YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <https://www.juniper.net/support/eula/>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <https://www.juniper.net/documentation/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <https://www.juniper.net/books>.

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
```

```
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

Documentation Conventions

Table 1 on page xiii defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xiii defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure

Table 2: Text and Syntax Conventions (continued)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	<code>user@host> show chassis alarms</code> <code>No alarms currently active</code>
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies guide names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: <code>[edit]</code> <code>root@# set system domain-name domain-name</code>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the <code>[edit protocols ospf area area-id]</code> hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	<code>stub <default-metric metric>;</code>
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<code>broadcast multicast</code> <code>(string1 string2 string3)</code>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<code>rsvp { # Required for dynamic MPLS only</code>
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	<code>community name members [community-ids]</code>
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	<code>[edit]</code> <code>routing-options {</code> <code> static {</code> <code> route default {</code> <code> nexthop address;</code> <code> retain;</code> <code> }</code> <code> }</code> <code>}</code>
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.

Table 2: Text and Syntax Conventions (continued)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the [Juniper Networks TechLibrary](#) site, and do one of the following:

- Click the thumbs-up icon if the information on the page was helpful to you.
- Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <https://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>
- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <https://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <https://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://www.juniper.net/support/requesting-support.html>.

CHAPTER 1

Software Overview

- [Introduction to Junos Applications on page 3](#)
- [Applications in the Junos Architecture on page 5](#)
- [Supported Platforms for Junos Applications on page 8](#)
- [Application Versions and Compatibility on page 9](#)

Introduction to Junos Applications

Using tools provided by Juniper Networks, third-party developers, called *providers* can create innovative applications and manipulate existing features of the Junos OS. The term *application*, as used in this guide, refers to an application built by a provider.

So applications run on the Routing and System applications (formerly called the RE SDK), the Services applications (formerly called the Services SDK), or the Remote Routing and System applications (also known as the Remote applications).

- Routing and System applications run on the control plane. Typically, these applications perform network management and protocol signaling. They also initiate servers. Positioned on the control plane, Routing Engine applications can coordinate other subsystems and services. A Routing Engine is always present in any device, so these applications are always deployable without the addition of any extra hardware or software.
- Services applications run on the services plane. The services plane is specialized to enable high-performance, customized, and stateful packet processing on the transit or monitored traffic selected for servicing. Services applications may also perform operations similar to Routing and System applications, but such activities typically supplement packet processing.
- With the development of the JunosV App Engine platform, providers can also build custom applications that run on other operating systems in a virtual environment. The JunosV App Engine enables non-Junos third-party applications to integrate with the Junos operating system (OS). Unlike the on-box integration model where applications are fully ported to run on Junos OS. JunosV App Engine enables these *remote applications* to run in their native environment requiring network integration only at the programming interfaces exposed by the network device. Each remote application gets built along with its native OS into a virtual device and is then packaged into an installable Junos package. Upon installation onto a Juniper device, the virtual device is deployed

as a guest on top of a hypervisor running on the JunosV App Engine platform. You can learn more about the remote applications that run on the JunosV App Engine from the JunosV App Engine Administration Guide.

As of Junos OS Release 14.1, remote applications no longer necessarily require the JunosV App Engine to run if they invoke JDAF services by configuring the **jda** statement at the **[edit services]** hierarchy level. The **jda** statement configures the routing instances on which JDAF is enabled. If the **jda** statement is not configured, then JDAF is disabled.

On some of the smaller Juniper Networks devices, physical modules do not necessarily plug in to a chassis. Rather a single box contains the necessary hardware. Nonetheless, applications are still supported in the control and services planes and we continue to use the Routing Engine and services modules terminology.

Applications in the Junos Architecture

The Junos operating system (OS) is a single network operating system that integrates routing, switching, and security. Most Juniper Networks platforms run the Junos OS and also support applications created by third-parties, referred to in this guide as *providers*.

This topic presents the Junos OS architecture at a high level and in detail where it pertains to building applications. It continues explaining how the architecture fits over the hardware, and what types of applications are best suited to the environments described.

Figure 1: Architecture Summary and Traffic Paths

9039250

The Junos OS is divided into three logical elements: the control plane, the data plane, and the services plane. These main conceptual separations are summarized in [Figure 1 on page 5](#) and described in more detail in the following sections:

- [Control Plane on page 6](#)
- [Data Plane on page 6](#)
- [Services Plane on page 7](#)
- [Traffic Types on page 7](#)

Control Plane

The control plane in the Junos OS is a logical element that manages and controls the behavior of the device and the other two planes, the data plane and the services plane. The control plane runs on the Routing Engine. The Routing Engine may be a separate physical module or may be integrated into a device. In some products the Routing Engine cards are hot-swappable physical modules in the chassis. A chassis option for a redundant Routing Engine backing up the master Routing Engine is also available. Applications can take advantage of this redundant Routing Engine to enable their own high availability.

The control plane:

- Has a global view of the device hardware and software
- Exposes the user interface and manages the native Junos OS features

The Routing Engine's key component is the Junos OS. The Junos OS is based on the FreeBSD operating system, an open-source software system. This mature, general-purpose system provides many of the essential functions of an operating system, such as scheduling resources. To transform it into a network operating system, Juniper Networks engineers have extensively modified and hardened it for the specialized requirements of networking.

On the control plane, the Junos kernel, many of the Junos daemons, and some ephemeral utility-style tools launched on demand are run. The daemons and tools that come bundled with the Junos OS are considered part of the Junos OS platform.

Applications for the control plane resemble these daemons and tools. In fact. These applications then become part of the common platform and Junos OS software bundle. Applications can programmatically manipulate the states of the platform software and make use of their services in a dynamic way. The daemons that control the Junos OS user interface also allow for programmatic and seamless extensibility of the user interface. You can configure and administer a modified user interface in the same way as you do for applications.

Data Plane

The data plane in the Junos OS is a logical element that spans many aspects of a device's chassis and its modules. The data plane's role is to forward traffic according to the forwarding table, primarily formed through the routing control service on the control plane. The data plane's main extended abilities include switching, filtering, rate limiting, shaping, and other quality-of-service (QoS) functions. These functions are controlled by the control plane.

In the Junos environment and the Junos applications architecture, the data plane abstraction is often specifically referred to as the Packet Forwarding Engine. It comprises ASIC-based hardware and software microcode to perform packet processing. Aiming to perform at fast wire speeds and within its hardware resource limits, the Packet Forwarding Engine generally defers stateful packet processing to the services plane. Applications do not run in the data plane, which is tightly bound to the hardware. An application running

in the control or services plane can influence the packet processing mechanism in the data plane, however.

Services Plane

The services plane in the Junos OS is a logical element that can be thought of as an extension to the data plane to perform stateful services and any services non-native to the Packet Forwarding Engine. A classic example of a Junos OS service application is the stateful firewall.

In traditional forwarding devices, the data plane usually handles much of the packet processing and the services plane runs on optionally installable and hot-swappable hardware, which are generically called services modules. The services plane spans the collection of all services modules in a chassis, and a given service application can be deployed on more than one module. For the M Series, T Series, and MX Series routers, the specific modules supporting the services plane are the Multiservices PIC and the Multiservices DPC.

In security and service-oriented devices, the services plane is the primary packet processor, and the data plane merely connects a chassis containing many services modules. While these devices can perform forwarding, they are purpose built and deployed to service traffic in stateful ways implemented in software running on the services modules.

The Junos kernel on a services engine further logically divides packet handling for applications in two sub-planes. Its services plane (data plane extension) is for fast customized transit traffic processing. Its control plane is for traffic termination with the IP stack. The control plane components frequently implement a server or signaling to communicate outside the device or simply to other components on the Routing Engine.

Applications in the services sub-plane of a service module can take on two roles involving inline packet processing: transforming and monitoring. Transforming applications have access to any traffic flowing through the Packet Forwarding Engine that is selected for servicing at the given service module. They can modify, drop, hold, and create entire packets. Monitoring applications work similarly, but the packets they receive are duplicates of some traffic originally transiting the Packet Forwarding Engine. When monitoring is used, the original traffic is not impacted or serviced. The selection and configuration of either packet processing option is application specific. A hybrid application can differentiate and deal with both original and duplicated packets. Sometimes hybrid applications are named *gateways*, and may combine a server or signaling control plane component with a transforming or monitoring services plane component. Many familiar service applications, such as the Junos IPsec service, work with both styles of components.

Traffic Types

Applications deal with two different types of traffic: control traffic and data traffic.

Control traffic is in the control plane. You can classify control traffic as traffic that is either internal to the device entirely (for example, interprocess communication) or, more generally, as traffic destined to or sourced from a device address. Most addresses configured on the device belong to the master Routing Engine. For example all addresses configured on network interfaces for I/O ports and the loop back interface pertain to the

Routing Engine, so control traffic destined to those addresses is forwarded to the master Routing Engine and handled there. The Junos OS also allows the configuration of addresses on interfaces representing a service module. Traffic destined to those addresses is forwarded to and handled on the given service engine's control sub-plane.

Data traffic flows through the data plane. You can classify data traffic that relates especially to any application as the traffic selected for servicing or monitoring. This is the traffic seen in the services plane handled by transforming or monitoring applications. Data traffic naturally flows through the Packet Forwarding Engine as transit traffic, but there are application-specific mechanisms by which it can be selected for steering through the service engine's services plane. On exit, the steered traffic is re-routed and filtered in the Packet Forwarding Engine as if it was entering the device from any I/O interface.

 - [Installing Application Packages on page 87](#)

Supported Platforms for Junos Applications

Applications may have components that execute on the control plane and on the service plane.

All control-plane-based components work across these Juniper Networks platforms:

- JCS 1200 Control System
- M Series Multiservice Edge Routers
- MX Series 5G Universal Routing Platforms
- SRX210, SRX240, and SRX650 Services Gateways
- T Series Core Routers
- TX Matrix

Service-plane-based components work across these Juniper Networks routers:

- M Series Multiservice Edge Routers
- MX Series 5G Universal Routing Platforms
- T Series Core Routers

All service-plane-based components work on the Multiservices 100 Physical Interface Card (PIC), the Multiservices 400 PIC, or the Multiservices Dense Port Concentrator (DPC). The Multiservices PICs are optionally installable in the M Series and T Series routers. The Multiservices DPCs are optionally installable in the MX Series routers.

NOTE: In the documentation, the term *Multiservices PIC* is equivalent to the Multiservices DPC on the MX Series routers, unless otherwise noted.

- Related Documentation**

 - [Applications in the Junos Architecture on page 5](#)

Application Versions and Compatibility

As of Junos OS Release 12.3, Junos applications will install on Junos only if the application is built with the same release as the Junos OS Release on which the application is being installed. For example, an application built with Release 12.3R2 will only install on Junos OS Release 12.3R2 and will not install on Junos OS Release 12.3R1 or Junos OS Release 12.3R3 or Junos OS Release 13.1R1.

Prior to Junos OS Release 12.3, Junos applications provided binary compatibility across the different releases of the Junos OS in a particular release train. For example, all the applications developed using the Release 10.3 are binary compatible with Junos OS releases 10.3R1, 10.3R2, 10.3R3, and so on.

Suppose you have Junos OS Release 11.1 on your device and you use the **request system software add** command to install an application developed using Release 10.4. The Junos OS gracefully refuses any attempt to add the software to the device.

CHAPTER 2

Feature Overviews

- [Resource Limits Imposed on Applications on page 11](#)

Resource Limits Imposed on Applications

Junos applications have four levels of policies to ensure that applications have the minimal impact on the native Junos operating system and system operations. These policies impose limits on the system resources the application uses. Each succeeding policy level overrides the previous level's settings, provided the constraints are within the previous level's settings.

Level I policy is the default global policy generated by Juniper Networks. Level II is a per-provider level policy that enables different resource limits per provider. A Level III policy is implemented in the policy file that providers write for each application package. The Level IV policy is set by you, the administrative user using the **resource-limits** statement at the **[edit system extensions]** hierarchy level.

NOTE: This documentation is not application-specific documentation. Features documented in this guide are generic to all applications. Refer to the application-specific documentation developed by your applications' provider for detailed instructions.

- [Restricting Resource Limits on page 11](#)
- [Displaying Resource Limits on page 13](#)

Restricting Resource Limits

NOTE: This information is for third-party Junos SDK applications only.

The Level IV policy is set by the administrative user using the **resource-limits** statement at the **[edit system extensions]** hierarchy level.

The limits imposed by a Level IV policy can be configured either by package or by individual processes in the package. Limits defined for individual processes override the limits defined for an entire package. Any limits not set as Level IV limits inherit the limits from Level III if they exist or from Level II.

