</p> <div> <b>NOTE:</b> You must also define the routing instance you want to use under the <code>[edit routing-instances]</code> hierarchy level.</div> |
| <b>Required Privilege Level</b> | <code>routing</code> —To view this statement in the configuration.<br><code>routing-control</code> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br><b>remote-vtep-v6-list</b> statement introduced in Junos OS Release 17.3 for MX Series routers with MPC and MIC interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | <p>Configure an additional routing entity for a router. You can create multiple instances of BGP, IS-IS, OSPF, OSPFv3, and RIP for a router. You can also create multiple routing instances for separating routing tables, routing policies, and interfaces for individual wholesale subscribers (retailers) in a Layer 3 wholesale network.</p> <p>Each routing instance consist of the following:</p> <ul style="list-style-type: none"> <li>• A set of routing tables</li> <li>• A set of interfaces that belong to these routing tables</li> <li>• A set of routing option configurations</li> </ul> <p>Each routing instance has a unique name and a corresponding IP unicast table. For example, if you configure a routing instance with the name <b>my-instance</b>, its corresponding IP unicast table is <code>my-instance.inet.0</code>. All routes for <b>my-instance</b> are installed into <code>my-instance.inet.0</code>.</p> <p>Routes are installed into the default routing instance <code>inet.0</code> by default, unless a routing instance is specified.</p> <p>In Junos OS Release 9.0 and later, you can no longer specify a routing-instance name of <i>master</i>, <i>default</i>, or <i>bgp</i> or include special characters within the name of a routing instance.</p> <p>In Junos OS Release 9.6 and later, you can include a slash (/) in a routing-instance name only if a logical system is not configured. That is, you cannot include the slash character in a routing-instance name if a logical system other than the default is explicitly configured. Routing-instance names, further, are restricted from having the form <code>__.*__</code> (beginning and ending with underscores). The colon <code>:</code> character cannot be used when multitopology routing (MTR) is enabled.</p> |
| <b>Default</b>             | Routing instances are disabled for the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b><i>routing-instance-name</i></b>—Name of the routing instance. This must be a non-reserved string of not more than 128 characters.</p> <p><b>remote-vtep-list</b>—Configure static remote VXLAN tunnel endpoints.</p> <p><b>remote-vtep-v6-list</b>—Configure static IPv6 remote VXLAN tunnel endpoints.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## segment-list

**Syntax**

```
segment-list name {
 hop-name name {
 ip_address ip address;
 label label;
 }
}
```

**Hierarchy Level** [edit logical-systems *name* protocols source-packet-routing],  
[edit protocols source-packet-routing]

**Release Information** Statement introduced in Junos OS Release 17.4R1 for MX Series and PTX Series with FPC-PTX-P1-A.  
**ip-address** statement introduced in Junos OS Release 18.1R1 for MX Series.

**Description** Specify an explicit path for source routing label switched path (LSPs) to traverse through traffic engineering segments. The segment list is essentially a stack of segment identifiers. that

**NOTE:** The segment list enables BGP and static segment routing LSP to steer traffic based on segment routing policies. When a segment list is used by the protocol BGP, the BGP protocol validates these segment identifiers and selects valid segments for traffic engineering.

**Options** **name**—Specify a name to identify the segment routing list, which is used in traffic engineering policy.

**hop-name**—Specify the name of a hop from the segment list in the segment routing traffic engineering policy.

**ip-address**—Specify the IP address of the hop. For a segment-list to be used by a non-colored segment routing LSP, the first hop must specify an IP address..

**label**—Specify the SID label of the hop in a segment routing traffic engineering segment list. In static segment routing LSPs, the source routing path uses the segment list only if the second to Nth hop specifies segment identifiers (SID) labels.

**Range:** 0 through 1,048,576

**NOTE:** The range is applicable for protocol BGP and static segment routing LSPs.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| <b>Description</b>              | <p>Configure a secure shell (SSH) session with a resource public key infrastructure (RPKI) cache server. The router-to-cache transport protocol is carried using a TCP session to a configurable port. Caches are organized in groups. The Junos OS implementation supports up to 63 sessions per group and both IPv4 and IPv6 address families.</p> <p>The maximum number of sessions in a group is two, by default, and is configurable. If the number of sessions in a group exceeds the <code>max-sessions</code> value, the connections are established in order by <code>preference</code> value. A numerically higher preference results in a higher probability for session establishment. The order of session establishment is random among sessions with equal preferences.</p> |

| <b>Description</b>              | <p>Configure BFD session mode to be single-hop or multihop. By default, BGP uses single-hop BFD sessions if the peer is directly connected to the router's interface. BGP uses multihop BFD sessions if the peer is not directly connected to the router's interface. If the peer session's <b>local-address</b> option is configured, the directly connected check is based partly on the source address that would be used for BGP and BFD.</p> <p>For backward compatibility, you can override the default behavior by configuring the <b>single-hop</b> or <b>multihop</b> option. Before Junos OS Release 11.1, the behavior was to assume that IBGP peer sessions were multihop.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>automatic</b>—Configure BGP to use single-hop BFD sessions if the peer is directly connected to the router's interface, and multihop BFD sessions if the peer is not directly connected to the router's interface</p> <p><b>multihop</b>—Configure BGP to use multihop BFD sessions.</p> <p><b>single-hop</b>—Configure BGP to use single-hop BFD sessions.</p> <p><b>Default:</b> automatic</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | Configure the SNMP options and customize the behavior of BGP-related MIBs. By default, SNMP generates traps when a session moves from a higher state to a lower state. For example, from <b>Active</b> to <b>Idle</b> or from <b>Established</b> to <b>Idle</b> . This can result in many uninteresting traps, especially when there are a large number of unconfigured BGP sessions that toggle continuously between <b>Active</b> and <b>Idle</b> state. Set the <b>backward-traps-only-from-established</b> option to eliminate the uninteresting traps, and receive backward trap notifications only when transitioning away from the <b>Established</b> state. This can substantially reduce the number of traps sent. |
| <b>Options</b>                  | <b>backward-traps-only-from-established</b> —Limit the generation of traps for backward transitions to session states that are moving from <b>Established</b> state only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Hierarchy Level** [edit logical-systems *name* protocols],  
[edit protocols]

**Release Information** Statement introduced in Junos OS Release 17.4R1 for the MX Series and PTX Series with FPC-PTX-P1-A.  
**telemetry** option introduced in Junos OS Release 18.3R1 for the MX Series and PTX Series with FPC-PTX-P1-A.

**Description** Enable Source Packet Routing in Networking (SPRING) or segment routing for traffic engineering packets for protocols that support segment routing. For example, you can configure segment routing capability for a BGP address family to steer traffic according to network requirements.

To enable segment routing traffic engineering for a BGP family, configure **segment-routing-te** at the [edit protocols bgp family inet|inet6] and [edit protocols bgp group *group-name* neighbor *neighborfamily* inet|inet6] hierarchy levels. Also, configure **sr-preference-override** at the [edit protocols bgp family inet|inet6 source-packet-routing]

hierarchy level. This allows BGP to support segment routing policies and to steer traffic based on the segment list.

A policy action **color: *color-mode:color-value*** is configured at the **[edit policy-options community *namemembers*]** hierarchy level to categorize segment routing traffic. The color value is attached to BGP communities when exporting prefixes from inet-unicast and inet6-unicast address families, which associates a BGP community with a segment routing policy path definition.

**Options** **lsp-external-controller *name***—Specify an external path computing entity, typically the network controller.

**maximum-segment-list-depth**—Specify a maximum segment list depth for segment routing traffic engineering policies.

**Default** The default value is 5.

**Range:** 1 through 5

**preference**—Route preference for segment routing traffic engineering routes.

**sr-preference**—Specify a preference for static segment routing policies. BGP chooses a segment routing policy with a higher value over policies with lower values.

**Range:** 0 through 4,294,967,295

**sr-preference-override**—Specify a preference override for static segment routing policies that BGP uses to select a segment routing policy. BGP chooses a policy with a higher value over policies with lower values.

**Default** The default value is 100

**Range:** 0 through 4,294,967,295

| <b>Description</b>         | <p>Configure a source routing label switched path (LSP) for steering traffic at an ingress router. Specify a binding segment identifier from the static label range. Configure other parameters such as color, weight, preference, and segment routing (SR) preference for traffic engineering.</p> <p>Starting with Junos OS Release 18.1R1, static non-colored SR label switched paths (LSPs) for protocol SPRING-TE in an MPLS network. Configure parameters such as destination address, binding SIDs, primary segment, secondary segment, metric, and preference. These SR LSPs do not have a color associated with them. If an ingress route is not required for a non-colored SR LSP then the ingress route installation in inet.3 table can be disabled.</p> |
| <b>Options</b>             | <p><b>name</b>—Specify a name to identify a source routing path.</p> <p><b>binding-sid</b>—Specify the binding label to enable transit functionality for this tunnel. For a non-colored static SR LSP, the binding SID label of protocol SPRING-TE have , by default, a preference of 8 and a metric of 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**NOTE:** This is optional for MPLS networks.

**Range:** 16 through 1,048,576

**color**—Specify a color identifier for the tunnel end point.

**NOTE:** This is only for colored SR LSPs. For non-colored SR LSPs, you do not have to configure the color parameter.

**metric**—Specify metric for routes downloaded for the non-colored static SR tunnel.

**Default:**

**NOTE:** This is the default label range for static LSPs in MPLS networks. You can configure the label range at `[edit protocols mpls label-range static label-range]` hierarchy level.

1000000 through 1048575

**Range:**

**NOTE:** This range is for protocol BGP.

1 through 16777215

**no-ingress**—Disable ingress route that is not required for the non-colored static SR tunnel

**preference**—Specify the preference for routes downloaded for this tunnel.

**primary**—Specify a primary segment list for the configured source routing path.

The non-colored static SR LSP can have a maximum of 8 primary paths. In case of multiple operational primary paths, the PFE distributes the traffic over the paths based on the weight configured on the paths. If none of the paths have weights configured then the weights default to 1 making it an ECMP path. The paths become weighted ECMP if at least one of the paths have a non-zero weight. In both cases, when one or some of the paths fail, the PFE automatically re-balances the traffic over the remaining paths resulting in path protection.

**weight *weight\_value***—Specify a percentage of the bandwidth with respect to the sum of weights of all paths for the primary segment list. If forwarding interfaces are also configured with weighted ECMP, then Junos OS applies hierarchical weighted ECMP. If the weight percentage is not configured, then only IGP weights are applied on the forwarding interfaces.

**secondary**—Specify a secondary segment list for the configured non-colored static SR LSP.

**sr-preference**—Configure a preference for segment routing routes for traffic engineering. BGP chooses a higher preference over a lower preference value.

**Range:** 0 through 4,294,967,295

**to**—Specify the IP address of the tunnel end-point

## stale-time (Long-Lived Graceful Restart for BGP Restarter)

**Syntax** `stale-time interval;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols bgp **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit routing-instances *routing-instance-name* protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit protocols bgp **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit protocols bgp group *group-name* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter],  
 [edit protocols bgp group *group-name* neighbor *address* **family** (l2vpn | route-target | inet) (labeled-unicast | flow) graceful-restart long-lived restarter]

**NOTE:** Each routing table is identified by the protocol family or address family indicator (AFI) and a subsequent address family identifier (SAFI). The AFI parameter can be one of the (l2vpn | inet | route-target) protocols and the SAFI parameter can be either of the (flow | labeled-unicast) protocols for inet family and one of the (auto-discovery-mspw | auto-discovery-only | signaling) protocols for L2VPN family..

Configuring LLGR does not require that BGP graceful restart also be configured. The long-lived-graceful-restart section is visible only for families l2vpn, inet labeled-unicast, inet flow and route-target. It is prohibited for inet-mvpn, inet6-mvpn and inet-mdt. It is hidden for other families.

**Release Information** Statement introduced in Junos OS Release 15.1 for M Series, MX Series, and T series routers.

**Description** Specify the period of time for which stale routes must be preserved by using the long-lived graceful restart capability for BGP sessions on the restarting router. When LLGR restarter is enabled or disabled for a family or the stale-time is changed, the session is reset so that the new capability can be sent to the neighbor. You can configure the stale period for each address family at the logical system or routing instance level.

The stanzas in the per-family graceful-restart long-lived restarter configuration section enables LLGR restarter mode negotiation for BGP globally, or for a group or neighbor. The values are inherited by groups from the global configuration, and by neighbors from the group configuration. The disable attribute is used to override configuration inherited from a higher level. It does not disable LLGR receiver mode; you must disable LLGR receiver mode explicitly for all families as necessary.

In addition, times can also be configured using the following notation:

<hours>:<minutes>:<seconds> For example, 12:00:00 specifies twelve hours. The hours and minutes are optional.

The two notations can be combined, for example, 2w1d 12:00:02 specifies two weeks, one day, twelve hours and two seconds (1339202 seconds). (Note that the CLI requires double-quotes around a value like this with spaces in it.) Expressed in this notation, the maximum stale time is 27w5d 04:20:15 (27 weeks, 5 days, 4 hours, 20 minutes and 15 seconds). While the show configuration command displays the actually configured values, when the associated timers are displayed in run-time show commands such as **show bgp neighbor**, the values are normalized, such as 1d36h becoming 2d 12:00:00. The full rules for displaying normalized LLGR times depend on the **clear bgp neighbor neighbor-address gracefully** command configuration.

**Options** *interval*—Period as a measure of the number of weeks, days, hours, minutes, and seconds for which stale routes must be maintained when long-lived graceful restart mechanism is enabled on the restarter router.

The range of values for stale-time is from 1 to 16777215 ( $2^{24} - 1$ ) seconds. The value is a simple integer giving the number of seconds by default, but it can also be specified using the following notation:

[<weeks>w][<days>d][<hours>h][<minutes>m][<seconds>s]

For example, you can specify 27 days as 27d, 648h, 38880m or 2332800s. 90 minutes can be configured as 1h30m, 90m or 5400s. The specified number of days is multiplied by 86400, the number of hours by 3600 and the number of minutes by 60; these are added to the seconds to get the total. A combined format of days and hours, in different time period units, such as 1d36h are permitted, as long as the specified total does not exceed the maximum stale time.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## static (Origin Validation for BGP)

---

**Syntax**

```
static {
 record destination {
 maximum-length prefix-length {
 origin-autonomous-system as-number {
 validation-state (invalid | valid);
 }
 }
 }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *instance-name* routing-options validation],  
[edit logical-systems *logical-system-name* routing-options validation],  
[edit routing-instances *instance-name* routing-options validation],  
[edit routing-options validation]

**Release Information** Statement introduced in Junos OS Release 12.2.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Configure a static route validation (RV) record.

RV records are received from the cache server using the protocol defined in Internet draft draft-ietf-sidr-rpki-rtr-19, *The RPKI/Router Protocol*, and can also be configured statically, as shown here.

Static records are useful for overwriting the information received from an RPKI cache server.

An RV record matches any route whose prefix matches the RV prefix **record**, whose prefix length does not exceed the **maximum-length** given in the RV record, and whose origin AS equals the **origin-autonomous-system** number given in the RV record.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Enable traffic-statistics collection on SR-TE policies through sensors for both SRTE policy next hop and binding segment identifier (SID) installed in the forwarding table, by using JVISION traffic sensors in Junos data plane to stream out traffic statistics on static segment routing policies and their corresponding binding SID routes.                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>Default:</b> By default statistics collection is disabled for static SRTE routes.</p> <p><b>no-ingress</b>—(Optional) Create sensors for binding SID transit routes only.</p> <p><b>no-transit</b>—(Optional) Create sensors for SRTE policy next hops and collect statistics on all steering routes that use the SRTE policy as nexthop.</p>                                                                                                                                                                                                   |
|                                 | <p> <b>NOTE:</b> <b>no-ingress</b> and <b>no-transit</b> are mutually exclusive. You cannot disable traffic collection at both destination route and binding SID route. If you enable statistics collection and do not configure one of the two options then the sensors collect traffic statistics steered by all routes that use the SRTE policy as a nexthop and the labeled traffic steered by the binding SID that are installed in the forwarding table.</p> |
| <b>Required Privilege Level</b> | routing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3 for the T Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Enables a TCP socket option for the affected BGP sessions, which prioritizes pure ACKs and does not exponentially back-off retransmission for couple of retransmissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Configure the maximum segment size (MSS) for the TCP connection for BGP neighbors.</p> <p>The MSS is only valid in increments of 2 KB. The value used is based on the value set, but is rounded down to the nearest multiple of 2048.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.3R1 on the MX Series and PTX Series with FPC-PTX-P1-A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Enable telemetry on segment routing traffic engineering policies at ingress nodes. Junos OS creates the following sensors to collect traffic statistics for segment routing:</p> <ul style="list-style-type: none"> <li>• BGP-SRTE policies for ingress routes, sensors are attached to nexthops in inet{6}color.0 table.</li> <li>• Static SRTE policies for ingress routes, sensors are attached to nexthops in inet{6}color.0 table.</li> <li>• Transit routes for BGP-SRTE policies in mpls.0 table.</li> <li>• Transit routes for static SRTE policies in mpls.0 table.</li> </ul> |
|                                 | <p> <b>NOTE:</b> If both static SRTE policy and BGP SRTE policy are to present for the same destination and color then only one of them is made active and BSID of the corresponding active policy is programmed to the mpls.0 table. In this case the sensor is attached to BSID of the active policy only.</p>                                                                                                                                                                                        |

**Release Information** Statement introduced in Junos OS Release 8.2.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for BFD authentication introduced in Junos OS Release 9.6.  
 Statement introduced in Junos OS Release 12.1 for the QFX Series.  
 Statement introduced in Junos OS Release 13.2 for Layer 2 VPNs and VPLS.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify the threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**NOTE:** The threshold value must be equal to or greater than the transmit interval.

The threshold time must be equal to or greater than the value specified in the `minimum-interval` or the `minimum-receive-interval` statement.

**Options** *milliseconds*—Value for the detection time adaptation threshold.  
**Range:** 1 through 255,000

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Enable a topology for BGP multitopology routing. You must first configure one or more topologies under the <b>[edit routing-options]</b> hierarchy level.</p> <p>Apply the community tags to identify the application topologies by configuring a routing topology name and BGP community value.</p> <p>In Junos OS, multitopology support for BGP is based on the community value in a BGP route. This configuration determines the association between a topology and one or more community values and populates the topology routing tables. Arriving BGP updates that have a matching community value are replicated in the associated topology routing table. You decide which BGP community values are associated with a given topology.</p> <p>For example, you can create a configuration that causes BGP updates that are received with community value <b>target:40:40</b> to be added into topology routing table <b>:voice.inet.0</b> (in addition to the default routing table <b>inet.0</b>). Likewise, you configuration can specify that updates that are received with community value <b>target:50:50</b> are added into topology routing table <b>:video.inet.0</b> (in addition to the default routing table <b>inet.0</b>).</p>                                                                                                                                                                                                                                                                                                                                |

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

The default peer-level trace options are inherited from the group-level <b>traceoptions</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                                                                                                                                                                             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**file name**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. We recommend that you place BGP tracing output in the file `bgp-log`.

**files number**—(Optional) Maximum number of trace files. When a trace file named `trace-file.0` reaches its maximum size, it is renamed `trace-file.0`, then `trace-file.1`, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### BGP Tracing Flags

- **4byte-as**—4-byte AS events.
- **bfd**—BFD protocol events.
- **damping**—Damping operations.
- **graceful-restart**—Graceful restart events.
- **keepalive**—BGP keepalive messages. If you enable the the BGP **update** flag only, received keepalive messages do not generate a trace message.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **open**—Open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets.
- **refresh**—BGP refresh packets.
- **update**—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the **keepalive** flag to generate a trace message for keepalive messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **filter**—Provide filter trace information. Applies only to **route**, **damping**, and **update** tracing flags.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

| Description         | Configure tracing options for BMP monitoring. To specify more than one tracing operation, include multiple flag statements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Options             | <p><b>file</b> <i>file-name</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place BMP tracing output in the file <b>bmp-log</b>.</p> <p><b>files</b> <i>number</i>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file.0</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files<br/><b>Default:</b> 10 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all BMP monitoring operations.</li><li>• <b>down</b>—Down messages.</li><li>• <b>error</b>—Error conditions.</li><li>• <b>event</b>—Major events, station establishment, errors, and events.</li><li>• <b>general</b>—General events.</li><li>• <b>normal</b>—Normal events.</li><li>• <b>packets</b>—All messages.</li><li>• <b>policy</b>—Policy processing.</li><li>• <b>route</b>—Routing information.</li><li>• <b>route-monitoring</b>—Route monitoring messages.</li></ul> |

- **state**—State transitions.
- **statistics**—Statistics messages.
- **task**—Routing protocol task processing.
- **timer**—Routing protocol timer processing.
- **up**—Up messages.
- **write**—Writing of messages.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **disable**—Disable the tracing flag.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

|                                 |                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.1R1 for the MX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Enable collection of periodic ingress labeled statistics for BGP label-switched paths in a network configured with segment routing. The traffic statistics are collected at a specified time interval and saved in a specified file. To collect traffic statistics of labeled unicast IPv4 and IPv6 families for specific BGP groups, configure the <b>labeled-path</b> option under the family or BGP group level at <b>[edit logical-systems <i>logical-system-name</i> protocols bgp group <i>group-name</i> family (inet   inet6) labeled-unicast]</b> hierarchy level.</p>                            |
| <b>Options</b>                  | <p><b>file <i>filename</i></b>—Specify a filename to collect traffic statistics.</p> <p><b>interval</b>—Specify a time interval in seconds to collect traffic statistics.<br/> <b>Range:</b> 60 through 65535 seconds.</p> <p><b>size</b>— (Optional) Specify the size of the file that records traffic statistics.<br/> <b>Range:</b> 10240 through 4294967295</p> <p><b>world readable   world unreadable</b>— (Optional) Specify whether the traffic statistics log file is accessible to everyone or not.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>         | <p>Specify the transmit interval for the <b>bfd-liveness-detection</b> statement. The negotiated transmit interval for a peer is the interval between the sending of BFD packets to peers. The receive interval for a peer is the minimum time that it requires between packets sent from its peer; the receive interval is not negotiated between peers. To determine the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.

The remaining statements are explained separately. See [CLI Explorer](#).

**Release Information**

Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Support for setting the TTL on single-hop external BGP (EBGP) peers introduced in Junos OS Release 13.3.

**Description**

Configure the maximum time-to-live (TTL) value for the TTL in the IP header of BGP packets.

For BGP multihop scenarios, in which EBGP peers are not directly connected to each other, setting a TTL is optional. The default setting is 64.

For BGP single-hop scenarios, in which external EBGP peers are directly connected to each other, you can, optionally, set the TTL to 255 and configure an inbound firewall filter

to allow only BGP control packets with the TTL set to 255. This is in accordance with RFC 3682, *The Generalized TTL Security Mechanism (GTSM)*. For example:

Send all BGP control packets with the TTL set to 255:

```
user@host# show protocols
bgp {
 group toAS2 {
 type external;
 peer-as 2;
 ttl 255;
 neighbor 10.1.2.3;
 neighbor 10.3.4.5;
 neighbor 10.5.6.7;
 }
}
```

Accept only BGP control packets that have the TTL set to 255:

```
user@host# show firewall
filter ttl-security {
 term gtsm {
 from {
 source-address {
 10.1.2.3/32;
 10.3.4.5/32;
 10.5.6.7/32;
 }
 protocol tcp;
 ttl-except 255;
 port 179;
 }
 then {
 discard;
 }
 }
 term else {
 then {
 accept;
 }
 }
}
```

Apply the firewall filter to the inbound interface for the EBGP single-hop peer:

```
user@host# show interfaces
ge-1/0/0 {
 unit 0 {
 family inet {
 filter {
 input gtsm;
 }
 }
 }
}
```

## type (Protocols BGP)

---

**Syntax** type type;

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols bgp **group** *group-name*],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols  
bgp **group** *group-name*],  
[edit protocols bgp **group** *group-name*],  
[edit routing-instances *routing-instance-name* protocols bgp **group** *group-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Specify the type of BGP peer group.

When configuring a BGP group, you can indicate whether the group is an IBGP group or an EBGp group. All peers in an IBGP group are in the same AS, while peers in an EBGp group are in different ASs and normally share a subnet.

**Options** **type**—Type of group:

- **external**—External group, which allows inter-AS BGP routing
- **internal**—Internal group, which allows intra-AS BGP routing

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                  |
| <b>Description</b>              | When <b>set protocols bgp group <i>group-name</i> allow network</b> is configured to accept dynamic BGP sessions, <b>unconfigured-peer-graceful-restart</b> statement should be configured to avoid traffic drop during graceful restart or graceful Routing Engine switchover. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                             |
| <b>Related Documentation</b>    |                                                                                                                                                                                                                                                                                 |

## validation (Origin Validation for BGP)

```
Syntax validation {
 group group-name {
 max-sessions number;
 session address {
 hold-time seconds;
 local-address local-ip-address;
 port port-number;
 preference number;
 record-lifetime seconds;
 refresh-time seconds;
 }
 }
 static {
 record destination {
 maximum-length prefix-length {
 origin-autonomous-system as-number {
 validation-state (invalid | valid);
 }
 }
 }
 }
 traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable>;
 flag flag;
 }
 }
```

**Release Information** Statement introduced in Junos OS Release 8.1  
 Statement introduced in Junos OS Release 12.1 for the QFX Series.  
 Statement introduced in Junos OS Release 13.2 for Layer 2 VPN and VPLS.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify the BFD version for detection. You can explicitly configure BFD version 0, version 1, or the routing device can automatically detect the BFD version. By default, the routing device automatically detects the BFD version, which is either 0 or 1.

**Options** Configure the BFD version to detect: **0** (BFD version 0), **1** (BFD version 1), or **automatic** (autodetect the BFD version)

**Default:** automatic

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## vpn-apply-export

**Syntax** `vpn-apply-export;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols bgp],  
[edit logical-systems *logical-system-name* protocols bgp group *group-name*],  
[edit logical-systems *logical-system-name* protocols bgp group *group-name* neighbor *neighbor*],  
[edit protocols bgp],  
[edit protocols bgp group *group-name*],  
[edit protocols bgp group *group-name* neighbor *neighbor*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Apply both the VRF export and BGP group or neighbor export policies (VRF first, then BGP) before routes from the **vrf** or **l2vpn** routing tables are advertised to other PE routers.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 16.1 for the ACX Series, M Series, MX Series, PTX Series, QFabric systems, and QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Description              | <p>Within BGP route prioritization, the <b>withdraw-priority</b> statement allows you to set specific priority levels for BGP routes that are to be withdrawn. The <b>withdraw-priority</b> statement can be configured for BGP neighbors during BGP configuration, or for sub-families within the following address families:</p> <ul style="list-style-type: none"><li>• <b>evpn</b></li><li>• <b>inet</b></li><li>• <b>inet-mdt</b></li><li>• <b>inet-mvpn</b></li><li>• <b>inet-vpn</b></li><li>• <b>inet6</b></li><li>• <b>inet6-mvpn</b></li><li>• <b>inet6-vpn</b></li><li>• <b>iso-vpn</b></li><li>• <b>l2vpn</b></li><li>• <b>route-target</b></li><li>• <b>traffic-engineering</b></li></ul> |
| Required Privilege Level | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## CHAPTER 31

# Operational Commands

- clear bfd adaptation
- clear bfd session
- clear bgp damping
- clear bgp neighbor
- clear bgp table
- clear validation database
- clear validation session
- clear validation statistics
- monitor traffic
- request validation policy
- restart
- show bfd session
- show bgp bmp
- show bgp group
- show bgp group output-queues
- show bgp group traffic-statistics
- show bgp neighbor
- show bgp output-scheduler
- show bgp replication
- show bgp replication logical-system
- show bgp summary
- show dynamic-tunnels pfe-tunnel-localization
- show nonstop-routing
- show (ospf | ospf3) bgp-orr
- show policy
- show policy conditions
- show policy damping
- show route

- `show route active-path`
- `show route advertising-protocol`
- `show route all`
- `show route aspath-regex`
- `show route best`
- `show route brief`
- `show route community`
- `show route community-name`
- `show route damping`
- `show route detail`
- `show route exact`
- `show route export`
- `show route extensive`
- `show route flow validation`
- `show route forwarding-table`
- `show route hidden`
- `show route inactive-path`
- `show route inactive-prefix`
- `show route instance`
- `show route next-hop`
- `show route no-community`
- `show route output`
- `show route protocol`
- `show route receive-protocol`
- `show route table`
- `show route terse`
- `show security keychain`
- `show validation database`
- `show validation group`
- `show validation replication database`
- `show validation session`
- `show validation statistics`
- `show v4ov6-tunnels`
- `test policy`

## clear bfd adaptation

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Clear adaptation for Bidirectional Forwarding Detection (BFD) sessions. BFD is a simple hello mechanism that detects failures in a network. Configured BFD interval timers can change, adapting to network situations. Use this command to return BFD interval timers to their configured values.</p> <p>The <b>clear bfd adaptation</b> command is hitless, meaning that the command does not affect traffic flow on the routing device.</p> |
| <b>Options</b>                  | <p><b>all</b>—Clear adaptation for all BFD sessions.</p> <p><b>address <i>session-address</i></b>—(Optional) Clear adaptation for all BFD sessions matching the specified address.</p> <p><b>discriminator <i>discr-number</i></b>—(Optional) Clear adaptation for the local BFD session matching the specified discriminator.</p>                                                                                                               |
| <b>Additional Information</b>   | For more information, see the description of the <b>bfd-liveness-detection</b> configuration statement in the <i>Junos Routing Protocols Configuration Guide</i> .                                                                                                                                                                                                                                                                               |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>                              | <p>Perform one of the following tasks:</p> <ul style="list-style-type: none"> <li>Change the state of one or more BGP neighbors to <b>IDLE</b>. For neighbors in the <b>ESTABLISHED</b> state, this command drops the TCP connection to the neighbors and then reestablishes the connection.</li> <li>(<b>soft</b> keyword only) Reapply export policies and send refresh updates to one or more BGP neighbors without changing their state.</li> <li>(<b>soft-inbound</b> keyword only) Send a route-refresh message to one or more BGP neighbors without changing their state, and reapply import policies on the received updates.</li> </ul> |
| <b>Options</b>                                  | <b>all</b> —Change the state of all BGP neighbors to <b>IDLE</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**as *as-number***—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).

**gracefully**—(Optional) Enable the BGP peer to start graceful-restart receiving-speaker mode. The receiving speaker also sends its own routes to the restarted speaker, and sends an End-of-RIB marker when it completes the update. The **clear bgp neighbor *neighbor-address* gracefully** command is the same as **clear bgp neighbor hard** (the default for **clear bgp neighbor**), but it does not use the new Hard Reset subcode on the Notify and Cease messages that are sent. This allows the neighbor to enter GR or LLGR helper mode, if negotiated. The session is still cleared on this router, and this router does not enter GR or LLGR helper mode.

**instance *instance-name***—(Optional) Apply this command only to neighbors for the specified routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**malformed-route**—(Optional) Remove malformed routes. If a specific neighbor is provided, Junos OS removes malformed routes for that particular neighbor. Otherwise, Junos OS removes malformed routes for all BGP neighbors. To find routes that have malformed attributes, run the **show route hidden** command, and look for routes marked with **MalformedAttr** in the AS path field.

**neighbor**—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

**soft**—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

**soft-inbound**—(Optional) Send a route-refresh message to BGP neighbors and reapply import policies on the route updates received from the BGP neighbors without clearing the BGP state.

**soft-minimum-igp**—(Optional) Provide soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

**stale-routes**—(Optional) Any stale route currently being held for the specified neighbor because of BGP graceful restart (GR) or long-lived graceful restart (LLGR) receiver mode operations.

**Required Privilege Level** clear

| <b>Description</b>                              | Request that BGP refresh routes in a specified routing table.                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                                  | <b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.<br><br><b><i>table-name</i></b> —Request that BGP refresh routes in the specified table.                                                                                                                                                           |
| <b>Additional Information</b>                   | In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the <b>clear bgp table</b> command to request that BGP refresh routes in a VPN instance table. |
| <b>Required Privilege Level</b>                 | clear                                                                                                                                                                                                                                                                                                                                                                                                    |

### Sample Output

#### clear validation statistics

```
user@host> clear validation statistics
Statistics cleared
```

## monitor traffic

**Syntax**    monitor traffic  
               <brief | detail | extensive>  
               <absolute-sequence>  
               <count *count*>  
               <interface *interface-name*>  
               <layer2-headers>  
               <matching *matching*>  
               <no-domain-names>  
               <no-promiscuous>  
               <no-resolve>  
               <no-timestamp>  
               <print-ascii>  
               <print-hex>  
               <resolve-timeout>  
               <size *size*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                               Command introduced in Junos OS Release 9.0 for EX Series switches.  
                               Command introduced in Junos OS Release 11.1 for the QFX Series.  
                               Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display packet headers or packets received and sent from the Routing Engine.

### NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the **no-resolve** option.

**NOTE:** This command is not supported on the QFabric system.

**Options**    **none**—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**absolute-sequence**—(Optional) Display absolute TCP sequence numbers.

**count** *count*—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The monitor traffic command quits automatically after displaying the number of packets specified.

**interface *interface-name***—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

**layer2-headers**—(Optional) Display the link-level header on each line.

**matching *matching***—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

**no-domain-names**—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

**no-promiscuous**—(Optional) Do not put the interface into promiscuous mode.

**no-resolve**—(Optional) Suppress reverse lookup of the IP addresses.

**no-timestamp**—(Optional) Suppress timestamps on displayed packets.

**print-ascii**—(Optional) Display each packet in ASCII format.

**print-hex**—(Optional) Display each packet, except the link-level header, in hexadecimal format.

**resolve-timeout *timeout***—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

**size *size***—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

**Additional Information** In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace **expression** with one or more of the match conditions listed in [Table 27 on page 1330](#).

Table 27: Match Conditions for the `monitor traffic` Command

| Match Type    | Condition                                             | Description                                                                                                                                                                                                                                                                            |
|---------------|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entity        | <b>host</b> [ <i>address</i>   <i>hostname</i> ]      | Matches packets that contain the specified address or hostname.<br><br>The protocol match conditions <b>arp</b> , <b>ip</b> , or <b>rarp</b> , or any of the directional match conditions can be prepended to the <b>host</b> match condition.                                         |
|               | <b>net</b> <i>address</i>                             | Matches packets with source or destination addresses containing the specified network address.                                                                                                                                                                                         |
|               | <b>net</b> <i>address mask mask</i>                   | Matches packets containing the specified network address and subnet mask.                                                                                                                                                                                                              |
|               | <b>port</b> ( <i>port-number</i>   <i>port-name</i> ) | Matches packets containing the specified source or destination TCP or UDP port number or port name.<br><br>In place of the numeric port address, you can specify a text synonym, such as <b>bgp</b> (179), <b>dhcp</b> (67), or <b>domain</b> (53) (the port numbers are also listed). |
| Directional   | <b>dst</b>                                            | Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                                  |
|               | <b>src</b>                                            | Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                                             |
|               | <b>src and dst</b>                                    | Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.                                                                                                                         |
|               | <b>src or dst</b>                                     | Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                        |
| Packet Length | <b>less</b> <i>value</i>                              | Matches packets shorter than or equal to the specified value, in bytes.                                                                                                                                                                                                                |
|               | <b>greater</b> <i>value</i>                           | Matches packets longer than or equal to the specified value, in bytes.                                                                                                                                                                                                                 |

Table 27: Match Conditions for the monitor traffic Command (continued)

| Match Type | Condition                                                | Description                                                                                                                                                                                                                                                                                                                     |
|------------|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol   | <b>amt</b>                                               | Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.                                                                                                                                                                                                |
|            | <b>arp</b>                                               | Matches all ARP packets.                                                                                                                                                                                                                                                                                                        |
|            | <b>ether</b>                                             | Matches all Ethernet packets.                                                                                                                                                                                                                                                                                                   |
|            | <b>ether (broadcast   multicast)</b>                     | Matches broadcast or multicast Ethernet frames. This match condition can be prepended with <b>src</b> and <b>dst</b> .                                                                                                                                                                                                          |
|            | <b>ether protocol (address   (arp   ip   rarp))</b>      | Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The <b>ether protocol</b> arguments <b>arp</b> , <b>ip</b> , and <b>rarp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ether protocol</b> match condition. |
|            | <b>icmp</b>                                              | Matches all ICMP packets.                                                                                                                                                                                                                                                                                                       |
|            | <b>ip</b>                                                | Matches all IP packets.                                                                                                                                                                                                                                                                                                         |
|            | <b>ip (broadcast   multicast)</b>                        | Matches broadcast or multicast IP packets.                                                                                                                                                                                                                                                                                      |
|            | <b>ip protocol (address   (icmp   igmp   tcp   udp))</b> | Matches packets with the specified address or protocol type. The <b>ip protocol</b> arguments <b>icmp</b> , <b>tcp</b> , and <b>udp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ip protocol</b> match condition.                                                 |
|            | <b>isis</b>                                              | Matches all IS-IS routing messages.                                                                                                                                                                                                                                                                                             |
|            | <b>proto ip-protocol-number</b>                          | Matches packets whose headers contain the specified IP protocol number.                                                                                                                                                                                                                                                         |

|            | <b>udp</b>                                               | Matches all UDP datagrams.                                                                                                                                                                                                                                                                                                      |

To combine expressions, use the logical operators listed in [Table 28 on page 1332](#).

Table 28: Logical Operators for the monitor traffic Command

| Logical Operator (Highest to Lowest Precedence) | Description                                                                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| !                                               | Logical NOT. If the first condition does not match, the next condition is evaluated.                                                                |
| &&                                              | Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped. |
|                                                 | Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.  |
| ( )                                             | Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).        |

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"arithmetic_expression relational_operator arithmetic_expression
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in [Table 29 on page 1333](#).

**NOTE:** Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The `monitor traffic` command cannot apply match conditions to inbound traffic.
- The `monitor traffic interface` command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the `match pipe` option (`| match`) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see [Table 27 on page 1330](#).
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the `monitor traffic interface ae[x]` command for aggregated Ethernet interfaces (such as `ae0`) only shows inbound traffic data, the command does not show VLAN tag information in the output.

**Table 29: Arithmetic and Relational Operators for the `monitor traffic` Command**

| Arithmetic or Relational Operator                         | Description                                                                         |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>Arithmetic Operator</b>                                |                                                                                     |
| +                                                         | Addition operator.                                                                  |
| -                                                         | Subtraction operator.                                                               |
| /                                                         | Division operator.                                                                  |
| &                                                         | Bitwise AND.                                                                        |
| *                                                         | Bitwise exclusive OR.                                                               |
|                                                           | Bitwise inclusive OR.                                                               |
| <b>Relational Operator (Highest to Lowest Precedence)</b> |                                                                                     |
| <=                                                        | If the first expression is less than or equal to the second, the packet matches.    |
| >=                                                        | If the first expression is greater than or equal to the second, the packet matches. |
| <                                                         | If the first expression is less than the second, the packet matches.                |
| >                                                         | If the first expression is greater than the second, the packet matches.             |
| =                                                         | If the compared expressions are equal, the packet matches.                          |

*Table 29: Arithmetic and Relational Operators for the monitor traffic Command (continued)*

| Arithmetic or Relational Operator | Description                                                  |
|-----------------------------------|--------------------------------------------------------------|
| !=                                | If the compared expressions are unequal, the packet matches. |

| <b>Description</b>              | When BGP origin validation is configured, manually request a route validation record policy to be reevaluated. This command causes dependent route validation records to be reevaluated. Dependent route validation records are exactly matching and more specific records.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>none</b>—Request a policy reevaluation of all dependent route validation records.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Request a policy reevaluation of all dependent route validation records for the specified routing instance. The instance name can be master for the main instance, or any valid configured instance name or its prefix.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on a particular logical system.</p> <p><b>record <i>ip-prefix</i></b>—(Optional) Request a policy reevaluation of all route validation records that match a given prefix.</p> |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Sample Output

### request validation policy

```
user@host> request validation policy
 Enqueued 1 IPv4 records
 Enqueued 0 IPv6 records
```

## restart

**Release Information**

Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Command introduced in Junos OS Release 12.2 for ACX Series routers.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **dlsf** in Junos OS Release 7.5.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

**Description** Restart a Junos OS process.

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

**Options**    **none**—Same as **gracefully**.

**adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

**all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

**ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

**application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

**audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

**auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.

**autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.

**captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**chassis-control**—(Optional) Restart the chassis management process.

**class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dls**—(QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**— (M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

**mib-process**—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**—(Optional) Restart the MPLS Periodic Traceroute process.

**mspd**—(Optional) Restart the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**—(QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway *gateway-name***—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—( MX Series routers) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level**    reset

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

## Sample Output

[restart interface-control gracefully](#)