The following hierarchy shows all the statements for setting resource limits:

```
[edit system extensions]
resource-limits {
  package package-name {
    resources {
      cpu {
        priority number;
        time seconds;
      }
      file {
        core-size bytes;
        open number;
        size bytes;
      }
      memory {
        data-size bytes;
        locked-in bytes;
        resident-set-size bytes;
        socket-buffers bytes;
        stack-size bytes;
      }
    }
  }
}
process process-ui-name {
  resources {
    cpu {
      priority number;
      time seconds;
    }
    file {
      core-size bytes;
      open number;
      size bytes;
    }
    memory {
      data-size bytes;
      locked-in bytes;
      resident-set-size bytes;
      socket-buffers bytes;
      stack-size bytes;
    }
  }
}
```

If an application exceeds any of the imposed limits, the router logs it. For example, if a process tries to exceed its stack size, the process is terminated and the system generates a core file.

Level IV policies can be more restrictive than previous policy levels, but they cannot ease the limits set by the other levels. If you try to commit a resource limit that is higher (less

stringent) than the inherited value, the commit operation fails with the following error message:

```
[edit system extensions resource-limits]
  'process jnx-example-service'
    Limit validation failed for program 'jnx-example-service', resource 'file'
  limit 'open': raising limits defined in role 'Provider_Daemon' is not allowed.
commit complete

[edit system extensions resource-limits]
```

Level IV policies can be applied either during runtime of the application or before the application gets started. However, if the application was already running when a new limit is applied, the application must be restarted manually in order to allow for the new limits to take effect.

If you delete a resource configuration, the setting goes back to the limits from the assigned role in the manifest file (Level II or Level III).

See Also • [Displaying Resource Limits on page 13](#)

Displaying Resource Limits

NOTE: This information is for third-party Junos SDK applications only.

To display the applied policies, use the **show system processes resource-limits process-name process-ui-name** operational command. The following example configuration, when committed, applies resource limits for an application package `jnx-example` and overrides it with process-level settings for the process `jnx-example-service`:

```
[edit system extensions]
user@router# show
resource-limits {
  package jnx-example {
    resources {
      memory {
        stack-size 4m;
      }
    }
  }
  process jnx-example-service {
    resources {
      file {
        size 4m;
      }
    }
  }
}
```

Using the **show system processes resource-limits process-name** command, the output for `jnx-example-foo-binary`, part of package `jnx-example`, looks like the following output because the package-level settings are applied on it:

```
user@router> show system processes resource-limits process-name jnx-example-foo-binary
Resource Limits:
  Area                Max. allowed  Max. configurable
  memory/stack-size   4MB          8MB
  memory/data-size    32MB         32MB
  memory/resident-set-size 24MB        24MB
  memory/locked-in    16MB         16MB
  cpu/priority        10           10
  file/open           64           64
```

The output for `jnx-example-service` looks like this:

```
user@router> show system processes resource-limits process-name jnx-example-service
Resource Limits:
  Area                Max. allowed  Max. configurable
  file/size           4MB          unlimited
  file/open           64           64
  cpu/priority        10           10
  memory/stack-size   8MB          8MB
  memory/data-size    32MB         32MB
  memory/resident-set-size 24MB        24MB
  memory/locked-in    16MB         16MB
```

For more detail on the **show system processes resource-limits process-name** *process-ui-name* operational command, see its command summary.

CHAPTER 3

Remote Applications Without the JunosV App Engine

- [Configuring the Juniper Distributed Application Framework on page 17](#)

Configuring the Juniper Distributed Application Framework

Remote applications interact with the Junos operating system and the router through a software services framework that extends access to Junos management-plane, control-plane, and data-plane features as services. The framework is known as the Juniper Distributed Application Framework (JDAF). Through JDAF, the Junos kernel communication, route management, firewall, configuration, and operational command services all become services for the remote application. Any participant in this framework can publish a service or can subscribe to a service. The framework keeps track of all the services that are published and the health of each service, and implements policies you provide for service access.

To access Junos services, remote applications communicate with the JDAF framework using stubs that you include in the application. JDAF relays application requests to the router and returns replies from the router to the application.

JDAF is available to applications in two ways:

- Using an internal JunosV App Engine server that has information about all system states, routing table entries, and so forth. In this case, you need to connect to a VSE Series device. See the JunosV App Engine Administration Guide for configuration instructions for the **[edit services app-engine]** hierarchy level.
- Invoking JDAF services without using the JunosV App Engine. In this case, the VSE Series device is not required. You access JDAF by configuring the **jdaf** statement, introduced in Junos OS Release 14.1, at the **[edit services]** hierarchy level. The **jdaf** statement configures the routing instances on which JDAF is enabled. If the **jdaf** statement is not configured, then JDAF is disabled.

To enable JDAF without JunosV App Engine:

- Specify the routing instances JDAF is to be enabled on.

You can specify one or more routing instances. The default routing instance is enabled by configuring default. For example, you could issue one or both of the following set commands:

```
set services jdaf routing-instances default routing-instances ri1
set services jdaf routing-instances [ ri2 ri3 ]
```

If both of the above set commands are issued and committed and all the routing instances are valid routing instances, the show configuration services command would show the following output:

```
user@host> show configuration services
  jdaf {
    routing-instances [ default ri1 ri2 ri3 ];
  }
```

CHAPTER 4

Deploying Service Applications

- [Deploying Service Applications on page 19](#)
- [Configuring Service Interfaces on page 20](#)
- [Configuring Control and Data Cores on page 20](#)
- [Configuring Packages on the PIC on page 21](#)
- [Configuring Packet Distribution Settings on page 22](#)
- [Setting the Forwarding Database and Policy Database Sizes on page 23](#)
- [Configuring Memory Settings on page 24](#)
- [Configuring System Log Messages on page 25](#)

Deploying Service Applications

There are several configurations that deal with deploying service applications. Most of these configurations are under the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level, shown here:

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  control-cores control-number;
  data-cores data-number;
  data-flow-affinity {
    hash-key (layer-3 | layer-4);
  }
  forwarding-db-size size;
  object-cache-size value;
  package package-name;
  policy-db-size size;
  syslog {
    facility {
      severity;
      destination destination;
    }
  }
  wired-process-mem-size mem-size;
}
```

Changing any of these settings except for the **syslog** statement causes the PIC to reboot.

Another important configuration is setting up service interfaces. The following topics cover this topic and the other configurations seen in the `[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]` hierarchy level. The first three are mandatory items; the others are optional.

Each of these topics contains only generic information. Check the application-specific documentation developed by your application's provider for the appropriate configuration for your application.

Configuring Service Interfaces

To be able to configure services on your PIC, you need to configure the service interfaces. You do this by creating service sets and applying them on an interface or interfaces using the `service-set` statement at the `[edit interfaces interface-name unit logical-unit-number family (inet | inet6) service (input | output)]` hierarchy level.

The following example shows configuring a service interface (**fe-0/1/0**) by applying a service set called **Firewall-Set**:

```
[edit]
interfaces {
  fe-0/1/0 {
    unit 0 {
      family inet {
        service {
          input {
            service-set Firewall-Set;
          }
          output {
            service-set Firewall-Set;
          }
        }
        address 10.1.3.2/24;
      }
    }
  }
}
```

Related Documentation

- [Configuring Packages on the PIC on page 21](#)
- [Configuring Control and Data Cores on page 20](#)
- [Configuring Packet Distribution Settings on page 22](#)
- [Configuring System Log Messages on page 25](#)

Configuring Control and Data Cores

There are eight cores in a PIC. Some cores, called *control cores*, are dedicated to running control functionality for the application. Cores dedicated to processing data for the application are called *data cores*.

To be able to deploy services on the PIC, you must configure at least one control core.

To configure control and data cores, use the **control-cores** and **data-cores** statements, respectively, at the `[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]` hierarchy level:

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  control-cores control-number;
  data-cores data-number;
}
```

Whereas you must designate at least one core as a control core, it is advisable you designate, depending on the nature of the application, a minimum of five data cores to achieve good performance. The total number of cores, both control and data cores, that you can dedicate using the **extension-provider** statement ranges from one through eight. Any cores not configured as control or data cores are treated as *user cores*.

NOTE: When the **extension-provider** statement is first configured, the PIC reboots. When the number of control or data cores is changed, the PIC reboots.

Related Documentation

- [Configuring Packet Distribution Settings on page 22](#)
- [Configuring Memory Settings on page 24](#)
- [Configuring Packages on the PIC on page 21](#)
- [Configuring System Log Messages on page 25](#)

Configuring Packages on the PIC

Applications are installed on the Multiservices PIC in one or more packages.

To designate which application package to install on a given PIC, include the **package package-name** option at the `[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]` hierarchy level:

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  package package-name;
}
```

Up to eight packages can be installed on a PIC; however, only one data package is allowed per PIC.

NOTE: When the **extension-provider** statement is first configured, the PIC reboots. When any package setting is added or removed, the PIC reboots.

As of Junos OS Release 9.5, a stateful firewall plug-in is provided as part of the **jbundle** package. To load this plug-in on the PIC, include the **package jservices-sfw** statement at

the `[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]` hierarchy level.

```
user@router# show chassis
fpc 0;
  pic 0;
    adaptive-services;
      service-package;
        extension-provider;
          control-cores 1;
          data-cores 4;
          object-cache-size 128;
          package jservices-sfw;
          policy-db-size 64;
        }
      }
    }
  }
}
```

NOTE: You cannot install both a Junos service package and an application package on the same PIC. However, you can load both the `jservices-sfw` package and an application package on the same PIC.

You can verify what packages are installed on a PIC by using the [show extension-provider system packages](#) command. However, you need to wait until the PIC has finished rebooting after adding configuration to the PIC.

Related Documentation

- [Checking Installed Application Packages on page 93](#)
- [Configuring Control and Data Cores on page 20](#)
- [Configuring Packet Distribution Settings on page 22](#)
- [Configuring Memory Settings on page 24](#)
- [Configuring System Log Messages on page 25](#)

Configuring Packet Distribution Settings

Flow affinity distribution is based on a hash distribution. Flow affinity is already the default behavior for the control CPUs, but the default behavior for distributing data packets over data cores is in a round-robin fashion.

You can change the default behavior for the data cores from round-robin to flow affinity by adding the `data-flow-affinity` statement at the `[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]` hierarchy level.

```
extension-provider {
  data-flow-affinity {
    hash-key (layer-3 | layer-4);
  }
}
```

```
}
```

Some applications may need you to set the **hash-key** statement (consult application-specific documentation). The options for the **hash-key** statement are 3-tuple hashing (source IP, destination IP address, and IP protocol) or 5-tuple hashing (3-tuple plus source and destination TCP or UDP ports). If the **hash-key** statement is not configured, the default value is 5-tuple. There is no need to differentiate the hashing between control and data traffic.

NOTE: When the **extension-provider** statement is first configured, the PIC reboots. Either adding or removing the **data-flow-affinity** statement causes the PIC to reboot.

Related Documentation

- [Configuring Memory Settings on page 24](#)
- [Configuring Packages on the PIC on page 21](#)
- [Configuring System Log Messages on page 25](#)

Setting the Forwarding Database and Policy Database Sizes

The forwarding database provides access to route information such as fast routing look-ups. It will typically have information related to route entries, their associated outgoing interfaces, and autonomous system information. The policy database stores the policies of plug-ins only. Both the forwarding database and the policy database are carved out of object cache. So the sum of both databases must be less than the total object cache.

You control the sizes of the forwarding database and the policy database using the **forwarding-db-size** and the **policy-db-size** statements, respectively, at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level. Both statements are configured in megabytes (MB). When setting these sizes, be guided by your provider's application-specific documentation.

NOTE: Changing either the **forwarding-db-size** or the **policy-db-size** statement causes the PIC to reboot.

NOTE: You must enable the **sampling** statement at the **[edit forwarding-options]** hierarchy level for the forwarding database to be created.

Related Documentation

- [Configuring Memory Settings on page 24](#)

- [Configuring Packages on the PIC on page 21](#)
- [Configuring System Log Messages on page 25](#)

Configuring Memory Settings

Configuring memory can help tune application performance. Two types of memory are provided: object cache and wired process memory. If wired process memory is exhausted, the processes use unwired memory.

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  object-cache-size value;
  wired-process-mem-size mem-size;
}
```

See the following topics for more information on these memory types:

- [Object Cache on page 24](#)
- [Wired Process Memory on page 25](#)

Object Cache

Object cache is shared memory. Both the size of the forwarding database and the size of the policy database are taken from object cache. Therefore, the size of object cache must be more than the sum of the sizes of both of these databases.

To configure object cache, specify a value that is a multiple of 128 MB and up to 512 MB for the Multiservices 100 PIC or up to 1280 MB for the Multiservices 400 PIC. However, if you set wired process memory as well, the maximum value for the object cache on the Multiservices 100 PIC is 128 MB and 768 MB on the Multiservices 400 PIC.

The current recommendations when configuring memory settings Multiservices PICs are as follows:

- Do not exceed a policy database size of 64 MB.
- Stay with one rule per term.
- Keep the object cache size high (1280 MB on Multiservices 400 PICs and DPCs and 512 MB on Multiservices 100 PICs).
- Do not configure anything for forwarding database.
- Keep the number of service sets per Multiservices PIC below 1000.

NOTE: When the `extension-provider` statement is first configured, the PIC reboots. Changing the object cache size, the policy database size, or the forwarding database size on a running system causes the PIC to reboot.