```
user@host> restart interface-control gracefully
Interface control process started, pid 41129
```

## show bfd session

**List of Syntax**    [Syntax on page 1351](#)  
                          [Syntax \(EX Series Switch and QFX Series\) on page 1351](#)

**Syntax**    show bfd session  
                  <brief | detail | extensive | summary>  
                  <address *address*>  
                  <client rsvp-oam (brief | detail | extensive | summary) | vpls-oam (brief | detail | extensive |  
                  instance *instance-name* | summary)>  
                  <discriminator *discriminator*>  
                  <logical-system (all | *logical-system-name*)>  
                  <prefix *address*>  
                  <subscriber (address *destination-address* | discriminator *discriminator* | extensive)>

**Syntax (EX Series Switch and QFX Series)**    show bfd session  
                  <brief | detail | extensive | summary>  
                  <address *address*>  
                  <client rsvp-oam (brief | detail | extensive | summary) | vpls-oam (brief | detail | extensive |  
                  instance *instance-name* | summary)>  
                  <discriminator *discriminator*>  
                  <prefix *address*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                  Options **discriminator** and **address** introduced in Junos OS Release 8.2.  
                  Option **prefix** introduced in Junos OS Release 9.0.  
                  Command introduced in Junos OS Release 12.1 for the QFX Series.  
                  Option **client** introduced in Junos OS Release 12.3R3.  
                  Option **subscriber** introduced in Junos OS Release 15.1 for the MX Series.

**Description**    Display information about active Bidirectional Forwarding Detection (BFD) sessions.

**Options**    **none**—(Same as **brief**) Display information about active BFD sessions.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**address *address***—(Optional) Display information about the BFD session for the specified neighbor address.

**client rsvp-oam**

(**brief | detail | extensive | summary**)

| **vpls-oam**

(**brief | detail | extensive | instance *instance-name* | summary**)—(Optional) Display information about RSVP-OAM or VPLS-OAM BFD sessions in the specified level of output. For VPLS-OAM, display the specified level of output or display information about all of the BFD sessions for the specified VPLS routing instance.

**discriminator *discriminator***—(Optional) Display information about the BFD session using the specified local discriminator.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**<subscriber (address *destination-address* | discriminator *discriminator* | extensive)>**—(Optional) Display information about all BFD sessions for subscribers, or for a single BFD subscriber session with a particular destination address, or with a particular denominator.

**Required Privilege Level**

| Remote state       | Reports whether the remote system's BFD packets have been received and whether the remote system is receiving transmitted control packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | detail extensive |
| Version            | BFD version: <b>0</b> or <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | extensive        |
| Replicated         | The <b>replicated</b> flag appears when nonstop routing or graceful Routing Engine switchover is configured and the BFD session has been replicated to the backup Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                                 | detail extensive |
| Min async interval | Minimum amount of time, in seconds, between asynchronous control packet transmissions across the BFD session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | extensive        |
| Min slow interval  | Minimum amount of time, in seconds, between synchronous control packet transmissions across the BFD session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | extensive        |

Table 30: show bfd session Output Fields (continued)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Adaptive async TX interval          | Transmission interval being used because of adaptation.                                                                                                                                                                                                                                                                                                                                                            | extensive       |
| RX interval                         | Minimum required receive interval.                                                                                                                                                                                                                                                                                                                                                                                 | extensive       |
| Local min TX interval               | Minimum amount of time, in seconds, between control packet transmissions on the local system.                                                                                                                                                                                                                                                                                                                      | extensive       |
| Local min RX interval               | Minimum amount of time, in seconds, between control packet detections on the local system.                                                                                                                                                                                                                                                                                                                         | extensive       |
| Remote min TX interval              | Minimum amount of time, in seconds, between control packet transmissions on the remote system.                                                                                                                                                                                                                                                                                                                     | extensive       |
| Remote min RX interval              | Minimum amount of time, in seconds, between control packet detections on the remote system.                                                                                                                                                                                                                                                                                                                        | extensive       |
| Threshold transmission interval     | Threshold for notification if the transmission interval increases.                                                                                                                                                                                                                                                                                                                                                 | extensive       |
| Threshold for detection time        | Threshold for notification if the detection time increases.                                                                                                                                                                                                                                                                                                                                                        | extensive       |
| Local discriminator                 | Authentication code used by the local system to identify that BFD session.                                                                                                                                                                                                                                                                                                                                         | extensive       |
| Remote discriminator                | Authentication code used by the remote system to identify that BFD session.                                                                                                                                                                                                                                                                                                                                        | extensive       |
| Echo mode                           | Information about the state of echo transmissions on the BFD session.                                                                                                                                                                                                                                                                                                                                              | extensive       |
| Prefix                              | LDP FEC address associated with the BFD session.                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| Egress, Destination                 | Displays the LDP FEC destination address. This field is displayed only on a router at the egress of an LDP FEC, where the BFD session has an LDP Operation, Administration, and Maintenance (OAM) client.                                                                                                                                                                                                          | All levels      |
| Remote is control-plane independent | <p>The BFD session on the remote peer is running on its Packet Forwarding Engine. In this case, when the remote node undergoes a graceful restart, the local peer can help the remote peer with the graceful restart.</p> <p>The following BFD sessions are not distributed to the Packet Forwarding Engine: tunnel-encapsulated sessions, and sessions over integrated routing and bridging (IRB) interfaces.</p> | extensive       |

Table 30: show bfd session Output Fields (continued)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output         |

## Sample Output

### show bfd session

```

user@host> show bfd session

Address State Interface Detect Time Transmit Interval Multiplier
10.9.1.33 Up so-7/1/0.0 0.600 0.200 3
10.9.1.29 Up ge-4/0/0.0 0.600 0.200 3

```

```
2 sessions, 2 clients
Cumulative transmit rate 10.0 pps, cumulative receive rate 10.0 pps
```

### show bfd session brief

The output for the **show bfd session brief** command is identical to that for the **show bfd session** command.

### show bfd session detail

```
user@host> show bfd session detail
```

## show bgp bmp

**Syntax** `show bgp bmp`

**Release Information** Command introduced in Junos OS Release 9.5.  
 Command introduced in Junos OS Release 9.5 for EX Series switches.  
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display information about the BGP Monitoring Protocol (BMP).

**Options** This command has no options.

**Required Privilege Level** view

**List of Sample Output** [show bgp bmp on page 1362](#)

**Output Fields** [Table 31 on page 1362](#) lists the output fields for the **show bgp bmp** command. Output fields are listed in the approximate order in which they appear.

*Table 31: show bgp bmp Output Fields*

| Field Name                          | Field Description                                                                                                                                              |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BMP station address/port</b>     | IP address and port number of the monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.                                               |
| <b>BMP session state</b>            | Status of the BMP session: <b>UP</b> or <b>DOWN</b> .                                                                                                          |
| <b>Memory consumed by BMP</b>       | Memory used by the active BMP session.                                                                                                                         |
| <b>Statistics timeout</b>           | Amount of time, in seconds, between transmissions of BMP data to the monitoring station.                                                                       |
| <b>Memory limit</b>                 | Threshold, in bytes, at which the routing device stops collecting BMP data.                                                                                    |
| <b>Memory-connect retry timeout</b> | Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded. |

## Sample Output

### show bgp bmp

```
user@host> show bgp bmp
 BMP station address/port: 172.24.24.157+5454
 BMP session state: DOWN
```

```
Memory consumed by BMP: 0
Statistics timeout: 15
Memory limit: 10485760
Memory connect retry timeout: 600
```

**Output Fields** [Table 32 on page 1365](#) describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

*Table 32: show bgp group Output Fields*

| Field Name                             | Field Description                                                                                                                                                                                                                                      | Level of Output             |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| <b>Group Type or Group</b>             | Type of BGP group: <b>Internal</b> or <b>External</b> .                                                                                                                                                                                                | All levels                  |
| <b>group-index</b>                     | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.                                                          | <b>rtf detail</b>           |
| <b>AS</b>                              | AS number of the peer. For internal BGP (IBGP), this number is the same as <b>Local AS</b> .                                                                                                                                                           | <b>brief detail</b><br>none |
| <b>Local AS</b>                        | AS number of the local routing device.                                                                                                                                                                                                                 | <b>brief detail</b><br>none |
| <b>Name</b>                            | Name of a specific BGP group.                                                                                                                                                                                                                          | <b>brief detail</b><br>none |
| <b>Options</b>                         | The Network Layer Reachability Information (NLRI) format used for BGP VPN multicast.                                                                                                                                                                   | <b>none</b> none            |
| <b>Index</b>                           | Unique index number of a BGP group.                                                                                                                                                                                                                    | <b>brief detail</b><br>none |
| <b>Flags</b>                           | Flags associated with the BGP group. This field is used by Juniper Networks customer support.                                                                                                                                                          | <b>brief detail</b><br>none |
| <b>BGP-Static Advertisement Policy</b> | Policies configured for the BGP group with the <b>advertise-bgp-static policy</b> statement.                                                                                                                                                           | <b>brief</b> none           |
| <b>Remove-private options</b>          | Options associated with the <a href="#">remove-private</a> statement.                                                                                                                                                                                  | <b>brief detail</b><br>none |
| <b>Holdtime</b>                        | Maximum number of seconds allowed to elapse between successive keepalive or update messages that BGP receives from a peer in the BGP group, after which the connection to the peer is closed and routing devices through that peer become unavailable. | <b>brief detail</b><br>none |
| <b>Export</b>                          | Export policies configured for the BGP group with the <b>export</b> statement.                                                                                                                                                                         | <b>brief detail</b><br>none |

| <b>Table</b>             | Name of a routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>brief</b> , none |
| <b>Tot Paths</b>         | Total number of routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>brief</b> , none |
| <b>Act Paths</b>         | Number of active routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>brief</b> , none |
| <b>Suppressed</b>        | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>brief</b> , none |

Table 32: show bgp group Output Fields (continued)

| Field Name   | Field Description                                                                                                                                                                                           | Level of Output |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| History      | Number of withdrawn routes stored locally to keep track of damping history.                                                                                                                                 | brief, none     |
| Damp State   | Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.                                                                                 | brief, none     |
| Pending      | Routes being processed by the BGP import policy.                                                                                                                                                            | brief, none     |
| Group        | Group the peer belongs to in the BGP configuration.                                                                                                                                                         | detail          |
| Receive mask | Mask of the received target included in the advertised route.                                                                                                                                               | detail          |
| Entries      | Number of route entries received.                                                                                                                                                                           | detail          |
| Target       | Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer. | detail          |
| Mask         | Mask which specifies that the peer receive routes with the given route target.                                                                                                                              | detail          |

| <b>Output Fields</b>            | <a href="#">Table 33 on page 1372</a> describes the output fields for the <b>show bgp group output-queues</b> command. Output fields are listed in the approximate order in which they appear. Some output fields are self-explanatory and so are not shown in the table.                                                                                                                   |

*Table 33: show bgp group output-queues Output Fields*

| Field Name | Field Description                                                                            |
|------------|----------------------------------------------------------------------------------------------|
| Index      | Group's index number.                                                                        |
| Options    | Options set within the BGP group definition.                                                 |
| NLRI       | Address family for which BGP route prioritization has been implemented within the BGP group. |
| OutQ       | Output priority queue designated for this address family within this group.                  |
| RRQ        | Route refresh priority queue designated for this address family within this group.           |

Table 33: show bgp group output-queues Output Fields (continued)

| Field Name   | Field Description                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| WDQ          | Withdraw priority queue designated for this address family within this group.                                                                  |
| Class        | Shows the name of the priority queues. There are always 16 numbered priority queues and the expedited queue for a total of 17 priority queues. |
| Tokens       | Shows the number of tokens assigned to each priority queue.                                                                                    |
| Total Routes | Shows the number of routes currently in each priority queue (class).                                                                           |

## show bgp neighbor

**List of Syntax** [Syntax on page 1379](#)  
[Syntax \(EX Series Switch, QFX Series, and OCX Series\) on page 1379](#)

**Syntax** `show bgp neighbor`  
`<exact-instance instance-name>`  
`<instance instance-name>`  
`<logical-system (all | logical-system-name)>`  
`<neighbor-address>`  
`<output-queue>`  
`<orf (detail | neighbor-address)>`

**Syntax (EX Series Switch, QFX Series, and OCX Series)** `show bgp neighbor`  
`<instance instance-name>`  
`<exact-instance instance-name>`  
`<neighbor-address>`  
`<orf (neighbor-address | detail)>`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.  
Command introduced in Junos OS Release 14.1x53-D20 for the OCX Series.  
**orf** option introduced in Junos OS Release 9.2.  
**exact-instance** option introduced in Junos OS Release 11.4.  
**output-queue** option introduced in Junos OS Release 16.1  
**DontGRHelpFateSharingBfdDown** is added to the **options** field of the command output in Junos OS Release 18.3R1.

**Description** Display information about BGP peers.

**Options** **none**—Display information about all BGP peers.

**exact-instance *instance-name***—(Optional) Display information for the specified instance only.

**instance *instance-name***—(Optional) Display information about BGP peers for all routing instances whose name begins with this string (for example, **cust1**, **cust11**, and **cust111** are all displayed when you run the **show bgp neighbor instance cust1** command).

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**neighbor-address**—(Optional) Display information for only the BGP peer at the specified IP address.

**orf (detail | *neighbor-address*)**—(Optional) Display outbound route-filtering information for all BGP peers or only for the BGP peer at the specified IP address. The default is to display brief output. Use the **detail** option to display detailed output.

**output-queue**—(Optional) Display information regarding the number of routes currently queued in the 17 prioritized BGP output queues.

**Additional Information** For information about the **local-address**, **nlri**, **hold-time**, and **preference** statements, see the *Junos OS Routing Protocols Library*.

| Authentication algorithm                                       | (Appears only if the <b>authentication-algorithm</b> statement has been configured) Type of authentication algorithm enabled: <b>hmac</b> or <b>md5</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 35: show bgp neighbor Output Fields (continued)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address families configured       | Names of configured address families for the VPN.                                                                                                                                                                                                                                                                                                                               |
| BGP-Static Advertisement Policy   | Name of the BGP static policy that is configured on the peer.                                                                                                                                                                                                                                                                                                                   |
| Local Address                     | Address of the local routing device.                                                                                                                                                                                                                                                                                                                                            |
| Remove-private options            | Options associated with the <code>remove-private</code> statement.                                                                                                                                                                                                                                                                                                              |
| Holdtime                          | Hold time configured with the <code>hold-time</code> statement. The hold time is three times the interval at which keepalive messages are sent.                                                                                                                                                                                                                                 |
| Flags for NLRI inet-label-unicast | Flags related to labeled-unicast: <ul style="list-style-type: none"> <li>• <b>TrafficStatistics</b>—Collection of statistics for labeled-unicast traffic is enabled.</li> </ul>                                                                                                                                                                                                 |
| Traffic statistics                | Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> <li>• <b>Options</b>—Options configured for collecting statistics about labeled-unicast traffic.</li> <li>• <b>File</b>—Name and location of statistics log files.</li> <li>• <b>size</b>—Size of all the log files, in bytes.</li> <li>• <b>files</b>—Number of log files.</li> </ul> |
| Traffic Statistics Interval       | Time between sample periods for labeled-unicast traffic statistics, in seconds.                                                                                                                                                                                                                                                                                                 |
| Preference                        | Preference value configured with the <code>preference</code> statement.                                                                                                                                                                                                                                                                                                         |
| Outbound Timer                    | Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the <code>out-delay</code> parameter is configured to a non-zero value.                                                                                                                                                             |
| Number of flaps                   | Number of times the BGP session has gone down and then come back up.                                                                                                                                                                                                                                                                                                            |
| Peer ID                           | Router identifier of the peer.                                                                                                                                                                                                                                                                                                                                                  |
| Group index                       | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.                                                                                                                                                                                   |
| Peer index                        | Index that is unique within the BGP group to which the peer belongs.                                                                                                                                                                                                                                                                                                            |
| Local ID                          | Router identifier of the local routing device.                                                                                                                                                                                                                                                                                                                                  |
| Local Interface                   | Name of the interface on the local routing device.                                                                                                                                                                                                                                                                                                                              |
| Active holdtime                   | Hold time that the local routing device negotiated with the peer.                                                                                                                                                                                                                                                                                                               |
| Keepalive Interval                | Keepalive interval, in seconds.                                                                                                                                                                                                                                                                                                                                                 |

Table 35: show bgp neighbor Output Fields (continued)

| Field Name                                                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BFD</b>                                                            | Status of BFD failure detection.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Local Address</b>                                                  | Name of directly connected interface over which direct EBGP peering is established.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>NLRI and times for LLGR configured on peer</b>                     | <p>Names of address families and stale time for BGP long-lived graceful restart configured on the BGP peer or neighbor.</p> <p>Times are displayed using the routing protocol daemon (rpd) %#OT format:</p> <p><b>&lt;weeks&gt;w&lt;days&gt;d &lt;hours&gt;:&lt;minutes&gt;:&lt;seconds&gt;</b></p> <p>Zero leading elements are omitted, for example, a value less than one week do not include the weeks.</p>                                       |
| <b>NLRI and times that peer supports LLGR Restarter for</b>           | <p>Names of address families and stale time that the BGP peer supports for restarter mode for BGP long-lived graceful restart.</p> <p>Times are displayed using the routing protocol daemon (rpd) %#OT format:</p> <p><b>&lt;weeks&gt;w&lt;days&gt;d &lt;hours&gt;:&lt;minutes&gt;:&lt;seconds&gt;</b></p> <p>Zero leading elements are omitted, for example, a value less than one week do not include the weeks.</p>                                |
| <b>NLRI that peer saved LLGR forwarding for</b>                       | Name of the address family for which the BGP peer saved BGP long-lived graceful restart forwarding.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Graceful Restart Details</b>                                       | Amount of time that is remaining until LLGR expires and the time remaining on the GR stale timer, along with RIB details, are displayed while LLGR receiver mode is active (a peer that negotiated LLGR has disconnected and not yet reconnected).                                                                                                                                                                                                    |
| <b>NLRI we are holding stale routes for</b>                           | Names of address families (NLRIs) for which that stale routes are held or preserved when BGP graceful restart receiver mode is active for a neighbor.                                                                                                                                                                                                                                                                                                 |
| <b>Time until end-of-rib is assumed for stale routes</b>              | <p>Amount of time remaining on the stale timer until which end-of-RIB (EoR) markers are assumed when BGP graceful restart receiver mode is active for a neighbor.</p> <p>Time is displayed in Coordinated Universal Time (UTC) format (YYYY-MM-DD-HH:MM:SS). Note that the stale timer display ('Time until end-of-rib is assumed') is also present when a session is active, but the neighbor as not yet sent all of the end-of-rib indications.</p> |
| <b>Time until stale routes are deleted or become long-lived stale</b> | Amount of time up to which stale routes are deleted or become long-lived stale routes when BGP graceful restart receiver mode is active for a neighbor.                                                                                                                                                                                                                                                                                               |
| <b>NLRI for restart configured on peer</b>                            | Names of address families configured for restart.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>NLRI advertised by peer</b>                                        | Address families supported by the peer: <b>unicast</b> or <b>multicast</b> .                                                                                                                                                                                                                                                                                                                                                                          |
| <b>NLRI for this session</b>                                          | Address families being used for this session.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Peer supports Refresh capability</b>                               | Remote peer's ability to send and request full routing table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .                                                                                                                                                                                                                                                              |

Table 35: show bgp neighbor Output Fields (continued)

| Field Name                                                 | Field Description                                                                                                                                                                                                                 |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Restart time configured on peer                            | Configured time allowed for restart on the neighbor.                                                                                                                                                                              |
| Stale routes from peer are kept for                        | When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.                                                                                                  |
| Peer does not support Restarter functionality              | Graceful restart restarter-mode is disabled on the peer.                                                                                                                                                                          |
| Peer does not support Receiver functionality               | Graceful restart helper-mode is disabled on the peer.                                                                                                                                                                             |
| Restart time requested by this peer                        | Restart time requested by this neighbor during capability negotiation.                                                                                                                                                            |
| Restart flag received from the peer                        | When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the <b>end-of-rib</b> marker from the speaker before advertising routing information to the speaker.                       |
| NLRI that peer supports restart for                        | Neighbor supports graceful restart for this address family.                                                                                                                                                                       |
| NLRI peer can save forwarding state                        | Neighbor supporting this address family saves all forwarding states.                                                                                                                                                              |
| NLRI that peer saved forwarding for                        | Neighbor saves all forwarding states for this address family.                                                                                                                                                                     |
| NLRI that restart is negotiated for                        | Router supports graceful restart for this address family.                                                                                                                                                                         |
| NLRI of received end-of-rib markers                        | Address families for which end-of-routing-table markers are received from the neighbor.                                                                                                                                           |
| NLRI of all end-of-rib markers sent                        | Address families for which end-of-routing-table markers are sent to the neighbor.                                                                                                                                                 |
| Peer supports 4 byte AS extension (peer-as 1)              | Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.                                                                                                                            |
| NLRIs for which peer can receive multiple paths            | Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.<br><br>Possible value is inet-unicast. |
| NLRIs for which peer can send multiple paths: inet-unicast | Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route.<br><br>Possible value is inet-unicast.        |

Table 35: show bgp neighbor Output Fields (continued)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Table inet.number             | <p>Information about the routing table:</p> <ul style="list-style-type: none"> <li>• <b>RIB State</b>—BGP is in the graceful restart process for this routing table: <b>restart is complete</b> or <b>restart in progress</b>.</li> <li>• <b>Bit</b>—Number that represents the entry in the routing table for this peer.</li> <li>• <b>Send state</b>—State of the BGP group: <b>in sync</b>, <b>not in sync</b>, or <b>not advertising</b>.</li> <li>• <b>Active prefixes</b>—Number of prefixes received from the peer that are active in the routing table.</li> <li>• <b>Received prefixes</b>—Total number of prefixes from the peer, both active and inactive, that are in the routing table.</li> <li>• <b>Accepted prefixes</b>—Total number of prefixes from the peer that have been accepted by a routing policy.</li> <li>• <b>Suppressed due to damping</b>—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</li> </ul> |
| Last traffic (seconds)        | Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Input messages                | Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Output messages               | Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Input dropped path attributes | <p>Information about dropped path attributes:</p> <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Input ignored path attributes | <p>Information about ignored path attributes:</p> <ul style="list-style-type: none"> <li>• <b>Code</b>—Path attribute code.</li> <li>• <b>Count</b>—Path attribute count.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Output queue                  | <p>Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.</p> <p>It also specifies the routing table name and the NLRI that the table was advertised through, in the format (<i>routing table name, NLRI</i>).</p> <p><b>NOTE:</b> The output queue of routing tables that are not advertised, will only show up at <b>extensive</b> output level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Trace options                 | Configured tracing of BGP protocol packets and operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 35: show bgp neighbor Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter Updates rcv</b>      | ( <b>orf</b> option only) Number of outbound-route filters received for each configured address family.<br><br><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.                                                                       |
| <b>Immediate</b>               | ( <b>orf</b> option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.<br><br><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list. |
| <b>Filter</b>                  | ( <b>orf</b> option only) Type of prefix filter received: <b>prefix-based</b> or <b>extended-community</b> .                                                                                                                                                                                                                                                |
| <b>Received filter entries</b> | ( <b>orf</b> option only) List of received filters displayed.                                                                                                                                                                                                                                                                                               |
| <b>seq</b>                     | ( <b>orf</b> option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.                                                                                                                                                                                                                        |
| <b>prefix</b>                  | ( <b>orf</b> option only) Address for the prefix entry that matches the filter.                                                                                                                                                                                                                                                                             |
| <b>minlength</b>               | ( <b>orf</b> option only) Minimum prefix length, in bits, required to match this prefix.                                                                                                                                                                                                                                                                    |
| <b>maxlength</b>               | ( <b>orf</b> option only) Maximum prefix length, in bits, required to match this prefix.                                                                                                                                                                                                                                                                    |
| <b>match</b>                   | ( <b>orf</b> option only) For this prefix match, whether to <b>permit</b> or <b>deny</b> route updates.                                                                                                                                                                                                                                                     |

## Sample Output

### show bgp neighbor

```
user@host > show bgp neighbor
```

For M Series, MX Series, and T Series routers running Junos OS Release 16.1 or later, the **show bgp neighbor** output includes the BGP group the peer belongs to, the routing instance (if any) that the peer is configured in, and the routing instance that the peer is using for the forwarding context (if applicable). An example follows.

```
Peer: 10.255.7.250+179 AS 10 Local: 10.255.7.248+63740 AS 10
Group: toAsbr2 Routing-Instance: master
Forwarding routing-instance: toAs2
 Type: Internal State: Established Flags: <Sync>
Last State: OpenConfirm Last Event: RecvKeepAlive
Last Error: None
Export: [redist_static]
Options: <Preference LocalAddress PeerAS Refresh>
Options: <AdvertiseBGPStatic>
Local Address: 10.255.7.248 Holdtime: 90 Preference: 170 Outbound Timer: 50
Number of flaps: 0
Peer ID: 10.255.7.250 Local ID: 10.255.7.248 Active Holdtime: 90
Keepalive Interval: 30 Group index: 0 Peer index: 0
BFD: disabled, down
NLRI for restart configured on peer: inet-unicast
```

```

NLRI advertised by peer: inet-unicast
NLRI for this session: inet-unicast
Peer supports Refresh capability (2)
Stale routes from peer are kept for: 300
Peer does not support Restarter functionality
NLRI that restart is negotiated for: inet-unicast
NLRI of received end-of-rib markers: inet-unicast
NLRI of all end-of-rib markers sent: inet-unicast
Peer supports 4 byte AS extension (peer-as 10)
Peer does not support Addpath
NLRI that we support extended nexthop encoding for: inet-unicast
NLRI that peer supports extended nexthop encoding for: inet-unicast

```

```

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.1 on ACX Series, M Series, MX Series, QFabric, QFX Series, and T Series                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Display output scheduler information including the number of tokens assigned to each priority output queue. Output queues are shown as classes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>none</b>—Display the number of tokens assigned to each of the 17 BGP priority output queues for the master routing instance.</p> <p><b>exact-instance <i>instance-name</i></b>—(Optional) Display the number of tokens assigned to each of the 17 BGP priority output queues for the specified routing instance name.</p> <p><b>fabric</b> —(Optional) Display the internal fabric state. The exact-instance and instance options can be used along with the fabric option.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about BGP peers for all routing instances whose name begins with the <i>instance-name</i> string. (for example, <b>cust1</b>, <b>cust11</b>, and <b>cust111</b> are all displayed when you run the <b>show bgp output-scheduler instance cust1</b> command).</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Display the number of tokens assigned to each of the 17 BGP priority queues within the specified logical-system. The instance and exact-instance options can be used along with the logical-system option.</p> |
| <b>Required Privilege Level</b> | routing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## show bgp replication

**Syntax** `show bgp replication`

**Release Information** Command introduced in Junos OS Release 8.5.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Command introduced in Junos OS Release 17.4R2 for SRX5400, SRX5600, and SRX5800 devices.  
 Support for **logical-system** option introduced in Junos OS Release 13.3.

**Description** Displays the status of BGP state replication between the master and backup Routing Engines on devices that have nonstop active routing configured on them.

**CAUTION:** Before attempting nonstop active routing switchover, check the output of `show bgp replication` to confirm that BGP routing table synchronization has completed on the backup Routing Engine. The complete status in the output of `show task replication` only indicates that the socket replication has completed and the BGP synchronization is in progress.

To determine whether BGP synchronization is complete, you must check the Protocol state and Synchronization state fields in the output of `show bgp replication` on the master Routing Engine. The Protocol state must be idle and the Synchronization state must be complete. If you perform NSR switchover before the BGP synchronization has completed, the BGP session might flap.

**NOTE:** The `commit synchronize` statement at the [edit system] hierarchy level is not supported on SRX Series devices. Hence, the status of nonstop active routing synchronization is not displayed on the master Routing Engine when you issue the command `show bgp replication`.

**Options** This command has no options.

## Sample Output

### show bgp replication (for Master)

```

user@host> show bgp replication
Synchronization master:
 Precision timer registration: Registered
 Session state: Up, Since: 10:14
 Flaps: 1, Last flap reason: Backup closed connection
 Protocol state: Idle, Since: 10:14
 Synchronization state: Complete
 Number of peers waiting: AckWait: 0, SoWait: 0, Scheduled: 0
 Messages sent: Open 1, Establish 11, GrHelper 0, Update 0, GrStaleLabel 0 Error
 0, Complete 1
 Messages received: Open 1, Request 1 wildcard 0 targeted, EstablishAck 11,
 GrHelperAck 0, CompleteAck 1

```

### show bgp replication (for Backup)

```

user@host> show bgp replication
Synchronization backup:
 State: Established 13 ago
 , Unsync timer: 2

 Unsync entry queue:
 Instance: 0 Neighbor: 30.30.30.1 elapsed: 7
 Instance: 0 Neighbor: 40.40.40.3 elapsed: 7
 Instance: 0 Neighbor: 40.40.40.4 elapsed: 7
 Instance: 0 Neighbor: 40.40.40.5 elapsed: 7
 Instance: 0 Neighbor: 40.40.40.6 elapsed: 7
 Instance: 0 Neighbor: 40.40.40.1 elapsed: 7
 Instance: 0 Neighbor: 40.40.40.2 elapsed: 7

```

## Sample Output

### show bgp replication logical-system

```

user@host> show bgp replication logical-system lr2
Synchronization master:
 Session state: Up, Since: 24:53
 Flaps: 0
 Protocol state: Idle, Since: 2
 Synchronization state: Complete
 Number of peers waiting: AckWait: 0, SoWait: 0, Scheduled: 0
 Messages sent: Open 1, Establish 145, Update 0, Error 1, Complete 145
 Messages received: Open 1, Request 1 wildcard 144 targeted, EstablishAck 0,
 CompleteAck 145

```

## show bgp summary

[show bgp summary \(BGP Graceful Restart or Long-Lived Graceful Restart\) on page 1411](#)

**Output Fields** [Table 38 on page 1407](#) describes the output fields for the **show bgp summary** command. Output fields are listed in the approximate order in which they appear.

*Table 38: show bgp summary Output Fields*

| Field Name          | Field Description                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Groups</b>       | Number of BGP groups.                                                                                                                                                  |
| <b>Peers</b>        | Number of BGP peers.                                                                                                                                                   |
| <b>Down peers</b>   | Number of down BGP peers.                                                                                                                                              |
| <b>Table</b>        | Name of routing table.                                                                                                                                                 |
| <b>Tot Paths</b>    | Total number of paths.                                                                                                                                                 |
| <b>Act Paths</b>    | Number of active routes.                                                                                                                                               |
| <b>Suppressed</b>   | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. |
| <b>History</b>      | Number of withdrawn routes stored locally to keep track of damping history.                                                                                            |
| <b>Damp State</b>   | Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.               |
| <b>Pending</b>      | Routes in process by BGP import policy.                                                                                                                                |
| <b>Peer</b>         | Address of each BGP peer. Each peer has one line of output.                                                                                                            |
| <b>AS</b>           | Peer's AS number.                                                                                                                                                      |
| <b>InPkt</b>        | Number of packets received from the peer.                                                                                                                              |
| <b>OutPkt</b>       | Number of packets sent to the peer.                                                                                                                                    |
| <b>OutQ</b>         | Number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is 0 because the queue usually is emptied quickly.                       |
| <b>Flaps</b>        | Number of times the BGP session has gone down and then come back up.                                                                                                   |
| <b>Last Up/Down</b> | Last time since the neighbor transitioned to or from the established state.                                                                                            |

Table 38: show bgp summary Output Fields (continued)

| Field Name                                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>State #Active<br/>/Received/Accepted<br/>/Damped</b> | <p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> <li>If a peer is not established, the field shows the state of the peer session: <b>Active</b>, <b>Connect</b>, or <b>Idle</b>. In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: <b>Idle (Removal in progress)</b> or <b>Idle (LicenseFailure)</b>.</li> <li>If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following: <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> </li> <li>If a BGP session is established in a routing instance, the field indicates the established (<b>Establ</b>) state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, <b>Establ VPN-AB.inet.0: 2/4/0</b> indicates the following: <ul style="list-style-type: none"> <li>The BGP session is established.</li> <li>Routes are received in the <b>VPN-AB.inet.0</b> routing table.</li> <li>The local routing device has two active routes, four received routes, and no damped routes from a BGP peer.</li> </ul> </li> </ul> <p>When a BGP session is established, the peers are exchanging update messages.</p> <p><b>NOTE:</b> When graceful restart or LLGR helper mode is active, the RIB information is now displayed by the <b>show bgp summary</b> command. If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following:</p> <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> |

## Sample Output

### show bgp summary (When a Peer Is Not Established)

## show dynamic-tunnels pfe-tunnel-localization

**Syntax** `show dynamic-tunnels pfe-tunnel-localization`

**Release Information** Command introduced in Junos OS Release 17.3R1 on the MX Series.

**Description** Display dynamic tunnel Packet Forwarding Engine (PFE) localization information such as tunnel count of an anchor PFE, the GENCFG blobs that are sent to the kernel for each IPv6 source, the aggregate routes connected to the anchor PFE, the IPv6 routes that are mapped to this anchor PFE. When the PFE goes down BGP withdraws all the aggregate routes and the IPv6 sources.

**NOTE:** PFE localization needs to be configured to display output for this command. This command throws back an error if there are no PFE localization entries to display.

**Options** **none**—Display dynamic tunnel localization information for the Packet Forwarding Engine tunnel.

**Required Privilege Level** view

**Output Fields** [Table 39 on page 1412](#) lists the output fields for the **show dynamic-tunnels pfe-tunnel-localization** command. Output fields are listed in the approximate order in which they appear.

*Table 39: show dynamic-tunnels pfe-tunnel-localization Output Fields*

| Field Name      | Field Description                    |
|-----------------|--------------------------------------|
| Anchor PFE Name | Name of the PFE in pfe-x/y/z format. |

Table 39: show dynamic-tunnels pfe-tunnel-localization Output Fields (continued)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reference count          | Number of the dynamic tunnels that are currently anchored to a particular PFE. Each tunnel prefix and each Gencfg takes one reference count.                                                                                                                                                                 |
| Gencfg keyid             | The key ID of a Gencfg blob that is returned by the kernel.                                                                                                                                                                                                                                                  |
| Gencfg tunnel type: UDP  | Tunnel count anchored to a particular anchor Packet Forwarding Engine (reference count).                                                                                                                                                                                                                     |
| Gencfg last index        | The last know index value of the Gencfg blob.                                                                                                                                                                                                                                                                |
| Gencfg current index     | The current index value of the Gencfg blob.                                                                                                                                                                                                                                                                  |
| Gencfg last state        | Last state of the tunnel: <b>Up</b> , or <b>Dn</b> (down).                                                                                                                                                                                                                                                   |
| Gencfg current state     | Current state of the tunnel: <b>Up</b> , or <b>Dn</b> (down).                                                                                                                                                                                                                                                |
| Gencfg V6 source address | Source IP address of the Gencfg blob IPv6 tunnel.                                                                                                                                                                                                                                                            |
| Gencfg backup lock       | Backup count of the Gencfg blob. This value is displayed in the backup routing protocol process. Each gencfg takes a backup reference count, which is decremented when tunnel is deleted or after NSR switchover and backup becomes new master.                                                              |
| Gencfg kqp               | Reference count of Gencfg entries in the KRTQ.                                                                                                                                                                                                                                                               |
| Gencfg Reference count   | Each prefix using a particular IPv6 source takes reference count on the Gencfg corresponding to that V6 source. If the Gencfg is added to the kernel and it has key ID, then it has additional reference count of 1. When Gencfg operation is queued in KRTQ then krt q entry takes one ref count on Gencfg. |
| Aggregate                | All aggregate routes that are connected with this anchor PFE. When the PFE goes down, BGP withdraws all these aggregates.                                                                                                                                                                                    |
| Aggregate refcnt         | Reference count of aggregate routes.                                                                                                                                                                                                                                                                         |
| V6 source address        | All IPv6 source routes that are connected to this anchor PFE. When the PFE goes down, BGP withdraws all these IPv6 sources.                                                                                                                                                                                  |
| V6 source refcnt         | Reference count of IPv6 source routes.                                                                                                                                                                                                                                                                       |

| <b>Output Fields</b>            | Table 40 on page 1417 describes the output fields for the <b>show nonstop-routing</b> command. Output fields are listed in the approximate order in which they appear. |

Table 40: show nonstop-routing Output Fields

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nonstop Routing             | State of NSR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Precision Timers state      | <p>State of precision timer feature in the kernel.</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—By default, autokeepalive precision timers are enabled on the kernel after switchover.</li> <li>• <b>Disabled</b>—Autokeepalive precision timers are disabled.</li> <li>• <b>Inactive</b>—Precision timer is inactive if it is disabled.</li> <li>• <b>Ready</b>—Kernel precision timer is ready but is never activated.</li> <li>• <b>InProcess</b>—Kernel precision timer is operational and is generating keepalives on behalf of the RPD after switchover. The / count indicates the number of sessions being serviced against the total sessions.</li> <li>• <b>Completed</b>—Kernel has completed keepalive generation for all the sessions after switchover, and RPD has taken over all of them successfully.</li> <li>• <b>Error</b>—Error while retrieving the precision timer status of the kernel.</li> </ul> |
| Precision Timers max period | Maximum period, in seconds, after the switchover from standby to master event for which the kernel autogenerates keepalives on behalf of BGP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 40: show nonstop-routing Output Fields (continued)

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Automerge             | Status of the automerge. <ul style="list-style-type: none"> <li>• <b>Active</b>—Automerge of sockets by the kernel after switchover is active.</li> <li>• <b>Inactive</b>—Automerge of sockets by the kernel after switchover is inactive.</li> </ul>                                                                                        |
| Batching              | Status of Batching. <ul style="list-style-type: none"> <li>• <b>Yes</b>—Automerge of sockets by the kernel after a switchover.</li> <li>• <b>No</b>—Automerge of sockets by the kernel after switchover is inactive.</li> </ul>                                                                                                              |
| Batch count           | Number of sockets merged per batch.                                                                                                                                                                                                                                                                                                          |
| Batch count adjust    | Speed at which the batch count is adjusted. <ul style="list-style-type: none"> <li>• <b>Slow</b>—Number of sockets merged per batch is incremented additively.</li> <li>• <b>Exp</b>—Number of sockets merged per batch is incremented exponentially.</li> <li>• <b>None</b>—Number of sockets merged per batch remains constant.</li> </ul> |
| Batch interval        | Time interval between batches of automerge operation.                                                                                                                                                                                                                                                                                        |
| Batch interval adjust | Speed at which the batch interval is adjusted. <ul style="list-style-type: none"> <li>• <b>Exp</b>—Time interval between automerge of batches is increased exponentially.</li> <li>• <b>None</b>—Time interval between automerge of batches is not adjusted.</li> </ul>                                                                      |
| Automerge State       | State of the automerge <ul style="list-style-type: none"> <li>• <b>Ready</b>—Ready to automerge socket pairs from secondary to primary routing engine</li> <li>• <b>InProgress</b>—Kernel is performing automerge after switchover</li> <li>• <b>Switchover Completed</b>—Sessions merged after switchover</li> </ul>                        |
| Sessions Processed    | Count of sessions that are automergerd.                                                                                                                                                                                                                                                                                                      |

## Sample Output

### show nonstop-routing (MX Series Router)

```

user@host show nonstop-routing
Nonstop Routing : Enabled
Precision Timers state: Enabled: Completed - 0/0
Precision Timers max period: 200
Automerge : Active

```

```
Batching: No
Batch count: 200
Batch count adjust: Exponential
Batch interval: 20 msec
Batch interval adjust: None
Automerge State: Ready
Sessions Processed: 0
```

### **show nonstop-routing (MX Series Router)**

```
user@host> show nonstop-routing
```

```
Nonstop Routing : Enabled
 Automerge : Active
 Batching: Yes
 Batch count: 500
 Batch count adjust: Slow
 Batch interval: 50 msec
 Batch interval adjust: None
 Automerge State: Ready
 Sessions Processed: 0
```

## show (ospf | ospf3) bgp-orr

---

**Syntax**    `show (ospf | ospf3) bgp-orr`  
              `<abr>`  
              `<asbr>`  
              `<brief | detail | extensive>`  
              `<extern>`  
              `<group group-name>`  
              `<instance instance-name>`  
              `<inter>`  
              `<intra>`  
              `<logical-system (all | logical-system-name)>`  
              `<network>`  
              `<router>`  
              `<topology>`

**Release Information**    Command introduced in Junos OS Release 16.2 for MX Series.

**Description**    Display information about OSPF BGP-ORR metric (RIB).

**Options**    **none**—Display group information about all OSPF BGP groups.

**abr** —(Optional) Display OSPF routes to area border routers.

**asbr** —(Optional) Display OSPF routes to autonomous systems border routers.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**extern**—(Optional) Display external OSPF routes.