See Also • [object-cache-size on page 65](#)

Wired Process Memory

Wired process memory, or Big TLB, is memory used by the operating system that is pretty much "off limits" to another application. If wired process memory is exhausted, the processes use unwired memory.

The size of wired process memory is configurable. To reserve Big TLB, configure the **wired-process-mem-size** statement at the **[edit adaptive-services service-package extension-provider]** hierarchy level.

NOTE: When the **wired-process-mem-size** statement is first changed, the PIC reboots.

As of Junos OS Release 11.2, the number of processes supported by Big TLB is also configurable. When you configure multiple Big-TLB-supported processes, the physical memory is divided equally among the number of processes that use it. For example, if **mem-size** is 1024 MB and the number of processes (**num-procs**) supported is 8, then each process is allocated 128 MB of physical memory. Thus, the amount of physical memory that is allocated to each process is **mem-size/num-procs**.

To specify the number of processes that use Big TLB, use the **wired-max-processes** statement at the **[edit adaptive-services service-package extension-provider]** hierarchy level. The amount of memory that can be reserved for Big TLB is platform dependent.

The amount of object cache is also dependent on the amount of wired memory. The following table lists details per platform.

Table 3: Wired Memory and Object Cache Combinations in Multiservices PICs

Device	Max. Object Cache (MB)	Max. Wired Memory (MB)	Max. Number of Processes
Multiservices 100 PIC	512	0	0
	0	512	8
Multiservices 400 PIC	1280	0	0
Multiservices 500 PIC	256	1024	8
Multiservices DPC			

See Also • [wired-process-mem-size on page 84](#)

Configuring System Log Messages

To record or view system log messages on a specific PIC, include the **syslog** statement at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  syslog {
    facility {
      severity;
      destination destination;
    }
  }
}
```

NOTE: When the **extension-provider** statement is first configured, the PIC reboots. After that, changing system log settings does not cause the PIC to reboot.

Each system log message belongs to a *facility*, which is a group of messages that are either generated by the same software process or concern a similar condition or activity. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions.

For the Junos Applications, there are four values for the **facility** statement that log either actions performed or errors encountered by the following entities:

- **daemon**—Various system processes.
- **external**—Local external applications.
- **kernel**—The PIC kernel.
- **pfe**—The Packet Forwarding Engine.

The **severity** statement has the same values as it does in the native Junos operating system (OS). See [Table 4 on page 26](#) for possible values.

Table 4: Severity Levels for Syslog Messages

Level	Description
any	Include all severity levels.
none	Disable logging of the associated facility to a destination.
emergency	System panic or other condition that causes the routing platform to stop functioning.
alert	Conditions that require immediate correction, such as a corrupted system database.
critical	Critical conditions, such as hard errors.
error	Error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.
warning	Conditions that warrant monitoring.

Table 4: Severity Levels for Syslog Messages (continued)

Level	Description
notice	Conditions that are not errors but might warrant special handling.
info	Events or nonerror conditions of interest.

Enhancements to the existing infrastructure make debugging on the Multiservices PIC easier by giving the user the option of redirecting the log messages to either the Routing Engine (**routing-engine**) or to the console of the PIC (**pic-console**).

The user does not have to specify a destination for the messages; by default all messages go to the **/var/log** directory on the Routing Engine. When the syslog destination is configured to redirect the log messages to the Routing Engine, you can use the **set system syslog** command, a command available in the Junos OS CLI, to override the syslog settings made on the Multiservices PIC.

To record or view system log messages on a specific PIC, include the **syslog** statement. System log information is passed to the Routing Engine and put in the **/var/log** directory.

Application Execution

Application execution includes the following topics.

- [Verifying the Execution Status of System Processes on page 29](#)
- [Disabling a System Process on page 30](#)
- [Configuring Application Failure Settings on page 30](#)

Verifying the Execution Status of System Processes

To see the execution status of system processes, use the **show system processes wide** operational command. The **wide** option is optional, but you must use it to display the provider name of your application.

show system processes wide

```
user@host> show system processes wide
  PID  TT  STAT      TIME PROVIDER  COMMAND
  ...
    9   ??  DL       0:00.01          [pagedaemon]
  ...
 6463  ??  DL       0:00.18          [md9]
 6738  ??  S        0:00.44          /usr/sbin/mgd -N
 7001  ??  S        0:00.12 jnx          /opt/sbin/jnx-exampled -N
 7063  ??  Ss       0:00.03          mgd: (mgd) (user)/dev/tty0 (mgd)
```

Disabling a System Process

You can disable Junos OS processes.

CAUTION: Never disable any of the software processes unless instructed to do so by a Customer Support engineer.

To disable a software process:

1. Specify the appropriate process to disable at the **[edit system]** hierarchy level using the **processes** statement.

```
[edit system]
user@router# set processes process-name disable
```

2. You can later go back and similarly enable the process.

```
[edit system]
user@router# set processes process-name enable
```

TIP: The *process-name* variable is one of the valid process names. You can obtain a complete list of process names by using the CLI command completion feature.

Configuring Application Failure Settings

For routers or switches with redundant Routing Engines, you can configure the router or switch to switch to backup media that contains a version of the system if a software process fails repeatedly. You can configure the router or switch to fail over to either backup media or the other Routing Engine. When you configure a failover option, the router will try to reboot a few times (within one minute) before going to the failover option you specify.

To configure automatic switchover to backup media if a software process fails:

- Include the **failover** statement at the **[edit system processes *process-name*]** hierarchy level:

```
[edit system]
user@router# set process-name failover (alternate-media | other-routing-engine)
```

TIP: The *process-name* variable is one of the valid process names. You can obtain a complete list of process names by using the CLI command completion feature.

Displaying Resource Limits

NOTE: This information is for third-party Junos SDK applications only.

To display the applied policies, use the **show system processes resource-limits process-name process-ui-name** operational command. The following example configuration, when committed, applies resource limits for an application package `jnx-example` and overrides it with process-level settings for the process `jnx-example-service`:

```
[edit system extensions]
user@router# show
resource-limits {
  package jnx-example {
    resources {
      memory {
        stack-size 4m;
      }
    }
  }
  process jnx-example-service {
    resources {
      file {
        size 4m;
      }
    }
  }
}
```

Using the **show system processes resource-limits process-name** command, the output for `jnx-example-foo-binary`, part of package `jnx-example`, looks like the following output because the package-level settings are applied on it:

```
user@router> show system processes resource-limits process-name jnx-example-foo-binary
Resource Limits:
```

Area	Max. allowed	Max. configurable
memory/stack-size	4MB	8MB
memory/data-size	32MB	32MB
memory/resident-set-size	24MB	24MB
memory/locked-in	16MB	16MB
cpu/priority	10	10
file/open	64	64

The output for `jnx-example-service` looks like this:

```
user@router> show system processes resource-limits process-name jnx-example-service
Resource Limits:
```

Area	Max. allowed	Max. configurable
------	--------------	-------------------

file/size	4MB	unlimited
file/open	64	64
cpu/priority	10	10
memory/stack-size	8MB	8MB
memory/data-size	32MB	32MB
memory/resident-set-size	24MB	24MB
memory/locked-in	16MB	16MB

For more detail on the **show system processes resource-limits process-name process-ui-name** operational command, see its command summary.

- [Example: Configuring Separate Resource Limits for a Process on page 43](#)

Restricting Resource Limits

NOTE: This information is for third-party Junos SDK applications only.

The Level IV policy is set by the administrative user using the **resource-limits** statement at the **[edit system extensions]** hierarchy level.

The limits imposed by a Level IV policy can be configured either by package or by individual processes in the package. Limits defined for individual processes override the limits defined for an entire package. Any limits not set as Level IV limits inherit the limits from Level III if they exist or from Level II.

The following hierarchy shows all the statements for setting resource limits:

```
[edit system extensions]
resource-limits {
  package package-name {
    resources {
      cpu {
        priority number;
        time seconds;
      }
      file {
        core-size bytes;
        open number;
        size bytes;
      }
      memory {
        data-size bytes;
        locked-in bytes;
        resident-set-size bytes;
        socket-buffers bytes;
        stack-size bytes;
      }
    }
  }
}
```

```

}
process process-ui-name {
  resources {
    cpu {
      priority number;
      time seconds;
    }
    file {
      core-size bytes;
      open number;
      size bytes;
    }
    memory {
      data-size bytes;
      locked-in bytes;
      resident-set-size bytes;
      socket-buffers bytes;
      stack-size bytes;
    }
  }
}
}

```

If an application exceeds any of the imposed limits, the router logs it. For example, if a process tries to exceed its stack size, the process is terminated and the system generates a core file.

Level IV policies can be more restrictive than previous policy levels, but they cannot ease the limits set by the other levels. If you try to commit a resource limit that is higher (less stringent) than the inherited value, the commit operation fails with the following error message:

```

[edit system extensions resource-limits]
'process jnx-example-service'
  Limit validation failed for program 'jnx-example-service', resource 'file'
  limit 'open': raising limits defined in role 'Provider_Daemon' is not allowed.
  commit complete

[edit system extensions resource-limits]

```

Level IV policies can be applied either during runtime of the application or before the application gets started. However, if the application was already running when a new limit is applied, the application must be restarted manually in order to allow for the new limits to take effect.

If you delete a resource configuration, the setting goes back to the limits from the assigned role in the manifest file (Level II or Level III).

Related Documentation

- [Displaying Resource Limits on page 13](#)

Application User Interface Extensions

Providers can extend the Junos OS user interface. The Junos OS has two configuration mode commands that help you work with applications. The following topics describe these commands in detail:

- [Displaying the Detail for Application Configurations on page 34](#)
- [Displaying and Deleting Configuration for Applications on page 34](#)

Displaying the Detail for Application Configurations

The **show | display detail** command is not new but has been updated to show application package information. The complete form of the command is as follows:

show <statement-path> | display detail

The **show | display detail** command displays the characteristics, descriptions, and constraints of each configuration statement in the Junos operating system (OS) configuration schema using comment lines. The configuration schema is piped through to the **display detail** command. The **show** command displays the entire user-defined configuration unless it is limited to a particular branch of the configuration scheme by the optional **statement-path** variable.

Generally, the information displayed is help strings and the permission bits required to add or modify the configuration statement. For configuration statements that are defined by an application package, the name of the package that defines the statement is also displayed. If a Junos statement is redefined by an application package, the package name is listed. However, if a configuration statement is defined by the native Junos OS only, no package name is displayed.

See Also • [Example: Displaying and Deleting Configuration Contributed by Applications on page 45](#)

Displaying and Deleting Configuration for Applications

To display or delete the configuration for a specific application package, use the **extension package-name (show | delete)** configuration mode command:

extension package-name (show | delete) <section>

This command filters for configuration based on the package named in the command, starting at the top of the configuration hierarchy, or, if you use the **section** option, starting at the hierarchy level indicated by the **section** option. The output displays the configuration of all matches.

NOTE: Remove all the soon-to-be invalid configurations before removing the application package. See [“Removing Application Packages” on page 92](#).

To delete application configuration:

1. Display any configuration specific to the application.

```
[edit]
user@router# extension package-name show
```

2. When you are satisfied that this is the configuration you want to delete, issue the **extension *package-name* delete** command. Use the **section** option to limit the scope of the deletion if needed.

```
[edit]
user@router# extension package-name delete
```

NOTE:

Matches for the extension show Command

Matches for the **extension *package-name* show** command include those packages whose package names exactly match the value of ***package-name*** as well as those whose names have the same root but may have longer names, similar to a wildcard situation.

The following example shows simplified output illustrating how the **extension *package-name* show** command works. Suppose a router has packageA, packageB, and packageAB installed and you issue the command **extension packageA show**. The output displays configuration for packages with names that not only exactly match packageA but also have roots that match (in this case, packageAB):

```
user@router# extension packageA show
system {
  packageA {
    ....
  }
  packageAB {
    ....
  }
}
```

Matches for the extension delete Command

In contrast, the **extension *package-name* delete** command treats the value of ***package-name*** as a literal. It deletes only configuration contributed by the package whose package name exactly matches the given value.

NOTE: A configuration schema defined in any native Junos package is never deleted by the removal of any third-party package.

See Also • [Example: Displaying and Deleting Configuration Contributed by Applications on page 45](#)

Application Health Monitoring

Providers can have their applications request and manage system resources. Some of this resource utilization is persistent across, for example, reboots or the restart of the application. Some system tasks such as deleting a package, disabling an application, or accessing shared resources require that resources be cleaned up by entities other than the application itself. Resources that are known to need cleaning up include the following:

- GENCFG blobs
- SYSV shared memory segments
- SYSV semaphores
- Temporary files

Currently, the **traceoptions** statement is the only CLI statement available for configuring resource cleanup.

To configure tracing operations for resource cleanup operations, include the **traceoptions** **flag** option for selectively turning the debugging of trace messages on or off:

```
[edit]
system {
  processes {
    resource-cleanup {
      traceoptions {
        file filename files number match regex size size (world-readable |
          no-world-readable);
        flag flag;
        level level;
        no-remote-trace;
      }
    }
  }
}
```

The available flags for the **traceoptions** statement include:

- **all**—Enable all trace option flags.
- **events**—Display process state change and cleanup events.
- **gencfg**—Display GENCFG blobs recorded for cleanup.
- **sysvsem**—Display SYSV semaphores recorded for cleanup.
- **sysvshm**—Display SYSV shared memory segments recorded for cleanup.
- **ui**—Display tracing messages for UI operational commands.

Verification of System Information on the Services PIC

Show commands exist that give information about the state of the Services PIC and so allow for monitoring of these management functions.

Several of these show commands are in the form of **show extension-provider system**:

- **show extension-provider system packages**—Display the packages that are installed on the PIC.
- **show extension-provider system processes**—Display the system processes running on the PIC.
- **show extension-provider system uptime**—Display the uptime on the Services PIC by interface.
- **show extension-provider system virtual-memory**—Display the kernel dynamic memory usage on the Services PIC.
- **show extension-provider system connections**—Display information about the connection activity on the Services PIC.

These commands collect and display the output for all active and fully booted Services PICs on the system.

Traffic Configuration with Applications

- [Configuring Traffic Sampling for Junos Applications on page 39](#)
- [Configuring Service Sets for Junos Applications on page 40](#)
- [Configuring the Service Order for Service Sets for Junos Applications on page 40](#)
- [Configuring the Sampling Service Set on page 41](#)

Configuring Traffic Sampling for Junos Applications

You enable sampling for Junos applications much as you do for with the regular Junos operating system (OS). But only family inet and family inet6 are supported for Junos applications receiving traffic on an **ms-** interface.

Developed for Junos applications, the **extension-service** statement provides a section of the configuration hierarchy in which the provider of your application may have added its own traffic-monitoring configuration statements. The **extension-service** statement is available at the following hierarchy levels:

- **[edit services service-set *service-set-name*]**
- **[edit forwarding-options sampling family *family* output]**
- **[edit forwarding-options sampling instance *instance-name* family *family* output]**

To enable sampling for applications and be able to use any application-specific configuration statements your application provider may have added, you must include the **extension-service** statement at the **[edit forwarding-options sampling family *family* output]** or **[edit forwarding-options sampling instance *instance-name* family *family* output]** hierarchy level. For application-specific configuration guidelines, see the documentation provided with your application.

NOTE: If you use the **extension-service** statement, the only other statement you can include at the **[edit forwarding-options sampling family *family* output]** hierarchy level is the interface statement. In this case, you must set the interface statement to an interface with an **ms-** prefix.

```
[edit]
forwarding-options {
```

```
sampling {
  family family {
    output {
      extension-service service-name {
        provider-specific rules;
      }
      interface ms-fpc/pic/port;
    }
  }
}
```

Related Documentation

- [Example: Traffic Sampling on a Multiservices PIC on page 47](#)

Configuring Service Sets for Junos Applications

A *service set* is a collection of policies taken from multiple services that can be applied as a unit to traffic coming to the PIC.

For applications, to include a defined service in a service set, you must reference it using the **extension-service** statement at the **[edit services service-set service-set-name]** hierarchy level.

```
[edit]
services {
  service-set service-set-name {
    extension-service service-name1;
    extension-service service-name2;
  }
}
```

Up to two plug-ins are supported per PIC and can be chained together in one service set.

NOTE: If the **extension-service** statement is used, the **service-order** statement is mandatory.

To specify the order of the policies within a service set, configure the **service-order** statement at the **[edit services extension-service]** hierarchy level.

Related Documentation

- [Configuring the Service Order for Service Sets for Junos Applications on page 40](#)
- [Example: Service Set Configuration for Junos Applications on page 46](#)

Configuring the Service Order for Service Sets for Junos Applications

The service order is the order in which services are applied for a given service set.

To configure the service order, include the **service-order** statement at the **[edit services service-set service-set-name extension-service]** hierarchy level.

```
[edit]
services {
  service-set service-set-name {
    extension-service service-name1;
    extension-service service-name2;
    service-order {
      forward-flow [ service-name1 service-name2 ];
      reverse-flow [ service-name1 service-name2 ];
    }
  }
}
```

NOTE: If the `extension-service` statement is specified, the `service-order` statement is mandatory. Service order should not be configured for native Junos internal services. For the internal services, there is a default service order.

The **service-order** statement must include all services defined in the service set. It is mandatory to specify the forward-flow service order and the reverse-flow service order. If the reverse-flow service order is not specified, the reverse-flow order is the reverse of the forward-flow service order. The exception to this is for the sampling service set type. If a service set is a sampling service set and the reverse-flow service order is not configured, all sampled traffic is considered to be forward traffic.

To change the service order, delete the service order elements and then add them again in the new order.

- Related Documentation**
- [Configuring Service Sets for Junos Applications on page 40](#)
 - [Configuring the Sampling Service Set on page 41](#)

Configuring the Sampling Service Set

In addition to next-hop and interface service sets there is also a *sampling service set*.

The sampling service set is configured using the **sampling-service** statement at the **[edit services service-set service-set-name]** hierarchy level.

```
[edit]
services {
  service-set service-set-name {
    sampling-service {
      service-interface interface-name;
    }
  }
}
```

The *service interface* is the interface the sampling is taken from. In the case of a sampling service set, the service interface must be a Multiservices PIC interface with a subunit number of 0 (zero). The subunit number defaults to 0. The **reverse-flow** statement is not

mandatory. All sampled traffic is considered to be forward traffic. If you set the **reverse-flow** statement, it is ignored.

The next example makes sure that any sampled packet to the **ms-6/1/0.0** interface has the service plug-ins **plugin1** and **plugin2** applied to it.

```
[edit]
services {
  service-set sset1 {
    sampling-service {
      service-interface ms-6/1/0;
    }
    service-order {
      forward-flow [ plugin1 plugin2 ];
    }
  }
}
```

CHAPTER 7

Examples

- [Example: Configuring Separate Resource Limits for a Process on page 43](#)
- [Example: Displaying and Deleting Configuration Contributed by Applications on page 45](#)
- [Example: Service Set Configuration for Junos Applications on page 46](#)
- [Example: Traffic Sampling on a Multiservices PIC on page 47](#)

Example: Configuring Separate Resource Limits for a Process

NOTE: This information is for third-party Junos SDK applications only.

In this example there are 10 programs in the application package. The programs have resource limits inherited from a Level II policy. The administrative user wants to limit the number of open files and the stack size but does not want to apply the same limits to the `jnx-example-service` program.

Limits set for a process will override those set for packages. Any limits not set inherit the Level II limits.

In the example output for this example, the maximum configurable amounts normally shown in the left column are omitted to make room for notation showing which policy level the maximum allowed values come from.

1. Commit the following configuration. It specifies limits for the `jnx-example` package. these limits will be in place except for any process (program) that has other limits set. There is a block that configures limits for the process `jnx-example-service`. Any limits not specified inherit the limits from the Level II policy.

```
[edit]
resource-limits {
  package jnx-example {
    resources {
      file {
        open 8;
      }
      memory {
        stack-size 4m;
      }
    }
  }
}
```

```

    }
    process jnx-example-service {
        resources {
            memory {
                resident-set-size 8m;
            }
        }
    }
}

```

2. Use the **show system processes resource-limits process-name *ui-process-name*** command to see the resource limits for each of the processes. For nine of them (represented by jnx-foo-service), the **file/open** and **memory/stack-size** fields show the more stringent limits you committed for the package.

```

user@router> show system processes resource-limits process-name jnx-foo-service
Resource Limits

```

Area	Max. allowed	
cpu/priority	10	<-- inherited from Level II
file/open	8	<-- defined in config
memory/data-size	32MB	<-- inherited from Level II
memory/locked-in	16MB	<-- inherited from Level II
memory/resident-set-size	24MB	<-- inherited from Level II
memory/stack-size	4MB	<-- defined in config

3. Use the **show system processes resource-limits process-name *process-ui-name*** command to see the resource limits for the jnx-example-service process. Since separate limits were set for jnx-example-service, it uses those limits defined in the CLI configuration and any not so set revert to the inherited values from Level II.

```

user@router> show system processes resource-limits process-name jnx-example-service
Resource Limits

```

Area	Max. allowed	
cpu/priority	10	<-- inherited from Level II
file/open	64	<-- inherited from Level II
memory/data-size	32MB	<-- inherited from Level II
memory/locked-in	16MB	<-- inherited from Level II
memory/resident-set-size	8MB	<-- defined in config
memory/stack-size	8MB	<-- inherited from Level II

Related Documentation

- [show system processes resource-limits process-name on page 128](#)
- [Resource Limits Imposed on Applications on page 11](#)
- [Restricting Resource Limits on page 11](#)
- [Displaying Resource Limits on page 13](#)

Example: Displaying and Deleting Configuration Contributed by Applications

This example demonstrates the usefulness of the **extension package-name show** command over the simple **show** command using a sample configuration.

1. If you use the **show** command at the top of the hierarchy, all configuration is shown.

```
[edit]
user@router# show
system {
  radius-server {
    10.1.1.1 {
      timeout 10;
      backup-server 10.1.1.2; # Contributed by pkg1
    }
  }
}
protocols {
  ospf {
    ....
  }
  proto1 { # Contributed by pkg1
    ....
  }
}
```

2. In contrast, the following is the output from the **extension pkg1 show** command. Notice that this command selects configurations contributed by and leading to the package named in the command. The **extension pkg1 show** command filters out the **timeout** and **ospf** commands from the displayed output, which were not contributed by the **pkg1** package.

```
[edit]
user@router# extension pkg1 show
system {
  radius-server {
    10.1.1.1 {
      backup-server 10.1.1.2;
    }
  }
}
protocols {
  proto1 {
    ....
  }
}
```

3. Continuing with the same example, notice how the configuration changes when the **extension pkg1 delete** command is used. Using this command, you can delete all user-defined configuration statements related to the pkg1 package.

TIP:

This one command accomplishes the same thing as issuing the following two commands:

- **delete system radius-server 10.1.1.1 backup-server**
- **delete protocols proto1**

```
[edit]
user@router# extension pkg1 delete
[edit]
user@router# show
system {
  radius-server {
    10.1.1.1 {
      timeout 10;
    }
  }
}
protocols {
  ospf {
    ....
  }
}
```

Related Documentation • [Displaying and Deleting Configuration for Applications on page 34](#)

Example: Service Set Configuration for Junos Applications

In the following configuration example, the **acme-svc1** service is defined by three rules (their content is unspecified) and the **acme-svc2** service is defined by a rule set made up of an unspecified number of rules. In this example, these services are defined at the **[edit acme services]** hierarchy level.

```
[edit]
acme {
  services {
    acme-svc1 { #Provider-defined service
      svc1-rule1 { # First rule's name
        ... # First rule defined
      }
      svc1-rule2 { # Second rule's name
        ... # Second rule defined
      }
      svc1-rule3 { # Third rule's name
        ... # Third rule defined
      }
    }
  }
}
```

```

acme-svc2 { # Provider-defined service
  rule-set svc2-rule-set { # Rule-set name
    [ rules rule-names ]; # Rules definitions start here
  }
}
}
}

```

At the **[edit services]** hierarchy level (no intervening “acme” level here), the **service-set sset1** is defined by referencing the three rule names for **acme-svc1** and the one rule set name for **acme-svc2** using the **service-set service-set-name extension-service** statement at the **[edit services service-set service-set-name]** hierarchy level.

The service order is also configured at the **[edit services service-set service-set-name]** hierarchy level.

The following is an example of configuring service sets, extension service rules, and the service order:

```

[edit]
services {
  service-set sset1 {
    extension-service acme-svc1 {
      svc1-rule1;
      svc1-rule2;
      svc1-rule3;
    }
    extension-service acme-svc2 {
      rule-set svc2-rule-set;
    }
    /* Now define the order */
    service-order {
      forward-flow [acme-svc1 acme-svc2];
      reverse-flow [acme-svc1 acme-svc2];
    }
  }
}

```

- Related Documentation**

 - [Configuring the Service Order for Service Sets for Junos Applications on page 40](#)
 - [Configuring Service Sets for Junos Applications on page 40](#)

Example: Traffic Sampling on a Multiservices PIC

The following example shows a firewall filter **sample-monitor**, which, when attached to an interface, ensures that all traffic entering that interface with a source address matching address 10.1.1.1 is sampled and sent to the output interface **ms-2/0/0**.