**group group-name**—(Optional) Display group information for the specified group.

**instance instance-name**—(Optional) Display information about BGP groups for all routing instances whose name begins with this string (for example, **cust1**, **cust11**, and **cust111** are all displayed when you run the **show bgp group instance cust1** command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.

**inter**—(Optional) Display inter-area OSPF routes.

**intra**—(Optional) Display intra-area OSPF routes.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**network**—(Optional) Display routes to networks.

**router**—(Optional) Display routes to all routers.

**topology**—(Optional) Name of topology.

**Required Privilege Level** view

**List of Sample Output** [show ospf bgp-orr on page 1421](#)  
[show ospf3 bgp-orr on page 1421](#)

**Output Fields** [Table 41 on page 1421](#) describes the output fields for the **show ospf bgp-orr** command. Output fields are listed in the approximate order in which they appear.

*Table 41: show bgp group Output Fields*

| Field Name                | Field Description                                                                                                                 | Level of Output |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>BGP ORR Peer Group</b> | Name of the BGP ORR peer group.                                                                                                   | All levels      |
| <b>Primary</b>            | Primary node (igp-primary) in a BGP peer group.                                                                                   | All levels      |
| <b>Backup</b>             | Backup node (igp-backup) in a BGP peer group, which is used when the primary node (igp-primary) goes down or becomes unreachable. | All levels      |
| <b>Prefix</b>             | Destination of the route.                                                                                                         | All levels      |
| <b>Path Type</b>          | Display the route learned path (inter-area route or intra-area route).                                                            | All levels      |
| <b>Route Type</b>         | Display the type of router from which the route was learned (Router or Transit).                                                  | All levels      |
| <b>Metric</b>             | IGP metric value.                                                                                                                 | All levels      |

## Sample Output

### show ospf bgp-orr

```

user@host> show ospf bgp-orr
Topology default Route Table:

BGP ORR Peer Group: toClients
 Primary: 1.1.1.1, active
 Backup: 5.5.5.5
Prefix Path Route Metric
 Type Type
1.1.1.2 Intra Router 100
1.1.1.3 Intra Router 130
1.1.1.1/32 Intra Network 0
1.1.1.2/32 Intra Network 100
10.1.1.0/30 Intra Network 100
10.1.1.4/30 Intra Network 130

```

### show ospf3 bgp-orr

```

user@host> show ospf3 bgp-orr
BGP ORR Peer Group: toClients
 Primary: 1.1.1.1, active

```

| Prefix          | Path Type | Route Type | Metric |
|-----------------|-----------|------------|--------|
| 1.1.1.2         | Intra     | Router     | 100    |
| 1.1.1.2;0.0.0.4 | Intra     | Transit    | 100    |
| 1.1.1.3         | Intra     | Router     | 130    |
| 1.1.1.3;0.0.0.2 | Intra     | Transit    | 130    |
| ::1.1.1.1/128   | Intra     | Network    | 0      |
| ::1.1.1.2/128   | Intra     | Network    | 100    |
| ::1.1.1.3/128   | Intra     | Network    | 130    |

| <b>Description</b>                 | Display information about configured routing policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                     | <p><b>none</b>—List the names of all configured routing policies.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>policy-name</i></b>—(Optional) Show the contents of the specified policy.</p> <p><b>statistics</b>—(Optional) Use in conjunction with the <b>test policy</b> command to show the length of time (in microseconds) required to evaluate a given policy and the number of times it has been executed. This information can be used, for example, to help structure a policy so it is evaluated efficiently. Timers shown are per route; times are not cumulative. Statistics are incremented even when the router is learning (and thus evaluating) routes from peering routers.</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Output Fields** Table 42 on page 1424 lists the output fields for the **show policy** command. Output fields are listed in the approximate order in which they appear.

*Table 42: show policy Output Fields*

| Field Name         | Field Description                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>policy-name</i> | Name of the policy listed.                                                                                                              |
| <i>term</i>        | Name of the user-defined policy term. The term name <b>unnamed</b> is used for policy elements that occur outside of user defined terms |
| <i>from</i>        | Match condition for the policy.                                                                                                         |
| <i>then</i>        | Action for the policy.                                                                                                                  |

## Sample Output

### show policy

```
user@host> show policy
Configured policies:
__vrf-export-red-internal__
__vrf-import-red-internal__
red-export
rf-test-policy
multicast-scoping
```

### show policy policy-name

```
user@host> show policy vrf-import-red-internal
Policy vrf-import-red-internal:
 from
 203.0.113.0/28 accept
 203.0.113.32/28 accept
 then reject
```

### show policy statistics policy-name

```
user@host> show policy statistics iBGP-v4-RR-Import
Policy iBGP-v4-RR-Import:
 [1243328] Term Lab-Infra:
 from [1243328 0] proto BGP

Table 43: show policy conditions Output Fields

| Field Name       | Field Description                                                                                                                                  | Level of Output |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Condition        | Name of configured condition.                                                                                                                      | All levels      |
| event            | Condition type. If the <b>if-route-exists</b> option is configured, the event type is:<br><b>Existence of a route in a specific routing table.</b> | All levels      |
| Dependent routes | List of routes dependent on the condition, along with the latest generation number.                                                                | <b>detail</b>   |

Table 43: show policy conditions Output Fields (continued)

| Field Name                        | Field Description                                                                                                         | Level of Output |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Condition tables</b>           | List of routing tables associated with the condition, along with the latest generation number and number of dependencies. | All levels      |
| <b>If-route-exists conditions</b> | List of conditions configured to look for a route in the specified table.                                                 | All levels      |

## Sample Output

### show policy conditions detail

```

user@host> show policy conditions detail
Configured conditions:
Condition cond1, event: Existence of a route in a specific routing table
Dependent routes:
 172.16.4.4/32, generation 3
 6.6.6.6/32, generation 3
 10.10.10.10/32, generation 3

Condition cond2, event: Existence of a route in a specific routing table
Dependent routes:
None

Condition tables:
Table inet.0, generation 4, dependencies 3, If-route-exists conditions: cond1
(static) cond2 (static)

```

| Description                              | Display information about BGP route flap damping parameters.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Options                                  | <b>none</b> —Display information about BGP route flap damping parameters.<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.                                                                                                                                                                                                                               |
| Additional Information                   | In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes. |
| Required Privilege Level                 | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Output Fields                            | <a href="#">Table 44 on page 1429</a> describes the output fields for the <b>show policy damping</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                |

Table 44: show policy damping Output Fields

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Halflife</b>              | Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes. |
| <b>Reuse merit</b>           | Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.                                                                                                                                                  |
| <b>Suppress/cutoff merit</b> | Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.                                                           |
| <b>Maximum suppress time</b> | Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.                                                                                                                                                                                                                                                                                           |
| <b>Computed values</b>       | <ul style="list-style-type: none"> <li>• <b>Merit ceiling</b>—Maximum merit that a flapping route can collect.</li> <li>• <b>Maximum decay</b>—Maximum decay half-life, in minutes.</li> </ul>                                                                                                                                                                                                                                                                         |

## Sample Output

### show policy damping

```

user@host> show policy damping
Default damping information:
 Halflife: 15 minutes
 Reuse merit: 750 Suppress/cutoff merit: 3000
 Maximum suppress time: 60 minutes
 Computed values:
 Merit ceiling: 12110
 Maximum decay: 6193
Damping information for "standard-damping":
 Halflife: 10 minutes
 Reuse merit: 4000 Suppress/cutoff merit: 8000
 Maximum suppress time: 30 minutes
 Computed values:
 Merit ceiling: 32120
 Maximum decay: 12453

```

## show route

                          [Syntax \(EX Series Switches\) on page 1430](#)

**Syntax**    show route  
              <all>  
              <destination-prefix>  
              <logical-system (all | *logical-system-name*)>  
              <private>  
              <te-ipv4-prefix-ip *te-ipv4-prefix-ip*>  
              <te-ipv4-prefix-node-ip *te-ipv4-prefix-node-ip*>  
              <te-ipv4-prefix-node-iso *te-ipv4-prefix-node-iso*>

**Syntax (EX Series Switches)**    show route  
                                          <all>  
                                          <destination-prefix>  
                                          <private>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Option **private** introduced in Junos OS Release 9.5.  
                              Option **private** introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.  
                              Option **display-client-data** introduced in Junos OS Release 16.2R1 on MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series routers.  
                              Options **te-ipv4-prefix-ip**, **te-ipv4-prefix-node-ip**, and **te-ipv4-prefix-node-iso** introduced in Junos OS Release 17.2R1 on MX Series and PTX Series.

**Description**    Display the active entries in the routing tables.

**Options**    **none**—Display brief information about all active entries in the routing tables.

**all**—(Optional) Display information about all routing tables, including private, or internal, routing tables.

**destination-prefix**—(Optional) Display active entries for the specified address or range of addresses.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**private**—(Optional) Display information only about all private, or internal, routing tables.

**display-client-data** —(Optional) Display client id and cookie information for routes installed by the routing protocol process client applications.

**te-ipv4-prefix-ip *te-ipv4-prefix-ip***—(Optional) Display IPv4 address of the traffic-engineering prefix, without the mask length if present in the routing table.

**te-ipv4-prefix-node-ip** *te-ipv4-prefix-node-ip*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 node addresses from the traffic-engineered routes in the **lsdist.0** table.

**te-ipv4-prefix-node-iso** *te-ipv4-prefix-node-iso*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 routes with the specified ISO circuit ID from the **lsdist.0** table.

**Output Fields** [Table 45 on page 1431](#) describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

*Table 45: show route Output Fields*

| Field Name                 | Field Description                                                       |
|----------------------------|-------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                        |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |

Table 45: show route Output Fields (continued)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number routes</i>                        | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <a href="#">add-path</a> or <a href="#">advertise-inactive</a> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>                   | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>                                                                                                                                                                                        |
| <i>[ protocol, preference ]</i>             | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                                 |
| <i>weeks:days<br/>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>metric</i>                               | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 45: show route Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>localpref</b>        | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>from</b>             | Interface from which the route was received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>AS path</b>          | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>encapsulated</b>     | Extended next-hop encoding capability enabled for the specified BGP community for routing IPv4 traffic over IPv6 tunnels. When BGP receives routes without the tunnel community, IPv4-Over IPv6 tunnels are not created and BGP routes are resolved without encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Route Labels</b>     | Stack of labels carried in the BGP route update.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>to</b>               | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 45: show route Output Fields (continued)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| via             | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul> |
| Private unicast | (Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes <i>not</i> managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
 * [MVPN/70] 19:53:41, metric2 1
 Indirect
1:65500:1:10.0.0.40/240
 * [BGP/170] 19:53:29, localpref 100, from 10.0.0.30
 AS path: I
 > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
 [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
 AS path: I
 > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
 * [BGP/170] 19:53:29, localpref 100, from 10.0.0.30
 AS path: I
 > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
 [BGP/170] 19:53:25, localpref 100, from 10.0.0.33
 AS path: I
 > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

### show route (VPN)

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```
user@host> show route 192.0.2.0

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)
+ = Active Route, - = Last Active, * = Both

192.0.2.0/24 [BGP/170] 00:28:32, localpref 100, from 10.9.9.160
 AS path: 13980 ?, validation-state: unverified
 > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
 [BGP/170] 00:28:28, localpref 100, from 10.9.9.169
 AS path: 13980 ?, validation-state: unverified
 > to 10.100.0.42 via ae2.0, Push 126016, Push 300368(top)
 #[Multipath/255] 00:28:28, metric2 102
 > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
 to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
```

### show route (with Destination Prefix)

```
user@host> show route 192.168.0.0/12

inet.0: 10 destinations, 10 routes (9 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.0.0/12 *[Static/5] 2w4d 12:54:27
 > to 192.168.167.254 via fxp0.0
```

### show route destination-prefix detail

```
user@host> show route 198.51.100.0 detail

## Sample Output

### show route active-path

```
user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.70.19/32 *[Direct/0] 21:33:52
```

```

> via lo0.0
10.255.71.50/32 * [IS-IS/15] 00:18:13, metric 10
> to 172.16.100.1 via so-2/1/3.0
172.16.100.1/24 * [Direct/0] 00:18:36
> via so-2/1/3.0
172.16.100.1/32 * [Local/0] 00:18:41
Local via so-2/1/3.0
192.168.64.0/21 * [Direct/0] 21:33:52
> via fxp0.0
192.168.70.19/32 * [Local/0] 21:33:52
Local via fxp0.0

```

### show route active-path brief

The output for the **show route active-path brief** command is identical to that for the **show route active-path** command. For sample output, see [show route active-path on page 1451](#).

### show route active-path detail

```

user@host> show route active-path detail

| <b>Additional Information</b>   | Routes displayed are routes that the routing table has exported into the routing protocol and that have been filtered by the associated protocol's <b>export</b> routing policy statements. Starting with Junos OS Release 13.3, you can display the routing instance table <b>foo</b> for any address family, on a VPN route reflector, or a VPN AS boundary router that is advertising local VPN routes. However, If you do not specify the <b>table</b> in the command, the output displays each VRF prefix twice.                                                                                                                                                                                                                                                                                                                           |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

*Table 46: show route advertising-protocol Output Fields*

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>routing-table-name</i>                    | Name of the routing table—for example, inet.0.                                                                                                                                                                                                                                                                                                                                                                                      | All levels              |
| <i>number destinations</i>                   | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                             | All levels              |
| <i>number routes</i>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                               | All levels              |
| <b>Prefix</b>                                | Destination prefix.                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>brief none</b>       |
| <i>destination-prefix (entry, announced)</i> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>BGP group and type</b>                    | BGP group name and type ( <b>Internal</b> or <b>External</b> ).                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Route Distinguisher</b>                   | Unique 64-bit prefix augmenting each IP subnet.                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Advertised Label</b>                      | Incoming label advertised by the Label Distribution Protocol (LDP). When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label. | <b>detail extensive</b> |
| <b>Label-Base, range</b>                     | First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>VPN Label</b>                             | Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.                                                                                                                                                                           | <b>detail extensive</b> |

Table 46: show route advertising-protocol Output Fields (continued)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output                |

See the output field table for the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>        |
| <b>AIGP</b>                 | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>        |

Table 46: show route advertising-protocol Output Fields (continued)

| Field Name                | Field Description                                                                                                                                                              | Level of Output         |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Attrset AS</b>         | Number, local preference, and path of the autonomous system (AS) that originated the route. These values are stored in the <b>Attrset</b> attribute at the originating router. | <b>detail extensive</b> |
| <b>Layer2-info:encaps</b> | Layer 2 encapsulation (for example, VPLS).                                                                                                                                     | <b>detail extensive</b> |
| <b>control flags</b>      | Control flags: <b>none</b> or <b>Site Down</b> .                                                                                                                               | <b>detail extensive</b> |
| <b>mtu</b>                | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                        | <b>detail extensive</b> |

## Sample Output

### show route advertising-protocol bgp (Layer 3 VPN)

```

user@host> show route advertising-protocol bgp 10.255.14.171
VPN-A.inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
Prefix Nexthop MED Lclpref AS path
10.255.14.172/32 Self 1 100 I
VPN-B.inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)
Prefix Nexthop MED Lclpref AS path
10.255.14.181/32 Self 2 100 I

```

### show route advertising-protocol bgp detail

```

user@host> show route advertising-protocol bgp 111.222.1.3 detail
bgp20.inet.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
111.222.1.11/32 (1 entry, 1 announced)
 BGP group pe-pe type Internal
 Route Distinguisher: 111.255.14.11:69

| List of Sample Output       | <a href="#">show route all on page 1462</a>                                                                                                                                                                                                                                                                                                   |
| Output Fields               | In Junos OS Release 9.5 and later, only the output fields for the <b>show route all</b> command display all routing tables, including private, or hidden, routing tables. The output field table of the <a href="#">show route</a> command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later. |

## Sample Output

### show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0 *[MPLS/0] 2d 02:24:39, metric 1
```

```

1 Receive
 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
2 *[MPLS/0] 2d 02:24:39, metric 1
 Receive
800017 *[VPLS/7] 1d 14:00:16
 > via vt-3/2/0.32769, Pop
800018 *[VPLS/7] 1d 14:00:26
 > via vt-3/2/0.32772, Pop

user@host> show route all
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0 *[MPLS/0] 2d 02:19:12, metric 1
 Receive
1 *[MPLS/0] 2d 02:19:12, metric 1
 Receive
2 *[MPLS/0] 2d 02:19:12, metric 1
 Receive
800017 *[VPLS/7] 1d 13:54:49
 > via vt-3/2/0.32769, Pop
800018 *[VPLS/7] 1d 13:54:59
 > via vt-3/2/0.32772, Pop
vt-3/2/0.32769 [VPLS/7] 1d 13:54:49
 Unusable
vt-3/2/0.32772 [VPLS/7] 1d 13:54:59
 Unusable

```

## show route aspath-regex

| <b>Release Information</b>         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>                 | Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                     | <b><i>regular-expression</i></b> —Regular expression that matches an entire AS path.<br><br><b><i>logical-system (all   logical-system-name)</i></b> —(Optional) Perform this operation on all logical systems or on a particular logical system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Additional Information</b>      | <p>You can specify a regular expression as:</p> <ul style="list-style-type: none"><li>• An individual AS number</li><li>• A period wildcard used in place of an AS number</li><li>• An AS path regular expression that is enclosed in parentheses</li></ul> <p>You also can include the operators described in the table of AS path regular expression operators in the <i>Junos Policy Framework Configuration Guide</i>. The following list summarizes these operators:</p> <ul style="list-style-type: none"><li>• <b><i>{m,n}</i></b>—At least <i>m</i> and at most <i>n</i> repetitions of the AS path term.</li><li>• <b><i>{m}</i></b>—Exactly <i>m</i> repetitions of the AS path term.</li><li>• <b><i>{m,}</i></b>—<i>m</i> or more repetitions of the AS path term.</li><li>• <b><i>*</i></b>—Zero or more repetitions of an AS path term.</li><li>• <b><i>+</i></b>—One or more repetitions of an AS path term.</li><li>• <b><i>?</i></b>—Zero or one repetition of an AS path term.</li><li>• <b><i>aspath_term   aspath_term</i></b>—Match one of the two AS path terms.</li></ul> <p>When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:</p> |

```
show route aspath-regex ".* 234 .*"
```

## Sample Output

### show route aspath-regex (Matching a Specific AS Number)

```
user@host> show route aspath-regex 65477
inet.0: 46411 destinations, 46411 routes (46409 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

111.222.1.0/25 *[BGP/170] 00:08:48, localpref 100, from 111.222.2.24
 AS Path: [65477] ({65548 65536}) IGP
 to 111.222.18.225 via fpa0.0(111.222.18.233)
111.222.1.128/25 *[IS-IS/15] 09:15:37, metric 37, tag 1
 to 111.222.18.225 via fpa0.0(111.222.18.233)
 [BGP/170] 00:08:48, localpref 100, from 111.222.2.24
 AS Path: [65477] ({65548 65536}) IGP
 to 111.222.18.225 via fpa0.0(111.222.18.233)
...
```

### show route aspath-regex (Matching Any Path with Two AS Numbers)

```
user@host> show route aspath-regex ".* 234 3561 .*"

inet.0: 46351 destinations, 46351 routes (46349 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

9.20.0.0/17 *[BGP/170] 01:35:00, localpref 100, from 131.103.20.49
 AS Path: [666] 234 3561 2685 2686 Incomplete
 to 192.156.169.1 via 192.156.169.14(so-0/0/0)
12.10.231.0/24 *[BGP/170] 01:35:00, localpref 100, from 131.103.20.49
 AS Path: [666] 234 3561 5696 7369 IGP
 to 192.156.169.1 via 192.156.169.14(so-0/0/0)
24.64.32.0/19 *[BGP/170] 01:34:59, localpref 100, from 131.103.20.49
 AS Path: [666] 234 3561 6327 IGP
 to 192.156.169.1 via 192.156.169.14(so-0/0/0)
...
```