```

[edit]
firewall {
  family inet {
    filter sample-monitor {

```

```
term sample-term {
  from {
    source-address {
      10.1.1.1/32;
    }
  }
  then {
    sample;
    accept;
  }
}
}
}
}
forwarding-options {
  sampling {
    input {
      family inet {
        rate 1;
      }
    }
    output {
      extension-service abc-sample {
        provider-specific rules;
      }
    }
    interface ms-2/0/0;
  }
}
```

You can attach the firewall filter created in the above sample to any interface in your network.

Syntax	<code>control-cores <i>control-number</i>;</code>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
Release Information	Statement introduced in Junos OS Release 9.0.
Description	Configure control cores. Any cores not configured as either control or data cores are treated as user cores. When the number of control cores is changed, the PIC reboots.
Options	<i>control-number</i> —Number of control cores. At least one core must be a control core. Range: 1 through 8
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Control and Data Cores on page 20• data-cores on page 51

data-cores

Syntax	<code>data-cores <i>data-number</i>;</code>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
Release Information	Statement introduced in Junos OS Release 9.0.
Description	Configure data cores. Any cores not configured as either data or control cores are treated as user cores. When the number of data cores is changed, the PIC reboots.
Options	<i>data-number</i> —Number of data cores. Although it is not mandatory to dedicate any cores as data cores, it is advisable, depending on the nature of the application, to dedicate a minimum of five as data cores to achieve good performance. Range: 0 through 7
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Control and Data Cores on page 20• control-cores on page 50

data-flow-affinity

Syntax	<code>data-flow-affinity { <code>hash-key</code> (layer-3 layer-4); }</code>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package <code>extension-provider</code>]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	<p>Enable flow affinity distribution for packets over data CPUs on the PIC. Once enabled, the default behavior distributing data packets changes from a round-robin distribution to a flow affinity distribution based on a hash distribution. Adding or deleting this statement causes the PIC to reboot.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Packet Distribution Settings on page 22

destination (Chassis)

Syntax	<code>destination <i>destination</i>;</code>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider syslog facility]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	Configure where log messages go. By default, all messages go to the <code>/var/log</code> directory on the Routing Engine. Enhancements to the existing infrastructure make debugging on the Multiservices PIC easier by giving the user the option of redirecting log messages. When the syslog destination statement is configured to redirect the log messages, you can use the set system syslog command, a command available in the native Junos OS CLI, to override the syslog settings made on the Multiservices PIC.
Options	<p>destination—Choose one of the following options:</p> <ul style="list-style-type: none"> routing-engine—Forward log messages to the Routing Engine. pic-console—Forward log messages to the console of the PIC.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring System Log Messages on page 25 extension-provider on page 54

extension-provider

Syntax

```
extension-provider {
  control-cores control-number;
  data-cores data-number;
  data-flow-affinity {
    hash-key (layer-3 | layer-4);
  }
  forwarding-db-size size;
  object-cache-size size;
  package package-name;
  policy-db-size size;
  syslog {
    facility {
      severity;
      destination destination;
    }
  }
  wired-max-processes num-procs;
  wired-process-mem-size mem-size;
}
```

Hierarchy Level [edit chassis fpc slot-number pic pic-number adaptive-services service-package]

Release Information Statement introduced in Junos OS Release 9.0.

Description Configure an application on a PIC.

CAUTION: Do not configure these settings unless it is specified you should do so. The default settings work under most normal scenarios. Unneeded settings can cause negative effects.

When the **extension-provider** statement is first configured, the PIC reboots.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Hierarchy Level [edit system services]
(ACX6360) [edit system extensions]

Release Information Statement introduced in Junos OS Release 9.0.
Statement introduced in Junos OS Release 9.0 for the ACX6360 Router.

Description Define a customer specific sampling configuration.

Define a service set or traffic monitoring for applications using application-specific configuration guidelines.

NOTE: If the extension-service statement is specified while configuring a service set, the service-order statement is mandatory.

Define configuration parameters for an application.

Options	<p>argument <i>argument-names</i>—Use the specified command line arguments to the JET application</p> <p>checksum <i>number</i>—Checksum of the script.</p> <p>daemonize—Run the application as a background process.</p> <p>file <i>filename</i>—Use the specified name of the file to receive the output of the tracing operation. All files are placed in the directory /var/log.</p> <p>flag <i>flag</i>—Use the specified tracing operation to perform:</p> <ul style="list-style-type: none"> • all—Trace everything. • config—Trace configuration events. • general—Trace general events. • notification—Trace notification events. • routing-socket—Trace routing socket calls. • thriftv—Trace thrift server events. • timeouts—Trace timeouts. • timer—Trace internal timer events. <p>max-datasize <i>datasize</i>—Maximum data segment size allowed for application execution (23068672..1073741824 bytes).</p> <p>no-remote-trace—Disable remote tracing.</p> <p>provider-specific rules—Provider-specific subhierarchy for services and service sets. See the application-specific documentation for details.</p> <p>service-name—Use the specified name of the service.</p> <p>refresh—Overwrite the local copy of all enabled commit scripts or a single enabled commit script with the copy located at the source URL, as specified in the source statement at the same hierarchy level. For more information, see <i>refresh</i>.</p> <p>refresh-from—Overwrite the local copy of all enabled commit scripts or a single enabled commit script with the copy located at the specified URL. For more information, see <i>refresh-from</i>.</p>

hash-key (Chassis)

Syntax	hash-key (layer-3 layer-4);
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider data-flow-affinity]
Release Information	Statement introduced in Junos OS Release 10.2.
Description	Set the hashing distribution of flow affinity. This is an optional setting. Once the data-flow-affinity statement is enabled, you may need to choose the hashing distribution. Modifying this statement causes the PIC to reboot.
Default	If you do not configure the hash-key statement, the hashing distribution is 5-tuple hashing, or layer-4 .
Options	layer-3 —3-tuple hashing (source IP address, destination IP address, and IP protocol). layer-4 —5-tuple hashing (3-tuple plus source and destination TCP or UDP ports).
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

ip-address-owner

Syntax	<code>ip-address-owner <i>owner</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced in Junos OS Release 13.2R1.
Description	Define the owner for IP addresses hosted on an ms- interface. This statement is used to specify that the steering of control plane packets to the Multiservices PIC be preserved. The provider of your application or its user documentation will tell you when you need to set this configuration.
Options	<p>owner—Owner of the IP address for the interface. There are two options:</p> <p>Values:</p> <p>routing-engine—IP address defined on the interface is hosted by the Routing Engine. This option is not used.</p> <p>service-plane—IP address defined on the interface is hosted by the service plane. This option is used to preserve the packet steering behavior built into your application. The provider of your application or its user documentation will tell you when you need to set this configuration.</p>
Required Privilege Level	view

jdaf

Syntax	<pre>jdaf { routing-instances [<i>routing-instance-names</i>]; }</pre>
Hierarchy Level	[edit services]
Release Information	Statement introduced in Junos OS Release 14.1.
Description	<p>Configure Juniper distributed application framework (JDAF).</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>

                }
                memory {
                    data-size bytes;
                    locked-in bytes;
                    resident-set-size bytes;
                    socket-buffers bytes;
                    stack-size bytes;
                }
            }
        }
    }
```

Hierarchy Level [edit system [extensions](#)]

Release Information Statement introduced in Junos OS Release 9.6.

Description Set resource limits for applications using the command-line interface (CLI). You can set limits for all applications listed in the application package's manifest file or define limits

for individual processes in the package. Limits defined for individual processes override the limits defined for an entire package.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege	admin—To view this statement in the configuration.
Level	admin-control—To add this statement to the configuration.

- [extensions on page 56](#)

routing-instances

Syntax routing-instances [*routing-instance-names*];

Hierarchy Level [edit services jdaf]

Release Information Statement introduced in Junos OS Release 14.1.

Description Configure the routing instances on which Juniper Distributed Application Framework (JDAF) is enabled. If the **jdaf** statement is not configured, then JDAF is disabled.

Options **routing-instances [*routing-instance-names*]**—Name or names of routing instances for JDAF clients. If multiple names are being configured, these can be set as an open set of values.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Related Documentation

- [jdaf on page 63](#)

service-order

Syntax `service-order {
 forward-flow [service-name1 service-name2];
 reverse-flow [service-name1 service-name2];
 }`

Hierarchy Level `[edit services service-set service-set-name]`

Release Information Statement introduced in Junos OS Release 9.3.

Description Define the order of services in service set to be applied to traffic coming to the PIC.

NOTE: If the `extension-service` statement is specified, the `service-order` statement is mandatory.

Options **forward-flow**—Order of services in service set to be applied in forward flow.

reverse-flow—Order of services in service set to be applied in reverse flow. If you want the order to be the reverse of that specified for forward flow, this is optional. However, if, for example, you want the order to be the same regardless of direction of flow, you must include this statement. (The exception to this is for the sampling service set type. If a service set is a sampling service set and the reverse-flow service order is not configured, all sampled traffic is considered to be forward traffic.)

Required Privilege Level `system`—To view this statement in the configuration.
 `system-control`—To add this statement to the configuration.

syslog (Chassis)

Syntax	<pre>syslog { facility { severity; destination destination; } }</pre>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
Release Information	Statement introduced in Junos OS Release 9.2. Options daemon and kernel (for <i>facility</i>) introduced in Junos OS Release 9.5.
Description	Enable PIC system logging to record or view system log messages on a specific PIC. The system log information is passed to the kernel for logging in the /var/log directory.
Options	<p>facility—Group of messages that are either generated by the same software process or concern a similar condition or activity. Possible values include the following: daemon, external, kernel, and pfe.</p> <p>severity—Classification of effect on functioning. Possible values are the following options:</p> <ul style="list-style-type: none">• any—Include all severity levels.• none—Disable logging of the associated facility to a destination.• emergency—System panic or other condition that causes the routing platform to stop functioning.• alert—Conditions that require immediate correction, such as a corrupted system database.• critical—Critical conditions, such as hard errors.• error—Error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.• warning—Conditions that warrant monitoring.• notice—Conditions that are not errors but might warrant special handling.• info—Events or nonerror conditions of interest. <p>The remaining statement is explained separately. See CLI Explorer.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring System Log Messages on page 25

traceoptions (Process Monitor)

Syntax `traceoptions {
 file filename files number match regex size size (world-readable | no-world-readable);
 flag flag;
 level level;
 no-remote-trace;
 }`

Hierarchy Level [edit system processes [process-monitor](#)]

Release Information Statement introduced in Junos OS Release 9.0.

Description Enable tracing options for the process health monitor process (pmon).

NOTE: Starting with Junos OS Release 15.1R2, the pmon process is enabled by default on the Routing Engines of MX Series routers, even when no service interfaces are configured.

Options **file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the **file** statement, you must specify a filename.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

flag *flag*—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Enable all trace options flags.
- **events**—Trace process state change and cleanup events.
- **gencfg**—Trace GENCFG blobs recorded for cleanup.
- **module**—Trace module code.
- **sysvsem**—Trace SYSV semaphores recorded for cleanup.
- **sysvshm**—Trace SYSV shared memory segments recorded for cleanup.
- **tracking**—Trace tracking code.
- **ui**—Trace user interface operations.

level *level*—Specify the level of debugging output:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match conditions that warrant special handling (but are not errors).
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace—Disable remote tracing.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files *number*** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable | no-world-readable—(Optional). Grant all users permission to read log files, or restrict the permission only to the **root** user and users who have the Junos **maintenance** permission.

Required Privilege	trace—To view this statement in the configuration.
Level	trace-control—To add this statement to the configuration.

Related Documentation	<ul style="list-style-type: none"> • Verifying the Execution Status of System Processes on page 99
------------------------------	---

traceoptions (Resource Cleanup)

Syntax	<pre> traceoptions { file <i>filename</i> files <i>number</i> match <i>regex</i> size <i>size</i> (world-readable no-world-readable); flag <i>flag</i>; level <i>level</i>; no-remote-trace; } </pre>
Hierarchy Level	[edit system processes resource-cleanup]
Release Information	Statement introduced in Junos OS Release 9.3.
Description	Enable debugging tracing for resource cleanup process.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the file statement, you must specify a filename.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>flag <i>flag</i>—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> • all—Enable all trace options flags. • events—Trace process state change and cleanup events. • gencfg—Trace GENCFG blobs recorded for cleanup. • module—Trace module code. • sysvsem—Trace SYSV semaphores recorded for cleanup. • sysvshm—Trace SYSV shared memory segments recorded for cleanup. • tracking—Trace tracking code. • ui—Trace user interface operations. <p>level <i>level</i>—Specify the level of debugging output:</p> <ul style="list-style-type: none"> • all—Match all levels. • error—Match error conditions.

- **info**—Match informational messages.
- **notice**—Match conditions that warrant special handling (but are not errors).
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace—Disable remote tracing.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files *number*** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable | no-world-readable—(Optional). Grant all users permission to read log files, or restrict the permission only to the **root** user and users who have the Junos **maintenance** permission.

Required Privilege	trace—To view this statement in the configuration.
Level	trace-control—To add this statement to the configuration.

Installing and Managing Application Packages

- [Installing Application Packages on page 87](#)
- [Upgrading Application Packages on page 90](#)
- [Removing Application Packages on page 92](#)
- [Checking Installed Application Packages on page 93](#)
- [Upgrading the Junos OS When Applications Are Installed on page 94](#)
- [Upgrading Application Packages Using Unified ISSU on page 95](#)

Installing Application Packages

To install an application you install the application package or packages, and then you install the application on the router. An application package consists of binaries and their supplements. Application packages are distributed in a single **.tgz** file, which contains all the necessary resources to run the application.

As of Junos OS Release 12.3, Junos applications will install on Junos only if the application is built with the same release as the Junos OS Release on which the application is being installed. For example, an application built with Release 12.3R2 will only install on Junos OS Release 12.3R2 and will not install on Junos OS Release 12.3R1 or Junos OS Release 12.3R3 or Junos OS Release 13.1R1.

To install an application on a router, you configure the statements that describe the certificate. These statements include the provider name, the type of certificate, and the scope of application deployment. The provider name identifies the provider of the application to the system and allows application packages from that provider to be installed on the router. Furthermore, each package's embedded certificate contains parameters about the provider's partnership with Juniper Networks: the license type and deployment scope parameters. As with the provider name, these parameters for the package must be allowed by the configuration in order for the package's installation to be allowed.

NOTE: If graceful routing engine switchover (GRES), or nonstop active routing (NSR) is enabled when you initiate a software installation, the software does not install properly. Make sure you issue the CLI `delete chassis redundancy` command when prompted. If GRES is enabled, it will be removed with this command. By default, NSR is disabled. If NSR is enabled, remove the `nonstop-routing` statement from the `[edit routing-options]` hierarchy level to disable it.

To install an application:

1. Go to configuration mode of the CLI.

```
user@router> configure
Entering configuration mode
[edit]
user@router#
```

2. Go to the `[edit system extensions]` hierarchy level.

```
[edit]
user@router# edit system extensions
[edit system extensions]
```

3. Configure the provider name, the license type, and the deployment scope associated with the application package. This information is supplied by the application's provider.

NOTE: Older certificates have all the certificate information concatenated in the `providers name` statement. These older certificates are still supported, and you can install packages signed with them.

```
[edit system extensions]
user@router# set providers name license-type license deployment-scope deployment
```

For example, if `abc` is a provider name issued to a provider with a customer type of `license` and two deployment scopes, you might issue the following command.

```
[edit system extensions]
user@router# set providers abc license-type customer deployment-scope [ private
commercial ]
```

4. Make other application-specific configuration changes as required by the application's provider.
5. Commit the changes to the configuration.

```
[edit system extensions]
user@router# top
[edit]
user@router# commit
commit complete
```

6. Exit the configuration mode.

```
[edit]
user@router# exit
Exiting configuration mode
```

7. If you have a rescue configuration, update the rescue configuration by issuing the **request system configuration rescue save** command.

```
user@host> request system configuration rescue save
```

NOTE: Making sure the active configuration and the rescue configuration are consistent will prevent errors when installing applications. The system will find the same provider information in both.

8. In the operational mode of the CLI, install the application package. You can add one or multiple packages at one time.

- To add one package at a time, use the **request system software add** command.

```
user@router> request system software add package-name
```

- To add multiple packages at once, use the **request system software add set** command.

```
user@router> request system software add set [package-name1 package-name2
package-name3]
```

For example, this **set** command allows you to install the core Junos OS package and Junos application packages simultaneously.

You will see the application package being installed. For example, if your package's filename is **abcapps-11.1_2011.tgz**.

```
user@router> request system software add abcapps-11.1_2011.tgz
```

```
Installing package '/var/home/user/abcapps-11.1_2011.tgz'
...
Verified abcapps-11.1_2011.tgz signed by abc-enggroup
Adding abcapps...
Available space: 150060 require: 2598
Saving package file in /var/sw/pkg/abcapps-11.1_2011.tgz Saving state
for rollback ...
```

Multiple provider names can be enabled on a router. For example, if **abc** and **xyz** are provider names issued to two providers, then the following configuration enables the router for the applications built by either provider. Notice that a provider can have more than one license type and that each license type can have multiple deployment scopes:

```
[edit]
system {
  extensions {
    providers {
      abc {
```

```
        license-type customer deployment-scope [ private commercial ];
    }
    xyz {
        license-type juniper deployment-scope private;
        license-type research deployment-scope public;
    }
}
}
```

- Related Documentation**
- [Application Versions and Compatibility on page 9](#)
 - [Creating and Returning to a Rescue Configuration](#)
 - [Installing the Software Package on a Router with Redundant Routing Engines](#)
 - [Upgrading Application Packages on page 90](#)
 - [Removing Application Packages on page 92](#)
 - [Checking Installed Application Packages on page 93](#)

Upgrading Application Packages

As of Junos OS Release 12.2, if you are upgrading an application package over an installed application package (that is, re-installing), you do not have to first remove the configuration contributed by that application. Also, if you have more than one package to install, you can add them at the same time using the **request system software add set** command.

As of Junos OS Release 12.3, Junos applications will install on Junos OS only if the application is built with the same release as the Junos OS Release on which the application is being installed. For example, an application built with Release 12.3R2 will only install on Junos OS Release 12.3R2 and will not install on Junos OS Release 12.3R1 or Junos OS Release 12.3R3 or Junos OS Release 13.1R1.

As of Junos OS Release 13.3R1, you can install multiple packages at a time using unified in-service software upgrade (ISSU). Unified ISSU enables you to upgrade the Junos OS release with no disruption on the control plane and minimal disruption of data traffic.

This topic describes the procedures for normal upgrade (re-install) and unified ISSU.

- [Upgrading Application Packages by Re-installing on page 91](#)
- [Upgrading Application Packages Using Unified ISSU on page 91](#)

Upgrading Application Packages by Re-installing

NOTE: If graceful routing engine switchover (GRES), or nonstop active routing (NSR) is enabled when you initiate a software installation, the software does not install properly. Make sure you issue the CLI `delete chassis redundancy` command when prompted. If GRES is enabled, it will be removed with this command. By default, NSR is disabled. If NSR is enabled, remove the `nonstop-routing` statement from the `[edit routing-options]` hierarchy level to disable it.

You can upgrade to the latest version of an application by reinstalling the application using the new package name.

To upgrade an application:

- Add both the application package. If there are more than one package, you can add them at the same time.

```
user@router> request system software add set [new-package-name1
new-package-name2 junos-package1 junos-package2]
```

TIP: After you have upgraded the software in the device and are satisfied that the new application package is successfully installed and running, take a snapshot to back up the new software to the `/altroot` and `/altconfig` file systems.

```
user@router> request system snapshot
```

After you run the `request system snapshot` command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

Upgrading Application Packages Using Unified ISSU

As of Junos OS Release 13.3R1, you can install multiple packages at a time using the unified in-service software upgrade (ISSU) operational command.

Unified in-service software upgrade (ISSU) is for the M Series, MX Series, and T Series only.

A unified ISSU is only supported by dual Routing Engine platforms. The Routing Engines must have same release of Junos OS installed.

In addition, graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) must be enabled.

1. Enable GRES and NSR by committing the following configuration commands:

```
user@router# set chassis redundancy graceful-switchover
```

```
user@router# set routing-options nonstop-routing
user@router# set system commit synchronize
user@router# commit
```

2. Exit to the operational CLI prompt and use the **request system software in-service-upgrade set** command to name the packages to be installed. Include the path if needed in the **package-name**. Include any other options you need after the value set (in square brackets).

```
user@router> request system software in-service-upgrade set [ package-name1
package-name2 ]
```

NOTE: Only *-signed.tgz packages will be accepted.

For example:

```
user@router> request system software in-service-upgrade set [
jinstall-13.3-20131009_ib_13_3_psd.0-domestic-signed.tgz
jtools-13.3-20131009_ib_13_3_psd.0-signed.tgz ]
```

Related Documentation

- [Checking Installed Application Packages on page 93](#)

Removing Application Packages

To remove an application, you may want to remove one application package, multiple packages, or an entire bundle. See the appropriate procedure for each in this section.

Before you delete an application package, you need to remove the configuration contributed by that application. See [“Displaying and Deleting Configuration for Applications” on page 34](#) for instructions on removing application-specific configuration.

NOTE: If you do not remove the configuration before deleting the application package, you will get error messages. You will need to do a commit to fix the configuration database. If you prefer not to see the error messages, remove the configuration contributed by the application before removing the application package.

To remove an application package:

1. Remove the configuration contributed by the application.

2. Delete the application package.

```
user@router>request system software delete package-name
```

To remove multiple application packages:

1. Remove the configuration contributed by the applications.
2. Delete the application packages using the **request system software delete set** command.

```
user@router>request system software delete set [package-name1 package-name2]
```

To remove a bundle:

- Uninstall each part of the bundle separately:
 - a. Remove the configuration contributed by the application.
 - b. Delete the application packages, either one by one or several at the same time.

Related Documentation

- [Installing Application Packages on page 87](#)
- [Checking Installed Application Packages on page 93](#)
- [Upgrading Application Packages on page 90](#)
- [Upgrading the Junos OS When Applications Are Installed on page 94](#)

Checking Installed Application Packages

You can get a list of the installed applications using the **show version** command.

The following is sample output from the **show version** command:

```
user@router> show version
jnpr@MX240-SDK-RE0> show version
Hostname: MX240-SDK-RE0
Model: mx240
JUNOS Base OS boot [12.1R1.9]
JUNOS Base OS Software Suite [12.1R1.9]
JUNOS 64-bit Kernel Software Suite [12.1R1.9]
JUNOS Crypto Software Suite [12.1R1.9]
JUNOS Packet Forwarding Engine Support (M/T Common) [12.1R1.9]
JUNOS Packet Forwarding Engine Support (MX Common) [12.1R1.9]
JUNOS Online Documentation [12.1R1.9]
JUNOS Voice Services Container package [12.1R1.9]
JUNOS Border Gateway Function package [12.1R1.9]
JUNOS Services ACL Container package [12.1R1.9]
JUNOS Services LL-PDF Container package [12.1R1.9]
JUNOS Services PTSP Container package [12.1R1.9]
JUNOS Services Stateful Firewall [12.1R1.9]
JUNOS Services NAT [12.1R1.9]
JUNOS Services Application Level Gateways [12.1R1.9]
JUNOS Services Captive Portal and Content Delivery Container package [12.1R1.9]
```

```
JUNOS Services RPM [12.1R1.9]
JUNOS Services HTTP Content Management package [12.1R1.9]
JUNOS AppId Services [12.1R1.9]
JUNOS IDP Services [12.1R1.9]
JUNOS Services Crypto [12.1R1.9]
JUNOS Services SSL [12.1R1.9]
JUNOS Services IPSec [12.1R1.9]
JUNOS Runtime Software Suite [12.1R1.9]
JUNOS Routing Software Suite [12.1R1.9]
```

The packages at the top of the list in the output are application packages provided by Juniper Networks with the Junos OS. If the application package names do not start with the Junos name, then you can take them to be third-party software. However, Juniper Networks reserves the right to deploy application packages separately under the Junos name.

- Related Documentation**
- [Installing Application Packages on page 87](#)
 - [Removing Application Packages on page 92](#)
 - [Upgrading Application Packages on page 90](#)

Upgrading the Junos OS When Applications Are Installed

As of Junos OS Release 12.2, when you upgrade a Junos OS release, you can do so without first having to remove the configuration contributed by an application or applications.

As of Junos OS Release 12.3, Junos applications will install on Junos only if the application is built with the same release as the Junos OS Release on which the application is being installed. For example, an application built with Release 12.3R2 will only install on Junos OS Release 12.3R2 and will not install on Junos OS Release 12.3R1 or Junos OS Release 12.3R3 or Junos OS Release 13.1R1.

To upgrade Junos OS with application configuration:

- Add the Junos OS and application packages at one time using the **request system software add set** command.

```
user@router> request system software add set [junos-release-packages
application-packages]
```

The Junos application configuration is validated against the Junos application package mentioned in the **set** command.

NOTE: You cannot add more than one install package at a time, even with the **set** command.

- Related Documentation**
- [Installing the Software Package on a Router with Redundant Routing Engines](#)
 - [Checking Installed Application Packages on page 93](#)

Upgrading Application Packages Using Unified ISSU

As of Junos OS Release 13.3R1, you can install multiple packages at a time using the unified in-service software upgrade (ISSU) operational command.

Unified in-service software upgrade (ISSU) is for the M Series, MX Series, and T Series only.

A unified ISSU is only supported by dual Routing Engine platforms. The Routing Engines must have same release of Junos OS installed.

In addition, graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) must be enabled.

1. Enable GRES and NSR by committing the following configuration commands:

```
user@router# set chassis redundancy graceful-switchover
user@router# set routing-options nonstop-routing
user@router# set system commit synchronize
user@router# commit
```

2. Exit to the operational CLI prompt and use the **request system software in-service-upgrade set** command to name the packages to be installed. Include the path if needed in the **package-name**. Include any other options you need after the value set (in square brackets).

```
user@router> request system software in-service-upgrade set [ package-name1
package-name2 ]
```

NOTE: Only *-signed.tgz packages will be accepted.