## show route best

| Release Information         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                            |
| Description                 | Display the route in the routing table that is the best route to the specified address or range of addresses. The best route is the longest matching route.                                                                                                                                                                                                                                                      |
| Options                     | <b>brief   detail   extensive   terse</b> —(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to <b>brief</b> .<br><br><b><i>destination-prefix</i></b> —Address or range of addresses.<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system. |
| Required Privilege Level    | view                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>                 | <p>Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                     | <p><b><i>as-number:community-value</i></b>—One or more community identifiers. <b><i>as-number</i></b> is the AS number, and <b><i>community-value</i></b> is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.</p> <p>For example:</p> <pre>user@host&gt; show route table inet.0 protocol bgp community "12083:6015" community "12083:65551"</pre> <p>or</p> <pre>user@host&gt; show route table inet.0 protocol bgp community [12083:6014 12083:65551]</pre> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| <b>Additional Information</b>      | <p>Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <i>routing-table-name</i>                    | Name of the routing table—for example, <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |
| <b>destinations</b>                          | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <i>number routes</i>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels              |
| <i>destination-prefix (entry, announced)</i> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <i>[protocol, preference]</i>                | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> | All levels              |
| <b>Next-hop reference count</b>              | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Source</b>                                | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Next hop</b>                              | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>via</b>                                   | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Protocol next hop</b>                     | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Indirect next hop</b>                     | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>State</b>                                 | Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

| Age               | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | detail extensive |
| Metric            | Metric for the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive |
| Task              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive |
| Announcement bits | List of protocols that announce this route. <i>n-Resolve inet</i> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive |
| AS path           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| to                | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | brief none       |
| via               | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | brief none       |
| Communities       | Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive |
| Localpref         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels       |
| Router ID         | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | detail extensive |

Table 47: show route damping Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                                        | Level of Output         |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Merit (last update/now)</b> | Last updated and current figure-of-merit value.                                                                                                                          | <b>detail extensive</b> |
| <b>damping-parameters</b>      | Name that identifies the damping parameters used, which is defined in the damping statement at the <b>[edit policy-options]</b> hierarchy level.                         | <b>detail extensive</b> |
| <b>Last update</b>             | Time of most recent change in path attributes.                                                                                                                           | <b>detail extensive</b> |
| <b>First update</b>            | Time of first change in path attributes, which started the route damping process.                                                                                        | <b>detail extensive</b> |
| <b>Flaps</b>                   | Number of times the route has gone up or down or its path attributes have changed.                                                                                       | <b>detail extensive</b> |
| <b>Suppressed</b>              | ( <b>suppressed</b> keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it. | All levels              |
| <b>Reusable in</b>             | ( <b>suppressed</b> keyword only) Time when a suppressed route will again be available.                                                                                  | All levels              |
| <b>Preference will be</b>      | ( <b>suppressed</b> keyword only) Preference value that will be applied to the route when it is again active.                                                            | All levels              |

## Sample Output

| <b>Output Fields</b>               | <p><a href="#">Table 48 on page 1480</a> describes the output fields for the <b>show route detail</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                  |

Table 48: show route detail Output Fields

| Field Name                 | Field Description                                                       |
|----------------------------|-------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                        |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |

Table 48: show route detail Output Fields (continued)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <i>label stacking</i>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [protocol, preference] | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value.</p> <p><b>Preference2</b> values are signed integers, that is, <b>Preference2</b> values can be either positive or negative values. However, Junos OS evaluates <b>Preference2</b> values as unsigned integers that are represented by positive values. Based on the <b>Preference2</b> values, Junos OS evaluates a preferred route differently in the following scenarios:</p> <ul style="list-style-type: none"> <li>• <b>Both Signed Preference2 values</b> <ul style="list-style-type: none"> <li>• Route A = -101</li> <li>• Route B = -156</li> </ul> <p>Where both the <b>Preference2</b> values are signed, Junos OS evaluates only the unsigned value of <b>Preference2</b> and Route A, which has a lower <b>Preference2</b> value is preferred.</p> </li> <li>• <b>Unsigned Preference2 values</b> <p>Now consider both unsigned <b>Preference2</b> values:</p> <ul style="list-style-type: none"> <li>• Route A = 4294967096</li> <li>• Route B = 200</li> </ul> <p>Here, Junos OS considers the lesser <b>Preference2</b> value and Route B with a <b>Preference2</b> value of 200 is preferred because it is less than 4294967096.</p> </li> <li>• <b>Combination of signed and unsigned Preference2 values</b> <p>When <b>Preference2</b> values of two routes are compared, and for one route the <b>Preference2</b> is a signed value, and for the other route it is an unsigned value, Junos OS prefers the route with the positive <b>Preference2</b> value over the negative <b>Preference2</b> value. For example, consider the following signed and unsigned <b>Preference2</b> values:</p> <ul style="list-style-type: none"> <li>• Route A = -200</li> <li>• Route B = 200</li> </ul> <p>In this case, Route B with a <b>Preference2</b> value of 200 is preferred although this value is greater than -200, because Junos OS evaluates only the unsigned value of the <b>Preference2</b> value.</p> </li> </ul> |
| Level                  | (IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Next-hop type                                 | Type of next hop. For a description of possible values for this field, see <a href="#">Table 49 on page 1486</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Next-hop reference count                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Flood nexthop branches exceed maximum message | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Next hop                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| via                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| Label-switched-path <i>lsp-path-name</i>      | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Label operation                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Interface                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Protocol next hop                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Indirect next hop                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| State                                         | State of the route (a route can be in more than one state). See <a href="#">Table 50 on page 1488</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Local AS                                      | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Age                                           | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AIGP                                          | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 48: show route detail Output Fields (continued)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Metric</b>            | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MED-plus-IGP</b>      | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>TTL-Action</b>        | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.<br><br>For sample output, see <a href="#">show route table</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Task</b>              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Announcement bits</b> | The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, <b>n-Resolve inet</b> indicates that the specified route is used for route resolution for next hops found in the routing table.<br><br><ul style="list-style-type: none"> <li><b>n</b>—An index used by Juniper Networks customer support only.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>AS path</b>           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li><b>I</b>—IGP.</li> <li><b>E</b>—EGP.</li> <li><b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li><b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li><b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li><b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li><b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li><b>( )</b>—Parentheses enclose a confederation.</li> <li><b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 48: show route detail Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| ORR Generation-ID       | Displays the optimal route reflection (ORR) generation identifier. ISIS and OSPF interior gateway protocol (IGP) updates filed whenever any of the corresponding ORR route has its metric valued changed, or if the ORR route is added or deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| FECs bound to route     | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Label-Base, range</b>                   | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                               |
| <b>status vector</b>                       | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Accepted Multipath</b>                  | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Accepted LongLivedStale</b>             | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                                  |
| <b>Accepted LongLivedStaleImport</b>       | <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p> |
| <b>ImportAccepted LongLivedStaleImport</b> | <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>                                                                                                                                                                      |
| <b>Accepted MultipathContrib</b>           | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Localpref</b>                           | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Router ID</b>                           | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Primary Routing Table</b>               | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Secondary Tables</b>                    | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                       |

Table 49 on page 1486 describes all possible values for the Next-hop Types output field.

Table 49: Next-hop Types Output Field Values

| Next-Hop Type            | Description           |
|--------------------------|-----------------------|
| <b>Broadcast (bcast)</b> | Broadcast next hop.   |
| <b>Deny</b>              | Deny next hop.        |
| <b>Discard</b>           | Discard next hop.     |
| <b>Dynamic List</b>      | Dynamic list next hop |

Table 49: Next-hop Types Output Field Values (continued)

| Next-Hop Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Flood</b>                    | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.                                                                                                                             |
| <b>Hold</b>                     | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                                                                                                                                                       |
| <b>Indexed (idxd)</b>           | Indexed next hop.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                                                                                                                                               |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                                                                                                                                               |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                                                                                                                                                     |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                                                                                                                                              |
| <b>Multicast discard (mdsc)</b> | Multicast discard.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Multicast group (mgrp)</b>   | Multicast group member.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Receive (recv)</b>           | Receive.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Resolve (rslv)</b>           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Routed multicast (mcrt)</b>  | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Router</b>                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |

*Table 49: Next-hop Types Output Field Values (continued)*

| Next-Hop Type  | Description                                                                                 |
|----------------|---------------------------------------------------------------------------------------------|
| Unicast (ucst) | Unicast.                                                                                    |
| Unilist (ulst) | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. |

[Table 50 on page 1488](#) describes all possible values for the State output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

*Table 50: State Output Field Values*

| Value                                 | Description                                                                                                                                                                          |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accounting                            | Route needs accounting.                                                                                                                                                              |
| Active                                | Route is active.                                                                                                                                                                     |
| Always Compare MED                    | Path with a lower multiple exit discriminator (MED) is available.                                                                                                                    |
| AS path                               | Shorter AS path is available.                                                                                                                                                        |
| Cisco Non-deterministic MED selection | Cisco nondeterministic MED is enabled, and a path with a lower MED is available.                                                                                                     |
| Clone                                 | Route is a clone.                                                                                                                                                                    |
| Cluster list length                   | Length of cluster list sent by the route reflector.                                                                                                                                  |
| Delete                                | Route has been deleted.                                                                                                                                                              |
| Ex                                    | Exterior route.                                                                                                                                                                      |
| Ext                                   | BGP route received from an external BGP neighbor.                                                                                                                                    |
| FlashAll                              | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden                                | Route not used because of routing policy.                                                                                                                                            |
| IfCheck                               | Route needs forwarding RPF check.                                                                                                                                                    |
| IGP metric                            | Path through next hop with lower IGP metric is available.                                                                                                                            |
| Inactive reason                       | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| Initial                               | Route being added.                                                                                                                                                                   |

Table 50: State Output Field Values (continued)

| Value                                                    | Description                                                                  |
|----------------------------------------------------------|------------------------------------------------------------------------------|
| <b>Int</b>                                               | Interior route.                                                              |
| <b>Int Ext</b>                                           | BGP route received from an internal BGP peer or a BGP confederation peer.    |
| <b>Interior &gt; Exterior &gt; Exterior via Interior</b> | Direct, static, IGP, or EBGp path is available.                              |
| <b>Local Preference</b>                                  | Path with a higher local preference value is available.                      |
| <b>Martian</b>                                           | Route is a martian (ignored because it is obviously invalid).                |
| <b>MartianOK</b>                                         | Route exempt from martian filtering.                                         |
| <b>Next hop address</b>                                  | Path with lower metric next hop is available.                                |
| <b>No difference</b>                                     | Path from neighbor with lower IP address is available.                       |
| <b>NoReadvrt</b>                                         | Route not to be advertised.                                                  |
| <b>NotBest</b>                                           | Route not chosen because it does not have the lowest MED.                    |
| <b>Not Best in its group</b>                             | Incoming BGP AS is not the best of a group (only one AS can be the best).    |
| <b>NotInstall</b>                                        | Route not to be installed in the forwarding table.                           |
| <b>NSR-incapable</b>                                     | Route added by non-NSR supported protocols.                                  |
| <b>Number of gateways</b>                                | Path with a greater number of next hops is available.                        |
| <b>Origin</b>                                            | Path with a lower origin code is available.                                  |
| <b>Pending</b>                                           | Route pending because of a hold-down configured on another route.            |
| <b>Programmed</b>                                        | Route installed programatically by on-box or off-box applications using API. |
| <b>Release</b>                                           | Route scheduled for release.                                                 |
| <b>RIB preference</b>                                    | Route from a higher-numbered routing table is available.                     |
| <b>Route Distinguisher</b>                               | 64-bit prefix added to IP subnets to make them unique.                       |
| <b>Route Metric or MED comparison</b>                    | Route with a lower metric or MED is available.                               |
| <b>Route Preference</b>                                  | Route with lower preference value is available                               |

Table 50: State Output Field Values (continued)

| Value          | Description                                                                                                                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Router ID      | Path through a neighbor with lower ID is available.                                                                                                                                                                         |
| Secondary      | Route not a primary route.                                                                                                                                                                                                  |
| Unusable path  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>The route is damped.</li> <li>The route is rejected by an import policy.</li> <li>The route is unresolved.</li> </ul> |
| Update source  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                             |
| ProtectionCand | Indicates paths requesting protection.                                                                                                                                                                                      |
| ProtectionPath | Indicates the route entry that can be used as a protection path.                                                                                                                                                            |

Table 51 on page 1490 describes the possible values for the Communities output field.

Table 51: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is <b>0</b> . A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                                  |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.                   |
| <b>domain-id</b>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                                             |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                                     |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from <b>0</b> through <b>4,294,967,295</b> (bytes per second).                                                                                                                                                                                                                   |
| <i>local AS number</i>                                  | Local AS number: from <b>1</b> through <b>65,535</b> .                                                                                                                                                                                                                                                  |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                        |
| <b>origin</b>                                           | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                                  |
| <i>ospf-route-type</i>                                  | 1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses. |

Table 51: Communities Output Field Values (continued)

| Value                                | Description                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route-type-vendor</b>             | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <b>area-number:ospf-route-type:options</b> . |
| <b>rte-type</b>                      | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <b>area-number:ospf-route-type:options</b> . |
| <b>target</b>                        | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.                                                               |
| <b>unknown IANA</b>                  | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                             |
| <b>unknown OSPF vendor community</b> | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                              |

| <b>Description</b>                 | Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                     | <p><b>none</b>—(Same as <b>brief</b>.) Display standard information about policy-based export for all instances and routing tables on all systems.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance &lt;instance-name&gt;</b>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>routing-table-name</b>—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the <b>show route export inet</b> command).</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Type                       | ( <b>instance</b> keyword only) Type of routing instance: <b>forwarding</b> , <b>non-forwarding</b> , or <b>vrf</b> .                                                                                                                                                                                                                                                       | <b>detail</b>     |

## Sample Output

### show route export

```

user@host> show route export
Table Export Routes
inet.0 N 0
black.inet.0 Y 3
red.inet.0 Y 4

```

### show route export detail

```

user@host> show route export detail
inet.0 Routes: 0
black.inet.0 Routes: 3
 Import: [inet.0]
red.inet.0 Routes: 4
 Import: [inet.0]

```

**show route export instance detail**

```
user@host> show route export instance detail
Instance: master Type: forwarding
 Flags: <config auto-policy> Options: <unicast multicast>
 Import policy: [(ospf-master-from-red || isis-master-from-black)]
Instance: black Type: non-forwarding
Instance: red Type: non-forwarding
```

## show route extensive

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 53: show route extensive Output Fields

| Field Name                 | Field Description                                                       |
|----------------------------|-------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                        |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |

Table 53: show route extensive Output Fields (continued)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>TSI</b>                                     | Protocol header information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                            |

Table 53: show route extensive Output Fields (continued)

| Field Name                                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Level</b>                                         | (IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Route Distinguisher</b>                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path lsp-path-name</b>             | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Offset</b>                                        | Whether the metric has been increased or decreased by an offset value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 53: *show route extensive Output Fields (continued)*

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>label-operation</b>    | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                              |
| <b>Indirect next hops</b> | <p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"><li>• 0x1 indicates active next hops.</li><li>• 0x4000 indicates passive next hops.</li></ul> |
| <b>State</b>              | State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Session ID</b>         | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Weight</b>             | <p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                  |

Table 53: show route extensive Output Fields (continued)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inactive reason | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGp path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul> |
| Local AS        | Autonomous system (AS) number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Age             | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AI GP           | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric          | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MED-plus-IGP    | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Task</b>                          | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Announcement bits</b>             | <p>List of protocols that are consumers of the route. Using the following output as an example, <b>Announcement bits (3): 0-KRT 5-Resolve tree 2 8-BGP RT Background</b> there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP).</p> <p>The notation <b><i>n</i>-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>AS path</b>                       | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>              | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>FECs bound to route</b>           | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>AS path: I &lt;Originator&gt;</b> | (For route reflected output only) Originator ID attribute set by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 53: show route extensive Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route status</b>     | <p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> <li>• <b>Accepted</b>—The specified BGP route is imported by the default BGP policy.</li> <li>• <b>Import</b>—The route is imported into a Layer 3 VPN routing instance.</li> <li>• <b>Import-Protect</b>—A remote instance egress that is protected.</li> <li>• <b>Multipath</b>—A BGP multipath active route.</li> <li>• <b>MultipathContrib</b>—The route is not active but contributes to the BGP multipath.</li> <li>• <b>Protect</b>—An egress route that is protected.</li> <li>• <b>Stale</b>—A route that is marked stale due to graceful restart.</li> </ul> |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                   |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                               |
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                           |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLAN ID                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Cluster list            | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Originator ID           | (For route reflected output only) Address of router that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Prefixes bound to route | Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Communities             | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Layer2-info: encaps     | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| control flags           | Control flags: <b>none</b> or Site Down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| mtu                     | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 53: show route extensive Output Fields (continued)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>status vector</b>         | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                              |
| <b>Localpref</b>             | Local preference value included in the route.                                                                                                                                                                                                                                                                    |
| <b>Router ID</b>             | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                 |
| <b>Primary Routing Table</b> | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                      |
| <b>Secondary Tables</b>      | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                   |
| <b>Originating RIB</b>       | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| <b>Node path count</b>       | Number of nodes in the path.                                                                                                                                                                                                                                                                                     |
| <b>Forwarding nexthops</b>   | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                            |

## Sample Output

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 54: show route flow validation Output Fields

| Field Name                | Field Description                                | Level of Output |
|---------------------------|--------------------------------------------------|-----------------|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). | All levels      |

Table 54: show route flow validation Output Fields (continued)

| Field Name                  | Field Description                                                       | Level of Output |
|-----------------------------|-------------------------------------------------------------------------|-----------------|
| <i>prefix</i>               | Route address.                                                          | All levels      |
| Active unicast route        | Active route in the routing table.                                      | All levels      |
| Dependent flow destinations | Number of flows for which there are routes in the routing table.        | All levels      |
| Origin                      | Source of the route flow.                                               | All levels      |
| Neighbor AS                 | Autonomous system identifier of the neighbor.                           | All levels      |
| Flow destination            | Number of entries and number of destinations that match the route flow. | All levels      |
| Unicast best match          | Destination that is the best match for the route flow.                  | All levels      |
| Flags                       | Information about the route flow.                                       | All levels      |

## Sample Output

### show route flow validation

```

user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 64501
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent

```

### show route flow validation (IPv6)

```

user@host> show route flow validation
inet6.0:
2001:db8::11:11:11:0/120
 Active unicast route
 Dependent flow destinations: 2
 Origin: 2001:db8::13:14:2:2, Neighbor AS: 2000
2001:db8::11:11:11:10/128
 Flow destination (1 entries, 1 match origin, next-as)
 Unicast best match: 2001:db8::11:11:11:0/120
 Flags: Consistent
2001:db8::11:11:11:30/128
 Flow destination (1 entries, 1 match origin, next-as)
 Unicast best match: 2001:db8::11:11:11:0/120
 Flags: Consistent

```

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Option **bridge-domain** introduced in Junos OS Release 7.5

Option **learning-vlan-id** introduced in Junos OS Release 8.4

Options **all** and **vlan** introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **bridge** (**ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn**), **ethernet-switching**, **evpn**, **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mcsnoop-inet**, **mcsnoop-inet6**, **mpls**, **satellite-inet**, **satellite-inet6**, **satellite-vpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers,

display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** —(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege Level**

| Enabled protocols | <p>The features and protocols that have been enabled for a given routing table. This field can contain the following values:</p> <ul style="list-style-type: none"> <li>• BUM hashing—BUM hashing is enabled.</li> <li>• MAC Stats—Mac Statistics is enabled.</li> <li>• Bridging—Routing instance is a normal layer 2 bridge.</li> <li>• No VLAN—No VLANs are associated with the bridge domain.</li> <li>• All VLANs—The <b>vlan-id all</b> statement has been enabled for this bridge domain.</li> <li>• Single VLAN—Single VLAN ID is associated with the bridge domain.</li> <li>• MAC action drop—New MACs will be dropped when the MAC address limit is reached.</li> <li>• Dual VLAN—Dual VLAN tags are associated with the bridge domain</li> <li>• No local switching—No local switching is enabled for this routing instance..</li> <li>• Learning disabled—Layer 2 learning is disabled for this routing instance.</li> <li>• MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached.</li> <li>• VPLS—The VPLS protocol is enabled.</li> <li>• No IRB I2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance.</li> <li>• ACKed by all peers—All peers have acknowledged this routing instance.</li> <li>• BUM Pruning—BUM pruning is enabled on the VPLS instance.</li> <li>• Def BD VXLAN—VXLAN is enabled for the default bridge domain.</li> <li>• EVPN—EVPN protocol is enabled for this routing instance.</li> <li>• Def BD OVSDb—Open vSwitch Database (OVSDb) is enabled on the default bridge domain.</li> <li>• Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain.</li> <li>• L2 backhaul—Layer 2 backhaul is enabled.</li> <li>• FRR optimize—Fast reroute optimization</li> <li>• MAC pinning—MAC pinning is enabled for this bridge domain.</li> <li>• MAC Aging Timer—The MAC table aging time is set per routing instance.</li> <li>• EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation.</li> <li>• PBBN—This routing instance is configured as a provider backbone bridged network.</li> <li>• PBN—This routing instance is configured as a provider bridge network.</li> <li>• ETREE—The ETREE protocol is enabled on this EVPN routing instance.</li> <li>• ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance.</li> <li>• Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain.</li> <li>• MPLS control word—Control word is enabled for this MPLS routing instance.</li> </ul> | All levels       |
| Address family    | Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels       |
| Destination       | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive |

Table 55: show route forwarding-table Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output  |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Route Type (Type)       | <p>How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li>• <b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li>• <b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li>• <b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li>• <b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li>• <b>ignore (ignr)</b>—Ignore this route.</li> <li>• <b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li>• <b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li>• <b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul> | All levels       |
| Route Reference (RtRef) | Number of routes to reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | detail extensive |

| Next hop Type (Type)       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b> —Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrst)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| Reference (NhRef)          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| Next-hop interface (Netif) | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive none</b> |
| Weight                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| Balance                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| RPF interface              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>             |

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```

so-1/1/0 {
 unit 0 {
 family inet {
 rpf-check;
 address 192.0.2.2/30;
 }
 }
}

user@host> show route forwarding-table extensive
Routing table: inet [Index 0]
Internet:
...
...
Destination: 192.0.2.3/32

```

```

Route type: destination
Route reference: 0
Flags: sent to PFE
Nexthop: 192.0.2.3
Next-hop type: broadcast
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0
Route interface-index: 67
Index: 328 Reference: 1

```

### show route forwarding-table (dynamic list next hop)

The **show route forwarding table** output shows the two next hop elements for a multihomed EVPN destination.