For example:

```
user@router> request system software in-service-upgrade set [
  jinstall-13.3-20131009_ib_13_3_psd.0-domestic-signed.tgz
  jtools-13.3-20131009_ib_13_3_psd.0-signed.tgz ]
```

Managing Resource Information

- [Displaying Resource Limits on page 97](#)
- [Application Health Monitoring on page 98](#)
- [Verifying the Execution Status of System Processes on page 99](#)

Displaying Resource Limits

NOTE: This information is for third-party Junos SDK applications only.

To display the applied policies, use the **show system processes resource-limits process-name process-ui-name** operational command. The following example configuration, when committed, applies resource limits for an application package `jnx-example` and overrides it with process-level settings for the process `jnx-example-service`:

```
[edit system extensions]
user@router# show
resource-limits {
  package jnx-example {
    resources {
      memory {
        stack-size 4m;
      }
    }
  }
  process jnx-example-service {
    resources {
      file {
        size 4m;
      }
    }
  }
}
```

Using the **show system processes resource-limits process-name** command, the output for `jnx-example-foo-binary`, part of package `jnx-example`, looks like the following output because the package-level settings are applied on it:

```
user@router> show system processes resource-limits process-name jnx-example-foo-binary
Resource Limits:
  Area                Max. allowed  Max. configurable
  memory/stack-size   4MB          8MB
  memory/data-size    32MB         32MB
  memory/resident-set-size 24MB        24MB
  memory/locked-in    16MB         16MB
  cpu/priority        10           10
  file/open           64           64
```

The output for `jnx-example-service` looks like this:

```
user@router> show system processes resource-limits process-name jnx-example-service
Resource Limits:
  Area                Max. allowed  Max. configurable
  file/size           4MB          unlimited
  file/open           64           64
  cpu/priority        10           10
  memory/stack-size   8MB          8MB
  memory/data-size    32MB         32MB
  memory/resident-set-size 24MB        24MB
  memory/locked-in    16MB         16MB
```

For more detail on the **show system processes resource-limits process-name** *process-ui-name* operational command, see its command summary.

Application Health Monitoring

Providers can have their applications request and manage system resources. Some of this resource utilization is persistent across, for example, reboots or the restart of the application. Some system tasks such as deleting a package, disabling an application, or accessing shared resources require that resources be cleaned up by entities other than the application itself. Resources that are known to need cleaning up include the following:

- GENCFG blobs
- SYSV shared memory segments
- SYSV semaphores
- Temporary files

Currently, the **traceoptions** statement is the only CLI statement available for configuring resource cleanup.

To configure tracing operations for resource cleanup operations, include the **traceoptions** **flag** option for selectively turning the debugging of trace messages on or off:

```
[edit]
system {
  processes {
    resource-cleanup {
      traceoptions {
        file filename files number match regex size size (world-readable |
          no-world-readable);
        flag flag;
        level level;
        no-remote-trace;
      }
    }
  }
}
```

The available flags for the **traceoptions** statement include:

- **all**—Enable all trace option flags.
- **events**—Display process state change and cleanup events.
- **gencfg**—Display GENCFG blobs recorded for cleanup.
- **sysvsem**—Display SYSV semaphores recorded for cleanup.
- **sysvshm**—Display SYSV shared memory segments recorded for cleanup.
- **ui**—Display tracing messages for UI operational commands.

Verifying the Execution Status of System Processes

The *process health monitor* process (pmon) is the central monitoring process for applications. It tracks resource usage and performs actions on processes when they trigger certain events (for example, when there is a runaway process event or when low-water or high-water resource marks are exceeded). Process monitoring ensures that applications are operating appropriately and provides an interface for operators to monitor the impact of their applications on the Routing Engine.

To trace process monitoring operations, include the **process-monitor** statement at the **[edit system processes]** hierarchy level:

```
[edit]
system {
  processes {
    process-monitor {
      disable;
      traceoptions {
        file filename files number match regex size size (world-readable |
          no-world-readable);
        flag flag;
        level level;
        no-remote-trace;
      }
    }
  }
}
```

```
    }  
  }  
}
```

The **traceoptions** statement is the only container statement at the **[edit system processes process-monitor]** hierarchy level. The available flags for the **traceoptions** statement include:

- **all**—Enable all trace options flags.
- **process-tracking**—Display process life-cycle events and parent/child pedigree changes.
- **heartbeat**—Display heartbeat updates from applications.
- **ui**—Display tracing messages for UI operational commands.

CHAPTER 11

Installation and Upgrade Commands

- request system software in-service-upgrade set

request system software in-service-upgrade set

Syntax request system software in-service-upgrade set [*package-name1 package-name2*]
 <no-copy>
 <no-old-master-upgrade>
 <reboot>
 <unlink>

Release Information Command introduced in Junos OS Release 13.3.

Description (For M Series, MX Series, and T Series only) Perform a unified in-service software upgrade (ISSU) for a list of packages for Junos SDK applications. Using this command you can enable a list of packages to be upgraded through unified ISSU. (You can also specify just one package without the brackets.)

A unified ISSU enables you to upgrade from one Junos OS Release to another with no disruption on the control plane and with minimal disruption of traffic. A unified ISSU is only supported by dual Routing Engine platforms. The Routing Engines must have same release of Junos OS installed. In addition, graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) must be enabled.

The **request system software in-service-upgrade** command, which upgrades only one package, is still supported.

NOTE: Any of the packages given in the list must be compatible with ISSU-INDB. Use only packages ending with ***-signed.tgz**.

Options **package-name**—Name of a package. Include the path. Include multiple packages by listing the packages' filenames inside an open set of values with square brackets as shown in the Syntax section.

no-copy—(Optional) Do not save copies of package files installed.

no-old-master-upgrade—(Optional) Do not upgrade the old master after switchover. When the **no-old-master-upgrade** option is included, after the backup Routing Engine is rebooted with the new software package and a switchover occurs to make it the new master Routing Engine, the former master (new backup) Routing Engine will not be upgraded to the new software. In this case, you must manually upgrade the former master (new backup) Routing Engine. If you do not include the **no-old-master-upgrade** option, the system will automatically upgrade the former master Routing Engine.

reboot—(Optional) Reboot system after adding package. When the **reboot** option is included, the former master (new backup) Routing Engine is automatically rebooted after being upgraded to the new software. When the **reboot** option is not included, you must manually reboot the former master (new backup) Routing Engine using the **request system reboot** command.

unlink—(Optional) Remove the package after successful installation. Use the **unlink** option to remove the software package from this directory (that is, the directory indicated in the **package-name** path) after a successful upgrade is completed.

Additional Information	For more information about unified ISSU, see the <i>Junos OS High Availability Configuration Guide</i> .

Applications Status Commands

- `show extension-provider system connections`
- `show extension-provider system packages`
- `show extension-provider system processes`
- `show extension-provider system uptime`
- `show extension-provider system virtual-memory`

show extension-provider system connections

Syntax	<code>show extension-provider system connections</code> <code><extensive></code> <code><inet inet6></code> <code><interface></code> <code><show-routing-instances></code>
Release Information	Command introduced in Junos OS Release 9.1.
Description	Show connection activity on the extension provider PIC. This command functions similarly to <code>show system connections</code> command.
Options	<p><code>extensive</code>—(Optional) Display exhaustive system process information.</p> <p><code>inet inet6</code>—(Optional) Display IPv4 connections or IPv6 connections, respectively.</p> <p><code>interface</code>—(Optional) Display the name of the extension provider interface.</p> <p><code>show-routing-instances</code>—(Optional) Display routing instances.</p>

show extension-provider system packages

Syntax show extension-provider system packages
<detail>
<interface>

Release Information Command introduced in Junos OS Release 9.1.

Description Show packages loaded on the extension provider PIC. This command functions similarly to **show system software** command.

Options **detail**—(Optional) Display detailed output.

interface—(Optional) Display the name of the extension provider interface.

Required Privilege Level view

Related Documentation

- *show system software*
- [Verifying the Execution Status of System Processes on page 99](#)

List of Sample Output [show extension-provider system packages on page 113](#)
[show extension-provider system packages detail on page 113](#)
[show extension-provider system packages interface on page 113](#)

Output Fields For a description of the output fields, see . Output fields are listed in the approximate order in which they appear.

Field Name	Field Description	Level of Detail
interface	Name of the interface. In the brief output, interface is the only named field, but it is followed by a line or lines, each with the following information: the name of a package and the contents and version of the package.	all
Information for	Name of the package.	detail
Comment	Contents and version of the package.	detail
Description	Description of package including contents and copyright information.	detail
Software version	Software version of package.	detail

Sample Output

show extension-provider system packages

```
user@host> show extension-provider system packages
Interface: ms-0/0/0

show extension-provider system uptime

Syntax	show extension-provider system uptime <interface>
Release Information	Command introduced in Junos OS Release 9.1.
Description	Show uptime on the extension provider PIC.
Options	interface —(Optional) Name of the extension provider interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Verifying the Execution Status of System Processes on page 99
List of Sample Output	show extension-provider system uptime on page 119 show extension-provider system uptime interface on page 119
Output Fields	For a description of the output fields, see the output fields table for the show system uptime command in the <i>Junos System Basics and Services Command Reference</i> .

Sample Output

show extension-provider system uptime

```
user@host> show extension-provider system uptime
Interface: ms-0/0/0
  5:08PM up 26 mins, 0 users, load averages: 0.09, 0.06, 0.04
Interface: ms-0/2/0
  5:08PM up 26 mins, 0 users, load averages: 0.15, 0.03, 0.01
```

show extension-provider system uptime interface

```
user@host> show extension-provider system uptime interface ms-0/2/0
Interface: ms-0/2/0
  5:08PM up 26 mins, 0 users, load averages: 0.15, 0.03, 0.01
```

show extension-provider system virtual-memory

Syntax	show extension-provider system virtual-memory <interface>
Release Information	Command introduced in Junos OS Release 9.1.
Description	Show kernel dynamic memory usage on the extension provider PIC. Display the usage of Junos kernel memory listed first by size of allocation and then by type of usage.
Options	interface —(Optional) Name of the extension provider interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Verifying the Execution Status of System Processes on page 99
List of Sample Output	show extension-provider system virtual-memory on page 120 show extension-provider system virtual-memory interface on page 121
Output Fields	For a description of the output fields, see Table 5 on page 120 . Output fields are listed in the approximate order in which they appear.

Table 5: show extension-provider system virtual-memory Output Fields

Field	Field Description
Size (unlabeled)	Memory block size in bytes.
Type(s) (unlabeled)	Kernel modules that are using the memory blocks. For a definition of each type, see a FreeBSD book.
interrupt	Type of interrupt: <ul style="list-style-type: none"> • total—Total number of interrupts for each type. • rate—Interrupt rate.
Total	Total of all interrupts.

Sample Output

show extension-provider system virtual-memory

```

user@host> show extension-provider system virtual-memory

CHAPTER 13

Resource Information Commands

- `show system processes health`
- `show system processes providers`
- `show system processes resource-limits process-name`
- `show system resource-cleanup processes`

show system processes health

Syntax	show system processes health <process-name <i>name</i> pid <i>pid</i> >
Release Information	Command introduced in Junos OS Release 8.5.
Description	Display the resource utilization (health), of all the Junos applications currently running. You can display health information about one specific process by specifying either the process name or the process ID (PID).
Options	<p>process-name <i>name</i>—(Optional) Display health information about the process identified by the process name.</p> <p>pid <i>pid</i>—(Optional) Display health information about the process identified by the PID.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Verifying the Execution Status of System Processes on page 99 • traceoptions (Process Monitor) on page 79 • process-monitor on page 70
List of Sample Output	<p>show system processes health on page 125</p> <p>show system processes health pid on page 126</p> <p>show system processes health process-name on page 126</p>
Output Fields	For a description of the output fields, see Table 6 on page 124 . Output fields are listed in the approximate order in which they appear.

Table 6: show system processes health Output Fields

Field Name	Field Description
PID	Process ID, a number that identifies the process.
Provider	Provider prefix. A string that identifies the provider of the Junos application.
Parent process	Process ID of the process that spawned the process in question.
Child processes	Process ID of the process that is launched from the process in question: <ul style="list-style-type: none"> • Process ID for child process—A number that identifies the child process. • Name of child process—A string that identifies the child process.
CPU accumulated	Maximum amount of CPU time that can be accumulated.

Table 6: show system processes health Output Fields (continued)

Field Name	Field Description
Heartbeat	<p>A regular signal sent from a router to indicate that the router is up and running:</p> <ul style="list-style-type: none"> • Interval—Number of seconds between heartbeats. • Allowed misses—Number of missed heartbeats allowed before the application restarts. • Last seen—Time in seconds when the last heartbeat occurred. • Total misses—Number of heartbeats missed so far.
Resource utilization	<p>How memory is divided:</p> <ul style="list-style-type: none"> • Area—Segment of memory. • Current—Current size of memory segment. • Max. allowed—Maximum size allowed for memory segment. • data size—Current and maximum sizes of data segment. • open files—Number of currently open files and the maximum allowed. • resident set size—Current and maximum size of resident set segment. • shared memory size—The amount of shared memory the process is using. • stack size—Current and maximum sizes of stack segment.