```

user@host> show route forwarding-table label 299952 extensive
MPLS:

Destination: 299952
Route type: user
Route reference: 0
Multicast RPF nh index: 0
P2mpidx: 0
Flags: sent to PFE, rt nh decoupled
Next-hop type: indirect
Nexthop:
Next-hop type: composite
Next-hop type: indirect
Nexthop: 1.0.0.4
Next-hop type: Push 301632, Push 299776(top) Index: 600 Reference: 2
Load Balance Label: None
Next-hop interface: ge-0/0/1.0
Next-hop type: indirect
Nexthop: 1.0.0.4
Next-hop type: Push 301344, Push 299792(top) Index: 619 Reference: 2
Load Balance Label: None
Next-hop interface: ge-0/0/1.0
Route interface-index: 0
Index: 1048575 Reference: 2
Index: 601 Reference: 2
Index: 1048574 Reference: 3
Index: 1048577 Reference: 3
Index: 619 Reference: 2

```

After one of the PE router has been disabled in the EVPN multihomed network, the same **show route forwarding table** output command shows one next hop element and one empty next hop element.

```

user@host> show route forwarding-table label 299952 extensive

| Description                 | Display routes for destinations that have no active route. An inactive route is a route that was not selected as the best path.                                                                                                                                                                                                                                                           |
| Options                     | <b>none</b> —Display all inactive routes.<br><br><b>brief   detail   extensive   terse</b> —(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to <b>brief</b> .<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system. |
| Required Privilege Level    | view                                                                                                                                                                                                                                                                                                                                                                                      |

**Output Fields** Table 56 on page 1553 lists the output fields for the **show route instance** command. Output fields are listed in the approximate order in which they appear.

*Table 56: show route instance Output Fields*

| Field Name                       | Field Description                                                                                                                                                                                                                                                  | Level of Output          |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Instance or <i>instance-name</i> | Name of the routing instance.                                                                                                                                                                                                                                      | All levels               |
| Operational Routing Instances    | ( <b>operational</b> keyword only) Names of all operational routing instances.                                                                                                                                                                                     | —                        |
| Type                             | Type of routing instance: <b>forwarding</b> , <b>l2vpn</b> , <b>no-forwarding</b> , <b>vpls</b> , <b>virtual-router</b> , or <b>vrf</b> .                                                                                                                          | All levels               |
| State                            | State of the routing instance: <b>active</b> or <b>inactive</b> .                                                                                                                                                                                                  | <b>brief detail none</b> |
| Interfaces                       | Name of interfaces belonging to this routing instance.                                                                                                                                                                                                             | <b>brief detail none</b> |
| Restart State                    | Status of graceful restart for this instance: <b>Pending</b> or <b>Complete</b> .                                                                                                                                                                                  | <b>detail</b>            |
| Path selection timeout           | Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is <b>300</b> .                                                                                                                                             | <b>detail</b>            |
| Tables                           | Tables (and number of routes) associated with this routing instance.                                                                                                                                                                                               | <b>brief detail none</b> |
| Route-distinguisher              | Unique route distinguisher associated with this routing instance.                                                                                                                                                                                                  | <b>detail</b>            |
| Vrf-import                       | VPN routing and forwarding instance import policy name.                                                                                                                                                                                                            | <b>detail</b>            |
| Vrf-export                       | VPN routing and forwarding instance export policy name.                                                                                                                                                                                                            | <b>detail</b>            |
| Vrf-import-target                | VPN routing and forwarding instance import target community name.                                                                                                                                                                                                  | <b>detail</b>            |
| Vrf-export-target                | VPN routing and forwarding instance export target community name.                                                                                                                                                                                                  | <b>detail</b>            |
| Vrf-edge-protection-id           | Context identifier configured for edge-protection.                                                                                                                                                                                                                 | <b>detail</b>            |
| Fast-reroute-priority            | Fast reroute priority setting for a VPLS routing instance: <b>high</b> , <b>medium</b> , or <b>low</b> . The default is <b>low</b> .                                                                                                                               | <b>detail</b>            |
| Restart State                    | Restart state: <ul style="list-style-type: none"> <li><b>Pending:protocol-name</b>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li><b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> | <b>detail</b>            |

Table 56: show route instance Output Fields (continued)

| Field Name             | Field Description                               | Level of Output                  |
|------------------------|-------------------------------------------------|----------------------------------|
| Primary rib            | Primary table for this routing instance.        | <b>brief</b> none <b>summary</b> |
| Active/holddown/hidden | Number of active, hold-down, and hidden routes. | All levels                       |

## Sample Output

### show route instance

```

user@host> show route instance
Instance Type
Primary RIB
master forwarding
inet.0 16/0/1
iso.0 1/0/0
mpls.0 0/0/0
inet6.0 2/0/0
l2circuit.0 0/0/0
__juniper_private1__ forwarding
__juniper_private1__.inet.0 12/0/0
__juniper_private1__.inet6.0 1/0/0

```

### show route instance detail (Graceful Restart Complete)

## show route protocol

---

**List of Syntax**    [Syntax on page 1574](#)  
                          [Syntax \(EX Series Switches\) on page 1574](#)

**Syntax**    `show route protocol protocol`  
                  `<brief | detail | extensive | terse>`  
                  `<logical-system (all | logical-system-name)>`

**Syntax (EX Series Switches)**    `show route protocol protocol`  
                                          `<brief | detail | extensive | terse>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **ospf2** and **ospf3** options introduced in Junos OS Release 9.2.  
                              **ospf2** and **ospf3** options introduced in Junos OS Release 9.2 for EX Series switches.  
                              **flow** option introduced in Junos OS Release 10.0.  
                              **flow** option introduced in Junos OS Release 10.0 for EX Series switches.

**Description**    Display the route entries in the routing table that were learned from a particular protocol.

**Options**    **brief | detail | extensive | terse**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***protocol***—Protocol from which the route was learned:

- **access**—Access route for use by DHCP application
- **access-internal**—Access-internal route for use by DHCP application
- **aggregate**—Locally generated aggregate route
- **arp**—Route learned through the Address Resolution Protocol
- **atmvpn**—Asynchronous Transfer Mode virtual private network
- **bgp**—Border Gateway Protocol
- **ccc**—Circuit cross-connect
- **direct**—Directly connected route
- **dvmrp**—Distance Vector Multicast Routing Protocol
- **esis**—End System-to-Intermediate System
- **flow**—Locally defined flow-specification route
- **frr**—Precomputed protection route or backup route used when a link goes down
- **isis**—Intermediate System-to-Intermediate System

- **ldp**—Label Distribution Protocol
- **l2circuit**—Layer 2 circuit
- **l2vpn**—Layer 2 virtual private network
- **local**—Local address
- **mpls**—Multiprotocol Label Switching
- **msdp**—Multicast Source Discovery Protocol
- **ospf**—Open Shortest Path First versions 2 and 3
- **ospf2**—Open Shortest Path First versions 2 only
- **ospf3**—Open Shortest Path First version 3 only
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation
- **rsvp**—Resource Reservation Protocol
- **rtarget**—Local route target virtual private network
- **static**—Statically defined route
- **tunnel**—Dynamic tunnel
- **vpn**—Virtual private network

**NOTE:** EX Series switches run a subset of these protocols. See the switch CLI for details.

**Output Fields** Table 57 on page 1588 describes the output fields for the **show route receive-protocol** command. Output fields are listed in the approximate order in which they appear.

*Table 57: show route receive-protocol Output Fields*

| Field Name                                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output         |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>routing-table-name</i>                       | Name of the routing table—for example, inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels              |
| <i>number destinations</i>                      | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                       | All levels              |
| <i>number routes</i>                            | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                      | All levels              |
| Prefix                                          | Destination prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                           | none <b>brief</b>       |
| MED                                             | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                      | none <b>brief</b>       |
| <i>destination-prefix</i><br>(entry, announced) | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Accepted LongLivedStale</b>                  | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                           | <b>detail extensive</b> |
| <b>Accepted LongLivedStaleImport</b>            | The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.<br><br>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table | <b>detail extensive</b> |
| <b>ImportAccepted LongLivedStaleImport</b>      | Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table<br><br>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Route Distinguisher</b>                      | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Label-Base, range</b>                        | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |

Table 57: show route receive-protocol Output Fields (continued)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>VPN Label</b>            | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Next hop</b>             | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels              |
| <b>Localpref or Lclpref</b> | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |
| <b>AS path</b>              | <p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.</li> <li>• [ ]—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels              |
| <b>Route Labels</b>         | Stack of labels carried in the BGP route update.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Cluster list</b>         | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Originator ID</b>        | (For route reflected output only) Address of routing device that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b> |

**Output Fields** [Table 45 on page 1431](#) describes the output fields for the **show route table** command. Output fields are listed in the approximate order in which they appear.

*Table 58: show route table Output Fields*

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Restart complete           | <p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> <li>• <b>Pending:</b><i>protocol-name</i>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>• <b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> <p>For example, if the output shows-</p> <ul style="list-style-type: none"> <li>• LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden)<br/>Restart Pending: OSPF LDP VPN</li> </ul> <p>This indicates that <b>OSPF</b>, <b>LDP</b>, and <b>VPN</b> protocols did not restart for the <b>LDP.inet.0</b> routing table.</p> <ul style="list-style-type: none"> <li>• vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)<br/>Restart Complete</li> </ul> <p>This indicates that all protocols have restarted for the <b>vpls_1.l2vpn.0</b> routing table.</p> |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 58: show route table Output Fields (continued)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> <li>• <b>inclusive multicast Ethernet tag route</b>—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> <li>• <b>route distinguisher</b>—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</li> <li>• <b>Ethernet tag ID</b>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</li> <li>• <b>IP address length</b>—(1 octet) Length of IP address in bits.</li> <li>• <b>originating router's IP address</b>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</li> </ul> </li> </ul> |
| <i>label stacking</i>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 58: show route table Output Fields (continued)

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ <i>protocol, preference</i> ]               | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> |
| Level                                         | (IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Route Distinguisher                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PMSI                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Next-hop type                                 | Type of next hop. For a description of possible values for this field, see <a href="#">Table 49 on page 1486</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Next-hop reference count                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Flood nexthop branches exceed maximum message | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Source                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Next hop                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| via                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>                                                                                                          |
| Label-switched-path <i>lsp-path-name</i>      | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 58: show route table Output Fields (continued)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Label operation   | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                              |
| Interface         | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Protocol next hop | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Indirect next hop | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| State             | State of the route (a route can be in more than one state). See <a href="#">Table 50 on page 1488</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Local AS          | AS number of the local routing devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Age               | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| AIGP              | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Metric            | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                       |
| MED-plus-IGP      | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TTL-Action        | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Task              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Announcement bits | <p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, <b>n-Resolve inet</b> indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <li>• <b>n</b>—An index used by Juniper Networks customer support only.</li> </ul> |

Table 58: show route table Output Fields (continued)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AS path             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| validation-state    | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FECs bound to route | Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Primary Upstream    | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| RPF Nexthops        | When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Label               | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 58: show route table Output Fields (continued)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| weight                              | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                    |
| VC Label                            | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                                 | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLAN ID                             | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Prefixes bound to route             | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                    |
| Communities                         | Community path attribute for the route. See <a href="#">Table 51 on page 1490</a> for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                             |
| Layer2-info: encaps                 | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| control flags                       | Control flags: <b>none</b> or <b>Site Down</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| mtu                                 | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Label-Base, range                   | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                                |
| status vector                       | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Accepted Multipath                  | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Accepted LongLivedStale             | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                                  |
| Accepted LongLivedStaleImport       | <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p> |
| ImportAccepted LongLivedStaleImport | <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>                                                                                                                                                                       |
| Accepted MultipathContrib           | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Localpref                           | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Router ID                           | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 58: show route table Output Fields (continued)**

| Field Name            | Field Description                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------|
| Primary Routing Table | In a routing table group, the name of the primary routing table in which the route resides.    |
| Secondary Tables      | In a routing table group, the name of one or more secondary tables in which the route resides. |

[Table 49 on page 1486](#) describes all possible values for the Next-hop Types output field.

**Table 59: Next-hop Types Output Field Values**

| Next-Hop Type            | Description                                                                                                                                                                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Broadcast (bcast)        | Broadcast next hop.                                                                                                                                                                                                                                                            |
| Deny                     | Deny next hop.                                                                                                                                                                                                                                                                 |
| Discard                  | Discard next hop.                                                                                                                                                                                                                                                              |
| Flood                    | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| Hold                     | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                           |
| Indexed (idxd)           | Indexed next hop.                                                                                                                                                                                                                                                              |
| Indirect (indr)          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                   |
| Interface                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                   |
| Local (locl)             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                         |
| Multicast (mcst)         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                  |
| Multicast discard (mdsc) | Multicast discard.                                                                                                                                                                                                                                                             |
| Multicast group (mgrp)   | Multicast group member.                                                                                                                                                                                                                                                        |
| Receive (recv)           | Receive.                                                                                                                                                                                                                                                                       |
| Reject (rjct)            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                 |

*Table 59: Next-hop Types Output Field Values (continued)*

| Next-Hop Type            | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resolve (rslv)           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                          |
| Routed multicast (mcrtr) | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                  |
| Router                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as a next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| Table                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                      |
| Unicast (ucst)           | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Unilist (ulst)           | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                  |

[Table 50 on page 1488](#) describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

*Table 60: State Output Field Values*

| Value                                 | Description                                                                      |
|---------------------------------------|----------------------------------------------------------------------------------|
| Accounting                            | Route needs accounting.                                                          |
| Active                                | Route is active.                                                                 |
| Always Compare MED                    | Path with a lower multiple exit discriminator (MED) is available.                |
| AS path                               | Shorter AS path is available.                                                    |
| Cisco Non-deterministic MED selection | Cisco nondeterministic MED is enabled, and a path with a lower MED is available. |
| Clone                                 | Route is a clone.                                                                |
| Cluster list length                   | Length of cluster list sent by the route reflector.                              |
| Delete                                | Route has been deleted.                                                          |
| Ex                                    | Exterior route.                                                                  |

*Table 60: State Output Field Values (continued)*

| Value                                       | Description                                                                                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ext                                         | BGP route received from an external BGP neighbor.                                                                                                                                    |
| FlashAll                                    | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden                                      | Route not used because of routing policy.                                                                                                                                            |
| IfCheck                                     | Route needs forwarding RPF check.                                                                                                                                                    |
| IGP metric                                  | Path through next hop with lower IGP metric is available.                                                                                                                            |
| Inactive reason                             | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| Initial                                     | Route being added.                                                                                                                                                                   |
| Int                                         | Interior route.                                                                                                                                                                      |
| Int Ext                                     | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| Interior > Exterior > Exterior via Interior | Direct, static, IGP, or EBGp path is available.                                                                                                                                      |
| Local Preference                            | Path with a higher local preference value is available.                                                                                                                              |
| Martian                                     | Route is a martian (ignored because it is obviously invalid).                                                                                                                        |
| MartianOK                                   | Route exempt from martian filtering.                                                                                                                                                 |
| Next hop address                            | Path with lower metric next hop is available.                                                                                                                                        |
| No difference                               | Path from neighbor with lower IP address is available.                                                                                                                               |
| NoReadvrt                                   | Route not to be advertised.                                                                                                                                                          |
| NotBest                                     | Route not chosen because it does not have the lowest MED.                                                                                                                            |
| Not Best in its group                       | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                            |
| NotInstall                                  | Route not to be installed in the forwarding table.                                                                                                                                   |
| Number of gateways                          | Path with a greater number of next hops is available.                                                                                                                                |
| Origin                                      | Path with a lower origin code is available.                                                                                                                                          |

**Table 60: State Output Field Values (continued)**

| Value                          | Description                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pending                        | Route pending because of a hold-down configured on another route.                                                                                                                                                                 |
| Release                        | Route scheduled for release.                                                                                                                                                                                                      |
| RIB preference                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| Route Distinguisher            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| Route Metric or MED comparison | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| Route Preference               | Route with lower preference value is available.                                                                                                                                                                                   |
| Router ID                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| Secondary                      | Route not a primary route.                                                                                                                                                                                                        |
| Unusable path                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| Update source                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

[Table 51 on page 1490](#) describes the possible values for the Communities output field.