Sample Output

show system processes health

```

user@host> show system processes health
PID: 10075 (jnx-flow-mgmt)
Provider: jnx
Parent process: 1 (init)
CPU accumulated: 0 seconds
Resource utilization:
  Area          Current  Max. allowed
  data size      7KB      32MB
  open files     20       64
  resident set size 12KB     24MB
  shared memory size 4KB
  stack size     2KB      8MB
PID: 420 (jnx-exampled)
Provider: jnx
Parent process: 1 (init)
Child processes: 1
  PID    Process name
  421    jnx-exampled
CPU accumulated: 21 seconds
Heartbeat:
  Interval:      1s
  Allowed misses: 5
  Last seen:     1s ago (0 missed)
  Total misses:  2
Resource utilization:
  Area          Current  Max. allowed
  data size      24KB     16MB
  open files     23      128

```

resident set size	1532KB	24MB
shared memory size	43KB	
stack size	8KB	8MB

show system processes health pid

The output for the **show system processes health pid *pid*** command is identical to that for the **show system processes health** command except that health information is displayed for only the process specified by the PID. For sample output, see [show system processes health on page 125](#).

show system processes health process-name

The output for the **show system processes health *process-name*** name command is identical to that for the **show system processes health** command except that health information is displayed for only the process named. For sample output, see [show system processes health on page 125](#).

show system processes providers

Syntax show system processes providers

Release Information Command introduced in Junos OS Release 8.5.
Command deprecated for Junos OS with Upgraded FreeBSD in Junos OS Release 15.1.

NOTE: To determine which platforms run Junos OS with Upgraded FreeBSD, see the table listing the platforms currently running Junos OS with upgraded FreeBSD in *Release Information for Junos OS with Upgraded FreeBSD*.

Description Display information about software processes that are running on the router. The output is similar to that of the **show system processes extensive** command, but this command displays only provider processes (that is, only external processes). Also, this command's output has an extra column labeled **PROVIDER** to display the provider prefix.

Required Privilege Level view

Related Documentation • [providers on page 71](#)

List of Sample Output [show system processes providers on page 127](#)

Output Fields For a description of the output fields, see the output fields table for the **show system processes** command in the *Junos System Basics and Services Command Reference*. This table explains all the fields except for **PROVIDER** which is for the string that is the provider prefix for the Junos application running the process.

Sample Output

show system processes providers

```
user@host> show system processes providers
last pid: 7014; load averages: 0.19, 0.09, 0.05 up 0+00:57:29 12:54:45
54 processes: 1 running, 53 sleeping
Mem: 101M Active, 105M Inact, 31M Wired, 132M Cache, 69M Buf, 369M Free
Swap: 1536M Total, 1536M Free
  PID USERNAME PROVIDER PRI NICE  SIZE   RES STATE   TIME  WCPU COMMAND
  7001 root      jnx       96   0 3240K 2700K select  0:00  0.00% jnx-exampled
```

show system processes resource-limits process-name

Syntax `show system processes resource-limits process-name process-ui-name`

Release Information Command introduced in Junos OS Release 9.6.

Description Display the resource limits of a process in a Junos applications package.

NOTE: This command is for third-party Junos SDK applications only.

Options *process-ui-name*—Name of the program or process.

Required Privilege Level view

Related Documentation

- [resource-limits on page 73](#)
- [Restricting Resource Limits on page 11](#)

List of Sample Output

[show system processes resource-limits process-name on page 129](#)
[show system processes resource-limits process-name brief on page 129](#)
[show system processes resource-limits process-name detail on page 129](#)

Output Fields For a description of the output fields, see [Table 7 on page 128](#). Output fields are listed in the approximate order in which they appear.

Table 7: show system processes resource-limits process-name Output Fields

Field Name	Field Description
Provider-ID	Process ID, a number that identifies the process.
Provider-prefix	Provider prefix. A string that identifies the provider of the Junos application.
Area	Segment of memory.
Max. allowed	Current value of the limits applied in the kernel (effective limit).
Max. configurable	Maximum value the administrator can set for the limit in the configuration.
cpu/priority	Highest priority number (nice level) process can run at.

Table 7: *show system processes resource-limits process-name* Output Fields (continued)

Field Name	Field Description
cpu/time	Maximum amount of CPU time that can be accumulated.
file/core-size	Maximum size of a core file that can be created.
file/open	Maximum number of simultaneous open files.
file/size	Maximum size of a file that can be created.
memory/data size	Maximum size of data segment.
memory/locked-in	Maximum number of bytes that can be locked into memory.
memory/resident set size	Maximum size of resident set.
memory/stack size	Maximum size of stack segment.
memory/socket-buffers	Maximum amount of physical memory that may be dedicated to the socket buffers.

Sample Output

show system processes resource-limits process-name

```

user@host> show system processes resource-limits process-name jnx-example-service
Resource Limits
  Area                Max. allowed  Max. configurable
  cpu/priority         10            10
  file/open            16            64
  memory/data-size     32MB          32MB
  memory/locked-in     16MB          16MB
  memory/resident-set-size 8MB          24MB
  memory/stack-size    4MB           8MB

```

show system processes resource-limits process-name brief

The output for the **show system processes resource-limits process-name jnx-example-service brief** command is the same as for the **show system processes resource-limits process-name jnx-example-service** command.

show system processes resource-limits process-name detail

```

user@host> show system processes resource-limits process-name jnx-example-service detail
Provider-ID:      0x8000
Provider-prefix:  jnx

Resource Limits
  Area                Max. allowed  Max. configurable
  cpu/priority         10            10
  cpu/time             unlimited     unlimited
  file/size            unlimited     unlimited

```

file/open	16	64
file/core-size	unlimited	unlimited
memory/data-size	32MB	32MB
memory/locked-in	16MB	16MB
memory/resident-set-size	8MB	24MB
memory/stack-size	4MB	8MB
memory/socket-buffers	unlimited	unlimited

show system resource-cleanup processes

Syntax	show system resource-cleanup processes <detail> <pid <i>number</i> > <process-name <i>name</i> >
Release Information	Command introduced in Junos OS Release 9.3. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the list of processes that have been registered for resource cleanup services.
Options	<p>detail—(Optional) Display the list of processes that have been registered for resource cleanup services, along with the resources that have been requested for cleanup.</p> <p>pid <i>number</i>—(Optional) Display a process that has been registered for resource cleanup services by specifying the Process Identifier number.</p> <p>process-name <i>name</i>—(Optional) Display a process that has been registered for resource cleanup services by name of the process.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • resource-cleanup on page 72 • traceoptions (Resource Cleanup) on page 81
List of Sample Output	show system resource-cleanup processes on page 132 show system resource-cleanup processes detail on page 132
Output Fields	For a description of the output fields, see Table 8 on page 131 . Output fields are listed in the approximate order in which they appear.

Table 8: show system resource-cleanup processes Output Fields

Field Name	Field Description
PID	Process ID, a number that identifies a process.
Process name	String that identifies the process.
Resources to clean	Resources that have been registered to be cleaned up.

Sample Output

show system resource-cleanup processes

```
user@host> show system resource-cleanup processes
PID      Process name      Resources to clean
420      jnx-exampled       GENCFG, SYSV shared memory
```

show system resource-cleanup processes detail

```
user@host> show system resource-cleanup processes detail
PID      Process name      Resources to clean
420      jnx-exampled       GENCFG blob major ID 0x8000, minor ID 0x0000
          SYSV shared memory ID 65536, key 1108955839
          SYSV shared memory ID 65537, key 1108955837
```

CHAPTER 14

JDAF Commands

- request jdaf clear statistics service (cmd | config | firewall | interface | route) client
- request jdaf clear statistics service (cmd | config | firewall | interface | route) server
- show jdaf service (cmd | config | firewall | interface | route) clients
- show jdaf service (cmd | config | firewall | interface | route) statistics client
- show jdaf service (cmd | config | firewall | interface | route) statistics server

request jdaf clear statistics service (cmd | config | firewall | interface | route) client

Syntax	request jdaf clear statistics service (cmd config firewall interface route) client < <i>client-id</i> >
Release Information	Command introduced in Junos OS Release 14.2.
Description	Clear JDAF client side statistics for either command, configuration, firewall, interface, or route service.
Options	<i>client-id</i> —Identifier for client.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">•

request jdaf clear statistics service (cmd | config | firewall | interface | route) server

Syntax request jdaf clear statistics service (cmd | config | firewall | interface | route) server

Release Information Command introduced in Junos OS Release 14.2.

Description Clear JDAF server statistics for either command, configuration, firewall, interface, or route service.

Required Privilege Level view

Related Documentation •

show jdaf service (cmd | config | firewall | interface | route) clients

Syntax	show jdaf service (cmd config firewall interface route) clients
Release Information	Command introduced in Junos OS Release 14.2.
Description	Display client state.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Configuring the Juniper Distributed Application Framework on page 17 • jdaf on page 63
List of Sample Output	show jdaf service cmd clients on page 136 show jdaf service config clients on page 136 show jdaf service firewall clients on page 137 show jdaf service Interface clients on page 137 show jdaf service route clients on page 137
Output Fields	For a description of the output fields, see Table 9 on page 136 . Output fields are listed in the approximate order in which they appear.

Table 9: show jdaf service route clients Output Fields

Field Name	Field Description
Client-id	Client ID.
State	State, as in active or inactive.
URL	The URL contains three pieces of information: protocol (TCP), IP address, and port number.

Sample Output

show jdaf service cmd clients

```
user@host> show jdaf service cmd clients
Client-id  State      URL
7          active    tcp://198.51.100.42:61614
8          active    tcp://198.51.100.42:62109
```

show jdaf service config clients

```
user@host> show jdaf service config clients
Client-id  State      URL
1          active    tcp://198.51.100.42:59019
```

show jdaf service firewall clients

```
user@host> show jdaf service firewall clients
Client-id  State      URL
14         active    tcp://10.102.43.179:37955
```

show jdaf service Interface clients

```
user@host> show jdaf service interface clients
Client-id  State      URL
2          active    tcp://10.102.43.179:48951
```

show jdaf service route clients

```
user@host> show jdaf service route clients
Client-id  State      URL
28         active    tcp://198.51.100.10:38269
```

show jdaf service (cmd | config | firewall | interface | route) statistics client

Syntax	show jdaf service (cmd config firewall interface route) statistics client <client-id>
Release Information	Command introduced in Junos OS Release 14.2.
Description	Display JDAF message statistics.
Options	client <i>client-id</i> —(Optional) The client connection you want to view statistics for.
Required Privilege Level	view
Related Documentation	•
List of Sample Output	show jdaf service route statistics client on page 142
Output Fields	For a description of the output fields, see Table 10 on page 138 . Output fields are listed in the approximate order in which they appear.

Table 10: show jdaf service route statistics client Output Fields

Field Name	Field Description
rx-bytes	Bytes received.
tx-bytes	Bytes transmitted.
rx-queued	Queued bytes.
rx-msgs	Number of received messages.
rx-errors	Number of errors received messages.
tx-msgs	Number of transmitted messages.
tx-errors	Number of errors during transmitted messages.

RouteLookup	0	0	0
RouteAdd	1	1	0
RouteDelete	0	0	0

show jdaf service (cmd | config | firewall | interface | route) statistics server

Syntax	show jdaf service (cmd config firewall interface route) statistics server
Release Information	Command introduced in Junos OS Release 14.2.
Description	Show JDAF server side statistics.
Required Privilege Level	view
Related Documentation	•
List of Sample Output	show jdaf service cmd statistics server on page 143 show jdaf service config statistics server on page 144 show jdaf service firewall statistics server on page 144 show jdaf service interface statistics server on page 144 show jdaf service route statistics server on page 144
Output Fields	For a description of the output fields, see Table 11 on page 143 . Output fields are listed in the approximate order in which they appear.

Table 11: show jdaf service statistics server Output Fields

Field Name	Field Description
Requests	Number of requests. This is further broken down to the following categories: <ul style="list-style-type: none"> • Accepts—Number of (cmd config firewall interface route) requests accepted. • Rejects—Number of (cmd config firewall interface route) requests rejected. • Errors—Number of (cmd config firewall interface route) requests returned with an error.
Routing-Instance-Id	Routing instance where JDAF service is running. This is broken down to the following categories: <ul style="list-style-type: none"> • Accepts—Number of (cmd config firewall interface route) requests accepted. • Errors—Number of (cmd config firewall interface route) requests returned with an error.

Sample Output

show jdaf service cmd statistics server

```

user@host> show jdaf service cmd statistics server
Requests    Accepts    Rejects    Errors
4           4          0          0

```

Routing-Instance-Id	Accepts	Errors
0	4	0

show jdaf service config statistics server

```
user@host> show jdaf service config statistics server
```

Requests	Accepts	Rejects	Errors
1	1	0	0

Routing-Instance-Id	Accepts	Errors
0	1	0

show jdaf service firewall statistics server

```
user@host> show jdaf service firewall statistics server
```

Requests	Accepts	Rejects	Errors
14	14	0	0

Routing-Instance-Id	Accepts	Errors