**Table 61: Communities Output Field Values**

| Value                                                             | Description                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                                | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                        |
| <b>bandwidth: local AS</b><br><b>number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| <b>domain-id</b>                                                  | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                           |
| <b>domain-id-vendor</b>                                           | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                   |
| <i>link-bandwidth-number</i>                                      | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).                                                                                                                                                                                                               |
| <i>local AS number</i>                                            | Local AS number: from 1 through 65,535.                                                                                                                                                                                                                                               |

Table 61: Communities Output Field Values (continued)

| Value                                | Description                                                                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>options</i>                       | 1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                        |
| <i>origin</i>                        | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                                  |
| <i>ospf-route-type</i>               | 1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses. |
| <i>route-type-vendor</i>             | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <i>area-number:ospf-route-type:options</i> .                                                                                            |
| <i>rte-type</i>                      | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <i>area-number:ospf-route-type:options</i> .                                                                                            |
| <i>target</i>                        | Defines which VPN the route participates in; <b>target</b> has the format <i>32-bit IP address:16-bit number</i> . For example, 10.19.0.0:100.                                                                                                                                                          |
| <i>unknown IANA</i>                  | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                        |
| <i>unknown OSPF vendor community</i> | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                                         |

## Sample Output

### show route table bgp.l2vpn

```

user@host> show route table bgp.l2vpn
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.24.1:1:4:1/96
 *[BGP/170] 01:08:58, localpref 100, from 192.168.24.1
 AS path: I
 > to 10.0.16.2 via fe-0/0/1.0, label-switched-path am

```

### show route table bgp.l3vpn.0

```

user@host> show route table bgp.l3vpn.0
bgp.l3vpn.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.71.15:100:10.255.71.17/32
 *[BGP/170] 00:03:59, MED 1, localpref 100, from
10.255.71.15
 AS path: I
 > via so-2/1/0.0, Push 100020, Push 100011(top)
10.255.71.15:200:10.255.71.18/32

```

```

10.255.71.15 *[BGP/170] 00:03:59, MED 1, localpref 100, from

## show route terse

**List of Syntax** [Syntax on page 1635](#)  
[Syntax \(EX Series Switches\) on page 1635](#)

**Syntax** show route terse  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route terse

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display a high-level summary of the routes in the routing table.

**NOTE:** For BGP routes, the **show route terse** command displays the local preference attribute and MED instead of the metric1 and metric2 values. This is mostly due to historical reasons.

To display the metric1 and metric2 value of a BGP route, use the [show route extensive](#) command.

**Options** **none**—Display a high-level summary of the routes in the routing table.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show route terse on page 1637](#)

**Output Fields** [Table 62 on page 1635](#) describes the output fields for the **show route terse** command. Output fields are listed in the approximate order in which they appear.

*Table 62: show route terse Output Fields*

| Field Name                 | Field Description                                                       |
|----------------------------|-------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                        |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table. |

Table 62: show route terse Output Fields (continued)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number routes</i> | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                |
| <i>route key</i>     | Key for the state of the route: <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul>                                                                                                                                                                                                                |
| <b>A</b>             | Active route. An asterisk (*) indicates this is the active route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>V</b>             | Validation status of the route: <ul style="list-style-type: none"> <li>• <b>?</b>—Not evaluated. Indicates that the route was not learned through BGP.</li> <li>• <b>I</b>—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>N</b>—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>V</b>—Valid. Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| <i>Destination</i>   | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>P</b>             | Protocol through which the route was learned: <ul style="list-style-type: none"> <li>• <b>A</b>—Aggregate</li> <li>• <b>B</b>—BGP</li> <li>• <b>C</b>—CCC</li> <li>• <b>D</b>—Direct</li> <li>• <b>G</b>—GMPLS</li> <li>• <b>I</b>—IS-IS</li> <li>• <b>L</b>—L2CKT, L2VPN, LDP, Local</li> <li>• <b>K</b>—Kernel</li> <li>• <b>M</b>—MPLS, MSDP</li> <li>• <b>O</b>—OSPF</li> <li>• <b>P</b>—PIM</li> <li>• <b>R</b>—RIP, RIPng</li> <li>• <b>S</b>—Static</li> <li>• <b>T</b>—Tunnel</li> </ul>                                                                                                                                                                                     |
| <b>Prf</b>           | Preference value of the route. In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.                                                                                              |

Table 62: show route terse Output Fields (continued)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Metric 1   | First metric value in the route. For routes learned from BGP, this is the MED metric.                                                                                                                                                                                                                                                                      |
| Metric 2   | Second metric value in the route. For routes learned from BGP, this is the IGP metric.                                                                                                                                                                                                                                                                     |
| Next hop   | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                          |
| AS path    | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>I—IGP.</li> <li>E—EGP.</li> <li>?—Incomplete; typically, the AS path was aggregated.</li> </ul> |

| <b>Description</b>              | Display information about authentication keychains configured for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, the Bidirectional Forwarding Detection (BFD) protocol, and the Intermediate System-to-Intermediate System (IS-IS) protocol. |
| <b>Options</b>                  | <b>none</b> —Display information about authentication keychains.<br><br><b>brief   detail</b> —(Optional) Display the specified level of output.                                                                                                                                          |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                      |
| <b>List of Sample Output</b>    | <a href="#">show security keychain brief on page 1640</a><br><a href="#">show security keychain detail on page 1640</a>                                                                                                                                                                   |
| <b>Output Fields</b>            | <a href="#">Table 63 on page 1638</a> describes the output fields for the <b>show security keychain</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                  |

*Table 63: show security keychain Output Fields*

| Field Name        | Field Description                                                                        | Level of Output |
|-------------------|------------------------------------------------------------------------------------------|-----------------|
| keychain          | The name of the keychain in operation.                                                   | All levels      |
| Active-ID Send    | Number of routing protocols packets sent with the active key.                            | All levels      |
| Active-ID Receive | Number of routing protocols packets received with the active key.                        | All levels      |
| Next-ID Send      | Number of routing protocols packets sent with the next key.                              | All levels      |
| Next-ID Receive   | Number of routing protocols packets received with the next key.                          | All levels      |
| Transition        | Amount of time until the current key will be replaced with the next key in the keychain. | All levels      |
| Tolerance         | Configured clock-skew tolerance, in seconds, for accepting keys for a key chain.         | All levels      |
| Id                | Identification number configured for the current key.                                    | <b>detail</b>   |
| Algorithm         | Authentication algorithm configured for the current key.                                 | <b>detail</b>   |

Table 63: show security keychain Output Fields (continued)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>State</b>      | <p>State of the current key.</p> <p>The value can be:</p> <ul style="list-style-type: none"> <li>• <b>receive</b></li> <li>• <b>send</b></li> <li>• <b>send-receive</b></li> </ul> <p>For the active key, the <b>State</b> can be <b>send-receive</b>, <b>send</b>, or <b>receive</b>. For keys that have a future start time, the <b>State</b> is <b>inactive</b>. Compare the <b>State</b> field to the <b>Mode</b> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>   |
| <b>Option</b>     | <p>For IS-IS only, the option determines how Junos OS encodes the message authentication code in routing protocol packets.</p> <p>The values can be:</p> <ul style="list-style-type: none"> <li>• <b>basic</b>—Based on RFC 5304.</li> <li>• <b>isis-enhanced</b>—Based on RFC 5310.</li> </ul> <p>The default value is <b>basic</b>. When you configure the <b>isis-enhanced</b> option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.</p> <p>When you configure <b>basic</b> (or do not include the <b>options</b> statement in the key configuration) Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.</p> <p>Because this setting is for IS-IS only, the TCP and the BFD protocol ignore the encoding option configured in the key.</p> | <b>detail</b>   |
| <b>Start-time</b> | Time that the current key became active.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail</b>   |
| <b>Mode</b>       | <p>Mode of each key (Informational only.)</p> <p>The value can be</p> <ul style="list-style-type: none"> <li>• <b>receive</b></li> <li>• <b>send</b></li> <li>• <b>send-receive</b></li> </ul> <p>The mode of the key is based on the configuration. Suppose you configure two keys, one with a start-time of today and the other with a start-time of next week. For both keys, the <b>Mode</b> can be <b>send-receive</b>, <b>send</b>, or <b>receive</b>, regardless of the configured start-time. Compare the <b>Mode</b> field to the <b>State</b> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b>   |

## Sample Output

| <b>Release Information</b>      | Command introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | Display information about the route validation database when resource public key infrastructure (RPKI) BGP route validation is configured. You can query all route validation records that match a given prefix or origin-autonomous-system. In addition, you can filter the output by a specific RPKI cache session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>none</b>—Display all route validation database entries.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about route validation database entries for the specified routing instance. The instance name can be master for the main instance, or any valid configured instance name or its prefix.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on a particular logical system.</p> <p><b>mismatch</b>—(Optional) Filter the output by mismatched origin autonomous systems.</p> <p><b>origin-autonomous-system <i>as-number</i></b>—(Optional) Filter the output by mismatched origin autonomous systems. The <b>mismatch</b> qualifier is useful for finding conflicting origin-autonomous-system information between RPKI caches. Mismatches might occur during cache reconfiguration.</p> <p><b>record <i>ip-prefix</i></b>—(Optional) Filter the output by route validation records that match a given prefix.</p> <p><b>session <i>ip-address</i></b>—(Optional) Filter the output by a specific RPKI cache session.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## List of Sample Output [show validation database on page 1642](#)

**Output Fields** [Table 64 on page 1642](#) describes the output fields for the **show validation database** command. Output fields are listed in the approximate order in which they appear.

*Table 64: show validation database Output Fields*

| Field Name   | Field Description                                                                                                                                                                                                 | Level of Output |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Prefix       | Route validation (RV) record prefix.<br><br>RV records are received from the cache server and can also be configured statically at the <a href="#">[edit routing-options validation static]</a> hierarchy level . | All levels      |
| Origin-AS    | Legitimate originator autonomous system (AS).                                                                                                                                                                     | All levels      |
| Session      | IP address of the RPKI cache server.                                                                                                                                                                              | All levels      |
| State        | State of the route validation records. The state can be <b>valid</b> , <b>invalid</b> or <b>unknown</b> .                                                                                                         | All levels      |
| Mismatch     | Conflicting origin-autonomous-system information between RPKI caches when nonstop active routing (NSR) is configured.                                                                                             | All levels      |
| IPv4 records | Number of IPv4 route validation records.                                                                                                                                                                          | All levels      |
| IPv6 records | Number of IPv6 route validation records.                                                                                                                                                                          | All levels      |

## Sample Output

### show validation database

```

user@host> show validation database
RV database for instance master

 Prefix Origin-AS Session State Mismatch

172.16.1.0/24-32 1 10.0.77.1 valid
172.16.2.0/24-32 2 10.0.77.1 valid
172.16.3.0/24-32 3 10.0.77.1 valid
172.16.4.0/24-32 4 10.0.77.1 valid
172.16.5.0/24-32 5 10.0.77.1 valid
172.16.6.0/24-32 6 10.0.77.1 valid
172.16.7.0/24-32 7 10.0.77.1 valid
172.16.8.0/24-32 8 10.0.77.1 valid

| <b>Output Fields</b>            | <p><a href="#">Table 65 on page 1643</a> describes the output fields for the <b>show validation group</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                               |

Table 65: show validation group Output Fields

| Field Name       | Field Description                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group            | Group name.                                                                                                                                                                               |
| Maximum sessions | Number of concurrent sessions for each group. The default is 2. The number is configurable with the <a href="#">max-sessions</a> statement.                                               |
| Session          | Resource public key infrastructure (RPKI) cache session IP address.                                                                                                                       |
| State            | State of the connection between the routing device and the cache server. <b>Up</b> means that the connection is established. <b>Connect</b> means that the connection is not established. |

*Table 65: show validation group Output Fields (continued)*

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preference | <p>Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.</p> <p>The default preference is 100. The preference is configurable with the <a href="#">preference</a> statement.</p> |

---

## Sample Output

### show validation group

```
user@host> show validation group
master
 Group: test, Maximum sessions: 3
 Session 10.255.255.11, State: Up, Preference: 100
 Session 10.255.255.12, State: Up, Preference: 100
 Group: test2, Maximum sessions: 2
 Session 10.255.255.13, State: Connect, Preference: 100
```

## show validation replication database

| <b>Release Information</b>      | Command introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Display the state of the nonstop active routing (NSR) records. The output is the same as the output of the <a href="#">show validation database</a> command, except for the <b>Mismatch</b> column.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>none</b>—Display all route validation database entries.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about route validation database entries for the specified routing instance. The instance name can be master for the main instance, or any valid configured instance name or its prefix.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on a particular logical system.</p> <p><b>origin-autonomous-system <i>as-number</i></b>—(Optional) Filter the output by mismatched origin autonomous systems. The <b>mismatch</b> qualifier is useful for finding conflicting origin-autonomous-system information between resource public key infrastructure (RPKI) caches. Mismatches might occur during cache reconfiguration.</p> <p><b>record <i>ip-prefix</i></b>—(Optional) Filter the output by route validation records that match a given prefix.</p> <p><b>session <i>ip-address</i></b>—(Optional) Filter the output by a specific RPKI cache session.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Output Fields** Table 66 on page 1646 describes the output fields for the **show validation replication database** command. Output fields are listed in the approximate order in which they appear.

*Table 66: show validation replication database Output Fields*

| Field Name   | Field Description                                                                                                                                                                                       | Level of Output |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Prefix       | Route validation (RV) record prefix.<br><br>RV records are received from the cache server and can also be configured statically at the <b>[edit routing-options validation static]</b> hierarchy level. | All levels      |
| Origin-AS    | Legitimate originator autonomous system (AS).                                                                                                                                                           | All levels      |
| Session      | IP address of the RPKI cache server.                                                                                                                                                                    | All levels      |
| State        | State of the route validation records. The state can be <b>valid</b> or <b>invalid</b> .                                                                                                                | All levels      |
| IPv4 records | Number of IPv4 route validation records.                                                                                                                                                                | All levels      |
| IPv6 records | Number of IPv6 route validation records.                                                                                                                                                                | All levels      |

## Sample Output

### show validation replication database

```
user@host> show validation replication database
RV database for instance master
```

| Prefix           | Origin-AS | Session       | State   |
|------------------|-----------|---------------|---------|
| 172.16.1.0/24-32 |           | 1 10.0.77.1   | valid   |
| 172.16.2.0/24-32 |           | 2 10.0.77.1   | valid   |
| 172.16.3.0/24-32 |           | 3 10.0.77.1   | valid   |
| 172.16.4.0/24-32 |           | 4 10.0.77.1   | valid   |
| 172.16.5.0/24-32 |           | 5 10.0.77.1   | valid   |
| 172.16.6.0/24-32 |           | 6 10.0.77.1   | valid   |
| 172.16.7.0/24-32 |           | 7 10.0.77.1   | valid   |
| 172.16.8.0/24-32 |           | 8 10.0.77.1   | valid   |
| 72.9.224.0/19-24 | 26234     | 192.168.1.100 | valid   |
| 72.9.224.0/19-24 | 3320      | 192.168.1.200 | invalid |
| 10.0.0.0/8-32    | 0         | internal      | valid   |
| IPv4 records: 14 |           |               |         |
| IPv6 records: 0  |           |               |         |

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| State              | State of the connection between the routing device and the cache server. <b>Up</b> means that the connection is established. <b>Connect</b> means that the connection is not established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| Flaps              | Number of attempts to establish a session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | None and brief  |
| Uptime             | Length of time that the session has remained established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | None and brief  |
| #IPv4/IPv6 records | Number of IPv4 and IPv6 route validation records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | None and brief  |
| Session index      | Every session has an index number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | detail          |
| Group              | Name of the group to which the session belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | detail          |
| Preference         | <p>Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.</p> <p>The default preference is 100. The preference is configurable with the <a href="#">preference</a> statement.</p>                                                                                                                                                                                                                                               | detail          |
| Port               | TCP port number for the outgoing connection with the cache server. The well-known RPKI port is TCP port 2222. For a given deployment, an RPKI cache server might listen on some other TCP port number. If so, you can configure the alternative port number with the <a href="#">port</a> statement.                                                                                                                                                                                                                                                                                                                                                                           | detail          |
| Refresh time       | Liveliness check interval for an RPKI cache server. Every <a href="#">refresh-time</a> (seconds), a serial query protocol data unit (PDU) with the last known serial number is transmitted. The <a href="#">hold-time</a> must be at least 2 x the <a href="#">refresh-time</a> .                                                                                                                                                                                                                                                                                                                                                                                              | detail          |
| Hold time          | <p>Length of time in seconds that the session between the routing device and the cache server is considered operational without any activity. After the hold time expires, the session is dropped.</p> <p>Reception of any PDU from the cache server resets the hold timer. The <a href="#">hold-time</a> is 600 seconds, by default, and must be least 2 x the <a href="#">refresh-time</a>. If the hold time expires, the session is considered to be down. This, in turn, triggers a session restart event. During a session restart, the routing device attempts to start a session with the cache server that has the numerically highest <a href="#">preference</a>.</p> | detail          |

Table 67: show validation session Output Fields (continued)

| Field Name                  | Field Description                                                                                                                                                                                                  | Level of Output |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Record Life time            | Amount of time that route validation (RV) records learned from a cache server are valid. RV records expire if the session to the cache server goes down and remains down for the <b>record-lifetime</b> (seconds). | <b>detail</b>   |
| Serial (Full Update)        | Number of full serial updates.                                                                                                                                                                                     | <b>detail</b>   |
| Serial (Incremental Update) | Number of incremental serial updates.                                                                                                                                                                              | <b>detail</b>   |
| Session flaps               | Number of attempts to establish a session.                                                                                                                                                                         | <b>detail</b>   |
| Session uptime              | Length of time that the session has remained established.                                                                                                                                                          | <b>detail</b>   |
| Last PDU received           | Time when the most recent PDU was received.                                                                                                                                                                        | <b>detail</b>   |
| IPv4 prefix count           | Number of IPv4 sessions.                                                                                                                                                                                           | <b>detail</b>   |
| IPv6 prefix count           | Number of IPv6 sessions.                                                                                                                                                                                           | <b>detail</b>   |

## Sample Output

### show validation session brief

```

user@host> show validation session brief
Session State Flaps Uptime #IPv4/IPv6
records
 1.3.0.2 up 2 00:01:37 13/0
 10.255.255.11 up 3 00:00:01 1/0
 10.255.255.12 connect 2 64/68

```

### show validation session detail

```

user@host> show validation session detail
Session 10.0.77.1, State: up
 Group: test, Preference: 100
 Local IPv4 address: 10.0.77.2, Port: 2222
 Refresh time: 300s
 Session flaps: 14, Last Session flap: 5h13m18s ago
 Hold time: 900s
 Record Life time: 3600s
 Serial (Full Update): 0
 Serial (Incremental Update): 0
 Session flaps 2
 Session uptime: 00:48:35
 Last PDU received: 00:03:35
 IPv4 prefix count: 71234
 IPv6 prefix count: 345

```

| <b>Output Fields</b>            | <a href="#">Table 68 on page 1650</a> describes the output fields for the <b>show validation statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                          |

*Table 68: show validation statistics Output Fields*

| Field Name                   | Field Description                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total RV records             | Group name.                                                                                                                                                             |
| Total Replication RV records | Number of concurrent sessions for each group. The default is 2. The number is configurable with the <a href="#">max-sessions</a> statement.                             |
| Prefix entries               | Resource public key infrastructure (RPKI) cache session IP address.                                                                                                     |
| Origin-AS entries            | State of the connection between the routing device and the cache server. <b>Up</b> means that the connection is up. <b>Connect</b> means that the connection is not up. |

Table 68: show validation statistics Output Fields (continued)

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Memory utilization                           | Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.<br><br>The default preference is 100. The preference is configurable with the <a href="#">preference</a> statement. |
| Policy origin-validation requests            | Number of queries for validation state of a given instance and prefix.                                                                                                                                                                                                                                                                                                                                                    |
| Valid                                        | Number of valid prefixes reported by the validation query.                                                                                                                                                                                                                                                                                                                                                                |
| Invalid                                      | Number of invalid prefixes reported by the validation query.                                                                                                                                                                                                                                                                                                                                                              |
| Unknown                                      | Number of unknown prefixes reported by the validation query. This means that the prefix is not found in the database.                                                                                                                                                                                                                                                                                                     |
| BGP import policy reevaluation notifications | A change, addition, or deletion of a route validation record triggers a BGP import reevaluation for all exact matching and more specific prefixes.                                                                                                                                                                                                                                                                        |
| inet.0                                       | Number of IPv4 route validation records that have been added, deleted, or changed.                                                                                                                                                                                                                                                                                                                                        |
| inet6.0                                      | Number of IPv6 route validation records that have been added, deleted, or changed.                                                                                                                                                                                                                                                                                                                                        |

## Sample Output

### show validation statistics

```

user@host> show validation statistics
Total RV records: 453455
Total Replication RV records: 453455
 Prefix entries: 35432
 Origin-AS entries: 124400
Memory utilization: 16.31MB
Policy origin-validation requests: 234995
 valid: 23445
 invalid: 14666
 unknown: 34567
BGP import policy reevaluation notifications: 460268
 inet.0: 435345
 inet6.0: 3454

List of Sample Output [show v4ov6-tunnels information on page 1653](#)

**Output Fields** [Table 69 on page 1653](#) lists the output fields for the **show v4ov6-tunnels** command. Output fields are listed in the approximate order in which they appear.

*Table 69: show v4ov6-tunnels*

| Field Name       | Field Description                                            |
|------------------|--------------------------------------------------------------|
| Destination      | Destination IPv6 address of the dynamic tunnel.              |
| Source           | Source IPv6 address of the dynamic tunnel.                   |
| Antispoof        | Anti-spoof address of the dynamic tunnel.                    |
| Antispoof Status | Status of the anti-spoof ability.                            |
| Mtu              | Maximum transmission unit configured for the dynamic tunnel. |
| Anchor pfe       | Anchor PFE of the dynamic tunnel.                            |
| tcnh             | Tunnel composite next hop address.                           |
| tcnh-index       | Index value of tunnel composite next hop address.            |
| tcnh-refcount    | Reference count of the tunnel composite next hop address.    |

## Sample Output

### show v4ov6-tunnels information

```

user@host> show v4ov6-tunnels information

```

## test policy

---

**Syntax** `test policy policy-name prefix`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Test a policy configuration to determine which prefixes match routes in the routing table.

**NOTE:** If you are using the `test policy` command on a logical system, you must first set the CLI to the logical system context. For example, if you want to test a routing policy that is configured on logical system R2, first run the `set cli logical-system R2` command.

**Options** *policy-name*—Name of a policy.  
*prefix*—Destination prefix to match.

**Additional Information** All prefixes in the default unicast routing table (inet.0) that match prefixes that are the same as or longer than the specific prefix are processed by the **from** clause in the specified policy. All prefixes accepted by the policy are displayed. The **test policy** command evaluates a policy differently from the BGP import process. When testing a policy that contains an **interface** match condition in the **from** clause, the **test policy** command uses the match condition. In contrast, BGP does not use the **interface** match condition when evaluating the policy against routes learned from internal BGP (IBGP) or external BGP (EGBP) multihop peers.

When testing a policy, you can see the length of time (in microseconds) required to evaluate the policy and the number of times it has been executed by running the `show policy policy-name statistics` command.
